Outline

- Motivation and Goal
- Modeling High-Lift Components
- Deflecting Flaps and Slats
- Gap, Overlap and Relative Deflection
- Current Shortcomings
- Recommendations

Motivation

- OpenVSP can model high-lift surfaces using simple shearing of the airfoil coordinates. This is an appropriate level of complexity for lower-order aerodynamic analysis methods, such as vortex-lattice.
- For higher-order analysis methods (panel and Euler codes), actual three-dimensional surfaces must be modeled, particularly for slats and slotted flaps.
- No direct method for controlling complex flap and slat motions parametrically or intuitively.

Goal

- Establish a set of best practices for modeling high-lift components in OpenVSP at a level of complexity suitable for higher-order analysis methods.
 - Flaps and slats modeled as separate three-dimensional surfaces
 - Controlling motion using simple parameters in the local frame of reference

Outline

- Current Shortcomings
- Recommendations

Modeling High-Lift Components

- Components of the high-lift configuration (main wing, slat, vane and flap) modeled as separate wings.
- Planform layout for components identical to the complete wing (same span, tip chord, root chord, sweep, dihedral and twist).
- Component airfoil coordinates use fractional chord but normalized by the chord of the full wing section.
- Transition segments allow for nearly-discontinuous change in cross section.
- Flap and slat surfaces can be assigned to separate sets to visualize and export independently.

Deflecting Flaps and Slats

- **Problem:** VSP transformations (XForm) are defined relative to the x , y , and z axes – whereas we want to specify flap and slat transformations relative to the hinge axis.

- **Solution:** derive the user to directly specify flap and slat transformations relative to the hinge axis.

- **Approach:** derive the user to directly specify flap and slat transformations relative to the hinge axis, and use the Advanced Parameters dialog to calculate the component's XForm parameters.

Definition of Hinge Line

- Flap with semispan, b
- Hinge line between $p_0 = (x_0, 0, z_0)$ and $p_1 = (x_1, y_1, z_1)$ where

$$y_1 = \sqrt{b^2 - (z_1 - z_0)^2}$$
- Hinge axis dihedral, $\Gamma = \sin^{-1} \left(\frac{z_1 - z_0}{b} \right)$ and sweep, $\Lambda = \tan^{-1} \left(\frac{x_1 - x_0}{b} \right)$

Hinge Axis Coordinates

- c -axis lies in the plane of the flap, orthogonal to the hinge axis (approx. chordwise).
- s -axis is aligned with hinge axis (approx. spanwise).
- n -axis is orthogonal to c and s (approx. vertical).

Deflection relative to hinge axis

- Inboard end of hinge axis translated by $(\Delta c_0, 0, \Delta n_0)$.
- Outboard translated by $(\Delta c_1, \Delta s_1, \Delta n_1)$, where

$$\Delta s_1 = \sqrt{\left(\frac{b}{\cos \Lambda}\right)^2 - (\Delta c_0 - \Delta c_1)^2 - (\Delta n_0 - \Delta n_1)^2} - \frac{b}{\cos \Lambda}$$

- Component rotated around hinge axis by θ_f .

Translation in xyz Coordinates

- In xyz coordinate system, deflection of inboard end of hinge axis is

$$\Delta p_0 = \begin{pmatrix} \Delta x_0 \\ \Delta y_0 \\ \Delta z_0 \end{pmatrix} = \begin{pmatrix} \Delta c_0 \cos \Lambda \\ -\Delta c_0 \cos \Gamma \sin \Lambda - \Delta n_0 \sin \Gamma \\ -\Delta c_0 \sin \Gamma \sin \Lambda + \Delta n_0 \cos \Gamma \end{pmatrix}$$

- Outboard deflection is

$$\Delta p_1 = \begin{pmatrix} \Delta x_1 \\ \Delta y_1 \\ \Delta z_1 \end{pmatrix} = \begin{pmatrix} \Delta c_1 \cos \Lambda + \Delta s_1 \sin \Lambda \\ -\Delta c_1 \cos \Gamma \sin \Lambda + \Delta s_1 \cos \Gamma \cos \Lambda - \Delta n_1 \sin \Gamma \\ -\Delta c_1 \sin \Gamma \sin \Lambda + \Delta s_1 \sin \Gamma \cos \Lambda + \Delta n_1 \cos \Gamma \end{pmatrix}$$

