EXECUTIVE SUMMARY

This Corrective Measures Study (CMS) Progress Report presents a summary of supplemental assessment activities, interim measures (IMs) implemented, and monitoring conducted during the CMS phase at Launch Complex 34 (LC34) located at Cape Canaveral Air Force Station (CCAFS), Florida. This report also presents a summary of site conditions and an overview of Engineering Evaluations (EEs) and Advanced Data Packages (ADPs) completed as part of the CMS phase. Progress Reports are used as a mechanism to document site progress toward completion of the CMS phase. This report, along with the routine Operations, Maintenance and Monitoring Reports, satisfies the requirement for submittal of a Remedial Action Status Report under Part VI.1 of Kennedy Space Center's (KSC's) Resource Conservation and Recovery Act (RCRA) Operating Permit (No. 0026028-009-HO). LC34 has been designated Solid Waste Management Unit CC054 under the KSC RCRA Corrective Action Program. This document was prepared by Tetra Tech, Inc., for the National Aeronautics and Space Administration under Indefinite Delivery Indefinite Quantity Contract 80KSC019D0011-80KSC019F0067.

Supplemental assessment activities summarized in this report were completed between 2008 and 2019 to investigate chlorinated volatile organic compound (CVOC) "Hot Spot" areas, as well as to re-characterize the dense non-aqueous phase liquid (DNAPL) source zone (DSZ). Multiple EEs were completed for this work and were presented to the KSC Remediation Team (KSCRT) as ADPs. The EE process, along with current understanding of site lithology, hydrogeology, and groundwater impacts are presented in this report.

Two groundwater remediation systems are currently operating as interim measures (IMs) at LC34, to include: (1) a Hydraulic Containment System (HCS) in the DSZ, and (2) an Air Sparge system in Hot Spot 6. These groundwater IMs, as well as soil IMs that have been completed at the site during the CMS phase, are outlined in this report. Performance monitoring, site-wide long-term monitoring, and land use controls are also summarized in this report.

Based on information presented in this CMS Progress Report, the following is recommended for future activities related to corrective measures at the site:

- Continue operating the HCS in the DSZ and Air Sparge system in Hot Spot 6;

- Continue performance monitoring of the HCS and Air Sparge system based on approved recommendations presented to the KSCRT in February 2020, and documented in the 2019 Operations, Maintenance, and Monitoring Report for DNAPL Source Zone and Hot Spot 6 Air Sparging System;
- Continue site-wide long-term monitoring of the CVOC groundwater plume, as well as a small area of polychlorinated biphenyl (PCB)-impacted groundwater within the footprint of the CVOC plume, on a biennial basis;
- Continue to implement land use controls for CVOCs and PCBs in groundwater, and PCBs in soil and concrete;
- Consider installing additional recovery wells to expand the HCS into "Layer 7" to capture and treat TCE mass stored in this lithology unit;
- Conduct a Remedial Alternatives Evaluation to evaluate other technologies to remediate the DSZ, which may include the use of a more aggressive technology such as Electrical Resistance Heating;
- Conduct Direct Push Technology assessment of Hot Spot 7; and
- Develop an Implementation Work Plan for air sparging at Hot Spot 5.

SECTION 1
PROGRESS REPORT

This Corrective Measures Study (CMS) Progress Report presents a summary of site investigation activities, interim measures (IMs) implemented, and monitoring conducted during the CMS phase at the Launch Complex 34 (LC34) site located at Cape Canaveral Air Force Station (CCAFS), Florida. Progress Reports will be used as a mechanism to document site progress toward completion of a CMS. This report, along with the routine Operations, Maintenance and Monitoring Reports, satisfies the requirement for submittal of a Remedial Action Status Report under Part VI.1 of Kennedy Space Center's (KSC's) Resource Conservation and Recovery Act (RCRA) Operating Permit (No. 0026028-009-HO). The LC34 site has been designated Solid Waste Management Unit (SWMU) CC054 under KSC's RCRA Corrective Action Program. This document was prepared by Tetra Tech, Inc., for the National Aeronautics and Space Administration (NASA) under Indefinite Delivery Indefinite Quantity (IDIQ) Contract 80KSC019D0011-80KSC019F0067.

1.1 INTRODUCTION

The purpose of this CMS Progress Report is to: (1) provide a summary of past and on-going corrective action activities that have been conducted during the CMS phase at LC34, and (2) document information generated during KSC's Engineering Evaluation (EE) process that is not captured in standalone reports. This CMS Progress Report provides:

- A summary of supplemental assessment activities and results associated with delineation of groundwater impacts;
- A summary of the EEs associated with site characterization activities and remediation options that have been completed and presented to the KSC Remediation Team (KSCRT) as Advanced Data Packages (ADPs);
- A summary of soil Interim Measures (IMs) that have been completed during the CMS phase; and
- Recommendations for future activities related to corrective measures at the site.

This CMS Progress Report, Revision 1, was updated to include additional activities that have been conducted at LC34 since the initial CMS Progress Report (Revision 0) was submitted in May 2014 (NASA, 2014a). An overview of changes is provided in Appendix A to outline the information incorporated and updated in Revision 1. The Florida Department of Environmental Protection (FDEP) correspondence letter received on the CMS Progress Report, Revision 0, is also included in Appendix A for reference. KSCRT meeting minutes are provided in Appendix B, and ADPs are provided in Appendix C.

1.2 REPORT ORGANIZATION

This report is organized as follows:

Section 1: Introduction – Identifies the purpose of this CMS Progress Report.

Section 2: Background – Provides brief and pertinent background information, including facility history and setting.

Section 3: Site Characterization – Summarizes current site conditions and regulatory status.

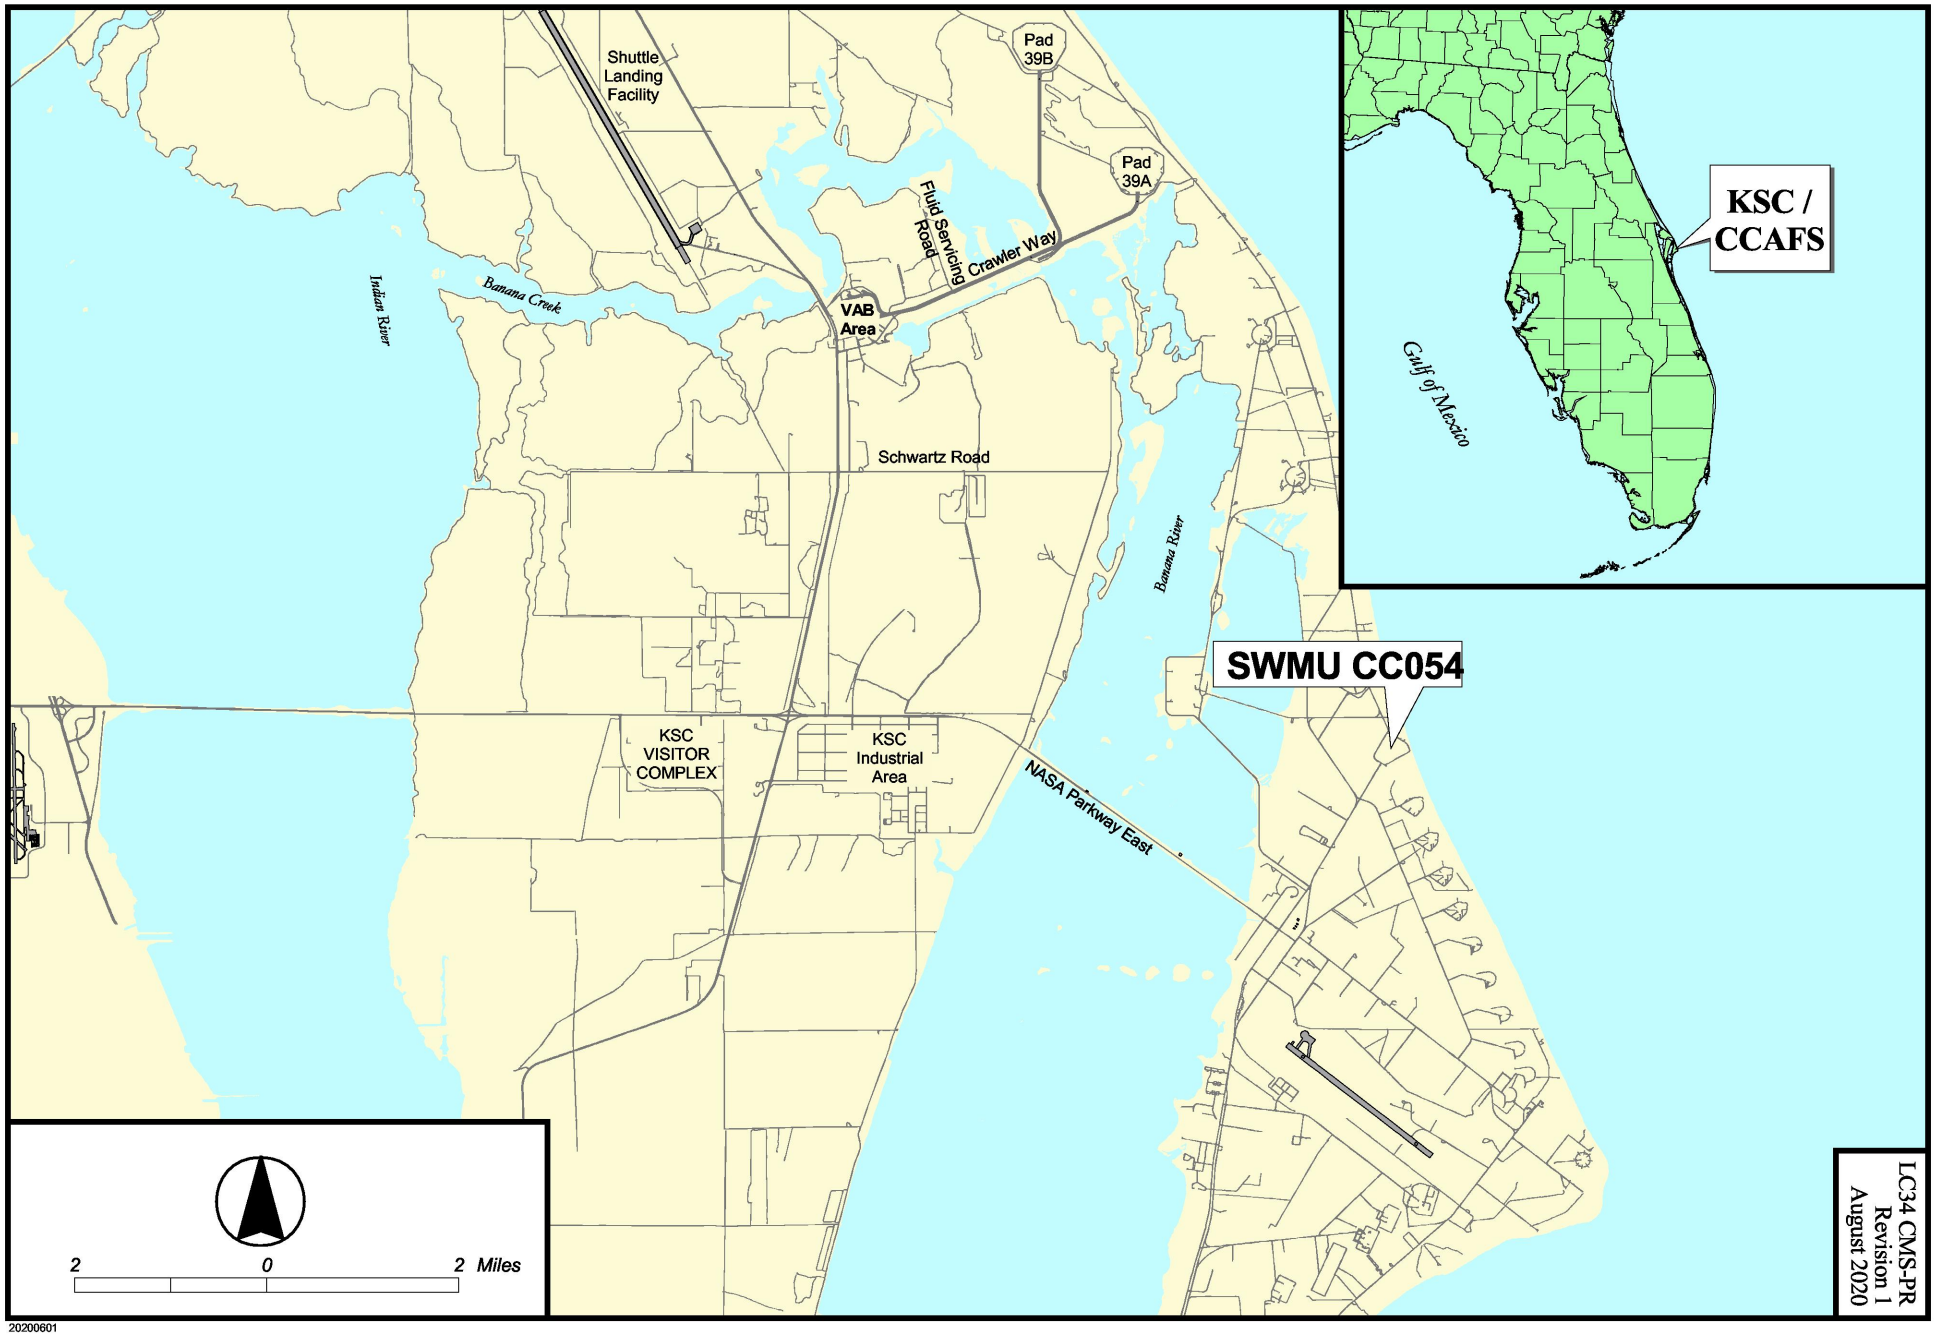
Section 4: Supplemental Groundwater Assessments – Includes details of LC34 groundwater assessments.

Section 5: Engineering Evaluations and Advanced Data Packages – Provides a summary of environmental evaluations conducted to date.

Section 6: Long-Term Groundwater Monitoring Program – Describes the current groundwater monitoring program.

Section 7: System Implementation and Performance Monitoring – Describes the operation and monitoring of groundwater treatment systems currently operating at the site.

Section 8: Recommendations – Provides recommendations for future actions.



SECTION 2
BACKGROUND

LC34 is located at CCAFS, Florida and is bordered to the north by Launch Complex 37, to the south by Launch Complex 20, to the west by ICBM Road (Samuel Phillips Parkway), and to the east by the Atlantic Ocean (Figures 2-1 and 2-2). The complex is located in Section 6, Township 23 South, and Range 38 East, in the False Cape Quadrangle.

The launch pad and associated facilities at LC34 were built in the late 1950s and were designed to support NASA's Saturn 1 and Saturn 1B program during Project Apollo. Historical records suggest that workers flushed rocket engines on the launch pad and conducted precision cleaning of spaceflight hardware in the Engineering Support Building (ESB) with trichloroethene (TCE). It is speculated that releases of TCE occurred from both intentional and unintentional discharges to nearby areas. Based on groundwater and soil sampling data, these releases occurred primarily in the immediate vicinity of the ESB (estimated to be greater than 100,000 pounds), which was previously located southwest of the Blockhouse (Figure 2-2). Since shutdown of the launch pad in 1968, LC34 has remained largely inactive, although several site features (e.g., Blockhouse, camera pad, etc.) are still present. Most operational equipment (service towers, fuel storage tanks, piping, etc.) has been dismantled, and the majority of previous on-site building and structures were abandoned in-place. LC34 was declared part of the Man in Space National Historic Landmark in 1984.

Additional details on site history and operations can be found in the RCRA Facility Investigation (RFI) Report (NASA, 1999) and CMS Report (NASA, 2007a).

SECTION 3
SITE CHARACTERIZATION

Beginning in 1993, a number of site investigations, engineering studies, and pilot-scale in-situ remedial technology demonstrations were conducted at LC34. Extensive soil and groundwater contamination was identified and characterized during these investigations. A detailed description of initial site investigations and analytical results is contained in the RFI Report (NASA, 1999), the RFI Addendum Report (NASA 2003), and the CMS Report (NASA, 2007a). An overview of the timeline and documents submitted as part of the RCRA Corrective Action process can be found in the most recent Operations, Maintenance, and Monitoring Report (NASA, 2020c).

Chlorinated compounds TCE, cis-1,2-dichloroethene (cDCE), trans-1,2-dichloroethene (tDCE), and vinyl chloride (VC) are the primary contaminants of concern (COCs) at LC34 and have been detected at trace to high concentrations in groundwater and soil. TCE is also present as a dense non-aqueous phase liquid (DNAPL) in the former ESB area.

The majority of TCE mass at LC34 is present within the DNAPL Source Zone (DSZ). Based on initial investigation activities in the 2000s, the CMS Report (NASA, 2007a) defined the DSZ as a 2.0-acre area to approximately 75 feet below land surface (ft bls), which encompassed the extent of TCE DNAPL determined by saturated soil concentrations with TCE $\geq$ 300 milligrams per kilogram (mg/kg) and the transition zone to 100 mg/kg that was found to contain significant dissolved and sorbed mass and mass diffused into fine-grained media. A conservative “box” was used to encompass the 100 mg/kg TCE soil contour, which became known as the “DSZ”. Based on the DSZ re-characterization study conducted in 2018-2019, the DSZ was re-defined as the area where TCE groundwater concentrations exceeded 1% solubility (11,000 micrograms per liter [µg/L]), which encompassed 1.4 acres to 98 ft bls.

The horizontal footprint of both “DSZ” definitions generally overlay the same area; however, the 2018-2019 re-characterization study identified a “lobe” that extended north towards the Blockhouse in the fine-grained unit identified as “Layer 7” within the 73-78 ft bls interval. The

DSZ area defined by the CMS Report, and the DSZ area defined by the 2018-2019 re-characterization study, is presented on Figure 3-2.

Although the recent DSZ re-characterization study provides better understanding of current site conditions, the DSZ area initially defined by soil data continues to be referenced in site documentation, as this data was used to develop the design of the Hydraulic Containment System (HCS) that has been operational for 10 years to hydraulically control the DSZ (further discussed in Section 7.0). Groundwater data is currently used for performance monitoring of the DSZ and the recent re-characterization groundwater data will be used to further support optimization of the HCS, as well as a Remedial Alternatives Evaluation to evaluate other technologies to remediate the DSZ. Cross-sections showing vertical distribution of TCE from the 2018-2019 DSZ re-characterization study are presented on Figures 3-3 through 3-7.

The overall mass of TCE released at the site is unknown; however, the calculated mass from initial soil delineation activities was 74,000 pounds and 12,000 pounds in the 300 mg/kg and 100 mg/kg zones, respectively. A model performed in 2005 estimated the mass of TCE at the time to be 40,500 pounds in the shallow zone (0 to 50 ft bls) and an additional 33,300 pounds in the lower zone (50 to 120 ft bls) of the surficial aquifer. In 2019, data collected as part of a DSZ re-characterization study indicated that the total TCE mass in the area of the DSZ has been reduced to 32,000 pounds, which was based on groundwater data where TCE exceeded 300 µg/L. The reduction in mass is attributed to the HCS, which is further discussed in Section 7.0.

A large, dissolved-phase plume has perpetuated from the DSZ, which is categorized as follows:

- High Concentration Plume (HCP): The HCP includes the area of impacted groundwater with TCE, cDCE, tDCE, and VC concentrations greater than FDEP Natural Attenuation Default Concentrations (NADCs); and
- Low Concentration Plume (LCP): The LCP includes the area of impacted groundwater with concentrations greater than the individual GCTLs for TCE, cDCE, tDCE, and VC, and less than the NADCs.

The current extent of the LC34 groundwater plume encompasses 327 acres (LCP), of which includes 162 acres of HCP (Figure 3-1). The CMS Report estimated approximately 700 million gallons of CVOC impacted groundwater in the HCP and LCP collectively, with the total CVOC mass in both the HCP and LCP estimated to be between 3,000 and 6,000 pounds (NASA, 2007a).

Groundwater investigations have continued at LC34 since completion of the RFI and are still on-going as part of the CMS phase to better characterize the large dissolved plume. Within the HCP area are 63 acres of "Hot Spots", which in general are defined as areas where COC concentrations exceed 10-times NADCs for one or more contaminants. At LC34, due to the extent of COC concentrations that exceed 10-times NADCs, the term "Hot Spot" has also been used to designate different areas of interest in order to more effectively manage investigation activities. Seven Hot Spot areas have currently been identified within the HCP at the site (Figure 3-8) and are summarized in the table below.

Hot Spot	Footprint (acres)	Interval (ft bls)	Estimated Contaminant Mass at Time of Delineation (lbs)	Comments
1	0.085	30-60	TCE - 75	Within hydraulic capture zone
2	3.9	60-80	Not documented - Mass removal incorporated into HCS deep capture zone design	Underlies part of the DNAPL SZ. Within hydraulic capture zone
3	7.0	16-30	TCE - 1,970	Within hydraulic capture zone
4	0.9	6-15	TCE - 6.2	Within hydraulic capture zone
5	23.5	5-34	cDCE - 1,205 VC - 374	--
6	10.7	5-40	cDCE - 1,500 VC - 430	Now significantly reduced by Air Sparge treatment
7	Under Investigation	Under Investigation	To be determined	Area of interest ~17 acres

Hot Spot site characterization efforts are discussed in Sections 4.0 and 5.0. The DSZ, and six of the seven Hot Spots, have been delineated both horizontally and vertically. Plume-wide sampling is conducted on a biennial basis, which is further discussed in Section 6.0.

Soil investigations were conducted during the RFI to evaluate contaminants in soil resulting from former launch activities, such as the use of polychlorinated biphenyl (PCB)-laden paints and PCB-dielectric fluids. Between 1997-1998, over 100 soil samples and five sediment samples were collected throughout the site and analyzed for PCBs. The RFI identified three areas of PCB-impacted soil with concentrations above the FDEP industrial Soil Cleanup Target Level (SCTL), which at the time was 2.1 milligrams per kilogram (mg/kg). In 2000, a soil interim measure (IM) was conducted in these three areas, which removed 263 tons of soil with PCB concentrations greater than the FDEP industrial SCTL (NASA, 2001).

During the CMS phase, soil re-assessment activities were conducted between 2014 and 2018 to investigate additional areas associated with the potential use of PCB-laden paints or PCB-dielectric fluids where sampling was previously not conducted, as well as in areas with known PCB contamination remaining above the FDEP residential SCTL (0.5 mg/kg). A total of 489 soil samples were collected from 383 locations, and analyzed for PCBs, total recoverable petroleum hydrocarbons (TRPH), and/or dioxins/furans. Soil IMs were conducted in 2018-2019 to excavate soils contaminated with PCBs, TRPH, and dioxins/furans. All areas were remediated to FDEP residential SCTLs, except for one area where a bank of electrical equipment was previously located near the launch pad. In this area, PCBs remain above the FDEP residential SCTL in soil and concrete. PCBs are also present in groundwater above the FDEP GCTL in this area. PCBs are the only remaining COC in soil and concrete at the site. Figure 3-9 shows the soil excavation areas from 2018-2019, and Figure 3-10 shows the area where remaining soil and concrete concerns are located. Section 5.9 provides additional information on these soil IMs.

3.1 SITE CONTAMINANTS AND CONTROLS

Groundwater at LC34 contains chlorinated volatile organic compounds (CVOCs) and PCBs at concentrations greater than FDEP GCTLs, and soil and concrete in one area of the site contains PCBs at concentrations greater than the FDEP residential SCTL.

The chosen remedial alternatives for groundwater in the CMS Report (NASA, 2007a) were as follows: (i) hydraulic containment of the DSZ, (ii) monitored natural attenuation (MNA) and supplemental investigations with follow-up IM of CVOC "hot spots" within the HCP, and (iii) MNA of the LCP with potential IM if the plume expands towards Launch Complex 37 or the Atlantic Ocean.

Based on these chosen alternatives, the following actions have occurred at LC34:

(i) A HCS was installed as an IM in the former ESB area to hydraulically contain and treat the DSZ and surrounding high-concentration plume with TCE concentrations greater than 300 µg/L. The system began operation in 2010 and is still currently operating. The hydraulic capture zone covers approximately 12.4 acres (Figure 3-1), and as of March 2020, a total of 222,643,055 gallons of groundwater containing 72,446 pounds of CVOCs have been removed by the system (NASA, 2020c). The HCS is further discussed in Section 7.0.

(ii) An Air Sparge system was installed as an IM in Hot Spot 6 and treats approximately 14.4 acres of groundwater. The system began operation in 2018 and is still currently operating. The Air Sparge system is further discussed in Section 7.0. Supplemental investigations of Hot Spot areas within the HCP are discussed in Sections 4.0 and 5.0.

(iii) Long-term monitoring of the HCP and LCP is conducted on a biennial basis, and is discussed in Section 6.0. Based on years of sampling data and plume stability assessments, there has been no indication that the plume is expanding towards Launch Complex 37 or the Atlantic Ocean; therefore, no additional IMs have been necessary to control plume expansion in those directions.

An Interim Land Use Control Implementation Plan (LUCIP) for LC34 (SWMU CC054) is currently in-place to implement institutional land use controls (LUCs) to prohibit groundwater use at the site for residual CVOCs and PCBs in groundwater, and institutional and engineering LUCs are in place for residual PCBs in soil and concrete. The Interim LUCIP was submitted to FDEP in June 2020 (NASA, 2020d), and is provided as Appendix D.

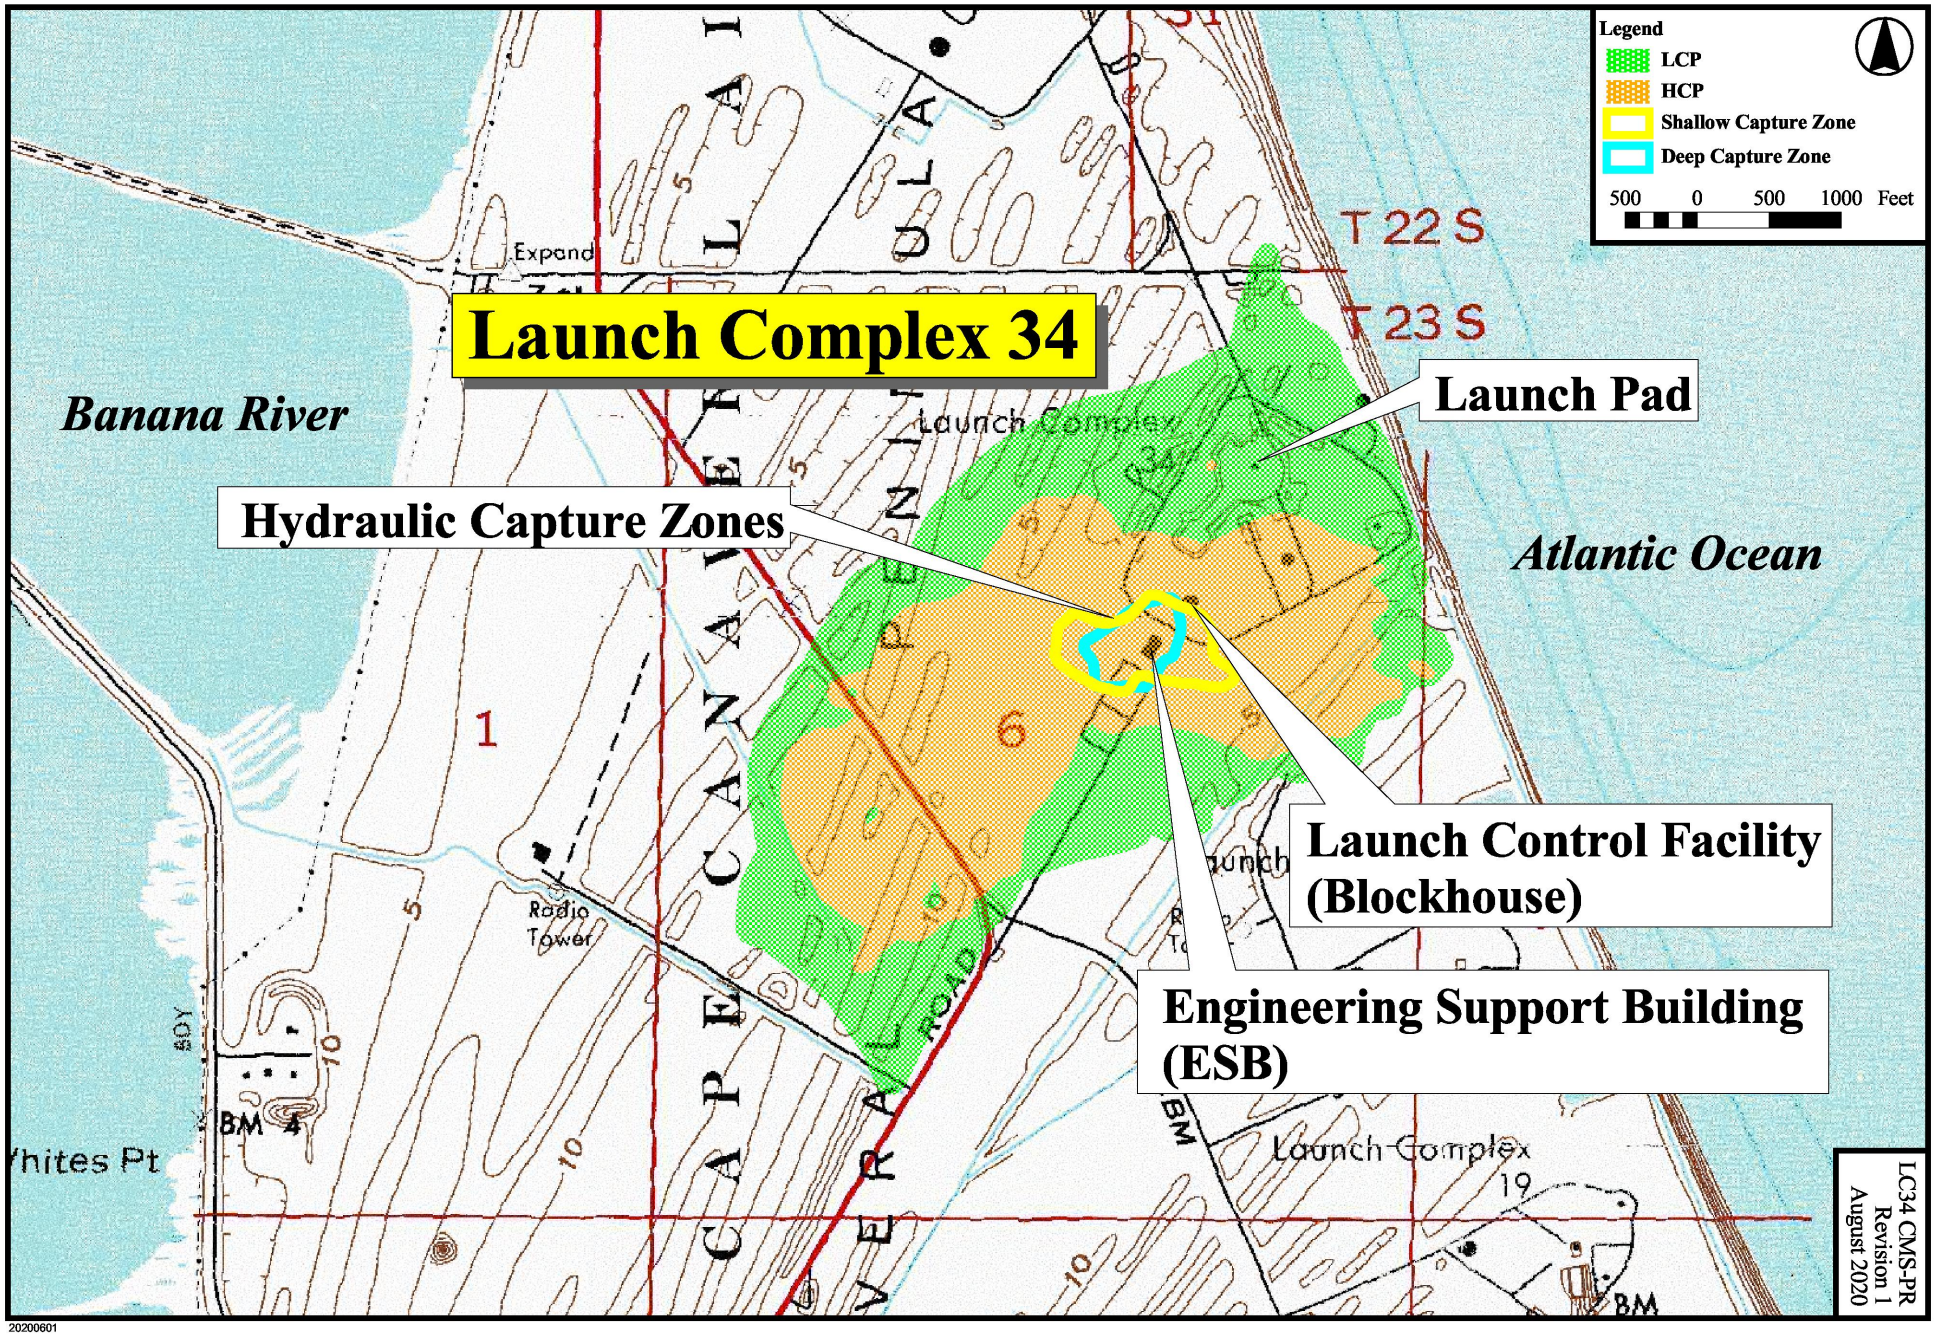
3.2 LITHOLOGY

Subsurface materials have been subdivided into nine facies (layers) in the LC34 area based on data collected during RFI and CMS activities. Layers 1, 2, 3, 6, and 8 are considered the primary water-transmitting units at the site. The lithologies of Layers 1 through 9 are as follows:

- Layer 1 – tan/gray fine sand with shell fragments (approximately 25 feet thick from 0 to 25 ft bls);
- Layer 2 – gray silty clayey fine sand (approximately 5 feet thick from 25 to 30 ft bls);
- Layer 3 – gray silty fine sand with shell fragments (approximately 12 to 15 feet thick from 30 to 45 ft bls);
- Layer 4 – (shallow confining unit) – greenish gray sandy clay unit (less than 1 to 5 ft thick from 45 to 50 ft bls);
- Layer 5 – medium to coarse sand with shell fragments (approximately 12 to 15 feet thick from 50 to 65 ft bls);
- Layer 6 – gray fine to medium “salt and pepper” sand (approximately 20 feet thick from 65 to 85 ft bls);
- Layer 7 – fine silty gray sand with abundant shell fragments (approximately 15 feet thick from 85 to 100 ft bls); and
- Layer 8 – fine to coarse sand with shell fragments (approximately 20 feet thick from 100 to 120 ft bls).

The Hawthorn Formation (Layer 9), which directly underlies the lower sand unit (Layer 8) and ranges from 120 to 140 ft bls, is a thick green sandy clay and is considered a regional confining unit. Figure 3-11 illustrates the lithology layers at the site. This figure also illustrates the depths of recovery wells associated with the HCS, which is discussed in Section 7.0.

Lithology observations from soil core sampling at LC34 have been generally consistent across the site, with the exception of one soil boring from the Hot Spot 1 area (SB1000) where a second clay layer was identified within Layer 5 from 54 to 55 ft bls (Slide 10 in Appendix C.3). The



most recent lithology observations from soil core sampling at LC34 are included in the DSZ Site Characterization Engineering Evaluation ADP (Slide 12 in Appendix C.9).

3.3 HYDROGEOLOGY

In general, groundwater flow is radially away from the vicinity of the former ESB in the shallow groundwater flow system (Layers 1, 2, and 3), to the southwest from the ESB, and to the northeast towards the Atlantic Ocean. In the deeper groundwater flow system (Layers 5, 6, and 8), groundwater generally flows inward within the vicinity of the capture area of the HCS (NASA, 2019a). Historically, groundwater flow was routinely evaluated as part of the site's long-term monitoring program; however, based on the stability of the overall plume as supported by trends in point-of-compliance wells, the KSCRT concurred to discontinue collection of site-wide water level measurements at LC34 (Meeting Minute 1204-M13, Decision 1204-D24). The average depth-to-groundwater across the site is approximately 5 ft bls.

A range of hydraulic conductivities for each lithologic layer is presented in the Engineering Evaluation – Step 1 Hot Spot One ADP (NASA, 2009b; Appendix C.2), the Step 1 Engineering Evaluation: Hot Spots 3 and 4 ADP (NASA, 2011b; Appendix C.4), and the DSZ Site Characterization Engineering Evaluation ADP (NASA, 2019c; Appendix C.9). Results from slug tests performed in Layer 5 in 2009 (Appendix I) suggest that Layer 5 is more permeable than originally conceptualized. Aquifer testing performed in Layer 7 in 2019 found lower hydraulic conductivities than presented in the CMS Report. Additional details on the Layer 5 slug test results are provided in the Engineering Evaluation – Step 1 Follow-Up Field Activities and Proposed Path Forward Hot Spot One ADP (NASA, 2009d) (Slide 9 in Appendix C.3), and additional details on the Layer 7 aquifer testing are provided in the DSZ Site Characterization Engineering Evaluation ADP (NASA, 2019c) (Slides 49 and 49a in Appendix C.9).

SECTION 4
SUPPLEMENTAL GROUNDWATER ASSESSMENTS

Supplemental groundwater assessment activities have been performed during the CMS phase to investigate CVOC Hot Spot areas within the HCP, as well as to re-characterize the DSZ. Supplemental groundwater assessments often, but not always, occur as part of the EE process. In those cases, additional information is provided in Section 5. The following sections summarize the supplemental groundwater assessment activities performed during the CMS phase.

4.1 OVERVIEW OF SUPPLEMENTAL ASSESSMENT ACTIVITIES (2008-2011)

Supplemental assessment activities were performed from June 2008 to September 2011 to investigate potential CVOC Hot Spot areas that exist within the HCP. To aid in the investigation of potential Hot Spots, the following activities were conducted during the supplemental assessment:

- Membrane Interface Probe (MIP)/Cone Penetrometer Testing (CPT) profiling;
- Direct Push Technology (DPT) groundwater sampling;
- Monitoring well installation and sampling (IW0076); and
- Pneumatic aquifer slug testing.

For all supplemental assessment activities listed above, field forms are included in Appendix E, laboratory analytical data is included in Appendix F, and KSC Remediation Information System (RIS) completion tickets are included in Appendix G.

4.1.1 MIP/CPT PROFILING. MIP/CPT profiling was used to evaluate the lateral and vertical extent of TCE impacts in the groundwater at LC34. MIP is a real-time, field screening tool with semi-quantitative capabilities that thermally vaporizes CVOCs in soil and groundwater, and transmits the CVOC vapor sample via carrier gas (e.g., helium or nitrogen) to a gas chromatograph/mass spectrometer, which measures CVOC concentrations via an electron capture detector, photo-ionization detector, and flame ionization detector. CPT uses pore pressure, tip resistance and frictional resistance to indirectly identify subsurface lithology. The

MIP/CPT activities were performed on 24, 26, 27, 30 June 2008, 1-3 July 2008, and 7-9 July 2008. The MIP/CPT profiles were collected from 26 locations within Hot Spots 1, 2, and 3 (no MIP/CPT profiles were collected from Hot Spots 4, 5, 6, or 7). The MIP/CPT profiles are provided in Appendix H, along with supporting figures to show profile locations. The MIP/CPT profiles are also presented on Slide 11/Figure 3 in Appendix C.1 for Hot Spot 1, and on Slide 17/Figure 7 in Appendix C.4 for Hot Spots 2 and 3.

4.1.2 DPT GROUNDWATER SAMPLING. Supplemental DPT groundwater sampling activities were performed on the following dates:

- 26, 27, and 30 June 2008;
- 2, 7-11, 14-18, and 21-25 July 2008;
- 15, 18, and 27-29 August 2008;
- 17 and 20-23 October 2008;
- 1-5 December 2008;
- 26-30 January 2009;
- 19 March 2009;
- 1, 2 and 5-8 October 2009;
- 10, 15 and 16 March 2010;
- 6-9 and 12-16 July 2010;
- 13-17 December 2010;
- 8 June 2011; and
- 14-16 September 2011.

DPT sampling included the collection of 1,224 groundwater samples from 271 locations (DPT0067 through DPT0275, DPT0277 through DPT327, and DPT0335 though DPT0345), which are presented on Slides 16 and 41 (Figures 3 and 18, respectively, on the slides) in the Engineering Evaluation – Step 1 Engineering Evaluation: Hot Spots 3 and 4 ADP (Appendix C.4), as well as supporting figures included in Appendix H. The DPT sample IDs are not

contiguous because some of the sample IDs were utilized for sampling performed as part of the Environmental Security Technology Certification Program (ESTCP) Partitioning Electron Donor (PED) Demonstration implemented in Hot Spot 1 (discussed in Section 5.1) while supplemental assessment activities were occurring (DPT0277 was used to collect soil and groundwater samples for submission to Sirem Laboratories for treatability testing, DPT0332 through DPT0334 and DPT0328 and DPT0331 were utilized for soil and groundwater sampling). The results for DPT samples collected as part of the PED Demonstration are presented in Hot Spot 1 Interim Measures Work Plan: Partitioning Electron Donor Demonstration (NASA, 2010b).

DPT groundwater sampling was generally performed at four-foot depth intervals, at various depths from 8 to 80 ft bls using a 6620DT track-mounted Geoprobe rig. The exact depth interval at which groundwater samples were collected was selected using the results from the MIP/CPT survey. Mobile laboratory services were provided by Analytical Laboratories of Florida and KB Labs, Inc., which are National Environmental Laboratory Accreditation Program certified. Mobile laboratory analysis of the groundwater samples for CVOCs was completed using EPA Method 8260B (KB Labs, Inc.) and EPA Method 8021 (Analytical Laboratories of Florida). DPT groundwater sampling results from supplemental assessment activities from 2008-2011 are presented in Appendix H.

4.1.3 MONITORING WELL INSTALLATION AND SAMPLING. Well IW0076 (screen interval of 70 to 80 ft bls) was installed via sonic drilling methods on 16 July 2009 to evaluate the concentration of CVOCs in Hot Spot 1 at depths greater than 60 ft bls. During well installation, a continuous soil core (SB1000) was collected to evaluate the lithology and to evaluate the sorbed TCE mass in Layers 3, 4 and 5. Six soil samples were collected and analyzed for CVOCs and fraction organic carbon. The well installation, soil core collection, and soil sampling are documented in the Hot Spot 1 Interim Measures Work Plan: Partitioning Electron Donor Demonstration (NASA, 2010b).

A groundwater sample was collected from monitoring well IW0076 on 3 August 2009, in general accordance with FDEP Standard Operating Procedures (FDEP, 2008) and the NASA-KSC Sampling and Analysis Plan (NASA, 2011a). The samples were analyzed for CVOCs using EPA Method 8260 by KB Labs, Inc.

4.1.4 PNEUMATIC SLUG TESTING. A pneumatic aquifer slug test was conducted to evaluate the hydraulic conductivity of Layer 5 as part of the supplemental assessment per request of the FDEP. The slug test was performed on 21 August 2009 at four Layer 5 monitoring wells (PA0020 [55 to 60 ft bls], PA0021 [55 to 60 ft bls] PA0022 [55 to 60 ft bls], and IW0002D1 [50 to 55 ft bls]). At least three repetitions were performed at each well location.

4.2 OVERVIEW OF SUPPLEMENTAL ASSESSMENT ACTIVITIES (2012-2019)

Supplemental assessment activities were performed from 2012-2019 to continue investigating Hot Spots within the HCP, support HCS optimization, and to re-characterize the DSZ and investigate Layer 7. The following activities were conducted during supplemental assessment activities:

- Hydraulic Profiling Tool (HPT) and MIP;
- DPT groundwater sampling;
- Monitoring well installation and soil core sampling; and
- Aquifer testing in Layer 7.

For supplemental assessment activities listed above, field forms are included in Appendix E and laboratory analytical data is included in Appendix F.

4.2.1 HPT/MIP PROFILING. HPT and MIP profiling was conducted in January 2013 to support HCS pumping optimization. Six HPT borings were advanced from 0 to 80 ft bls to evaluate hydraulic permeability variations, and 11 MIP borings were advanced from 0 to 80 ft bls to evaluate contaminant magnitude. Results of the MIP and HPT investigations were correlated to distinguish mobile and stored mass signatures within the hydraulic containment zone and to provide pumping optimization recommendations. Based on results, seven new shallow recovery wells and one new deep recovery well was installed to further improve plume containment and contaminant removal. HPT and MIP profiles and detailed data reports are included in the Step 4C Engineering Evaluation Pumping Optimization and Hot Spot 3/4 Expansion ADP (NASA, 2013d) in Appendix C.6.

4.2.2 DPT GROUNDWATER SAMPLING. DPT groundwater sampling activities were performed on the following dates:

- Hot Spot 5 and Plume Conditions south of Phillips Parkway: January 2015 - March 2019
- Hot Spot 6: June 2014 - June 2016
- DSZ: May 2018 - March 2019

Hot Spot 5 and plume condition assessment south of Phillips Parkway included 953 groundwater samples from 200 DPT locations. Samples collected from January 2015 through March 2019 were used to supplement DPT samples previously collected in parts of the Hot Spot 5 area from 2010-2011. Sample locations and results are presented in the Hot Spot 5 Site Characterization ADP (NASA, 2019b) in Appendix C.7, and in Appendix J.

Hot Spot 6 sampling included the collection of 681 groundwater samples from June 2014 to June 2016, which were used to supplement DPT samples previously collected in this area from 2010-2011. A total of 745 groundwater samples from 150 DPT locations were used to complete Hot Spot 6 delineation. Sample locations and results are presented in the Hot Spot 6 Area of Investigation Site Characterization ADP (NASA, 2016) in Appendix C.8, and in Appendix J.

DSZ sampling included the collection of 1,196 groundwater samples from 89 DPT locations between May 2018 and March 2019. A select few additional DPT samples were collected in November 2019 to fill in data gaps for the surrounding high-concentration TCE contour. Samples were collected in 5-ft intervals from 8 to 98 ft bls to complete DSZ re-characterization efforts. Four DPT locations were selected for verification sampling of the 80 to 100 ft bls interval to confirm initial elevated TCE concentrations detected in Layer 7. This was completed using a sonic rig 3” core barrel followed by a 4” override barrel to minimize potential drag-down and prevent cross-contamination between lithology layers. DPT sample locations and results are presented in the DSZ Site Characterization ADP (NASA, 2019c) in Appendix C.9, and in Appendix J.

4.2.3 MONITORING WELL INSTALLATION AND SOIL CORE SAMPLING. As part of DSZ re-characterization activities, six new monitoring wells (IWs 160 to 165) were

installed in “Layer 8” to complete vertical delineation of TCE. These MWs were installed in the July-August 2019 timeframe, and screened from 105 to 115 ft bls. Additionally, five new monitoring wells (IWs 155 to 159) were installed in “Layer 7” to monitor TCE concentrations over time, as there was only one pre-existing well that was being monitored in Layer 7 (IW-42D2, screened 87 to 92 ft bls). Four of the new Layer 7 monitoring wells were screened from 88 to 93 ft bls, and the other was screened from 80.5 to 85.5 ft bls. At each of the Layer 7 well locations, soil cores were collected from ground surface to 80 ft bls using a sonic rig 3” core barrel to evaluate lithology and collect PID readings. Soil samples were also collected above, within, and below Layers 1 to 7 and submitted for Total Organic Carbon analysis. Samples with elevated PID readings were also submitted for VOC analysis. Monitoring well and sore core sample locations and results are presented in the DSZ Site Characterization ADP (NASA, 2019c) in Appendix C.9.

4.2.4 AQUIFER TESTING IN LAYER 7. As described in Section 3.2, “Layer 7” consists of a fine silty gray sand with abundant shell fragments. High concentrations of TCE were identified in Layer 7 during DSZ re-characterization activities in 2019. To evaluate feasibility of recovering TCE mass from within Layer 7, a 48-hour constant rate pumping test was conducted on 13-15 August 2019 using a new recovery well installed in Layer 7 (RW017C, screened 80 to 95 ft bls). Twenty monitoring wells, varying in distance from approximately 25 ft to 200 ft from RW017C (including two newly installed observation wells, IWs 166 and 167, located approximately 25-ft away from RW017C), were monitored with pressure transducers from 5-20 August 2019. Observed drawdown readings included: 62.5 ft in RW017C, 2.18 ft in IW-167, 1.75 ft in IW-166, 0.5 to 1.0 ft at other Layer 7 wells, and 0.2 to 0.7 ft at other wells supporting the test. Following the aquifer test, RW017C was kept in operation as part of the HCS as a Pilot Study to determine mass removal over time. The Layer 7 aquifer test is presented in the DSZ Site Characterization ADP (NASA, 2019c) in Appendix C.9.

4.3 SUMMARY OF GROUNDWATER IMPACTS

The following provides an overview of groundwater impacts based on supplemental sampling activities described above. The overall groundwater plume is shown on Figure 3-1, and DSZ and Hot Spots are shown on Figure 3-2 and Figure 3-8, respectively.

4.3.1 HOT SPOT 1. The MIP results from 2008 indicated that CVOC mass is limited to the area around MP003, which is adjacent to monitoring well IW0002D1 (well with varying TCE concentrations). The CPT results from MP003 were consistent with the lithology observed in SB0001 and with the findings of RFI and CMS activities.

Sample results (all CVOCs less than laboratory detection limits) from the installation of monitoring well IW0076 were presented during the Engineering Evaluation – Step 1 Follow-Up Field Activities and Proposed Path Forward Hot Spot One ADP (NASA, 2009d) (Slide 13 in Appendix C.3) and suggested that no CVOC mass is present below 60 ft bls.

Hot Spot 1 is generally defined as the area where TCE concentrations were found to be greater than 300 µg/L from approximately 30 to 60 ft bls. That area is approximately 0.085 acres (3,750 square feet [ft²]). The Hot Spot was defined by TCE greater than 300 µg/L because the Hot Spot is encompassed by the dissolved plume from the DSZ, so there is comingling of plumes (cDCE and VC). The estimated mass of TCE in Hot Spot 1 at the time of delineation was 75 pounds. Hot Spot 1 is located within the hydraulic capture zone from the HCS currently in operation.

4.3.2 HOT SPOT 2. Results of the MIP/CPT assessment in 2008 confirmed that high concentrations of CVOCs are generally located in the silty sand interval between 60 and 80 ft bls. The results also show that impacts extend away from the ESB towards the southwest. CPT results suggest there is a clay/silt layer at approximately 40 ft bls surrounding the ESB, but electron capture detector (ECD) data does not suggest high concentrations of CVOCs are present within this layer (for locations outside the DSZ). This is generally consistent with previous lithologic characterizations during RFI and CMS activities.

Hot Spot 2 is generally defined as the area surrounding the ESB where TCE concentrations were found to be greater than 300 µg/L from approximately 60 to 80 ft bls. That area is approximately 3.90 acres (170,000 ft²) when excluding the DSZ area. The estimated mass of TCE in Hot Spot 2 is not documented; however, the area associated with this hot spot was included in the HCS design for the deep capture zone (Meeting Minute 0808, Decision D04; Appendix B). The objective of the HCS currently in operation is to hydraulically control and provide treatment of the DSZ, and the TCE HCP within Hot Spots 2, 3, and 4.

4.3.3 HOT SPOT 3. Results of the 2008 MIP assessment indicated that CVOC mass was found around portions of the ESB area between 15 to 30 ft bls. The CPT results suggested the 15 to 25 ft bls interval is comprised of mostly sand, which is generally consistent with the previous lithologic characterizations completed during the RFI and CMS activities.

Hot Spot 3 is generally defined as the area surrounding the ESB where TCE concentrations were found to be greater than 300 µg/L from approximately 16 to 30 ft bls. That area (excluding the DSZ area) is approximately 7.0 acres (305,000 ft²). The estimated mass of TCE in Hot Spot 3 at the time of delineation was 1,970 pounds. The objective of the HCS currently in operation is to hydraulically control and provide treatment of the DSZ, and the TCE HCP within Hot Spots 2, 3, and 4.

4.3.4 HOT SPOT 4. Hot Spot 4 is the area around monitoring well IW0052S, which is based on historical fluctuating concentrations of TCE detected in samples collected from this monitoring well. No MIP/CPT profiles were collected in the area.

Hot Spot 4 is generally defined as the area surrounding IW0052S where TCE concentrations were found to be greater than 300 µg/L from approximately 6 to 15 ft bls. Due to the distribution of TCE mass, Hot Spot 4 is best described as two separate areas at different depths (6 to 10 ft bls and 11 to 15 ft bls). The 6 to 10 ft bls interval is approximately 0.2 acres (8,700 ft^2) and the 11 to 15 ft bls interval is approximately 0.7 acres (30,500 ft^2). The estimated mass of TCE in Hot Spot 4 at the time of delineation was 6.2 pounds. The objective of the HCS currently in operation is to hydraulically control and provide treatment of the DSZ, and the TCE HCP within Hot Spots 2, 3, and 4.

4.3.5 HOT SPOT 5. Hot Spot 5 was initially defined as the area around monitoring well IW0051S, which was based on high concentrations of cDCE detected in samples collected from this monitoring well. Additional DPT sampling determined Hot Spot 5 extends down to Phillips Parkway and consists of cDCE and VC. No MIP/CPT profiles were collected in the area.

Delineation of Hot Spot 5 was completed in 2019 and was found to encompass 23.5 acres down to a depth 34 ft bls (above Layer 4). Mass calculations estimate a total of 1,205 and 374 pounds of cDCE and VC, respectively, in Hot Spot 5.

4.3.6 HOT SPOT 6. Hot Spot 6 was initially defined as the area around monitoring wells IW0057S and IW0057I, which was based on an initial high concentration of TCE measured in IW0057S and high concentrations of cDCE detected in samples collected from both monitoring wells. Additional DPT sampling determined Hot Spot 6 has very little TCE and is comprised of cDCE and VC. No MIP/CPT profiles were collected in the area.

Delineation of Hot Spot 6 was completed in 2016 and encompasses 10.7 acres down to a depth of 40 ft bls (above Layer 4). Mass calculations estimate a total of 1,500 pounds and 430 pounds of cDCE and VC, respectively, in Hot Spot 6. An Air Sparge system is currently in operation in Hot Spot 6.

4.3.7 HOT SPOT 7. Hot Spot 7 is located on the north and south sides of the DSZ. The area of impact of Hot Spot 7 has not been fully investigated or delineated.

4.3.8 DELUGE BASIN. The deluge basin is an area to the northeast of the ESB where the flushing of launch engines occurred. No MIP/CPT profiles were collected in the area, but groundwater samples have been collected from monitoring wells and DPT activities throughout the area and at various times since 2003. No Hot Spots were identified during the supplemental assessment activities in the deluge basin area.

4.3.9 DNAPL SOURCE ZONE. DSZ re-characterization activities in 2018-2019 identified DNAPL product in seven sample locations at depths ranging from 48 to 78 ft bls. The DNAPL source zone, where TCE $\geq$ 11,000 µg/L (1% solubility), was found to be 1.4 acres in size and extending down into "Layer 7" (up to 98 ft bls). Layer 8 monitoring wells (screened 105 to 115 ft bls) did not detect TCE above GCTLs. Groundwater and PID results determined Layers 4 and 7, which are fine-grained units, to be storing much of the remaining TCE mass in the DSZ. Mass calculations estimate 32,000 pounds of TCE remaining in the DSZ and surrounding high-concentration TCE contour where TCE $\geq$ 300 µg/L from the time at which the 2018-2019 DSZ re-characterization study was completed. This is much less than initial mass estimates from soil investigation activities in the 2000s, which estimated upwards of 90,000 pounds of mass in the DSZ before the HCS began operation in 2010.

4.3.10 PLUME CONDITIONS SOUTH OF PHILLIPS PARKWAY. DPT sampling south of Phillips Parkway determined that Hot Spot 5 does not extend past the roadway. The HCP and LCP south of Phillips Parkway are being monitored as part of the site's long-term monitoring program (Section 6.0).

SECTION 5
ENGINEERING EVALUATIONS AND ADVANCED DATA PACKAGES

The EE Multi-Step Process is being used to address groundwater contamination at LC34, which allows input from all KSCRT members for delineation of contaminated groundwater, evaluation of technologies to be implemented, review of preliminary designs, and evaluation of remediation systems following installation and operation. Supplemental groundwater assessment activities conducted at LC34 (discussed in Section 4.0) were documented in various EE ADPs and reports. The reports and ADPs, along with the conclusions reached within the reports and ADPs, are discussed in the following sections for each Hot Spot area, as well as for the DSZ. Although soil is not included in the EE process, ADPs for soil are also discussed in this section as these soil IMs were completed during the CMS phase. As previously discussed, meeting minutes for the various ADPs discussed in this section are provided in Appendix B.

5.1 HOT SPOT 1 ENGINEERING EVALUATIONS

Hot Spot 1 delineation activities were summarized in the following ADPs:

- Dynamic Testing and Hot Spot One and Two Investigation Results ADP (NASA, 2008a; Appendix C.1) – presented initial results from assessment activities;

- Engineering Evaluation – Step 1 Hot Spot One ADP (NASA, 2009b; Appendix C.2) – presented the results of supplemental assessment activities and additional data was requested (installing a monitoring well, IW0076) to complete TCE delineation; and

- Engineering Evaluation – Step 1 Follow-Up Field Activities and Proposed Path Forward Hot Spot One ADP (NASA, 2009d; Appendix C.3) – presented results of the additional field activities and the KSCRT agreed delineation of 300 µg/L TCE was complete and the path forward was the implementation of a PED Demonstration.

The decision items from the KSCRT meetings for the above referenced ADPs can be found in the Meeting Minutes included in Appendix B and the decision items are summarized below:

- Decision 0808-D04 – consensus was reached to move forward with an IM Work Plan (IMWP) for Hot Spot One;
- Decision 0904-D09 – consensus was reached to install a monitoring well with a screen interval of 70 to 80 ft bls in the area of monitoring well cluster IW0002;
- Decision 0904-D10 – consensus was reached to conduct a slug test in the area of monitoring well IW0002 and using the PA wells north of the ESB (if not previously completed);
- Decision 0904-D11 – consensus was reached on the remedial alternatives to evaluate during the Step 2 (bioremediation, thermal, large-diameter auger, and excavation alternatives);
- Decision 0904-D12 – consensus was reached to add piezometers with the capture zone in Layer 5 (pertains to the hydraulic capture system for DSZ); and
- Decision 0910-D34– consensus was reached to move forward with the ESTCP pilot-scale study and to prepare an IMWP with details of the pilot study (Hot Spot 1).

An IMWP ADP for PED implementation was presented in May 2010 (NASA, 2010a), and the IMWP (NASA, 2010b) was submitted in August 2010. A status report on the PED implementation was presented as an ADP in February 2012 (NASA, 2012a). To document the implementation and performance of the PED Demonstration a Step 4C EE ADP (NASA, 2012b) was presented in December 2012, a Basket Item ADP (NASA, 2013a) was presented in May 2013, and an IM Report (NASA, 2013c) was submitted in September 2013. Meeting minutes for the PED implementation are not included in this report, since they were documented in the IMWP (NASA, 2010b) and the IM Report (NASA, 2013c).

5.2 HOT SPOT 2 ENGINEERING EVALUATIONS

Hot Spot 2 delineation activities were summarized in the following:

- Dynamic Testing and Hot Spot One and Two Investigation Results ADP (NASA 2008a; Appendix C.1) – presented initial results from the supplemental assessment; and
- Interim Measure Design for Hydraulic Containment of the DNAPL Source Zone and Deep TCE Groundwater Plume (NASA, 2008b) – presented final TCE 300 µg/L plume.

The decision item from the KSCRT meeting for the above referenced ADP was that consensus was reached to include TCE concentrations greater than 300 µg/L in Layer 6 (60 to 80 ft bls) in the groundwater IMWP (0808-D04; Appendix B).

Installation of the original HCS was completed in December 2009 and includes capture of the 60 to 80 ft depth interval with TCE concentrations greater than 300 µg/L. The HCS is currently operational. Details of system installation are provided in Section 7.0.

5.3 HOT SPOT 3 ENGINEERING EVALUATIONS

Hot Spot 3 delineation activities were summarized in Step 1 Engineering Evaluation: Hot Spots 3 and 4 ADP (NASA 2011b; Appendix C.4). The decision items from the KSCRT meeting for this ADP were that consensus was reached that delineation of 300 µg/L TCE from 11 to 15 ft bls and 16 to 20 ft bls was complete (Decision 1112-D18; Appendix B) and that delineation of TCE within Hot Spot 3 was complete (Decision 1112-D19; Appendix B).

During the same meeting in December 2011, the Step 1B Engineering Evaluation: Hot Spots 3 and 4 ADP (NASA 2011c; Appendix C.5) was presented, which provided an initial evaluation of applicable remediation technologies for Hot Spot 3. The decision item from the KSCRT meeting for this ADP was that the path forward for Hot Spot 3 was to focus on evaluating the expansion of the hydraulic containment system (no Step 2 or Step 3 EE for Hot Spot 3) (Decision 1112-D20; Appendix B).

A Step 4C Engineering Evaluation Pumping Optimization and Hot Spot 3/4 Expansion ADP (NASA, 2013d; Appendix C.6) was presented at the March 2013 KSCRT meeting, which described proposed IM pumping optimization and HCS expansion to address Hot Spots 3 and 4. Team consensus was reached on recovery well optimizations at select wells, to include adjusting pump intake invert elevations and isolating screened intervals via water-inflated packers (Meeting Minute 1303-M3, Decision 1303-D9). For HCS expansion, Team consensus was reached for modification and retrofitting of the treatment system, proposed recovery well locations, pumping rates, and expansion construction plans (Meeting Minute 1303-M4, Decisions 1303-D10 through D14). Implementation of the HCS expansion is discussed in Section 7.0.

5.4 HOT SPOT 4 ENGINEERING EVALUATIONS

Hot Spot 4 delineation activities were summarized in Step 1 Engineering Evaluation: Hot Spots 3 and 4 ADP (NASA, 2011b; Appendix C.4). The decision item from the KSCRT meeting for this ADP was that consensus was reached that delineation of 300 µg/L TCE within Hot Spot 4 (Decision 1112-D17; Appendix B).

During the same meeting in December 2011, the Step 1B Engineering Evaluation: Hot Spots 3 and 4 ADP (NASA, 2011c; Appendix C.5) was presented, which provided an initial evaluation of applicable remediation technologies for Hot Spot 4. The decision items from the KSCRT meeting for this ADP were that the path forward for Hot Spot 4 was to focus on evaluating the expansion of the HCS (no Step 2 or Step 3 EE for Hot Spot 3) (Decision 1112-D20; Appendix B) and to install monitoring wells in Hot Spot 4 to evaluate TCE concentrations above NADC in the 6 to 10 ft bls and 11 to 15 ft bls interval (Decision 1112-D21; Appendix B).

A Step 4C Engineering Evaluation Pumping Optimization and Hot Spot 3/4 Expansion ADP (NASA, 2013d; Appendix C.6) was presented at the March 2013 KSCRT meeting, which described proposed IM pumping optimization and HCS expansion to address Hot Spots 3 and 4. Team consensus was reached on recovery well optimizations at select wells, to include adjusting pump intake invert elevations and isolating screened intervals via water-inflated packers (Meeting Minute 1303-M3, Decision 1303-D9). For HCS expansion, Team consensus was

reached for modification and retrofitting of the treatment system, proposed recovery well locations, pumping rates, and expansion construction plans (Meeting Minute 1303-M4, Decisions 1303-D10 through D14). Implementation of the HCS expansion is discussed in Section 7.0.

5.5 HOT SPOT 5 ENGINEERING EVALUATIONS

Hot Spot 5 delineation activities were summarized in the Hot Spot 5 Site Characterization ADP (NASA, 2019b; Appendix C.7), and presented during the June 2019 KSCRT meeting. This ADP also presented DPT sampling activities that were conducted to determine HCP and LCP conditions along and to the south of Phillips Parkway. Team consensus was reached that Hot Spot 5 was adequately delineated horizontally and vertically, and to also implement an air sparge barrier wall north of Phillips Parkway (Meeting Minute 1906-M12, Decisions 1906-D70 and D71).

5.6 HOT SPOT 6 ENGINEERING EVALUATIONS

Hot Spot 6 delineation activities were summarized in the Hot Spot 6 Area of Investigation Site Characterization ADP (NASA, 2016; Appendix C.8), and presented during the December 2016 KSCRT meeting. Team consensus was reached to collect additional samples at depth at DPT418 and surface water samples from the ditch within Hot Spot 6 (Meeting Minute 1612-M2, Decisions 1612-D2 through D4).

Delineation data for Hot Spot 6 was included in the Implementation Work Plan for Hot Spot 6 (NASA, 2017b). This document also included the Air Sparge system design to remediate contaminated groundwater within Hot Spot 6. This hot spot was selected for Air Sparge treatment for several reasons: (1) it was not located within the hydraulic capture zone area, (2) to mitigate and prevent potential contaminant discharge to a surface water feature located in this area, and potential further expansion of the hot spot, (3) the depth of hot spot contaminants only extends to 40 feet bls, which is above Layer 4 (a shallow confining unit), and (4) there was appropriate air sparging equipment ready for use from a nearby remediation site at KSC (Converter Compressor Building).

The conceptual design for the Air Sparge system was presented during the December 2016 KSCRT meeting in the Hot Spot 6 Area of Investigation Site Characterization ADP (NASA, 2016; Appendix C.8). Team consensus was reached to eliminate the Step 2 Engineering Evaluation (Remedial Alternatives Evaluation) for Hot Spot 6 because this hot spot was a good candidate for air sparging as it consists only of daughter products, and its lithology, along with readily available infrastructure at LC34, support this technology (Meeting Minute 1612-M2, Decision 1612-D2). Details relating to the Hot Spot 6 Air Sparge system expansion was provided in the Hot Spot 6 Area Expansion Implementation Work Plan (NASA, 2018c). Of note, the Air Sparge system expansion extends into a portion of the lower concentration plume above Hot Spot 1.

The Air Sparge system at Hot Spot 6 is currently operational. System implementation is further discussed in Section 7.0.

5.7 HOT SPOT 7 ENGINEERING EVALUATIONS

No EEs have been presented for Hot Spot 7 to date.

