

**Computationally
Accelerated Materials
Development for Ultra
High Strength Lightweight
Structures**

NASA Advisory Committee Meeting December 5, 2017

Problem

- Cost increases in proportion to the mass ratio
- Mass ratio increases linearly with the dry mass and exponentially with Δv
- Reducing structural mass reduces mission cost at constant payload or increases mission capability at constant cost

	Mass Ratio*	Cost per pound*
Low Earth Orbit	20	\$4,000
Earth to Moon	200	\$40,000
To Moon, Return to Earth	500	\$100,000
Earth to Mars	500	\$100,000
To Mars, Return to Earth	5000	\$1,000,000

* Order of magnitude estimates for mass ratios and costs.

G. Gordon, AIAA SPACE 2007, paper 6278.

Setting Goals using Systems Analysis

Result: Increasing material specific strength by 2x could reduce Gross Lift Off Weight (M_{initial}) by 25% (over 200,000 lbs)!

Observations

- Baseline mass fractions typical of existing rockets
- Weight savings applied to tension driven structures only, others could benefit

Carbon Nanotube (CNT) Gartner Hype Cycle

Nano to Macro Challenge

Computationally Accelerated Materials Development for Ultra High Strength Lightweight Structures

Ultra High Strength Composite Panel

High Strength CNT Yarn

CNT Sheets

CNT Powder

1991-Early 2000s

- Early national investments in CNT research
- NASA interest in structural properties
- Powder form CNT unable to enhance mechanical properties to compete with state of the art structural materials

2004

- CNT sheets first became available
- Manufacturing maturation heavily supported by DoD, including Title III funding
- Property enhancements were focused on electrical properties
- CNT sheets for electrostatic charge dissipation were used on Juno which launched in 2011

2015

- NASA Game Changing Development Program supported efforts in structural CNT resulted in mechanical property improvements to commercially available CNT yarn for composite application
- NASA's internal efforts supported 500% increase in specific strength and 1600% increase in specific modulus of CNT composites over 3 years despite non-optimal CNT composites
- CNT composites at tipping point, needing better understanding of mechanisms for load transfer to continue improvements in mechanical properties

2022

- 5-year Space Technology Research Institute (STRI) funding expected to yield fundamental understanding of CNT composite mechanical properties to reach panel level properties that will enable systems level mass reduction
- Materials Genome Initiative accelerated panel properties development required by STRI will yield both models to enhance understanding of CNT composites and continued maturation of CNT materials manufacturing
- Vision for STRI includes complementary internal NASA efforts to assure timely integration of this technology in systems architecture concepts

Computationally Accelerated Materials Development for Ultra High Strength Lightweight Structures

Topic Focus

Ultra high strength lightweight structural material enabled by Materials Genome Initiative (MGI)
computational guidance

Distinctive Features of Topic

- MGI approach that spans entire materials development cycle
- Requires demonstration article with challenging property targets at the end of performance period
- Panel properties specified are at least double that of state of the art carbon fiber composite properties
- Properties defined with systems guidance on overall payoff in mass reduction for aerospace systems

Computational Guidance Spans Materials Development Cycle

- Application-guided structural materials design – predictive modeling of material properties including load transfer mechanisms that will influence material and structure design
- Computationally guided design, synthesis, and processing to enable macroscale fabrication of ultra high strength composite
- Accelerated testing and evaluation of material properties to inform iterative advancement of materials design, synthesis, and processing

NASA Contribution to Emerging Materials Technology Development

- Provide the mission pull to define relevant material properties that make insertion into NASA missions plausible
- Leverage DoD investments in electrically conductive materials to enable the advancement of high strength materials with broad commercial implications for aerospace
- Theoretical understanding of ultra high strength CNT structures that complements internally funded advancements in prototyping and structural design of advanced high strength composite structures

Building Stronger Materials

The Institute for Ultra-Strong Composites by Computational Design (US-COMP) is a NASA Space Technologies Research Institute (STRI) awarded in 2017 to a partnership of 11 universities, 2 companies, and the Air Force Research Laboratory. Lead by Prof. Greg Odegard at Michigan Technological University, the institute is funded at \$15M over 5 years.

THE TECHNOLOGY

Scope

The Institute for Ultra-Strong Composites by Computational Design (US-COMP) is a NASA Space Technology Research Institute awarded in 2017.

US-COMP will serve as a focal point for partnerships between NASA, other agencies, industry, and academia to: (1) enable computationally-driven development of CNT-based ultra high strength lightweight structural materials within the Materials Genome Initiative (MGI) and (2) expand the resource of highly skilled engineers, scientists and technologists in this emerging field.

Thank You

“For a successful technology, reality must take precedence over public relations, for nature cannot be fooled.”