- New semispan, dihedral, and sweep:

$$b' = \sqrt{(y_1 + \Delta y_1 - y_0 - \Delta y_0)^2 + (z_1 + \Delta z_1 - z_0 - \Delta z_0)^2}$$

$$\Gamma' = \sin^{-1} \left(\frac{z_1 + \Delta z_1 - z_0 - \Delta z_0}{b'} \right), \Lambda' = \cos^{-1} \left(\frac{x_1 + \Delta x_1 - x_0 - \Delta x_0}{b'} \right)$$

Flap Transformation Steps

1. Translate the flap by $-p_0$ so that the inboard end of the hinge axis coincides with the flap origin.
2. Rotate about the x -axis by the negative of the dihedral angle ($-\Gamma$) so that the hinge axis lies in the $z = 0$ plane.
3. Rotate about the z -axis by the sweep angle (Λ) so that the hinge axis coincides with the y -axis.
4. Rotate about y -axis by the flap rotation angle (θ_f).
5. Rotate about the z -axis by the negative of the new sweep angle ($-\Lambda'$).
6. Rotate about the x -axis by the new dihedral angle (Γ').
7. Translate by $p_0 + \Delta p_0$ so that the inboard end of the hinge axis coincides with its new location.

Transformation Matrix

$$A = \begin{bmatrix} A_{11} & A_{12} & A_{13} & X \\ A_{21} & A_{22} & A_{23} & Y \\ A_{31} & A_{32} & A_{33} & Z \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

Where

$$A_{12} = -\sin \Gamma \sin \theta_f \cos \Lambda' - \cos \Gamma \cos \theta_f \sin \Lambda \cos \Lambda' + \cos \Gamma \cos \Lambda \sin \Lambda'$$

$$A_{13} = \cos \Gamma \sin \theta_f \cos \Lambda' - \sin \Gamma \cos \theta_f \sin \Lambda \cos \Lambda' + \sin \Gamma \cos \Lambda \sin \Lambda'$$

$$A_{23} =$$

$$\sin \Gamma \cos \Lambda \cos \Lambda' \cos \Gamma' - \cos \Gamma (\sin \theta_f \sin \Lambda' \cos \Gamma' + \cos \theta_f \sin \Gamma')$$

$$- \sin \Gamma \sin \Lambda (\sin \theta_f \sin \Gamma' - \cos \theta_f \sin \Lambda' \cos \Gamma')$$

⋮

(etc.)

OpenVSP Transformation Steps

1. Rotate around the z -axis by angle γ .
2. Rotate around the y -axis by angle β .
3. Rotate around the x -axis by angle α .
4. Translate along the vector $(\Delta x, \Delta y, \Delta z)$.

$$B =$$

$$\begin{bmatrix} \cos \beta \cos \gamma & -\cos \beta \sin \gamma & \sin \beta & \Delta x \\ \sin \alpha \sin \beta \cos \gamma + \cos \alpha \sin \gamma & \cos \alpha \cos \gamma - \sin \alpha \sin \beta \sin \gamma & -\sin \alpha \cos \beta & \Delta y \\ \sin \alpha \sin \gamma - \cos \alpha \sin \beta \cos \gamma & \sin \alpha \cos \gamma + \cos \alpha \sin \beta \sin \gamma & \cos \alpha \cos \beta & \Delta z \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

If these transformations are equivalent, then

$$A = B.$$

Solve by Inspection

$$A = \begin{bmatrix} A_{11} & A_{12} & A_{13} & X \\ A_{21} & A_{22} & A_{23} & Y \\ A_{31} & A_{32} & A_{33} & Z \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$B = \begin{bmatrix} \cos \beta \cos \gamma & -\cos \beta \sin \gamma & \sin \beta & \Delta x \\ \sin \alpha \sin \beta \cos \gamma + \cos \alpha \sin \gamma & \cos \alpha \cos \gamma - \sin \alpha \sin \beta \sin \gamma & -\sin \alpha \cos \beta & \Delta y \\ \sin \alpha \sin \gamma - \cos \alpha \sin \beta \cos \gamma & \sin \alpha \cos \gamma + \cos \alpha \sin \beta \sin \gamma & \cos \alpha \cos \beta & \Delta z \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