5.8 DNAPL SOURCE ZONE ENGINEERING EVALUATIONS

DSZ re-characterization activities were summarized in the DSZ Site Characterization Engineering Evaluation ADP (NASA, 2019c; Appendix C.9), and presented during the October 2019 KSCRT meeting. Re-characterization of the DSZ was completed to support optimization of the HCS, as well as a Remedial Alternatives Evaluation for more aggressive technologies to remediate the DSZ. Team consensus was reached that TCE is adequately delineated in the source area to 300 ug/L and that the path forward includes preparation of a Remedial Alternatives Evaluation to evaluate the next phase of the treatment train (Meeting Minute 1910-M2, Decision 1910-D2 through D22). Based on the ADP, the alternatives will include expansion of the existing HCS into Layer 7, as well as the use of Electrical Resistance Heating (ERH) to more aggressively target the remaining mass in the DSZ.

5.9 SOIL INTERIM MEASURES ADVANCED DATA PACKAGES

Information about initial soil investigation activities conducted in 1997-1998 during the RFI phase, and the subsequent soil IM in 2000, can be found in the following references: NASA, 1999 and NASA, 2001. The following information is based on soil investigation and IM activities conducted during the CMS phase.

Site-wide soil re-assessment activities were presented in the Soil Re-Assessment Results ADP (NASA, 2018e) during the March 2018 KSCRT meeting, as well as in a Soil Re-Assessment Report which included an IM Work Plan (NASA, 2018b). Soil re-assessment activities were conducted to investigate areas associated with the potential use of PCB-laden paints or PCB-dielectric fluids where sampling was previously not conducted during the RFI, or in areas with known PCB contamination remaining above the residential SCTL (0.5 mg/kg). Soil was analyzed for PCBs, TRPH, and/or dioxins/furans. Team consensus was reached for soil IMs to be conducted at Locations of Concern (LOCs) 1 through 4, 8A through 8E, and LOC9, for additional investigation at LOC2, and for no further action at LOCs 5, 6, and 7 (Meeting Minute 1803-M02, Decisions D02-D16). The first phase of soil IMs were conducted in August-September 2018, removing approximately 1,619 cubic yards (2,328 tons) of PCB, TRPH, and dioxin/furan contaminated soil from 20 areas at the site (total area of 1.48 acres). Completed IM activities were presented during the December 2018 KSCRT meeting in the Soil Interim Measures ADP (NASA, 2018d; Appendix C.10) and documented in the LC34 Interim Measure Report (NASA, 2019d). Team consensus was reached for no further action for the 20 areas excavated (Meeting Minute 1812-M10, Decision D44) based on excavations completed to the residential SCTL for each contaminant.

The second phase of soil IMs was conducted in September-December 2019 in the Electrical Substation T-2 area (LOC2). Delineation data and the IM Work Plan for PCB, TRPH, and dioxin/furan contaminated soil was presented during the June 2019 KSCRT meeting in the TSCA Area Interim Measure Work Plan ADP (NASA, 2019e) and documented in the Interim Measure Work Plan for the Electrical Substation T-2 at Launch Complex 34 (NASA, 2019f). Per the KSC Generic Work Plan for the Investigation and Cleanup of PCB-Contaminated Sites Under the Toxic Substances Control Act (NASA, 2007b), this Work Plan was coordinated with

the U.S. Environmental Protection Agency-Region 4 based on PCB concentrations equal to or exceeding 50 mg/kg. A total of 343 tons of contaminated soil was removed from a 0.16-acre area. TRPH and dioxins/furans were removed to their FDEP residential SCTLs; however, PCBs remained above regulatory cleanup criteria. Due to the site's National Historic Landmark status, soil beneath the concrete transformer bay and the concrete bay itself (following a concrete wash and rinse) were left in-place with PCB concentrations equal to or greater than 50 mg/kg using a risk-based approach under 40 CFR 761.61(c) (PCB remediation waste; Risk-based disposal approval). A fence was installed as an engineering control to prevent exposure to PCBs in soil and concrete in this area (Figure 3-10). All soil outside of the fenceline was removed to the residential SCTL or evaluated using a risk-based 95-pecent upper confidence level approach; therefore, this area is not part of the soil land use control area. Following excavation, a monitoring well was installed within the fenced area based on PCB soil concentrations exceeding the FDEP leachability SCTL; PCB groundwater results exceeded the FDEP GCTL. Groundwater was also sampled prior to the IM for PCBs, TRPH, dioxins/furans (based on FDEP leachability exceedances) and chlorobenzenes (based on historic use as a PCB diluent in dielectric fluid), and PCBs were the only contaminant that exceeded FDEP GCTLs. Completed IM activities were presented during the February 2020 KSCRT meeting in the T-2 Area Soil Interim Measures ADP (NASA, 2020b; Appendix C.11) and documented in the Soil Interim Measure Report, Electrical Substation T-2 Area (NASA, 2020a), with the following approved recommendations: (1) incorporate residual PCB contamination in soil, concrete, and groundwater and the fence into the site's existing LUCIP, and (2) incorporate the groundwater monitoring well into the site's biennial long-term monitoring program for PCB analysis.

SECTION 6
LONG-TERM GROUNDWATER MONITORING PROGRAM

Monitored natural attenuation was the selected alternative in the CMS Report for the LCP and HCP (NASA, 2007a). Currently, site-wide groundwater monitoring is conducted on a biennial frequency during the wet season (December). Sampling events are conducted during the wet season based on a quantitative evaluation of wet season versus dry season results (November/December), which were presented in the 2008 Annual LTM Report (NASA, 2009a). The wet season was selected for sampling because contaminant concentrations were found to be consistently higher in the wet season than in the dry season.

The most recent biennial sampling event was conducted in December 2018, with results and recommendations presented in the April 2019 KSCRT meeting and 2018 Operations, Maintenance, and Monitoring Report and Hot Spot 6 Construction Completion Report (NASA, 2019a). Recommendations were approved to conduct sampling at 65 locations for VOC analysis in December 2020, discontinue sampling at IW0015D, IW0031D, IW0052D, IW0066D1 and IW0068D because of their proximity to the HCS, and abandon IW0021S, IW0038S and IW0038I because of damage or obstructions. In addition to those recommendations, an additional monitoring well, IW0122, was added to the biennial network for PCB analysis in the Electrical Substation T-2 IM area, as approved during the June 2019 KSCRT meeting (Meeting Minute 1906-M13, Decision 1906-D92), and the frequency of Layer 8 wells (IW0001D2, IW0042D2, IW0043D2, IW0044D2, IW0045D2) was changed from biennial to annual to monitor performance of the HCS.

The next biennial event is scheduled for December 2020. Currently, the extent of the overall groundwater contaminant plume where COCs exceed FDEP GCTLs (LCP) is approximately 327 acres.

SECTION 7
SYSTEM IMPLEMENTATION AND PERFORMANCE MONITORING

Two remediation systems are currently operating as IMs at LC34; (1) the HCS in the DSZ and, (2) the Air Sparge system in Hot Spot 6. The objective for each IM includes:

(1) The primary objective of the HCS IM is to contain the DSZ and surrounding high-concentration dissolved-phase plume where TCE concentrations exceed 300 μg/L. Secondary IM objectives include maintaining treatment standards for aqueous and air discharges, maintaining system equipment to sustain plume containment, and maximizing contaminant mass removal. The hydraulic capture zone is approximately 12.4 acres.

(2) The objective for the Hot Spot 6 Air Sparge IM is to remediate contaminated groundwater within the treatment zone (to reduce concentrations of the Hot Spot 6 COCs, cDCE and VC, to less than FDEP NADCs), prevent impacts to the drainage canal, and support transition to MNA. The Hot Spot 6 treatment area is approximately 14 acres.

Installation of the HCS was completed in December 2009 to provide hydraulic control and treatment of Hot Spot 2, and full-scale operation and maintenance (O&M) began in May 2010. In 2015, the HCS was expanded to provide hydraulic containment of Hot Spots 3 and 4. The expanded containment system included areas within the 300 μg/L TCE groundwater iso-concentration contours of Hot Spots 3 and 4. The current layout of the HCS is shown in Figure 7-1, and the HCS capture zones (shallow and deep) are shown on Figure 7-2. As shown on Figure 7-2, the HCS capture zones adequately control the DSZ and surrounding hot spot areas (Hot Spots 1-4) where TCE concentrations were found to be greater than 300 μg/L.

The following documents provide details about HCS implementation:

- LC34 Interim Measures Design for Hydraulic Containment of the DNAPL Source Zone and Deep TCE Groundwater Plume (NASA, 2008b) – Provides design details for the original HCS. The pre-IM design 300 μg/L TCE groundwater contour was used to establish the deep zone capture area for deep recovery wells, and the shallow zone capture area was defined by the DSZ.

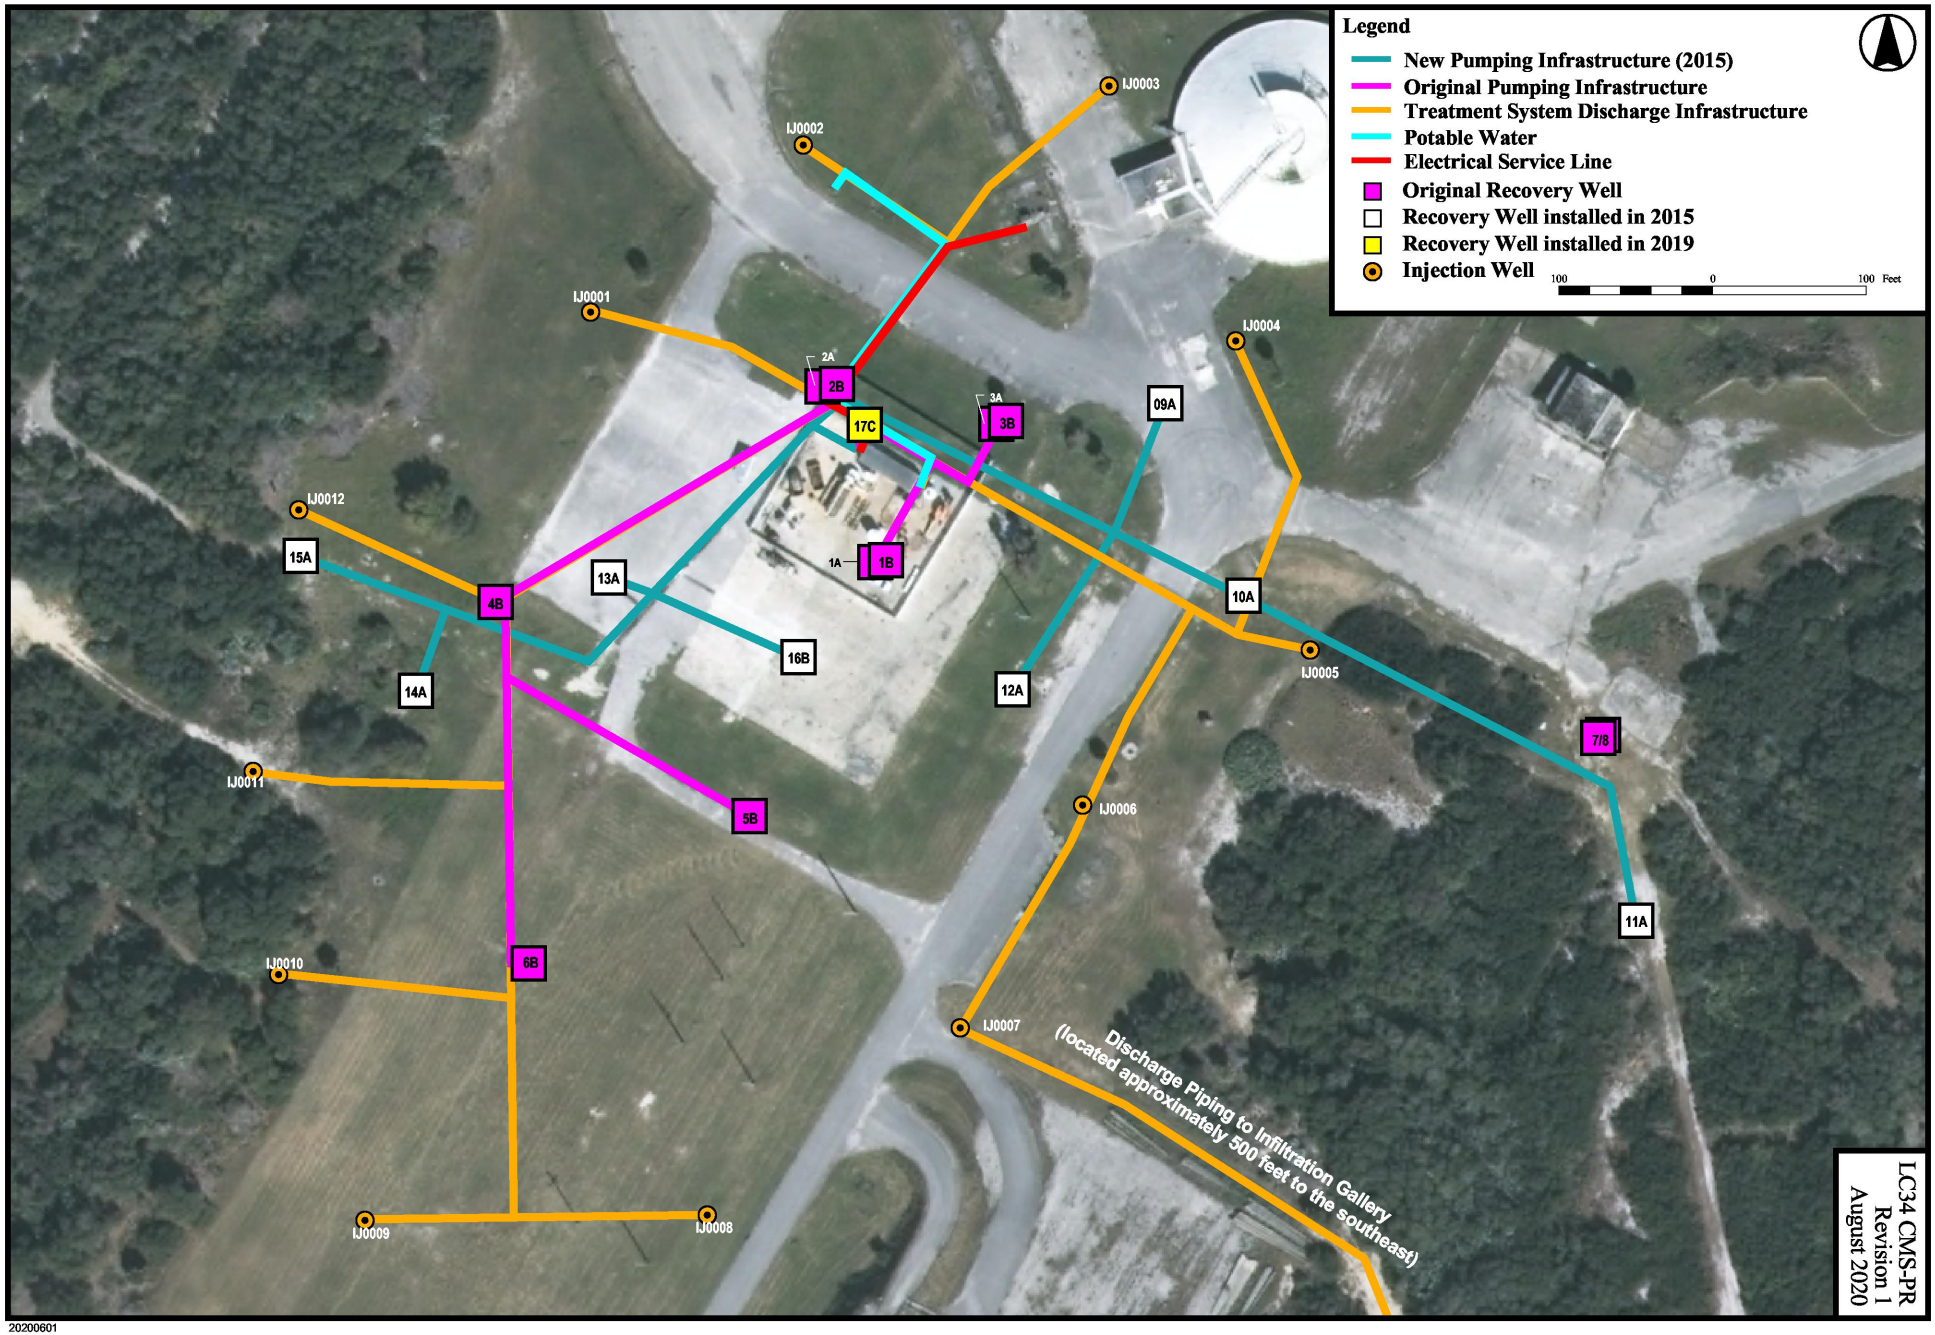
- DSZ Interim Measure Work Plan (NASA, 2009c) – Presents activities required to install, operate, and monitor the HCS IM. The primary components of the original system included groundwater recovery via three shallow (screened interval of 15 to 40 ft bls) and six deep recovery wells (screened interval of 50 to 80 ft bls) for DSZ and deep TCE plume containment, primary treatment via air stripping with liquid-phase granular activated carbon (LPGAC) for polishing, air stripper off-gas treatment via catalytic oxidation, and treated groundwater discharge to an infiltration gallery and 12 deep injection wells (screened interval of 50 to 80 ft bls).

- LC34 Hydraulic Containment Interim Measure Completion Report (NASA, 2011d) – Presents activities associated with implementation of the Hot Spot 2 IM, including construction, commissioning, and startup.

- Hydraulic Containment Expansion Implementation Work Plan (NASA, 2014b) – Describes activities for expansion, which included seven new shallow recovery wells and one deep recovery well, 11 new monitoring wells, and installation of infrastructure and treatment equipment required to accommodate expansion of the hydraulic containment footprint.

- LC34 Hydraulic Containment IM Expansion Construction Completion Report (NASA, 2015) – Presents activities associated with implementation of the HCS expansion, which included installation of new recovery wells, installation of packers in selected recovery wells, installation of a new air stripper, refurbishment of the catalytic oxidizer, commissioning, and startup.

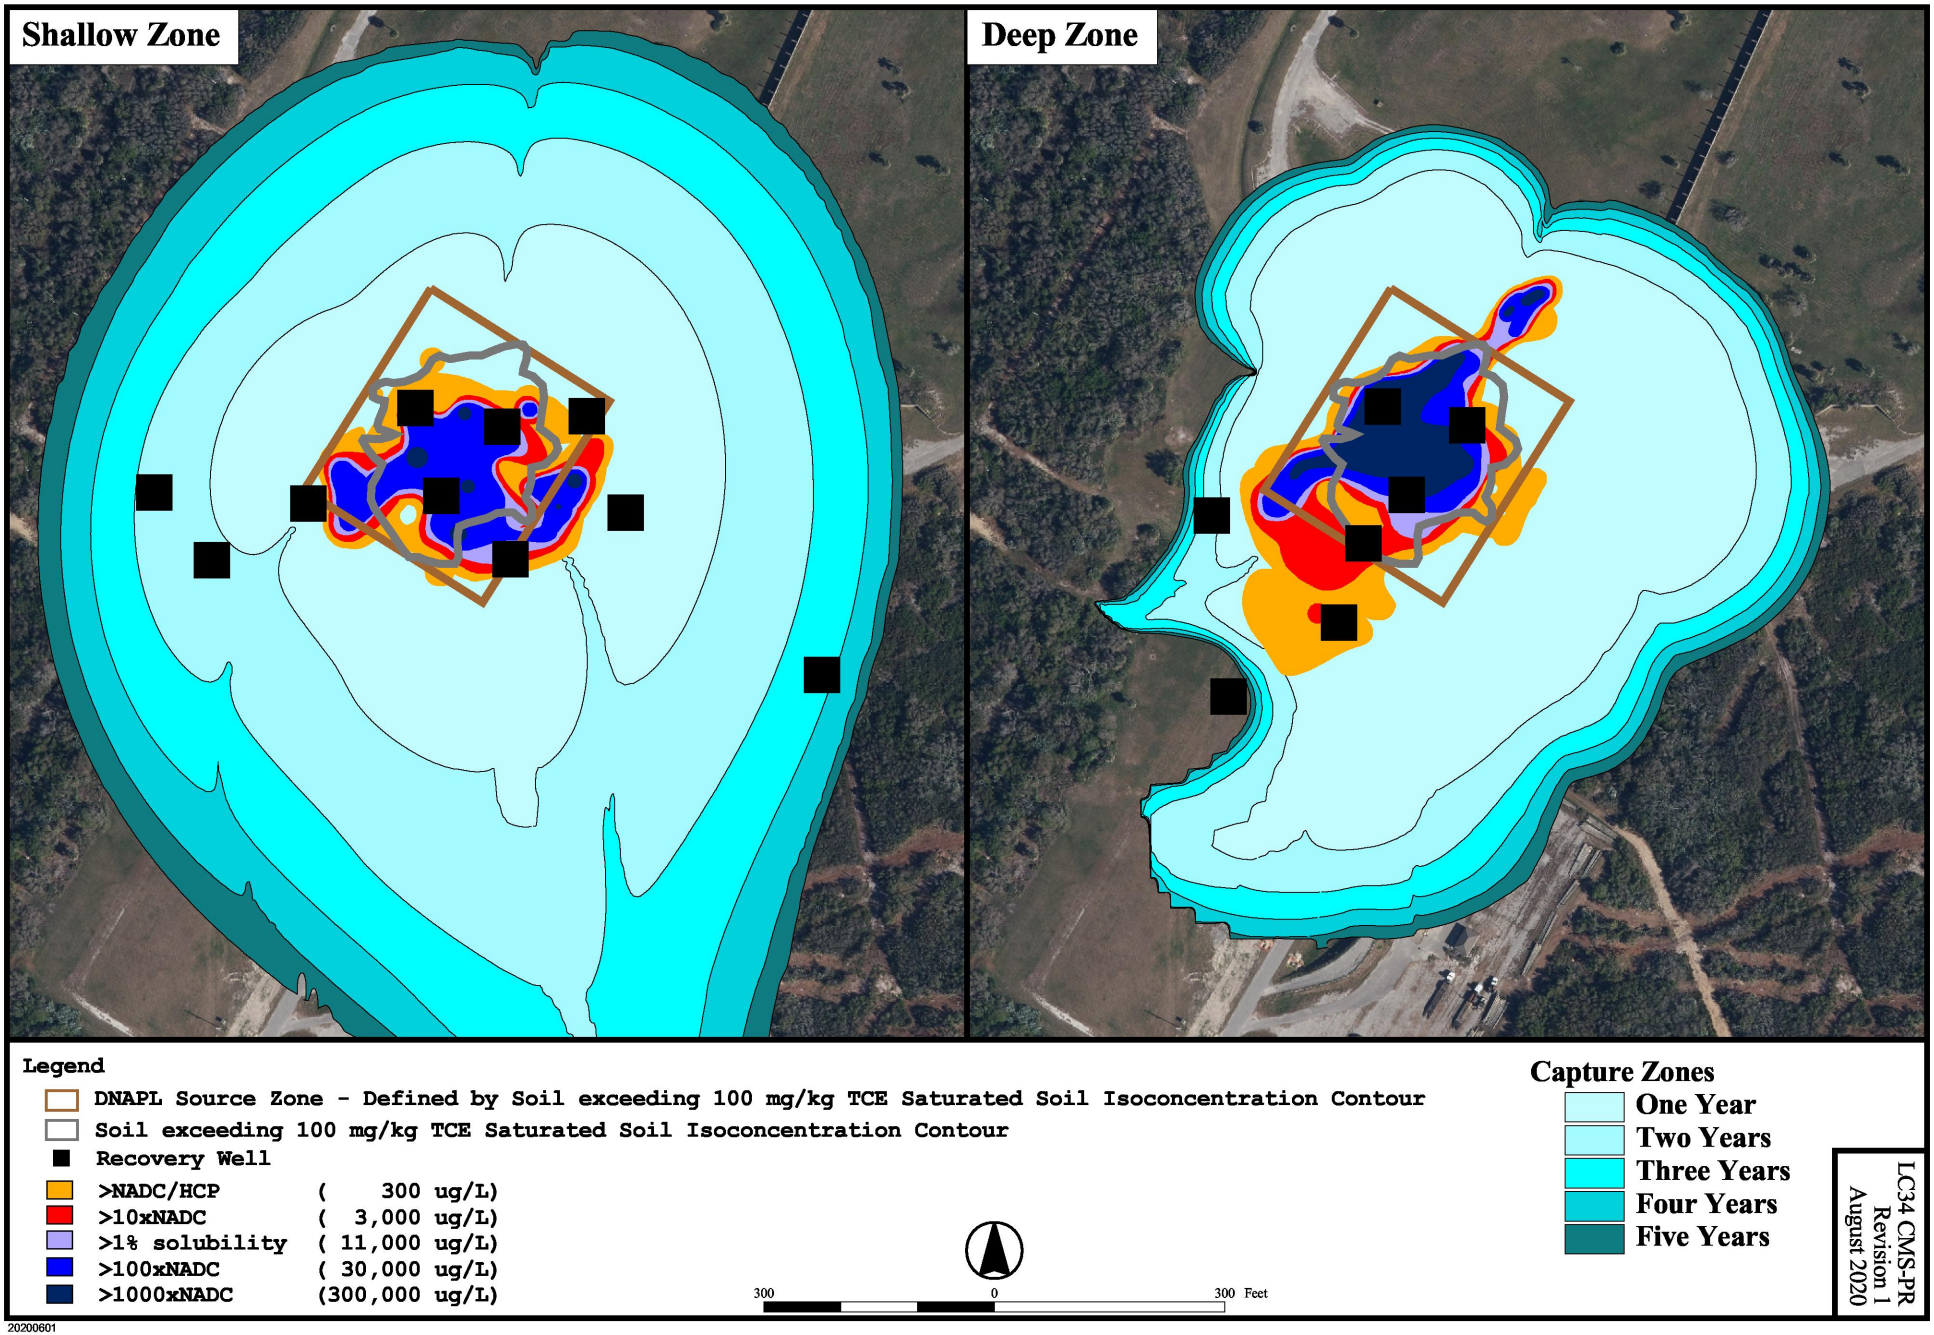
- LC34 DSZ Site Characterization Engineering Evaluation ADP (NASA, 2019c) – Provides information about a new recovery well, RW017C, installed in August 2019 to support pump testing conducted during DSZ re-characterization activities. RW017C is screened from 80 to 95 ft bls, which targets Layer 7 where high TCE concentrations were observed during DPT sampling. RW017C was incorporated into the HCS as a Pilot Study to determine mass removal over time.



Performance monitoring of the HCS is evaluated by two methods; (1) process system sampling, and (2) groundwater sampling within the DSZ. Process system sampling currently consists of aqueous sampling on a monthly or quarterly basis for system influent (combined and individual recovery wells), primary and secondary air stripper effluents, and LPGAC effluent (when online), and vapor sampling on an annual basis for air stripper exhaust and catalytic oxidation unit scrubber exhaust. Groundwater sampling in the DSZ is currently conducted at nine DPT locations (in lieu of performance wells), collected at 5-foot intervals from 8 to 83 ft bls within the TCE 30 mg/L contour (100 times the NADC). Performance well sampling was suspended in the beginning of 2017 (Year 8 of operation) based on significant differences identified between maximum TCE concentrations in recovery well influent and DSZ monitoring well samples. This discrepancy was evaluated based on a decision to use DPT sampling in the DSZ (Meeting Minute 1805-M2, Decision 1805-D4). DPT sampling results provided a better indication of current conditions of the aquifer in the DSZ, and has; therefore, continued on an annual frequency. Operation, maintenance, and monitoring (OM&M) activities for the HCS are presented to the KSCRT and submitted in OM&M Reports on an annual basis. HCS optimization, including recovery well pumping rates, is performed on a routine basis after evaluating system and groundwater performance data. As of March 31, 2020, a total of 222,643,055 gallons of groundwater containing 72,446 pounds of CVOCs have been removed by the system.

Installation of the Hot Spot 6 air sparge system was completed in two phases; (1) an initial 160 air sparge well system was installed to prevent further discharge into the drainage canal and to prevent the hot spot from expanding, and (2) the system was expanded with an additional 140 air sparge wells after six months of operation to contain and remediate the Hot Spot 6 area located downgradient of the HCS. The initial phase was installed between February 19, 2018 and July 7, 2018 in accordance with the Hot Spot 6 Area Implementation Work Plan (NASA, 2017b). The system operated through January 7, 2019 when it was shut down for the expansion, which was completed between November 9, 2018 through April 2, 2019 in accordance with the Hot Spot 6 Expansion Implementation Work Plan (NASA, 2018c). Detailed information about the Hot Spot 6 Air Sparge system design, startup, prove-out and O&M activities can be found in the 2018

OM&M Report and Hot Spot 6 Construction Completion Report (NASA, 2019a). The current layout of the Hot Spot 6 Air Sparge system is shown in Figure 7-3.



Performance monitoring of the Hot Spot 6 Air Sparge system currently includes quarterly monitoring of 28 monitoring wells and three surface water locations. OM&M activities and results from the Hot Spot 6 Air Sparge system are presented to the KSCRT and submitted in OM&M Reports on an annual basis. Performance monitoring results have showed decreasing trends of COCs in groundwater, and no significant impact to the drainage canal.

SECTION 8
RECOMMENDATIONS

Based on the information presented in this CMS Progress Report, the following is recommended:

- Continue operating the HCS in the DSZ and Air Sparge system in Hot Spot 6;
- Continue performance monitoring of the HCS and Air Sparge system based on approved recommendations presented to the KSCRT in February 2020, and documented in the 2019 Operations, Maintenance, and Monitoring Report for DNAPL Source Zone and Hot Spot 6 Air Sparging System (NASA, 2020c);
- Continue site-wide long-term monitoring of the CVOC groundwater plume, as well as a small area of PCB-impacted groundwater within the footprint of the CVOC plume, on a biennial basis;
- Continue to implement land use controls for CVOCs and PCBs in groundwater, and PCBs in soil and concrete;
- Consider installing additional recovery wells to expand the HCS into “Layer 7” to capture and treat TCE mass stored in this lithology unit;
- Conduct a Remedial Alternatives Evaluation to evaluate other technologies to remediate the DSZ, which may include the use of a more aggressive technology such as ERH;
- Conduct DPT assessment of Hot Spot 7; and
- Develop an Implementation Work Plan for air sparging at Hot Spot 5.

OVERVIEW OF CHANGES

Overview of changes between Revisions 0 and 1:

- Re-structured overall format and sections to align with guidance included in KSC's Decision Process Document for the RCRA Corrective Action Program, Revision 2, February 2019
- Added the following sections:
  - Executive Summary
  - 1.1, Introduction
  - 3.1, Site Contaminants and Controls
  - 4.2 (and subsequent subsections), Overview of Supplemental Assessment Activities (2012-2019)
  - 4.3.7, Hot Spot 7
  - 4.3.9, DNAPL Source Zone
  - 4.3.10, Plume Conditions South of Phillips Parkway
  - 5.5, Hot Spot 5 Engineering Evaluations
  - 5.6, Hot Spot 6 Engineering Evaluations
  - 5.7, Hot Spot 7 Engineering Evaluations
  - 5.8, DNAPL Source Zone Engineering Evaluations
  - 5.9, Soil Interim Measures Advanced Data Packages
  - 6.0, Long-Term Groundwater Monitoring Program
  - 7.0, System Implementation and Performance Monitoring
- Revised / Updated the following sections:
  - 3.0, Site Characterization
  - 3.2, Lithology
  - 3.3, Hydrogeology
  - 4.3 (and subsequent subsections), Summary of Groundwater Impacts
  - 5.1, Hot Spot 1 Engineering Evaluations
  - 5.2, Hot Spot 2 Engineering Evaluations
  - 5.3, Hot Spot 3 Engineering Evaluations
  - 5.4, Hot Spot 4 Engineering Evaluations

OVERVIEW OF CHANGES (CONTINUED)

  - 8.0, Recommendations
  - 9.0, References
- Moved Table 3-1, and Figures 3-1 and 3-2 to Appendix H
- Added FDEP Correspondence Letter for Revision 0 of CMS Progress Report to Appendix A
- Added recent LC34 KSCRT meeting minutes to Appendix B
- Added the following files to Appendix C, Advanced Data Packages:
  - C.6, Step 4C Engineering Evaluation Pumping Optimization and Hot Spot 3/4 Expansion ADP
  - C.7, Hot Spot 5 Site Characterization ADP
  - C.8, Hot Spot 6 Area of Investigation Site Characterization ADP
  - C.9, DSZ Site Characterization Engineering Evaluation ADP
  - C.10, Soil Interim Measures ADP
  - C.11, T-2 Area Soil Interim Measures ADP
- Added Interim LUCIP as Appendix D
- Added relevant Field Forms and Laboratory Analytical Data packages to Appendix E and F, respectively
- Added Appendix J, DPT Results – Hot Spots 5 / 6 and DNAPL Source Zone

RE: Corrective Measures Study Progress Report (Revision 0)
SWMU CC054 (Launch Complex 34 (LC34))
Kennedy Space Center, Florida

Dear Mrs. Santos-Ebaugh;

I have reviewed the referenced document dated May 2014 (received June 17, 2014) and have the following comments.

The report is acceptable for its intended purpose.

If I can be of any further assistance in this matter, please contact me at (850) 245-8981.

cc: NASA Team via e-mail

APPENDIX B

KSCRT MEETING MINUTES AND DECISIONS

(PROVIDED IN ELECTRONIC VERSION ONLY)

Meeting Minutes Report

Rev 1 Meeting Minutes for August 28, 2008

Meeting Date From: 8/28/2008 To: 8/28/2008

Meeting ID: 0808

Location Description: Kennedy Space Center-FL

Meeting Type: Full Partnering Team Meeting

Meeting Topic:	**Launch Complex 34 (SWMU CC054)**		
Minute: 0808-M5	**Site:**	**Goal:**	**Discussion:**
Presenter: Langenbach, Jim	LC-34 (SWMU CC054)	Dynamic testing and Hot Spot One and Two Investigation Results	Installed six stainless steel recovery wells (3 shallow and 3 deep) for the containment of the DNAPL source zone (DSZ). Dynamic testing indicated the three shallow recovery wells will contain the DSZ. Delineated isolated TCE source area in Hot Spot One (east of ESB) from 41 to 45 ft BLS. During Hot Spot Two investigation discovered TCE present in 16 to 20 ft BLS interval. Further delineation is required for the 16 to 20 ft BLS, 23 to 27 ft BLS and 60 to 80 ft BLS intervals. Team consensus reached to include TCE concentrations greater than 300 µg/L in layer 6 (60 to 80 ft BLS) in the groundwater interim measures work plan and to also prepare an interim measures work plan for Hot Spot One.
Decision:4	0808-D04 Launch Complex 34 (SWMU CC054) - Team consensus reached to include TCE concentrations greater than 300 µg/L in layer 6 (60 to 80 ft BLS) in the groundwater interim measures work plan and to move forward with an interim measures work plan for Hot Spot One.		

Meeting Topic:	**Area 1 Rechlorination Buildings L6-0043/M7-0433 (PRL 171)**		
Minute: 0808-M6	**Site:**	**Goal:**	**Discussion:**
Presenter: Tzareff, Sue	AREA 1 RECHLORINATION BUILDINGS, L6-0043 AND M7-0433 (PRL 171)	Confirmation Sampling Results	Soil sampling performed and samples were analyzed for PCBs and TPH; no exceedances at LOC1, LOC2, LOC4 and LOC5. TPH exceedance (470 mg/kg) at LOC3; location was resampled and analysis indicated no exceedance (130 mg/kg) and SPLP (< 90 µg/L) indicated no exceedance of leachability. Team consensus reached on NFA for site.
Decision:5	0808-D05 Area 1 Rechlorination Buildings L6-0043/M7-0433 (PRL 171) - Team consensus reached on NFA for site.		

Meeting Topic:	**Fire Department Staging Building #1 L6-1388 (PRL 160)**		
Minute: 0808-M7	**Site:**	**Goal:**	**Discussion:**
Presenter: Tzareff, Sue	FIRE DEPARTMENT STAGING BUILDING 1, L6-1563 (PRL 160)	Confirmation Sampling Results	DPT groundwater sampling performed at LOC1 with analysis for VOCs with chlorobenzenes and TPH. No exceedances occurred. Team consensus reached on NFA for site.
Decision:6	0808-D06 Fire Department Staging Building #1 L6-1388 (PRL 160) - Team consensus reached on NFA for site.		

Meeting Minutes Report

Attendees:

(LFR) Joe Applegate, (NASA) Jennifer Yates, (Geosyntec) Jim Langenbach, (Geosyntec) Andrew Montgomery, (FDEP) John Armstrong, (Geosyntec) Rebecca C. Daprato, (NASA) Mike Deliz, (NASA) Bob Kline, (Geosyntec) Tom Peel, (LFR) Eric Sager, (NASA) Rosaly Santos-Ebaugh, (LFR) Susan Sitkoff, (Tetra Tech) Mark Speranza, (NASA) Harold Williams, (LFR) Kevin Warner, (Geosyntec) Emily Guyer, (IHA) Sue Tzareff, (IHA) Michelle Ouellette, (IHA) Alicia Denegar

Rev 2. Meeting Minutes for April 2 and 3, 2009

Meeting Date From: 4/2/2009 To: 4/3/2009

Meeting ID: 0904

Location Description: Kennedy Space Center-FL

Meeting Type: Full Partnering Team Meeting

Meeting Topic:	**Meeting Minutes, Action Items, CAMP, Deliverables**		
Minute: 0904-M1	**Site:**	**Goal:**	**Discussion:**
Presenter: TEAM, TEAM	CENTERWIDE		Discussion of Meeting Minutes, Action Items, CAMP, Deliverables
Decision:1	Team consensus reached on Rev 2 February 2009 team meeting minutes.		

Meeting Topic:	**Area 2 Repeater Buildings (PRL 174)**		
Minute: 0904-M2	**Site:**	**Goal:**	**Discussion:**
Presenter: Tzareff, Sue	AREA 2 REPEATER BUILDINGS, K6-1193 (PRL 174)	Present SAR findings and obtain team consensus on proposed Confirmatory Sampling	VAB repeater Area: Team consensus reached on the proposed sampling approaches as presented in the ADP for LOC 1 (samples will be evenly spaced on the east and west sides of the pad), LOC2, LOC4, LOC5, LOC6, LOC7, LOC8, LOC10, and LOC11. Team consensus reached on proposed sampling approach as presented in the ADP for LOC 3 with the addition of collecting soil samples beneath the gravel in the two active dry wells and a soil sample at the soil/water interface from the two inactive dry wells on the west side. Team consensus reached on proposed sampling as presented in the ADP for LOC9 with the addition of collecting 0.5 to 2 ft samples at the three sample locations on the eastern side and add a DPT sampling location in the area of the historic spill (analyze for VOCS, SVOCs, and TPH (TRPH) in the shallow samples and VOCs only in the 25, 35 and 45 ft BLS samples). . Action item: get details on high pressure gas lines maintenance and operations (including when they were installed). Team consensus reached on proposed sampling as presented in the ADP for LOC12 (Active transformer USS 892 west of repeater building #2). Team consensus reached on proposed sampling as presented in the ADP for LOC13 (former transformed SS893 at K7-0089 Repeater Building #3). There were no LOCs found at Repeater Building #1 and the cable terminal building.
Decision:2	Area 2 Repeater Buildings (PRL 174)- VAB repeater Area: Team consensus reached on the proposed sampling approaches as presented in the ADP for LOC 1 (samples will be evenly spaced on the east and west sides of the pad), LOC2, LOC4, LOC5, LOC6, LOC7, LOC8, LOC10, and LOC11.		

Minute: 0904-M4	Site:	Goal:	Discussion:
Presenter: Langenbach, Jim	LC-34 (SWMU CC054)	Engineering Review Process Step 1 for Hot Spot 1	Hot spot 1 is separate from the mass under ESB. Hot spot 1 is delineated for TCE to the 300 µg/L. There is difficulty in separating plumes on map due to the comingling of plumes in regards to the TCE 3 µg/L, cDCE and VC. Lithologically hot spot 1 is lower layer 3, all layer 4, and top of layer 5. MIP0008 shows the lingering contamination from Hot Spot 2 and is not associated with Hot Spot 1. There is mass that has made it below 45 feet through the clay layer. . The delineation efforts presented in this data package are for source material (TCE) and not delineated for cDCE and VC due to comingling of the plumes. Concern was expressed in regards to 65 to 75ft or deeper zones. MIP003 indicated no response from 65 to 80 feet. MIP0003 is the deepest penetration. Why is there noe more mass through layer 6? From a conceptual model point we ran out of mass. Based on the ECD response from the MIP there should be no significant mass from 65 to 80 ft BLS. There are three wells (IW-67D1, IW-70D1, and IW-71D1) with clean data from 65-75 feet. Team member felt that it would be prudent to install a true D1 well in the area of MIP0003. For any interim action that is conducted in hot spot 1 will want a well in there anyway. There was a suggestion to go to Layer 7 for a well? Is it worth it to go after hot spot 1 with shallow contamination mingling from hot spot 2? Treatment of hot spot1 could be considered a pilot test for potential applicability of a treatment for the lower permeability unit for the larger plume (ESB Area). If this is a new arrival is it going to fully penetrates layer 5? Is it going to spread laterally through layer 6? If we ignore are we going to make things worse? Contamination in Layer 6 for hot spot 2 is extremely well defined at this point. There are four true layer 5 wells on the site. Does modeler want piezometers in layer 5? Pump test was done farther north, clean area so the values may be a little different. Rotosonic cores were done in the pump test area. There is definitely mass in layer 5. Team discussed putting in a deeper well potentially in layer 6 or layer 7. Does the 43 ppb (DPT103 from 61 to 65 ft BLS) prove there is no contamination deeper? Team consensus reached to install a well 70 to 80ft in the area at well cluster IW02. Question was raised, “If I was going after this how would I get it out?” This area is a responsible size and does not have any other complicating factors (i.e. structures, utilities, etc). Team feels that the treatment chosen for this hot spot maybe valuable to other sites on the center. Can we get mass out of low permeability unit? The treatment of hot spot 1 will be implemented as an IM and the success of the technologies will be defined by whether or not they can effectively treat the silty layer. Team considered moving towards potential

Presenter: Langenbach, Jim	LC-34 (SWMU CC054)	Engineering Review Process Step 1 for Hot Spot 1	technology evaluation and costing to determine whether or not it was worth treating hot spot 1. What can we do to learn more about layer 5? For hot spot 1, a lot of samples have been collected from layer 5. Do we know geotechnical properties, hydraulic conductivity, vertical permeability versus the horizontal permeability, etc? Team consensus reached to conduct slug test in the area of IW-02 cluster (may have already been done) and the PA wells north of ESB if it has not been conducted. A suggestion was made to look at seismic topography and the lithology together to give you another tool in terms of modeling to see what is happening. Eric Sager conducted this type of work in his thesis. Seismic topographic work has been done up and down the east coast of the United States. The resolution on shore is approximately 5 to 10 feet where as off shore the resolution is meter. Not sure if we can apply this type of analysis here need to weigh cost, etc. There was a feeling that this could be one part of the story. There has been a tremendous amount of oxidant demand testing, how portable is that data? Suggestion was made to tailor treatment towards higher end of values. Thermal is highly aggressive and a surprisingly expensive approach. Thermal and LDA would be the two most expensive and most aggressive treatment options. The target depth for treatment is 30 to 60 ft BLS at Hot spot 1. Excavation should be considered but not pursued since team would like to focus technologies that would be applicable at the ESB for treatment of this area. Team agrees that the technologies that are highly likely to work are the thermal, LDA, or excavation options. Chemical oxidation and bioremediation treatment scenarios will have to be very creative in regards to deployment. Some members feel that chemical oxidation is the least likely to work. Treatment via bioremediation would be a way to be innovative and try other approaches with the strong possibility of being able come up with a silver bullet (cost effective and scalable). Can we come up with a thermal process better that the vendors and do that as a demonstration here? This team has a much better understanding of this site; conductivity, lithology, etc. CMS had technologies above 55 feet that team should not forget as options. The clay layer is the big problem (layer 4). Layer 4 is a huge sponge and is the hold up to success for the big picture. What is the team's focus for this area? Clean hot spot 1 up or pilot technologies to treat hot spot 2? Summary – Determining a corrective action objection is actually the step 2 in the engineering review process. NASA wants to know if there any other technologies that should be evaluated besides those presented in the ADP. High pressure EZVI injection, costing has been requested. Previous evaluation of this at the site had no success (four different

Presenter: Langenbach, Jim	LC-34 (SWMU CC054)	Engineering Review Process Step 1 for Hot Spot 1	placement techniques). This technology is not a one shot deal, requires multiple placements. May want to consider doing something different for each layer? Engineering review process step – take technology evaluations cost out and rate regarding meeting the corrective action objective. Should step 1 have corrective action objective firmly established? Team consensus reached on Alternatives to look at for Step 2:Chemical oxidation - remove from evaluation process. Bioremediation – remain.Thermal – remain LDA – remain Excavation derivatives –add. Add piezometers within capture zone in layer five. Ask modeler if wells are needed.
Decision:9	Launch Complex 34 (SWMU CC054)- Team consensus reached to install a well 70 to 80ft in the area at well cluster IW02.		
Decision:10	Launch Complex 34 (SWMU CC054)- Team consensus reached to conduct slug test in the area of IW-02 cluster (may have already been done) and the PA wells north of ESB if it has not been conducted.		
Decision:11	Launch Complex 34 (SWMU CC054)- Team consensus reached on Alternatives to look at for Step 2: Bioremediation, thermal, LDA, and excavation derivatives.		
Decision:12	Launch Complex 34 (SWMU CC054)- Team consensus reached to add piezometers within capture zone in layer five.		

Meeting Topic:	**Merritt Island Launch Annex (SWMU 86)**		
Minute: 0904-M5	**Site:**	**Goal:**	**Discussion:**
Presenter: Sager, Eric	SPACEFLIGHT TRACKING AND DATA NETWORK STATION (SWMU 086)	Update on the installation and early operation of the Temporary Air Sparge Remedial system and obtain team consensus on the proposed recommendations for system improvements.	Seven in situ air sparge wells were installed using DPT due to large number of underground utilities. Soil samples were collected so well screens would be placed in the transmissive unit. Remediation system startup began on January 14, 2009. Prior to startup the average depth to water was 6.86 ft BLS with flow towards the southwest. After startup the average depth to water was 3.32 ft BLS with flow radially outward from MW0005, MW0011, and MW0012. Actual area of influence greater than estimated even when operating in situ air sparge wells at reduced flow (due to water mounding to surface). MW0009, that was installed to confirm DPTs results on the northern edge of the contaminated area, was initially clean, but contaminants of concern were above GCTLs after system startup. Thought is that these were sorbed in the soil and when the system was turned on the contamination was mobilized. The last monthly even, in March 2009 was below GCTLs in MW0009. For this reason, revisions were made to slide 32 prior to meeting to eliminate a recommendation for installation of a new sparge point near MW009; however, LFR may recommend installing an additional IAS well near MW0014 to extend the influence of the IAS system if concentrations of COCs do not decrease in MW0014.. Team consensus reached to continue running system.
Decision:13	Merritt Island Launch Annex (SWMU 86)- Team consensus reached to continue running in situ air sparge system.		

Meeting Minutes Report

October 2009 Remediation Team Meeting

Meeting Date From: 10/8/2009 To: 10/9/2009

Meeting ID: 0910

Location Description: Kennedy Space Center-FL

Meeting Type: Full Partnering Team Meeting

Meeting Topic:	**LC34 (CC054)**		
Minute: 0910-M11	**Site:**	**Goal:**	**Discussion:**
Presenter: Langenbach, Jim	LC-34 (SWMU CC054)	Present hot spot 1 re-evaluation and proposed ESTCP Pilot Test	Pneumatic slug testing was performed at four Layer 5 monitoring wells. Sonic drilling was performed in Hot Spot 1, in the immediate vicinity of MIP0003. A continuous core was collected and logged to 80 ft bls. Six discrete saturated zone soil samples were collected to assess TCE mass in layers 3/4/5, these results are consistent with MIP logs and DPT data. The monitoring well IW0076 installed (70-80 ft bls), sampled for VOCs, and all VOC results were non detect. Result suggests Layer 5 is more permeable than originally conceptualized. Monitoring well sample results in combination with previous MIP/DPT data suggest deep mass is not present at Hot Spot 1. Geosyntec received an Environmental Security Technology Certification Program (ESTCP) grant to implement a pilot study to evaluate bioremediation with a portioned electron donor (PED). The pilot location was originally proposed on a site in California, but fell through so a new location was being sought. LC34 Hot Spot 1 was identified as an ideal candidate site. PED pilot structure similar to IM evaluation for bioremediation in costing summary. Collected data will be evaluated and reported separate to ESTCP reporting. A pilot study work plan will be submitted to FDEP. Pilot study is anticipated to run for 9 to 12 months. Team consensus reached to move forward with ESTCP pilot study in hot spot 1 and preparing an IM work plan.
Decision:34	Team consensus reached to move forward with ESTCP pilot study in hot spot 1 and preparing an IM work plan.		

Meeting Topic:	**LC34 (CC054)**		
Minute: 0910-M12	**Site:**	**Goal:**	**Discussion:**
Presenter: Ruffing, Steve	LC-34 (SWMU CC054)	Present LTM update	A status update summary was distributed at the team meeting. Building and equipment has been moving along pretty well. Estimated delivery of the building is October 19th. Modifications have been made to the design. A thermal oxidizer is being used in place of the carbon as originally proposed. A DNAPL separator has also been added. All MWs, PZs, deep injection wells, and recovery wells have been installed. Pump installation is complete. Building siting is currently under review by CCAFS.

Meeting Minutes Report

December 2011 Team Meeting

Meeting Date From: 12/7/2011 To: 12/8/2011

Meeting ID: 1112

Location Description: Kennedy Space Center-FL

Meeting Type: Full Partnering Team Meeting

Meeting Topic:	**Agenda Items Meeting February 7th and 8th**		
Minute: 1112-M12	**Site:**	**Goal:**	**Discussion:**
Presenter: TEAM, TEAM	CENTERWIDE		DASR Tower (PRL 197) SAR/CS WP 30 Mins – Sue T Area 1 Camera Pads (PRL 206) SAR/CSWP 30 mins – Sue T Industrial Area LTM – 30 mins _ Susan Sitkoff VAB Area LTM – 30 mins – Jill Johnson GSA Rec Yard Step 3 – Scott Starr – 45 mins CRCA – Matt Shelton – 30 mins HBF Step 1 60 mins- Debbie Wilson FS 6 LUCIP – 15 mins – Rebecca Daprato LC39B Annual Report – 30 mins – Rebecca Daprato ESTCP data presentation – 45mins – Rebecca Daprato PSBA HCP Step 1 – 45 mins – Mark Jonnet CCF Hot Spot 1 Step 2 EE – 60 mins – Mark Jonnet/Chris Hook Fidelity of Step 2s – NASA 30 mins LC34 LTM – 60 mins – Chris Hook

Meeting Topic:	**LC34 (SWMU CC054)**		
Minute: 1112-M13	**Site:**	**Goal:**	**Discussion:**
Presenter: Daprato, Rebecca C.	LC-34 (SWMU CC054)	Present Step 1A for Hot Spots 3 and 4	Action item was given to send Regina (CCAFS) a copy of the updated presentation. This presentation focused on hot spot 3 (the interval of TCE impacted groundwater outside the DSZ surrounding the ESB in the 16 to 30 ft BLS interval) and hot spot 4 (the area around monitoring well IW0052S, based on historical fluctuating concentrations of TCE). This step 1 focused on delineation of parent material (TCE), since hot spots are located within larger HCP and LCP of site (cDCE and VC). If a sample result had an elevated detection limit, it was assumed that the result is one half the detection limit for contouring and evaluation purposes. The 11 to 15 ft interval was evaluated to provide additional data for hot spot 3. Deluge basin area results were presented for informational purposes only. Team consensus reached on delineation of TCE 300 µg/L within Hot Spot 4. Team consensus reached on delineation of TCE 300 µg/L in 11 to 15 and 16 to 20 feet BLS interval. Team consensus reached on delineation of TCE is Hot Spot 3. Hard to differentiate what is flux and what is an old source area.
Decision:17	Team consensus reached on delineation of TCE 300 µg/L within Hot Spot 4.		

Meeting Minutes Report

December 2011 Team Meeting

Meeting Date From: 12/7/2011 To: 12/8/2011

Meeting ID: 1112

Location Description: Kennedy Space Center-FL

Meeting Type: Full Partnering Team Meeting

Decision:18	Team consensus reached on delineation of TCE 300 µg/L in 11 to 15 and 16 to 20 feet BLS interval.
Decision:19	Team consensus reached on delineation of TCE is Hot Spot 3.

Meeting Topic:	**LC34 (SWMU CC054)**		
Minute: 1112-M14	**Site:**	**Goal:**	**Discussion:**
Presenter: Daprato, Rebecca C.	LC-34 (SWMU CC054)	Present Step 1B for Hot Spots 3 and 4	Action item was given to send Regina (CCAFS) a copy of the updated presentation. There are little spots in other areas, but the DNAPL is definitely with in the DSZ. Critical element of the assessment is that the hydraulic containment system has been running and the results collected prior to startup may have changed. Want to evaluate MNA, GW extraction, bioremediation and air sparging. Is this really a Step 4? We are capturing a lot of mass now and should we be costing other technologies now or should we be looking at expanding the hydraulic capture system to data contain these other areas. We are about $125 per pound mass removed at this time at LC34. Team consensus reached to focus on evaluating expanding the hydraulic containment system as a Step 4 optimization, there will be no step 2 or 3 for hot spots 3 and 4. NASA intends to keep looking for other sources. Team consensus reached to install monitoring wells in Hot Spot 4 to evaluate TCE concentrations above NADC in 6 to 10 and 11 to 15 feet BLS interval. If the results are above NADCs, bring results back to team and discuss performing a Step 2 EE on those areas or incorporate into above evaluation.
Decision:20	Team consensus reached to focus on evaluating expanding the hydraulic containment system as a Step 4 optimization, there will be no step 2 or 3 for hot spots 3 and 4.		
Decision:21	Team consensus reached to install monitoring wells in Hot Spot 4 to evaluate TCE concentrations above NADC in 6 to 10 and 11 to 15 feet BLS interval.		

Meeting Topic:	**Area 3 North Pump Stations (PRL 203)**		
Minute: 1112-M15	**Site:**	**Goal:**	**Discussion:**
Presenter: Tzareff, Sue	AREA 3 NORTH PUMP STATION (PRL 203)	Present SWMU Assessment and obtain team consensus on CS WP	There was discussion at a previous meeting that single pole mounted transformers would no longer be sampled. LOC1 has three transformers mounted to one pole. PAFB screened out any less than 20 KVA. Out of the electrical equipment that were sampled only 20 locations had exceedances. Four sampling locations seem to be overkill for these transformers. NASA will look at what came out of the PAFB study to determine the best method for evaluating other locations with more than one pole mounted

Description

April 2012 Team Meeting

Attendees

FDEP: John Armstrong
Geosyntec: Rebecca C. Daprato; Melissa Hensley; Jim Langenbach; Emily Lawson; Tom Peel
IHA: Michele Cielukowski; Sue Tzareff
LFR: Joe Applegate
NASA: Anne Chrest; Mike Deliz; Bob Kline; Harry Plaza; Rosaly Santos-Ebaugh
Portage Environmental: Lauren Lorenz
Tetra Tech: Chris Hook; Mark Jonnet; Mark Speranza; Deborah Wilson

Minute Id	Presenter	PRL SWMU
M1	TEAM, TEAM	KSC PROGRAM DOCUMENTS

Topic

Action items, deliverable, and meeting minutes

Discussion

Team consensus reached that rev2 meeting minutes for February 2012 are final.

Goal

Decision Id	Decision
D1	Team consensus reached that rev2 meeting minutes for February 2012 are final.

Minute Id	Presenter	PRL SWMU
M2	Daprato, Rebecca C.	LAUNCH COMPLEX 39B (SWMU 009)

Topic

LC39B (SWMU 009)

Discussion

Team consensus reached to present a Step 4 EE which will include buffering study previously proposed and evaluate approaches to transition to passive remediation. Team consensus reached to continue performance monitoring on an annual basis with an annual report. Team consensus reached to continue annual MNA sampling of four wells.

Goal

Present results of performance monitoring, MNA, and O&M activities.

Decision Id	Decision
D2	LC39B (SWMU 009) - Team consensus reached to present a Step 4 EE which will include buffering study previously proposed and evaluate approaches to transition to passive remediation.
D3	LC39B (SWMU 009) -Team consensus reached to continue performance monitoring on an annual basis with an annual report.
D4	LC39B (SWMU 009) -Team consensus reached to continue annual MNA sampling of four wells.

Minute Id	Presenter	PRL SWMU
M3	Tzareff, Sue	SHUTTLE LANDING FACILITY LANDING AIDS CONTROL BUILDING (PRL 187)

Topic

Landing Aids Control Building (PRL 187)

Discussion

Team consensus reached for NFA for soil at LOC 1, LOC 2, and LOC 3. Team consensus reached for NFA for groundwater at LOC 4 for DPTs 1, 2, 3, 5, 6 and 7. Team consensus reached to install a shallow monitoring well at DPT4 for Benzo(b)fluoranthene, Indeno(1,2,3-cd)pyrene, and Dibenzo(a,h)anthracene analyses.

Goal

Present confirmatory sampling results and obtain team consensus on path forward.

D20	presented at the April 2012 team meeting.

Minute Id	Presenter	PRL SWMU
M12	Willson, Deborah	COMPONENTS REFURBISHMENT AND CHEMICAL ANALYSIS (SWMU 041)

Topic

Components Refurbishment and Chemical Analysis Facility (SWMU 041)

Discussion

Team consensus reached on the LUCIP with the following changes: revise the third sentence in the Why Land Use Controls Are Needed section as follows: Polychlorinated biphenyls (PCBs) were identified in shallow soils at concentrations exceeding the Florida Department of Environmental Protection (FDEP) residential Soil Cleanup Target Levels (SCTLs) but less than industrial SCTLs at LOC 1., specify VOC parameters in the Why Land Use Controls Are Needed section, remove and solvent spills text from page 2, column 1, add and soil to the third sentence in Site Contamination and Control section as well as add information to this section about soils being capped by asphalt, and remove the following sentence from the Implementation section, Upon approval of this Interim LUCIP, it will be incorporated into the permit by reference.

Goal

Onboard review of Interim LUCIP

Decision Id	Decision
D21	Components Refurbishment and Chemical Analysis Facility (SWMU 041) - Team consensus reached on the LUCIP with the following changes: revise the third sentence in the Why Land Use Controls Are Needed section as follows: ?Polychlorinated biphenyls (PCBs) were identified in shallow soils at concentrations exceeding the Florida Department of Environmental Protection (FDEP) residential Soil Cleanup Target Levels (SCTLs) but less than industrial SCTLs at LOC 1.?, specify VOC parameters in the Why Land Use Controls Are Needed section, remove ?and solvent spills? text from page 2, column 1, add ?and soil? to the third sentence in Site Contamination and Control section as well as add information to this section about soils being capped by asphalt, and remove the following sentence from the Implementation section, ?Upon approval of this Interim LUCIP, it will be incorporated into the permit by reference?.

Topic

Launch Complex 34 (CC054)

Discussion

In December 2011 targeted key wells for plume delineation, source area concentration trends, and hydraulic control system performance resulting in 113 wells sampled. VOC analyses were conducted in all wells. A comprehensive round of water levels was collected in December 2011. The overall extent of contamination is fairly stable as supported by the trends in the point of compliance wells. Team consensus reached to continue sampling all performance monitoring wells associated with the hydraulic control system (IWs 77 to 94). Team consensus reached to optimize monitoring well network for 2012 LTM sampling event this will be sent to team via email for consensus prior to submitting the report. Team consensus reached to discontinue water level measurements. Team consensus reached to continue IM operations, maintenance, and monitoring with no other modifications.

Goal

Present 2011 annual report and year 2 hydraulic containment IM operations.
Presented by Debbie Wilson and Chris Hook both of Tetra Tech

Decision Id	Decision
D22	Launch Complex 34 (CC054) - Team consensus reached to continue sampling all performance monitoring wells associated with the hydraulic control system (IWs 77 to 94).
D23	Launch Complex 34 (CC054) - Team consensus reached to optimize monitoring well network for 2012 LTM sampling event this will be sent to team via email for consensus prior to submitting the report.
D24	Launch Complex 34 (CC054) - Team consensus reached to discontinue water level measurements.
D25	Launch Complex 34 (CC054) - Team consensus reached to continue IM operations, maintenance, and monitoring with no other modifications.

M14	Jonnet, Mark	FLUID SERVICING ROAD AREA

Topic

Fluid Servicing Road Area (SWMU 30, 89, 100, and 102)

Discussion

The size and complexity of the sites will likely extend hot spot remediation implementations over the next 5 to 10 years, therefore, interim groundwater monitoring was proposed to evaluate plume stability over time until remediations are implemented. The IGWM plan will also monitor the stability of each plume with in the FSRA over time and collect groundwater level measurements to calibrate the area groundwater model. This plan was also intended to evaluate Hot Spot concentrations and project trends as well as to track high concentration plumes (HCP) to determine expansion or contraction. The 2011 plan consisted of annual monitoring of 129 wells using passive diffusion bag (PDB) samplers for VOC and Freon analyses. Team consensus reached to add MW0012 to the 2012 IGWM program for PSBA area. Team consensus reached to add a monitoring well down gradient of MW0015 at DPT0157 (MW-A) screened 30 to 40 ft BLS for PSBA area. Team consensus reached to add MW0077 to the 2012 IGWM program for the CCB Hot Spot 3 area. Team consensus reached to add MW0021 to the 2012 IGWM program for CCB

M2	Tzareff, Sue	SOUTH WATER PUMP STATION (PRL 213)

Topic

South Water Pump Station (PRL 213)

Discussion

Site is located on the east side of Kennedy Parkway South at the southern boundary of KSC. Site was developed as an orange grove prior to acquisition by NASA in 1962. Adjacent areas to the north, south, east, and west are former grove areas and are now considered shrub and brush. Air Liquide facility is located just outside the KSC boundary across Kennedy Parkway and northwest from the south water pump station. The Air Liquide facility produces and stores industrial gases and associated services. Air Liquide has no hazardous waste permit and there are no cleanups on going or pending. Who owns the pipeline and transmission stations for Air Liquide? It is believed that the lines and stations are owned and maintained by Air Liquide.

Team consensus reached at LOC 1 Former Fuel Storage Tanks to collect 3 surface soil samples for metals, SVOCs, and TPH analyses and 1 DPT groundwater location sampled from 10 ft BLS for VOCs, TPH, and PAH analyses and samples from 25, 35, and 45 ft BLS analyzed for VOCs only. LOC 1 will be screened as follows: soil human health criteria only and general industrial soil reference values and groundwater human health criteria only and KSC G-II groundwater background values.

Team consensus reached at LOC 2 Electrical Equipment to collect 8 surface soil samples, 1 from each side of each pad for PCBs and TPH analyses. LOC 2 will be screened as follows: soil human health criteria only and KSC combined soil background values.

Former Redstone Rocket display: previous investigaton sampling was conducted due to industrial hygiene concerns for workers dismantling and moving rocket. NASA was concerned that the proposed sampling as presented in the ADP would detect impacts from the large asphalt parking lot (i.e. TPH, PAHs and SVOCs) and not just the rocket refurbishment activities (metals, PCBs, solvents). The concern in this area is that the parking lot is large and the potential effects from the former rocket display must be distinguished. NASAs Remediation Program is not investigating general stormwater issues. Concern at this site is really rocket display refurbishment impacts; therefore, NASA wants to remove hydrocarbons analyses from soil and groundwater reducing the analyte list to metals, PCBs and solvents only.

Team consensus reached at LOC 3 Former Redstone Rocket Display to collect three surface soil samples for metal and PCB analyses and 1 DPT groundwater location sampled from 10, 25, 35, and 45 ft BLS analyzed for VOCs only. LOC 3 will be screened as follows: soil human health criteria only and heavy parking/traffic soil reference values and groundwater human health criteria only and KSC G-II groundwater background values.

Revisions were made to LOCs 4, 5, and 6. The concern for these areas is due to rocket refurbishment and not stormwater concerns.

Team consensus reached at LOCs 4 and 5 Stormwater Discharges to collect 2 swale soil samples (1 at each LOC) for metal and PCB analyses and eliminate proposed DPT sampling. LOCs 4 and 5 will be screened as follows human health criteria only and heavy parking/traffic soil reference values.

Team consensus reached to eliminate LOC 6 Stormwater Discharges since the former rocket display would not be expected to affect these locations. The concern for these areas is due to rocket refurbishment and not stormwater concerns.

Team consensus reached at LOC 7 Site Groundwater to collect 1 DPT location in the NW corner of the site from 10 ft BLS for VOCs, TPH, and PAH analyses and samples from 25, 35, and 45 ft BLS analyzed for VOCs only. LOC 7 will be screened as follows: groundwater human health criteria only and KSC G-II groundwater background values.

Goal

Present SWMU Assessment and obtain team consensus on confirmatory sampling.

Decision Id	Decision
D3	Team consensus reached at LOC 1 Former Fuel Storage Tanks to collect 3 surface soil samples for metals, SVOCs, and TPH analyses and 1 DPT groundwater location sampled from 10 ft BLS for VOCs, TPH, and PAH analyses and samples from 25, 35, and 45 ft BLS analyzed for VOCs only. LOC 1 will be screened as follows: soil human health criteria only and general industrial soil reference values and groundwater human health criteria only and KSC G-II groundwater background values.
D4	Team consensus reached at LOC 2 Electrical Equipment to collect 8 surface soil samples, 1 from each side of each pad for PCBs and TPH analyses. LOC 2 will be screened as follows: soil human health criteria only and KSC combined soil background values.
D5	Team consensus reached at LOC 3 Former Redstone Rocket Display to collect three surface soil samples for metal and PCB analyses and 1 DPT groundwater location sampled from 10, 25, 35, and 45 ft BLS analyzed for VOCs only. LOC 3 will be screened as follows: soil human health criteria only and heavy parking/traffic soil reference values and groundwater human health criteria only and KSC G-II groundwater background values.
D6	Team consensus reached at LOCs 4 and 5 Stormwater Discharges to collect 2 swale soil samples (1 at each LOC) for metal and PCB analyses and eliminate proposed DPT sampling. LOCs 4 and 5 will be screened as follows human health criteria only and heavy parking/traffic soil reference values.
D7	Team consensus reached to eliminate LOC 6 Stormwater Discharges since the former rocket display would not be expected to affect these locations. The concern for these areas is due to rocket refurbishment and not stormwater concerns.
D8	Team consensus reached at LOC 7 Site Groundwater to collect 1 DPT location in the NW corner of the site from 10 ft BLS for VOCs, TPH, and PAH analyses and samples from 25, 35, and 45 ft BLS analyzed for VOCs only. LOC 7 will be screened as follows: groundwater human health criteria only and KSC G-II groundwater background values.

