Re: PDF - Analytical Data Package

Analytical Laboratories of Florida, Inc. (ALF) office located at 2265 Leaside Court, Merritt Island, Florida provided laboratory services for TetraTech NUS, Inc. at the Launch Complex 34 (LC34) area of Kennedy Space Center during direct push temporary well sample collection. The site is located at NASA's Kennedy Space Center, Florida complex. The laboratory contact is Dale Schamp at 321-258-1355. The laboratory project name is TT071519. Analysis was performed utilizing EPA8260D methodology. A total of 29 ground water samples were analyzed by Dale Schamp (Chemist) over a period of twelve days from July 15 – 27, 2019. The project utilized one of two mobile laboratories over the duration of the project. The mobile laboratories are certified (Certification Number E83934 or E831090) by the Florida Department of Health using the guidelines of the national NELAC certification program. TetraTech's Information System's Group (http://isg.ttnus.com) specified the excel spreadsheet format utilized to transport environmental analytical data to TetraTech in an electronic format. ALF's data was submitted to TetraTech under file name EDD.NASA.LC34.071519total on July 30, 2019.

TetraTech/NUS' Project Manager is Mark Jonnet out of the Pittsburgh, Pa. office. The Prime Contact's subcontract number is S1157417. The mobile laboratory was utilized to perform laboratory analysis to delineate volatile organic contamination in the groundwater at various NASA sites. The contaminants of concern included vinyl chloride, 1,1-DCE, Freon 113, cis/trans-1,2-DCE, and trichloroethene . The sample analysis load was expected to be up to 25 samples per day.

ALF performed the sample extraction with a Teledyne Stratum sample concentrator utilizing a purge and trap technique. The EPA 5030 method was used as a guideline for this procedure. The process involved is done by purging a gas (UHP helium) through a known sample volume (10 ml – undiluted) at a constant flow rate and specific time. This process transfers the contaminants of concern (COC) from the liquid matrix (groundwater) onto the trap. The trap is then heated to 250C releasing the compounds from the trap into the GC/MS system. An electronic value inside

the Stratum sample concentrator is electronically moved from the load position to the inject position to transfer the COCs to the GC/MS.

ALF's GC/MS system consists of a Stratum PTC hooked up to an Agilent 6890 (or Model 7890) Gas Chromatograph in series with an Agilent 5973 (or Model 5975C) MS detector. The COCs are separated by the gradual increase of temperature of GC oven from 45C to 200C and the column's internal coating. ALF's column of choice is a J&W DB-VRX 20 meter, 0.18mm ID, 1um df. This setup closely follows the requirements of EPA Method 8260D for identification and quantification.

The target compound list had a very wide range of project specific detection limit requirements between 1 and 100 ppb to meet the Florida GCTLs. The lab settled on a method detection level for all compounds of 1 ppb. This detection level allowed the compounds to be analyzed in the scan sensitivity mode only.

The compounds are identified by two ways: retention time and ion spectrum. Simply under repetitive flow rates and consistent oven variation of temperatures a compound will pass through a detector at the same time for unknown samples and known calibration standards. The time, after the start of a run, the compound passes through a detector to give a peak type response is known as the retention time. This is how any Gas Chromatograph with a detector identifies a compound. The MS detector has the additional power of compound ion spectrums which occur when the compounds are bombarded with electrons as they pass into the detector which causes the compounds to fragment. Each COC fragments differently from all other compounds thus this is an additional aid in identifying compounds. In the SIM mode, the detector looks for specific compound fragments which increase detector sensitivity.

The compounds are quantified by comparing area responses of unknown sample concentrations to known calibration standards. The greater the peak area response the greater the concentration of the COC present.

Dale Schamp was the designated Field Chemist for this project. Each day on the Field Activity Form (FAF), the sample analyst would document the sample field description, matrix, sample's date and collection time for each sample received. The FAF also recorded the date and time the sample was received by the mobile laboratory.

Analytical Laboratories of Florida, Inc.

The FAF was also used to record the sample analysis time and volume utilized to perform the analysis. The GC/MS system is linear to 500 ppb for the COCs. Mr. Schamp may have utilized one or two SRI GC systems to determine the sample size which was required to run the sample on the GC/MS. This sample pre-screening process prevented the field chemist from doing multiple runs due to high COC concentrations in the groundwater sample which in turn allowed him to get the final data to the contractor quicker.

Quality Assurance (QA) is an important part of sample analysis. QA is utilized to aid in the measurement of the data quality generated. The FDEP and EPA methods require the mobile laboratory run: a calibration curve, laboratory duplicates, laboratory matrix spikes, daily instrument tune checks, daily method blanks, internal standards, surrogate standards and calibration check standards. Other than the initial calibration standards curves and tune checks, this information can be found in the Excel Data Summary Tables provided and/or the overall Project EDD table required by TetraTech.