Equivalent Transformations

$$\beta = \sin^{-1} A_{13}$$
$$\alpha = -\sin^{-1} \frac{A_{23}}{\cos \beta}$$
$$\gamma = -\sin^{-1} \frac{A_{12}}{\cos \beta}$$

$$\Delta x = X$$

$$\Delta y = Y$$

$$\Delta z = Z$$

Gap, Overlap, Rel. Deflection

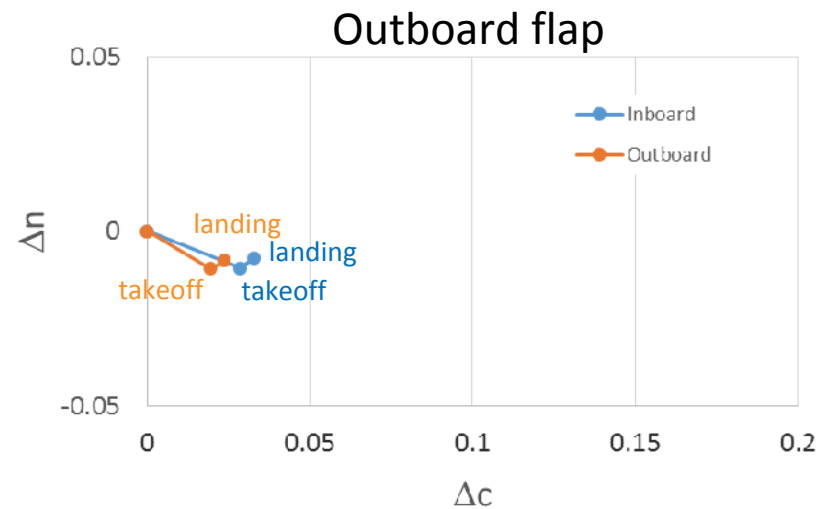

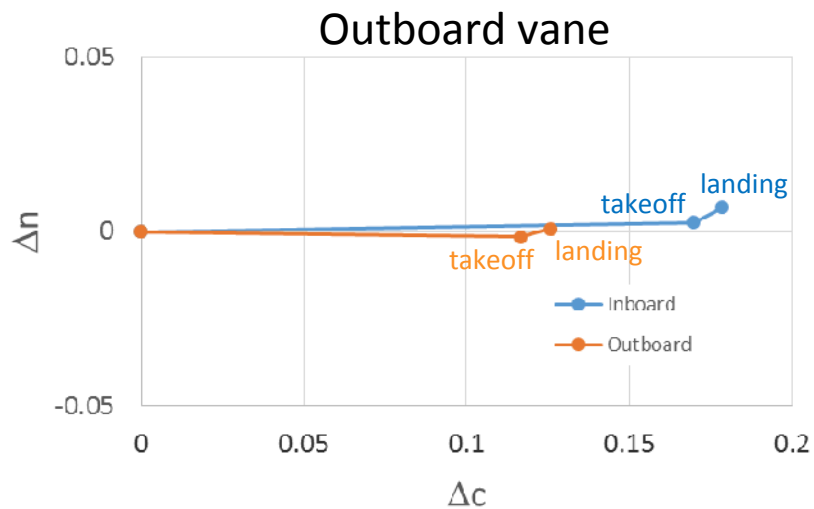

- Problem: flap and slat translation and rotation tends to be specified in terms of Gap, Overlap, and Relative Deflection (δ_v).
- Solution: determine Δc_0 , Δn_0 , Δc_1 , and Δn_1 that correspond to the desired gap, overlap and δ_v .
- Approach: post-process OpenVSP geometry to calculate gap, overlap and δ_v . Use constrained optimization to solve for Δc_0 , Δn_0 , Δc_1 , and Δn_1 .

- Deflecting Flaps and Slats
- Gap, Overlap and Relative Deflection
- **Current Shortcomings**
- **Recommendations**

Current Shortcomings

- Discontinuous Airfoils in Cove Region
 - VSP w-lofting (chordwise) is always continuous.
- Spanwise Lofting of Discontinuities
 - When “discontinuities” are at different arc lengths, u-lofting does not connect them to each other.

Recommendations

1. Add rotation about an arbitrary axis.
2. Add a method for introducing discontinuities to airfoils (repeated point?).
3. Automatically connect discontinuities during spanwise lofting (in conjunction with #2) .