Topic

LC34 (CC054)

Discussion

Present Membrane Interface Probe (MIP) and Hydraulic Profiling Tool (HPT) Field Events and Pumping Optimization. Historic sampling was conducted from 1997 to 2006.

2004-2007events: LC34 Corrective Measures Study performed by NASA in 2004-2007, draft report was submitted in February 2007 (FDEP comments September 2007), identified plume zones: Low Concentration Plume (LCP), High Concentration Plume (HCP), and DNAPL Source Zone (DSZ). Interim LTM Work Plan (CMS Section 7) implemented by NASA June/December 2007, and interim semi-annual LTM conducted since June 2004. Annual groundwater monitoring report approved July 2008.

2008 events: Supplemental investigations conducted at Hot Spot (HS) 1/2 in the DSZ vicinity, dynamic testing at DNAPL source zone June 26 to July 11, 2008, and LTM sampling June and December, annual monitoring recommended.

2009 events: continued supplemental assessments in HS 3/4, installation of hydraulic containment system, and annual LTM sampling conducted Nov/Dec (recommended removing and adding wells within monitoring network).

2010 events: commissioning and full scale operation of hydraulic containment system, continued supplemental assessment in HS 3, installation of new LTM monitoring wells (IW-95 through IW-110), hydraulic capture study conducted, annual LTM sampling conducted in December.

2011 events: continued operation of hydraulic containment system, annual LTM sampling conducted in December, PED Demonstration Pilot at HS 1, Step 1A/1B Engineering Evaluation for HS 3, 4 and 5 (December), Step 1A/1B Engineering Evaluation for HS 3/4 recommended expansion of the groundwater extraction network into HS 3/4via a Step 4C EE (driver for this presentation).

2012 events: continued operation of hydraulic containment system, LTM and recovery well extraction rate optimization, annual LTM sampling conducted in December per 2012 LTM optimization, confirmation monitoring wells installed per Step 1B; presented as basket item, and PED Demonstration Pilot at HS 1.

2013 events: HPT field event (January 8-10, 2013) and MIP field event (January 21-25, 2013).

Overview of the DSZ and TCE HCP IM: hydraulic control of the DNAPL source zone and deep groundwater TCE plume 300 g/l, treat extracted groundwater to GCTLs, and operate system constructed with a design peak flow of 50 gpm and a design flow of 39 gpm. cVOC Mass recovery:

31,300 lb as of 02/06/2013 and Groundwater recovery: 42,942,600 gallons as of 02/06/2013.

HPT Event (January 8-10, 2013): advanced 6 HPT borings from 0 to 80 ft BLS, placed to provide better understanding of conductivity near RWs, and secondary objective of pairing with MIP data to determine storage/transport zones.

MIP Event (January 21-25, 2013): advanced 11 MIP borings from 0 to 80 ft BLS, MIP locations paired with HPT borings and within ESB area where additional wells are being considered in ESB area. Measured EC/ECD/PID/FID to provide a qualitative summary of contaminant levels and compared to pre-IM MIP borings advanced by Geosyntec to evaluate IM influences. Raw data interpreted to evaluate on a location-specific basis and also equalized scales across all borings for event-wide comparison.

HPT Technology Overview: Real-time vertical profiling of hydraulic conductivity. Equipment used DPT Rig, HPT Tooling (pressure sensor, water injector, depth transducer, electrical conductivity sensor, control box). Tool is advanced via DPT while water is injected, pressure sensor measures pressure response of soil to water injection, and pressure response identifies ability of soil to transmit water (high pressure response low K; low pressure response high K). Electrical conductivity, injection flow and pressure are the measured data output. EC indicates changes in lithology. Pressure response is depth-corrected. K value calculated by HPT software using flow and pressure data; peaks indicate high K/flow zones, and valleys indicate low K/flow zones.

Comments received were very good, but team was reminded that the goal of the IM is containment. Mass removal and plume collapse are secondary objectives. The intention of some of the comments was on increasing mass removal. NASAs opinion at this point is to optimize based on current progress and site conditions. This optimization is only the first step and additional changes can be made iteratively.

Pre-IM to 2013 MIP Comparisons:
MIP016 (Pre-IM)/MIP005 (2013): ECD above 47 feet bls indicative of VOC removal in this interval. At depths greater than 50 feet bls, it appears that immediately below Layer 4 is being flushed and portions of Layer 6. FID/PID spikes not observed from approximately 40 to 56 and 65 to 76 feet bls, as observed in Pre-IM MIP. FID/PID scale increased one order of magnitude on MIP016 plot for comparative purposes. This location is near the RW2A/B cluster.

MIP018 (Pre-IM)/MIP004 (2013): ECD above 36 bls indicative of VOC removal in this interval, with several FID spikes ranging from 15 to 25 bls. Generally, ECD/PID/FID similar with small spikes in 2013 FID from 64 to 68 feet bls and 70 to 75 feet bls. FID/PID scale increased one order of magnitude on MIP018 plot for comparative purposes. This location is near the RW1A/B cluster.

MIP015 (Pre-IM)/MIP010 (2013): ECD comparison indicative of VOC removal responses. ECD/FID spikes in 2013 MIP from 28 to 40, 60 to 63, and 74 to 80 feet bls. Moderate ECD/FID response from 63 to 74 feet bls. Location west of RW1A/B and south of RW2A/2B clusters. FID/PID scale increased one order of magnitude on MIP015 plot for comparative purposes.

MIP011 (Pre-IM)/MIP011 (2013): ECD/FID peak observed from 24 to 34 feet bls and not observed in MIP011. Profile of ECD in deep zone reduced from 55 to 80 feet bls to 65 to 80 feet bls. Location is between RW4B and RW5B. FID/PID scale increased one order of magnitude on MIP011 (Pre-IM) plot for comparative purposes.

MIP011 and MIP012 (Pre-IM)/MIP003 (2013): FID spike observed in 2013 from 28 to 36 feet bls not observed in Pre-IM MIP borings. ECD appears in Pre-IM borings appears to be reduced in magnitude based on 2013 boring, with small FID spikes near 63 feet bls and 68 feet bls. Location is upgradient of RW5B.

MIP013 (Pre-IM)/MIP005 (2013): FID/ECD spikes in 2013 similar to ECD pre-IM from 18 to 30 feet bls. ECD response observed in Pre-IM boring not observed from 60 feet bls to 80 feet bls. Appears that this zone has flushed with small FID peaks at 60 and 64 feet bls. Location is near RW4B.

MIP017 (Pre-IM)/MIP002 (2013): ECD spike observed in Pre-IM MIP not observed in 2013 MIP. Indicative of VOC removal from 58 feet bls to 80 feet bls. Location is near RW6B. Justifies low concentration and sharp decreasing trend from RW6B influent.

Observations from overlaying HPT/MIP data:
RW1A: Mass transport evident at 15 to 25 and 36 to 41 feet bls. No modifications to pumping approach recommended.

RW1B: Mass storage likely at 50 to 53 feet bls (Layer 4). Mass transport likely at 53 to 74 feet bls. Based on HPT/MIP observations, move pump intake to 74 feet bls. Below this depth are higher permeability zones and low FID/ECD responses.

RW2A: Primary mass transport likely from 33 to 45 feet bls. Well packer proposed to isolate active pumping from 33 to 45 feet bls.

RW2B: Mass storage likely at 47 to 50 feet bls (Layer 4). Mass transport likely from 53 to 73 feet bls. Based on HPT/MIP observations move pump intake to 74 feet bls.

RW3A: Majority of mobile mass likely situated from 30 to 36 feet bls. Potential storage zone from 43 to 46 feet bls based on low conductivity. Well packers proposed to isolate active pumping from 30 to 46 feet bls.

RW3B: Mass storage likely from 43 to 52 feet bls (Layer 4). Based on declining FID trend and ECD plateau, mobile mass likely at 52 to 64 feet bls. Proposed to move pump intake to 65 feet bls. If no significant change in influent concentrations, consider well rehabilitation of RW3A/RW3B. Comparatively much lower concentration than nearby ESB recovery well RW1A/B and RW2A/B clusters.

RW4B: Minimal impacts observed in top 10 feet of screen (50 to 60 feet bls). Proposed isolating active pumping interval from 60 to 80 feet bls via well packer. ECD/FID spikes observed above RW4B screen interval and a consideration for the Hot Spot 3 pumping design. Possible ECD drift from 25 to 80 feet bls.

RW5B: Minimal impacts observed in top 10 feet of screen (50 to 60 feet bls). Proposed isolating active pumping interval from 60 to 80 fet bls via well packer. This location is likely a downgradient location of the DNAPL source zone and comparatively between deep zone wells has moderate influent concentrations.

RW6B: Low level FID/PID/ECD detections. Reduce flow to 2 gpm for sustained containment purposes and eventually consider phasing out well, as appropriate.

Based on MIP results and current site conditions an additional deep zone pumping well was proposed with a screen interval typical to RW4B/5B. This location is within an area that is likely on the boundary of the existing DNAPL source zone and will benefit the IM by likely reducing

downgradient containment/pumping requirements as well as function as a mass removal location. Modeling of this proposed location was presented in Part 2 of the EE.

Screen Isolation Approach:
RW2A (15-45 ft BLS screen) - Isolate well pumping screen from 33-45 ft BLS and install 20ft inflatable packer from 13-33ft BLS.

RW3A (16-46 ft BLS screen) - Isolate screen from 30-46 ft BLS and install 15 ft inflatable packer from 14-29 ft BLS

RW4B (50-80 ft BLS screen) - Isolate pumping screen from 60-80 ft BLS and install 10 ft inflatable packer from 49-59 ft BLS

RW5B (50-80 ft BLS screen) - Isolate pumping screen from 60-80 ft BLS and install 10 ft inflatable packer from 49-59 ft BLS

Proposed RW (50-80 ft BLS screen) - Isolate pumping screen from 60-80 ft BLS and install 10 ft inflatable packer from 49-59 ft BLS (may remove if needed).

Packer design was presented for the proposed packers. The packers will be constructed with a water-filled Viton B gland with sliding collar rated for 250 psig. The packers will be inflated to a target pressure of 140 psig based on vendor recommendations.

Team consensus reached on the following RW Optimizations: RW1A (no modifications to screen/pumping), RW1B (move pump intake to 74 ft BLS), RW2A (isolate well pumping screen from 33-45 ft BLS), RW2B (move pump intake to 73 ft BLS), RW3A (isolate screen from 30-46 ft BLS), RW3B (move pump intake to 65 ft BLS), RW4B (isolate pumping screen from 60 to 80 ft BLS and reduce flow rates from 4 to 2 gallons per minute (gpm)), RW5B (isolate pumping screen from 60 to 80 ft BLS and reduce flow rates from 5 to 3 gpm) and RW6B (reduce flow from 4 to 2 gpm).

Goal

Obtain team consensus on EE Step 4C, Part 1 (pumping optimization)

Decision Id	Decision
D9	Team consensus reached on the following RW Optimizations: RW1A (no modifications to screen/pumping), RW1B (move pump intake to 74 ft BLS), RW2A (isolate well pumping screen from 33-45 ft BLS), RW2B (move pump intake to 73 ft BLS), RW3A (isolate screen from 30-46 ft BLS), RW3B (move pump intake to 65 ft BLS), RW4B (isolate pumping screen from 60 to 80 ft BLS and reduce flow rates from 4 to 2 gallons per minute (gpm)), RW5B (isolate pumping screen from 60 to 80 ft BLS and reduce flow rates from 5 to 3 gpm) and RW6B (reduce flow from 4 to 2 gpm).

Topic

LC34 (CC054)

Discussion

The primary objective of this expansion is to hydraulically capture Hot Spot 3/4 within the zone with TCE greater than 300 g/L and the secondary objective is to increase mass removal.

Recovery well selection and location for the shallow zone expansion was based on Groundwater Vistas modeling. The original model used for the 2009 Interim Measures Design was utilized as a base model. Recovery wells were placed based on 1.) modeled capture behavior (via potentiometric surface and particle transport) as primary criteria for plume containment and 2.) magnitude of TCE concentrations identified during site investigations as secondary criteria for mass removal. Pumping rate scenarios were manipulated to determine and validate proposed pumping rates and well placement. All shallow zone wells were determined to provide capture and particle transport durations in line with reasonable site objectives.

Overview of the shallow zone expansion: addition of 6 recovery wells (15-45 ft BLS screen: RW09A through RW14A and 5-40 ft BLS screen: RW15A, sonic installation, identical construction and completion as existing shallow recovery wells (refer to IMD), 6 inch diameter stainless steel well construction, Grundfos 5S07-18 submersible pump (0.5 HP pollution recovery motor (4-wire, single-phase, 208V) and replace 0.75 HP motors in RW01A and RW03A with 0.5 HP (motors overheat at lower flows due to throttling/reduced motor cooling). Trenching network identical to IMD (dedicated 1 HDPE groundwater conveyance lines and 4-wire 10THHN pump wire in 1 PVC conduit). Electrical pull boxes every 250 feet and at conduit elbows and transition

Team reviewed interval maps (Figures 11 and 12 from LC34 EE Step1) for cDCE and VC data to determine if some of the proposed wells should be shallower (discussion based on comment from slide 12). Decision was made for the proposed recovery wells to screen 5 to 40 ft BLS on the western side of the site and 15 to 45 ft BLS elsewhere based on MIP observations and previous Hot Spot 3 investigation efforts.

As presented in Part 1 of the EE, one additional deep extraction well (RW16B) was proposed with a screen interval of 50 to 80 feet bls. Based on MIP observations the top 10 feet of the RW16B will be packered such that in the future pumping immediately below Layer 4 may be conducted based on future operations. Particle tracking and potentiometric surfaces were presented to illustrate the capture benefits as well as validate pumping rates proposed in Part 1 of the EE.

Overview of deep zone expansion: addition of 1 recovery well, sonic installation, identical construction and completion as existing deep recovery wells (refer to IMD), 6 inch diameter stainless steel well construction, screen set from 50-80 ft BLS, packer set from 49-59 ft BLS (screen and packer specified so that the bottom of Layer 4 can be extracted, if needed in the future), Grundfos 5S07-18 submersible pump (0.75 HP pollution recovery motor (4-wire, single-phase, 208V) and replace 0.75 HP motors in RW03B, RW04B, RW06B with 0.5 HP, motors overheat due to throttling/reduced groundwater motor cooling at lower flows), and trenching network identical to shallow description.

Based on the recovery well expansion and proposed pumping optimizations, the total influent entering the treatment system was estimated for a general estimate of influent conditions and to size expansion upgrade treatment equipment.

Modifications to the treatment system were presented in order to accommodate the additional flow rates. The existing air stripper is flow limited to a flow rate of near 42 gpm. When flows are in excess of 42 gpm occur, excessive moisture carry over and increased backpressure on the air stripper from tray flooding result in insufficient treatment efficiencies of the air stripper. Other variables associated with the expansion were also

presented. As a result of the optimization/expansion, the pumping rate will increase from 39 to 55 gpm. Based on the flow rates estimated and influent conditions, two scenarios were presented for primary groundwater treatment. The first option was to replace the existing air stripper to a QED EZ Tray 12.6 air stripper package rated for 120 GPM and 600 scfm. The second option presented included addition of a venture air stripper in series and prior to the existing air stripper to provided a staged treatment process. Based on team discussion, upgrade of the air stripper to a QED EZ Tray 12.6 air stripper package was selected.

The QED air stripper model was run for several flow and concentration conditions to verify performance and accommodate influent fluctuations/process modifications. For flow rates up to 80 gpm, treatment objectives can be achieved for influent stream with concentrations up to TCE: 50,000 g/l; cDCE: 25,000 g/l; VC: 10,000 g/l. For flow rates up to 65 gpm, treatment objectives can be achieved for influent stream with concentrations up to TCE: 100,000 g/l; cDCE: 50,000 g/l; VC: 20,000 g/l.

Summary system modification: add Pumptec pump contollers for each new pump, wire RW07B into spare pump control slot in control panel, add secondary shallow pump control panel H/O/A switch and cycle timers, wire expansion control panel into spare pump slot with H/O/A and PLC input, add manifold for 8 new extraction wells (typical of existing. Manifold will tie directly into existing manifold. Remove DNAPL separator, move EQ tank to DNAPL separator location, and upgrade air stripper.

Team consensus reached on treatment Modification Option A:
? re-plumb lines to and between manifolds and EQ tank,
? replace current air stripper with QED EZ Tray 12.6 air stripper package (rated for up to 120 gpm, 600 scfm, skid-mounted, including: 7.5 HP regenerative blower; 2 HP transfer pump, local control panel (tied into existing control panel for overall on/off/alarm functionality), 73 in (W) x 71 in (L) x 107 in (H) footprint, plus ~1(H) outlet connection. This will require secondary building enclosure or roof modification, due to footprint.

Team consensus reached for shallow zone expansion of 7 recovery wells at proposed locations and construction.

Team consensus reached for deep zone expansion of 1 recovery well at proposed location and construction.

Team consensus reached on proposed pumping rates: deep well optimization/packering implemented following meeting and shallow well optimization following HS3/4 expansion.

Team consensus reached system construction plans (existing IMD/IMWP used as typical construction details for expansion).

Goal

Obtain team consensus on EE Step 4C, Part 2 (pumping optimization and hot spot 3/4 expansion)

Decision Id	Decision
D10	Team consensus reached on treatment Modification Option A: ? re-plumb lines to and between manifolds and EQ tank, ? replace current air stripper with QED EZ Tray 12.6 air stripper package (rated for up to 120 gpm, 600 scfm, skid-mounted, including: 7.5 HP regenerative blower; 2 HP transfer pump, local control panel (tied into existing control panel for overall on/off/alarm functionality), 73 in (W) x 71 in (L) x 107 in (H) footprint, plus ~1?(H) outlet connection. This will require secondary building enclosure or roof modification, due to footprint. ? QED modeler run for several flow and concentration conditions to verify performance and accommodate influent fluctuations/process modifications. For flow rates up to 80 gpm, treatment objectives can be achieved for influent stream with concentrations up to TCE: 50,000 ?g/l; cDCE: 25,000 ?g/l; VC: 10,000 ?g/l. For flow rates up to 65 gpm, treatment objectives can be achieved for influent stream with concentrations up to TCE: 100,000 ?g/l; cDCE: 50,000 ?g/l; VC: 20,000 ? g/l.
D11	Team consensus reached for shallow zone expansion of 7 recovery wells at proposed locations and construction.
D12	Team consensus reached for deep zone expansion of 1 recovery well at proposed location and construction.
D13	Team consensus reached on proposed pumping rates: deep well optimization/packering implemented following meeting and shallow well optimization following HS3/4 expansion.
D14	Team consensus reached system construction plans (existing IMD/IMWP used as typical construction details for expansion).

Minute Id	Presenter	PRL SWMU
M6	Shelton, Matt	SUPPLY WAREHOUSE 3 (SWMU 088)

Topic

Supply Warehouse #3 (SWMU 088)

Discussion

System expansion conducted in accordance with the approved Site Plan and the SSSAHP. KSC Air Sparge Trailer #1 was used as well as existing piping. A tee was installed at manifold B to supply air to manifold C. 1.5 inch HDPE inside a 4 inch HDPE conduit was installed and horizontally drilled under the ditch south of 5th Street. MW0008 was abandoned and MW0027 and MW0028 were installed. 12 air sparge wells were installed. A soil boring identified no clay lens to 50 ft BLS. Galvanized steel lines were installed from manifold C to each air sparge well. Wells inside the fence were installed above ground and those outside the fence were installed below ground. Baseline monitoring well sampling was conducted December 2012. TCE results remained below NADC in all wells. The maximum TCE concentration was 25 g/L. Vinyl chloride concentration in MW0022, MW0024, MW0025, and MW0028 exceed NADC. Initial startup conducted 19 to 21 December 2012. Drainage swales along 5th Street bubbling. Pressure caused water overflow in MW0021, MW0022, MW0026. Balanced each zone separately for at least 12 hours. Design flow rate of 5 scfm could not be achieved due to high amp draw at the blower. System wells balanced at 4 scfm for Zones1 and 2. Flows are highest in the southwest corner of Zone 3. Damaged well heads in northern ARZ were repaired. Air monitoring was conducted per the HASP and there were no PID readings above background in the breathing zone. Vapor monitoring was conducted per the CMI FIP; baseline MW PID readings ranged from 0 to 5.9 ppm and operational MW PID readings range from 0 to 75.1 ppm. Deviations from work plan include top of screens were installed 26.73 to 27.26 ft MSL, ASW0063 was moved 3 ft to the north (well installed in original location rose above acceptable tolerance while removing rods, abandoned original location), ASW0057 and ASW0058 was moved 3 to 4 feet south due to utilities. ASW0061 was installed below grade and flow

M2	Jonnet, Mark	LAUNCH COMPLEX 34 (SWMU CC054)

Topic

LC34 (SWMU CC 054)

Discussion

Hot Spot 6 is designated as the area downgradient of Hot Spot 1 based on elevated concentrations in monitoring wells IW0057S and IW0057I. The goal of the investigation was to determine if any source was present and to delineate/refine Hot Spot and High Concentration Plume (HCP); any refinement of the Low Concentration Plume (LCP) should have been considered a benefit of investigation, not a goal. The ADP had not explained that LCP delineation was not a goal of this study, which accounts for a number of comments received regarding delineation. The preliminary investigation began during the Hot Spots 3 and 4 investigations in 2010 and 2011. Sampling depths were 8 ft, 13 ft, 18 ft, 25 ft, and 38 feet below land surface (ft BLS). Initial results indicated daughter products of trichloroethene (TCE) downgradient of Hot Spot 1 with very little TCE present. National Aeronautics and Space Administration (NASA) proceeded with investigation in 2014 to determine if any source was present beyond the Shallow Capture Zone (SCZ) of the hydraulic capture system. In addition to the initial sampling depths, the 32 ft depth was added to refine the vertical delineation. The sampling intervals are based on previous investigations at LC34, including soil cores, membrane interface probes (MIP), and hydraulic profiling tool (HPT). For example the 16 ft to 20 ft interval was based on elevated MIP responses. The 30 ft to 34 ft interval was added during the 2014 to 2016 sampling events based on previous results, where 23 ft to 27 ft had high detections when 36 ft to 40 ft results were much lower or below detection limits. The purpose for the 36 ft to 40 ft sample was to vertically refine delineation.

This presentation addressed the area with the investigation boundaries to the include the area south and east of the white dashed lines [see advanced data package (ADP) slide 3] and extent of the SCZ and Hot Spot 1. Hot Spot 6 delineation is based on results from 745 direct push technology (DPT) samples collected from 150 locations. Data set includes the 2010/2011 samples and 681 samples collected from 2014 to 2016. Due to the plume size, Kennedy Space Center Remediation Team (KSCRT) delineation rule of thumb is not tenable.

The 38 ft sample at DPT0368 had results for cis-1,2-dichloroethene (cDCE) and vinyl chloride (VC) which could be attributed to drag down; therefore, these results were not used in delineation efforts. The cDCE results at DPT0418 and DPT0444 in the 32 ft and 38 ft sample appear to be suspect, surrounding samples do not have similar results; therefore, these results were not used in delineation efforts. The 38 ft sample at DPT0405 had results for cDCE which could be attributed to drag down; therefore, these results were not used in delineation efforts. There was a discussion regarding whether drag down was the cause of the deeper detections, given site lithology. Tetra Tech plans to resample the 32' and 38' intervals at DPT0418 to confirm the earlier results.

TCE, cDCE, trans-1,2-dichloroethene (tDCE) and VC had results exceeding the Florida Department of Environmental Protection (FDEP) Groundwater Cleanup Target Levels (GCTLs). cDCE and VC had exceedances of the natural attenuation default concentrations (NADC) and ten times NADCs. Hot Spot and HCP extend to 34 ft BLS, with the exception of DPT0339 being the only locations with 38 ft sample greater than NADC.

The drainage canal appears to be influencing the plume. Wet and dry seasons likely influence hydraulic recharge and discharge. Drainage canal in the Hot Spot 6 area flows to the Cape Canaveral Air Force Station (CCAFS) industrial area (FT17 canal) and not towards the ocean. Florida

Department of Environmental Protection (FDEP) asked if Team has sampled surface water from this ditch. At this time, the Team has not, but it is believed that this canal has been sampled at some point in time by CCAFS program. Team will sample the surface water in the ditch.

Hot Spot 6 area of investigation plume has very little TCE (no TCE source) and is comprised of cDCE and VC to a depth of 40 ft BLS. Upgradient source is within and being treated by the hydraulic capture interim measure system. To date over 50,000 pounds of volatile organic compounds (VOC) have been destroyed. There is approximately 1500 lbs of cDCE and 430 lbs of VC in Hot Spot 6.

Team consensus reached to eliminate the Step 2 for Hot Spot 6, because the hot spot is a very good candidate for air sparging. The fact that the hot spot consists only of daughter products and its lithology, along with readily available infrastructure at LC34, support that path forward.

Suggestion was made to look into the potential of using this Hot Spot area for the 500,000 cubic yards (yd3) of sand needed for beach re-nourishment on NASA property to create a passive treatment basin, rather than an active air sparge system. FDEP says this is something that CCAFS will look at favorably. This would have some green benefits, but may be a long haul for transport. Mike took an action to look into this.

If the air sparge option goes forward, rather than the passive treatment basin, the interim measures workplan (IMWP) would present a phase 1 layout of potentially 70 to 140 air sparge wells. The path forward would be to bring the proposed layout and system detail to the Team as a Step 3 Engineering Evaluation.

Team consensus reached to collect at depth samples for VOCs at DPT418 (32 and 38 ft samples).

Team consensus reached to collect surface water samples in the ditch within Hot Spot 6.

Goal

Present Hot Spot 6 area of investigation for site characterization.

Decision Id	Decision
D2	Team consensus reached to eliminate the Step 2 for Hot Spot 6.
D3	Team consensus reached to collect at depth samples for VOCs at DPT418 (32 and 38 ft samples).
D4	Team consensus reached to collect surface water samples in the ditch within Hot Spot 6.

Minute Id	Presenter	PRL SWMU
M3	Kent, Ronald	CLAMSHELL 4 (PRL 191)

Topic

Clamshell #4 (PRL 191)

Discussion

Clamshell #4 is a 4.82-acre facility located to the east of the Shuttle Landing Facility along Kennedy Parkway North. It was constructed in 1999 for ground support equipment storage for the Space Shuttle Orbiter. Major features at the site include: Clamshell #4 (J6-2327), connex box (J6-2321) which has been removed from the site, and a stormwater pond. The results of the Solid Waste Management Unit Assessment (SWMU) and the Confirmation Sampling Work Plan, prepared by Innovative Health Applications, were presented to the NASA Remediation Team in May 2013 and documented in a report dated April 2014. Three locations of concern (LOC) were identified and a determination was made that there was no ecological habitat.

Confirmation sampling was conducted in October 2016.
Two soil borings:
? field screened to the water table with a photoionization detector
? two surface soil samples (0 to 0.5 ft BLS) were collected for fixed-base laboratory analysis: total recoverable petroleum hydrocarbons (TRPH), 13 Priority Pollutant Metals plus Barium, and semi-volatile organic compounds.
? Sampling locations identified by visual observation, global positioning system (GPS), and physical measurement from permanent features
5 DPT groundwater samples
? 6 to 10 ft BLS samples were analyzed by fixed-base laboratory for volatile organic compounds (VOC), low level polycyclic aromatic hydrocarbon and TRPH.
? 21 to 25 ft, 31 to 35 ft, and 41 to 45 ft BLS samples were analyzed by fixed-base laboratory for volatile organic compounds (VOC).

Results for all soil and groundwater samples were less than screening criteria at all LOCs.

Team consensus reached for no further action (NFA) for LOC 1, LOC 2, and LOC 3 for soil and groundwater. NFA for the entire potential release location (PRL).

NASA will add a cover letter to the confirmation sampling report to support a request to FDEP for NFA approval for the entire PRL.

Goal

Present confirmatory sampling results and obtain team consensus on path forward.

Decision Id	Decision
D5	Team consensus reached for no further action (NFA) for LOC 1, LOC 2, and LOC 3 for soil and groundwater. NFA for the entire potential release location (PRL).

Topic

Meeting Minutes and Miscellaneous Items

Discussion

Team consensus reached that revision 1 meeting minutes for the October 2018 Team meeting are final. Team members acknowledged and did not object to the fact that the meeting minutes may become public as part of a final report at a later date.

NASA has had some delays in getting report through Scientific and Technical Information/Document Availability Authorization (STI/DAA) approval. Most the delays stem from the patent office encountering pages in documents containing proprietary and confidential labels. In order to remedy this, the RPMs would like to request all reports that are currently being produced or will be produced in the future not contain the following terms: proprietary, confidential, business sensitive, limited rights, Small Business Innovation Research (SBIR) rights, or restricted rights. This pertains to all portions of our reports (text, analytical reports, emails, appendices, etc.). If for any reason you feel the use of one of the above terms in a report is warranted, please make the RPM aware when providing the draft version of the document for review. This is super critical. No tear sheets, items that could be considered copyrighted, etc. should be included in documents. These key words that need to be searched for. NASAs copy should have cut sheets, but FDEPs copy will not. When getting memo from lab to indicate lab reports can be reproduced include this memo in front of each lab report within the appendix.

Goal

M2		GENERAL SERVICES ADMINISTRATION RECLAMATION YARD (SWMU 010)

Topic

GSA Reclamation Yard (GSRY) Northeast Area (SWMU 010)

Discussion

The GSRY is used to facilitate the reuse, resale, and recycling of equipment and materials used by NASA. Dielectric fluid was apparently released from electrical equipment stored in the northeast corner of the facility. Polychlorinated biphenyl (PCB) and 1,2,4-thrichlorobenzene (TCB) dense non-aqueous phase liquid (DNAPL) and PCB-contaminated soil are present in the northeast area. DNAPL and contaminated soil are the source of the dissolved PCB and chlorinated benzene compound groundwater contamination.

The Interim Measures Work Plan (IMWP) received regulatory approval from Florida Department of Environmental Protection (FDEP) in July 2017 and from United States Environmental Protection (EPA) in January 2018. The IM objective is to reduce PCB concentrations in unsaturated soil in the northeast area to meet the Florida Soil Cleanup Target Level (SCTL) of 0.5 parts per million (ppm) and to remove the contaminant mass in excess of 1 ppm PCBs in saturated soils to accelerate groundwater cleanup.

NASA expedited the soil excavation with a large diameter auger (LDA)/caisson IM to remove contamination prior to the area being disturbed by a near-term water line replacement project.

Site preparation included the removal of a modular office and associated transformer as well as a shed in the Corrosion Control Yard. Nineteen wells were abandoned within the excavation area. Temporary fencing and erosion and stormwater controls were installed. Removal of north-south electric line and parking area lights from parking lot. Survey monuments were established.

Caisson and conventional excavation were conducted from January to October 2018. Conventional excavation was typically conducted from 0 to

internal, and north-northeast area with elevated VOCs.
In summary:
48 wells sampled with PDBs in October 2018
Monitor elevated concentration area identified north-northeast of Hot Spot 1.
Monitor the horizontal and vertical downgradient periphery and internal downgradient VOC impacts.
Evaluate groundwater gradient and flow direction.

? Nine monitoring wells installed within and near the Hot Spot 1 LDA treatment area in December 2016:
? MW0140, MW0141 and MW0145 through MW0148 installed within Hot Spot 1 treated area.
? MW0142 through MW0144 installed in the untreated area in Hot Spot 1.
? 5 newly installed delineation wells and 2 replacement wells installed in December 2017.

Peripheral wells generally delineate plume to GCTLs, exceptions:
? 15 to 30 ft BLS: East (MW0129) TCE, cDCE, and VC greater than GCTL.
? 23 to 35 ft BLS: Northwest (MW0088, MW0090) and west (MW0097) VC greater than GCTL in MW0129 and MW0152.
Interior downgradient well VOC concentrations generally fluctuate within historic ranges.
MW0152 and MW0129 are upgradient of the elevated concentration area characterized during 2017 DPT investigation near MW0062; recent concentrations are generally decreasing at MW0152 and MW0129.
Vertical extent of VOCs:
? Central vertical extent wells exceed the NADC for VC (MW0130) and GCTL for cDCE (MW0078 and MW0130). Concentrations generally decreasing in MW0130 and MW0078 since 2015 and 2014, respectively.
? Recommend installation of vertical extent well in central (Hot Spot 2) portion of the site when remediation is complete.
Dissolved plume footprint appears generally stable and delineated by monitoring well data.
2018 LTM results generally support the existing Conceptual Site Model.

The proposed 2019 LTM sampling for VOCs focuses on sample locations on the downgradient periphery, downgradient internal, and north-northeast area with inconsistent elevated VOCs. 2019 LTM sampling will remove six monitoring wells because two consecutive clean results and not delineating periphery (NPSH-MW0036, MW0087, MW0106, MW0148, MW0150, and MW0151). Goals of the 2018 LTM:
? Monitor elevated concentration area identified during 2017 DPT investigation north-northeast of Hot Spot 1.
? Monitor the horizontal and vertical downgradient periphery and internal downgradient VOC impacts.
? Provide periphery of NADC and GCTL plumes in the north-northwest and north-northeast.
? Evaluate groundwater gradient and flow direction.

Deep wells have increasing contaminant trend. There is an approved workplan to do an IM. After LDA IM, do DPT below and install wells based on DPT work. Wells will be abandoned in the area of this IM prior to IM implementation.

Team consensus reached on annual monitoring for VOCs via PDBs and collection of water level measurements from the following wells: NPSH-MW0027, MW0064, MW0074, MW0091, MW0095, MW0152, MW0154, MW0089, MW0096, MW0109, MW0116, MW0125, MW0129, MW0142, MW0149, MW0153, NPSH-MW0010, NPSH-MW0017, NPSH-MW0019, NPSH-MW0020, NPSH-MW0022, MW0062, MW0065, MW0080, MW0088, MW0090, MW0097, MW0111, MW0140, MW0143, MW0146, MW0155, NPSH-MW0039, MW0046D, MW0068, MW0118, MW0141, MW0144, MW0145, MW0147,MW0078, and MW0130.

Team consensus reached for removal of the following wells from the 2019 LTM due to achieving two consecutive clean results and are not delineating periphery: NPSH-MW0036, MW0087, MW0106, MW0148, MW0150, and MW0151.

Team consensus reached to install well at DPT location with concentration greater than 2,000 g/L of TCE in the area of NPSH-MW0036 and add this location to the LTM program.

Goal

Present 2018 Annual LTM and obtain Team consensus on path forward.

Decision Id	Decision
D41	Team consensus reached on annual monitoring for VOCs via PDBs and collection of water level measurements from the following wells: NPSH-MW0027, MW0064, MW0074, MW0091, MW0095, MW0152, MW0154, MW0089, MW0096, MW0109, MW0116, MW0125, MW0129, MW0142, MW0149, MW0153, NPSH-MW0010, NPSH-MW0017, NPSH-MW0019, NPSH-MW0020, NPSH-MW0022, MW0062, MW0065, MW0080, MW0088, MW0090, MW0097, MW0111, MW0140, MW0143, MW0146, MW0155, NPSH-MW0039, MW0046D, MW0068, MW0118, MW0141, MW0144, MW0145, MW0147,MW0078, and MW0130.
D42	Team consensus reached for removal of the following wells from the 2019 LTM due to achieving two consecutive clean results and are not delineating periphery: NPSH-MW0036, MW0087, MW0106, MW0148, MW0150, and MW0151.
D43	Team consensus reached to install well at DPT location with concentration greater than 2,000 ?g/L of TCE in the area of NPSH-MW0036 and add this location to the LTM program.

Minute Id	Presenter	PRL SWMU
M10	Neumann, Chris	LAUNCH COMPLEX 34 (SWMU CC054)

Topic

Launch Complex 34 (SWMU CC054)

Discussion

Previous IM conducted in 2000 to excavate soil with PCBs greater than FDEP ISCTL from three areas. Soil re-assessment sampling conducted from 2014 to 2018. Goal of re-assessment was to confirm the presence or absence of PCBs, TRPH, and/or dioxins/furans and delineate contamination to FDEP RSCTLs at 9 LOCs (8 LOCs not previously investigated, and 1 LOC previously delineated to Industrial SCTL. Team consensus was reached on 20 excavation areas presented in March 2018 IMWP.

The IM objective was to excavate contaminated soil with PCBs, TRPH, and/or dioxins/furans (TCDD TEQ) at concentrations greater than RSCTLs from 20 areas and dispose of off-site (total volume of 1,622 cubic yards, total area 1.48 acres).

IM Overview
? 2,328.1 tons of soil (77 truckloads) were sent to OMNI Landfill. Each truck was inspected before site exist; manifested, inspected and weighed at landfill.
? 52 truckloads of backfill, 32 truckloads of topsoil placed.
? Restoration/demobilization activities were conducted 10 to 14 September 2018. Applicable areas were hydroseeded and watered and equipment removed from site.

Deviations from IMWP
? Area 1 was hand excavated around tight areas rather than using vacuum truck.
? At Area 13, a track machine was needed in some portions of area due to flat tire on wheel loader from rebar.
? Area 14, the elevator pit, had a planned excavation of 5ft. Soil was actually excavated to 2 feet due to encountering metal debris below that depth. There was a minimal amount of soil below 2 ft.
? Area 20 had vehicular access issues due to soft sand.

Team consensus reached for NFA for 20 areas excavated in this IM.

Further investigation into Electrical Substation T-2 (LOC 2) is ongoing due to PCB concentrations greater than 50 milligram per kilogram (mg/kg) and cleanup will be conducted as a separate IM.

Goal

Present soil excavation interim measures and obtain Team consensus on path forward.

Decision Id	Decision
D44	Team consensus reached for NFA for 20 areas excavated in this IM.

Minute Id	Presenter	PRL SWMU
M11	Neumann, Chris	RADAR WIND PROFILER SITE D (PRL 194)

Topic

Radar Wind Profiler Site (RWPS) (PRL 194)

Discussion

RWPS is used for remotely operated camera and video coverage of launches from KSC and CCAFS (located southeast of LC39A along the coastline). SWMU Assessment conducted 2010 to 2011 identified 5 LOCs. Confirmation sampling was conducted in November 2017 and March 2018. PCBs were detected at LOC 2 (electrical load break switch 310) greater than R-SCTLs and LOC 3 (electrical substation 1161) greater than I-SCTL. Team consensus was reached on IM for soil excavations at LOCs 2 and 3 (meeting minute 1805-M07, decision 1805-D21).

Excavation was performed on 18 September 2018. Six tons of affected soil was disposed of and staged at East Crawler Park Site rather than on-site due to limited volume. Backfilled with topsoil that had been sampled to ensure it met FDEP criteria for backfill. Site restoration conducted on 17 October 2018 (sod placed after backfilling and grading).

NASA will submit a SRCO.

Team consensus reached for NFA for soil at RWPS.

Goal

Present soil excavation interim measure and obtain Team consensus for NFA.

Decision Id	Decision
D45	Team consensus reached for NFA for soil at RWPS.

Minute Id	Presenter	PRL SWMU
M12	Murphy, Alex	PAINT AND OIL LOCKER (SWMU 067)

Topic

Paint and Oil Locker (POL) (SWMU 067)

Discussion

POL air sparge system operations report for period from February 2018 to March 2018. System was shutdown permanently 23 March 2018.

POL Groundwater Monitoring Results:
Samples were collected from 1 monitoring well in March 2018 and 13 monitoring wells in May 2018 and October 2018. TCE was greater than GCTLs in 7 wells and have been less than NADC since baseline sampling except at MW0034S. VC was less than GCTL in all wells except MW0026S and MW0034S in May 2018. All other VOC concentrations remain less than the GCTLs.

TCE and VC concentrations remain less than NADCs in all wells except MW0034S.
? TCE concentrations were observed to be increasing throughout 2018 (340, 1,000, and 3,300 g/L in March, May, and October 2018, respectively).
? TCE concentration in October 2018 (3,300 g/L) is the highest it has been since November 2017 (4,100 g/L)
Monitoring wells MW009SI, MW009I, MW0021S, MW0029S, MW0031S, and MW0031I remain below the GCTLs.

Is it worth excavating at POL near MW0034S as the soil investigation highest results were shallow? NASA suggested considering excavation and will discuss internally.

What is the big picture for the entire site? Not moving toward NFA at the site; therefore, PARM may not be the appropriate path forward. Source area was sampled around building where drums were stored. Now that the building has been demolished.

Discussion
An extensive site history was presented. The objective of the Hot Spot 5 Site characterization is to delineate horizontal and vertical extent of ten times Natural Attenuation Default Concentrations (NADC) as well as to determine dissolved plume conditions along Phillips Parkway. The area south of Phillips Parkway is beyond the geographic area of the permit the Cape Canaveral Air Force Station has issued to the National Aeronautics and Space Administration (NASA). Due to the hot spot size, Kennedy Space Center Remediation Team (KSCRT) delineation rules of thumb are not tenable. Refinement within Hot Spot 5 will be coupled with future Interim Measures (IM). Dataset includes 953 samples from 200 locations collected via direct push technology (DPT) in 2010, 2011, and 2015 to 2019. Data evaluation intervals: 0-10 ft, 10-15 ft, 15-20 ft, 20-28 ft, 28-34 ft, and greater than 34 ft BLS. Trichloroethene (TCE), cis-1,2-dichloroethene (cDCE), trans-dichloroethene (tDCE), and vinyl chloride (VC) are greater than Groundwater Cleanup Target Levels (GCTL). All tDCE results greater than GCTLs coincide with cDCE results greater than GCTLs; therefore, tDCE is not discussed independently. cDCE and VC exceeded NADCs and ten times NADC. Hot Spot and High Concentration Plume extends to 34 ft BLS with the exception of DPT0712 being the only locations with a 38 ft BLS sample greater than NADC. No other compounds exceeded GCTLs in this area based on Biennial Site-wide Long Term Monitoring (LTM). Freon was analyzed in 440 samples; all results were below detection limits. Hot Spot 5 Area of Investigation plume has very little TCE and is comprised of cDCE and VC exceeding NADCs to a depth of 34 ft BLS, with the exception of DPT0712 760 micrograms per liter (g/L) in Hot Spot 5/7 area. Cross-sections were generated for cDCE and VC to demonstrate vertical extents of Hot Spot and High Concentration Plume with the exception of DPTs 281, 290, 293, and 297 shown on D-D. Note these samples are adjacent to the Hydraulic Capture System Shallow Capture Zone. Hot Spot 5 boundary is west of the upgradient source and adjacent to the Shallow Capture Zone of the Hydraulic Capture IM system, to date over 65,000 pounds of volatile organic compounds (VOC) have been destroyed. Hot Spot 5 is 23.5 acres with isolated area around DPT0723 VC at 1,300 g/L. Team consensus reached that Hot Spot 5 is adequately horizontally and vertically delineated. There are approximately 1,600 total pounds of mass, 1,205 and 374 pounds of cDCE and VC, respectively. The upgradient source for Hot Spot 5 is being treated by Hydraulic Capture IM. Hot Spot 5 is above Layer 4 in sandy units. Hot Spot 5 is a prime candidate for air sparging based on success of the LC34 Hot Spot 6, 516S, Converter Compressor Building, and Fluid Servicing Road Area IMs. The objective of the Hot Spot 5 IM is to remediate contaminated groundwater within treatment zone to support transition to Monitored Natural Attenuation (MNA) and prevent additional contaminant migration beyond Phillips Parkway. Team consensus reached to implement the Hot Spot 5 barrier wall north of Phillips Parkway. Team suggested adding additional barrier walls closer to the source zone as permanent cleared paths already exist. Will not implement other proposed air sparge well installation outside of the barrier wall. Suggestion was also made to consider horizontal air sparge wells.
Goal
Present Hot Spot 5 Site characterization.

Decision Id	Decision
D70	Team consensus reached that Hot Spot 5 is adequately horizontally and vertically delineated.
D71	Team consensus reached to implement the Hot Spot 5 barrier wall north of Phillips Parkway.

M13	Jonnet, Mark	LAUNCH COMPLEX 34 (SWMU CC054)

Topic
Launch Complex (LC) 34 SWMU #CC054 TSCA Interim Measure Work Plan
Discussion
Site-wide polychlorinated biphenyl (PCB), total recoverable petroleum hydrocarbons (TRPH), and dioxin/furan contamination in soil from former electrical substations and paint releases has been addressed except for one area. LOC 2 Toxic Substances Control Act (TSCA) - Electrical Substation T-2 located on southern edge of launch pad. Western transformer bay installed in 1960, eastern transformer bay added sometime between 1963-1968. The date of electrical equipment removal is unknown. Remaining site features include: ? transformer bays with concrete floors, divider walls, and a back wall adjacent to the launch pad ? concrete support wall for the former cable tray that runs from pad to blockhouse

? two concrete electrical/communication utility manhole vaults with steel lids adjacent to the cable tray wall

A site history of soil investigations at the site was presented.

Soil reassessment results identified PCB concentrations equal to or exceeding 50 milligram per kilogram (mg/kg). Assessment objectives adjusted to delineate to PCB Bulk Remediation Waste Cleanup Level for High Occupancy, Unrestricted Use (1.0 mg/kg) per Kennedy Space Center PCB Generic Work Plan. Interim Measures objective is to remove all soil exceeding 1.0 mg/kg that is accessible without altering the transformer bays and cable wall based on the National Historic Landmark status. Land Use Controls will be implemented to address contamination left in place.

In 2014 soil reassessment, two soil samples collected for PCBs in front of transformer bays:
? SB0005 result of 6,050 mg/kg exceeded TSCA level,
? SB0006 result of 9.6 mg/kg exceeded Florida Industrial (I-) Soil Cleanup Target Level (SCTL)
? SB0107 collected to delineate SB0005 and the result of 20,900 mg/kg exceeded TSCA level.

May 2018 to May 2019, a total of 533 additional soil samples (including hold samples) collected from 151 locations to delineate PCBs. Samples were collected on a 10-ft grid. All PCB samples were extracted using Method 3540C (Soxhlet extraction). Delineation achieved to the PCB Bulk Remediation Waste Cleanup Level for High Occupancy, Unrestricted Use (1.0 mg/kg) per PCB Generic Work Plan.

Team consensus reached for Interim Measure (IM) delineation boundary at 0 to 0.5 ft BLS, for the areas shown in the June 2019 advance data package (ADP) with concentrations greater than or equal to 50 mg/kg and greater than or equal to 500 mg/kg.

Team consensus reached for IM delineation boundary at 0.5 to 2.0 ft BLS, for the areas shown in the June 2019 ADP with concentrations greater than or equal to 50 mg/kg and greater than or equal to 500 mg/kg.

Team consensus reached for IM delineation boundary at 2.0 to 3.0 ft BLS, for the areas shown in the June 2019 ADP with concentrations greater than or equal to 1.0 mg/kg and greater than equal to 50 mg/kg.

Team consensus reached for IM delineation boundary at 3.0 to 4.0 ft BLS, for the areas shown in the June 2019 ADP with concentrations greater than or equal to 50 mg/kg and greater than or equal to 500 mg/kg.

Team consensus reached for IM delineation boundary at 4.0 to 5.0 ft BLS, for the areas shown in the June 2019 ADP with concentrations greater than or equal to 1.0 mg/kg.

Team consensus reached for IM delineation boundary at 5.0 to 6.0 ft BLS, for the areas shown in the June 2019 ADP with concentrations greater than or equal to 1.0 mg/kg.

Team consensus reached on delineation of the 6.0 to 7.0 ft BLS to 1.0 mg/kg.

Team consensus reached on total petroleum hydrocarbon (TPH) delineation has been achieved and is within the PCB contaminant footprint and will be removed. Additionally, because TPH fractions were below their SCTLs, the TPH in soil is not a human health risk.

Dioxins/furans in Soil:
Soil samples SB005 and SB006 collected from edge of concrete at the transformer bays analyzed for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) toxicity equivalent (TEQ), both results exceeded R- and I-SCTLs. Sixteen additional samples collected from perimeter of PCB footprint. Highest concentration at site was 19,300 pg/kg at SB0005 from 0 to 0.5 ft BLS (exceeded R-, I-, and Leachability SCTL). Samples along cable tray wall (SB0471, SB0485, SB0507) and one perimeter sample along south boundary (SB0579) exceeded SCTL. Vertical delineation sample collected at SB0471 the highest detection along the cable tray wall, results less than SCTL. Soil sampling on the western side of the wall not conducted, concrete walkway occupies the 0 to 0.5 ft BLS interval. SB0579 was re-collected and results were less than SCTLs.

Team consensus reached that dioxin/furan contamination is within the PCB contaminant footprint and will be removed.

Concrete:
Electrical equipment has been removed; therefore, there is no continuing contaminant source. The dimensions of the floor of both bays is approximately 48 ft by 30 ft and 8 inches thick. Concrete walls are 12 inches thick.
Twenty-five concrete samples (0-0.5 inches) collected from the floor of the transformer bays and concrete support wall corresponding to soil ground surface to 0.5 ft BLS interval.
? 18 concrete samples exceed 1.0 mg/kg
? 10 concrete samples also exceed 50 mg/kg
? Three samples were over 16,000 mg/kg.
  Highest detection was 27,000 mg/kg at CO0024
  Highest soil concentration beneath the floor was 83 mg/kg (SB0567, 4.0 ft BLS).
Further sampling not warranted to preserve integrity of concrete.
Because of LC34s, National Historic Landmark (NHL) status, minimal disturbance to site features is a priority; therefore, removing the concrete transformer bays is not recommended.

IM Approach for Concrete:
Remove and properly dispose of concrete along the southern edge of the transformer bays shown on Concrete Sampling Overview slide and excavate and dispose soil beneath removed concrete
  Leave contaminated concrete and soils beneath in place in accordance with 40 CFR 761.61(c) Risk Based Disposal Approval
  NASA proposes to leave the concrete slab in place and soils beneath it following the protocol outlined in 761.30(p), with the following modifications:
? Although it is unlikely any residual oils remain on the concrete surface, propose double wash rinse of concrete surface in accordance with Subpart S 761.375, to clean oil, dust and debris from surface.
? In lieu of encapsulation, enclose the area with a fence to prevent exposure of any receptors in this low occupancy area of the site.
? Affix ML Mark on back wall or on fence in accordance with 761.40
? Incorporate PCB soil/concrete contamination exceeding 0.5 mg/kg and fence into sites existing Land Use Control Implementation Plan.

Team consensus reached to leave PCB-contaminated concrete in place in accordance with the EPAs Risk Based Approval scenario.

LOC 2 Groundwater:
Five monitoring wells were installed and analyzed for PCBs, TRPH, dioxins/furans and chlorobenzenes. PCBs, TRPH, and dioxins/furans were

analyzed based on soil L-SCTL exceedances. Chlorobenzenes were analyzed based on historic use as a PCB diluent in dielectric fluid. PCBs exceed GCTL of 0.5 g/L in IW0122 and IW0148, but are below NADC of 50 g/L. Dioxins/furans were less than GCTL of 0.00003 g/L. TRPH and Chlorobenzenes were less than GCTLs.

Team consensus reached to install three wells (including an upgradient well and a side gradient well) to complete the groundwater delineation.

Team consensus reached that because IW0122 and IW0148 are in the 6 foot excavation screened intervals they will be compromised during excavation; therefore, both wells will be sampled and analyzed for PCBs prior to excavation and abandoned during excavation activities. Following the excavation, install a well at the monitoring well location with the highest detection and include in biennial LTM program.

Team consensus reached on proposed excavation Areas 1 to 6 for excavation depth to 0.5 ft BLS as presented in the June 2019 ADP.

Team consensus reached on proposed excavation Areas 7 to 11 for excavation depth 2.0 ft BLS as presented in the June 2019 ADP.

Team consensus reached on proposed excavation Areas 12 to 14 for excavation depth 3.0 ft BLS as presented in the June 2019 ADP.

Team consensus reached on proposed excavation Areas 15 to 18 for excavation depth 4.0 ft BLS as presented in the June 2019 ADP.

Team consensus reached on proposed excavation Area 19 for excavation depth 5.0 ft BLS as presented in the June 2019 ADP.

Team consensus reached on proposed excavation Area 20 for excavation depth 6.0 ft BLS as presented in the June 2019 ADP.

Team consensus reached on IM approach to remove 342 cubic yards of soil impacted with PCBs, TRPH, dioxins/furans.

Team consensus reached on IM approach to remove a portion of the concrete transformer bay slab and leave the remaining concrete in place, along with PCB soil impacts underneath the slab, under the EPAs risk based approval scenario.

Team consensus reached on IM approach to include PCB sampling prior to excavation to determine if well installation after excavation is required and incorporated into the biennial LTM program.

Team consensus reached to include residual PCB-impacted soil, concrete and groundwater and the fence into the sites existing LUCIP.

Goal

Present TSCA IM WP and obtain Team consensus on path forward.

Decision Id	Decision
D72	Team consensus reached for Interim Measure (IM) delineation boundary at 0 to 0.5 ft BLS, for the areas shown in the June 2019 advanced data package (ADP) with concentrations greater than or equal to 50 mg/kg and greater than equal to 500 mg/kg.
D73	Team consensus reached for IM delineation boundary at 0.5 to 2.0 ft BLS, for the areas shown in the June 2019 ADP with concentrations greater than or equal to 50 mg/kg and greater than equal to 500 mg/kg.
D74	Team consensus reached for IM delineation boundary at 2.0 to 3.0 ft BLS, for the areas shown in the June 2019 ADP with concentrations greater than or equal to 1.0 mg/kg and greater than equal to 50 mg/kg.
D75	Team consensus reached for IM delineation boundary at 3.0 to 4.0 ft BLS, for the areas shown in the June 2019 ADP with concentrations greater than or equal to 50 mg/kg and greater than equal to 500 mg/kg.
D76	Team consensus reached for IM delineation boundary at 4.0 to 5.0 ft BLS, for the areas shown in the June 2019 ADP with concentrations greater than or equal to 1.0 mg/kg.
D77	Team consensus reached for IM delineation boundary at 5.0 to 6.0 ft BLS, for the areas shown in the June 2019 ADP with concentrations greater than or equal to 1.0 mg/kg.
D78	Team consensus reached on delineation of the 6.0 to 7.0 ft BLS to 1.0 mg/kg.
D79	Team consensus reached on total petroleum hydrocarbon (TRPH) delineation has been achieved and is within the PCB contaminant footprint and will be removed, additionally, because TRPH fractions were below SCTLs, the TRPH in soil is not a human health risk.
D80	Team consensus reached that dioxin/furan contamination is within the PCB contaminant footprint and will be removed.
D81	Team consensus reached that dioxin/furan contamination is within the PCB contaminant footprint and will be removed.
D82	Team consensus reached to install three wells (an upgradient well and a side gradient well) to complete the groundwater delineation.
D83	Team consensus reached that because IW0122 and IW0148 are in the 6 foot excavation screened intervals will be compromised during excavation; therefore, both wells will be sampled and analyzed for PCBs prior to excavation and abandoned during excavation activities and install a well at the monitoring well location with the highest detection following the excavation and include in biennial LTM program.
D84	Team consensus reached on proposed excavation Areas 1 to 6 for excavation depth to 0.5 ft BLS as presented in the June 2019 ADP.
D85	Team consensus reached on proposed excavation Areas 7 to 11 for excavation depth 2.0 ft BLS as presented in the June 2019 ADP.
D86	Team consensus reached on proposed excavation Areas 12 to 14 for excavation depth 3.0 ft BLS as presented in the June 2019 ADP.
D87	Team consensus reached on proposed excavation Areas 15 to 18 for excavation depth 4.0 ft BLS

	as presented in the June 2019 ADP.
D88	Team consensus reached on proposed excavation Area 19 for excavation depth 5.0 ft BLS as presented in the June 2019 ADP.
D89	Team consensus reached on proposed excavation Area 20 for excavation depth 6.0 ft BLS as presented in the June 2019 ADP.
D90	Team consensus reached on IM approach to remove 342 cubic yards of soil impacted with PCBs, TRPH, dioxins/furans.
D91	Team consensus reached on IM approach to remove a portion of the concrete transformer bay slab and leave the remaining concrete in place, along with PCB soil impacts underneath the slab, under the EPA?s risk based approval scenario.
D92	Team consensus reached on IM approach to include PCB sampling prior to excavation to determine if well installation after excavation is required and incorporated into the biennial LTM program.
D93	Team consensus reached to include residual PCB impacted soil, concrete and groundwater and the fence into the site?s existing LUCIP.

1906-M01	Team	Meeting Minutes and Miscellaneous Items Team consensus was reached that Revision 0 of the meeting minutes for the August 2019 Team meeting are final (**1910-D01**). Team members acknowledged and did not object to the fact that the meeting minutes may become public as part of a final report at a later date. Open action items were reviewed by the Team. The following action items were closed: 1906-A01 (NASA) - Per FDEP correspondence letter (dated March 22, 2019) RPM Ryan O'Meara will provide a site history of the Visitor Center Maintenance Area (SWMU 099) at a future team meeting. This action is closed, as NASA provided FDEP with a briefing on this site during an internal meeting on 10/2/19. Based on that meeting, NASA will be submitting Site Rehabilitation Completion Order (SRCO) documentation using applicable alternate cleanup target levels for isopropylbenzene in groundwater and PAHs in soil. 1908-A02 (FDEP) - FDEP will check with their records department to add language that requires the preferred submission method of a report cover page with the CD only for report submittals moving forward. This action is closed, as FDEP has no concerns with only receiving electronic files of document submissions (CD only with cover page) since KSC does not have any legal requirements for hardcopy document submissions. **Result**: Decision item **1906-D01**

Tetra Tech

Goal: Present DNAPL Source Zone Site Characterization Engineering Evaluation results and obtain team consensus that TCE groundwater contamination is delineated horizontally and vertically to 300 µg/L, and on the proposed remedial technologies moving forward in a Remedial Alternatives Evaluation (RAE) for the DSZ where TCE exceeds 3,000 ug/L.

Discussion: The objective of the dense non-aqueous phase liquid (DNAPL) Source Zone (DSZ) Site Characterization at Launch Complex 34 (LC34) was to delineate trichloroethene (TCE) to 300 micrograms per liter (µg/L). Field efforts were conducted from May 2018 to July 2019 and included the collection of multi-increment groundwater samples using Direct Push Technology (DPT), extraction of five soil cores to 80 feet (ft) below land surface (bls), installation of six monitoring wells (MWs) in Layer 8 for vertical delineation, installation of one recovery well (RW) in Layer 7, and aquifer testing of the new RW with two additional MWs installed to support aquifer testing.

Summary of Site Overview, History, Description and Geology:

The DSZ was first identified in the 1990s where the former Engineering Support Building (ESB) was located. Several test cells were completed from 1999-2003 to evaluate different remedial technologies, including Chemical Oxidation (ISCO), Six-Phase Heating (SPH), Steam Injection, Emulsified zero-valent iron (EZVI) and Bioaugmentation. These treatments were completed to a depth of approximately 43 ft bls. A Corrective Measures Study (CMS) was completed in 2007. The DSZ was based on a solids model developed where TCE was greater than or equal to 300 milligrams per kilogram (mg/kg), which included a 2-acre area to 75 ft bls. The recommended corrective measure alternative included a Land Use Control Implementation Plan (LUCIP) for groundwater use, Hydraulic Containment System (HCS) for the DSZ, monitored natural attenuation (MNA) with interim measures (IMs) in the high concentration plume (HCP), and MNA in the low concentration plume (LCP). LC34 is still in the CMS phase because there is no approval letter for the CMS; therefore, the HCS is considered an IM.

A briefing provided at the Battelle Conference in 2008 entitled "Remediation Costing and Interim Measure Selection for LC34"

included “time-to-cleanup” modeling scenarios, as well as costs for different remedial technologies. Cleanup timeframes to reach maximum contaminant levels (MCLs) ranged from over 900 years (no action) to 250 years (99% DNAPL source removal and dissolved plume control). This evaluation posed an important question: How much money do you spend to reduce the cleanup timeframe from “very long” to “long” on a barrier island with no exposure pathway?

Total net present value (NPV) costs for DSZ treatment technologies (first year cost + total operations, maintenance, and monitoring [OM&M] NPV) ranged from $4M for hydraulic containment to $55-$75M for large diameter auger (LDA)/Steam/Iron to 55 ft bls, and Enhanced Bioremediation from 55-85 ft bls. Considering NASA’s annual budget for environmental remediation and the question raised above, hydraulic containment was selected as the DSZ IM.

The current LC34 plume covers 327 acres (LCP), 162 acres (HCP), 63 acres (Hot Spots [HS]), and 11 acres (10x Hot Spots). The HCS began operation in 2009 and is still operating. The system includes 10 shallow RWs (15 to 45 ft bls), 7 deep RWs (50 to 80 ft bls), 12 deep injection wells, infiltration gallery, and air stripping units with catalytic oxidizer for treatment. To date, 205 million gallons of groundwater have been processed and 67,000 pounds of volatile organic compounds (VOCs) have been destroyed. In 2016, data collected from performance MWs in the DSZ did not appear to reflect concentrations in RWs. Subsequent DPT sampling identified results orders of magnitude higher than MW results. Additional DPT sampling identified DNAPL near the northern DSZ boundary, which led to this DSZ re-characterization effort.

Due to DSZ size, DPT spacing recommendations outlined in NASA’s Decision Process Document (DPD) for site characterization were not tenable. The recommended sampling spacing would have resulted in 792 DPT locations, which could have potentially taken up to 1.5 years to complete (assuming 1.5 DPT locations per day). In the interest of time and funding, an alternative sampling strategy was developed to support following the RAE Source Area Alternatives: LDA with Steam, Thermal Treatment, and Pump and Treat with amendment addition. This resulted in 89 DPT locations, with samples collected at 5 ft intervals from 8 to 98 ft bls from May 2018 through March 2019. A total of 1,196 samples were collected and

analyzed for Freon, TCE, dichloroethene (DCE), and vinyl chloride (VC). DNAPL was observed at seven locations.

Summary of TCE Site Characterization:

TCE results were presented for each DPT interval showing horizontal and vertical delineation to 300 µ/L at each interval:

Team consensus reached on delineation of the 8 ft bls interval (Layer1): TCE does not exceed 300 µ/L. **(1910-D02)**

Team consensus reached on delineation of the 13 ft bls interval (Layer 1): TCE does not exceed 300 µ/L. **(1910-D03)**

Team consensus reached on delineation of the 18 ft bls interval (Layer 1): TCE is adequately delineated horizontally to 300 µ/L. **(1910-D04)**

Team consensus reached on delineation of the 23 ft bls interval (Layer 1): TCE is adequately delineated horizontally to 300 µ/L. However, a suggestion was made to consider future additional groundwater assessment at this and at all depth intervals as needed based on FDEP concerns that the 300 µg/L TCE may not be fully delineated at all intervals based on lithology, horizontal sampling spacing, and vertical sampling spacing. **(1910-D05)**

Team consensus reached on delineation of the 28 ft bls interval (Layer 2): TCE is adequately delineated horizontally to 300 µ/L; however, there is a data gap at DPT612 which should be identified moving forward for the RAE. **(1910-D06)**

Team consensus reached on delineation of the 33 ft bls interval (Layer 3): TCE is adequately delineated horizontally to 300µ/L; however, there is a data gap at DPT658. **(1910-D07)**

Team consensus reached on delineation of the 38 ft bls (Layer 3): TCE is adequately delineated horizontally to 300 µ/L. **(1910-D08)**
Team consensus reached on delineation of the 43 ft bls interval (Layer 3/4): TCE is adequately delineated horizontally to 300 µ/L. **(1910-D09)**

Team consensus reached on delineation of the 48 ft bls (Layer 4/5): TCE is adequately delineated horizontally to 300 µ/L. **(1910-D10)** Team consensus reached on delineation of the 53 ft bls interval (Layer 5): TCE is adequately delineated horizontally to 300 µ/L. **(1910-D11)**

Team consensus reached on delineation of the 58 ft bls interval (Layer 5): TCE is adequately delineated horizontally to 300 µ/L; however, there are data gaps at DPT612 and DPT660 at this interval. **(1910-D12)**

Team consensus reached for delineation of the 63 ft bls (Layer 6): TCE is adequately delineated horizontally to 300 µ/L. **(1910-D13)**

Team consensus reached for delineation of the 68 ft bls interval (Layer 6): TCE is adequately delineated horizontally to 300 µ/L; however, there is a data gap at DPT612. **(1910-D14)**

Team consensus reached for the 73 ft bls interval (Layer 6): TCE is adequately delineated horizontally to 300 µ/L; however, additional delineation was not completed east of DPT685 due to the Blockhouse, which is part of LC34's National Historic Landmark. **(1910-D15)**

Layer 7 seems to be impeding vertical migration, as this layer is a fine-grained unit consisting of olive gray fine silty sand (SM) with white angular shell fragments. The TCE footprint at 78 ft bls shows how contamination has horizontally spread at this interval. DNAPL was identified at three locations in the 78 ft bls interval.

Team consensus reached for delineation of 78 ft bls interval (Layer 7): TCE is adequately delineated horizontally to 300 µ/L in the 78 ft bls interval. **(1910-D16)**

Team consensus reached for delineation of the 83 ft bls interval (Layer 7): TCE is adequately delineated horizontally to 300 µ/L; however, there are data gaps at DPT612 and DPT679.**(1910-D17)**

Team consensus reached for delineation of the 88 ft bls interval (Layer 7): TCE is adequately delineated horizontally to 300 µ/L; however, there is a data gap at DPT654. **(1910-D18)**

Team consensus reached for delineation of the 93 ft bls interval (Layer 7): TCE is adequately delineated horizontally to 300 µ/L. **(1910-D19)**
Team consensus reached for delineation of the 98 ft bls interval (Layer 7/8): TCE is adequately delineated horizontally to 300 µ/L in the 98 ft bls interval, however, there is a data gap at DPT674. **(1910-D20)**

Summary of Verification Sampling and Well Installation:

Verification sampling was conducted at select DPT locations (645, 648, 650, 656, and 679) to determine if TCE concentrations below 80 ft bls could be due to drag down. Soil cores were collected, and monitoring wells (IW155 to IW159) were installed at each location. Verification sampling confirmed high levels of TCE present in deep intervals with the exception of DPT656/IW157.