Once the sample's analysis was completed, the chemist entered the data into an Excel Data Summary Table spreadsheet. ALF analyzed 4 sample(s) for matrix spike analysis to determine whether the samples themselves cause interferences with the data generation. Project requirements specify 5 % while ALF's frequency was 14 % (4/29). ALF analyzed 4 sample duplicate(s) to check analysis reproducibility. This is also required at a frequency of 5% while ALF did this at a rate of 14 % (4/29).

The following information is attached or included in the electronic deliverables:

1. TetraTech EDD Data Summary Tables which includes QC data
2. Field Activities Forms
3. A Copy of this Project Summary

The data generated has been reviewed and submitted under TetraTech's EDD format and the data has been reviewed by TetraTech personnel for errors. I can be reached at 321-258-1355, if you have any follow-up questions.

Sincerely,

Re: PDF - Analytical Data Package

Analytical Laboratories of Florida, Inc. (ALF) office located at 2265 Leaside Court, Merritt Island, Florida provided laboratory services for TetraTech NUS, Inc. at the Launch Complex 34(LC34) areas of Kennedy Space Center during direct push temporary well sample collection. The site is located at NASA's Kennedy Space Center, Florida complex. The laboratory contact is Dale Schamp at 321-258-1355. The laboratory project name is TT111819. Analysis was performed utilizing EPA8260D methodology. A total of 158 ground water samples were analyzed by Dale Schamp (Chemist) over a period of seven days from November 18-26, 2019. The project utilized both of the two mobile laboratories over the duration of the project. The mobile laboratories are certified (Certification Number E83934 or E831090) by the Florida Department of Health using the guidelines of the national NELAC certification program. TetraTech's Information System's Group (http://isg.ttnus.com) specified the excel spreadsheet format utilized to transport environmental analytical data to TetraTech in an electronic format. ALF's data was submitted to TetraTech under file name EDDNASA.LC34.111819.final on December 2, 2019.

TetraTech/NUS' Project Manager is Mark Jonnet out of the Pittsburgh, Pa. office. The Prime Contact's subcontract number is S1169041. The mobile laboratory was utilized to perform laboratory analysis to delineate volatile organic contamination in the groundwater at various NASA sites. The contaminants of concern included vinyl chloride, freon 113, cis/trans-1,2-DCE, and trichloroethene . The sample analysis load was expected to be up to 25 samples per day.

ALF performed the sample extraction with a Teledyne Stratum sample concentrator utilizing a purge and trap technique. The EPA 5030 method was used as a guideline for this procedure. The process involved is done by purging a gas (UHP helium) through a known sample volume (10 ml – undiluted) at a constant flow rate and specific time. This process transfers the contaminants of concern (COC) from the liquid matrix (groundwater) onto the trap. The trap is then heated to 250C releasing the compounds from the trap into the GC/MS system. An electronic value inside

the Stratum sample concentrator is electronically moved from the load position to the inject position to transfer the COCs to the GC/MS.

ALF's GC/MS system consists of a Stratum PTC hooked up to an Agilent 6890 (or Model 7890) Gas Chromatograph in series with an Agilent 5973 (or Model 5975C) MS detector. The COCs are separated by the gradual increase of temperature of GC oven from 45C to 200C and the column's internal coating. ALF's column of choice is a J&W DB-VRX 20 meter, 0.18mm ID, 1um df. This setup closely follows the requirements of EPA Method 8260D for identification and quantification.

The target compound list had a very wide range of project specific detection limit requirements between 1 and 100 ppb to meet the Florida GCTLs. The lab settled on a method detection level for all compounds of 1 ppb. This detection level allowed the compounds to be analyzed in the scan sensitivity mode only.

The compounds are identified by two ways: retention time and ion spectrum. Simply under repetitive flow rates and consistent oven variation of temperatures a compound will pass through a detector at the same time for unknown samples and known calibration standards. The time, after the start of a run, the compound passes through a detector to give a peak type response is known as the retention time. This is how any Gas Chromatograph with a detector identifies a compound. The MS detector has the additional power of compound ion spectrums which occur when the compounds are bombarded with electrons as they pass into the detector which causes the compounds to fragment. Each COC fragments differently from all other compounds thus this is an additional aid in identifying compounds. In the SIM mode, the detector looks for specific compound fragments which increase detector sensitivity.

The compounds are quantified by comparing area responses of unknown sample concentrations to known calibration standards. The greater the peak area response the greater the concentration of the COC present.

Dale Schamp was the designated Field Chemist for this project. Each day on the Field Activity Form (FAF), the sample analyst would document the sample field description, matrix, sample's date and collection time for each sample received. The FAF also recorded the date and time the sample was received by the mobile laboratory.