Additional wells were installed as part of the site characterization process to support potential expansion of the HCS into Layer 7, which is a fine-grained unit with high TCE concentrations. Recovery well, RW17, was installed for a pump test and monitoring wells, IW166 and IW167, were installed as observation wells for the pump test.

For vertical delineation, in Layer 8, four existing wells (01D2, 43D2, 44D2, and 45D2) have been sampled historically to vertically delineate the DSZ. Four additional monitoring wells (IW160 to IW163) were installed to complement the existing four wells. These wells were installed outside of the TCE > 300 µ/L contour in the intervals greater than 80ft bls to prevent drag down or conduits for vertical migration. TCE results from Layer 8 monitoring wells were all below GCTLs and serve as vertical delineation.

The Team reached consensus that the monitoring wells in Layer-8 vertically delineate the TCE. **(1910-D21)**

The team discussed sampling the Layer 8 wells which are recommended to be sampled as part of the next annual plume-wide sampling event schedule for December 2020.

Action item for NASA to work with Tetra Tech to make sure the deep wells get incorporated into the sampling program accordingly. **(1910-A01)**

Cross sections were presented to demonstrate the vertical extent of the TCE. A question was asked where the enhanced bioremediation test cell was done on the cross-section. It was determined that it was close to recovery well RW0001A as shown in cross section B-B', revealing that bioremediation was successful in the shallow zone.

Summary of Constant Rate Pumping Test -

Mass calculations show that there is still a lot of mass in the DSZ, with a lot of mass within the fine-grained units. Based on re-characterization data, it is estimated that 31,599 pounds of CVOCs are still present in the DSZ.

A 48-hour constant rate pumping test was conducted on RW17 in Layer 7. Wells were monitored for influence and varied from 25 ft to 200 ft away from RW17. Significant drawdown was observed in RW17, and influence was detected in the two monitoring wells 25 feet away. Analysis of Layer 6 and Layer 8 well pairs consistently exhibited upward gradients, suggesting that Layer 7 is confining or possibly semi-confining based on upward gradient maintained before and after HCS wells were turned on and off in the area. RW17 was added to the HCS system and is operating as a pilot study to determine mass removal over time.

Pumping zones were presented with each blue zone representing a one year capture zone of the HCS. A suggestion was made to turn off well RW5B because it has a low flow rate (2 gpm). Since RW5B has only operated a couple of months, more data should be evaluated prior to considering shutting off this well.

Summary of Pumping Rate Optimization -

HCS revised pumping rates and results over the last year were presented.

The pumping rates were optimized based on TCE concentrations. Some RWs were shut off over the past year based on low

concentrations. In the shallow zone (15 to 45 ft bls), the pumping rate was reduced from 42 to 24 gpm and TCE mass removal increased from 5.3 to 5.7 pounds per day. In the deep zone (50 to 80 ft bls), the pumping rate was increased from 42 to 49 gpm and TCE mass removal increased from 9.5 to 9.8 pounds per day.

With RW17 online at 1 gpm, the overall pumping rate of the system is 74 gpm. Since this optimization effort, three additional RWs were brought back online based on cDCE and VC concentrations in RWs, thereby increasing the system pumping rate to 83 pgm. The system is designed to handle up to 120 gpm; however, the highest rate is only 85-90 gpm due to back pressure issues.

HCS trend graphs were prepared for RWs within the TCE high concentration plume (HCP). The recovery wells that removed the majority of the mass included RWs 1A, 2A, 2B, and 17C.

A recap of the site conditions shows the DSZ underlies surface obstructions to include the Blockhouse, transformer pad, roadways, utilities, former ESB pad, parking area, and HCS. Layers 4 and 7 are fine grained units storing a lot of mass. Based on NASA's RAE expectations, preliminary discussions for treatment technologies have included 1) LDA with steam and ZVI, 2) In-situ thermal, 3) Pump and Treat with amendments, and 4) HCS expansion to control Layer 7. The target treatment contour would be 3,000 ug/L.

<u>Summary of Treatment Alternatives -</u>

The Team discussed the two aggressive treatment options to eviscerate the DSZ: 1) LDA and 2) in-situ thermal (Electrical Resistance Heating [ERH]).

For LDA, potential limitations include depth, future land use, cost and physical site features such as the proximity to the roadway and blockhouse:

- The largest Kelly Bar known is only 80 ft, which would not be deep enough.
- The Air Force is considering a new tow route through LC34 (based on the proximity of the new FPL power lines to Phillips Parkway).

- The DSZ underlies the existing roadway, so shutting down that roadway to complete LDA treatment may not be an option.
- LDA could not be used next to the blockhouse, as this is part of the site's National Historic Landmark.

It was stated that LDA has been used at Wilson Corners, with a second phase planned in the future. The biggest question for LDA is can this technology get down to 100 ft? A team member indicated that there are LDA companies with the capability to get to 100 ft. A suggestion was made that perhaps two technologies can be used, with LDA used for the majority of the DSZ and in-situ thermal used in the area of the roadway and blockhouse.

For ERH, because this technology is an in-situ technology, it may have fewer limitations than LDA with regard to the physical site features, but the power demand to supply the electrodes is a consideration. It was suggested to consider installing the electrodes over the course of several years to spread out the cost, and then bring in power once the infrastructure is in place.

The team discussed the need for an RAE and a design to look at possible implementation of a combination of options, with an updated cost model to remediate the source. The HCS IM will continue to run while alternatives are evaluated. It was stated that none of the options address the area near the building, and the bio option cannot treat a fine grain unit. NASA is looking at multiple technologies and may conduct LDA where possible, and in situ thermal by the blockhouse. This is the purpose of working up the RAE; to identify if one or coupled technologies will be implemented moving forward.

To address more of the source zone, Option 2 may be the best plan (option 1 – the company is having issues). It was suggested to wait another year before picking it up. The Team agreed, but right now the Team doesn't know any potential costs are for the technologies on the list. This RAE will provide that information. Another team member mentioned with option #2, costs can be split across years if you expand electros across the years. With LDA, it is more difficult to build year after year. A team member inquired if anyone has treated 2.5 acres with this contaminant? No one had. Everyone was

reminded that this is Air Force property and NASA is under a permit and there are many determining factors here, which is why NASA would like different options to consider. TetraTech is looking at phases to work through addressing contamination at the entire site. The size of the plume has changed, so the objective has changed. This is a math exercise, but good point to install thermal (electrodes) over next several years. NASA can buy what they can afford each year and bring the power in once the infrastructure is in place.

A team member inquired if this RAE would be presented in a phased approach. This could provide a contingency plan, even if step outs are required. The response was given that the CMS initially did this for us when evaluating the different technologies. The team member further inquired if we should produce a phased approach now to identify where to implement which technology first, and phase a technology every other year for a few years. It was noted that if we only clean up a portion, there is a potential for recontamination. It was added that part of the team consensus is the phasing through the IM. A team member stated then we wouldn't work up a RAE, we would just go straight to design and skip the evaluation. Another team member stated if we complete so many ERH cells and continue to expand as we get money, we can agree on the technology. In addition to the two aggressive options (LDA and ERH), two other options were discussed: 3) Pump and Treat with amendments and 4) HCS expansion to control Layer 7. Of these, Option 4 is currently being implemented and Option 3 may not be a viable option because the lithology would likely impede the amendments.

It was suggested to proceed with design and costing for ERH based on the footprints of Layer 4 and Layer 7.

Team consensus reached on the path forward to conduct a RAE using existing data to evaluate ERH install costs for TCE above 1) 3,000 µ/L and then above 2) 11,000 µ/L and base the designs on the footprints of Layer 4 and Layer 7. The cost analysis should also include any phasing opportunities in terms of infrastructure (i.e., installing electrodes first and then system equipment), as well as understand if power demands can be met. **(1910-D22)**

Hot Spot Two

Dynamic Testing Results – Shallow RWs

- Total influent – 7 samples:
  - *TCE ranged from 170 to 197 mg/L*
  - *cDCE ranged from 64.9 to 109 mg/L*
  - *VC ranged from <10 to 26.1 mg/L*
- Individual RWs:
  - *RW-1A (average) = 11.3 mg/L TCE*
  - *RW-2A (average) = 270.5 mg/L TCE*
  - *RW-3A (average) = 385 mg/L TCE*

Geosyntec consultants

Dynamic Testing Results – Shallow RWs

- Individual RW pumping rates:
  - *RW-1A = 9.2 gpm*
  - *RW-2A = 5.5 gpm*
  - *RW-3A = 3 gpm*
- Total volume extracted/treated = 130,000 gallons
- Mass removed in 5 days at 17.7 gpm:
  - *167 lbs TCE, 274 lbs total VOCs*
  - *Equates to 8,000 lbs/month from 3 shallow RWs in DSZ*

Site Overview and Background

Dynamic Testing

Hot Spot One

Hot Spot Two

Geosyntec consultants

Dynamic Testing Results – Deep RWs

- Total influent – 5 samples:
  - *TCE ranged from 250 to 430 mg/L*
  - *cDCE ranged from 5.4 to 9.4 mg/L*
  - *VC less than detection limit <1.6 to <10 mg/L*
- Individual RWs:
  - *RW-1B (average) = 33.4 mg/L TCE*
  - *RW-2B (average) = 767 mg/L TCE*
  - *RW-3B (average) = 155 mg/L TCE*

Geosyntec consultants

Dynamic Testing Results – Deep RWs

- Individual RW Pumping Rates:
  - *RW-1A = 3 gpm*
  - *RW-2A = 3 gpm*
  - *RW-3A = 3 gpm*
- Total volume extracted/treated = 63,000 gallons
- Mass Removed at 9 gpm:
  - *305 lbs TCE, 313 lbs total VOCs*
  - *Equates to 9,400 lbs/month from 3 deep RWs in DSZ*

Site Overview and Background

Hot Spot One - 1969

Site Overview and Background

Field Activities

Results

Path Forward

Geosyntec consultants

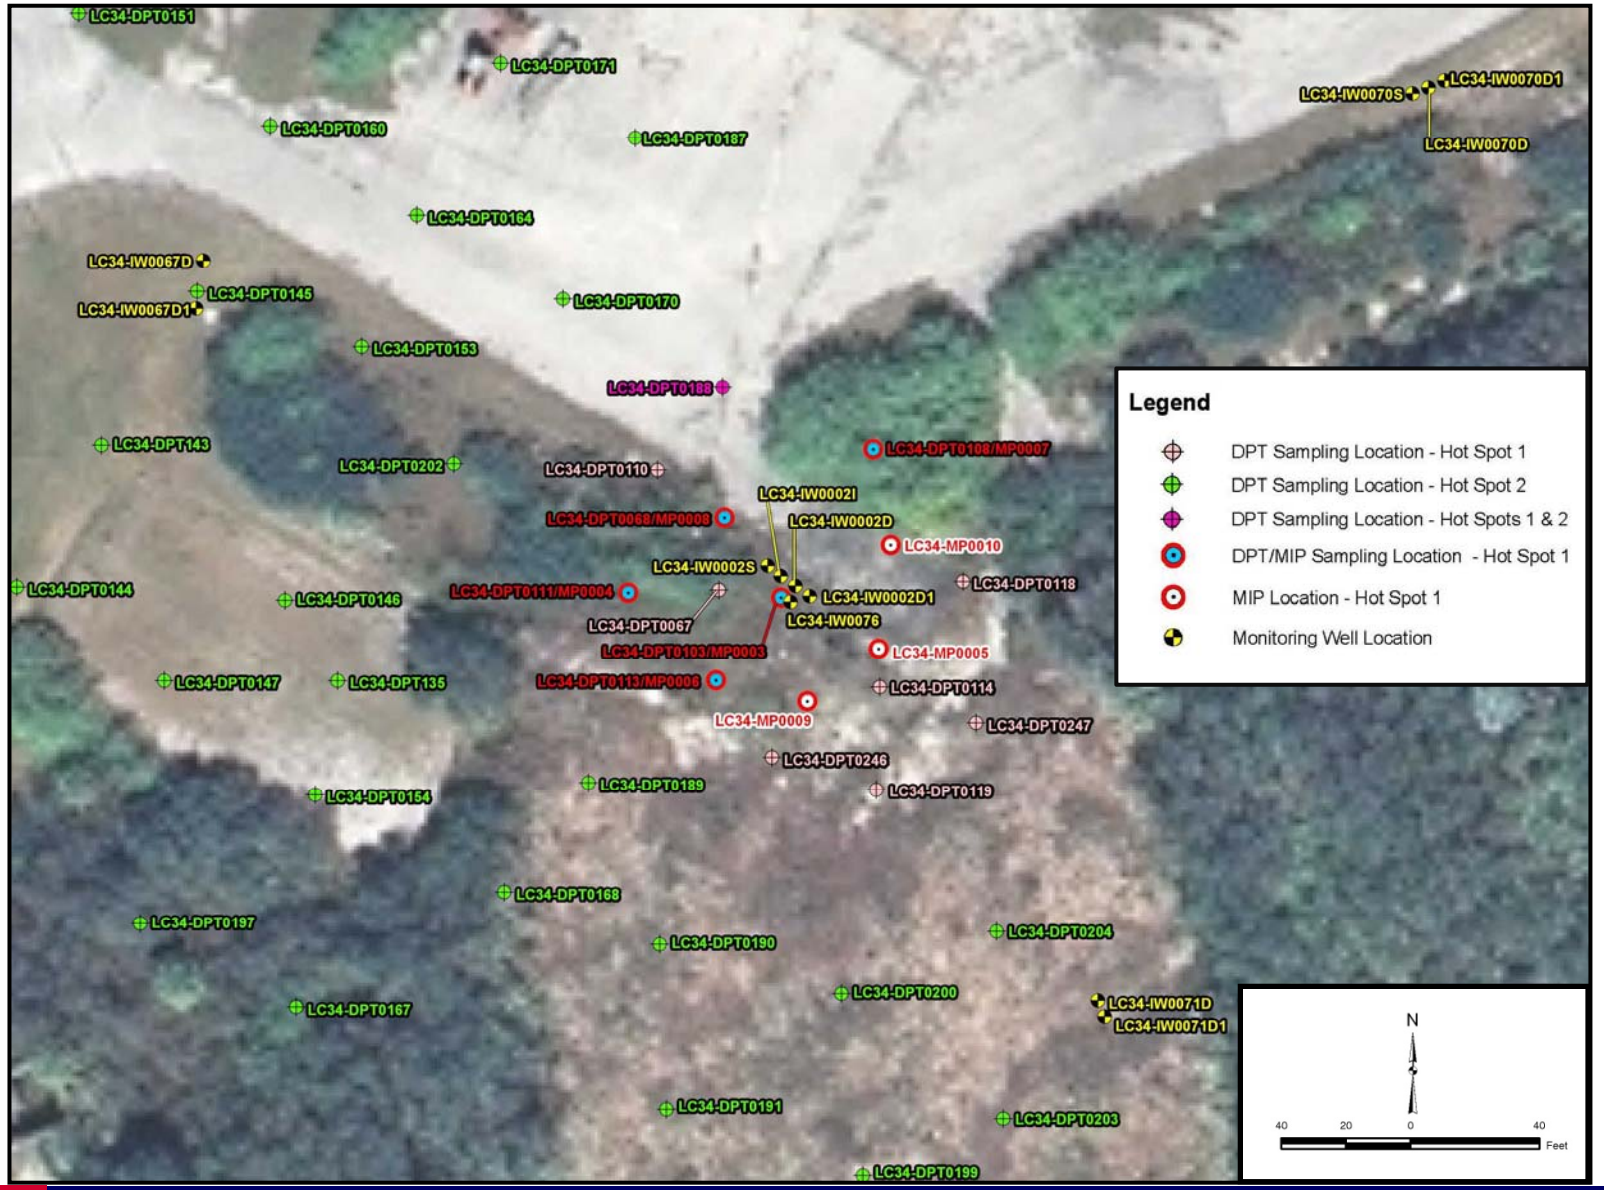
Where did we leave off with Step 1 in April 2009?

Site Overview and Background

Field Activities

Results



Path Forward

Meeting minutes actions:

- Assess absence/presence of mass at depths greater than 60' BLS
- Evaluate the hydraulic conductivity of Layer 5 (~48-60 ft BLS)
- Remedial technologies to be evaluated for Step 2:
  - *Bioremediation*
  - *Thermal*
  - *LDA applications*
  - *Excavation derivatives*
  - *Chemical oxidation – Removed at Team request*
  - *EZVI injection (added based upon discussions during meeting)*

Geosyntec consultants

Sample Locations

Site Overview and Background

Field Activities

Results

Path Forward

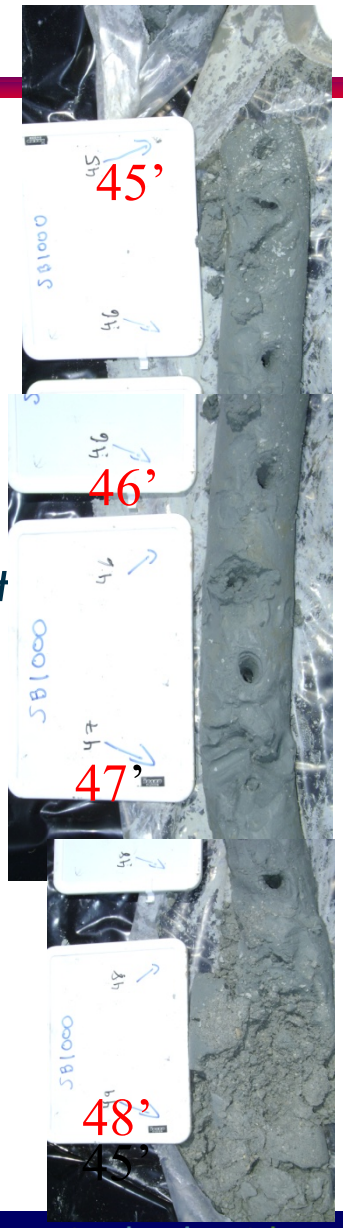
Geosyntec consultants

Follow-Up Activities

- Pneumatic slug testing performed at four Layer 5 monitoring wells
- Sonic drilling performed in Hot Spot 1, in the immediate vicinity of MIP0003
  - *Continuous core collected and logged to 80 ft bls*
  - *Six discrete saturated zone soil samples collected to assess TCE mass in Layers 3/4/5.*
  - *Monitoring well IW0076 installed (screen interval from 70 – 80 ft bls) and sampled for VOCs*

Site Overview and Background
Field Activities
Results
Path Forward

Geosyntec consultants



Layer 5 Pneumatic Testing

- Four locations, minimum of 3 tests per location (K) results:
  - *IW-02D1 (50-55 ft bls) = 2.7 ft/day*
  - *PA-20 (55-60 ft bls) = 5.6 ft/day*
  - *PA-21 (55-60 ft bls) = 1.4 ft/day*
  - *PA-22 (55-60 ft bls) = 1.5 ft/day*
  - *Average = 2.8 ft/day (Layer 5 previously reported as 0.4 ft/day)*
- Results suggest Layer 5 is more permeable than originally conceptualized

Geosyntec consultants

Sonic Core Lithology Observations

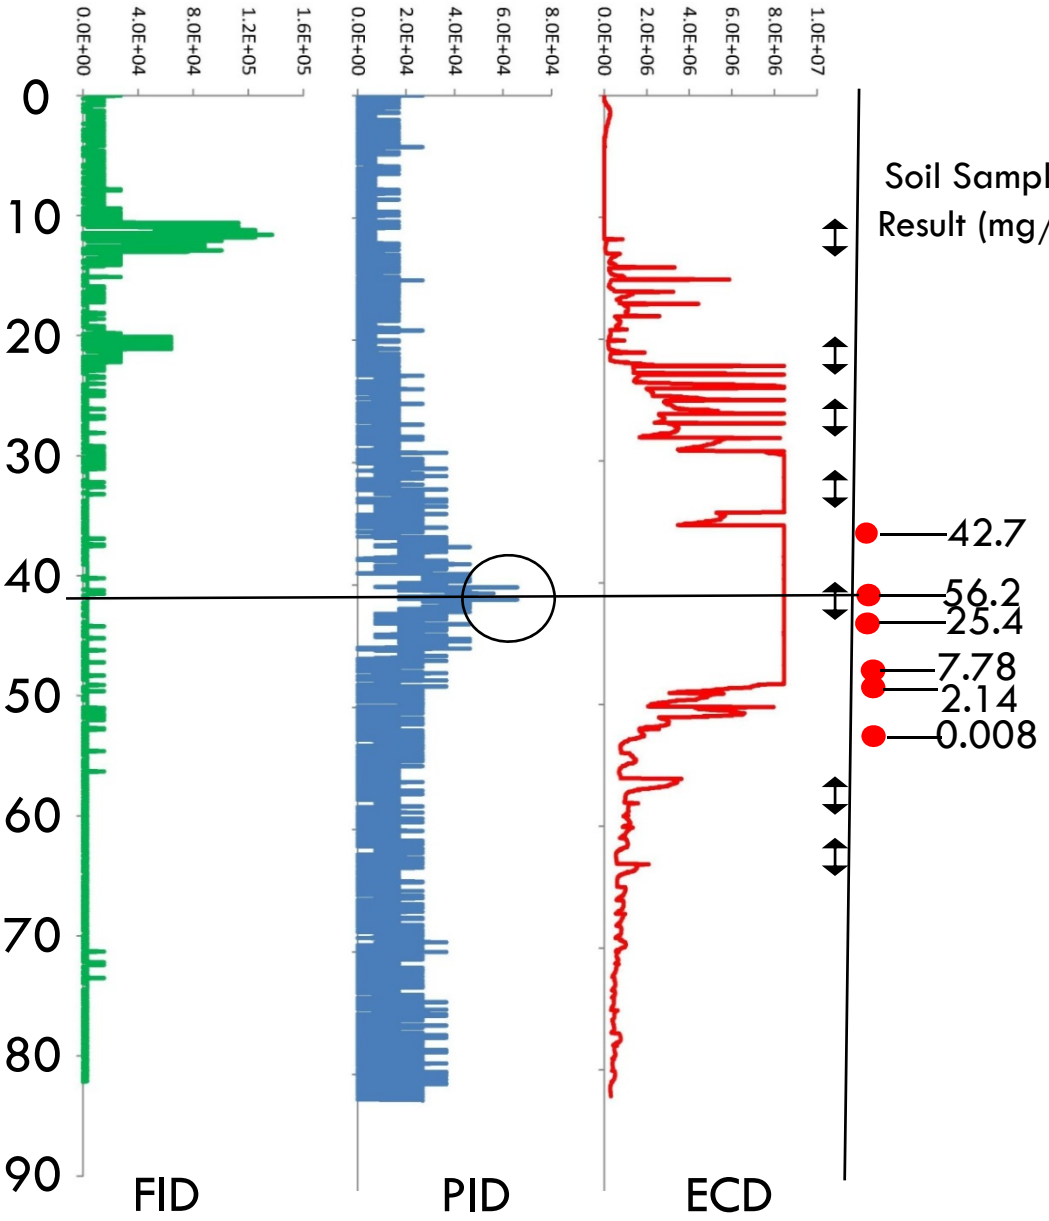
- Pertinent lithologic observations:
  - *Gray fine sand w/ shell fragments below 29 ft bls (Layer 3)*
  - *Very fine, silty gray sand below 42 ft bls*
  - *Gray sandy clay below 45 ft bls (Layer 4)*
  - *Gray clayey fine sand with shell fragments below 47 ft bls (Layer 5)*
  - *Gray/tan fine silty sand w/ shell fragments below 48 ft bls to 66 ft bls (Layer 5)*
  - *Salt & pepper sand below 66 ft bls (Layer 6)*

Geosyntec consultants

Saturated Soil Sampling Results

Site Overview and Background

Field Activities



Results

Path Forward

- Six saturated zone soil samples collected to assess mass distribution:
  - *37.0 ft bls – TCE = 42.7 mg/kg*
  - *42.0 ft bls – TCE = 56.2 mg/kg*
  - *44.5 ft bls – TCE = 25.4 mg/kg*
  - *47.0 ft bls – TCE = 7.78 mg/kg*
  - *48.5 ft bls – TCE = 2.14 mg/kg*
  - *53.0 ft bls – TCE = 0.008 mg/kg*
- Mass distribution is consistent w/ MIP logs and DPT groundwater data

Geosyntec consultants

MIP0003

DPT0103	
Interval (ft BLS)	TCE (µg/L)
12 to 16	40 U
20 to 24	200
25 to 29	3,300
31 to 35	42,000
41 to 45	141,000
56 to 60	39,100
61 to 65	43

Monitoring Well Installation/Sampling

- Monitoring well IW0076 installed July 2009
  - *2-inch diameter*
  - *Screened interval from 70 to 80 ft bls*
- Groundwater sampling results revealed no VOCs above laboratory detection limits (<1.0 µg/L)
- Monitoring well sampling results – in combination with previous MIP/DPT data suggest deep mass is not present at Hot Spot 1

Geosyntec consultants

TCE 30 to 60 ft BLS

Geosyntec consultants

Hot Spot 1 – Alternative Summary

ALTERNATIVE	Anticipated Effectiveness	Capital Cost	Estimated Timeframe to <NADC
Electrical Resistivity Heating	High	$973,000	<1 yr
Large Diameter Auger with Steam, Hot Air and Zero Valent Iron	High	$1,230,000	<1 yr
Large Diameter Auger with EZVI	Moderate-High	$917,000	<1 yr
Large Diameter Auger with ZVI/Clay	Moderate-High	$946,000	<1 yr
LDA Excavation/Flowable Fill Backfill	High	$2,002,000	<1 yr
High Pressure EZVI Injection (Badger System) w/ 25% Redose	Low-Moderate	$825,000	1 - 5 yrs
Pump and Treat System Expansion to Include Pumping from Hot Spot 1	Containment*	$50,000	10+ yrs
Bioremediation utilizing injection wells, electron donor and microbial culture with up to 5 targeted lactate and/or oil re-applications	Moderate	$582,000	2 - 4 yrs

Notes:

1. Capital costs are based largely upon vendor provided budgetary estimates for treatment of Hot Spot 1.
2. Vendor costs include a 10% subcontractor markup.
3. NADC - Natural Attenuation Default Criteria.
4. All construction oversight/implementation field support costs are based upon the use of local personnel (i.e. no costs have been included for extensive travel, airfare, perdiems, hotels, parking, etc.).
5. P&T system expansion costs do not include electrical costs for 1/2 hp pump, O&M costs associated with operations, and assumes that the P&T system orginally designed for the site, which included room in control panel for system expansion, is installed.
6. Bioremediation alternatives include re-dosing, monitoring, and reporting costs (spanning up to four years)as "capital costs" for cost comparison purposes.
7. * - P&T system expansion will provide dissolved plume treatment; however, primarily considered a containment technology.

Geosyntec consultants

ESTCP Pilot

Site Overview and Background

Field Activities

Results

Path Forward

- Geosyntec received ESTCP grant to implement a pilot study to evaluate bioremediation with a partitioning electron donor (PED)
- What is PED?
  - *Electron donor that partitions directly into and out of DNAPL*
  - *Promotes growth of dechlorinating biomass close to DNAPL, which enhances DNAPL dissolution rates*
  - *Results in higher concentrations of electron donor at the DNAPL:water interface*
  - *Particularly suited for heterogeneous zones*
- Pilot location originally proposed in CA fell through – new location sought. LC34 Hot Spot 1 identified as ideal candidate site

Geosyntec consultants

ESTCP Pilot (cont'd)

- PED pilot structure similar to IM evaluated for bioremediation in costing summary
- Benefits to NASA
  - *Pilot Test implementation is funded by ESTCP grant*
  - *Hot Spot 1 potentially "remediated" through actions largely funded by others*
  - *NASA will have complete access to data as it comes in for parallel Pilot Study Report*
  - *Information learned may yield positive information for LC34 and other KSC/CCAFS sites*
  - *If it fails? – valuable information learned regarding a technology that will not work*
- Collected data will be evaluated and reported separate to ESTCP reporting

Geosyntec consultants

ESTCP Pilot Path Forward

- Submittal of Pilot Study Work Plan to FDEP
- Anticipated implementation elements
  - *Injection network for DPT injection of n-butyl acetate throughout treatment zone*
  - *Extraction of groundwater at low flow (potentially only intermittently) from recovery well cluster in center of plot*
  - *Two bundle wells (4 or 5 depth specific sample ports each), and existing monitoring wells to be sampled to assess performance*
  - *Mass flux assessed via concentration changes in extraction well cluster*
  - *Extracted fluids (if ultimately warranted) to either be re-injected around periphery of treatment cell or treated with GAC and discharged distal to pilot area*
  - *Pilot anticipated to run for 9 to 12 months*

Hot Spot 1 Alternative Summary

ALTERNATIVE	Anticipated Effectiveness	Capital Cost	Estimated Timeframe to <NADC
Electrical Resistivity Heating	High	$973,000	<1 yr
Large Diameter Auger with Steam, Hot Air and Zero Valent Iron	High	$1,230,000	<1 yr
Large Diameter Auger with EZVI	Moderate-High	$917,000	<1 yr
Large Diameter Auger with ZVI/Clay	Moderate-High	$946,000	<1 yr
LDA Excavation/Flowable Fill Backfill	High	$2,002,000	<1 yr
High Pressure EZVI Injection (Badger System) w/ 25% Redose	Low-Moderate	$825,000	1 - 5 yrs
Pump and Treat System Expansion to Include Pumping from Hot Spot 1	Containment*	$46,000	10+ yrs
Bioremediation utilizing injection wells, electron donor and microbial culture with up to 5 targeted lactate and/or oil re-applications	Moderate	$582,000	2 - 4 yrs

Notes:

1. Capital costs are based largely upon vendor provided budgetary estimates for treatment of Hot Spot 1.
2. Vendor costs include a 10% subcontractor markup.
3. NADC - Natural Attenuation Default Criteria.
4. All construction oversight/implementation field support costs are based upon the use of local personnel (i.e. no costs have been included for extensive travel, airfare, perdiems, hotels, parking, etc.).
5. P&T system expansion costs do not include electrical costs for 1/2 hp pump, O&M costs associated with operations, and assumes that the P&T system orginally designed for the site, which included room in control panel for system expansion, is installed.
6. Bioremediation and Potassium Permanganate alternatives include re-dosing, monitoring, and reporting costs (spanning up to four years)as "capital costs" for cost comparison purposes.
7. * - P&T system expansion will provide dissolved plume treatment; however, primarily considered a containment technology to mitigate potential dissolved plume migration below 60 ft bls.

LAUNCH COMPLEX 34, HOT SPOT 1

TECHNOLOGY: ELECTRICAL RESISTIVITY HEATING

DESCRIPTION: Installation of 11 heating electrodes to approximately 61 ft bls, with top of electrode conductivity zone at 12 ft bls and 11 co-located vapor recovery wells. Off-gas treatment from vapor recovery wells (200 scfm 15-hp vapor recovery blower) provided by granular activated carbon. Anticipated average electrical heating power input of 440 kW and total heating treatment time of 91-131 days. Performance of four confirmatory borings with associated soil sampling following treatment.

Item	Description	Quantity	Unit	Unit Cost	Total Cost
Contractor Mobilization/Demobilization	Contractor preparation and equipment to and from site	1	LS	$ 150,000	$ 150,000
Site Preparation	Miscellaneous site preparation, surveying, utility clearance	1	LS	$ 5,000	$ 5,000
Contractor shop drawings, work plans, permits	Deliverable requirements prior to implementation	1	LS	$ 42,000	$ 42,000
Drilling and Subsurface Installation	Installation of Electrodes, vapor recovery wells, monitoring points	1	LS	$ 175,000	$ 175,000
Remediation System Operations	Contractor system operating costs	1	LS	$ 210,000	$ 210,000
Drilling and Soil Sampling	Characterization/confirmatory sampling	1	LS	$ 80,000	$ 80,000
IDW Handling/Disposal	Drill cuttings and groundwater disposal	1	LS	$ 10,000	$ 10,000
Electrical Connection	Service from existing power to equipment	1	LS	$ 20,000	$ 20,000
Electrical Energy Usage	Electrical costs based upon $0.11 per kWh	1	LS	$ 135,000	$ 135,000
Carbon Usage, Transport and Regeneration	Off-gas Treatment of vapors	1	LS	$ 13,000	$ 13,000
Water/Condensate Disposal	Process condensate water	1	LS	$ 1,000	$ 1,000
Other Operational Costs	Vapor Sampling, OSHA Monitoring, etc.	1	LS	$ 15,000	$ 15,000
Construction Management/Installation Oversight	Construction Management/Installation Oversight	880	HR	$ 100	$ 88,000
Project Management	Project coordination, meetings, telephone conferences, progress reports	120	HR	$ 120	$ 14,400
Installation Report	Summary of project implementation and results	120	HR	$ 120	$ 14,400
TOTAL ESTIMATED COST					**$ 972,800**

Notes:

1. Electrical Resistivity costs are based upon budgetary proposal from Thermal Remediation Services, Inc. for the treatment of up to 4,000 sf to a total depth of 60 ft and a treatment zone from 30 to 61 ft bls.
2. Construction management/oversight costs are based upon 110 day project duration with personnel on-site 8 hrs/day.
3. ERH quote Based upon 11 electrodes and 91-131 days of heating time.

LAUNCH COMPLEX 34, HOT SPOT 1

TECHNOLOGY: LARGE DIAMETER AUGER MIXING WITH STEAM AND ZVI

DESCRIPTION: Thermal treatment of contaminanted soils and groundwater by in-situ soil mixing using an 8-ft diameter large diameter auger (LDA) while injecting hot air and steam to remove source zone CVOCs. Following thermal treatment, zero valent iron (ZVI) will be applied as a slurry which will be injected and mixed using the LDA to provide a polishing step. LDA activities will focus on the 30 to 60.5 ft bls depth interval, and with a 17.5% planned overlap, will require 97 treatment cells. Off-gas treatment from a vapor recovery shroud will be treated via granular activated carbon. Performance of four confirmatory borings with associated soil sampling following treatment.

Item	Description	Quantity	Unit	Unit Cost	Total Cost
Contractor Mobilization/Demobilization	Contractor preparation and equipment to and from site	1	LS	$ 175,000	$ 175,000
Site Preparation	Miscellaneous site preparation and surveying	1	LS	$ 5,000	$ 5,000
LDA Mixing/Steam Cost	Contractor Costs for Soil Mixing and Steam Treatment (3,800 sf from 0 to 60 ft bls), 8 ft diameter cells with 17.5% overlap	8,444	cy	$ 83	$ 700,852
Treatment Materials	ZVI Iron	75	Ton	$ 1,215	$ 91,125
No Dig Day	No work due to weather, lightning, and/or launch operations	5	day	$ 15,000	$ 75,000
Drilling and Soil Sampling	Characterization/confirmatory sampling	1	LS	$ 80,000	$ 80,000
Carbon Usage, Transport and Regeneration	Off-gas Treatment of vapors	1	LS	$ 25,000	$ 25,000
IDW Handling/Disposal	Drill cuttings and groundwater disposal	1	LS	$ 10,000	$ 10,000
Other Operational Costs	Vapor Sampling, OSHA Monitoring, etc.	1	LS	$ 10,000	$ 10,000
Construction Management/Installation Oversight	Construction Management/Installation Oversight	350	HR	$ 100	$ 35,000
Project Management	Project coordination, meetings, telephone conferences, progress reports	80	HR	$ 120	$ 9,600
Installation Report	Summary of project implementation and results	120	HR	$ 120	$ 14,400
TOTAL ESTIMATED COST					**$ 1,230,977**

Notes:

1. Costs are based upon FECC budgetary proposal dated March 17, 2009.
2. Electrical costs for operation of equipment ARE NOT INCLUDED.
3. Soil mixing with steam and hot air will be focused from 30 to 60 ft bls with the injection of ZVI at 0.5% to 1% by weight (Peerless P1 with less than 50 mesh grain size).

LAUNCH COMPLEX 34, HOT SPOT 1

TECHNOLOGY: LARGE DIAMETER AUGER MIXING WITH EZVI INJECTION

DESCRIPTION: Emulsified zero valent iron (EZVI) treatment of contaminanted soils and groundwater by in-situ soil mixing using an 8-ft diameter large diameter auger (LDA). LDA/EZVI injection activities will focus on the 30 to 60.5 ft bls depth interval, and with a 17.5% planned overlap, will require 97 treatment cells. A calculated 18, 245 gallons of 10% micro scale EZVI mixture will be applied to the treatment zone. Performance monitoring from up to 10 monitoring wells within the treatment zone will be implemented following the completion of LDA activities.

Item	Description	Quantity	Unit	Unit Cost	Total Cost
Contractor Mobilization/Demobilization	Contractor preparation and equipment to and from site	1	LS	$ 95,000	$ 95,000
Site Preparation	Miscellaneous site preparation and surveying	1	LS	$ 5,000	$ 5,000
LDA Mixing Cost	Contractor Costs for Soil Mixing with 17.5% overlap	8,444	cy	$ 30	$ 253,320
Treatment Materials	EZVI	18,425	gal	$ 19	$ 350,075
No Dig Day	No work due to weather, lightning, and/or launch operations	5	day	$ 11,000	$ 55,000
MW Installations and Performance Monitoring	Characterization/confirmatory sampling, performance monitoring of groundwater	1	LS	$ 80,000	$ 80,000
IDW Handling/Disposal	Drill cuttings and groundwater disposal	1	LS	$ 10,000	$ 10,000
Other Operational Costs	Vapor Sampling, OSHA Monitoring, etc.	1	LS	$ 10,000	$ 10,000
Construction Management/Installation Oversight	Construction Management/Installation Oversight	350	HR	$ 100	$ 35,000
Project Management	Project coordination, meetings, telephone conferences, progress reports	80	HR	$ 120	$ 9,600
Installation Report	Summary of project implementation and results	120	HR	$ 120	$ 14,400
TOTAL ESTIMATED COST					**$ 917,395**

Notes:

1. Costs are based upon FECC units costs from HMF budgetary proposal dated February 23, 2009.
2. Electrical costs for operation of equipment (mixers and pumps) ARE NOT INCLUDED.
3. EZVI costs are for premixed 10% EZVI delivered (with 10% markup) from TEA.

LAUNCH COMPLEX 34, HOT SPOT 1

TECHNOLOGY: LARGE DIAMETER AUGER MIXING ZVI AND CLAY

DESCRIPTION: Soil will be mixed via an 8 to 8.5 foot diameter large diameter auger (LDA). Clay will be added in the form of bentonite as a drilling fluid. Once the soil is mixed, zero valent iron (ZVI) is added at the top of the column prior to the first mixing stroke. Emulsified oil substrate (EOS) is added at the pump and injected during the second mixing stroke. Treatment will be provided by an estimated 85 - 100 treatment cells focusing on the addition of clay, ZVI and EOS within the 30 to 60 ft bls depth range.

Item	Description	Quantity	Unit	Unit Cost	Total Cost
Contractor Mobilization/Demobilization	Contractor preparation and equipment to and from site	1	LS	$ 95,000	$ 95,000
Site Preparation	Miscellaneous site preparation and surveying	1	LS	$ 5,000	$ 5,000
LDA Mixing Cost	Contractor Costs for Soil Mixing (3,800 sf from 0 to 60 ft bls)	8,444	cy	$ 60	$ 506,640
Treatment Materials	ZVI and Bentonite Material (injected from 30 to 60 ft bls exclusively)	4,222	cy	$ 25	$ 105,550
No Dig Day	No work due to weather, lightning, and/or launch operations	5	day	$ 15,000	$ 75,000
Drilling and Soil Sampling	Characterization/confirmatory sampling	1	LS	$ 80,000	$ 80,000
IDW Handling/Disposal	Drill cuttings and groundwater disposal	1	LS	$ 10,000	$ 10,000
Other Operational Costs	Vapor Sampling, OSHA Monitoring, etc.	1	LS	$ 10,000	$ 10,000
Construction Management/Installation Oversight	Construction Management/Installation Oversight	350	HR	$ 100	$ 35,000
Project Management	Project coordination, meetings, telephone conferences, progress reports	80	HR	$ 120	$ 9,600
Installation Report	Summary of project implementation and results	120	HR	$ 120	$ 14,400
TOTAL ESTIMATED COST					**$ 946,190**

Notes:

1. LDA Mixing and materials costs based upon feasibility study performed for similar sized site for private industrial client.
2. Based upon available information (Vint Hills), actual costs were $243/cy, cost provided above are $112/cy (indicates substantial uncertainty in costs).

LAUNCH COMPLEX 34, HOT SPOT 1

TECHNOLOGY: DRIVEN CAISSONS WITH LDA EXCAVATION, FLOWABLE FILL AND OFFSITE DISPOSAL OF SOIL

DESCRIPTION: Caissons will be vibrated in to a depth of approximately 80 ft bls (keyed into low permeability materials at the base of the aquifer). Soil within the caissons will be excavated using a large diameter auger to a depth of approximately 60 ft bls (deeper if DNAPL is vibrated downward within caissons). Once excavated, the caisson will be backfilled with flowable fill material and the caisson will be removed. Excavated impacted soils will be properly disposed off-site. Treatment will require some overlap to ensure complete removal of the source area materials.

Item	Description	Quantity	Unit	Unit Cost	Total Cost
Contractor Mobilization/Demobilization	Contractor preparation and equipment to and from site	1	LS	$ 150,000	$ 150,000
Site Preparation	Miscellaneous site preparation and surveying	1	LS	$ 5,000	$ 5,000
Casing Driving, Excavation, Fill, and Disposal	Contractor Costs for Soil Mixing with 15% overlap - Excavation to 60 ft	13,500	ton	$ 125	$ 1,687,500
Drilling and Soil Sampling	Characterization/confirmatory sampling	1	LS	$ 80,000	$ 80,000
IDW Handling/Disposal	Drill cuttings and groundwater disposal	1	LS	$ 10,000	$ 10,000
Other Operational Costs	Vapor Sampling, OSHA Monitoring, etc.	1	LS	$ 10,000	$ 10,000
Construction Management/Installation Oversight	Construction Management/Installation Oversight	350	HR	$ 100	$ 35,000
Project Management	Project coordination, meetings, telephone conferences, progress reports	80	HR	$ 120	$ 9,600
Installation Report	Summary of project implementation and results	120	HR	$ 120	$ 14,400
TOTAL ESTIMATED COST					**$ 2,001,500**

Notes:

1. Contractor costs are based upon general budgetary information for concept level costing provided by LFR. Unit rate of $170/ton provided; however, based upon quantity, unit cost reduced by 26% to account for cost saving associated with increased weight.

2. Soil weight based upon 1.4 ton/cy conversion factor and 8,444 cy of impacted soil with 15% overlap (9,711 cy).

LAUNCH COMPLEX 34, HOT SPOT 1

TECHNOLOGY: EZVI BADGER INJECTION SYSTEM

DESCRIPTION: High pressure injection via 26 injection points at 10 depth intervals per point of 18,425 gallons of 10% micro scale EZVI and 9,212 gallons of emulsified oil througout the treatment zone utilizing Badger (or equivalent) high-pressure injection system. Performance monitoring upon completion of injection activities.

Item	Description	Quantity	Unit	Unit Cost	Total Cost
Contractor Mobilization/Demobilization	Contractor preparation and equipment to and from site	1	LS	$ 3,000	$ 3,000
Site Preparation	Miscellaneous site preparation and surveying	1	LS	$ 3,000	$ 3,000
EZVI Injection	26 Injection Points, 10 injection intervals per point, inc	27,637	gal	$ 5.5	$ 152,004
Treatment Materials	EZVI	18,425	gal	$ 19	$ 350,075
Treatment Materials	Carrier Oil for EZVI Injection with Badger Tooling	9,212	gal	$ 2	$ 18,424
Monitoring Costs	Characterization/confirmatory sampling/performance monitoring	1	LS	$ 80,000	$ 80,000
IDW Handling/Disposal	Drill cuttings and groundwater disposal	1	LS	$ 5,000	$ 5,000
Other Operational Costs	Vapor Sampling, OSHA Monitoring, etc.	1	LS	$ 5,000	$ 5,000
Construction Management/Installation Oversight	Construction Management/Installation Oversight	150	HR	$ 100	$ 15,000
Project Management	Project coordination, meetings, telephone conferences, progress reports	80	HR	$ 120	$ 9,600
Installation Report	Summary of project implementation and results	160	HR	$ 120	$ 19,200
TOTAL ESTIMATED COST					**$ 660,303**
TOTAL ESTIMATED COST WITH 25% INITIAL VOLUME REDOSE					**$ 825,378**

Notes:

1. Unit costs for injection and carrier oil volume are based upon Renegade estimate dated April 10, 2009.
2. EZVI costs are for premixed 10% EZVI delivered (with 10% markup) from TEA.
3. Based upon a ROI of up to 8 ft.

LAUNCH COMPLEX 34, HOT SPOT 1

TECHNOLOGY: Pump-and-treat system expansion to include groundwater extraction from Hot Spot 1

DESCRIPTION: Installation of one recovery well to provide hydraulic containment of Hot Spot 1 and prevent potential movement of mass to Layer 6 (60 to 80 ft bls depth interval). One recovery well will be installed and tied into the ESB-area P&T system.

Item	Description	Quantity	Unit	Unit Cost	Total Cost
Site Preparation	Miscellaneous site preparation, utility clearance	1	LS	$ 2,000	$ 2,000
Sonic Driller Mobilization		1	LS	$ 2,500	$ 2,500
Sonic Drilling	One, 6-inch diameter stainless steel recovery well to 60 ft	1	LS	$ 11,000	$ 11,000
Well Drilling Oversight/Travel/Equipment	Project geologist oversight of installation and development of recovery well	1	DAY	$ 2,000	$ 2,000
Recovery well vault box	24x24x24 inch steel vault box with concrete apron	1	LS	$ 1,320	$ 1,320
Recovery well pump	1/2 HP pump w/ leads, installed	1	LS	$ 2,000	$ 2,000
Recovery well piping, trenching, and electrical	Approximately 500 ft of trenching, HDPE pipe, electrical wire and conduit, surface completion to match existing	500	FT	$ 30.00	$ 15,000
flow meter, valves, sample ports, misc.		1	LS	$1,000	$ 1,000
IDW Handling/Disposal	Drill cuttings and groundwater disposal	1	LS	$ 1,000	$ 1,000
Project Management	Project coordination, meetings, telephone conferences, progress reports	8	HR	$ 120	$ 960
Data Evaluation During Implementation	Evaluating results, adjusting and optimizing pumping rate, etc.	16	HR	$ 120	$ 1,920
Installation Report	Summary of project implementation and results	40	HR	$ 120	$ 4,800
TOTAL ESTIMATED COST					**$ 45,500**

Notes:

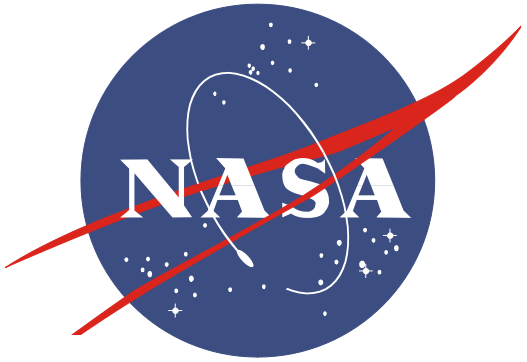
1. No costs are included for operation of pump (electrical), maintenance, etc.

LAUNCH COMPLEX 34, HOT SPOT 1

TECHNOLOGY: MULTI-CHAMBER WELL BIOREMEDIATION WITH SOLAR MIXING ABOVE AND BELOW CLAY

DESCRIPTION: Installation of 48 multi-chamber wells (7 chambers per well), with chamber intervals focused on specific targeted depth intervals. Installation of 10 performance monitoring wells, 2 extraction wells and 6 injection wells. Injection of 20 drums of emulsified oil using low pressure injection/gravity feed techniques and injection of 40 liters of microbial culture. Installation and operation of a solar circulation system to extract groundwater from just above and just below clay layer, pump to land surface and evenly re-distribute to three injection wells above and three injection wells below the clay layer. The pumping system will be low flow and only operational during "sun" hours. Performance of up to five follow-up targeted re-injections and performance monitoring.

Item	Description	Quantity	Unit	Unit Cost	Total Cost
Site Preparation	Miscellaneous site preparation, surveying, utility clearance	1	LS	$ 5,000	$ 5,000
Dosing Wells	Drillers costs for DPT installation of 48 multi-chamber wells (7 chambers per well)	1	LS	$ 115,000	$ 115,000
Performance Monitoring Wells/Circulation Wells	10 performance wells, 2 extraction wells, 6 injection wells	1	LS	$ 15,000	$ 15,000
Drilling Oversight	Oversight of all drilling activities	25	DAY	$ 1,500	$ 37,500
Electron Donor Purchase and Injection	emulsified oil (20 drums), shipping, onsite injection, and equipment	1	LS	$ 74,600	$ 74,600
Electron Donor Purchase and Injection	ethyl lactate (2 drums) plus shipping	2	drum	$ 900	$ 1,800
Microbial Culture	Purchase and Injection of culture (40 Liters)	1	LS	$ 27,500	$ 27,500
IDW Handling/Disposal	Drill cuttings and groundwater disposal	1	LS	$ 10,000	$ 10,000
In-situ mixing system	Solar panels, pumps, valving, etc.	1	LS	$ 20,000	$ 20,000
Monitoring Costs	Groundwater performance Sampling	1	LS	$ 100,000	$ 100,000
O&M Costs	Bimonthly inspection and maintenance of low flow solar pumping system	24	MONTH	$ 1,000	$ 24,000
Installation Oversight (Solar system)	Construction Management/Installation Oversight	60	HR	$ 100	$ 6,000
Project Management	Project coordination, meetings, telephone conferences, progress reports	80	HR	$ 120	$ 9,600
Data Evaluation During Implementation	Evaluating results, adjusting and optimizing dosing plans, etc.	120	HR	$ 120	$ 14,400
Installation Report	Summary of project implementation and results	240	HR	$ 120	$ 28,800
TOTAL ESTIMATED COST					**$ 489,200**
Reinjection (25% of initial volume) of Electron Donor		5	LS	$ 18,650	**$ 93,250**
TOTAL WITH FIVE FOLLOW UP PARTIAL RE-INJECTIONS					**$ 582,450**



Notes:

1. Multi-chamber will costs are based upon quote from EDS.
2. Injection well layout based upon conservative 5 ft ROI throughout treatment plot.

ADVANCED DATA PACKAGE

C.4 Step 1 Engineering Evaluation: Hot Spots 3 and 4 ADP

Geosyntec consultants

Launch Complex 34 (LC34)

SWMU CC054

Step 1 Engineering Evaluation:

Hot Spots 3 and 4

December 2011

Geosyntec consultants

Presentation Outline

- Site overview and background
- Hot spot definitions and update
- Goals of presentation
- Assessment results
  - *Test consensus*
- Path forward

Geosyntec consultants

Site Overview and Background

- LC34 supported Saturn 1 and Saturn 1B
- Multiple releases of TCE (>100K pounds) between 1950 to 1968 in area of ESB
- RFI (1999) and RFI addendum (2003) identified TCE, cDCE, tDCE and VC at concentrations greater than GCTL
- CMS completed in 2007

Site Overview and Background

Goals
Assessment Results
Path Forward

Areas defined during CMS

- DNAPL source zone (DSZ)
  - *area within a "box" with >100 mg/kg TCE*
- HCP
  - *area of impacted groundwater with TCE, cDCE, tDCE, and VC concentrations greater than NADCs outside DSZ*
- LCP
  - *area of impacted groundwater with TCE, cDCE, tDCE, and VC concentrations greater than GCTLs and less than the NADCs*

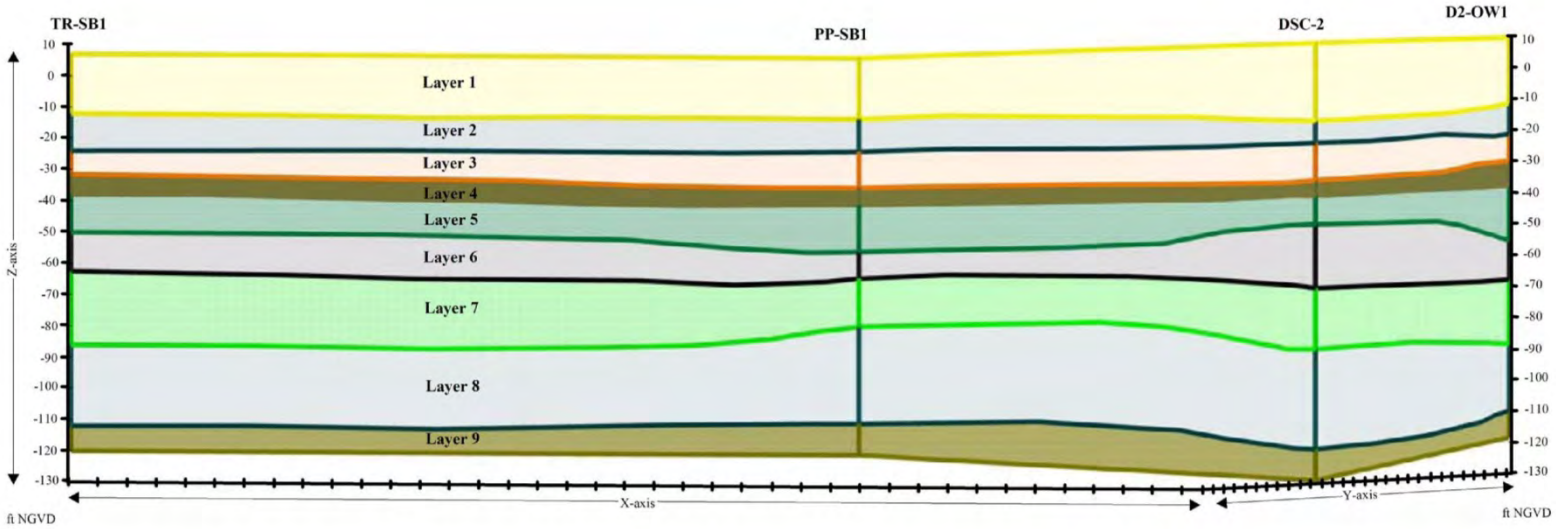
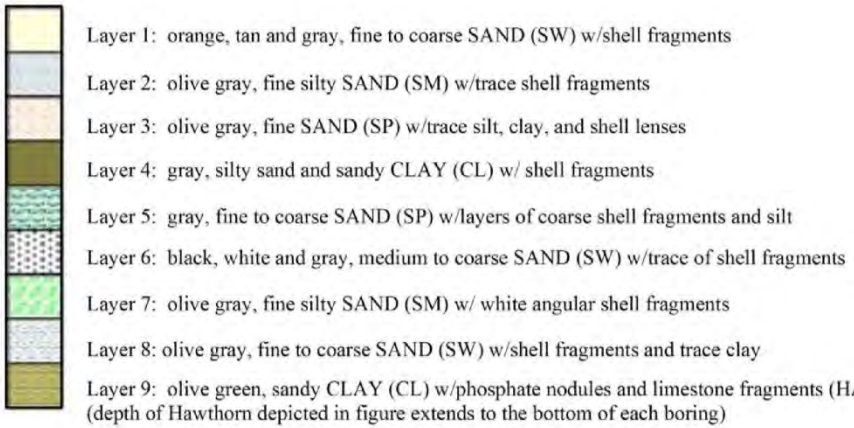
Site Lithology from CMS



Site Overview and Background



Hot Spots

Goals

Assessment Results

Path Forward

Layer 1: orange, tan and gray, fine to coarse SAND (SW) w/shell fragments

Layer 2: olive gray, fine silty SAND (SM) w/trace shell fragments

Layer 3: olive gray, fine SAND (SP) w/trace silt, clay, and shell lenses

Layer 4: gray, silty sand and sandy CLAY (CL) w/ shell fragments

Layer 5: gray, fine to coarse SAND (SP) w/layers of coarse shell fragments and silt

Layer 6: black, white and gray, medium to coarse SAND (SW) w/trace of shell fragments

Layer 7: olive gray, fine silty SAND (SM) w/ white angular shell fragments

Layer 8: olive gray, fine to coarse SAND (SW) w/shell fragments and trace clay

Layer 9: olive green, sandy CLAY (CL) w/phosphate nodules and limestone fragments (HAWTHORN GROUP)
(depth of Hawthorn depicted in figure extends to the bottom of each boring)

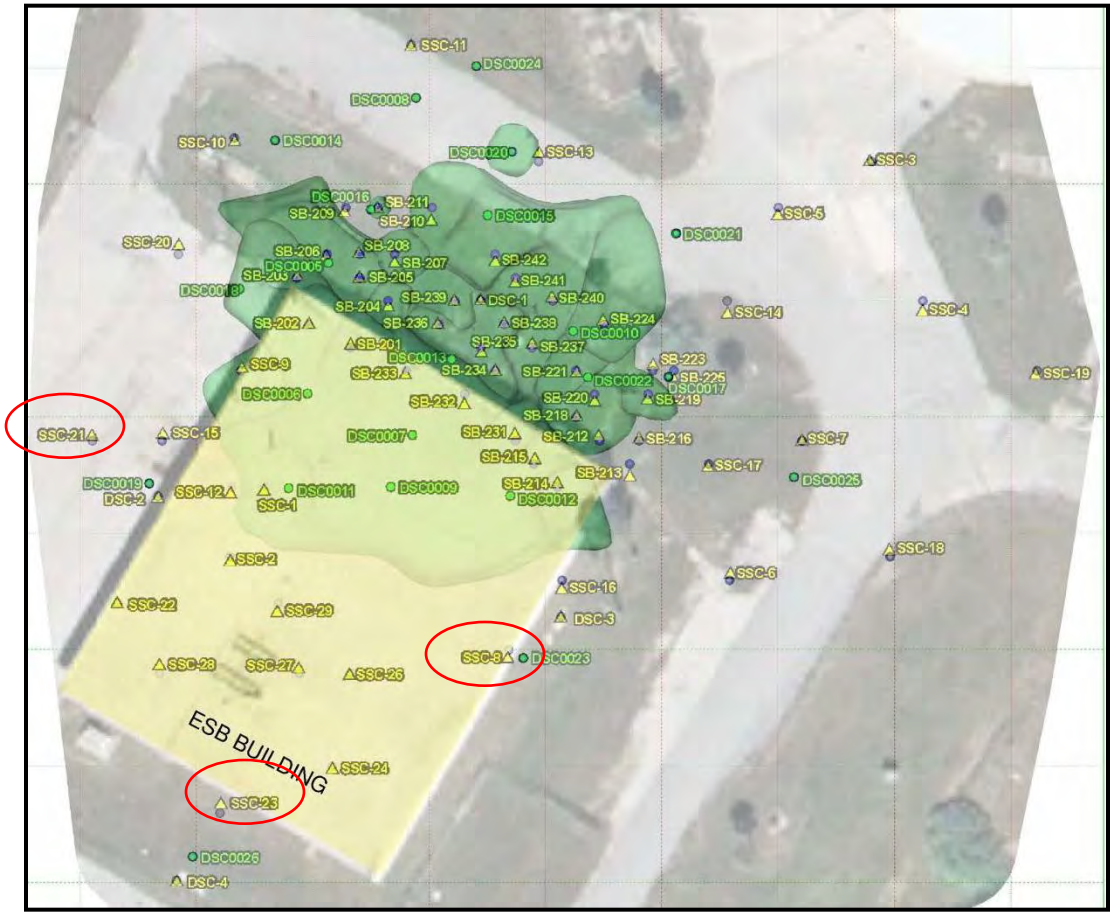
Figure 1

Groundwater Flow and Hydraulic Conductivity

- Groundwater flow at the site is generally radial from the vicinity of the former ESB
  - *Flows to the southwest from the ESB and to the northeast towards the Atlantic Ocean*
- Hydraulic conductivity
  - *Layer 1 (~0 to 25 ft BLS)= 30 ft/d (sand)*
  - *Layer 2 (~25 to 30 ft BLS)= 4 ft/d (silty sand)*
  - *Layer 3 (~30 to 45 ft BLS)= 3 ft/d (fine sand)*
  - *Layer 4 (~45 to 48 ft BLS)= 10^{-3} to 10^{-4} ft/d (silty sand and sandy clay)*
  - *Layer 5 (~48 to 60 ft BLS)= 0.4 ft/d (coarse sand with shell and silt layers)*
  - *Layer 6 (~60 to 80 ft BLS)= 7.5 ft/d (medium to coarse sand)*

Geosyntec consultants

Soil Sampling Performed During CMS



Site Overview and Background

Hot Spots

Goals

Assessment Results

Path Forward

SHALLOW SOIL BORINGS (<45 FEET MSL)

DEEP SOIL BORINGS (>45 FEET MSL)

- Soil sampling performed based on PID screening
- Concentrations outside of DSZ drop off drastically
  - *SSC-21 max = 5.8 mg/kg*
  - *SSC-23 max = 0.0049 mg/kg*
  - *SSC-8 max = 3.5 mg/kg*

Geosyntec consultants

Site Overview and Background

- Remedial alternatives chosen during CMS
  - *Hydraulic containment of the DSZ as an IM*
  - *MNA of HCP and LCP with supplemental investigations and follow-up IMs of CVOC "hot spots", as appropriate*
  - *MNA of the LCP with potential IM if the plume expands towards LC37 or the Atlantic Ocean*
- Hydraulic containment system (IM) for DSZ installed in December 2009

Geosyntec consultants

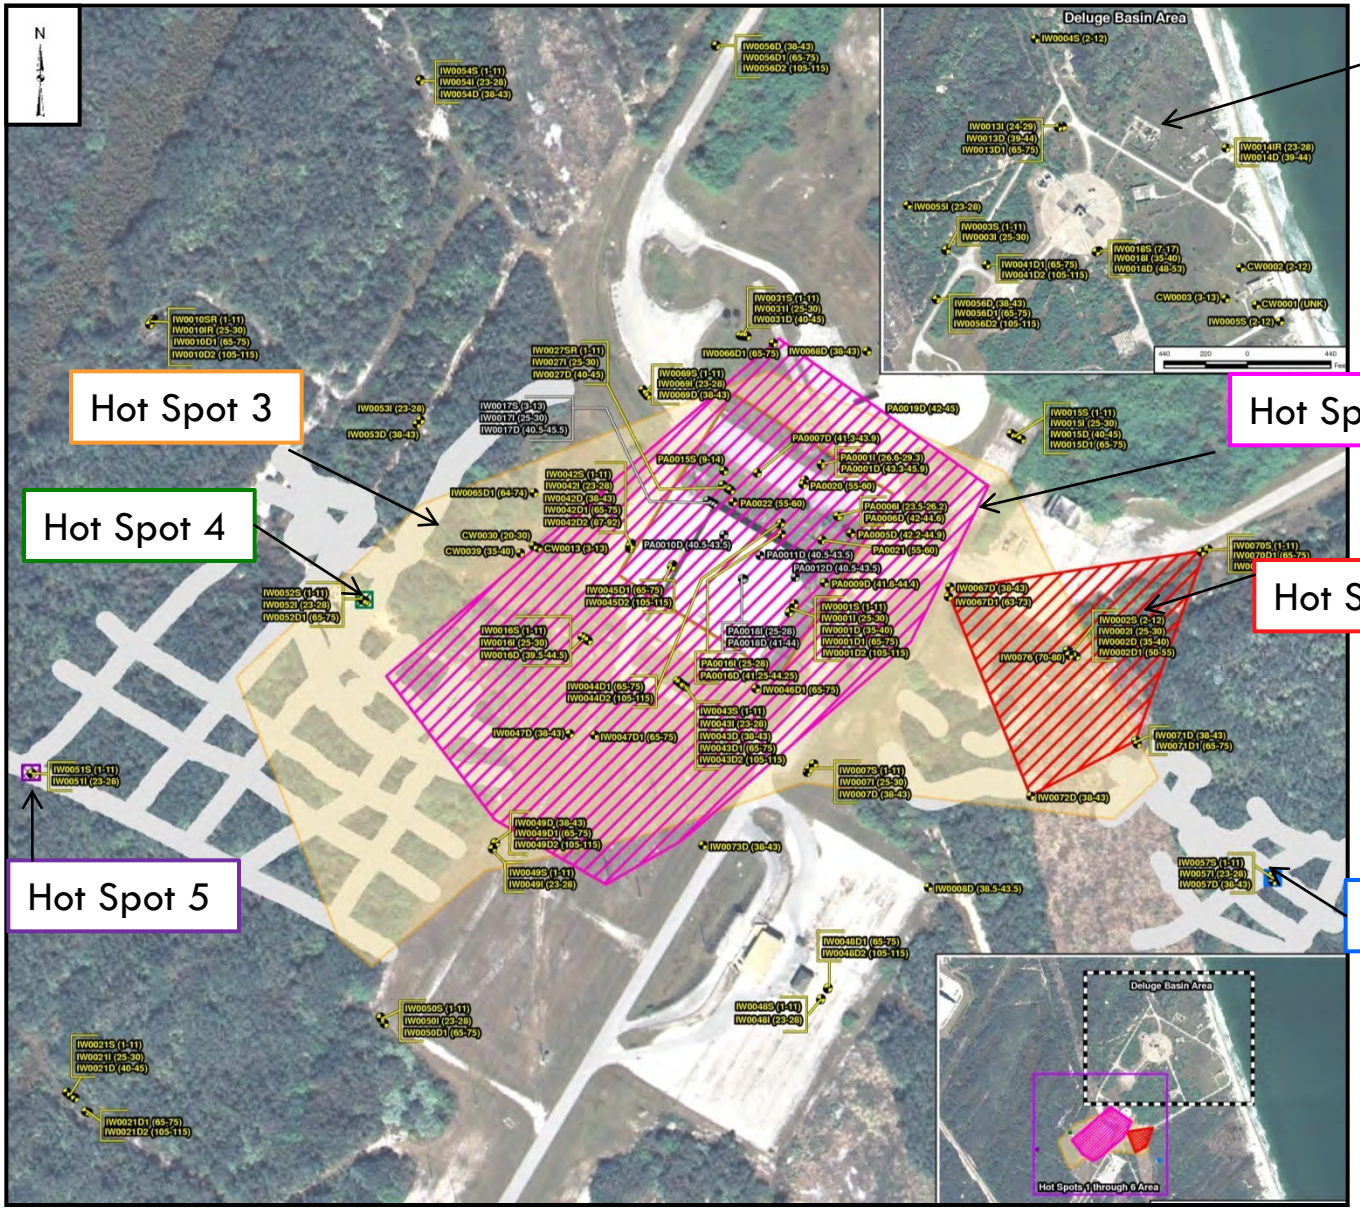
Hot Spot Definitions

- The term "Hot Spot" is not 10X NADC for this site
  - *Based on areas of interest/investigation*
- Hot Spot 1: the area around monitoring well IW0002D, based on historical fluctuating concentrations of TCE
- Hot Spot 2: the interval of TCE impacted groundwater surrounding the ESB in the 60 to 80 ft BLS interval
- Hot Spot 3: the interval of TCE impacted groundwater outside the DSZ surrounding the ESB in the 16 to 30 ft BLS interval
- Hot Spot 4: the area around monitoring well IW52S, based on historical fluctuating concentrations of TCE

Site Overview and Background
Hot Spots
Goals
Assessment Results
Path Forward
Presentation Focus

engineers | scientists | innovators

Geosyntec consultants



Hot Spot Definitions

- Hot Spot 5: the area around monitoring well IW51S, based on high concentrations of cDCE
- Hot Spot 6: the area around monitoring wells IW57S and IW57I - based on initial high concentrations of TCE detected IW57S and cDCE concentrations detected from both monitoring wells
- Deluge Basin Area: area chosen to investigate if impacts present from former launch activities (flushing of engines)

Current Status of Hot Spot Investigations

- Step 1 for Hot Spot 1 completed Aug 2008 and Oct 2009
- PED IM Work Plan for Hot Spot 1 presented in May 2010 and implemented in January 2011 (ongoing)
- Hot Spot 2 was included in the hydraulic containment system IM
- Current ADP focuses on assessment of Hot Spots 3 and 4
  - *Includes data collected to-date from other hot spots*

Geosyntec consultants

Goals of Presentation

- Present Step 1 Engineering Evaluation for Hot Spots 3 and 4
  - *Investigation of areas where other source areas could exist outside of DSZ*
  - ***Focused on delineation of parent material (TCE), since hot spots are located within larger HCP and LCP of site (cDCE and VC)***
  - *Presentation of data includes the latest LTM groundwater sampling results*
    - LTM data and DPT data combined to create updated overall contours for the site (see insets on panel maps)
- Discuss path forward
- Obtain Team consensus

Geosyntec consultants

Summary of Assessment Activities

Site Overview and Background

Hot Spots

Goals

Assessment Results

Path Forward

- MIP profiles collected in June and July 2008
  - *18 locations around ESB*
- DPT groundwater sampling performed from June 2008 to Sept 2011
  - *271 locations with 1,224 samples (all hot spots)*
  - *Sample intervals generally 6 to 10, 11 to 15, 16 to 20, 23 to 27, 36 to 40, and 56 to 60 ft BLS*
- Maximum concentrations outside DSZ
  - *TCE = 263,000 µg/L (DPT133; 23 to 27 ft BLS)*
  - *cDCE = 367,000 µg/L (DPT233; 23 to 27 ft BLS)*
  - *VC = 81,000 µg/L (DPT69; 16 to 20 ft BLS)*

Hot Spots

Goals

Assessment Results

Path Forward

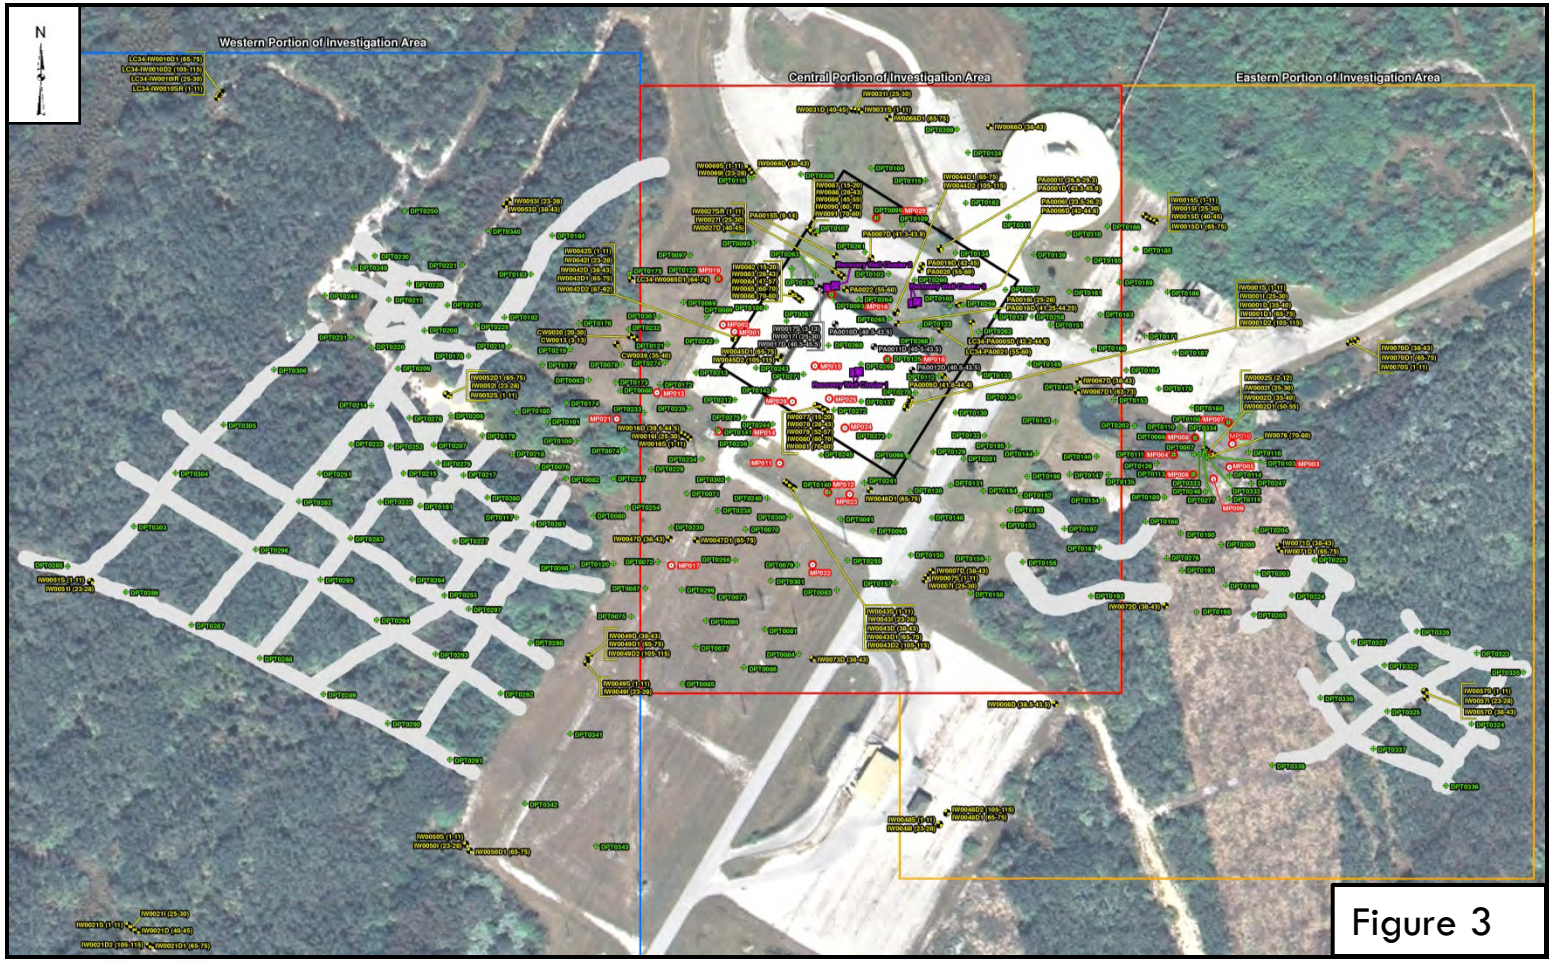

Figure 3

Spider diagrams included as Figures 4, 5 and 6 (not included in presentation)

MIP Results

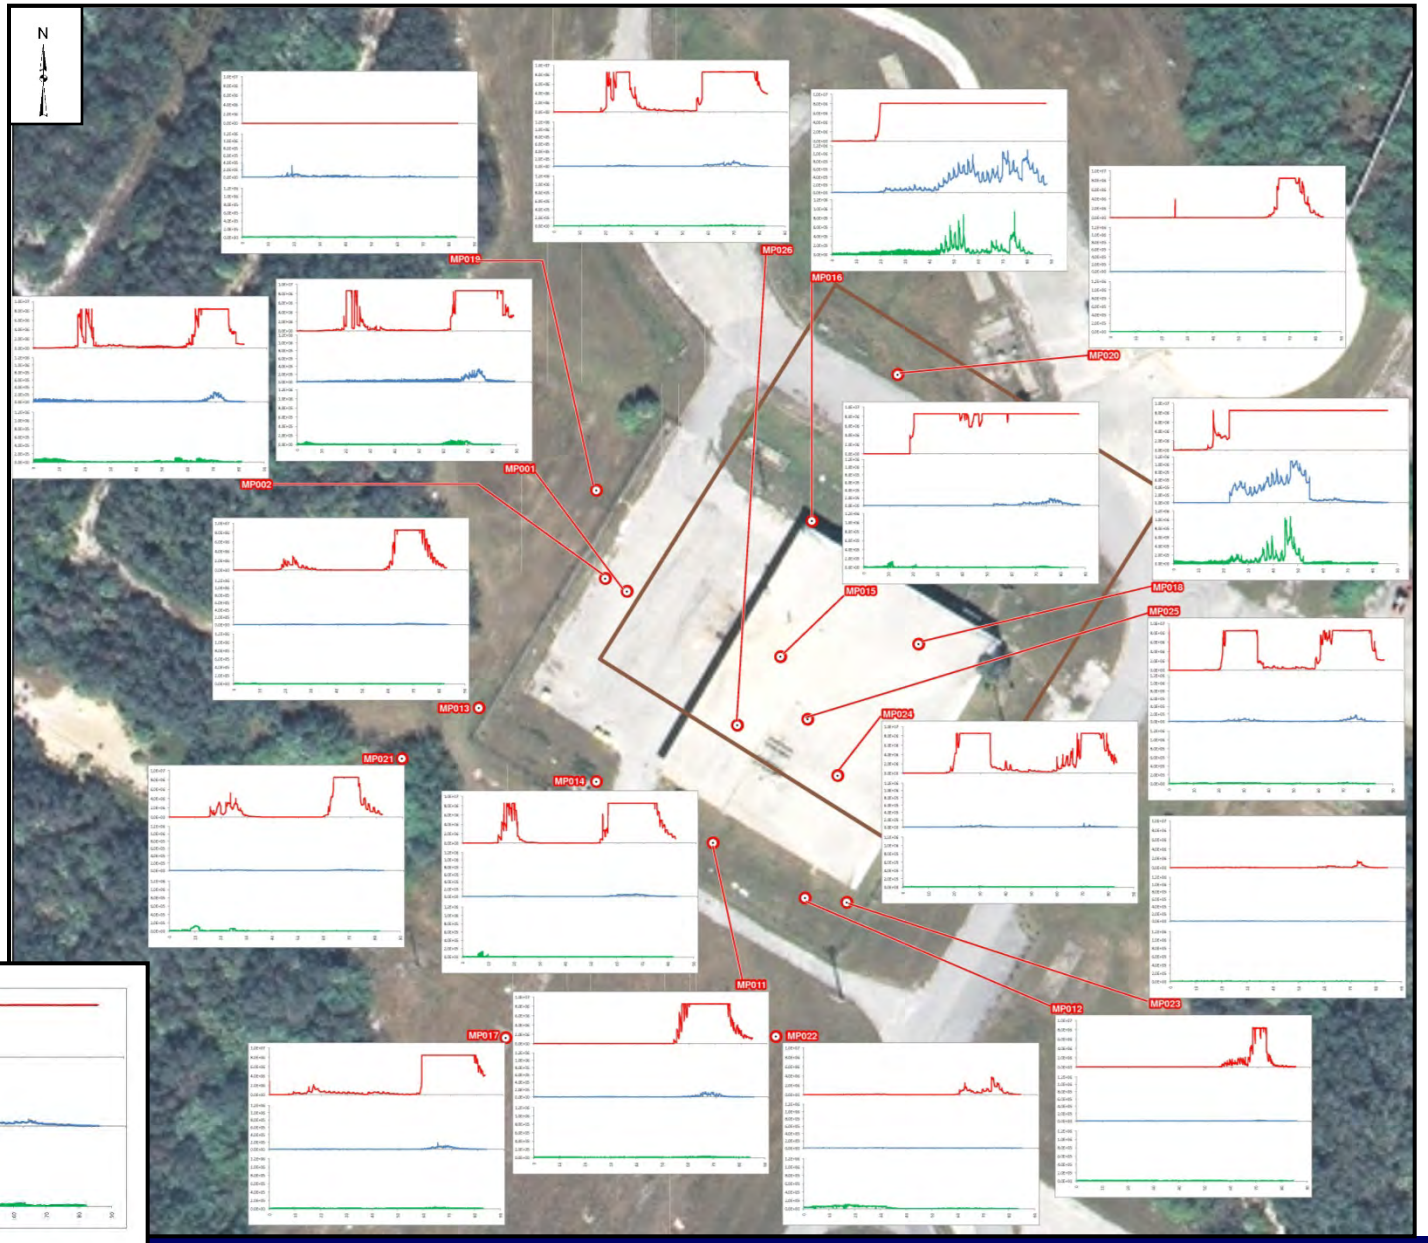

Figure 7

Geosyntec consultants

MIP Results

- MIP profiles (outside DSZ area) identified impacted intervals/dissolved plume transport zones
  - *16 to 27 ft BLS (Hot Spot 3)*
  - *60 to 80 ft BLS (Hot Spot 2)*
- DPT sampling intervals chosen based on MIP results

Geosyntec consultants

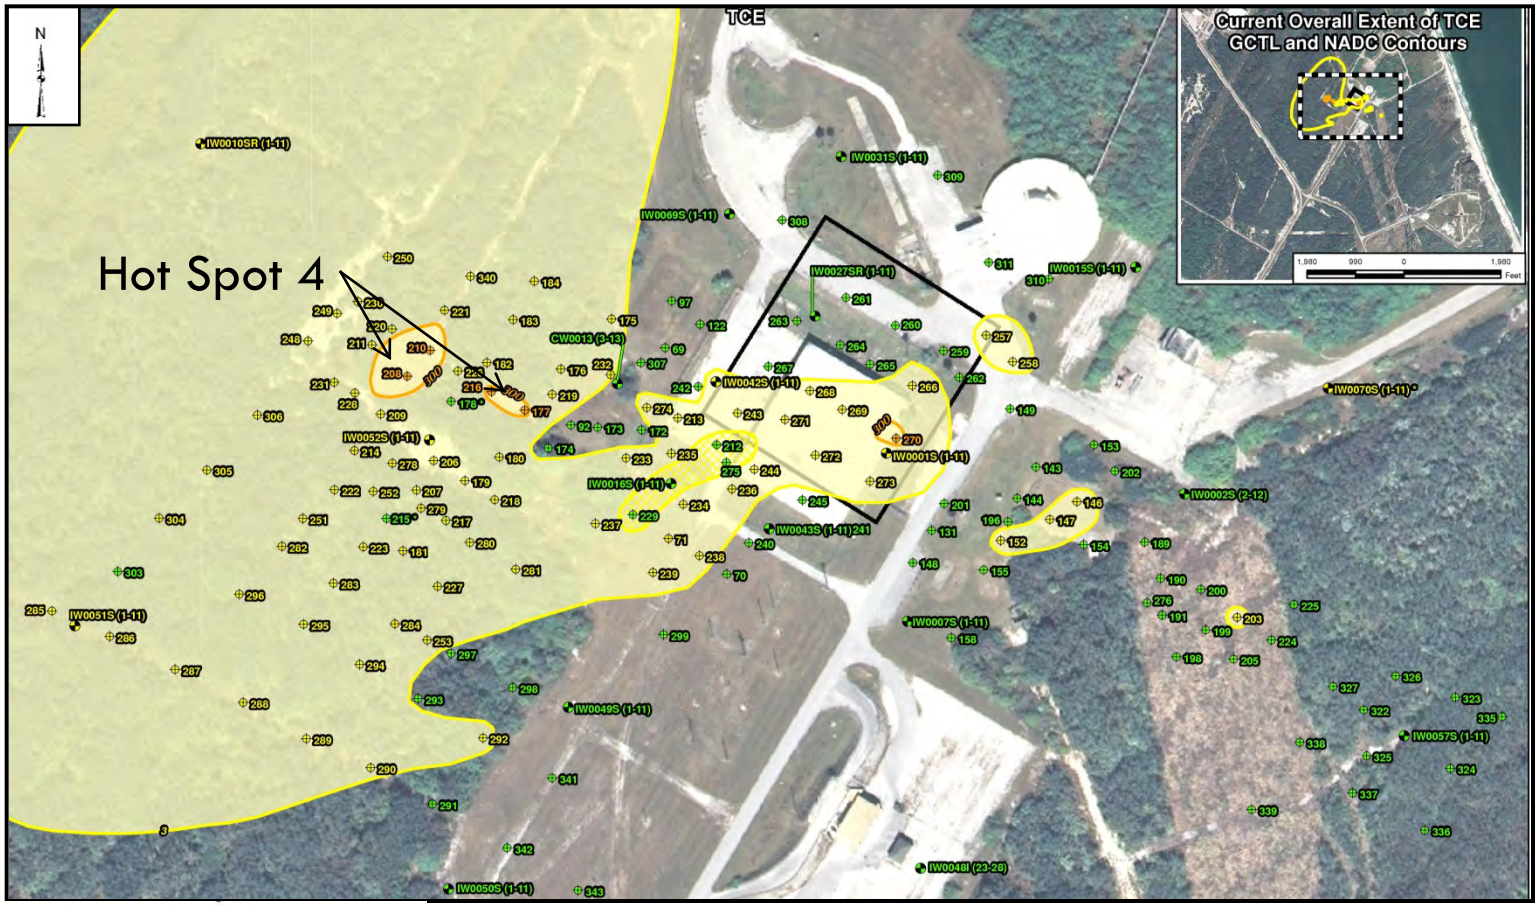
Interval Maps Information

- Hot Spot delineation based on TCE NADC line as done for Hot Spot 1 and Hot Spot 2
- Only TCE maps presented in this ADP, but cDCE and VC maps included on attached figures and as back up slides at end of presentation
  - *Also only presenting TCE EVS, but cDCE and VC included on CD*
- On interval maps, the DPT number is next to location – no data presented

Geosyntec consultants

Response to Comments

- Arcadis comment: elevated detection limits of TCE and is there horizontal delineation southwest of DPT87
  - *If a sample result has an elevated detection limit, Geosyntec assumes that the result is one half the detection limit*
  - *DPT166, DPT162, DPT104 are included within the 300 ppb contour in Hot Spot 3 because one half the detection limit is greater than 300 ppb*
  - *DPT311, DPT308 and DPT97 are not included within the 300 ppb contour because one half the detection limit is less than 300 ppb*
  - *Confirmation of the TCE at these locations is not necessary and will not materially alter the big picture dissolved plume interpretation and/or path forward for the site*
  - *There is horizontal delineation southwest of DPT87, which is shown on Figure 10 and Figure 11*
    - DPT75, DPT298 and DPT297 are all located southwest of DPT87 and sample results are less than 300 ppb



Geosyntec consultants

6 to 10 ft Interval

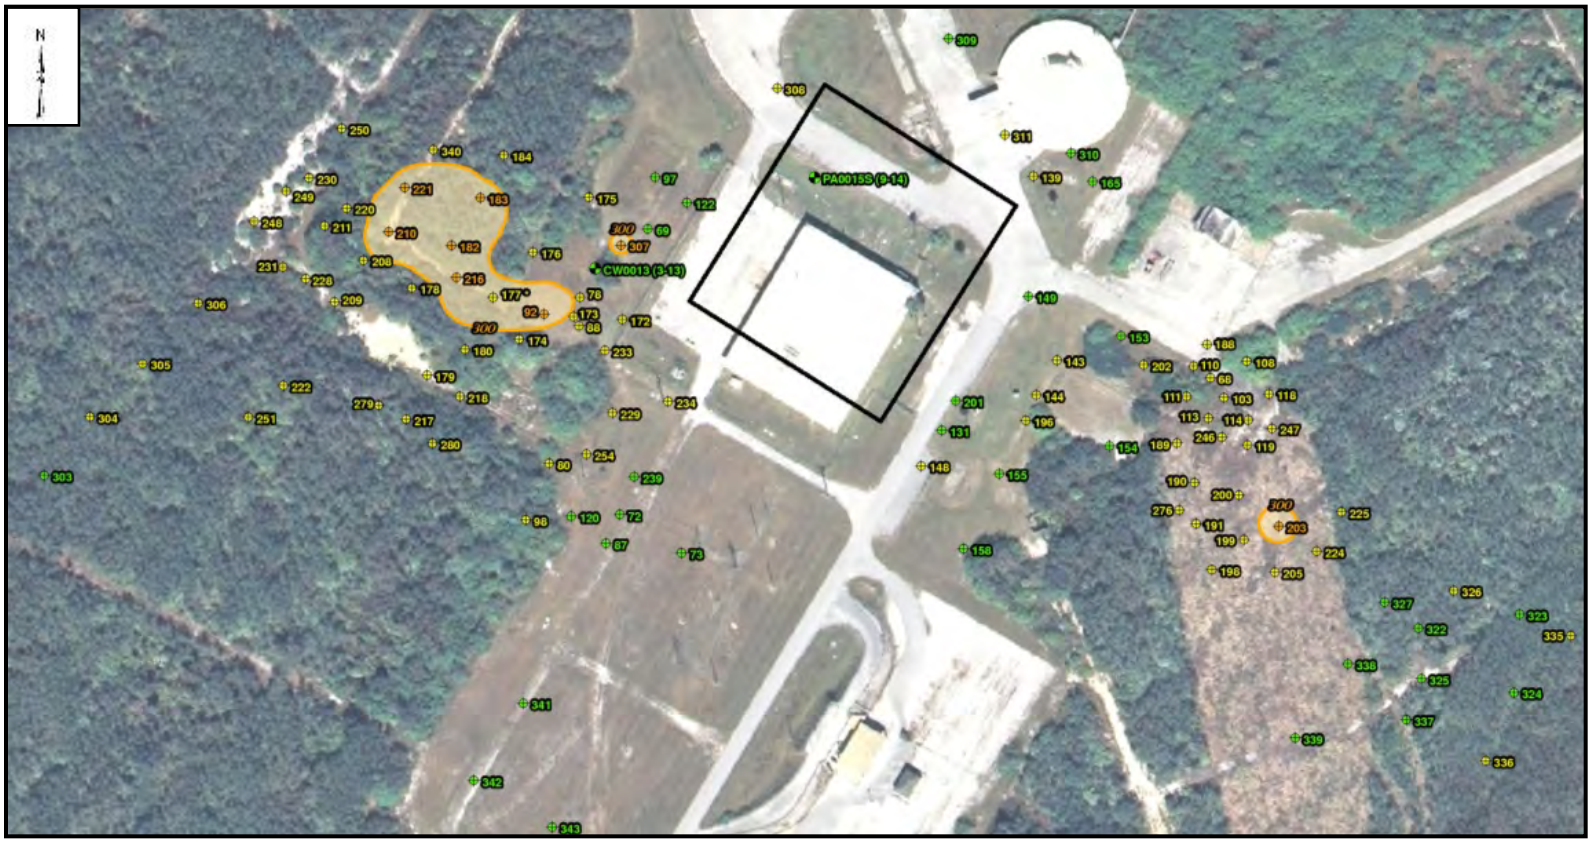
- Sampled to investigate Hot Spot 4 – area around IW52S (1 to 11 ft BLS)
- Monitoring well network shown with screen intervals in 6 to 10 ft BLS interval below with area of DPT investigation

TCE 6 to 10 ft BLS

See Figure 8 for full legend

Geosyntec consultants

11 to 15 ft Interval



- Sampled to provide additional data for Hot Spot 3 – 16 to 20 and 23 to 27 ft BLS intervals
- Monitoring well network with screen intervals in 11 to 15 ft BLS interval shown below with area of DPT investigation – only two wells in this interval

Geosyntec consultants

6 to 10 ft BLS Results

- TCE above NADC identified at DPTs 177, 208, 210 and 216
  - *Max concentration 2,000 µg/L at DPT208*
  - *Possible this area is responsible for fluctuating TCE concentrations in IW52S*
- Areas delineated fit within CSM from CMS
- Test consensus on delineation of TCE 300 µg/L within Hot Spot 4

Site Overview and Background
Hot Spots
Goals
Assessment Results

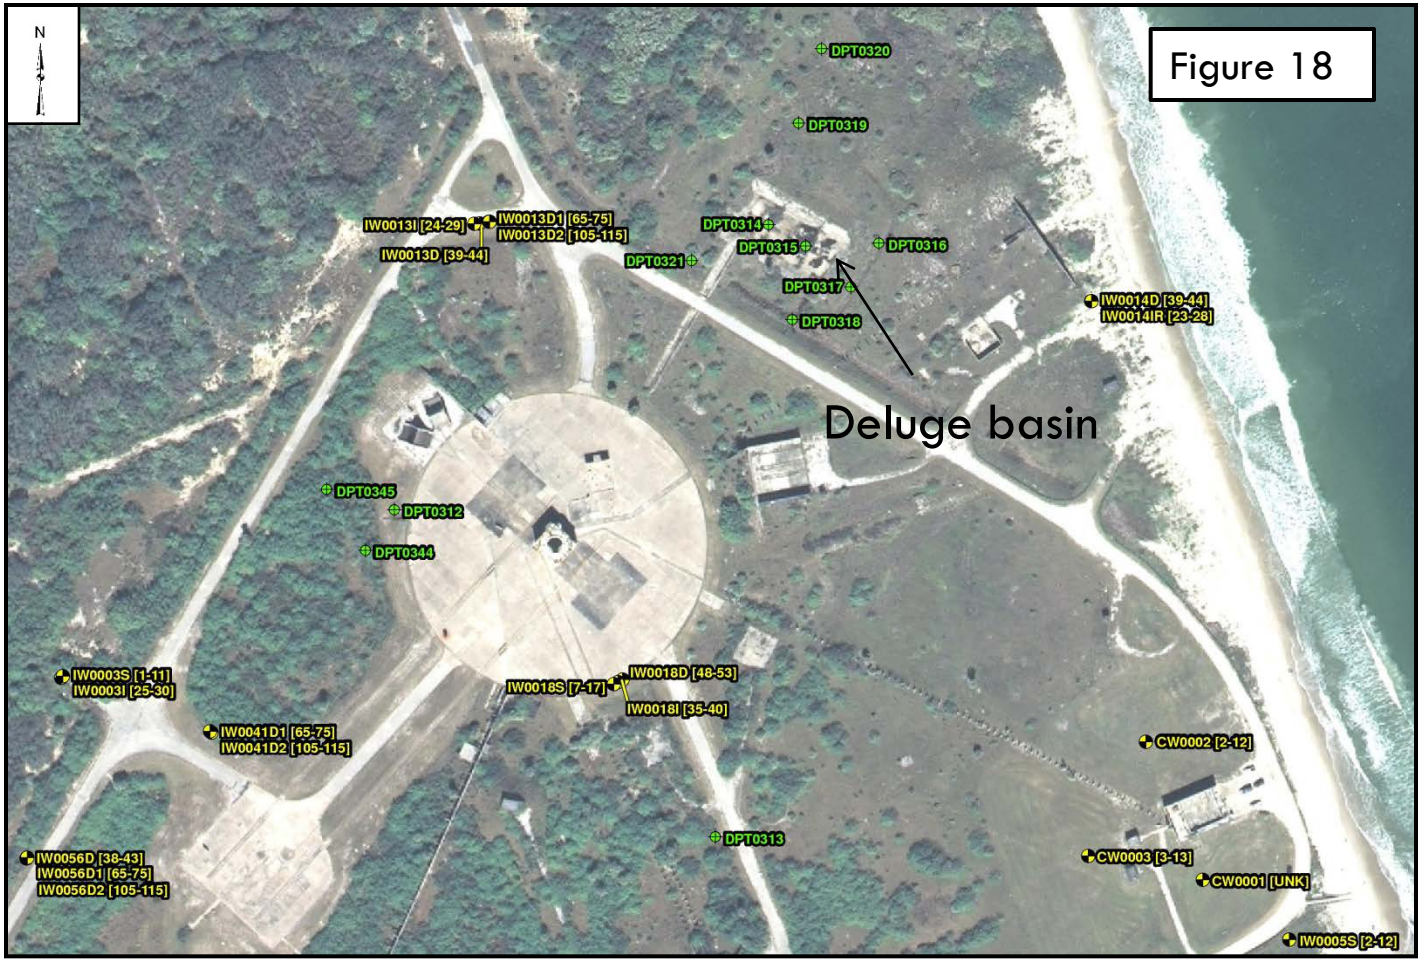
Geosyntec consultants

11 to 30 BLS Results

- 11 to 15 and 16 to 20 ft BLS interval separated to show that most of mass is present in 16 to 20 ft BLS interval
- Difficult to compare results from 11 to 20 ft interval to CSM due to lack of monitoring wells in this zone
- Impacted interval generally from 11 to 30 ft BLS
  - *One location in drain field (DPT135) in 35 to 45 ft BLS interval with TCE concentrations > NADC (6,100 µg/L)*
  - *Sampled deeper and results were 1.0 U*

Geosyntec consultants

11 to 30 BLS Results



- Test consensus on delineation of TCE 300 µg/L in 11 to 15 and 16 to 20 ft BLS interval
- In 20 to 30 ft BLS interval, areas delineated fit within CSM from CMS
- Test consensus on delineation of TCE in Hot Spot 3

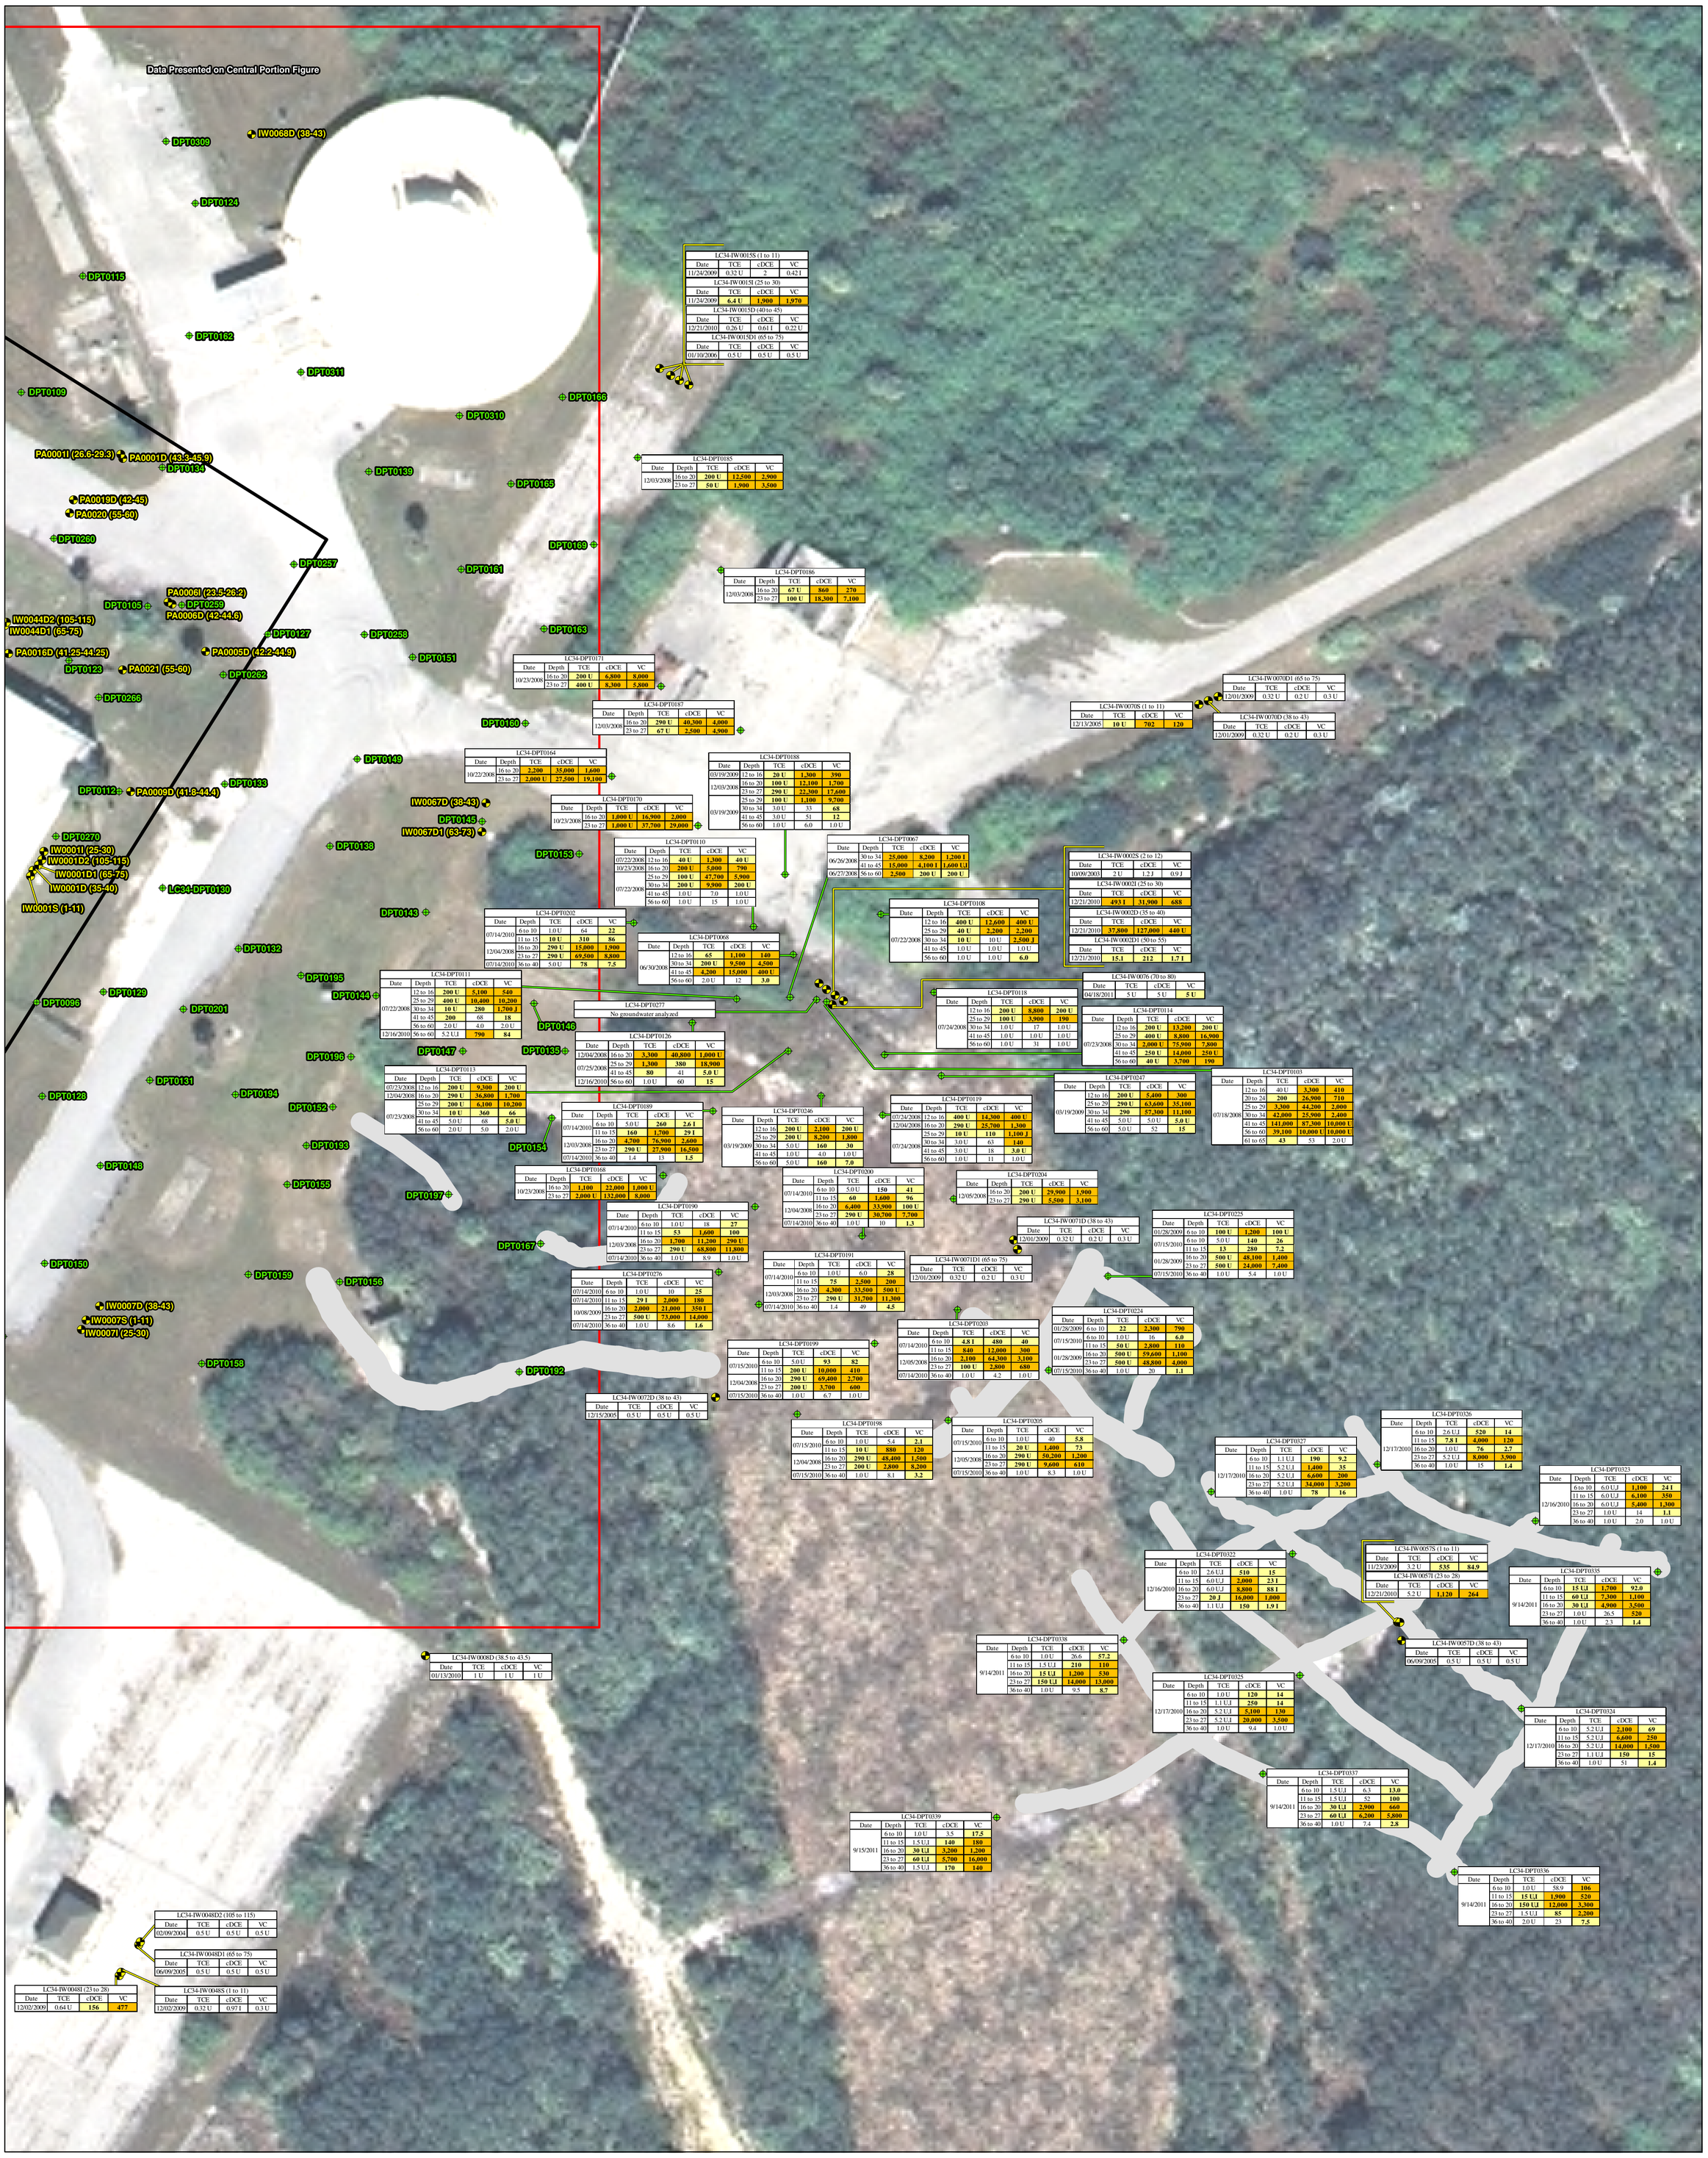

Figure 6
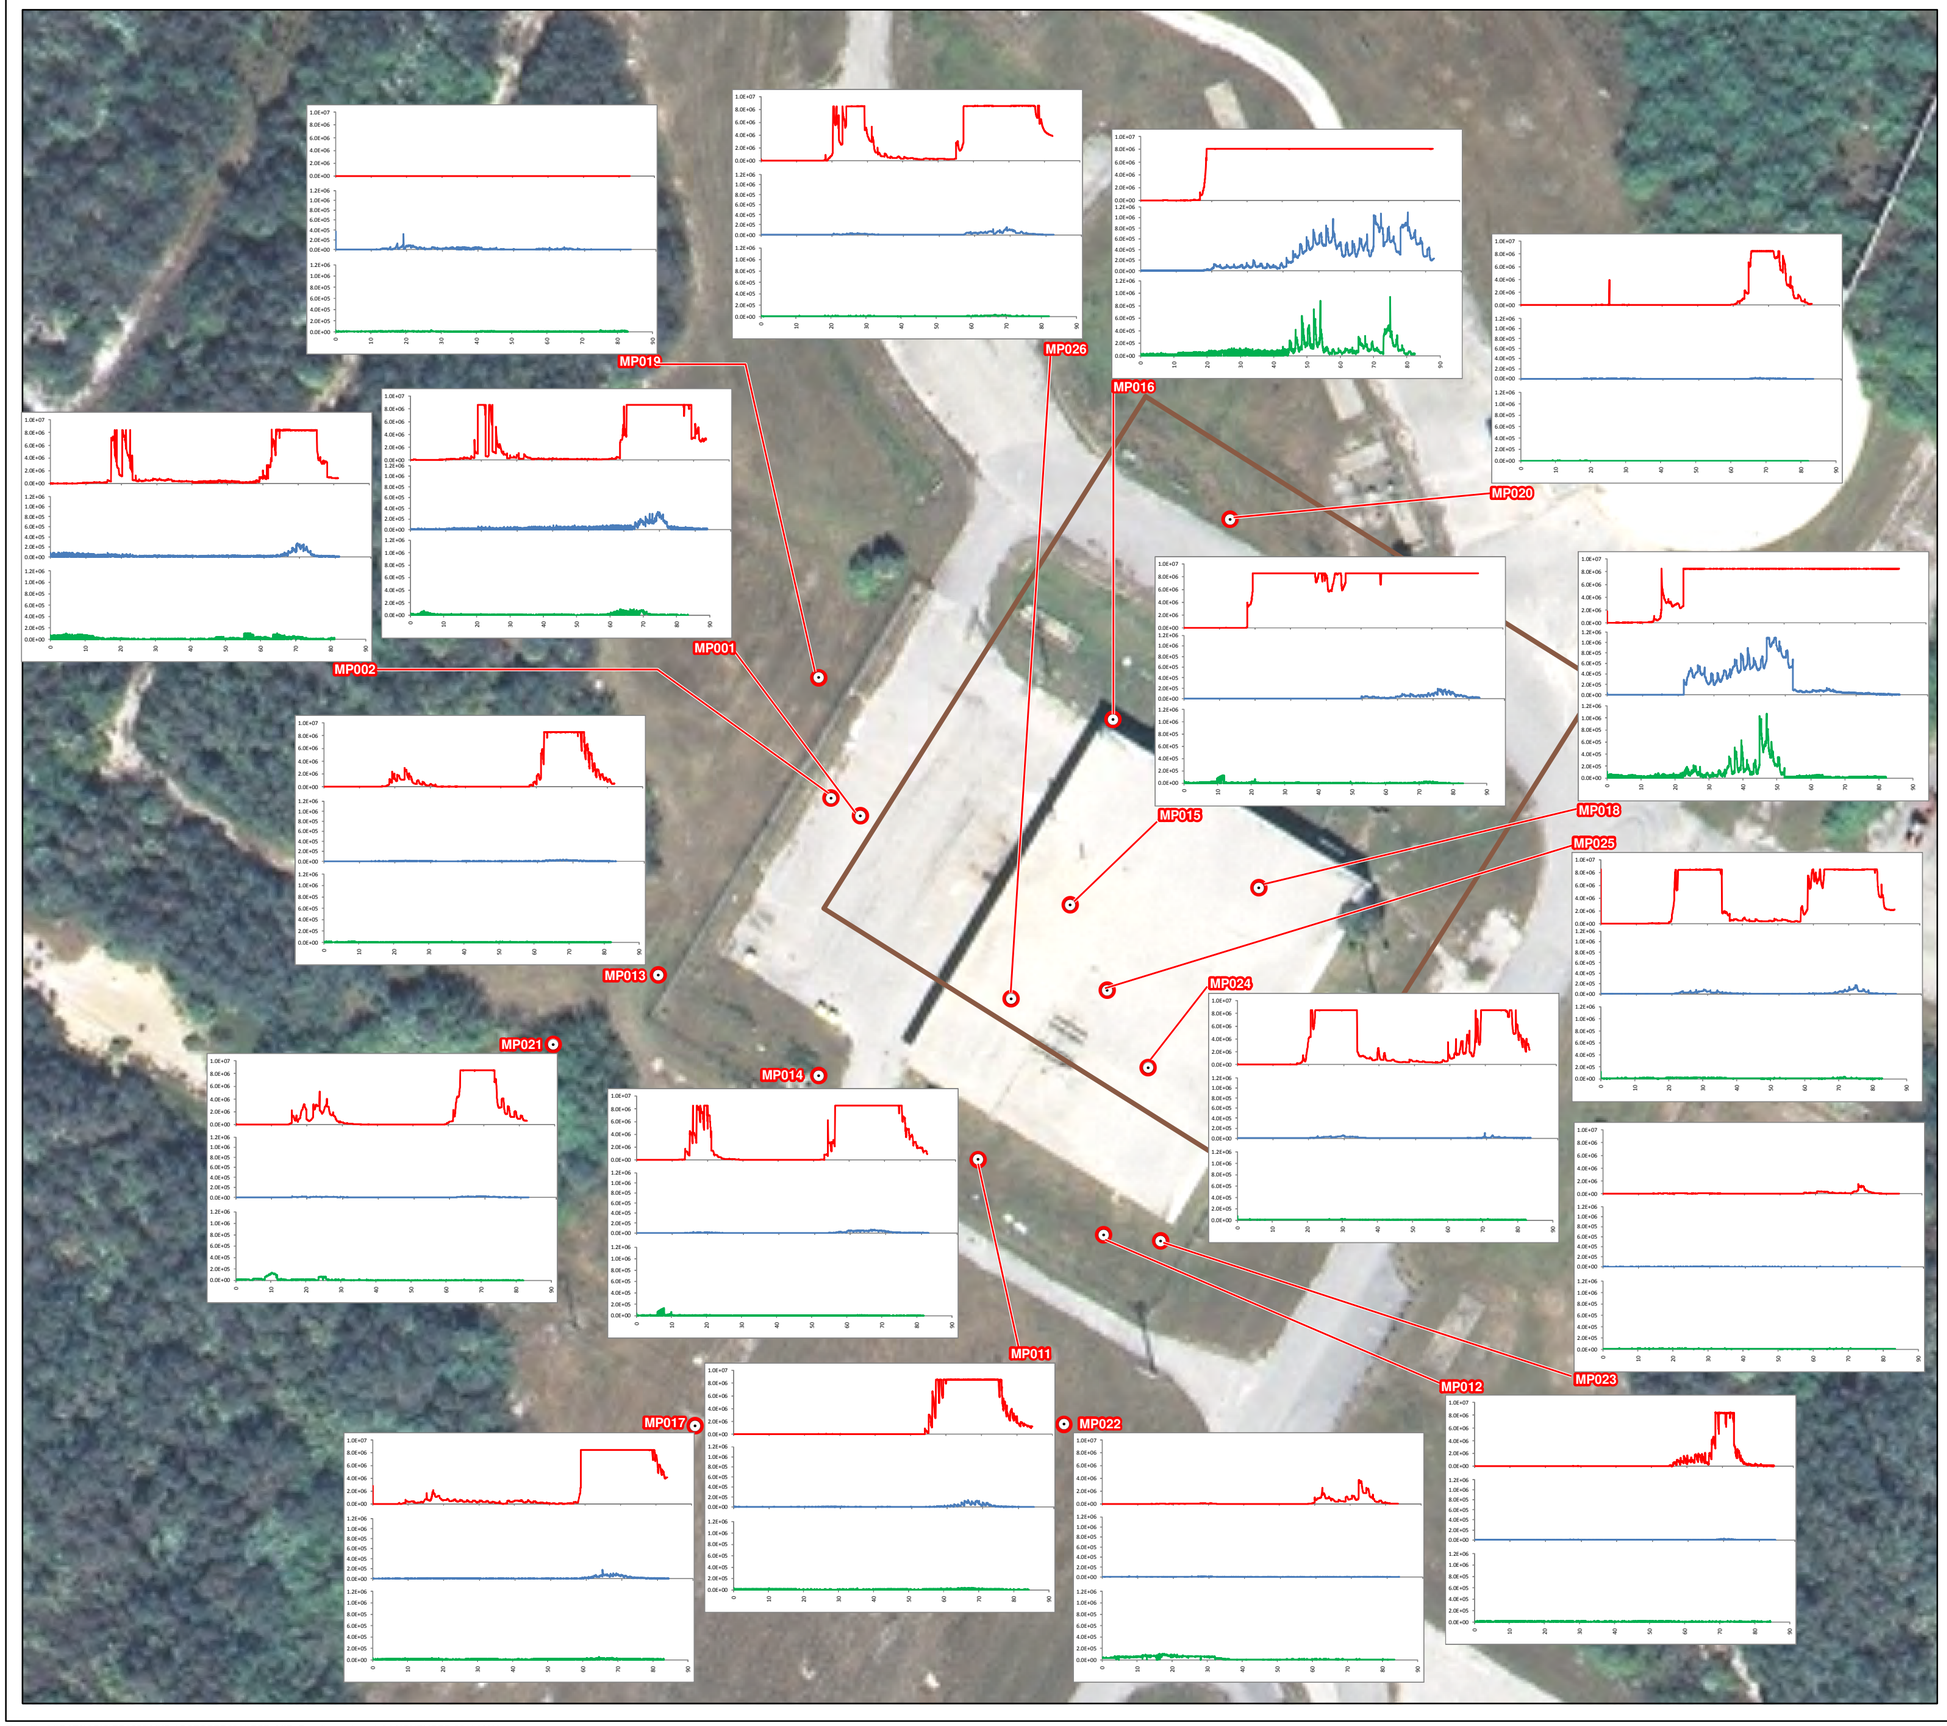
Summary of VOC Results - Eastern Portion of Investigation Area

Legend

- DPT Sampling Location
- Monitoring Well Location
- Cleared Path
- DNAPL Source Zone
- Central Portion of Site



Notes:
1. Depth is presented in feet below land surface (ft BLS).
2. Results are presented in micrograms per liter (µg/L).
3. Yellow shading indicates exceedance of the Florida Department of Environmental Protection (FDEP) Groundwater Cleanup Target Level (GCTL).
4. Orange shading indicates exceedance of the FDEP Natural Attenuation Default Concentration (NADC).
5. I indicates result above the detection limit, but below the reporting limit.
6. J indicates estimated value.
7. U indicates result below detection limit.
8. Please note widths of trails are approximate.
9. Data presented does not reflect interim measures being implemented in Hot Spot 1.

Screening Criteria

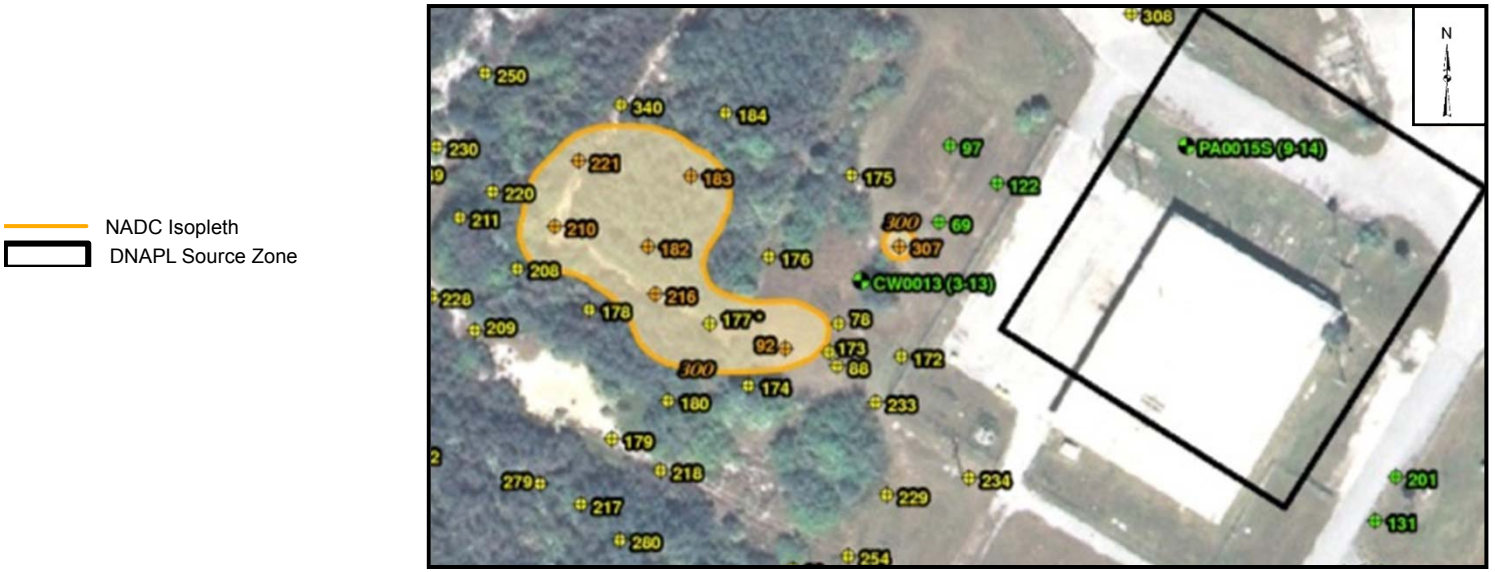
Presentation Outline

- Delineation summary
- Site conditions
- List of technologies
- Technologies retained
- Test consensus

Delineation Summary

- Hot Spot 4 – TCE > 300 µg/L 6 to 10 ft BLS
  - *Area = 0.2 acres*
  - *Max concentration TCE = 2,000 µg/L (DPT208)*
  - *Estimated TCE mass present = 0.76 lb dissolved; 0.31 lb sorbed*



Note: Pore volume calculated using area x depth interval x porosity (0.25). Dissolved mass calculated using average concentration (1,100 µg/L) x pore volume. Sorbed mass calculated using equilibrium partitioning of average concentration to soil using literature Koc (126) and foc from CMS (0.0005). Sorbed mass is considered a conservative high estimate.

Delineation Summary

- Hot Spot 4 – TCE > 300 µg/L 11 to 15 ft BLS
  - *Area = 0.7 acres*
  - *Max concentration TCE = 2,400 µg/L (DPT182)*
  - *Estimated TCE mass present = 3.6 lbs dissolved; 1.5 sorbed*

Note: Pore volume calculated using area x depth interval x porosity (0.25). Dissolved mass calculated using average concentration (1,500 µg/L) x pore volume. Sorbed mass calculated using equilibrium partitioning of average concentration to soil using literature Koc (126) and foc from CMS (0.0005). Sorbed mass is considered a conservative high estimate.

Delineation Summary

- Hot Spot 3 – TCE > 300 µg/L 16 to 30 ft BLS
  - *Area = 7.0 acres*
  - *Max concentration TCE = 263,000 µg/L (DPT133)*
  - *Estimated TCE mass present = 1,400 lbs dissolved, 570 lbs sorbed*

DNAPL Source Zone

Note: Dissolved mass calculated using EVS. Sorbed mass calculated using equilibrium partitioning of average concentration (9,000 µg/L) to soil using literature Koc (126) and foc from CMS (0.0005). Sorbed mass is considered a conservative high estimate.

Geosyntec consultants

Response to Comments

- Tetra Tech comment 1: how were average concentrations developed? Disagree with our sorbed mass estimate.
  - *Average concentrations were calculated by averaging the TCE concentrations in the TCE greater than 300 µg/L area (excluding the DSZ)*
  - *Sorbed mass presented originally was actually soil concentration in mg/kg – the sorbed mass has been updated on the slides*

Response to Comments

- Delineation Summary
- Site Conditions
- Technologies
- Technologies Retained
- Consensus

- Arcadis comment 2: possibility of DNAPL present at locations with high groundwater concentrations outside the DSZ (DPT213 and DPT130)
  - *DSZ was conservatively defined by saturated soil sampling results greater than 100 mg/kg*
  - *Given the size of the DSZ and the amount of mass present, Geosyntec considers the high groundwater concentrations outside the DSZ to be dissolved flux*
  - *Soil sampling results decrease rapidly outside the DSZ*
  - *MIP show no FID response outside DSZ*

Response to Comments

- Arcadis comment 3: requested the area and estimated mass for Hot Spot 3 where concentrations of TCE > 3,000 µg/L
  - *Hot Spot 3 – TCE > 3,000 µg/L 16 to 30 ft BLS*
    - Area = 4.1 acres
    - Estimated TCE mass present = 1,300 lbs dissolved, 500 lbs sorbed
    - Dissolved mass calculated using EVS
    - Sorbed mass calculated using equilibrium partitioning of average concentration (27,800 µg/L) to soil using literature Koc (126) and foc from CMS (0.0005). Sorbed mass is considered a conservative high estimate.