The FAF was also used to record the sample analysis time and volume utilized to perform the analysis. The GC/MS system is linear to 500 ppb for the COCs. Mr. Schamp may have utilized one or two SRI GC systems to determine the sample size which was required to run the sample on the GC/MS. This sample pre-screening process prevented the field chemist from doing multiple runs due to high COC concentrations in the groundwater sample which in turn allowed him to get the final data to the contractor quicker.

Quality Assurance (QA) is an important part of sample analysis. QA is utilized to aid in the measurement of the data quality generated. The FDEP and EPA methods require the mobile laboratory run: a calibration curve, laboratory duplicates, laboratory matrix spikes, daily instrument tune checks, daily method blanks, internal standards, surrogate standards and calibration check standards. Other than the initial calibration standards curves and tune checks, this information can be found in the Excel Data Summary Tables provided and/or the overall Project EDD table required by client.

Once the sample's analysis was completed, the chemist entered the data into an Excel Data Summary Table spreadsheet. ALF analyzed 11 sample(s) for matrix spike analysis to determine whether the samples themselves cause interferences with the data generation. Project requirements specify 5 % while ALF's frequency was 7.0 % (11/158). ALF analyzed 10 sample duplicate(s) to check analysis reproducibility. This is also required at a frequency of 5% while ALF did this at a rate of 6.3 % (10/158).

The following information is attached or included in the electronic deliverables:

1. TetraTech EDD Data Summary Tables which includes QC data
2. Field Activities Forms
3. A Copy of this Project Summary

The data generated has been reviewed and submitted under TetraTech's EDD format and the data has been reviewed by TetraTech personnel for errors. I can be reached at 321-258-1355, if you have any follow-up questions.

Sincerely,

SAMPLE DELIVERY GROUP CASE NARRATIVE

Client: Tetra Tech NUS **Job No** FA60039

Site: NASA-LC 34 **Report Date** 12/31/2018 10:45:58

15 Samples were collected between 12/03/2018 and 12/04/2018 and were received at SGS North America Inc - Orlando on 12/08/2018 properly preserved, at 4.4 Deg. C and intact. These samples received an SGS Orlando job number of FA60039. A listing of the Laboratory Sample ID, Client Sample ID and dates of collection are presented in the Results Summary Section. Except as noted below, all method specified calibrations and quality control performance criteria were met for this job. For more information, please refer to QC summary pages.

MS Volatiles By Method SW846 8260B

Matrix: AQ **Batch ID:** V1A560

Sample(s) FA60104-10MS, FA60104-10MSD were used as the QC samples indicated.

All method blanks for this batch meet method specific criteria.

The following samples were run outside of holding time for method SW846 8260B: FA60039-12, FA60039-14.

Samples analyzed beyond holding time; reported results are considered minimum values.

Matrix Spike Recovery(s) for Methyl Bromide are outside control limits. Probable cause is due to matrix interference.

FA60039-12: Sample analyzed beyond holding time; reported results are considered minimum values.

FA60039-14: Sample re-analyzed beyond hold time; reported results are considered minimum values. No sample available for reanalysis.

FA60039-14 for Methyl Bromide: Associated CCV outside control limits low.

Matrix: AQ **Batch ID:** V3C122

All samples were analyzed within the recommended method holding time.

All method blanks for this batch meet method specific criteria.

Sample(s) FA59920-1MS, FA59920-1MSD were used as the QC samples indicated.

Blank Spike Recovery(s) for Methyl Bromide are outside control limits.

Matrix Spike Recovery(s) for Methyl Bromide are outside control limits. Probable cause is due to matrix interference.

Matrix Spike Duplicate Recovery(s) for Methyl Bromide are outside control limits. Probable cause is due to matrix interference.

FA60039-9 for Methyl Bromide: Associated BS recovery outside control limits low. Associated CCV outside of control limits low.

Matrix: AQ **Batch ID:** V3C123

Sample(s) FA60039-10MS, FA60039-10MSD were used as the QC samples indicated.

All method blanks for this batch meet method specific criteria.

The following samples were run outside of holding time for method SW846 8260B: FA60039-10, FA60039-11, FA60039-12, FA60039-13, FA60039-15

Blank Spike Recovery(s) for Methyl Bromide are outside control limits.

Matrix Spike Recovery(s) for Methyl Bromide are outside control limits. Probable cause is due to matrix interference.

Matrix Spike Duplicate Recovery(s) for Methyl Bromide are outside control limits. Probable cause is due to matrix interference.

RPD(s) for MSD for Methyl Bromide are outside control limits for sample FA60039-10MSD. Probable cause is due to sample non-homogeneity.

FA60039-10 for Methyl Bromide: Associated BS recovery outside control limits low.