Geosyntec consultants

Site Conditions

- Hydraulic containment system in operation to treat Hot Spot 2 (60 to 80 ft BLS) and DSZ
- PED implemented in Hot Spot 1
- No site impediments for system installation
  - *Exception is piping for current hydraulic containment system*
- Lithology is primarily sand until approximately 45 ft BLS

Technologies Retained

Consensus

- Geochemical parameters from CMS
  - *DO generally less than 0.5 mg/L*
  - *ORP generally from -100 to -200 mV*
  - *TOC ranges from 2 to 18 mg/L*
  - *Methane ranges from 0.5 to 292 µg/L*
  - *pH generally ranges from 6.8 to 7.8 SU*
  - *Sulfate ranges from 2 to 107 mg/L*
- Conditions generally conducive for microbial reductive dechlorination
  - *Data from Hot Spot 1 to aid in design*
  - *Data from DSZ bioremediation pilot support that complete dechlorination is feasible*
- No geochemical data gaps identified warranting collection prior to Step 2 evaluation

Response to Comments

- Tetra Tech Comment 3: Along with site conditions, it would be appropriate to detail design elements and potential limiting factors of the existing containment and treatment system that would be considered in expanding the system to Hot Spot 3 and 4
  - *Geosyntec believes this is more appropriate for a Step 2 EE*

CMS Summary

- The term "Hot Spot" is not 10X NADC for this site
  - *Based on areas of interest/investigation*
- Summary of CMS
  - *Hydraulic containment of the DSZ as an IM*
  - *MNA of HCP and LCP with supplemental investigations and follow-up IMs of CVOC "hot spots", as appropriate*
  - *MNA of the LCP with potential IM if the plume expands towards LC37 or the Atlantic Ocean*
- Modeling from CMS
  - *With 100% DNAPL removal (not feasible)*
    - 150 years to NADC for VC and 300 years to GCTL for VC
  - *With 85% DNAPL removal*
    - 475 years to NADC for VC and 750 years to GCTL for VC

Delineation Summary
Site Conditions
Technologies
Technologies Retained
Consensus

Technology	Screening Result and Rationale
No Action No Further Action	Eliminated – not protective of human health and environment or allowed from a regulatory perspective.
Limited Action (Passive)	
Institutional Controls	Retained – Facility Land Use Controls warranted to prevent exposure to groundwater and/or installation of potable wells.
Monitoring (LTM, MNA)	Retained – continue LTM groundwater program to monitor site conditions or implement MNA program as part of existing LTM program to confirm stability of plume
Action (Aggressive)	
GW Extraction (Hydraulic Containment, pump and treat)	Retained – expansion of current hydraulic containment system and/or construction of parallel system.
Impermeable Barrier	Eliminated - would not provide any treatment of impacted groundwater and could interfere with operation of hydraulic containment system.
Bioremediation (Bioaugmentation, Biostimulation)	Retained – site conditions appear favorable for reductive dechlorination and is currently being implemented in Hot Spot 1.
Large Diameter Auger (LDA) (solidification, steam, EZVI approaches)	Eliminated – mass present is primarily dissolved flux from DSZ, no source area treatment.
Air Sparge/Soil Vapor Extraction	Retained – effective treatment above Layer 4 for volatilization of CVOCs

Technology	Screening Result and Rationale
Action (Aggressive)	
Multiphase Extraction (MPE)	Eliminated – no significant vadose zone impacts, high energy use if deployed for groundwater dewatering/extraction.
Heating Technologies	Eliminated – Steam and Six phase heating deployed as part of IDC demonstrations; however, mass is mainly dissolved flux from DSZ and presence of dissolved plume over large area.
Oxidation Technologies	Eliminated – during IDC demonstrations technology implemented successfully ($KMnO_4$), but rebound and tailing effects observed.
EZVI	Eliminated – Technology better suited for focused DNAPL source zones not dissolved CVOCs and/or mass diffused into lower permeability zones.
Co-Solvent Flushing	Eliminated – Technology better suited for focused DNAPL source zones.
Electrokinetic (EK) Enhanced Bio or ChemOx	Eliminated – Technology better suited for focused uniform distribution of e-donor, microbial culture, or oxidant in limited footprint areas with high level of heterogeneity and diffused mass/DNAPL in low permeability zones
Excavation	Eliminated – Technology better suited for focused DNAPL source zones

- Technologies Retained:
  - *Institutional Controls*
  - *Monitoring*
  - *Hydraulic containment/pump and treat*
  - *Bioremediation*
  - *Air sparging*

Delineation Summary

Site Conditions

Technologies

Technologies Retained

Consensus

- Tetra Tech comment 2: how will piping from the drain fields be managed if they are encountered? Were line-of-sight interferences considered while determining that impediments were not present?
  - *Piping runs should not be a hinderance to installation; line-of-sight and piping runs will be considered during Step 2 and Step 3 EE*
- Tetra Tech comment 4: Step 2 should include cost benefit analysis and life cycle evaluations
  - *Agree- the Step 2 EE should consider the cost-benefit analysis for the alternatives evaluated, and the net benefit (if any) with regards to cleanup timeframes*

Geosyntec consultants

Consensus/Path Forward

Delineation Summary

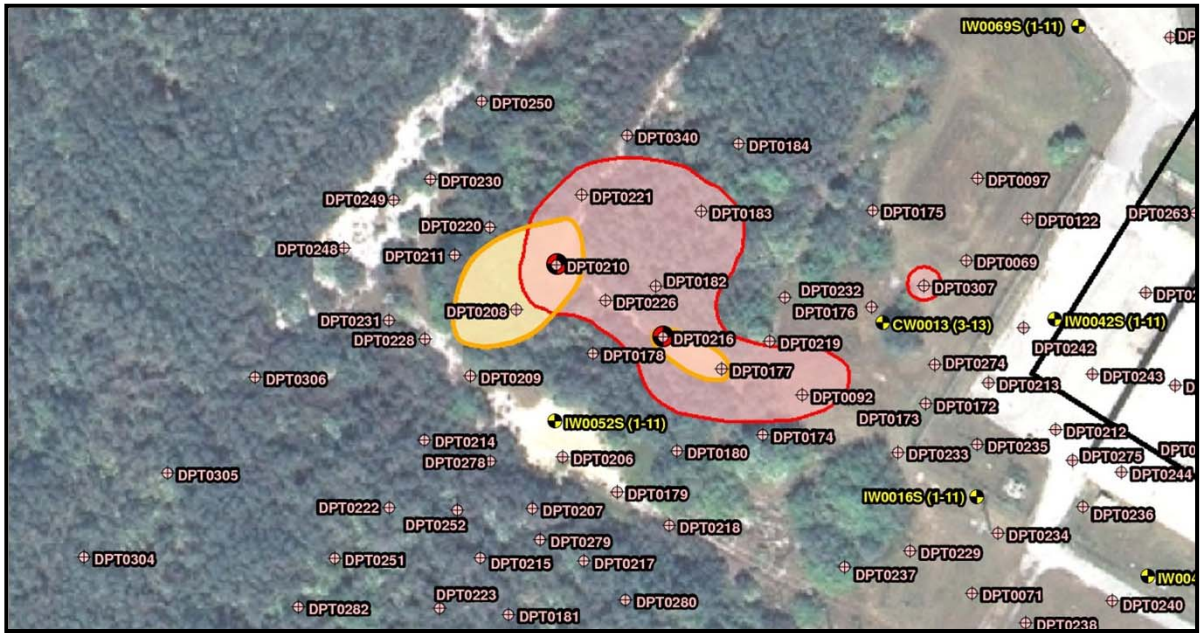
Technologies Retained
Consensus

- Test consensus
  - *Institutional controls (default component of all alternatives)*
  - *Evaluate MNA, GW extraction, bioremediation and air sparging*
    - 16 to 30 ft BLS interval (Slide 8)
  - *Install monitoring wells in Hot Spot 4 to evaluate TCE concentrations above NADC in 6 to 10 and 11 to 15 ft BLS interval*
    - Evaluate MW results
    - If MW results are above NADCs, bring results back to Team and discuss performing a Step 2 EE on those areas or incorporate into above evaluation



Geosyntec consultants

Response to Comments

- Tetra Tech comment 5 – provide monitoring well locations and sampling plan for Hot Spot 4
  - *See next slide*
- Tetra Tech comment 6 - It is not clear if the technology consensus bullet is only for Hot Spot 3. Please clarify this consensus statement. At this stage, is consensus requested for Hot Spot 4 technologies or will this be deferred until proposed monitoring well results are obtained?
  - *The technology consensus bullet is for Hot Spot 3 only*
  - *The next bullet test consensus for installing monitoring wells in Hot Spot 4, monitoring, and bringing results back to Team*

Geosyntec consultants

Consensus/Path Forward

- Install monitoring wells at DPT210 and DPT216
- Sample for VOCs to confirm concentrations
  - *If concentrations > NADC, sample semi-annually for VOCs*
  - *If concentrations < NADC, sample annually for VOCs*
  - *If after 4 sampling events concentrations > NADC return to team to reevaluate path forward*

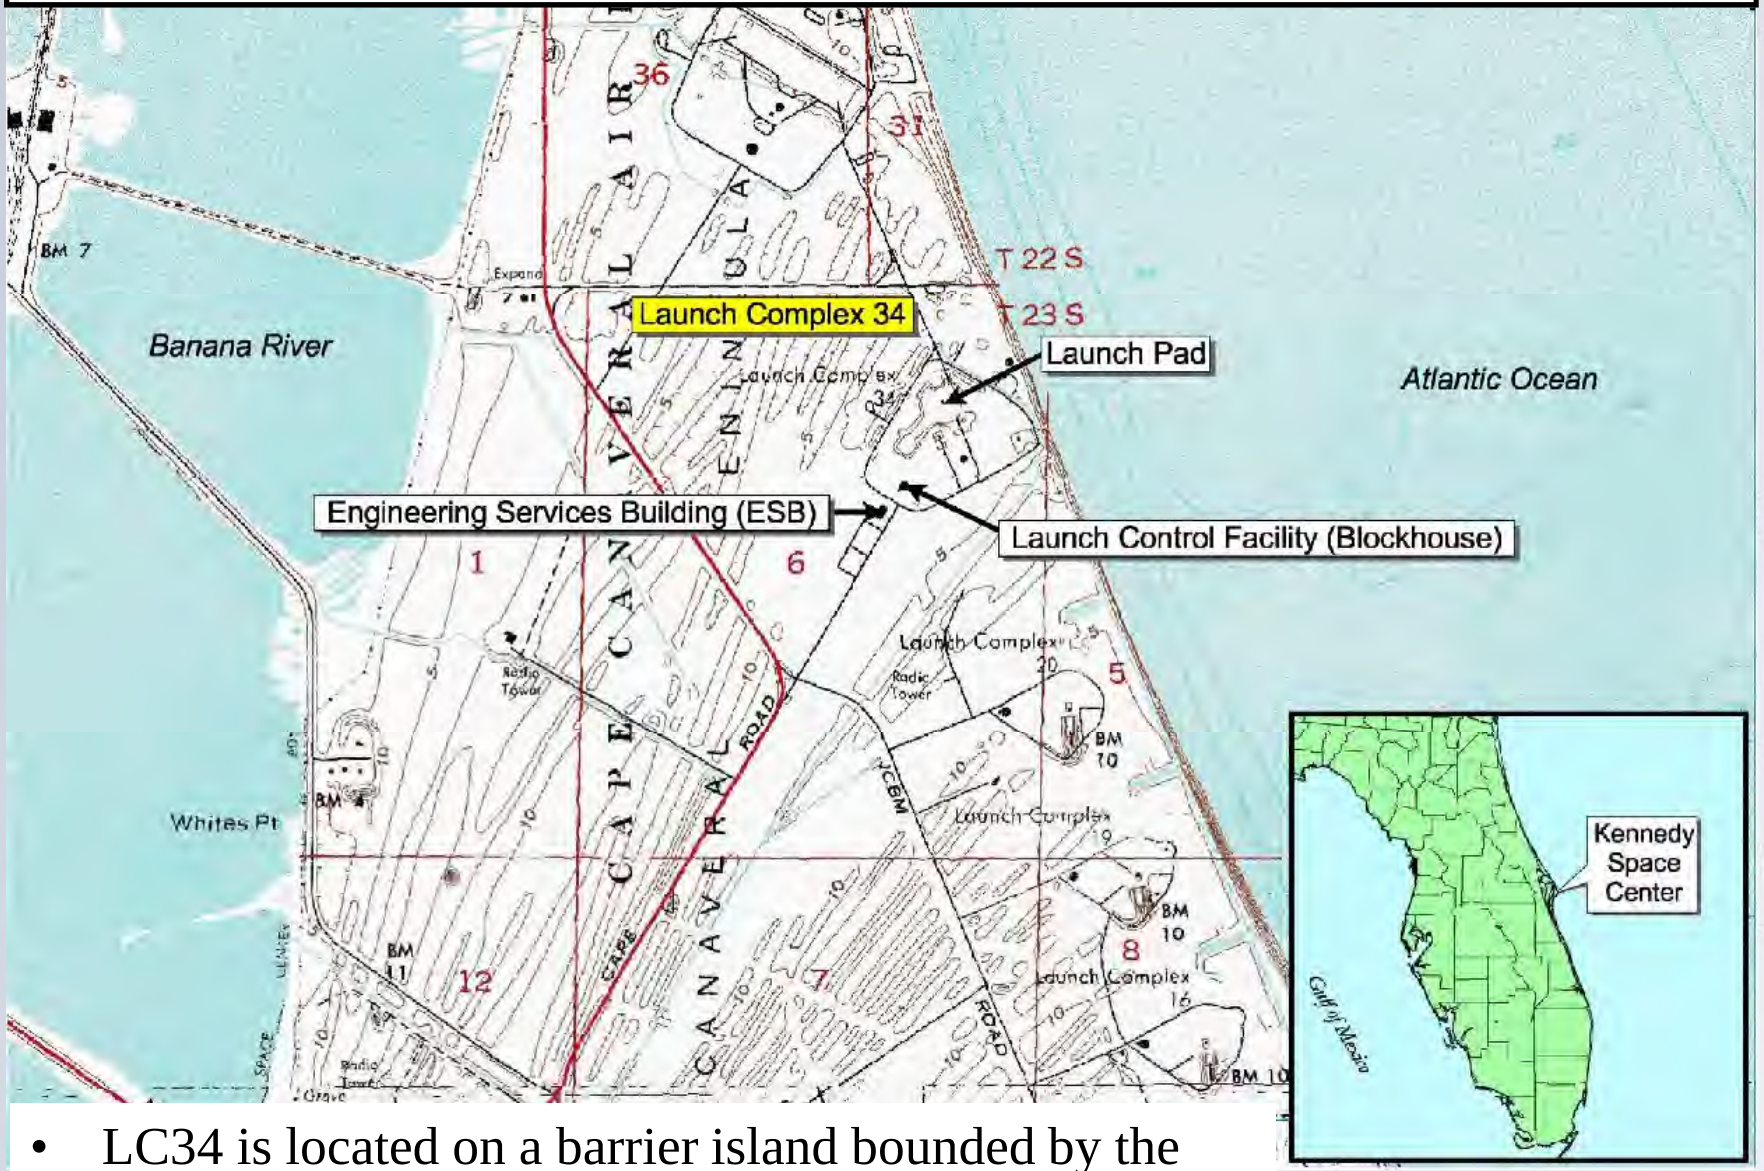
TETRA TECH

Presentation Part 1 Objectives

Purpose: Present Membrane Interface Probe (MIP) and Hydraulic Profiling Tool (HPT) Field Events and Pumping Optimization

- Site Overview
- Overview of ongoing IM
- MIP/HPT Pre-design Investigation
  - Results presentation
  - Comparison of pre-IM MIP
  - Mobile/stored mass signatures
- Optimization of existing pumping network
- Request consensus on Step 4C, Part 1 (pumping optimization)

TETRA TECH



Presentation Part 2 Objectives

Purpose: Detail recovery well expansion, treatment modification, and implementation

- Hot Spot (HS) 3/4 and deep zone expansion
  - Groundwater flow model
  - Recovery well placement and construction
  - Flow budget
  - Process modifications
  - Permitting
  - Implementation Work Plan
  - Construction overview
- Request consensus on Step 4C, Part 2 (expansion and process modification)

TETRA TECH

LC34 Major Site Features

- LC34 is located on a barrier island bounded by the Atlantic Ocean and the Banana River

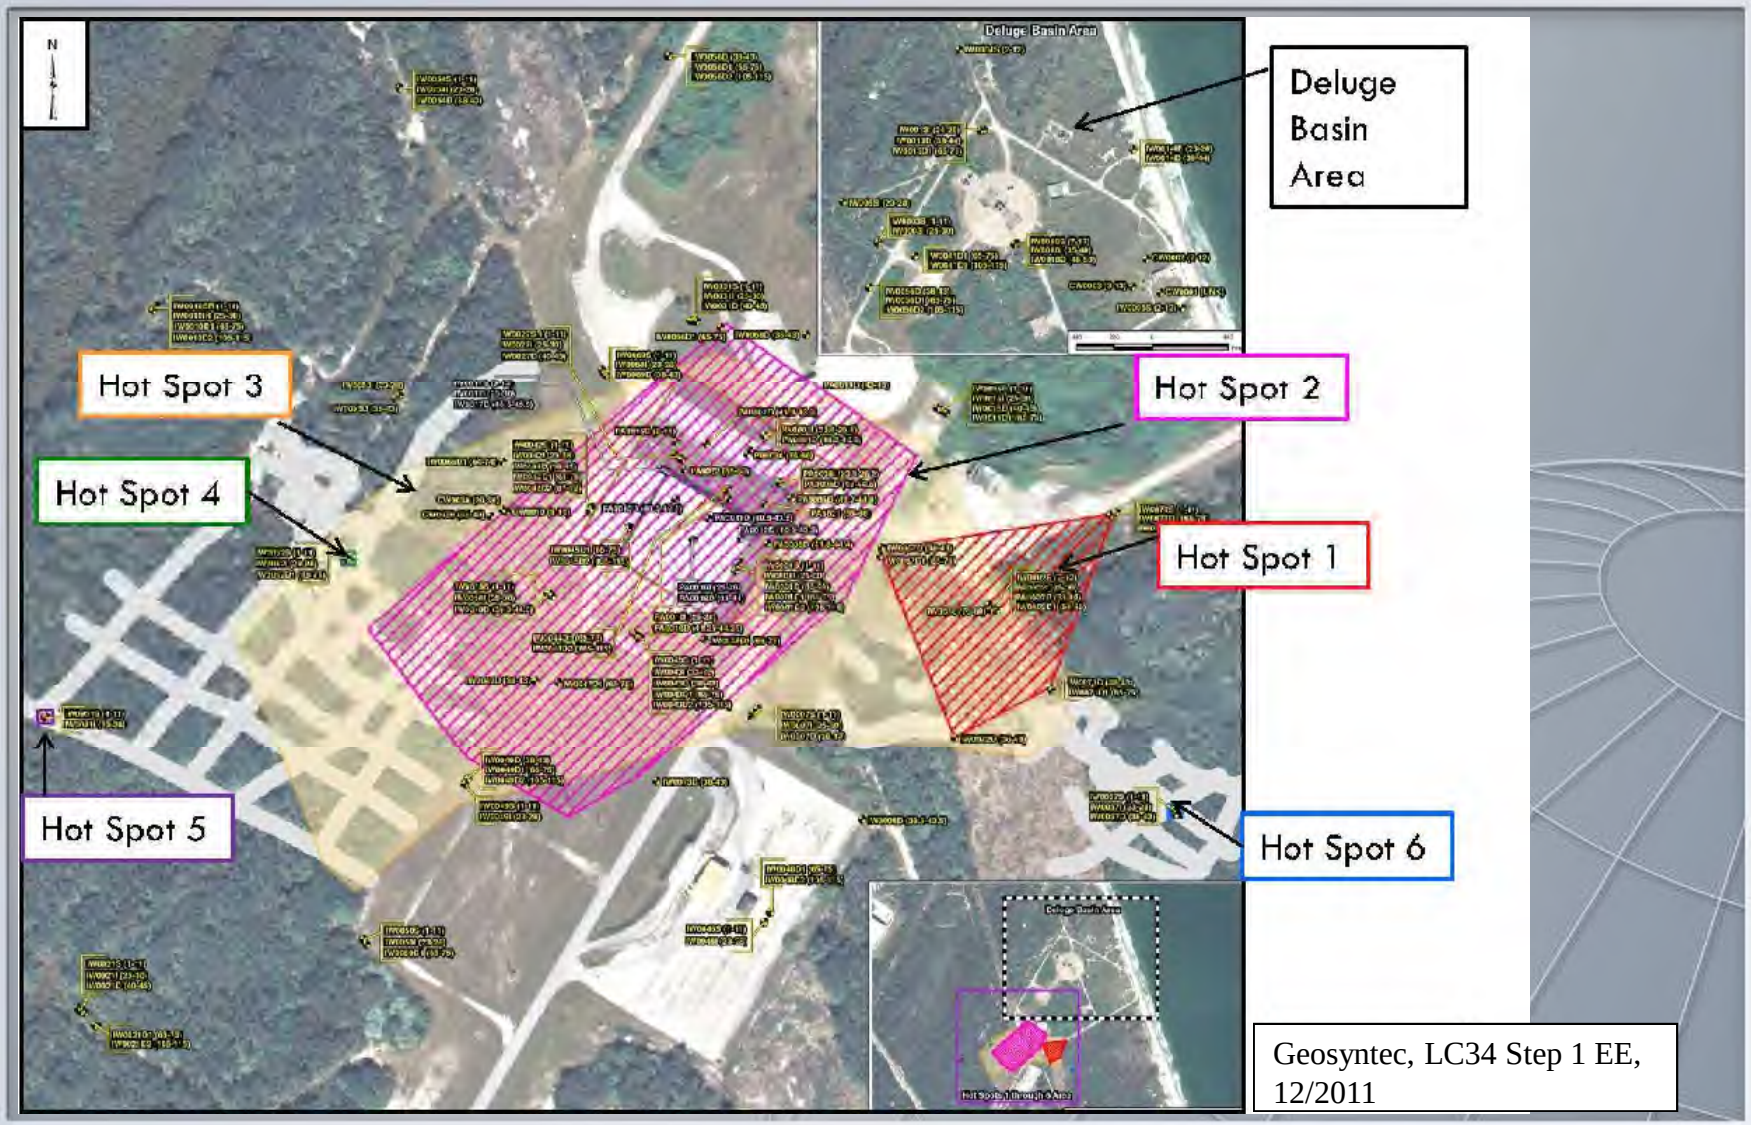
TETRA TECH

Site History

- Historic sampling was conducted from 1997 to 2006
- 2004-2007
  - LC34 Corrective Measures Study
    - Performed by NASA in 2004-2007
    - Draft report was submitted in February 2007 (FDEP comments September 2007)
    - Identified plume zones:
      - Low Concentration Plume (LCP)
      - High Concentration Plume (HCP)
      - DNAPL Source Zone (DSZ)
    - Interim LTM Work Plan (CMS Section 7)
      - Implemented by NASA June / December 2007
      - Interim semi-annual LTM conducted since June 2004
  - Annual Groundwater Monitoring Report (approved July 2008)
- 2008
  - Supplemental investigations conducted at HS 1/2 in the DSZ vicinity
  - Dynamic testing at DNAPL Source Zone June 26 to July 11, 2008
  - LTM sampling June and December, annual monitoring recommended

TETRA TECH

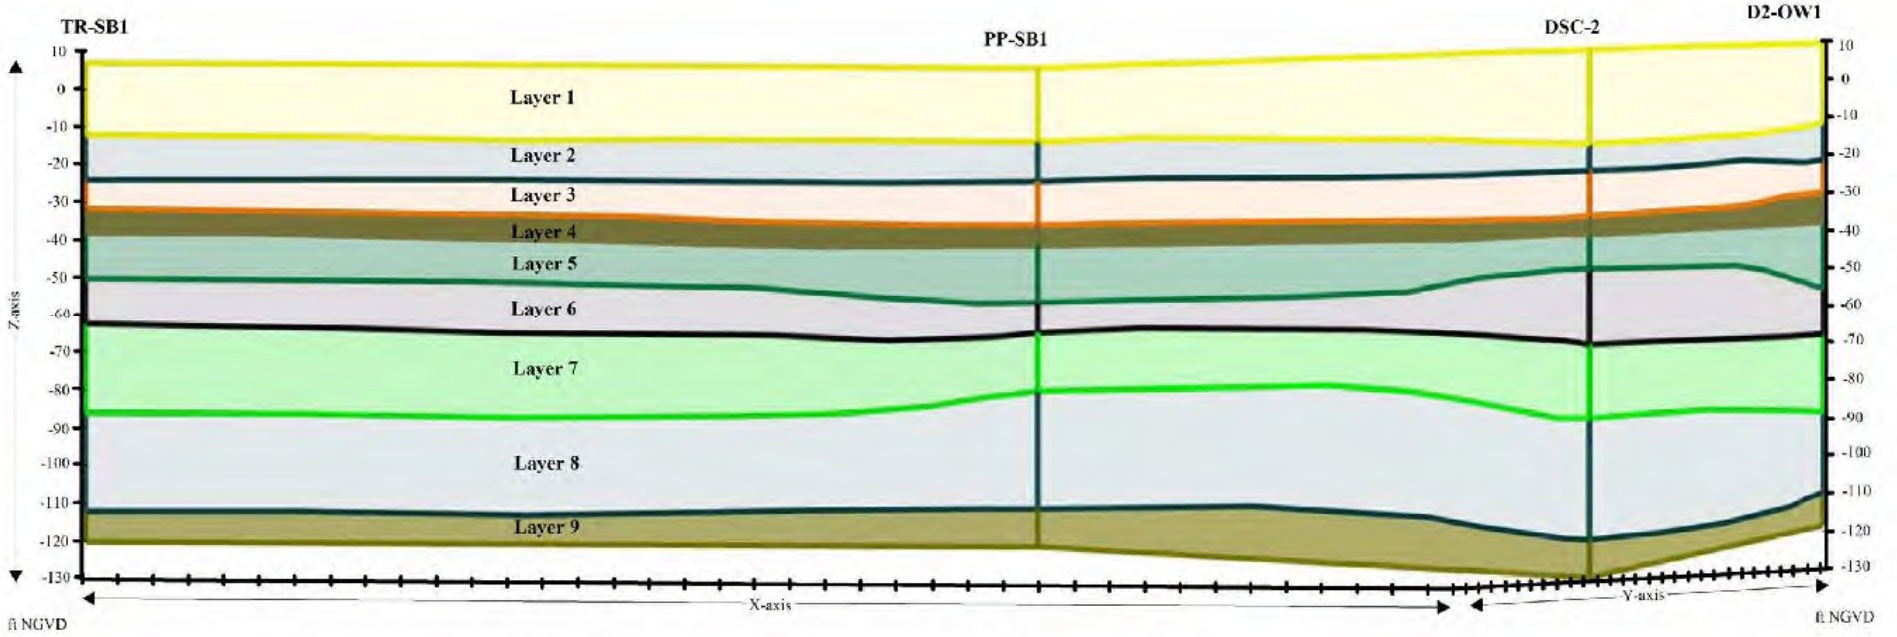
Site History (continued)



- 2009
  - Continued supplemental assessments in HS 3/4
  - Installation of hydraulic containment system
  - Annual LTM sampling conducted Nov/Dec, recommended removing and adding wells within monitoring network
- 2010
  - Commissioning and full scale operation of hydraulic containment system
  - Continued supplemental assessment in HS 3
  - Installation of new LTM monitoring wells (IW-95 through IW-110)
  - Hydraulic capture study conducted
  - Annual LTM sampling conducted in December
- 2011
  - Continued operation of hydraulic containment system
  - Annual LTM sampling conducted in December
  - PED Demonstration Pilot at HS 1
  - Step 1A/1B Engineering Evaluation for HS 3, 4 and 5 (December)

Site History (continued)

- 2011 (continued)
  - Step 1A/1B Engineering Evaluation for HS 3/4 recommended expansion of the groundwater extraction network into HS 3/4via a Step 4C EE (driver for this presentation)
- 2012
  - Continued operation of hydraulic containment system
  - Recovery well extraction rate optimization
  - Annual LTM sampling conducted in December
  - Confirmation monitoring wells installed per Step 1B; presented as basket item
  - PED Demonstration Pilot at HS 1
- 2013
  - HPT field event (January 8-10, 2013)
  - MIP field event (January 21-25, 2013)



TETRA TECH

Hot Spot Areas

Geosyntec, LC34 Step 1 EE, 12/2011

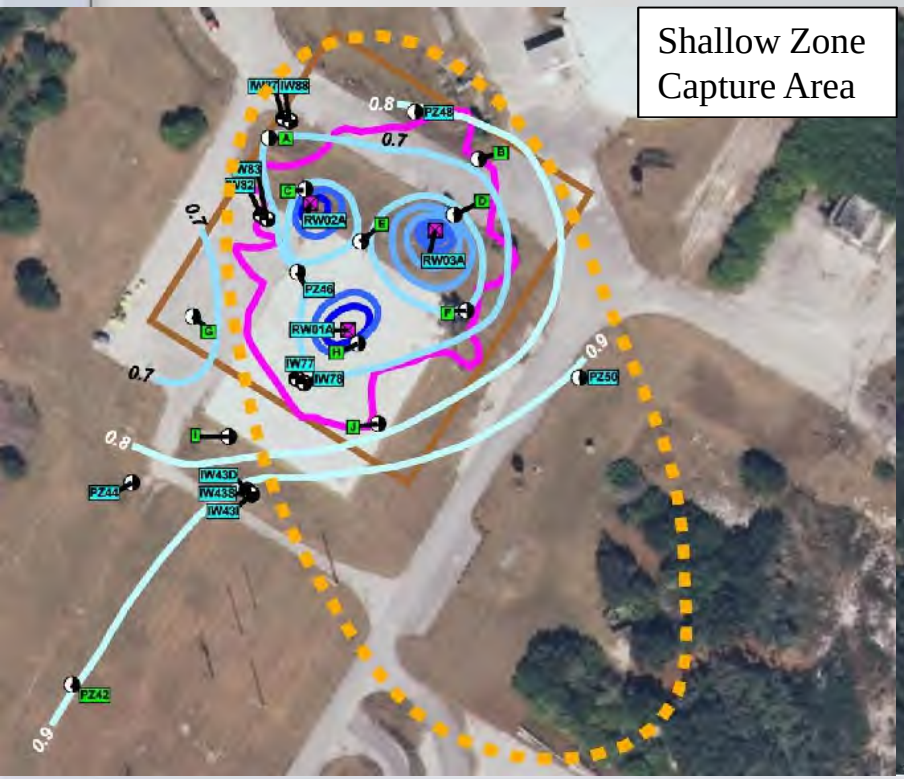
TETRA TECH

Layer 1: Sand (Upper sand unit; S zone; 30 LTM wells; 10 foot screen interval 1'-17' range; 3 System Performance Wells 13'-23')
Layer 2: Fine silty sand (Middle fine-grained unit; I zone; 39 LTM wells; 5 foot screen interval 20'-35' range; 3 SPW 20'-28')
Layer 3: Coarse to silty sand (Lower sand unit; D zone; 11 LTM wells; 5 foot screen interval 35'-45' range; 3 SPW 28'-43')
Layer 4: Silt and clay (Lower clay unit, ~ 5 feet thick; no wells in this layer)
Layer 5: Fine to coarse silty sand with shell fragments (3 SPW 45'-55'/47'-57'/52'-57')
Layer 6: "Salt and pepper" sand (D1 zone; 10 LTM wells; 10 foot screen interval 50'-75' range; 6 SPW 60'-70'/70'-80')
Layer 7: Silty to clayey sand (IW42D2 screened 87'-92')
Layer 8: Fine to coarse sand (D2 Zone; 5 LTM well; 10 foot screen interval 105'-115' range)
Layer 9: Clay to sandy clay (Hawthorn confining unit; no wells in this layer)

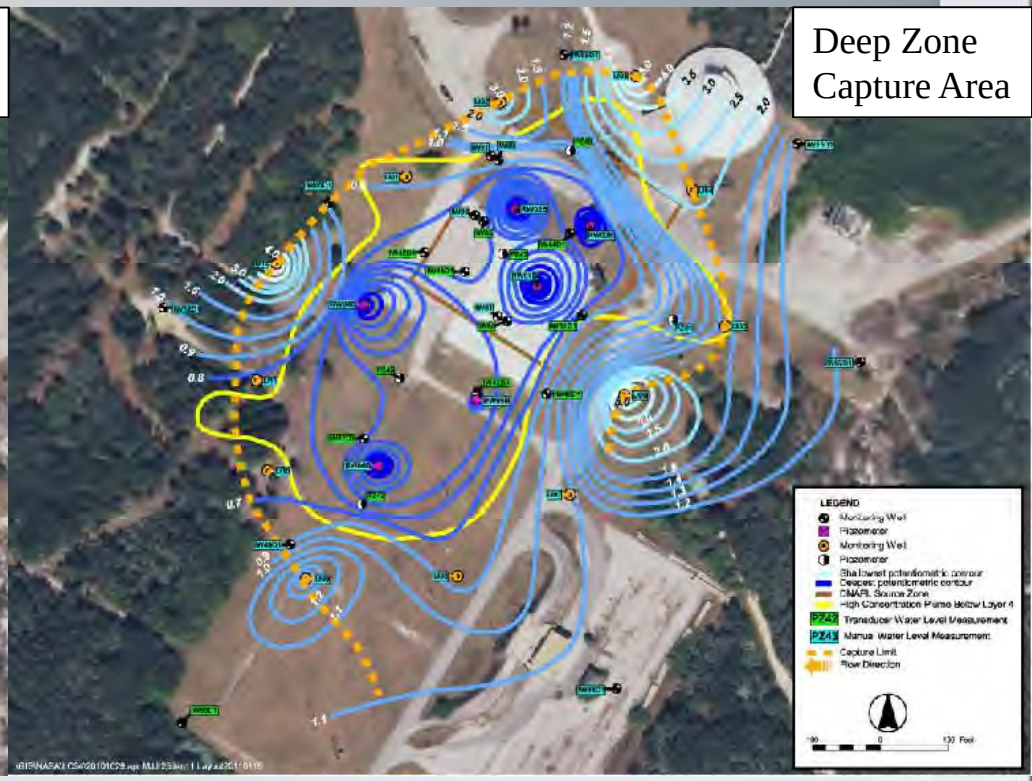
Coarser grained units have moderate permeabilities, are primary groundwater migration pathways
Clay and silt units have low permeabilities, impede groundwater flow
Very low groundwater flow gradients – the groundwater migration rate is slow

General Site Geology

TETRA TECH



DSZ and TCE HCP IM Overview

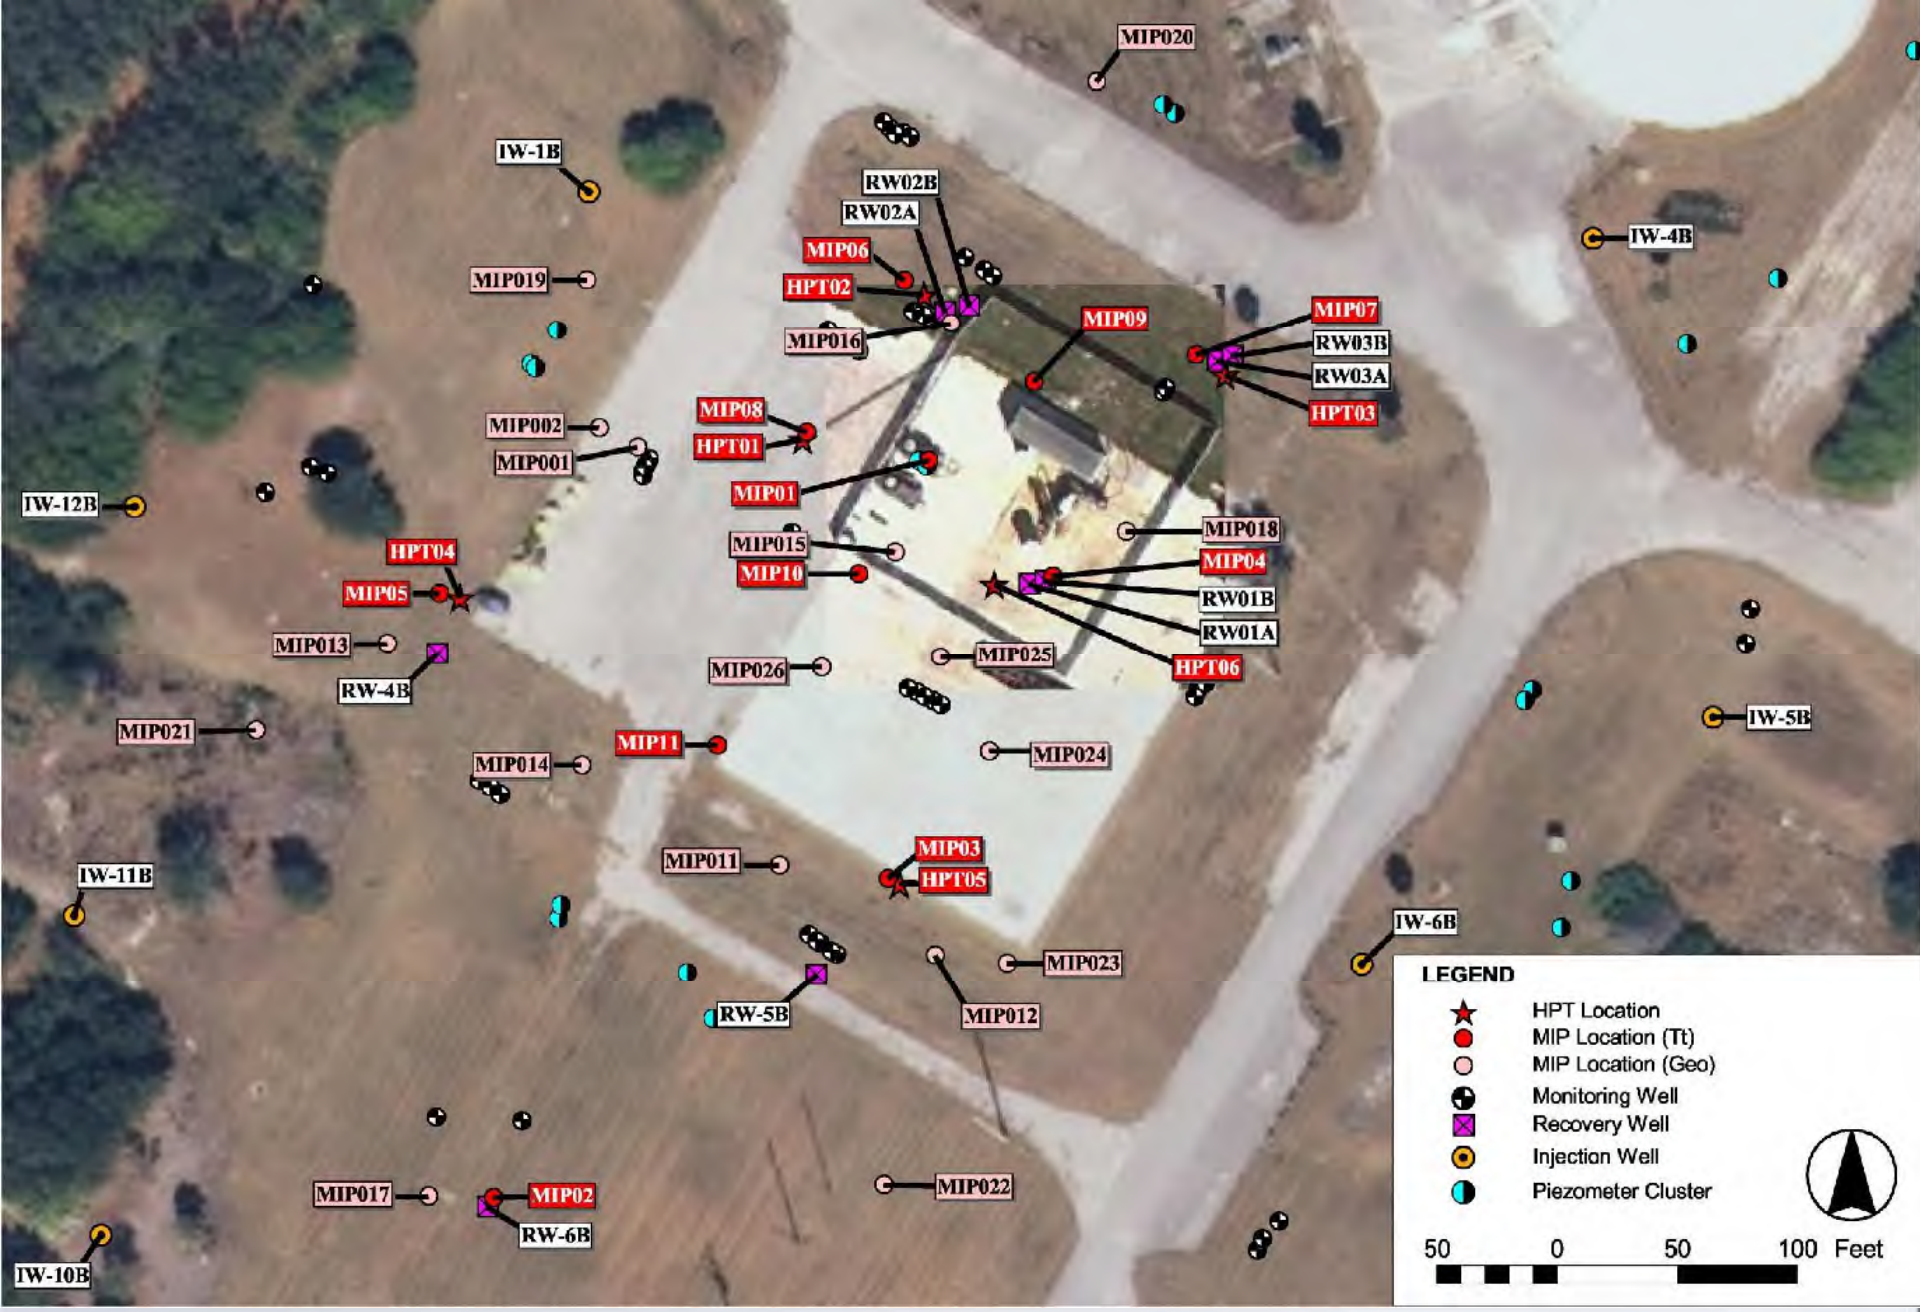


- Hydraulic control of the DNAPL source zone and deep groundwater TCE plume >300 µg/l
- Treat extracted groundwater to GCTLs
- Operate system constructed with a design peak flow of 50 gpm and a design flow of 39 gpm
- Primary components include:
  - Groundwater recovery via 3 shallow and 6 deep recovery wells for DSZ and deep TCE plume containment
  - Primary treatment via air stripping
  - LPGAC polishing
  - Air stripper offgas treatment via catalytic oxidation and scrubbing
  - Discharge treated groundwater to 12 deep injection wells and infiltration gallery

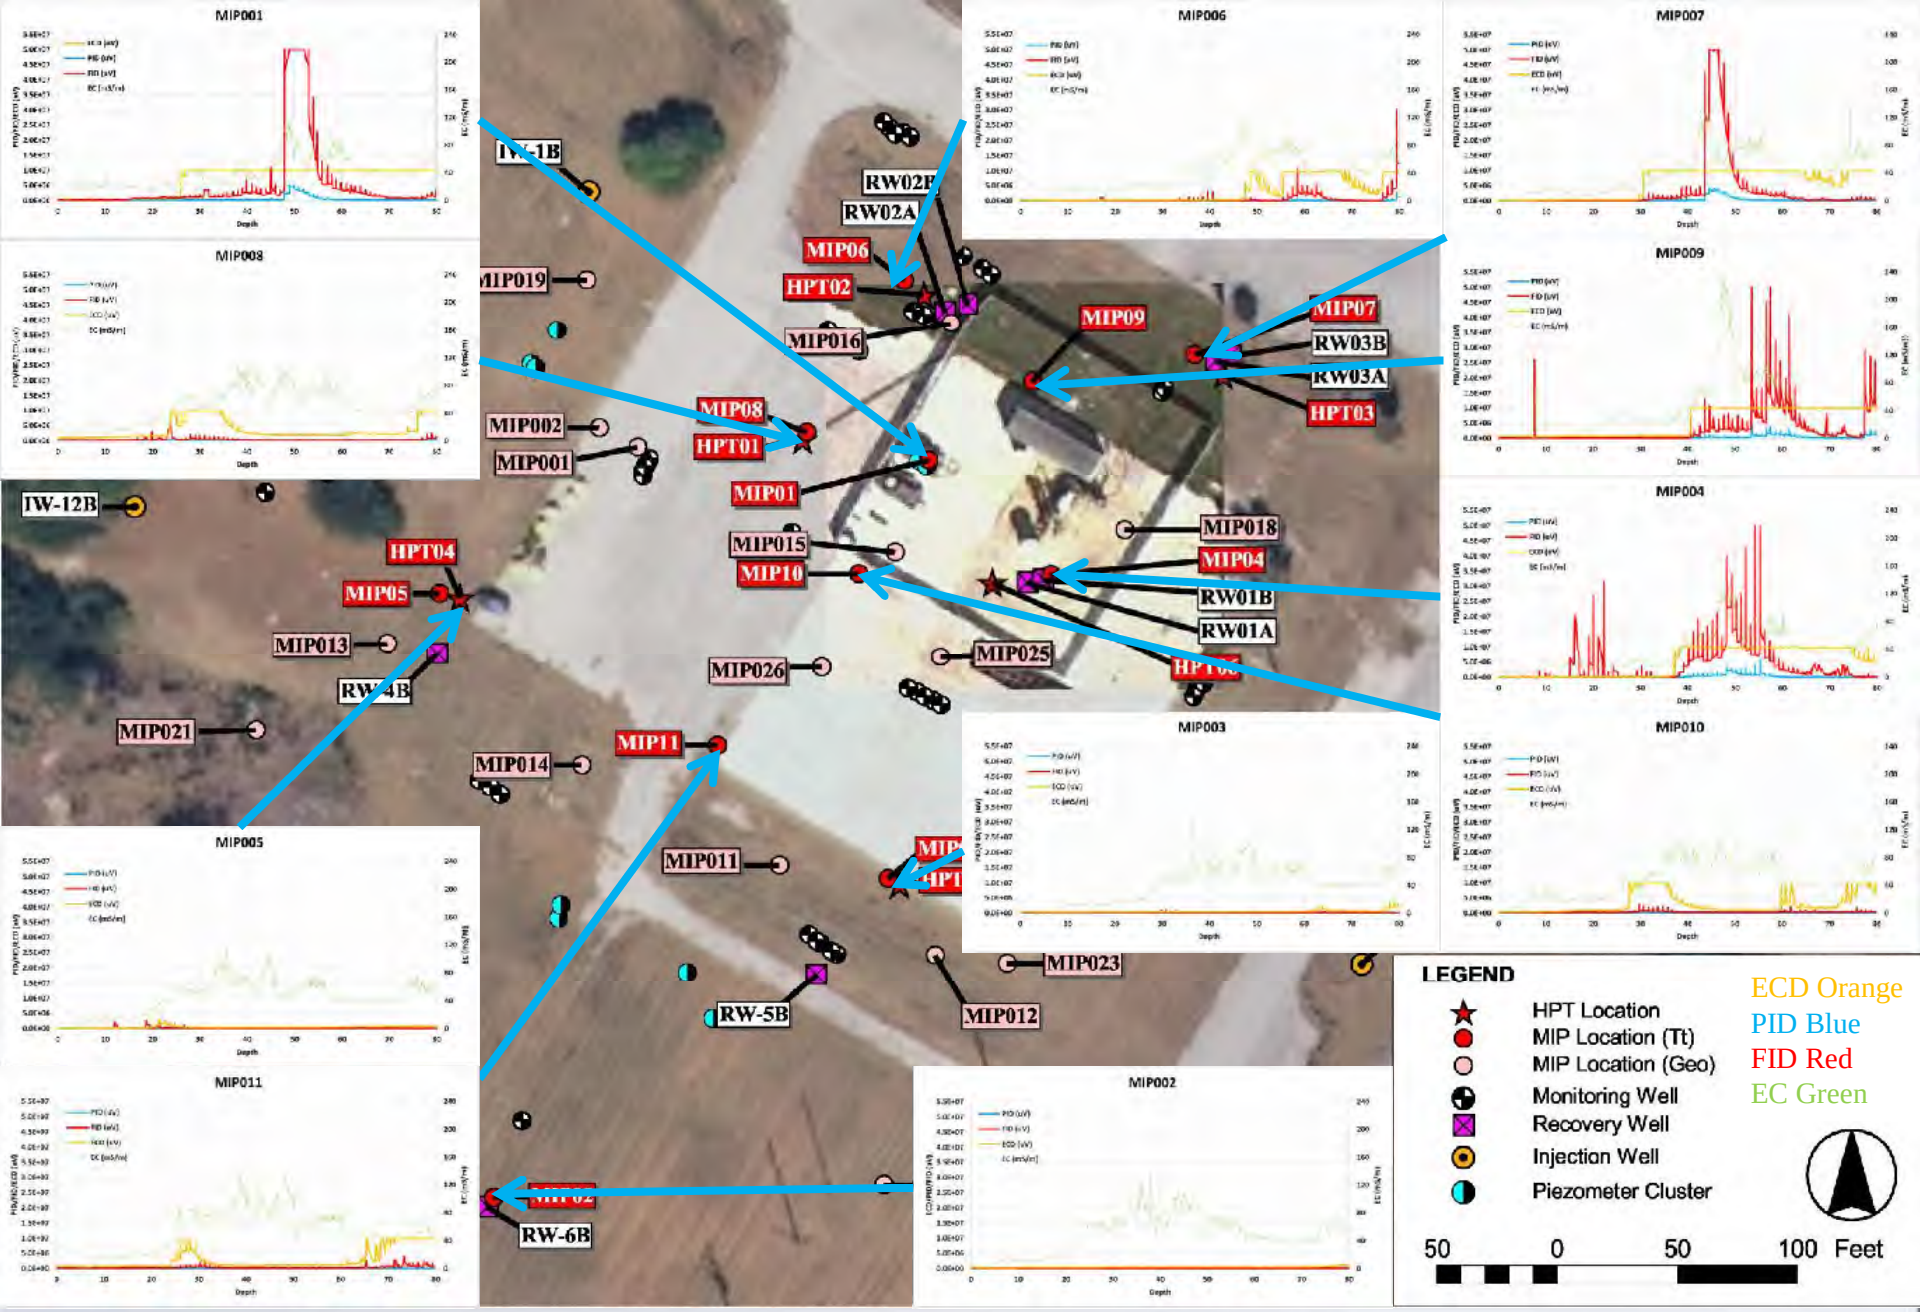
TETRA TECH

DSZ and TCE HCP IM Overview

- cVOC Mass recovery: 31,300 lb (02/06/2013)
- Groundwater recovery: 42,942,600 gallons (02/06/2012)



TETRA TECH



Pre-Design Investigation Summary

- HPT Event (January 8-10, 2013)
  - Advanced 6 HPT borings from 0 to 80’ bls
  - Placed to provide better understanding of conductivity near RWs
  - Secondary objective of pairing with MIP data to determine storage/transport zones
- MIP Event (January 21-25, 2013)
  - Advanced 11 MIP borings from 0 to 80’ bls
  - MIP locations paired with HPT borings and within ESB area where additional wells are being considered in ESB area
  - Measured EC/ECD/PID/FID to provide a qualitative summary of contaminant levels
  - Compared to pre-IM MIP borings advanced by Geosyntec to evaluate IM influences
- Raw data interpreted to evaluate on a location-specific basis and also equalized scales across all borings for event-wide comparison.

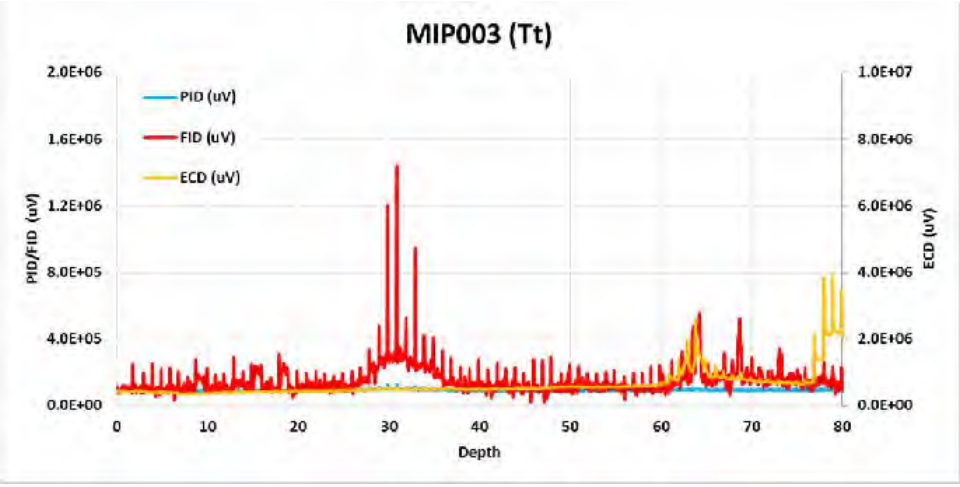
Response to Comments – RW01B

Geosyntec: Slide 19 and Slide 20 present the MIP data (MIP015 and MIP011) that Geosyntec collected pre-IM and it appears that was an error with plotting the FID values; that the values were not normalized.



Response: FID values were not normalized in any plots. The plots were checked versus the data Geosyntec sent and are represented as provided. The pre-IM plots appear to be noisy due to the order of magnitude scale correlation between the Geosyntec and Tetra Tech MIP borings.

HPT Technology Overview

- Technology use: Real-time vertical profiling of hydraulic conductivity
- Equipment: DPT Rig, HPT Tooling (pressure sensor, water injector, depth transducer, electrical conductivity sensor, control box)
  - Tool is advanced via DPT while water is injected
  - Pressure sensor measures pressure response of soil to water injection
  - Pressure response identifies ability of soil to transmit water (high pressure response – low K; low pressure response – high K)
- Measured data output: Electrical conductivity, injection flow and pressure
- Interpretation:
  - EC indicates changes in lithology
  - Pressure response is depth-corrected
  - K value calculated by HPT software using flow and pressure data
  - Peaks indicate high K/flow zones
  - Valleys indicate low K/flow zones

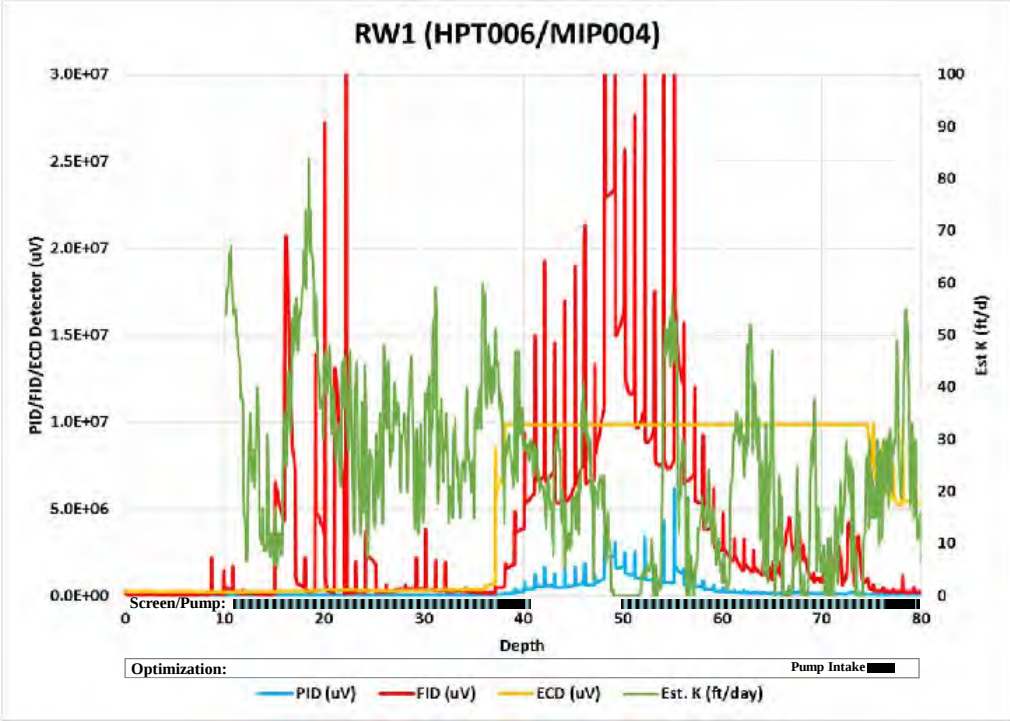
Pumping Optimization Approaches

- Conceptual Site Model (CSM) Update ✓
  - Function: Optimize pumping approaches relative to current site conditions via field investigations and/or site evaluations
- Conductivity Interpretation ✓
  - Function: Identify and focus optimizations on zones where mass is recoverable; interpret mass storage/transport zones
- Flow Rate Adjustment ✓
  - Function: Manipulate hydraulic capture, increase/decrease mass removal
- Screen Isolation/Pump Intake Adjustment ✓
  - Function: Focus groundwater extraction where known elevated levels of COCs exist; bypass zones with low concentration and high permeability; reduce pumping rate requirements
- Pump Cycling (future)
  - Function: Cycle pumps to increase mass removal where stagnation zones between recovery wells may exist (not considered for this optimization phase, but in future optimization evaluations)



Response to Comments – RW01B

Geosyntec: It would be helpful for this evaluation to provide a table (or present the information in the ADP) with the information on current pumping rates from the pumps in each recovery well.

Response: Current pump rates are set as follow (in gpm):

RW01A	RW02A	RW03A	RW01B	RW02B	RW03B	RW04B	RW05B	RW06B
5	5	3	5	5	3	4	5	4

TETRA TECH

RW1A (11-41’ bls screen)

- Mass transport at 15-25’ and 36-41’ bls
- No modifications to screen/pumping

RW1B (50-80’ bls screen)

- Mass storage at 50-53’ bls
- Mass transport at 53-74’ bls
- Move pump intake to 74’bls

*Layer 4 mass storage

HPT/MIP: RW1A/RW1B

Response to Comments – RW01B

Jacobs: RW-1B – Seems like high CVOC/High K zone is right below the 50 ft. clay – why not move intake to between 55 and 65 ft. BGS instead of 74 ft. BGS?

Geosyntec: We recommend installing a packer from 65 to 80 ft BLS in recovery well RW1B and moving the pump intake to above the 65 ft BLS depth interval to put a heavier stress on the aquifer and force water from the mass storage zone from 50 to 53 ft BLS (thereby significantly increasing RW1B influent concentration). Isolating the lower screen interval should force the pump to pull more water from the most heavily impacted interval (interval with FID response). To evaluate if the packer would aid in increasing mass removal, a simple field test could be performed. A sample could be collected from the pump with the pump installed at 74 ft BLS in the configuration proposed in the ADP and one from when the packer is installed and the pump is set above 65 ft BLS. If the sample collected with the packer installed has a higher concentration of VOCs, it is recommended to keep the packer in the well and to force flow from the mass storage zone.

Response: While pumping immediately below the storage zone in RW01B would be an effective approach for focused mass removal, we believe it is premature to move the pump to the proposed level, considering the remaining deeper impacts. The MIP boring had an ECD plateau to approximately 74' bls, where the intake is proposed. The well is still producing high mass removals, with TCE influent near 80 mg/L. Until the Layer 6 permeability stringers are flushed/addressed, we recommend a pumping plan at RW01B as proposed. Once influent levels decrease to a level triggering optimization, this suggestion will be considered and the pump could be moved to a higher invert elevation.

RW2A (15-45’ bls screen)

- Primary mass transport at 33-45’ bls
- Isolate well pumping screen from 33-45’ bls

RW2B (50-80’ bls screen)

- Mass storage at 47-50’bls
- Mass transport at 53-73’ bls
- Move pump intake to 73’ bls

*Layer 4 and 7 mass storage

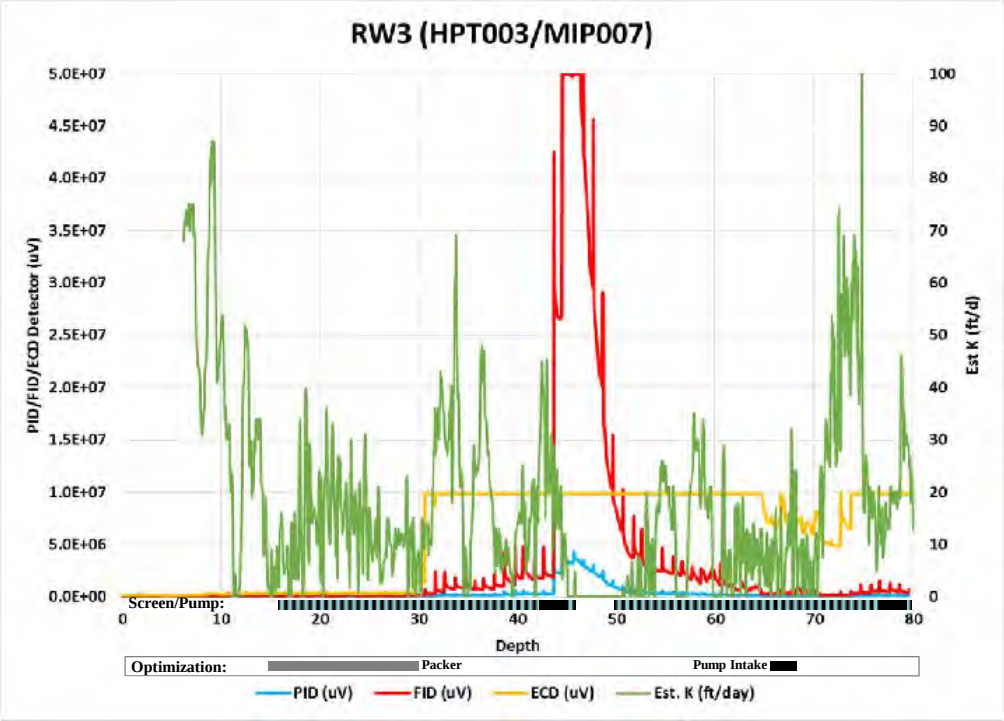
HPT/MIP: RW2A/RW2B



Response to Comments – RW02B

Jacobs: RW-2B – Similar situation to RW-1B – pump intake should be around 60 ft. BGS instead of 73 ft. BGS.

Response: Same response as RW01B comment.

Geosyntec: Slide 29: What proposed benefit do you anticipate from moving the pump intake to 73 ft BLS in recovery well RW2B? The MIP data suggests that most of the mass is in the 55 to 65 ft interval.

Response: The proposed pump intake location was considered by two criteria – the edge of the ECD plateau and FID inflection point. The pump was moved such that pumping influence in the high conductivity zone identified near the existing pump intake location is reduced.

RW3A (16-46’ bls screen)

- Primary mass transport at 30-46’ bls
- Mass storage at 43-52’ bls (within screen)
- Isolate screen from 30-46’ bls

RW3B (50-80’ bls screen)

- Mass storage at 43-52’ bls
- Mass transport at 52-65’ bls
- Move pump intake to 65’bls; pump at 3 gpm

*Rehab (surge/chemical) if no signif. changes

*Layer 4 mass storage

HPT/MIP: RW3A/RW3B

TETRA TECH

Response to Comments – RW03B

Geosyntec: We recommend installing a packer from 65 to 80 ft BLS in recovery well RW3B. If the bottom of the well screen has a packer installed, this should force the pump to pull water from the impacted interval (based on FID response). What is the current pumping rate for recovery well RW3B and why the suggested pumping rate change?

Response: Installing packers below the extraction pumps will not have a significant influence that we believe is significantly advantageous. RW03B is currently set to pump at 3 gpm.

RW4B (50-80’ bls screen)

- Minimal impacts in top 10’ of screen
- Isolate pumping screen from 60 to 80’ bls
- Reduce flow rates from 4 to 2 gpm (expansion flow budget variable)

*Mass transport at 16-35’ bls (HS3 design factor)

HPT/MIP: RW4B

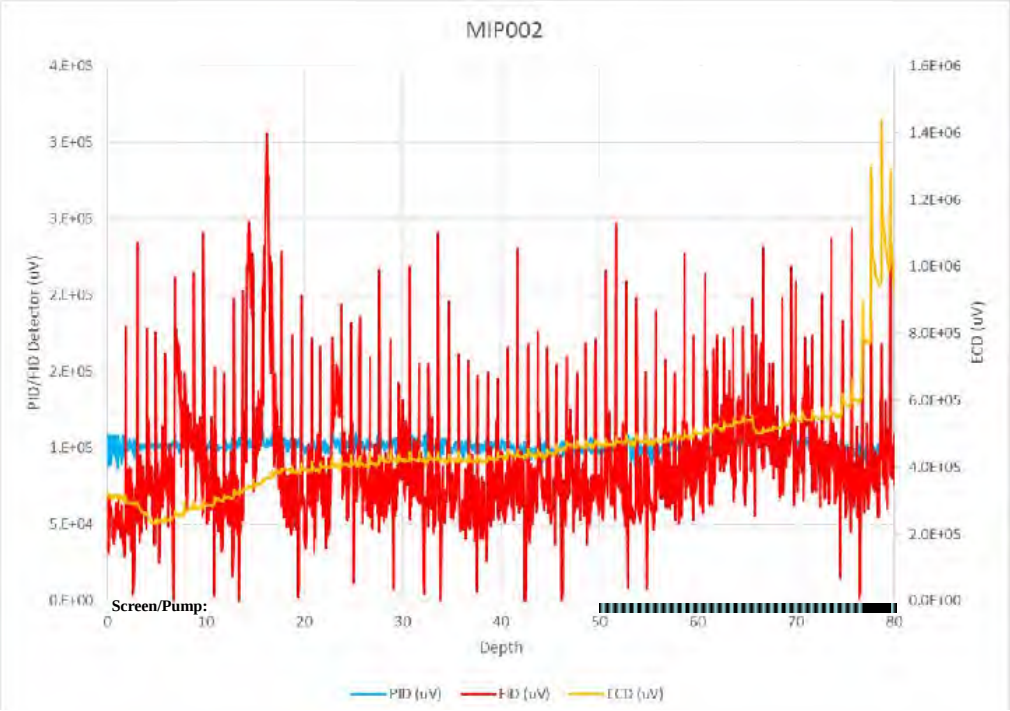
Response to Comments – RW04B

Geosyntec: How did you choose the proposed isolation of the screen from 60 to 80 ft BLS for recovery well RW4B? The statement is made "minimal impacts in top 10 ft of screen", but the MIP data does not seem to confirm this. The ECD data from the MIP seems to show drift and may not be representative of the VOC concentrations in that interval and there only appears to be a small FID spike from approximately 60 to 68 ft BLS.

Response: Layer 4 impacts were not observed in this area and PID/FID results were minimal in the 50 to 60 feet bls interval. While the concept that the ECD may have some drift could be true, the deviation from a potential drift slope is observed at a similar depth as that of the peaks observed at MIP011. A FID spike from 60 to 66 feet bls was observed and the well still functions as a containment well, hence the proposed screen isolation.

RW5B (50-80' bls screen)

- Minimal impacts in top 10' of screen
- Isolate pumping screen from 60 to 80' bls
- Lower flow rates for system expansion flow budget (from 5 to 3 gpm)



*Potential mass storage in Layer 7

*Mass transport at 16-35' bls (HS3 design consideration)

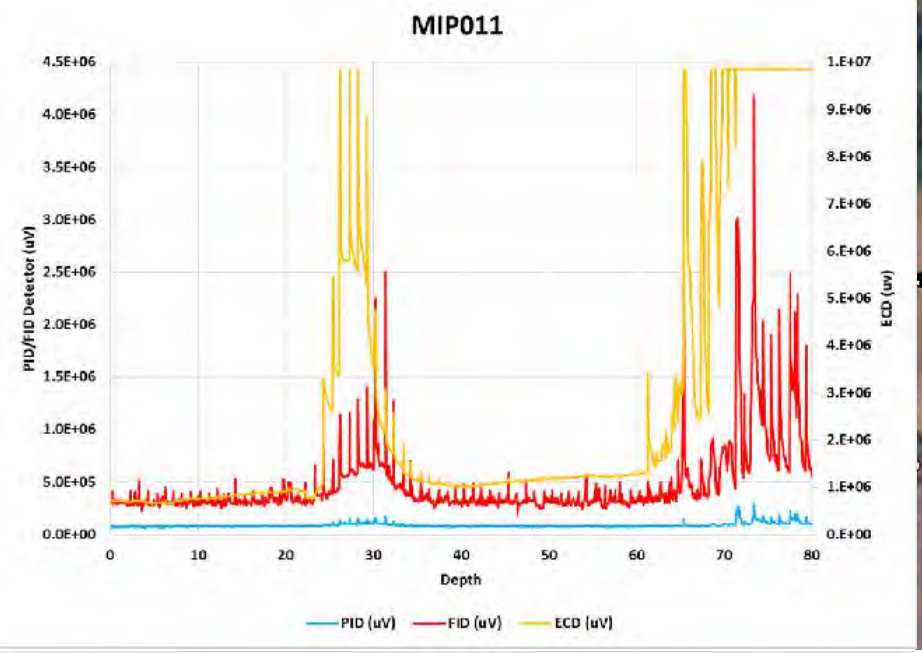
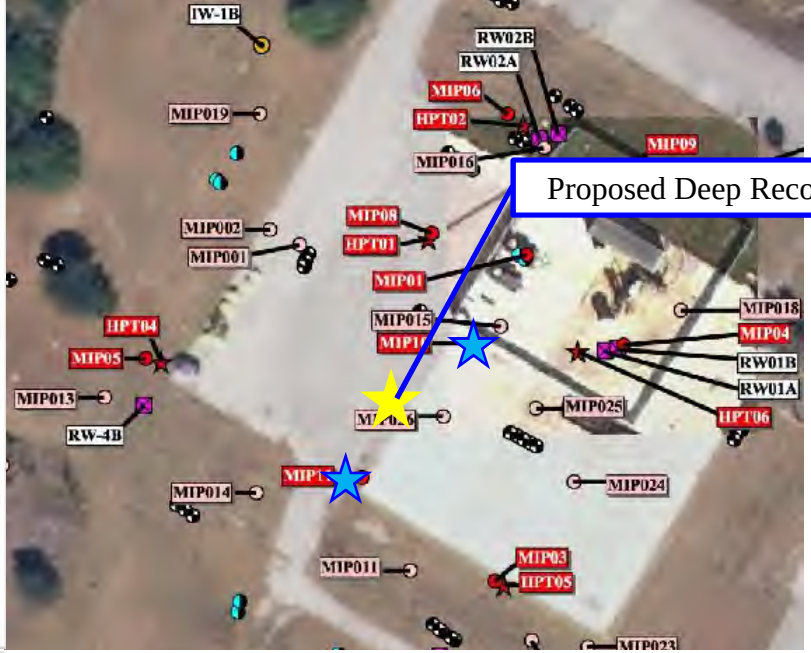
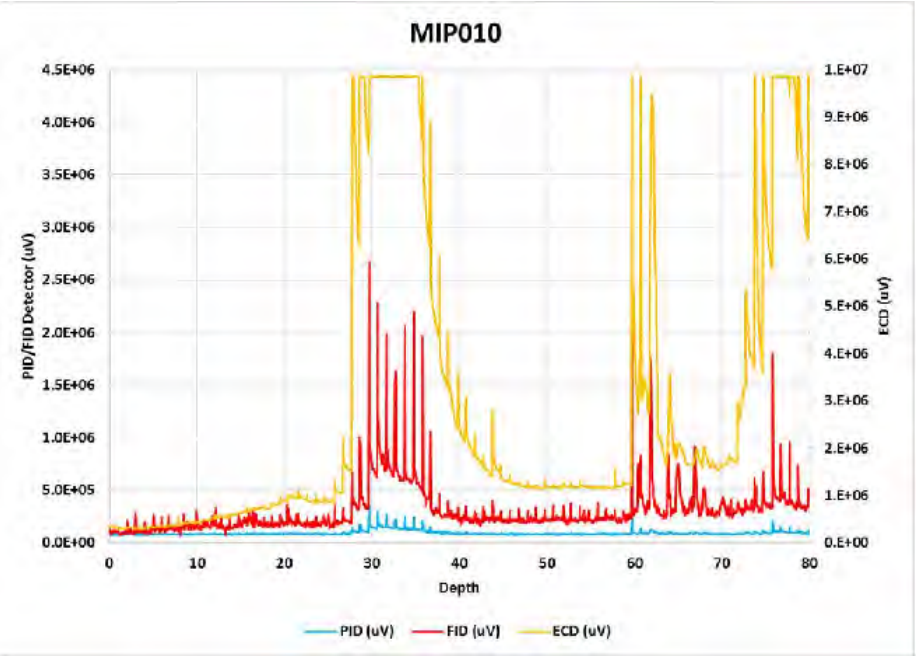
MIP: RW6B







HPT001/HPT008:

- Primary contaminant transport from 17-43’ bls
- Mass storage not found in Layer 4
- No significant observations in mass transport/storage between Layer 4 and 7
- Mass storage likely in Layer 7
- Shallow optimization pumping recommendation in Step 4C EE, Part 2 (Slides 26-28)

HPT/MIP: HPT001/MIP008

Deep RW Expansion:

- Considering MIP event, add RW between MIP10 and 11 (see Part 2 for modeling)
- Identical construction to RW4B/5B
- Utilize RW4B/5B and new well for ESB containment
- Pumping rate of 5 gpm
- Reduce RW4B/5B to 2 gpm
- Reduce pumping at RW-6B

*Mass present at 23-43’ bls (HS3 consideration)

*Layer 7 mass storage

MIP010/MIP011 Expansion

Response to Comments – Proposed RW

Geosyntec: It is proposed that the new deep recovery well will be installed with identical construction to recovery wells RW4B/5B and you are proposing to packer off the top 10 ft of the new recovery well. It is stated in Part 2 of this ADP that the screen interval of 50 to 80 ft BLS is chosen, to have the ability to pump from the bottom of layer 4 if necessary. If this recovery well is being installed to increase mass removal in the deep interval, Geosyntec recommends installing the recovery well with a screen interval of 60 to 80 ft BLS, since this interval is the interval with highest VOC impacts (based on MIP results). Was the location of this new well based on the MIP locations or based on modeling?

Response: Comment noted. Tetra Tech prefers to have the future ability to pump immediately below Layer 4, should future optimizations suggest this prudent. Note that the proposed location is near the conceptualized boundary of the Layer 4 mass storage zone and future pumping below this layer may be a potential supplement to storage zone mass depletion. The location for the proposed recovery well was placed based on MIP results, modeling, and decreases in downgradient recovery well influent.

Screen Isolation Approach

- RW2A (15-45’ bls screen) - Isolate well pumping screen from 33-45’ bls
  - Install 20’ inflatable packer from 13-33’ bls
- RW3A (16-46’ bls screen) - Isolate screen from 30-46’ bls
  - Install 15’ inflatable packer from 14-29’ bls
- RW4B (50-80’ bls screen) - Isolate pumping screen from 60-80’ bls
  - Install 10’ inflatable packer from 49-59’ bls
- RW5B (50-80’ bls screen) - Isolate pumping screen from 60-80’ bls
  - Install 10’ inflatable packer from 49-59’ bls
- Proposed RW (50-80’ bls screen) - Isolate pumping screen from 60-80’ bls
  - Install 10’ inflatable packer from 49-59’ bls (may remove if needed)

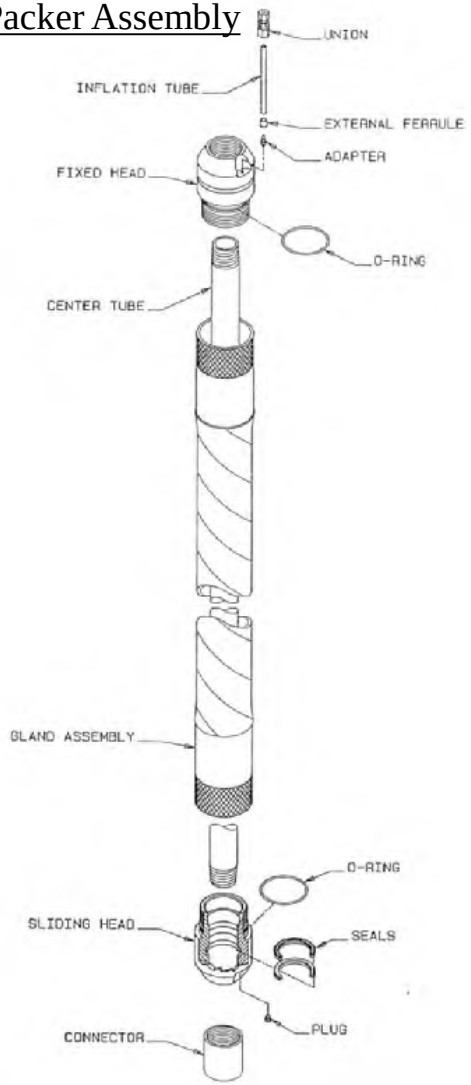
TETRA TECH

Response to Comments – Packering

Jacobs: Be aware that isolation of the screened zone with a packer in a screened well may not provide significant isolation in formation, depending on relative permeabilities of gravel pack and formation.

Response: Comment noted.

Geosyntec: Prior to making the various proposed changes to pump intake depths, consideration may be given to first running packer isolation tests to evaluate changes in recovery well influent with a mobile lab running VOC samples. This approach would facilitate the placement/isolation of recovery well screens based upon actual dynamic field testing results and ensure that the P&T system, while continuing to provide hydraulic capture, also maximizes the mass removal rate.



Response: A more cost-effective approach would be to install the packers based on the MIP observations, sample one week following post-packer installation pumping, and continue quarterly sampling to determine if adjustments are practical. We feel the resolution of the MIP data is sufficient to be able to accurately place the packers and dynamic testing is extraneous. The initial pumping conditions are not representative of the actual flux within the packered intervals. The pumps should operate for a longer duration for the representative concentrations to be extracted. To implement the comment's suggestion, a crane or drill rig would be needed throughout the testing (for packer adjustment) in addition to the mobile lab and associated field support. In general, the additional cost-benefit of dynamic testing is diminished with the additional resources needed to complete the testing adequately.

Packer Design

- As pressure is applied, air gland begins to inflate and sliding head slides to allow for expansion
- Stainless steel components
- Viton B gland (250 psig rating)
- Inflation pressure of 140 psig (water)
- Fitting for pump wire/cable run
- 1-1/4” threaded piping connections

General Packer Assembly

TETRA TECH

Summary of RW Optimization

- RW1A - No modifications to screen/pumping
- RW1B - Move pump intake to 74’bls
- RW2A - Isolate well pumping screen from 33-45’ bls
- RW2B - Move pump intake to 73’ bls
- RW3A - Isolate screen from 30-46’ bls
- RW3B - Move pump intake to 65’bls;
- RW4B - Isolate pumping screen from 60 to 80’ bls; Reduce flow rates from 4 to 2 gpm
- RW5B - Isolate pumping screen from 60 to 80’ bls; Reduce flow rates from 5 to 3 gpm
- RW6B - Reduce flow from 4 to 2 gpm
- **Test Consensus on optimization of existing RWs, as described herein**

HS3/4 Footprint and Current Capture

TETRA TECH

Groundwater Model Summary

- Groundwater Vistas model prepared by Geosyntec during IM Design (IMD) used for expansion (with all criteria from IMD model retained)
- General screen zone nomenclature:
  - Shallow (15-45’ bls screen)
  - Deep (50-80’ bls screen)
- Primary criteria evaluated during modeling:
  - Flow rate scenario evaluation
  - Placement of recovery wells
  - Particle tracking interpretation
  - Capture evaluation
- Model permutation #3 selected for expansion (see next slide)
  - Shallow zone containment within TCE >300 µg/L plume (HS3/4)
  - Mass removal component within HS3/4
    - Where possible, placed in 3,000 µg/L plume and near elevated DPT TCE detections
  - Continued mass recovery in DSZ
  - Optimized deep zone extraction rates

Shallow Zone Expansion Overview

- Addition of 6 recovery wells
  - 15-45’ bls screen: RW09A through RW14A
  - 5-40’ bls screen: RW15A
- Sonic installation
- Identical construction and completion as existing shallow recovery wells (refer to IMD)
- 6” diameter stainless steel well construction
- Grundfos 5S07-18 submersible pump
  - 0.5 HP pollution recovery motor (4-wire, single-phase, 208V)
  - Replace 0.75 HP motors in RW01A and RW03A with 0.5 HP
    - Motors overheat at lower flows due to throttling/reduced motor cooling
- Trenching network identical to IMD
  - Dedicated 1” HDPE groundwater conveyance lines
  - 4-wire 10THHN pump wire in 1” PVC conduit
  - Electrical pull boxes every 250 feet and at elbows and transitions.

TETRA TECH

Response to Comments – RW14A/15A

Jacobs: Looking at existing performance, RW-01a and RW-02A generate capture zones of around 150 ft. to 175 ft. to the west-southwest. The model predicts that RW-14A and RW-15A will generate a 200 ft. to 300 ft. capture zone to the west-southwest. This may be optimistic. Consider moving these wells out farther from center of plume or adding another well.

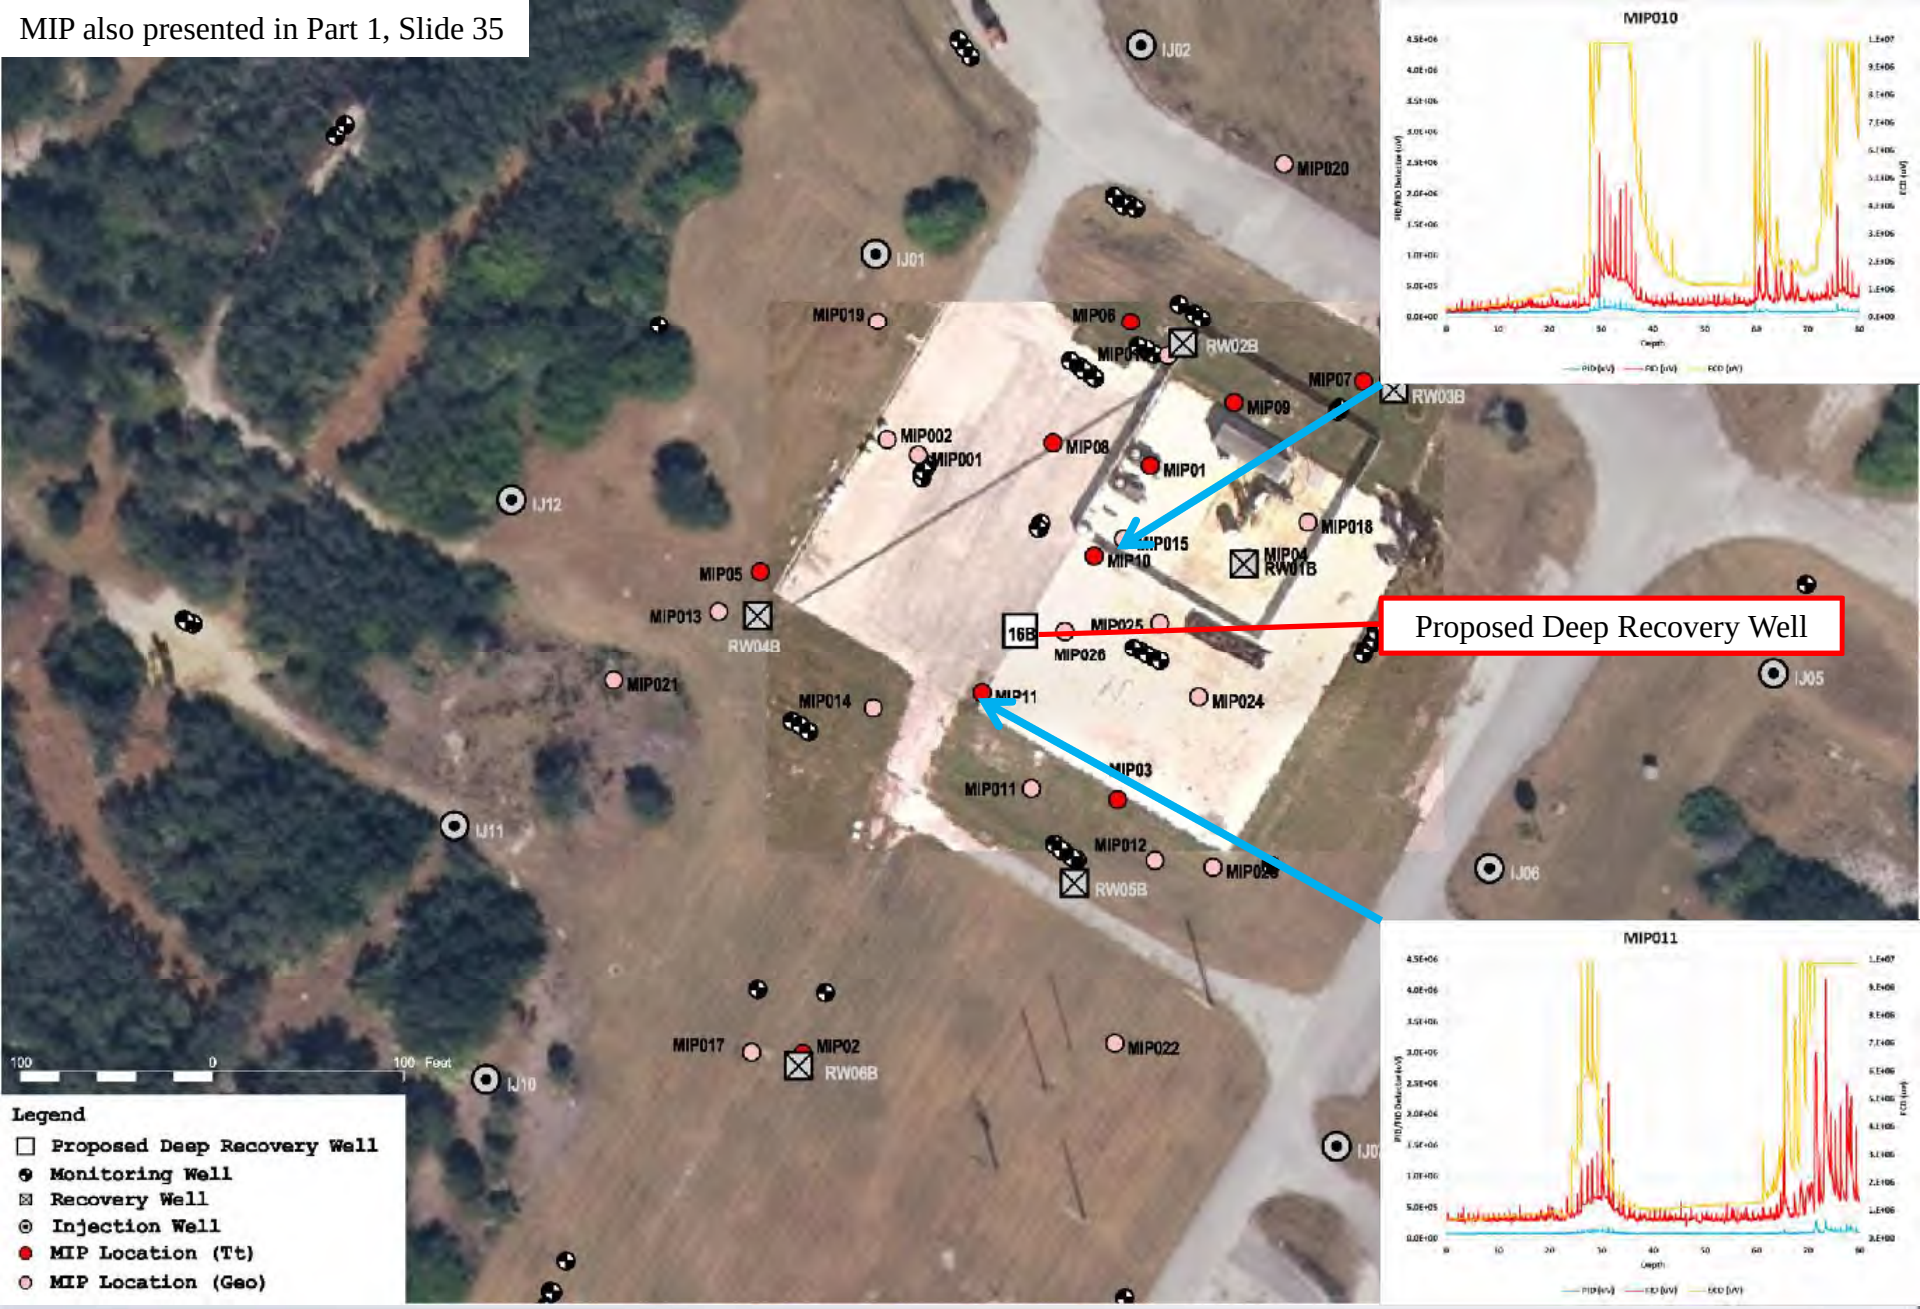
Response: Comment noted. Note that during shallow zone capture evaluations a stagnation point with only three wells operating was near 277 feet. With additional pumping in the shallow zone resulting from the expansion, we would expect the overall stagnation distance to increase. The wells were placed in a central plume location with bias towards sampling results to increase mass removals. The particle tracking was used to verify that the plume fringes would be contained and transports times were within reason. Depending on the system treatment process decisions (air stripper modifications) made during the meeting, the pumping rates at these wells could be increased to shorten transport time, if the team feels prudent.

Response to Comments – RW15A

Geosyntec: Is the shallow proposed recovery well RW15A being installed to address Hot Spot 4 as well as Hot Spot 3? The impacts in the Hot Spot 4 area are generally shallow (6 to 15 ft BLS). If recovery well RW15A is being installed to address the Hot Spot 4 area, it is recommended to install the well with a screen interval of 5 to 30 ft BLS. This should allow this recovery well to pull in impacted water from the Hot Spot 4 area.

Response: Comment noted. Note that the expansion to Hot Spot 3 proposed within the Step 1B EE was for expansion of the hydraulic containment system. Language specific to mass removal was not included and solely referenced containment as the primary remedial approach. This response is not to diminish the benefit of mass removal, but to highlight that the entire shallow recovery well network should be viewed to operate as a system of wells for containment. The consistent screen intervals could also have potential advantages of increased ESB influence with reduced recharge near some of the wells.

In the area of RW15A, consistent concentration data gaps exist between 27 to 36 feet bls. Based on this observation, there is a likelihood that HS-level concentrations exist below the comment's proposed well depth of 30 feet bls (not including pump offset). With the intent of focusing on containing Hot Spot 3/4 and also increasing mass removal, the screen interval at RW15A will be modified from 5 to 40 feet bls.



Response to Comments – Shallow Expansion

Geosyntec: Hot Spot 3 was delineated with the vertical intervals of 16 to 30 ft BLS because this interval had the highest concentration of VOCs. For the expansion, it is proposed to install the shallow recovery wells with a screen interval of 15 to 45 ft BLS. Why install the screen interval to 45 ft BLS? Based on the DPT investigation performed by Geosyntec, most of the mass from 35 to 45 ft BLS is underneath the ESB parking lot area. Geosyntec recommends installing the shallow recovery wells with a screen interval of 15 to 30 ft BLS to focus on mass removal.

Response: Based on the orientation of the recovery wells, the Hot Spot 3 wells could supplement aquifer dewatering regionally near the ESB, hence the typical well construction. Note that MIP locations along the periphery of the ESB and Hot Spot 3 contained elevated FID/ECD responses below 35 feet BLS (see MIP05 and 11).

- Identical construction and completion as existing deep recovery wells (refer to IMD)
- 6” diameter stainless steel well construction
- Screen set from 50-80’ bls
- Packer set from 49-59’ bls
  - Screen and packer specified so that the bottom of Layer 4 can be extracted, if needed in the future.
- Grundfos 5S07-18 submersible pump
  - 0.75 HP pollution recovery motor (4-wire, single-phase, 208V)
  - Replace 0.75 HP motors in RW03B, RW04B, RW06B with 0.5 HP
    - Motors overheat due to throttling/reduced groundwater motor cooling at lower flows
- Trenching network identical to shallow description

TETRA TECH

Response to Comments – RW16B

Jacobs: Not clear what the purpose of RW-16B. Is it mass removal?

Response: The function of RW-16B is multi-purpose. Based on marked reductions in RW04B and RW05B from influent data trends and MIP observations, the well will function as a mass removal location. Additionally, operation of this well will reduce pumping requirements downgradient and increase focus on containment near the ESB area as the dissolved-phase TCE plume decreases in footprint..

Existing Piping & Instrumentation Diagram

TETRA TECH

System Modification Variables

- Increase system flow rate from 39 to 55 gpm
- Existing stripper limited to flows near 42 gpm when operated at 600 cfm
  - When >42 gpm, excessive moisture carryover (CatOx detriment)
  - Vertical expansion of tray stripper already maximized
- CatOx flow must remain 600 cfm
- Increase in estimated mass loading from 25 to 33 lb/d
- Increased flow will require proportionally higher biodispersant (Redux 620) addition
- Height/space limitations for expansion equipment
  - 84” maximum height clearance
- 2 gpm/well reinjection; 31 gpm infiltration gallery discharge
- Considered use of mobile air strippers, but screened out due to:
  - Air flow capacity too high
  - Air discharge pressure too high
  - Age and durability of air strippers of concern for site application

System Modification Summary

- Add Pumptec pump contollers for each new pump
- Wire RW07B into spare pump control slot in control panel
- Add secondary shallow pump control panel H/O/A switch and cycle timers
- Wire expansion control panel into spare pump slot with H/O/A and PLC input
- Add manifold for 8 new extraction wells (typical of existing)
  - Manifold will tie directly into existing manifold
- Remove DNAPL separator
- Move EQ tank to DNAPL separator location
- Upgrade air stripper (see subsequent slides)

TETRA TECH

Response to Comments – System Mods.

Jacobs: Are we comfortable removing the DNAPL separator? Is it no longer necessary? Is keeping it an additional cost, until the new pumping regime is instituted and normalized?

Response: The separator has not recovered observable, drainable, separate phase NAPL (even during startup). Note that the process of pumping, conveying, manifolding, and filtering, results in a very high probability of any recoverable NAPL being mixed into dissolved phase. Along with the additional footprint of the unit, the unit increases the process retention time. The increased retention time could provide a means for bacterial growth, which affects air stripper performance and maintenance.

TETRA TECH

Response to Comments – Air Stripper

Geosyntec: Is the air stripper limited to flow rates of 42 gpm because of excessive moisture carryover only or is the stripper not capable of reducing VOC concentrations at that flow rate (though liquid phase GAC provides polishing)? If the excessive moisture is the only issue, can a moisture knock out trap be installed to eliminate that issue? The fluids collected in the moisture separator can simply be re-routed to the equalization tank. If the moisture carryover is the only issue, this would eliminate need to upgrade or add another air stripper in series.

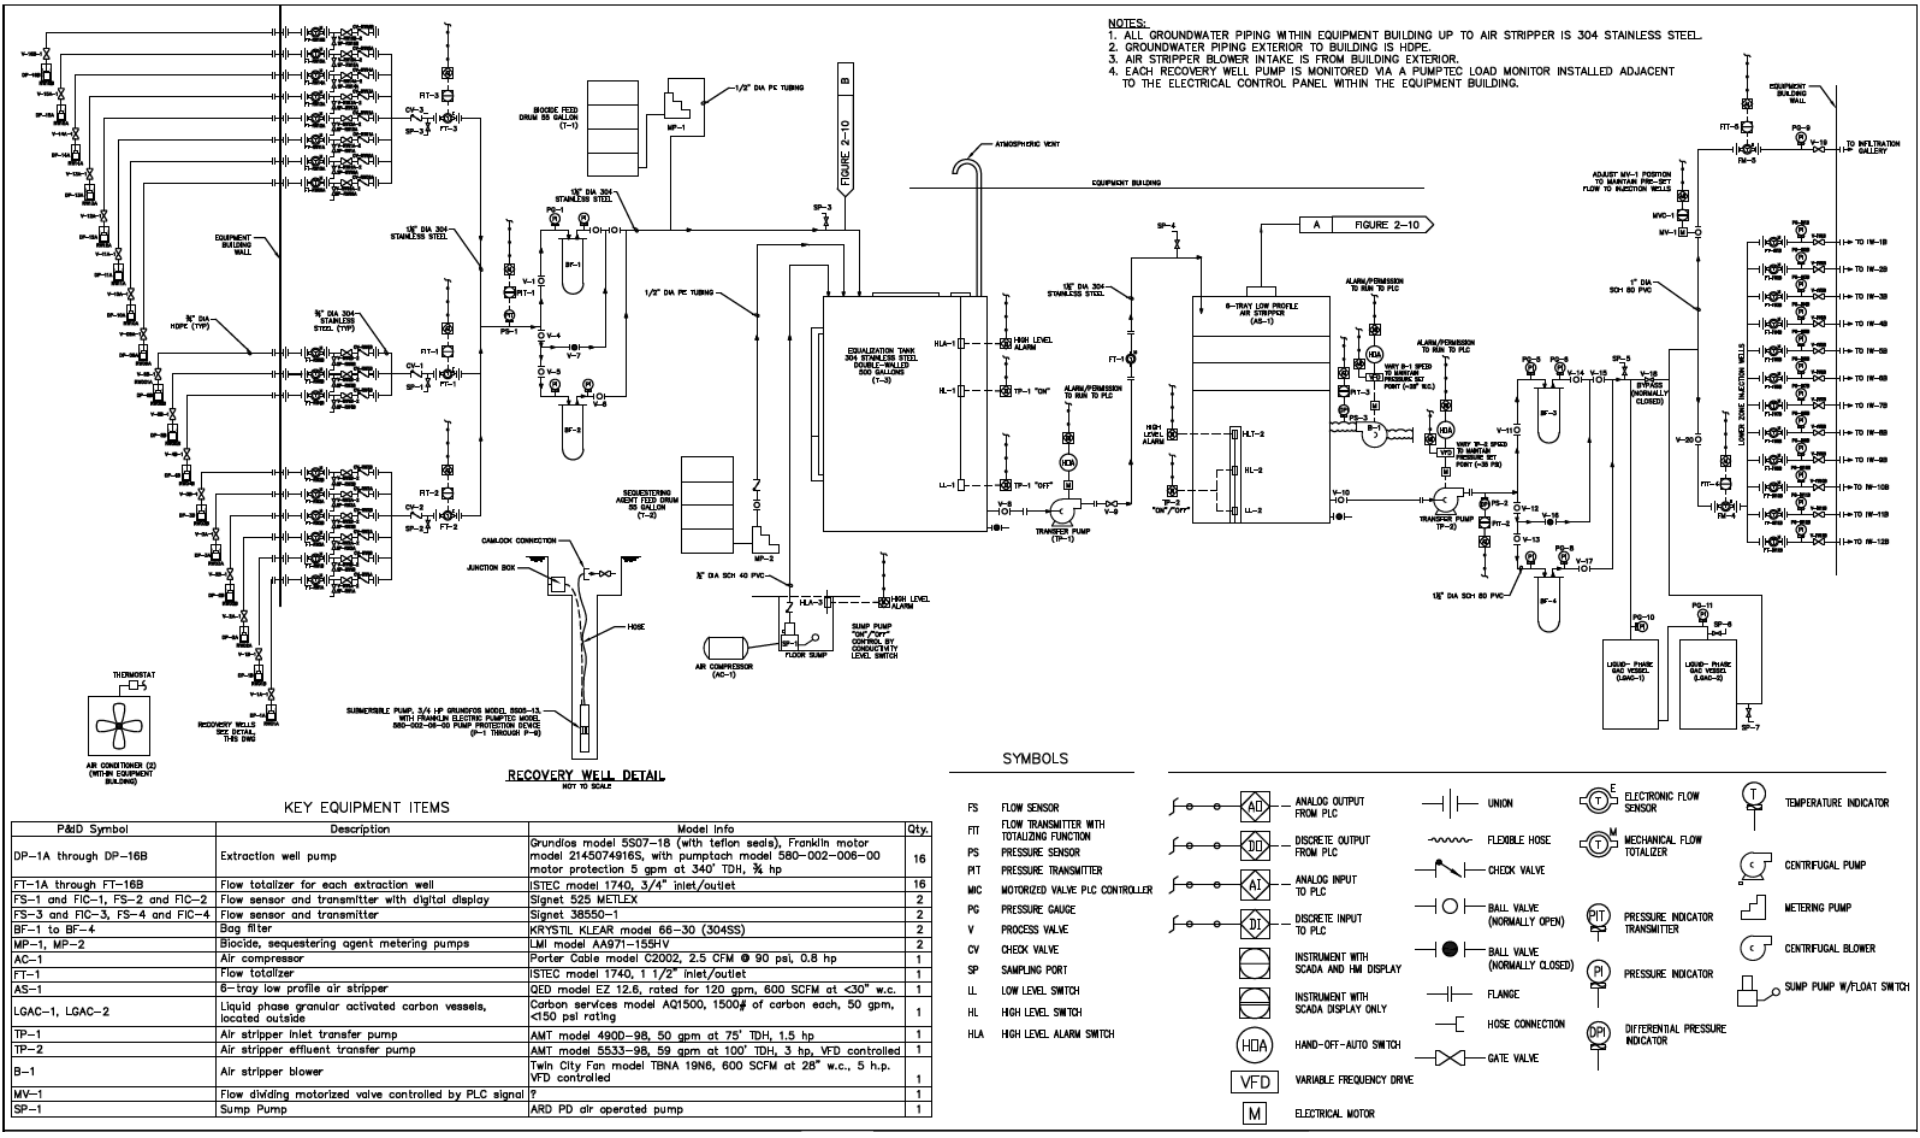
Response: Response: When notable moisture carryover occurs, the headspace in the top and false trays blinds, which results in an increase in back pressure and reduced flow. The reduced flow results in decreased air stripper phase transfer efficiency. The issue is at the air stripper not at the moisture separator. As shown on the P&ID the condensate is rerouted back to the air stripper intake. The existing air stripper is not adequate to increase process flows to meet additional hydraulic loading and upgrades are required to meet the expansion.

Treatment Modification Option A

- Replumb lines to and between manifolds and EQ tank
- Replace current air stripper with QED EZ Tray 12.6 air stripper package (rated for up to 120 gpm, 600 scfm)
  - Skid-mounted, including:
    - 7.5 HP regenerative blower; 2 HP transfer pump
    - Local control panel (tied into existing control panel for overall on/off/alarm functionality)
  - 73”(W) x 71”(L) x 107”(H) footprint [plus ~1’(H) outlet connection]
  - Will require secondary building enclosure due to footprint (or roof mod.)
- QED modeler run for several flow and concentration conditions to verify performance and accommodate influent fluctuations/process modifications
- Flow rate up to 80 gpm treats below influent stream to TCE<3µg/l
  - TCE: 50,000 µg/l; cDCE: 25,000 µg/l; VC: 10,000 µg/l
- Flow rate up to 65 gpm treats below influent stream to TCE<3µg/l
  - TCE: 100,000 µg/l; cDCE: 50,000 µg/l; VC: 20,000 µg/l

TETRA TECH

Treatment Modification Option B



- Add venturi air stripper package prior to existing air stripper (in series)
  - Rated for up to 80 gpm; 50% target aqueous to vapor mass transfer
  - Passive approach, considering notable mass transfer
  - 500 gal tank with pump controls and integral control panel
  - 2 HP recirculation transfer pump (1 pass); 1.5 HP discharge transfer pump
  - 100 cfm induced draft blower tied into moisture separator to CatOx
- Replumb lines to and between manifolds, EQ tank, and venturi stripper
- With added mass removal component, existing air stripper will be tested to operate at higher pumping rate and lower air flow rate (500 cfm)
  - Use mobile lab for modification testing
- If treatment performance is not met, replace venturi and current air stripper with QED EZ Tray 12.6 air stripper package (rated for 120 gpm, 600 scfm)

Treatment Modification Evaluation

- Option A Advantages:
  - Specified air stripper capable of wide range of flow and concentration conditions
  - Easily integrated into system with minimal controls modifications
  - Allows for optimization with less emphasis on minimizing pumping rate impacts
  - Existing stripper showing signs of wear/degradation, requiring eventual replacement
- Option A Disadvantages:
  - High mass removal required within one treatment stage
  - Footprint requirements; requires secondary building and additional plumbing
- Option B Advantages:
  - Fairly passive primary treatment process
  - Lower costs than upgrading air stripper
  - Tiered mass removal spreads mass removal requirements over 2 stages
- Option B Disadvantages:
  - Added complexity/equipment
  - Additional processes require additional modification of controls
  - Unknown performance of existing air stripper at lower air flow and higher pumping rate may require adoption of Option A, if performance inadequate
- **Option A preferred option**
  - **Team discussion in preferred treatment approach**

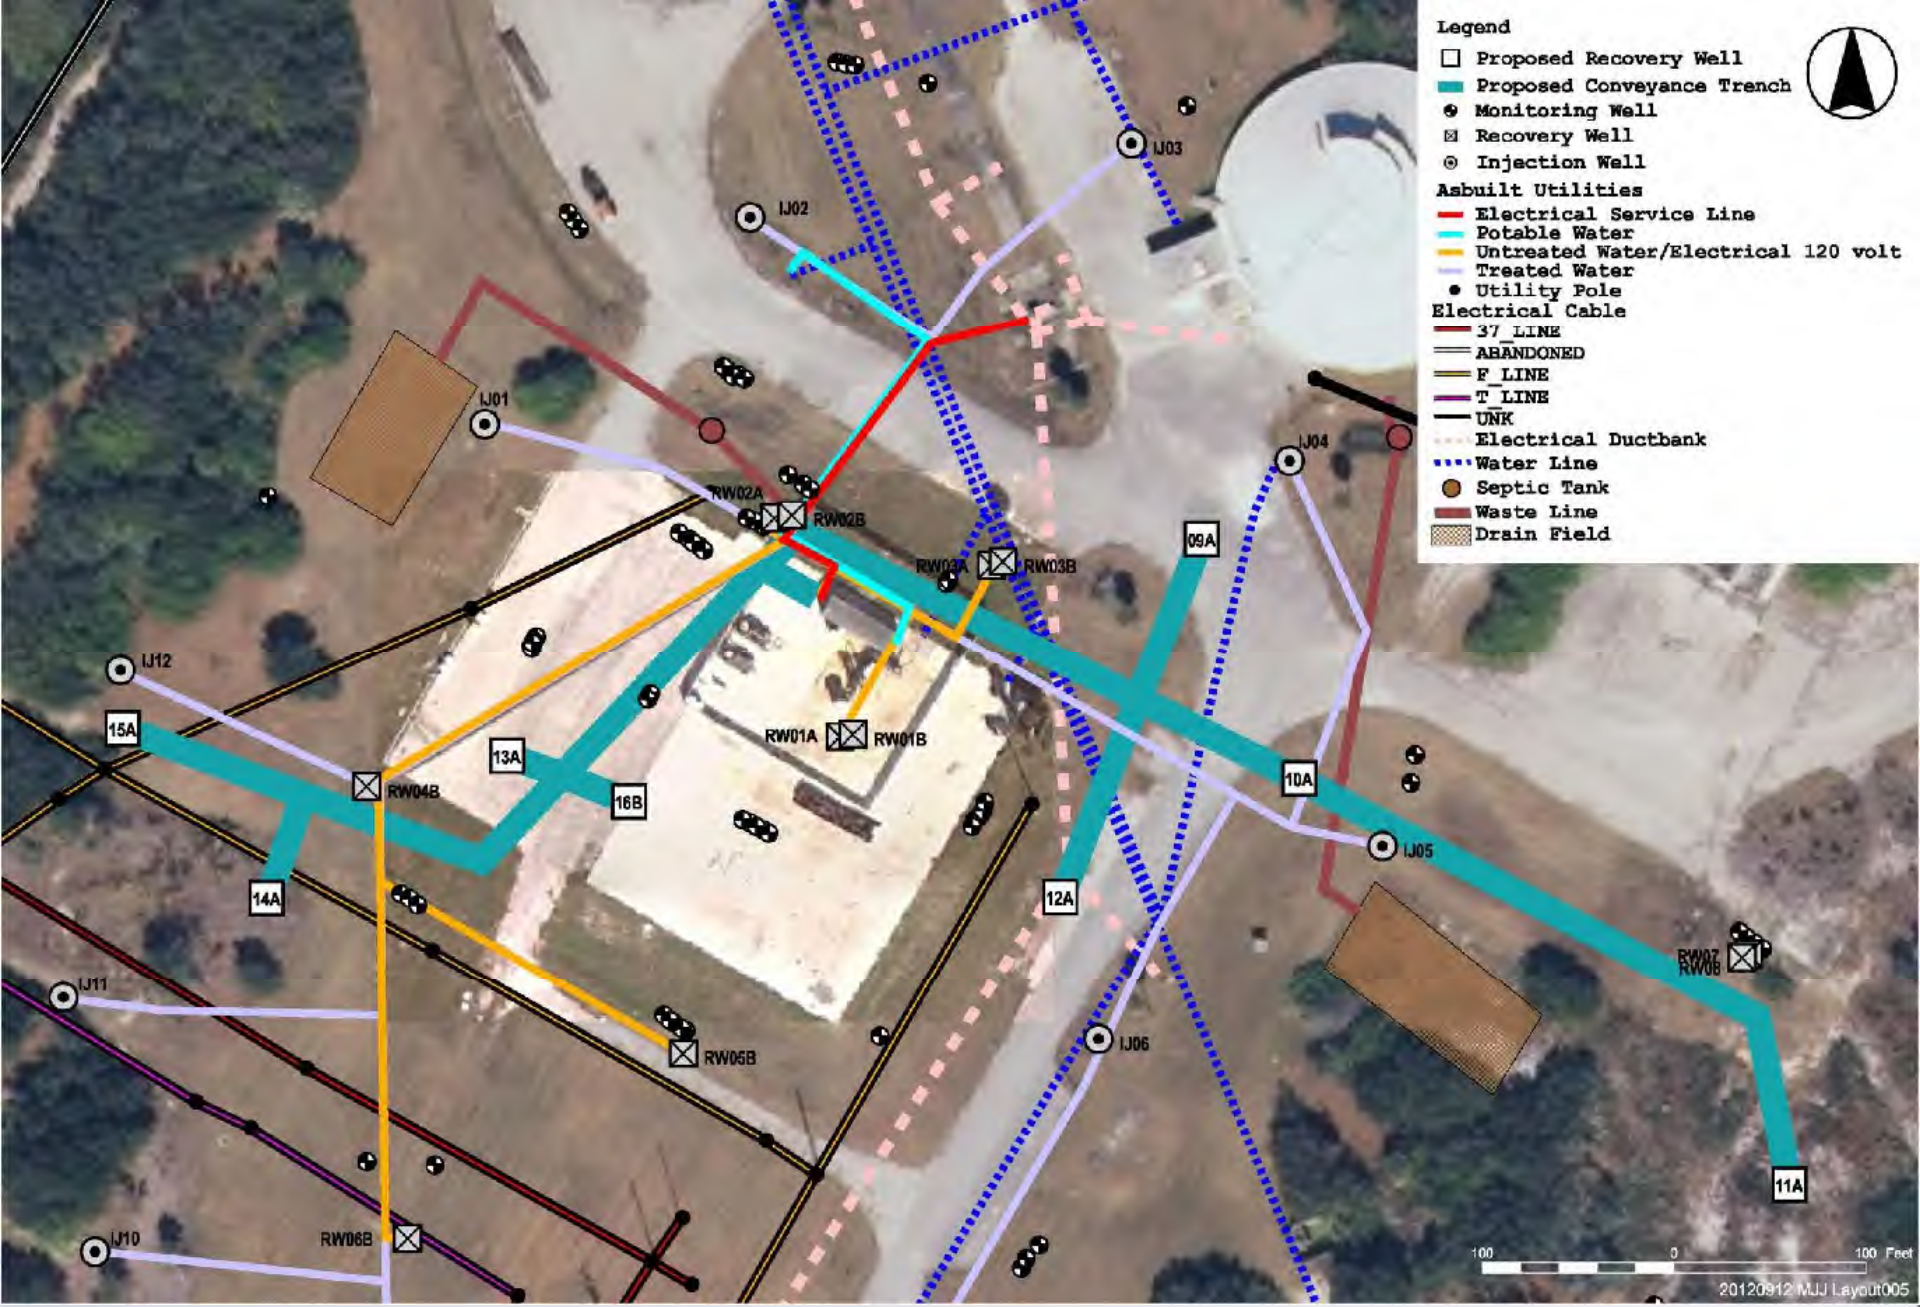
Proposed Piping & Instrumentation Diagram

TETRA TECH

Construction Overview



- Install new recovery wells via sonic drilling
  - 1 shallow RW (5-40'bls); 6 shallow RW (15-45' bls screen)
  - 1 deep RW (50-80' bls screen)
- Trench to the 8 new recovery wells
  - Install dedicated 1" HDPE conveyance piping, wiring, and conduit
  - Install tracer wire and utility warning tape 12" from surface grade
  - Backfill trenches
- Remove DNAPL separator
- Upgrade air stripper and ancillary equipment/enclosure
- Construct new manifold for shallow expansion wells
- Install pump controllers and secondary pump control panel
- Integrate pump wiring and lines into system manifold
- Commission and perform startup testing

Response to Comments – RW Depth

Geosyntec: Slide 22: States proposed deep recovery well screen interval is 70 to 80 ft BLS. This is different than what was presented in part 1. Please verify screen interval.

Response: Typographical error. Correct screen interval is 50-80 feet bls as presented in Part 1 (Slide 35) and Part 2 (Slide 16).

Introduction:

As a subcontractor to Tetra Tech, KB Labs mobilized a Hydraulic Profiling Tool (HPT) unit to KSC/CCAFS-LC34 located in Cape Canaveral, FL, providing Hydraulic Profiling Tool/Electrical Conductivity (HPT/EC) logging. Based on the initial SOW, KB Labs was scheduled to perform HPT/EC logging for two days. Environmental Drilling Services (EDS) of Orlando, FL, was subcontracted by KB Labs to provide the DPT platform to push the HPT/EC probe.

The purpose of the site investigation was to further define the vertical and lateral hydraulic profile of the subsurface looking for contaminant transport zones to aid in a more accurate sampling plan. Borings were scheduled to be typically completed to approximately either 40 ft bgs or 80 ft bgs.

Equipment utilized on site:

- **Environmental Data Acquisition Vehicle carrying custom built MIP, HPT, CPT, and EC systems**
- **DPT sampling machines: Geoprobe 6620DT [EDS]**
- **Portable computers and printer**
- **Data processing software**

HPT Description:

Hydraulic Profiling Tool (HPT) System: A system manufactured by Geoprobe Systems® to evaluate the hydraulic behavior of subsurface soil. The tool is advanced through the subsurface at a constant rate while water is injected through a screen on the side of the probe. An in-line pressure sensor measures the pressure response of the soil to water injection. The pressure response identifies the relative ability of a soil to transmit water. Both pressure and flow rate are logged versus depth.

The HPT system features automatic depth measurement utilizing a linear transducer ("stringpot") attached to the side of the DPT probe. A Wenner array is integrated into the HPT probe. This allows a user to collect soil electrical conductivity (EC) data for lithologic interpretation. In general, the higher the electrical conductivity value, the smaller the grain size, and vice versa. However, other factors can affect EC, such as mineralogy and pore water chemistry (brines, extreme pH, contaminants). Conversely, the HPT pressure response is independent of these chemical and mineralogical factors.

The HPT probe is linked to a control box where the signal is received by a field computer. The signal from the probe is matched with precise depth measurements and logged on the screen. The HPT operator is able to read real time data showing changes in soil conductivity and hydraulic profile.

Data collection occurs in real time by connecting the controller to the field instrument. The field instrument collects, stores and displays transducer pressure, flow rate and electrical conductivity, line pressure, probe rate, and diagnostic parameters, with depth.

Since the HPT pressure response is analogous to relative changes in the ability to transmit water (and therefore the relative change in dominant grain size), the HPT system can be used to identify potential contaminant migration pathways. Similarly, it can help identify zones for remedial material injection or provide qualitative guidance on how difficult injection may be in different zones of the formation.

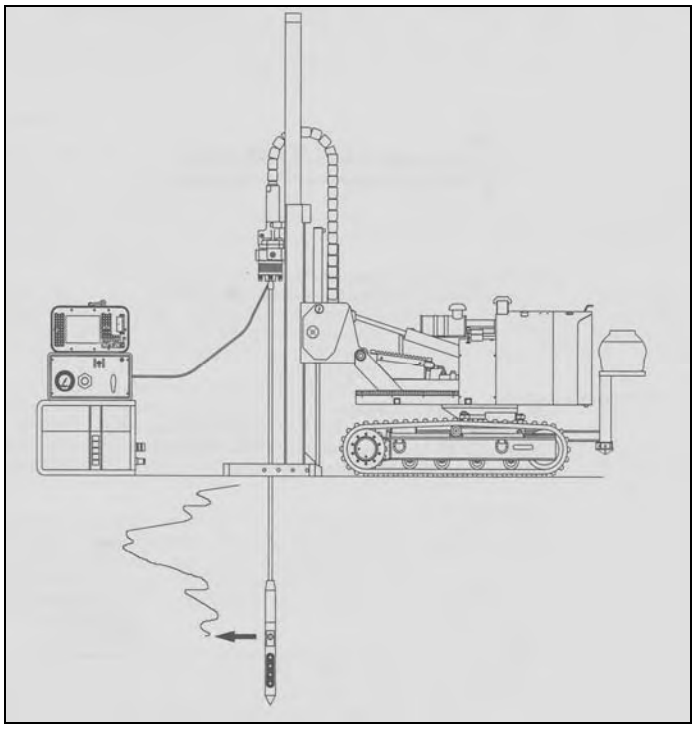

Figure 1. The HPT System

HPT Response Tests

Response testing is used to evaluate any changes that occur in the HPT screen after it is advanced in the subsurface, and aids in accurately determining static water levels. Field testing is required before and after the first log, and after each additional log to verify the screen is not damaged or clogged. If clogged or damaged, remove the screen for cleaning or replacement, as appropriate.

The response is completed submersing the HPT probe into the HPT reference tube measuring the pressure with the water flow on and off. Ideally, the pressure difference observed between the upper and lower water level, both with and without flow, is 0.217 psi. If the pressures observed vary significantly from this value, corrective measures may be required. Additional purging of the trunkline or replacement of the HPT screen may be necessary.

HPT Dissipation Tests

Dissipation tests are performed using the HPT below the water table to determine the static pressure at a particular depth which is used to determine the static water table, correct the hydraulic pressure profile, and provide an estimated hydraulic conductivity (Est. K) value. Once the HPT probe is advanced below the water table, measurements may be performed to determine the static water level (see Figure 2).

Dissipation test measurements may be performed at multiple depths during one log and plotted versus depth. Non linear variations of pressure vs. depth may indicate vertical gradients within the formation. Static water level calculations will require static pressure and depth data, as well as pre- and post-test response data measured at the top of the reference tube at zero flow. Since the HPT system uses an absolute pressure transducer to measure in-situ pressures, pre- and post-test data must be changed to reference atmospheric pressure.

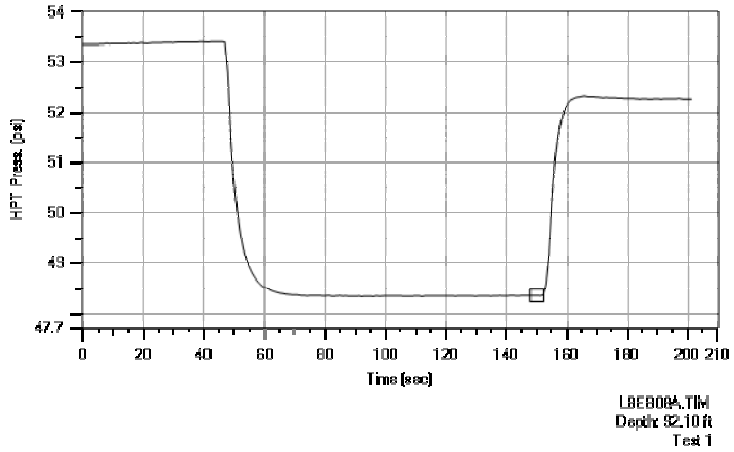

Figure 2: Dissipation Test Example.

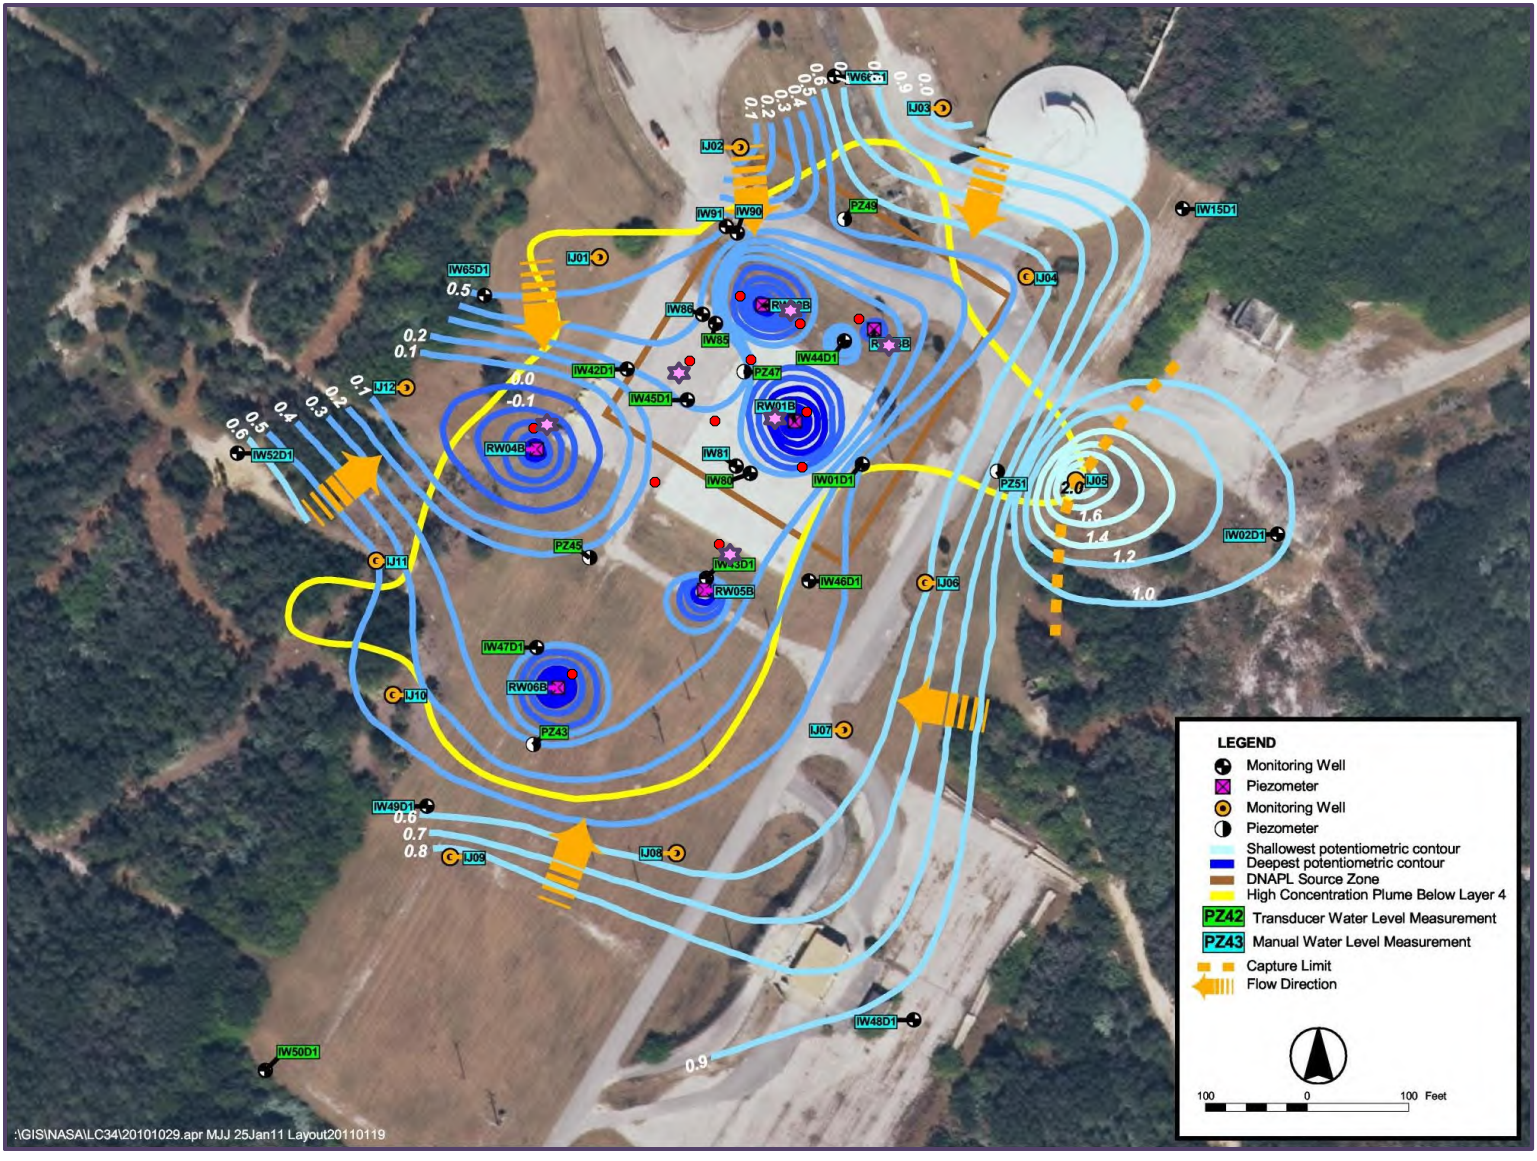
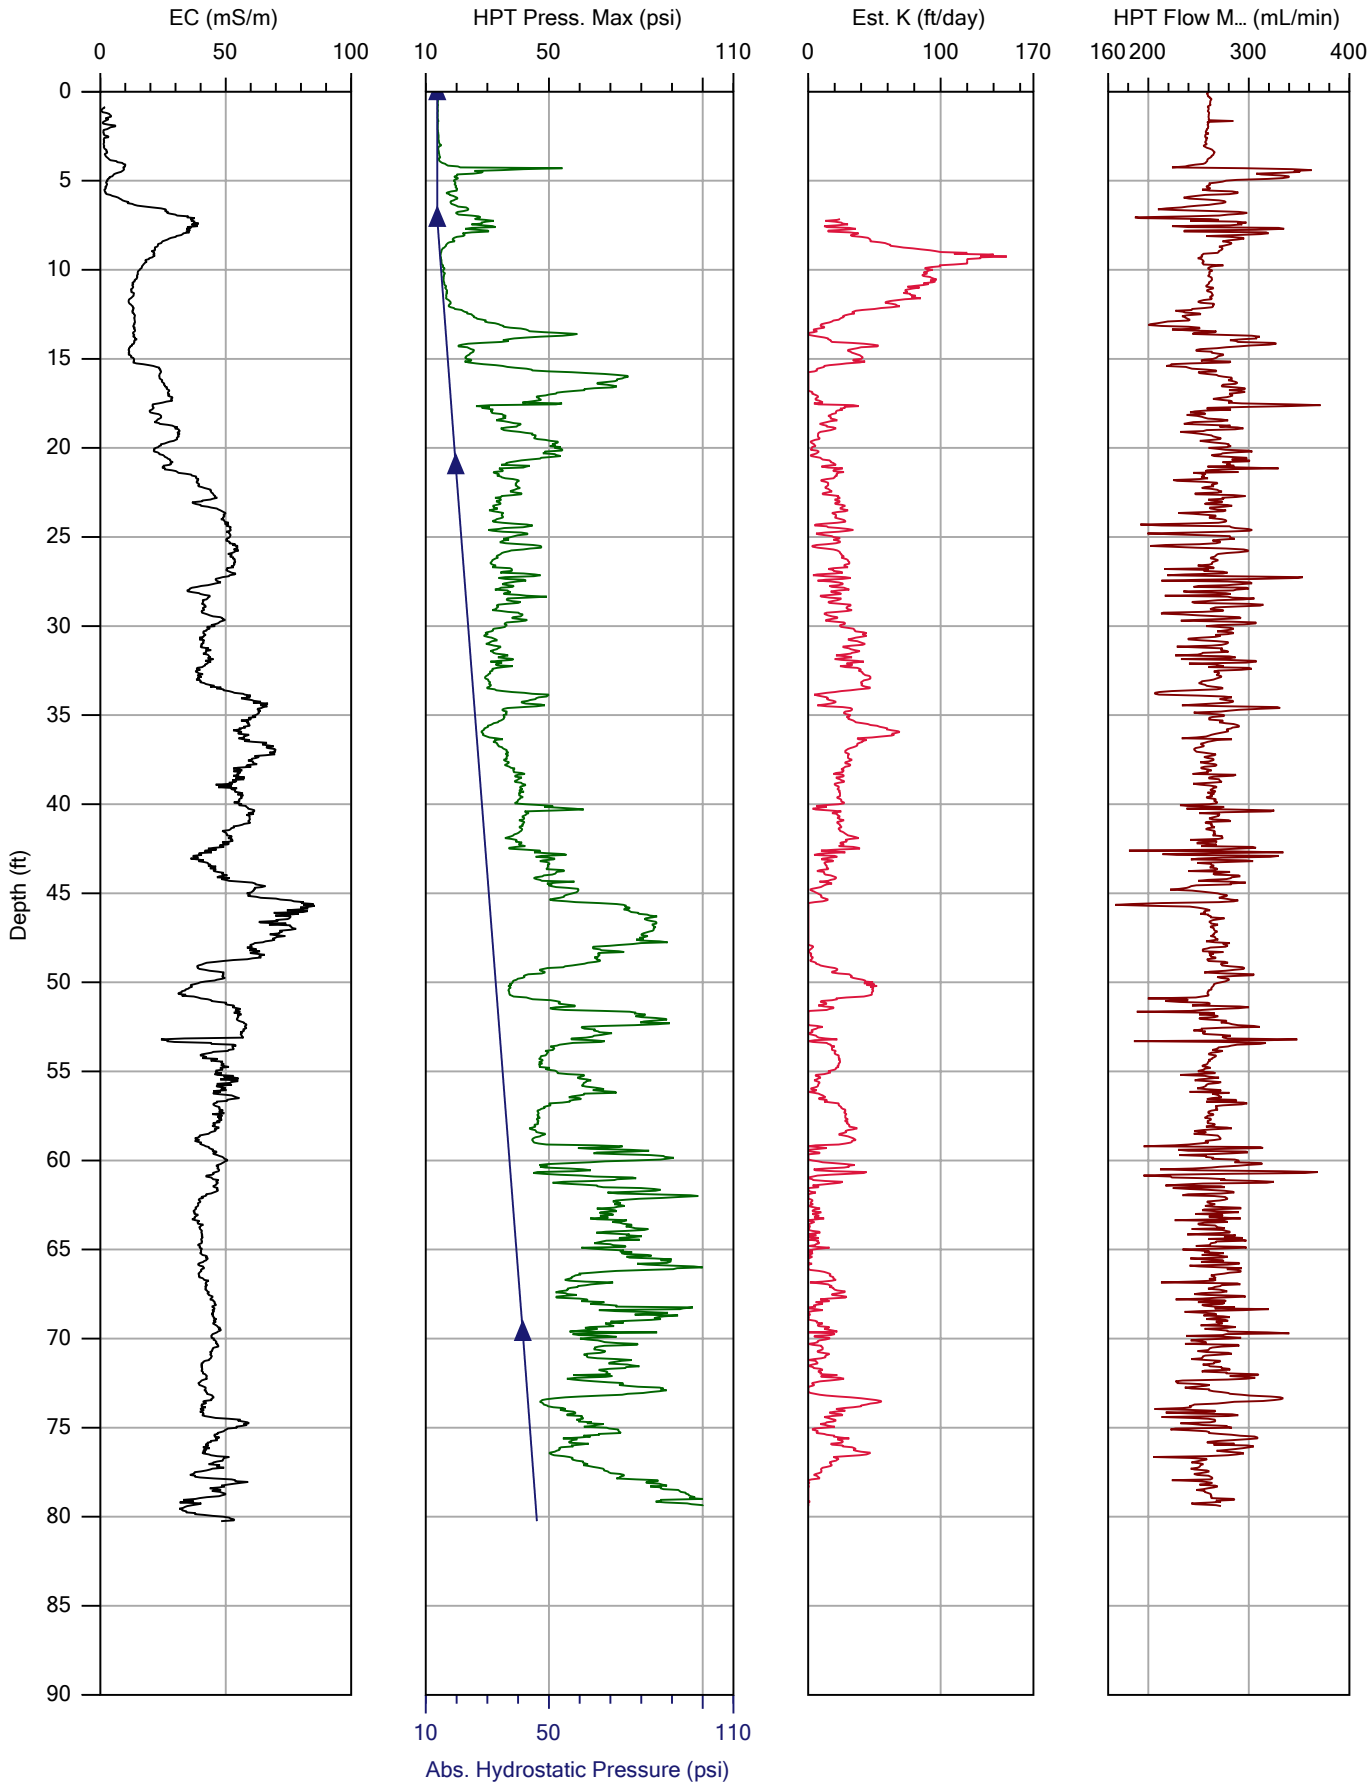
Data Narrative

HPT/EC logging operations commenced on Tuesday, January 8, 2013, continuing until the morning of Thursday, January 10, 2013.

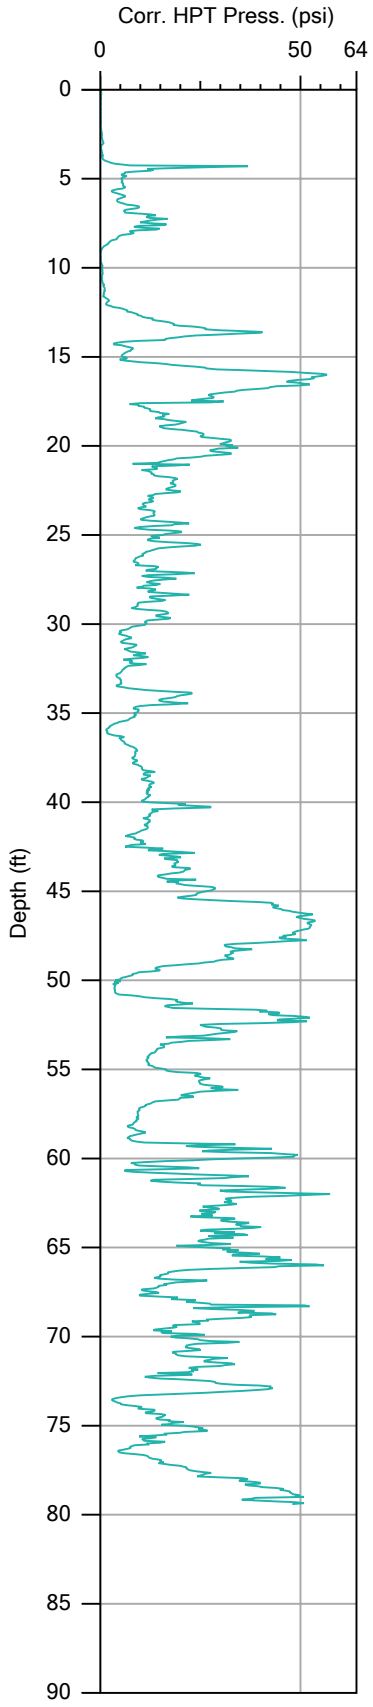


Six (6) HPT/EC borings were logged all to a depth of 80'. At total footage of about 560' was logged over the three days. Following each HPT/EC boring, a hardcopy HPT/EC log was provided to the onsite Tetra Tech POC onsite and emailed offsite to the Tetra Tech PM.



Because of EC failure starting at 50' bgs during boring HPT4, the boring was relogged (HPT4R).

Pressure grouting of the HPT/EC boring and steam-cleaning of the probe and rods were completed after each boring as per KSC requirements for LC34.



Please refer to the attached summary of HPT/EC logs.

This electronic report is a part of a comprehensive data set provided in digital format.

Introduction:

As a subcontractor to Tetra Tech, KB Labs mobilized to KSC/CCAFS Launch Complex 34 in Cape Canaveral, FL, providing Membrane Interface Probe/Electrical Conductivity (MIP/EC) logging. KB Labs subcontracted Environmental Drilling Services (EDS) to provide DPT pushing services to advance the MIP.

The purpose of the site investigation was to further define the vertical and lateral extent of possible chlorinated solvent contamination at the site while providing continuous stratigraphy with the use of the EC.

Equipment utilized on site:

- **Environmental Data Acquisition Vehicle carrying a custom built Membrane Interface Probe unit**
- **DPT sampling machine: Geoprobe 6620DT [EDS]**
- **Portable computers and printer**
- **Data processing software**

MIP equipment description:

The Membrane Interface Probe (MIP) is a percussion-tolerant down-hole VOC sensor interface that can continuously log volatile organics that diffuse through a semi-permeable membrane. Using a mixture of nitrogen, air, and hydrogen carrier gases, the VOCs are brought to the surface through tubing, which is connected to a laboratory grade Photoionization Detector (PID), Flame Ionization Detector (FID) and Electron Capture Detector (ECD) for immediate analysis. The MIP system utilized at this site uses a Flame Ionization Detector (FID), Photo ionization Detector (PID), and Electron Capture Detector (ECD). The data obtained with the detectors are being logged versus depth utilizing proprietary software.

The MIP system features automatic depth measurement utilizing a linear transducer ("stringpot") attached to the side of the probe. The MIP system includes the Direct Sensing Soil Conductivity system as an integral part of the equipment package. This system utilizes a simple dipole conductivity array mounted near the tip of the MIP probe. The dipole array is taking continuous measurements of soil conductivity as it is being driven into the ground. The sensing probe is linked to a control box where the signal is received by a field computer. The signal from the probe is matched with precise depth measurements and logged on the screen. The MIP operator is able to read real time data showing changes in soil conductivity. These changes can be used to identify lithology, contaminant plumes, salt-water intrusion, or any other subsurface condition that displays a change in conductivity/resistivity.

Figure 1. The MIP data acquisition system

Summary of Site Activities

MIP logging and data pre-processing

At each location, a MIP probe was advanced to a specified depth as the data were recorded by the system's data acquisition hardware and software.

The logging was performed using "high sensitivity" mode in accordance with ASTM Standard Operating Procedures for MIP Logging in order to ensure consistency and repeatability of the data. Decontamination of down-hole components of the MIP system was performed using Alconox lab-grade detergent and potable water. In addition to QA/QC and maintenance procedures recommended by the detector manufacturers and ASTM, on-site Quality Control/Quality Assurance (QA/QC) procedures included performing pre- and post-boring standard sensitivity Response Tests using solutions of CVOC and BTEX compounds.

Upon completion of the logging, the push rod assembly was extracted from the ground and cleaned. When necessary, the membrane and the trunkline are cleaned using hexane, methanol and purged with nitrogen in order to remove residual contamination.

Figure 2: MIP Probe.