FA60039-11 for Chloroethane: Associated CCV outside control limits.

FA60039-11 for Methyl Bromide: Associated BS recovery outside control limits low.

FA60039-13 for Chloroethane: Associated CCV outside control limits.

FA60039-13 for Methyl Bromide: Associated BS recovery outside control limits low.

FA60039-15 for Chloroethane: Associated CCV outside control limits.

FA60039-15 for Methyl Bromide: Associated BS recovery outside control limits low.

Matrix: AQ **Batch ID:** VC5130

All method blanks for this batch meet method specific criteria.

Sample(s) FA60039-5MS, FA60039-5MSD were used as the QC samples indicated.

The following samples were run outside of holding time for method SW846 8260B: FA60039-1, FA60039-3, FA60039-4

Matrix: AQ **Batch ID:** VC5132

All method blanks for this batch meet method specific criteria.

Sample(s) FA60017-2MS, FA60017-2MSD were used as the QC samples indicated.

The following samples were run outside of holding time for method SW846 8260B: FA60039-2 Sample re-analyzed beyond hold time; reported results are considered minimum values.

FA60039-2: Sample re-analyzed beyond hold time; reported results are considered minimum values.

Matrix: AQ **Batch ID:** VC5135

Sample(s) FA60135-15MS, FA60135-15MSD were used as the QC samples indicated.

All method blanks for this batch meet method specific criteria.

The following samples were run outside of holding time for method SW846 8260B: FA60039-9

Sample analyzed beyond hold time; reported results are considered minimum values.

FA60039-9: Sample analyzed beyond hold time; reported results are considered minimum values.

Matrix: AQ **Batch ID:** VI1805

All samples were analyzed within the recommended method holding time.

All method blanks for this batch meet method specific criteria.

Sample(s) FA59920-15MS, FA59920-15MSD were used as the QC samples indicated.

Matrix Spike Recovery(s) for Carbon Disulfide are outside control limits. Probable cause is due to matrix interference.

Matrix Spike Duplicate Recovery(s) for Carbon Disulfide, cis-1,3-Dichloropropene are outside control limits.

Probable cause is due to matrix interference.

FA60039-1 for 2-Butanone (MEK): Associated CCV outside of control limits high, sample was ND.

FA60039-2 for 2-Butanone (MEK): Associated CCV outside of control limits high, sample was ND.

FA60039-3 for 2-Butanone (MEK): Associated CCV outside of control limits high, sample was ND.

FA60039-4 for 2-Butanone (MEK): Associated CCV outside of control limits high, sample was ND.

FA60039-5 for 2-Butanone (MEK): Associated CCV outside of control limits high, sample was ND.

FA60039-6 for 2-Butanone (MEK): Associated CCV outside of control limits high, sample was ND.

FA60039-7 for 2-Butanone (MEK): Associated CCV outside of control limits high, sample was ND.

Matrix: AQ **Batch ID:** VY1551

All method blanks for this batch meet method specific criteria.

Sample(s) FA60039-8MS, FA60039-8MSD were used as the QC samples indicated.

The following samples were run outside of holding time for method SW846 8260B: FA60039-8

VY1551-BS: No ECC for this run.

Matrix Spike Recovery(s) for Vinyl Chloride are outside control limits. Outside control limits due to high level in sample relative to spike amount.

Matrix Spike Duplicate Recovery(s) for Methyl Bromide, Vinyl Chloride are outside control limits. Probable cause is due to matrix interference.

RPD(s) for MSD for Chloroethane are outside control limits for sample FA60039-8MSD. Probable cause is due to sample non-homogeneity.

FA60039-8 for Methyl Bromide: Associated CCV outside control limits low.

FA60039-8 for Carbon Tetrachloride: Associated CCV outside control limits high.

FA60039-8 for Trichlorofluoromethane: Associated CCV outside control limits high.

SGS Orlando certifies that this report meets the project requirements for analytical data produced for the samples as received at SGS Orlando and as stated on the COC. SGS Orlando certifies that the data meets the Data Quality Objectives for precision, accuracy and completeness as specified in the SGS Orlando Quality Manual except as noted above. This report is to be used in its entirety. SGS Orlando is not responsible for any assumptions of data quality if partial data packages are used.

Notes:

1. Bold values indicate an exceedance of the Florida Department of Environmental Protection (FDEP) Groundwater Cleanup Target Level GCTL).
2. Bold and yellow shaded values indicate an exceedance of the FDEP Natural Attenuation Default Concentration (NADC).
3. µg/L indicates micrograms per liter.
4. U indicates concentration below detection limit.
5. I indicates concentration above the detection limit, but below the reporting limit.
6. L indicates concentration exceeds calibration range.
7. J indicates concentration is estimated.