Raw MIP data logs were printed out immediately upon completion of a logging location and posted to the website the same day.

Detector Sensitivity

The PID, FID, and ECD are detectors used in an array to recognize possible VOC contamination. Each detector is more or less sensitive to different chemical VOC compositions.

Detector	Sensitivity
ECD	Primary: CVOCs (TCE, PCE)
PID	Primary: Aromatic Compounds (BTEX); Secondary: CVOCs at higher contamination levels
FID	Primary: Ethane, Methane, Ethene; Secondary: CVOCs & Aromatic Compounds at higher contamination levels

MIP Data Processing

Field data were transferred to a Data Processing Specialist upon completion of field activities. The raw MIP logs and data were internally reviewed**.** The summary of the MIP logging results as recorded (non-normalized, including all location information, logging depths, individual detector, and summary data graphs) is presented in the PDF Formatted Data Sets (see attached files)**.**

Data Narrative

MIP/EC logging operations began on Monday, January, 21, 2013, and concluded on Friday, January 25, 2103. Over the week KB Labs logged 11 MIP borings to depths about 80'. A total MIP footage of about 881' was logged. MIP logging detector patterns determined a varying presence of possible chlorinated solvents (CVOC) at most locations. Some MIP borings were very contaminated requiring the MIP system to purge either for several hours while onsite or overnight to lower the ECD baseline before the next boring could be attempted.

All MIP log borings were emailed to Tetra Tech following each log for offsite viewing.

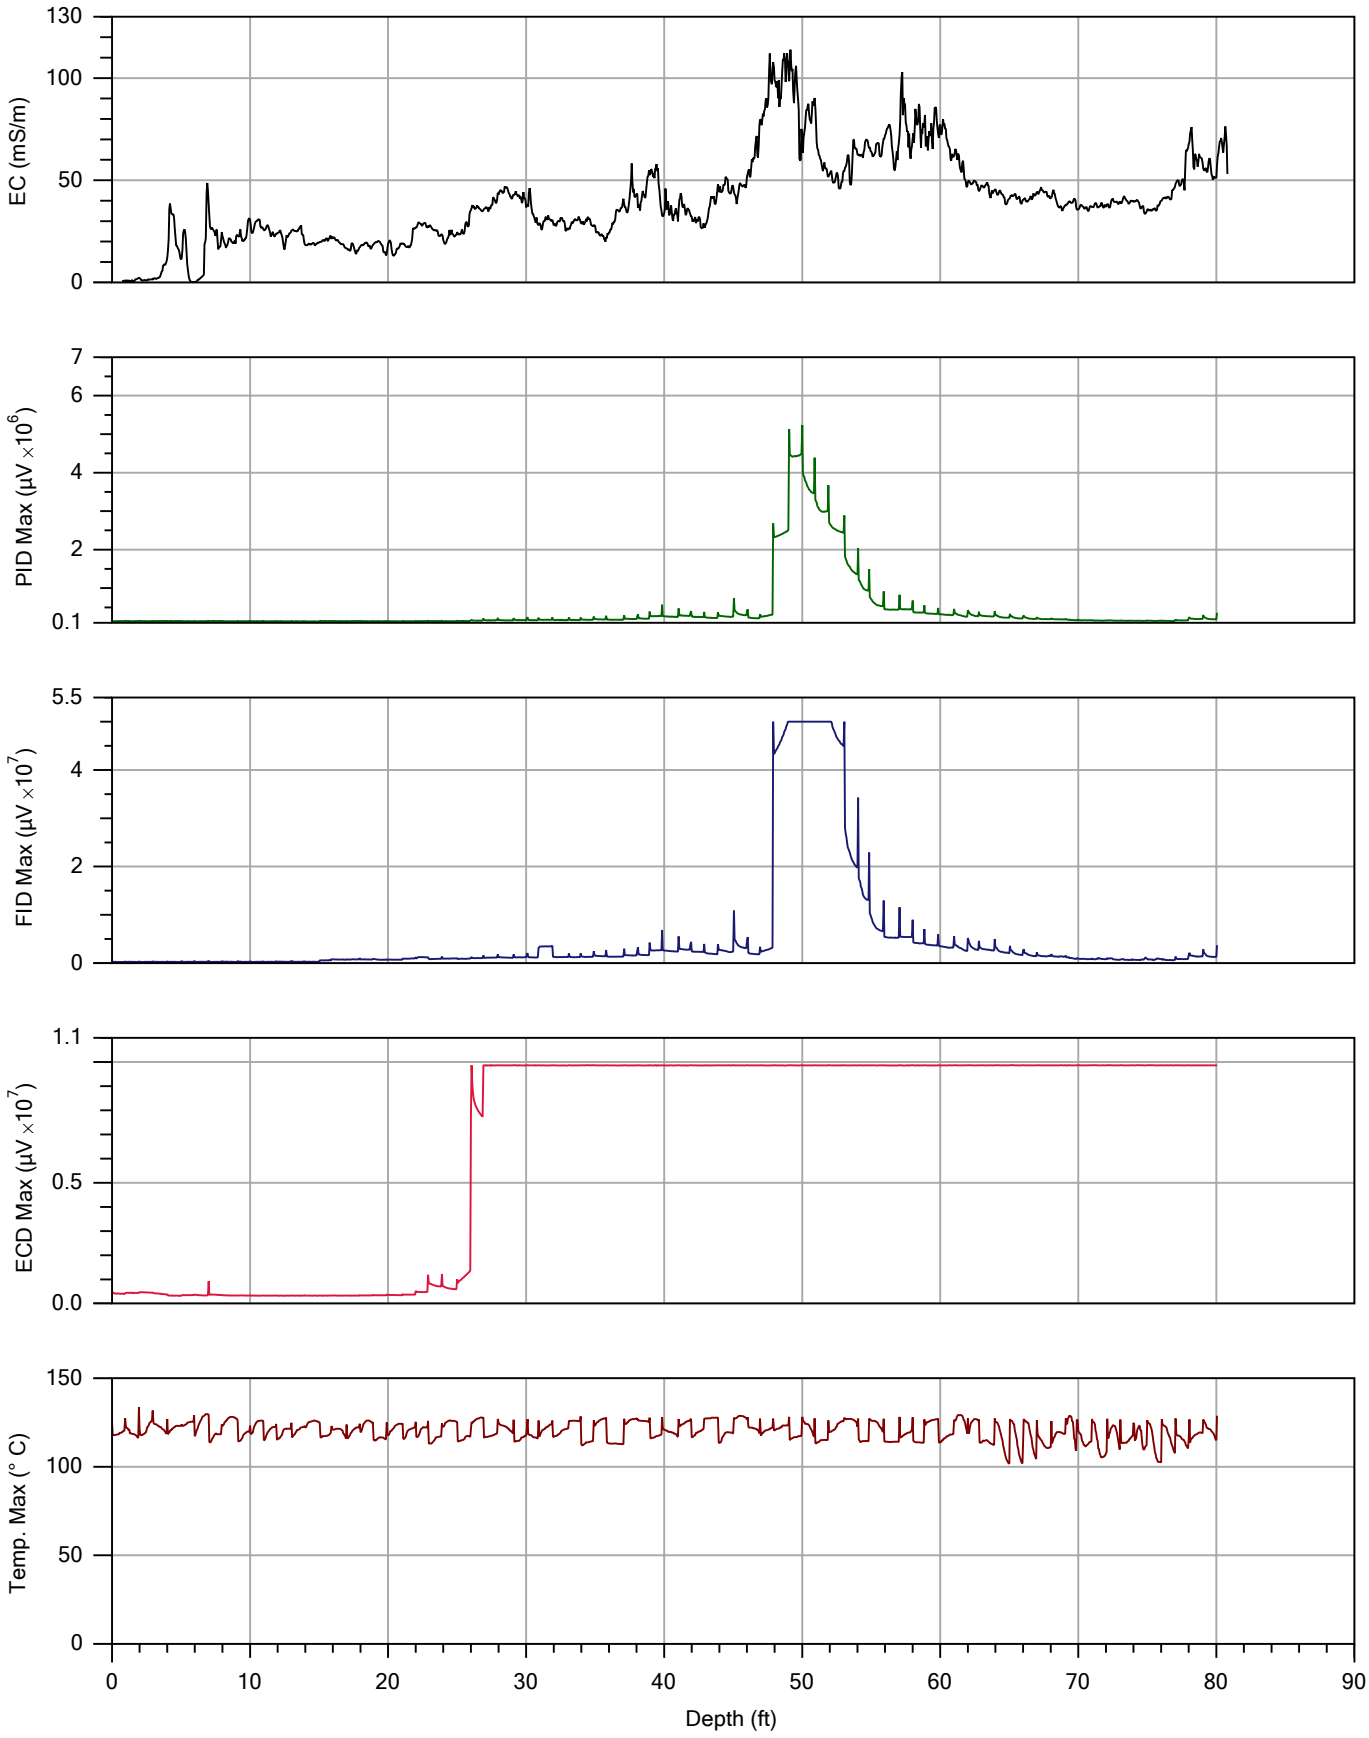
Please refer to the MIP Log Summary for individual boring descriptions.

This electronic report is a part of a comprehensive data set provided in digital format.

MIP Log Summary

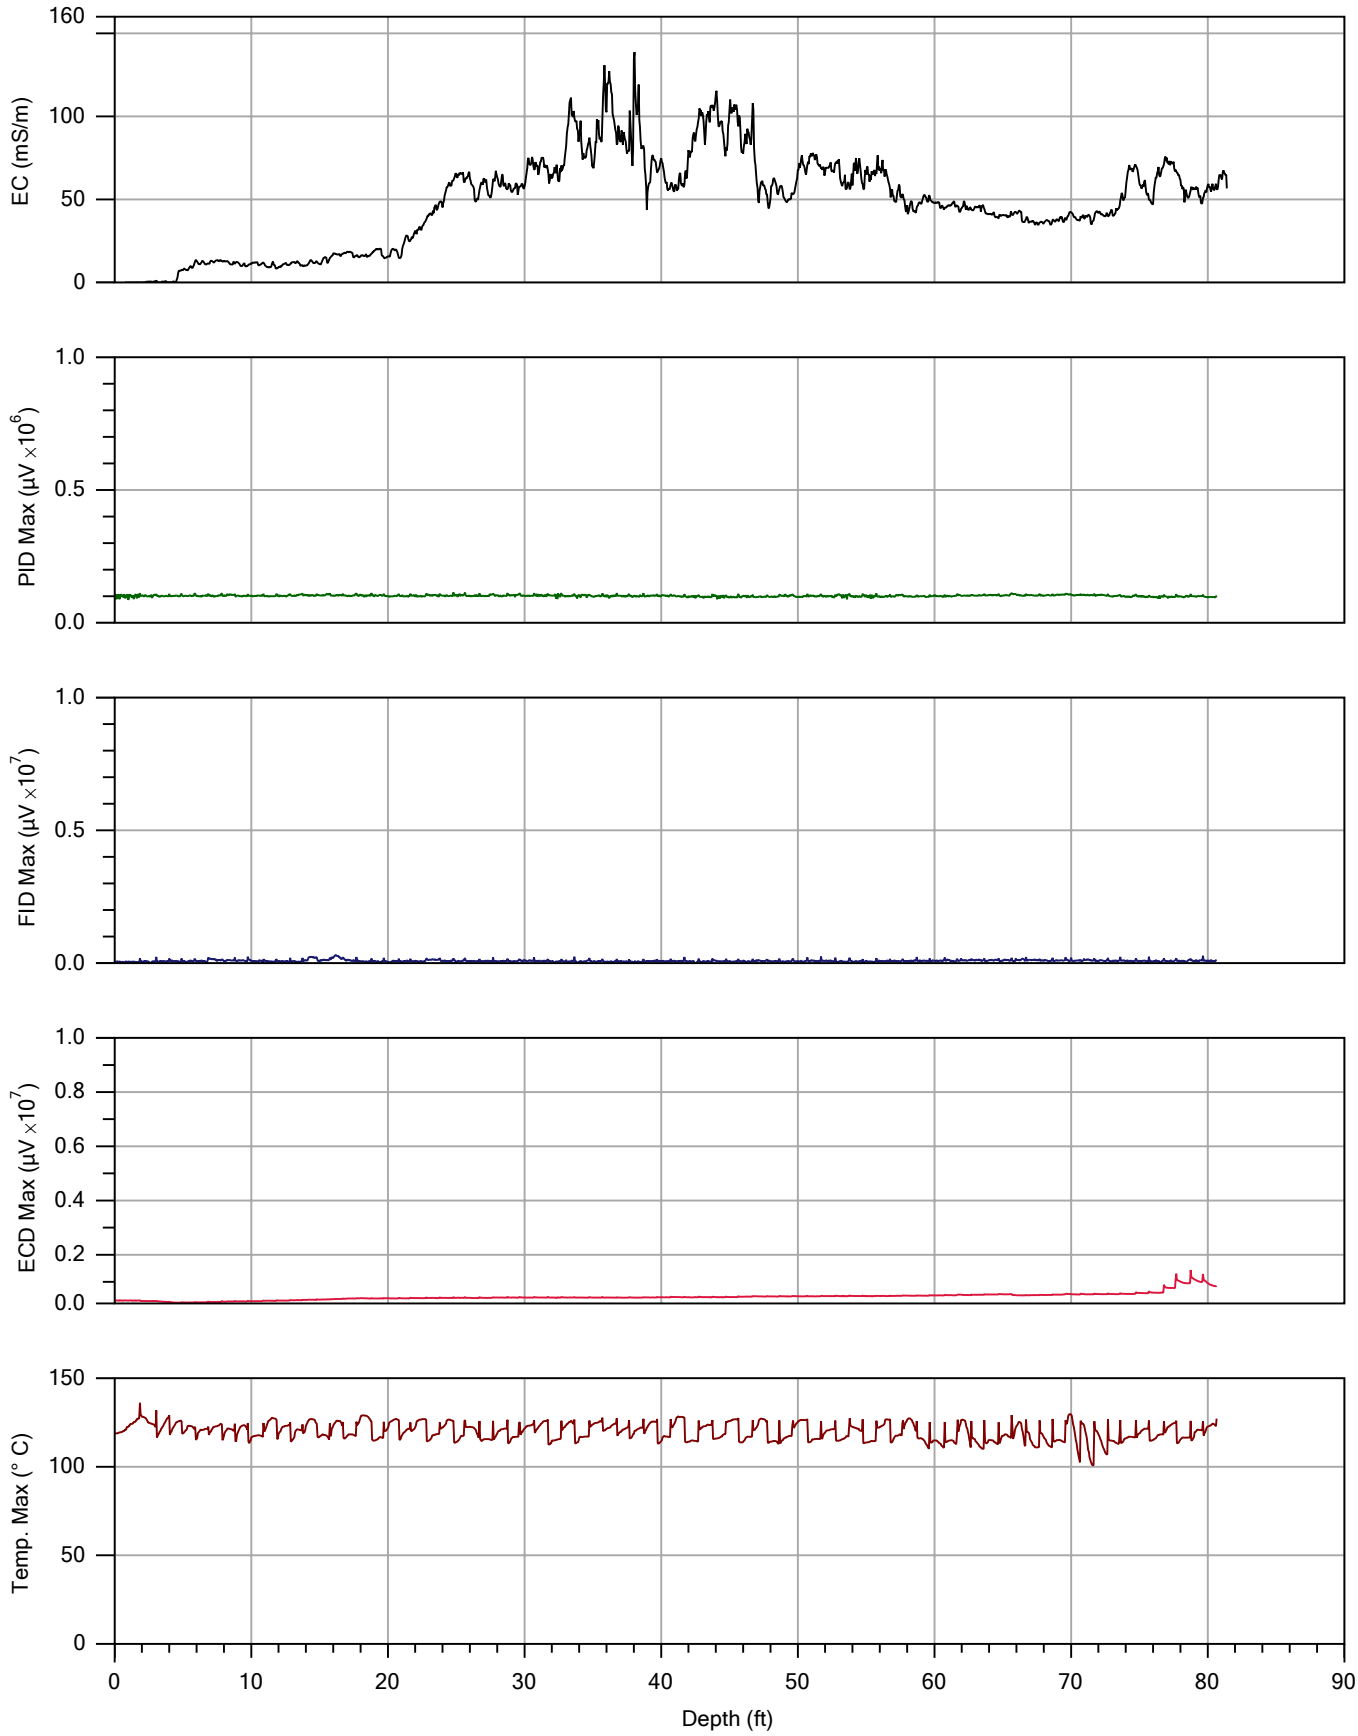
MIP Boring ID	Date	Logging Depth (ft)	MIP Detector Response			Possible Contaminant Signature		Comment
			ECD	PID	FID	CVOC	Petroleum	
MIP-001-20130121	1/21/2013	80	Yes	Yes	Yes	Yes	No	ECD detector became saturated about 25'. High readings of the PID and FID detectors near 50' indicate possible DNAPL levels of CVOCs. MIP system purged overnight.
MIP-002-20130122	1/22/2013	81	Yes	No	No	Yes	No	Lower level possible CVOC contamination detected near refusal.
MIP-003-20130122	1/22/2013	80	Yes	Slight	Yes	Yes	No	Lower level possible CVOC contamination detected near 63' and refusal. Slight PID and FID responses near 30' without significant ECD response indicates possible non-CVOCs.
MIP-004-20130122	1/22/2013	80	Yes	Yes	Yes	Yes	No	ECD detector became saturated about 36'. High readings of the PID and FID detectors between 48' and 56' indicate possible concentrated levels of CVOCs. MIP system purged overnight.
MIP-005-20130123	1/23/2013	80	Yes	Slight	Yes	Yes	No	Higher ECD readings near 22' indicate possible lower level CVOCS. Slight ECD responses near refusal indicate possible lower level CVOCs.

MIP Log Summary



MIP Boring ID	Date	Logging Depth (ft)	MIP Detector Response			Possible Contaminant Signature		Comment
			ECD	PID	FID	CVOC	Petroleum	
MIP-006-20130123	1/23/2013	80	Yes	Yes	Yes	Yes	No	ECD detector became saturated about 48'. Higher readings of the PID and FID detectors near refusal indicate possible concentrated higher levels of CVOCs in the boring than around 60'. MIP system purged overnight.
MIP-007-20130124	1/24/2013	80	Yes	Yes	Yes	Yes	No	ECD detector became saturated about 30'. High readings of the PID and FID detectors near 46' indicate possible DNAPL levels of CVOCs.
MIP-008-20130124	1/24/2013	80	Yes	Yes	Yes	Yes	No	Two significant distinct zones of possible CVOCS. ECD was saturated from 23' to 34' with elevated PID and ECD responses. A similar pattern of responses started at 76' until refusal.
MIP-009-20130124	1/24/2013	80	Yes	Yes	Yes	Yes	No	ECD detector became saturated about 40'. High readings of the PID and FID detectors near 54' to 60' and then near refusal indicate two possible zones of higher CVOCs.
MIP-010-20130125	1/25/2013	80	Yes	Yes	Yes	Yes	No	Based on responses of ECD, PID, and FID detectors, there are possibly 3 distinct zones of possible higher CVOCs: 28'-36', ~60', and ~78'.

MIP Log Summary



MIP Boring ID	Date	Logging Depth (ft)	MIP Detector Response			Possible Contaminant Signature		Comment
			ECD	PID	FID	CVOC	Petroleum	
MIP-011-20130125	1/25/2013	80	Yes	Yes	Yes	Yes	No	Based on responses of ECD, PID, and FID detectors, there are possibly 2 distinct zones of possible higher CVOCs: 24'-32' and 66'-refusal.

Total Depth Logged: **881 feet**
Maximum Depth: **81 feet**
Minimum Depth: **80 feet**

NASA LC34 Shallow and Deep Groundwater Capture System Evaluation

Background/Goal – The calibrated groundwater flow model for LC34 received from Geosyntec Consultants was used to evaluate groundwater extraction pumping networks in both the Shallow and Deep groundwater zones. The intent of the groundwater extraction evaluation was to assist in determining expansion recovery well placement and extraction rates to increase capture of contaminated groundwater recently identified in various field investigations.

Calibrated Groundwater Flow Model - The calibrated groundwater flow model contains 7 layers ranging in elevation from approximately 8 feet MSL to -150 feet MSL. Model grid spacing is variable, ranging from 7.5 feet to 450 feet for rows (y-axis) and 7.5 feet to 525 feet for columns (x-axis). To assist in evaluating groundwater capture, Hot Spots 3 and 4 plume outlines from the LC34 Step 1B Engineering Evaluation were imported into the flow model. Since contours were not provided with TCE greater than 3,000 µg/l, all locations with DPT TCE detections greater than 30,000 µg/l were plotted to focus recovery well placements near high concentration areas. Additional model information is summarized below:

Model Layer	Lithologic Layer	Hydraulic Conductivity (ft/day)	Elevation (ft MSL)	Depth (ft BLS)
1	1 to 4	15.91	~8 to -42	0 to 50
2	5	0.6035	-42 to -48	50 to 56
3	5	1	-48 to -54	56 to 62
4	6	1	-54 to -73	62 to 81
5	7	0.01859	-73 to -83	81 to 91
6	8	25.77	-83 to -116	91 to 124
7	9	0.03372	-116 to -150	124 to 158

Shallow Zone Evaluation – Three scenarios were evaluated for the shallow groundwater zone. Both scenarios had extraction from the three existing recovery wells (RW01A, RW02A and RW03A) and 7 additional locations. Recovery wells were placed in model layer 1 and located near the areas of elevated TCE maximum concentrations (30,000 µg/l). One scenario had all of the recovery wells operating at 3 gpm. A second scenario was run with all recovery wells operating at 5 gpm. A hybrid, third scenario had 8 of the recovery wells operating at 3 gpm and the remaining 2 locations operating at 5 gpm (RW02A and new location, RW13A). Forward particle tracking was performed whereby several lines of particles were located outside of the current plume extents to ensure all areas of the plume would be captured by the extraction system. Particles were placed near the bottom of the model layer where elevated concentrations have been observed. Model output was evaluated showing the potentiometric surface (water table) and particle tracks with arrows representing one year of travel time.

Deep Zone Evaluation – Four scenarios were evaluated in the deep groundwater zone. Six existing recovery wells (RW01B to RW06B) and a new recovery well (RW16B - located approximately between RW01B and RW04B) were placed from 50 to 80 feet bls, within model layers 2, 3 and 4. Extraction rates for the deep recovery wells were partitioned based on Transmissivity (where T = hydraulic conductivity * layer thickness), whereby layer 2 received 12.7%, layer 3 received 21.0% and layer 4 received 66.4% of

the total extracted flow rate. Twelve injection wells (IW01 to IW12) were also included in the evaluations, also being placed from 50 to 80 feet bls. As with the recovery wells, the flow rate was partitioned. A flow rate of approximately 2 gpm was used for each injection well (rate was reduced from 2 gpm to prevent flooding – modeled water levels above ground surface).

The following extraction rates were evaluated in the designated scenarios:

Recovery Well	Scenario 1	Scenario 2	Scenario 3	Scenario 4
RW01B	5	5	5	5
RW02B	5	5	5	5
RW03B	3	3	3	3
RW04B	3	2	2	2
RW05B	3	3	3	2
RW06B	0	2	2	0
RW16B	0	0	5	5

Forward particle tracking was performed whereby several lines of particles were located within the injection wells to ensure all areas were captured by the extraction system. Additionally, some particles were placed between RW01B to RW03B and RW16B to ensure that stagnation of flow is minimized. Particles were placed near the top of the model layer 4 where maximum concentrations have been observed. Model output was evaluated showing the potentiometric surface and particle tracks with arrows representing one year of travel time.

LAUNCH COMPLEX 34, CAPE CANAVERAL AIR FORCE STATION, FLORIDA

NOTES:
1. ALL GROUNDWATER PIPING WITHIN EQUIPMENT BUILDING UP TO AIR STRIPPER IS 304 STAINLESS STEEL.
2. GROUNDWATER PIPING EXTERIOR TO BUILDING IS HDPE.
3. AIR STRIPPER BLOWER INTAKE IS FROM BUILDING EXTERIOR.
4. EACH RECOVERY WELL PUMP IS MONITORED VIA A PUMPTEC LOAD MONITOR INSTALLED ADJACENT TO THE ELECTRICAL CONTROL PANEL WITHIN THE EQUIPMENT BUILDING.

QTY	PART NO.	DESCRIPTION	UM	UNIT PRICE	EXTENSION
1	EZ-12.6SS	EZ-12.6SS Tray: Air Stripper Assembly, 6 Tray, This EZ-TRAY Series 12 unit has a flow rate of 1-120GPM, 304 Stainless Steel trays and shell with integral sump. INCLUDES: 6 trays, see-through front hatch, polypropylene de-mister, liquid level sight gauge and sump pressure gauge. Note: This price does not include the blower. *INCLUDES ADDITIONAL COUPLING IN SUMP, AND ABOVE TRAYS TO MEASURE DIFFERENTIAL PRESSURE.*	EA	21,395.00	21,395.00
1	807142	Blower, pressure / mfg. New York Blower. Motor: 7.5 hp, 230/460 volt, 3-phase, TEFC. Inlet: 6.625" OD - discharge: 6" flange 150 lb. class. Standard on a 12.6 stainless steel & 16.6 stainless steel.	EA	3,492.50	3,492.50
1	EZ-LOWP	Kit, blower low air pressure sump switch (explosion-proof). Includes: (1) EZPLOW pressure switch, tubing & fittings.	EA	210.00	210.00
1	EZ-HIGHP	Kit, blower high air pressure sump switch (explosion-proof). Includes: (1) EZPHIGH pressure switch, tubing & fittings. Used on EZ Tray systems.	EA	240.00	240.00
1	BLKIT6	Blower piping kit 6" PVC SCH40 pipe & flange (150# class). For EZ-12.x stainless steel & EZ-16.x stainless steel series air strippers. Blower to sump piping kit for QED skid mounted systems.	EA	495.00	495.00
1	T135503	Pump, transfer / mfg. Goulds - NPE series. 135 GPM @ 50TDH, 3 hp, 208-230/460V, 3 phase, TEFC. Pump material: 316L / Viton. Suction: 2" NPT - discharge: 1 1/2" NPT. *PLEASE NOTE:* *PUMP MOTORS ARE VFD READY.*		1,725.00	1,725.00

1	EZ-DIS	Sump discharge pump float switch kit. Includes: (1) 800065 warrick float switch & (1) cord strain relief. Note: Requires intrinsically-safe relay for explosive environments. QED p/n CPIS.	EA	145.00	145.00
1	3STDS	Discharge pump plumbing kit, 30-160 GPM system. Designed for QED skid mounted EZ-Tray air strippers. AS sump and discharge pump includes: 2" hose, fittings, pressure gauge, check valve, ball valve and sample port.	EA	955.00	955.00
1	807159	Skid, 68"W x 72"L platform for QED EZ-12.x stainless steel series air strippers. Material: C3 x 5.0# welded steel construction with forklift access holes. Finish: PPG pit guard two part epoxy paint over an epoxy primer. Designed for QEDs air stripper, blower, (2) pumps and control panel.	EA	1,900.00	1,900.00
1	EZ-L3	LABOR, Assembly of QED Skid mounted Air Stripper systems. Std. on EZ-12.xSS, EZ-16.xSS systems.		945.00	945.00
1	RT-CUSTOM	Remediation/Treatment Custom Product *DWYER DIFFERENTIAL PRESSURE GAUGE. MEAUSRES PRESSURE ACROSS TRAYS*	EA	265.00	265.00
				TOTAL	**31,767.50**

TERMS & CONDITIONS: Payment Terms: NET 30

Estimated Shipping Time 4-6 weeks after receipt of Purchase Order and subsequent customer approval of submittal package (if necessary), unless custom equipment is included in the order. Final delivery date will be determined at time of order. A purchase order with a 30% deposit required upon placing order. Balance plus shipping is due within 30 days of shipping. Prices do not include freight. All prices are in U.S. dollars, FOB Dexter, MI, USA. A copy of your purchase order is required at time of order. "Pricing and Delivery on all specials will be determined after receipt of order." Total price does not include applicable sales tax or freight. A service charge of 1.5% per month will be applied to all past due invoices. Pricing valid for 30 days. After seller accepts, NO order may be cancelled without Seller's written consent. Cancellation, if approved, is subject to reasonable restocking and/or handling fee. All products will be returned freight prepaid to Seller's facility.

The QED modeler estimates unit performance for the listed contaminants. ***Results assume -***

1. *Contaminants are in the dissolved-phase, within a water matrix*
2. *Stripper Influent air is contaminant-free*
3. *Influent liquid does not have surfactants, oil, grease, other immiscible phase(s) or other Henry's constant altering additions present, such as dissolved phase polar organic contaminants*
4. *The air stripper is operated within the given parameters listed above and as instructed in the E-Z Tray O&M manual*

Stripper performance shall meet or exceed either the required effluent concentration(s) or effluent estimates, whichever is greater, for the conditions supplied and assumes the influent concentrations of each contaminant are less than 25% solubility in water. QED makes no claim of the model's accuracy beyond the 25% solubility in water limit.

Air Stripping without Trays or Packing

No clogging, no fouling, no maintenance

TW offers a revolutionary design for stripping VOC's & dissolved gases from groundwater & wastewater. We offer this design in multiple configurations depending on the flow rate, contaminant type, and loading.

The primary stripping technology utilizes our innovative stripping nozzle system that strips VOC's and dissolved gases from water using a powerful shearing action as the water passes through the nozzle. This system requires no packing, no blowers, and no trays. This design is effective on large flows and is efficient in stripping the easier to strip compounds such as Benzene, Toluene, Carbon Dioxide, Radon, etc. For harder to strip compounds such as MTBE, we can provide a multi-pass system or combine it with one of our other stripping technologies.

This design is ideal for sites where large concentrations of iron and manganese as well as suspended solids may create a maintenance problem for conventional low profile air stripper designs as well as towers. It is also ideal for applications where flows may be large as well as where short term treatment is the goal.

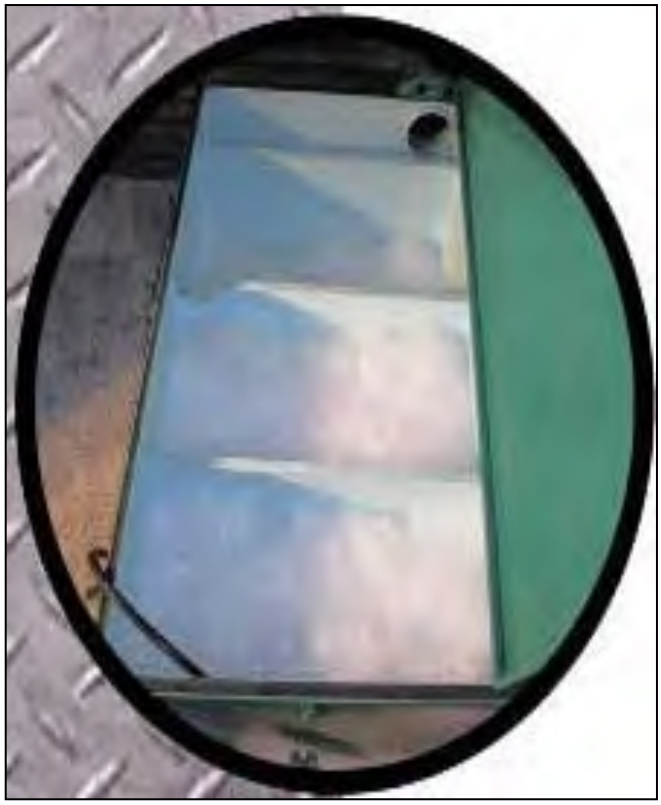
THEIA
Air . Water . Land

www.Theia-Air.com p. 888.330.2260

The Key: the main stripping vehicle for this system is a unique self aspirating nozzle that aspirates ambient air into a liquid using the natural vacuum generated by the liquid being pumped through a flow reducing (venturi) nozzle to draw air into a liquid. This natural vacuum draws in 2.2 volumes of ambient air to 1 volume of liquid. It transfers 20% of available oxygen--in the aspirated air-into the liquid being processed. The system does NOT require a separate source of air for the stripping.

Air Stripping: Because there is a pressure differential at the discharge nozzle (D p 16) into the Venturi's mixing and oxidizing zone, substances with weak Henry's constants are readily stripped. E.g. BTEX, PCE, TCE, CO2, radon, etc. From a mechanical efficiency standpoint, the Oxygenator is far more cost effective to operate than conventional packed tower or low profile air stripper systems

Stripped gases are removed by keeping the tank under slight negative pressure using exhaust fan or blower. Unlike other air strippers, it is maintenance free and will never foul. We pump raw sewage through this device and that does not clog it. There is no packing to clean, no trays to remove, etc. We use a simple maintenance free centrifugal pump, a Venturi Aspirator and a small tank.



Different configurations: As mentioned above, this stripping system is available in a variety of configurations. A single pass through the stripping nozzle will typically remove from 50-75% of the contaminant depending on its Henry's constant and water temperature. Nozzle flow rates range from 50 to 1500 GPM capacity. For instance, for Radon removal, a three pass system will yield a removal efficiency of roughly 97%. For MTBE removal, we can utilize multiple passes through our nozzle combined with either a mini-tower or a tub style stripper to improve the overall removal efficiency to over 99%.

Metals & Solids Removal: The high levels of induced D.O. will typically oxidize a large percentage of the iron coming into the system, allowing it to drop out of solution. This eliminates the need to introduce separate oxidizing agents like peroxide, or inversely, the need for sequestering agents to keep the iron in solution. Because of the tank configuration and retention time above grounds, this system can allow the iron and other solids to settle to the bottom of the tank. Our reaction tank can be configuration to further promote settling and easy removal of these solids.

Thus, all the solids and iron that would normally be clogging up your air stripper, fall harmlessly to the bottom of our storage tank. If solids and metals handling is part of the design, this tanks can be fitted with a conical bottom as well as inclined plates, etc. If chemical addition is necessary for settling, etc, the venturi is a very efficient in-line mixer and the tank will afford the chemicals and water time to mix.

Air Stripping without Trays or Packing

Tub Style with multi-chamber design

This simple and low maintenance air stripper consists of a multichamber tank and one of three main configurations: A Venturi stripping system as referenced above; a high velocity blower system; or a Venturi stripping system followed by a blower system for polishing. The design will depend on the nature of the contaminants to be stripped, the loading, and the characteristics of the site.

This system requires almost no maintenance and will never clog or foul. For very high iron and solids loading, we offer a conical bottom tank and sludge removal system which allows removal of any solids without having to even shut down the system. The stripping tank features a removable lid for easy access.

- ⇒ System will never clog of foul
- ⇒ Almost no maintenance
- ⇒ Multiple designs available to address a large variety of contaminants
- ⇒ Energy efficient
- ⇒ Removal rates as high as 99.99% in many cases. No packing or trays to clean
- ⇒ Long runs between cleaning

Applications

These air strippers are an efficient method of removing contaminates from water and wastewater in a wide range of applications, including: VOC Removal, Chlorine, Radon Removal, Carbon Dioxide Removal, Potable Water Contamination, Groundwater Remediation. We also employ them as a polishing step for our Venturi Style Air stripping units.

February 9, 2013

Mr. Christopher A. Hook, P.E.
Environmental Engineer

Reference: unknown
Our proposal number 021113GF1

We are pleased to provide the following budgetary proposal for the above referenced project. As discussed, TDM and its team provide a wide range or water, wastewater and air treatment solutions.

Application Data: the customer is treating groundwater with very high levels of chlorinated solvents. They presently have a tray air stripper in place that is not able to meet the discharge standards. They are looking for a simple maintenance free solution to pretreat the groundwater and allow the existing air stripper to perform better.

Flow rate: Maximum 70 GPM

Option 1: 50% reduction

Water Quality Parameter	Average Concentration Based on Data Provided by customer (µg/l)	Maximum Concentration Based on Data Provided by customer(µg/l)	Limit (µg/l)
Total Petroleum Hydrocarbons, Gasoline Range Organics (GRO)	NA	NA	NA
TCE	50000	50000	25000
DCE	20000	20000	10000
Vinyl Chloride	10000	10000	5000
Iron – total	500	500	n.a.
Iron – dissolved		NA	n.a.

Option 2: treat to discharge

Water Quality Parameter	Average Concentration Based on Data Provided by customer (µg/l)	Maximum Concentration Based on Data Provided by customer(µg/l)	Limit (µg/l)
Total Petroleum Hydrocarbons,	NA	NA	NA

Gasoline Range Organics (GRO)			
TCE	50000	50000	5.8
DCE	20000	20000	2.3
Vinyl Chloride	10000	10000	1.8
Iron – total	500	500	n.a.
Iron – dissolved		NA	n.a.

Design: TDM offers a unique air stripping system that is efficient enough to meet your stringent requirements but robust enough to run continuously regardless of the water quality with little or no maintenance.

Unlike tray and tower air strippers, this system will not foul from iron, calcium, that exists in many groundwater sources throughout the US.

Proposal: The following is a budgetary proposal for the purchase of the treatment system. Also, please note that the sizing is based on worst case calculations.

Process flow: water will be pumped from the customer's process to the stripping tank.

Option 1: Water in this tank will be recirculated through our TA-ST80 stripping nozzle. Recirculation rate will be 80 gpm which will afford the water 1 pass through the nozzle.

Option 2: Water in this tank will be recirculated through our TA-ST600 stripping nozzle. Recirculation rate will be 600 gpm which will afford the water 8 passes through the nozzle.

As the water passes through the nozzle it is sent into the stripping tank through a cross-style spray system. As the water passes through the spray array, it cascades downward. Air is drawn upward through the stripping tank and out countercurrent to the direction of the water. The water coming off the stripping nozzles slowly loses the entrained air and sinks slowly downward. Relative gas levels in the water keeps the water stratified such that we maintain a first in first out stripping order. This multi-pass design is similar in principal to a tray air stripper.

Based on the level in the tank, water will be drawn off the bottom of the tank and pumped out (it is unknown where we are pumping to) or can flow by gravity.

System description:

Air stripper. **Option one**

Air stripping system consists of the following major items

- Tank: tank will be 4 foot diameter x 6 feet tall and is constructed from Polyethylene. Tank has flanged inlet and outlet, 2 drain connections, 2 Venturi inlets and outlets, and two(2) vent connections. Vessel has a top manway for access to the tank should that ever be necessary.
- One(1) TA-ST80 Stripping nozzle with specially designed "shredder" discharge.
- One(1) 2 Hp Goulds centrifugal pumps to draw the water from the tank and pump through the nozzles.
- One induced draft blower to pull exhausted air from the tank and to increase the volatility of the contaminants. Blower will be 100 CFM fan.
- One(1) 1.5 Hp Goulds Centrifugal pump for drawing water from the stripping tank and pushing through the remainder of the system. (option)

Control system –System does not require any sophisticated control as designed. System is provided with simple starter panel with relays to send alarms and receive commands from the customer's control panel.
Logistics: we have provided a skid mounted stripping system for this application. System can be placed in an enclosure if that is of interest.

System price(budget) . . . $ 24,500.00
Adder for discharge pump . . . add . . . $ 2,500.00

Air stripper. Option Two
Air stripping system consists of the following major items

- Tank: tank will be 6 foot diameter x 7 feet tall and is constructed from fiberglass reinforced plastic (FRP). Tank has flanged inlet and outlet, 2 drain connections, 2 Venturi inlets and outlets, and two(2) vent connections. Vessel has a top manway for access to the tank should that ever be necessary.
- One(1) TA-ST600 Stripping nozzle with specially designed "shredder" discharge.
- One(1) 15 Hp Goulds centrifugal pumps to draw the water from the tank and pump through the nozzles.
- One induced draft blower to pull exhausted air from the tank and to increase the volatility of the contaminants. Blower will be 1000 CFM fan.
- One(1) 1.5 Hp Goulds Centrifugal pump for drawing water from the stripping tank and pushing through the remainder of the system. (option)

Control system –System does not require any sophisticated control as designed. System is provided with simple starter panel with relays to send alarms and receive commands from the customer's control panel.
Logistics: we have provided a skid mounted stripping system for this application. System can be placed in an enclosure if that is of interest.

System price(budget) . . . $ 49,500.00
Adder for discharge pump . . . add . . . $ 2,500.00

Delivery to the site. . . TBD (based on location)
Start up and training of personnel . . . TBD

Not included:

- Installation
- unloading
- permit

Please contact our office if you have any questions or require any additional information.

Thank you for this opportunity

MEMORANDUM

TO: **Mr. Mike Deliz** **DATE:** **March 11, 2013**

FROM: **Mark Speranza, PE and Christopher Hook**

SUBJECT: **Launch Complex 34 (SWMU CC054)**
Response to Comments
Step 4C: Pumping Optimization and HS 3/4 Expansion

Below are Tetra Tech's response to comments provided by Jacobs and Geosyntec from review of the Launch Complex 34 (SWMU CC054) Step 4C Engineering Evaluation.

Jacobs Comments:
We have reviewed the LC34 Step 4C Engineering Evaluation ADP. The following comments are offered for your consideration.

General
Overall, the optimization strategy looks good. The capture zones are fine and the CVOC recovery has been solid, particularly in the shallow zone. There is generally good agreement between the HPT and MIP data. A few specific comments:

1. RW-1B – Seems like high CVOC/High K zone is right below the 50 ft. clay – why not move intake to between 55 and 65 ft. BGS instead of 74 ft. BGS?

Response: While pumping immediately below the storage zone in RW01B would be an effective approach for focused mass removal, we believe it is premature to move the pump to the proposed level, considering the remaining deeper impacts. The MIP boring had an ECD plateau to approximately 74' bls, where the intake is proposed. The well is still producing high mass removals, with TCE influent near 80 mg/L. Until the Layer 6 permeability stringers are flushed/addressed, we recommend a pumping plan at RW01B as proposed. Once influent levels decrease to a level triggering optimization, this suggestion will be considered and the pump will be moved to a higher invert elevation.

2. RW-2B – Similar situation to RW-1B – pump intake should be around 60 ft. BGS instead of 73 ft. BGS.

Response: See response to Comment 1.

3. Be aware that isolation of the screened zone with a packer in a screened well may not provide significant isolation in formation, depending on relative permeabilities of gravel pack and formation.

Response: Comment noted.

Comments on RW Expansion and Treatment System Mods (2nd presentation)

1. Looking at existing performance, RW-01a and RW-02A generate capture zones of around 150 ft. to 175 ft. to the west-southwest. The model predicts that RW-14A and RW-15A will generate a 200 ft. to 300 ft. capture zone to the west-southwest. This may be optimistic. Consider moving these wells out farther from center of plume or adding another well.

Response: Comment noted. Note that during shallow zone capture evaluations a stagnation point with only three wells operating was near 277 feet. With additional pumping in the shallow zone resulting from the expansion, we would expect the overall stagnation distance to increase. The wells were placed in a central plume location with bias towards sampling results to increase mass removals. The particle tracking was used to verify that the plume fringes would be contained and transports times were within reason. Depending on the system treatment process decisions (air stripper modifications) made during the meeting, the pumping rates at these wells could be increased to shorten transport time, if the team feels prudent.

2. Not clear what the purpose of RW-16B. Is it mass removal?

Response: The function of RW-16B is multi-purpose. Based on marked reductions in RW04B and RW05B from influent data trends and MIP observations, the well will function as a mass removal location. Additionally, operation of this well will reduce pumping requirements downgradient and increase focus on containment near the ESB area as the dissolved-phase TCE plume decreases in footprint..

3. Slide 14 – Anticipated mass recovery might be a little high because flow-weighted average may actually get a bit lower since most of the new wells are located on the periphery of the plume.

Response: Acknowledged and included as a conservative means of evaluating treatment options.

4. Are we comfortable removing the DNAPL separator? Is it no longer necessary? Is keeping it an additional cost, until the new pumping regime is instituted and normalized?

Response: The separator has not recovered observable, drainable, separate phase NAPL (even during startup). Note that the process of pumping, conveying, manifolding, and filtering, results in a very high probability of any recoverable NAPL being mixed into dissolved phase. Along with the additional footprint of the unit, the unit increases the process retention time. The increased retention time could provide a means for bacterial growth, which affects air stripper performance and maintenance.

General Construction and Operation Comments

We note that some of the items we commented on may be addressed in construction documents, and we are simply not aware of certain equipment and/or practices already in place.

1. Is there a back-up plan in the event power is lost at the site and the system goes down? Has consideration been given to a back-up power source?

Response: There is not a back-up power source. The requirements of a back-up power source would be significant since the oxidizer has notable voltage and load needs.

2. Will the new pump controllers and pump control panel be connected to existing remote telemetry or alarm systems?

Response: Yes.

3. How often will the exfiltration gallery be checked for fouling? Has fouling been assessed to date? What is the plan to address fouling, should it occur?

Response: The gallery is checked semi-annually for fouling. Historically, the gallery has been able to accept the entire flow of the process system without any notable pressure limitations. At this point in time, fouling is not anticipated based on historic operations over the past 3 years.

4. Will tank precipitates and air stripper precipitates be drummed and sampled or have waste characteristics (haz/non-haz) been established already?

Response: Tank precipitates have not accumulated to a level requiring evacuation. Stripper fouling is biological and precipitates are not formed. Should solids require removal, they will be drummed and sampled for waste characteristics.

5. In the event a HURCON is issued for the Center, will plans be in place to protect the system and peripherals? There was not a line item in the cost estimate to address a system shutdown, partial demobilization and restart in the event of a HURCON.

Response: During HURCON conditions, the system would be shut down and site secured. No additional efforts from HURCON responses will be required as part of the expansion.

Design Cost Estimate, Item 1.7 Pump Removal/Maintenance – Has fouling of submersible pumps been observed to date? If so, what is the plan for mitigation? May want to consider more frequent pump extraction for maintenance.

Response: Pumps have not shown indications of fouling.

Design Cost Estimate, Item 5 Recovery Well Installation – Does this estimate include installation of a typical pad or a vault that will house controls and pump extraction components? There was not a well detail drawing included in the ADP for reference.

Response: The Interim Measure Design which was provided electronically with the team submission provides the well installation construction details. The costs do include a well vault and all ancillary components.

Design Cost Estimate, Item 7.2 Concrete/Asphalt Replacement – Since the concrete and asphalt are combined in the same line item, it is difficult to determine if the cost estimate is in-line with

current prices. It is also difficult to determine from the drawings how much of each will require replacing. May consider a more detailed estimate or drawing, depending upon procurement plans.

Response: The costs were developed based on the original installation due to the similar nature of the installation and similar scope and quantities. Resurfacing construction details will follow that as provided in the Interim Measure Design.

Design Cost Estimate, Item 8.1 Air Sampling – Startup VOC air sampling is identified in cost estimate scenarios A and B. Air sampling is not identified once startup is complete. Will periodic air sampling be performed once the system is operating full-scale? Or will the decision regarding air sampling be made based on startup results?

Response: No additional air sampling costs will result when the system is operating, as the same sample frequency as currently conducted will be maintained. The startup samples were included to prove-out the treatment system expansion/modification.

Design Cost Estimate, Item 1.4 Electrical – Will power usage be monitored/metered at the PLC? Item 1.4 makes a kWH assumption.

Response: Electrical usage is monitored at a meter installed where the service feed is connected to the substation, not at the PLC.

Geosyntec Comments:

Geosyntec's understands that this Step 4C was performed to evaluate the expansion of the existing hydraulic containment system to contain/extract mass from Hot Spots 3 and 4. The Advanced Data Package (ADP) is well organized and effectively conveys the presented information. Based on our review of the provided information, we have the following comments.

Part 1- Pumping Optimization

It would be helpful for this evaluation to provide a table (or present the information in the ADP) with the information on current pumping rates from the pumps in each recovery well.

Response: Current pump rates are set as follow (in gpm):

RW01A	RW02A	RW03A	RW01B	RW02B	RW03B	RW04B	RW05B	RW06B
5	5	3	5	5	3	4	5	4

Slide 19 and Slide 20 present the MIP data (MIP015 and MIP011) that Geosyntec collected pre-IM and it appears that was an error with plotting the FID values; that the values were not normalized.

Response: FID values were not normalized in any plots. The plots were checked versus the data Geosyntec sent and are represented as provided. The pre-IM plots appear to be noisy due to the order of magnitude scale correlation between the Geosyntec and Tetra Tech MIP borings.

Slide 28: We recommend installing a packer from 65 to 80 ft BLS in recovery well RW1B and moving the pump intake to above the 65 ft BLS depth interval to put a heavier stress on the aquifer and force water from the mass storage zone from 50 to 53 ft BLS (thereby significantly increasing RW1B influent concentration). Isolating the lower screen interval should force the pump to pull more water

from the most heavily impacted interval (interval with FID response). To evaluate if the packer would aid in increasing mass removal, a simple field test could be performed. A sample could be collected from the pump with the pump installed at 74 ft BLS in the configuration proposed in the ADP and one from when the packer is installed and the pump is set above 65 ft BLS. If the sample collected with the packer installed has a higher concentration of VOCs, it is recommended to keep the packer in the well and to force flow from the mass storage zone.

Response: While pumping immediately below the storage zone in RW01B would be an effective approach for focused mass removal, we believe it is premature to move the pump to the proposed level, considering the remaining deeper impacts. The MIP boring had an ECD plateau to approximately 74' bls, where the intake is proposed. The well is still producing high mass removals, with TCE influent near 80 mg/L. Until the Layer 6 permeability stringers are flushed/addressed, we recommend a pumping plan at RW01B as proposed. Once influent levels decrease, this suggestion will be considered and perhaps the pump will be moved to a higher invert elevation.

Slide 29: What proposed benefit do you anticipate from moving the pump intake to 73 ft BLS in recovery well RW2B? The MIP data suggests that most of the mass is in the 55 to 65 ft interval.

Response: The proposed pump intake location was considered by two criteria – the edge of the ECD plateau and FID inflection point. The pump was moved such that pumping influence in the high conductivity zone identified near the existing pump intake location is reduced.

Slide 30: We recommend installing a packer from 65 to 80 ft BLS in recovery well RW3B. If the bottom of the well screen has a packer installed, this should force the pump to pull water from the impacted interval (based on FID response). What is the current pumping rate for recovery well RW3B and why the suggested pumping rate change?

Response: Installing packers below the extraction pumps will not have a significant influence that we believe is significantly advantageous. RW03B is currently set to pump at 3 gpm.

Slide 31: How did you choose the proposed isolation of the screen from 60 to 80 ft BLS for recovery well RW4B? The statement is made "minimal impacts in top 10 ft of screen", but the MIP data does not seem to confirm this. The ECD data from the MIP seems to show drift and may not be representative of the VOC concentrations in that interval and there only appears to be a small FID spike from approximately 60 to 68 ft BLS.

Response: Layer 4 impacts were not observed in this area and PID/FID results were minimal in the 50 to 60 feet bls interval. While the concept that the ECD may have some drift could be true, the deviation from a potential drift slope is observed at a similar depth as that of the peaks observed at MIP011. A FID spike from 60 to 66 feet bls was observed and the well still functions as a containment well, hence the proposed screen isolation.

Slide 35/36: It is proposed that the new deep recovery well will be installed with identical construction to recovery wells RW4B/5B and you are proposing to packer off the top 10 ft of the new recovery well. It is stated in Part 2 of this ADP that the screen interval of 50 to 80 ft BLS is chosen, to have the ability to pump from the bottom of layer 4 if necessary. If this recovery well is being installed to increase mass removal in the deep interval, Geosyntec recommends installing the recovery well with a screen interval of 60 to 80 ft BLS, since this interval is the interval with highest VOC impacts (based on MIP results). Was the location of this new well based on the MIP locations or based on modeling?

Response: Comment noted. Tetra Tech prefers to have the future ability to pump immediately below

Layer 4, should future optimizations suggest this prudent. Note that the proposed location is near the conceptualized boundary of the Layer 4 mass storage zone and future pumping below this layer may be a potential supplement to storage zone mass depletion. The location for the proposed recovery well was placed based on MIP results, modeling, and decreases in downgradient recovery well influent.

General Comment: Prior to making the various proposed changes to pump intake depths, consideration may be given to first running packer isolation tests to evaluate changes in recovery well influent with a mobile lab running VOC samples. This approach would facilitate the placement/isolation of recovery well screens based upon actual dynamic field testing results and ensure that the P&T system, while continuing to provide hydraulic capture, also maximizes the mass removal rate.

Response: A more cost-effective approach would be to install the packers based on the MIP observations, sample one week following post-packer installation pumping, and continue quarterly sampling to determine if adjustments are practical. We feel the resolution of the MIP data is sufficient to be able to accurately place the packers and dynamic testing is extraneous. The initial pumping conditions are not representative of the actual flux within the packered intervals. The pumps should operate for a longer duration for the representative concentrations to be extracted. To implement the comment's suggestion, a crane or drill rig would be needed throughout the testing (for packer adjustment) in addition to the mobile lab and associated field support. In general, the additional cost-benefit of dynamic testing is diminished with the additional resources needed to complete the testing adequately.

Part 2 – Expansion of System

Hot Spot 3 was delineated with the vertical intervals of 16 to 30 ft BLS because this interval had the highest concentration of VOCs. For the expansion, it is proposed to install the shallow recovery wells with a screen interval of 15 to 45 ft BLS. Why install the screen interval to 45 ft BLS? Based on the DPT investigation performed by Geosyntec, most of the mass from 35 to 45 ft BLS is underneath the ESB parking lot area. Geosyntec recommends installing the shallow recovery wells with a screen interval of 15 to 30 ft BLS to focus on mass removal.

Response: Based on the orientation of the recovery wells, the Hot Spot 3 wells could supplement aquifer dewatering regionally near the ESB, hence the typical well construction. Note that MIP locations along the periphery of the ESB and Hot Spot 3 contained elevated FID/ECD responses below 35 feet BLS (see MIP05 and 11).

Is the shallow proposed recovery well RW15A being installed to address Hot Spot 4 as well as Hot Spot 3? The impacts in the Hot Spot 4 area are generally shallow (6 to 15 ft BLS). If recovery well RW15A is being installed to address the Hot Spot 4 area, it is recommended to install the well with a screen interval of 5 to 30 ft BLS. This should allow this recovery well to pull in impacted water from the Hot Spot 4 area.

Response: Comment noted. Note that the expansion to Hot Spot 3 proposed within the Step 1B EE was for expansion of the hydraulic containment system. Language specific to mass removal was not included and solely referenced containment as the primary remedial approach. This response is not to diminish the benefit of mass removal, but to highlight that the entire shallow recovery well network should be viewed to operate as a system of wells for containment. The consistent screen intervals could also have potential advantages of increased ESB influence with reduced recharge near some of the wells.

In the area of RW15A, consistent concentration data gaps exist between 27 to 36 feet bls. Based on this observation, there is a likelihood that HS-level concentrations exist below the comment's proposed well depth of 30 feet bls. With the intent of focusing on containing Hot Spot 3/4and also increasing mass removal, the screen interval at RW15A will be modified from 10 to 40 feet bls.

Slide 16: Is the air stripper limited to flow rates of 42 gpm because of excessive moisture carryover only or is the stripper not capable of reducing VOC concentrations at that flow rate (though liquid phase GAC provides polishing)? If the excessive moisture is the only issue, can a moisture knock out trap be installed to eliminate that issue? The fluids collected in the moisture separator can simply be re-routed to the equalization tank. If the moisture carryover is the only issue, this would eliminate need to upgrade or add another air stripper in series.

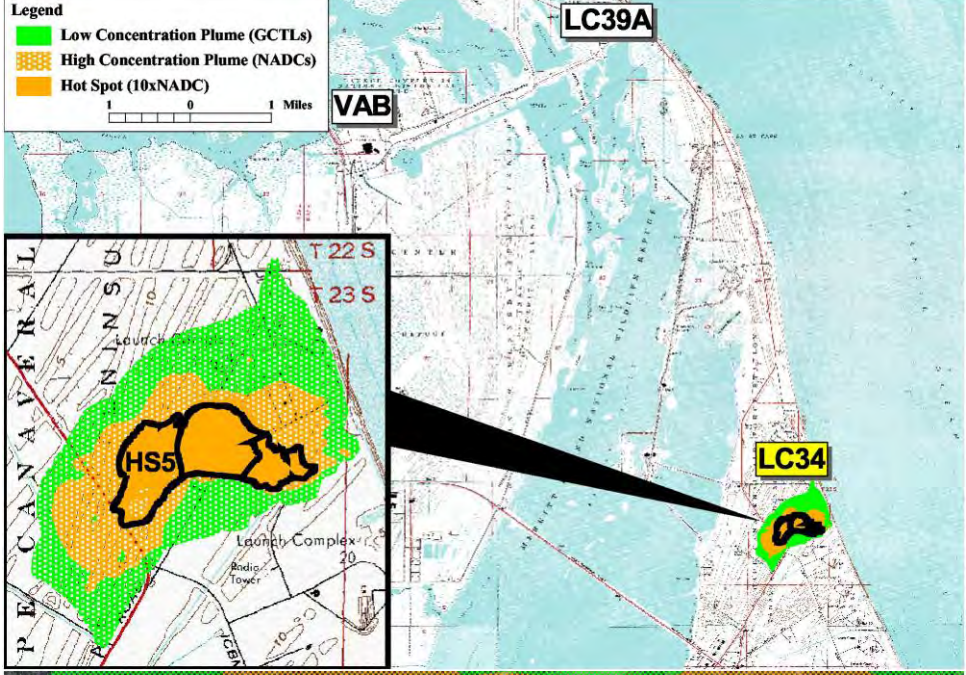
Response: When notable moisture carryover occurs, the headspace in the top and false trays blinds, which results in an increase in back pressure and reduced flow. The reduced flow results in decreased air stripper phase transfer efficiency. The issue is at the air stripper not at the moisture separator. As shown on the P&ID the condensate is rerouted back to the air stripper intake. The existing air stripper is not adequate to increase process flows to meet additional hydraulic loading and upgrades are required to meet the expansion.

Slide 22: States proposed deep recovery well screen interval is 70 to 80 ft BLS. This is different than what was presented in part 1. Please verify screen interval.

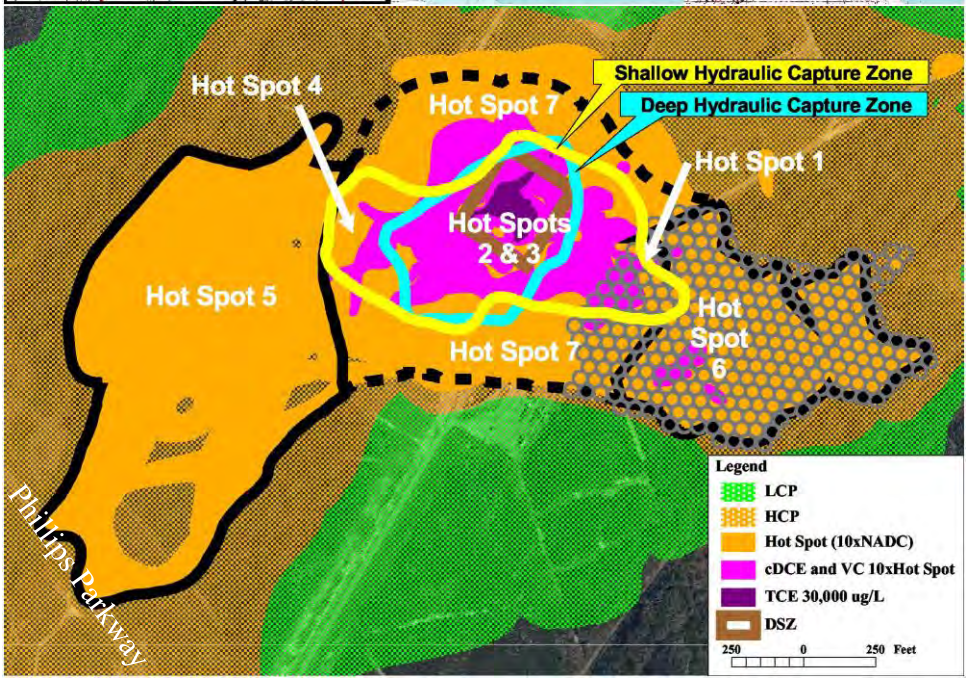
Response: Typographical error. Correct screen interval is 50-80 feet bls as presented in Part 1 and Part 2 (Slide 13).

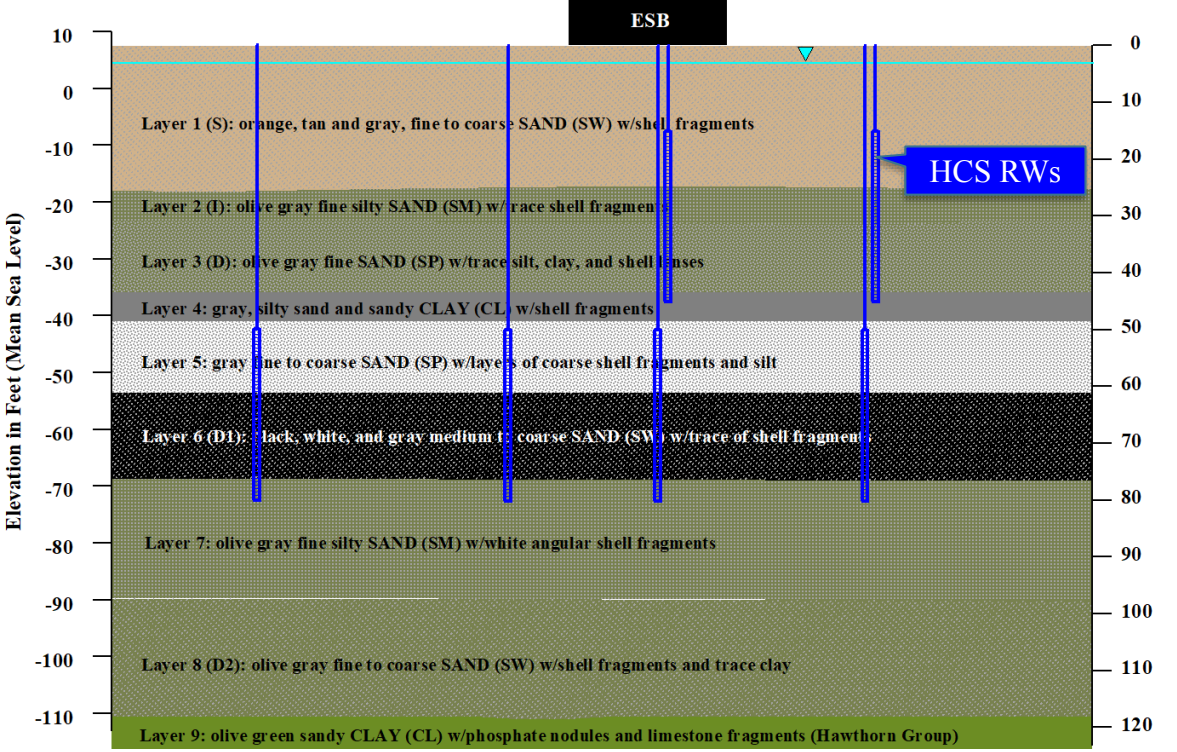
ADVANCED DATA PACKAGE

C.7 Hot Spot 5 Site Characterization ADP

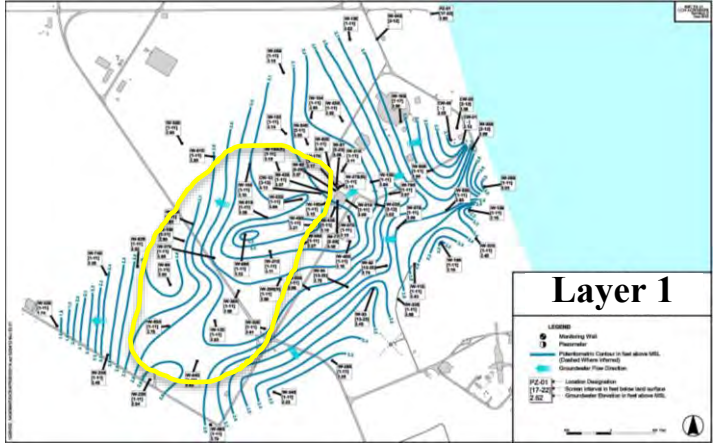


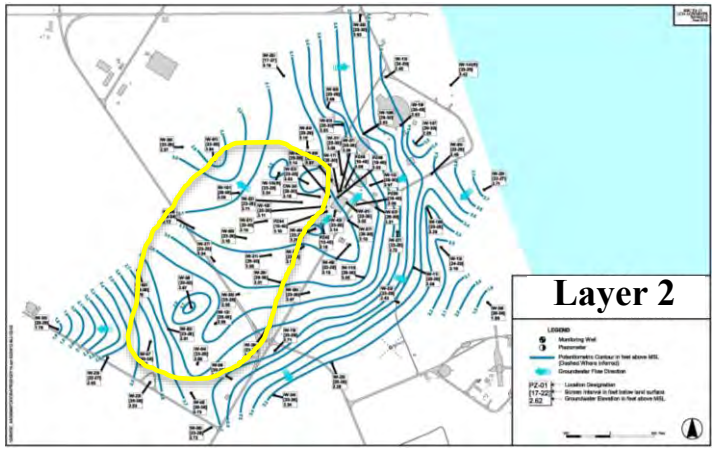
Launch Complex 34 (LC34), SWMU CC054
Hot Spot 5 Site Characterization
June 2019



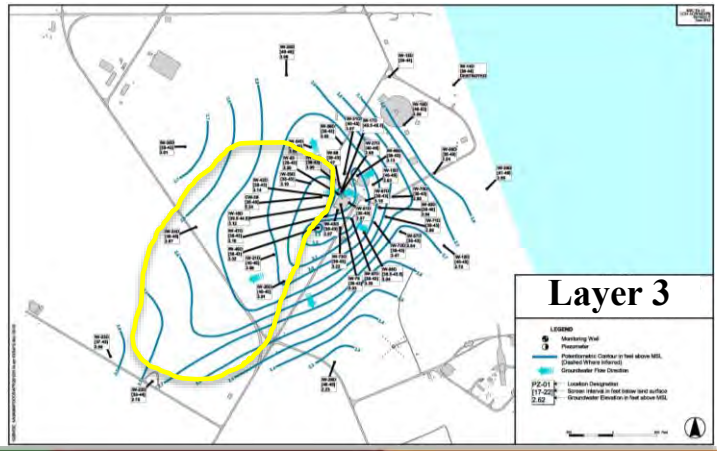


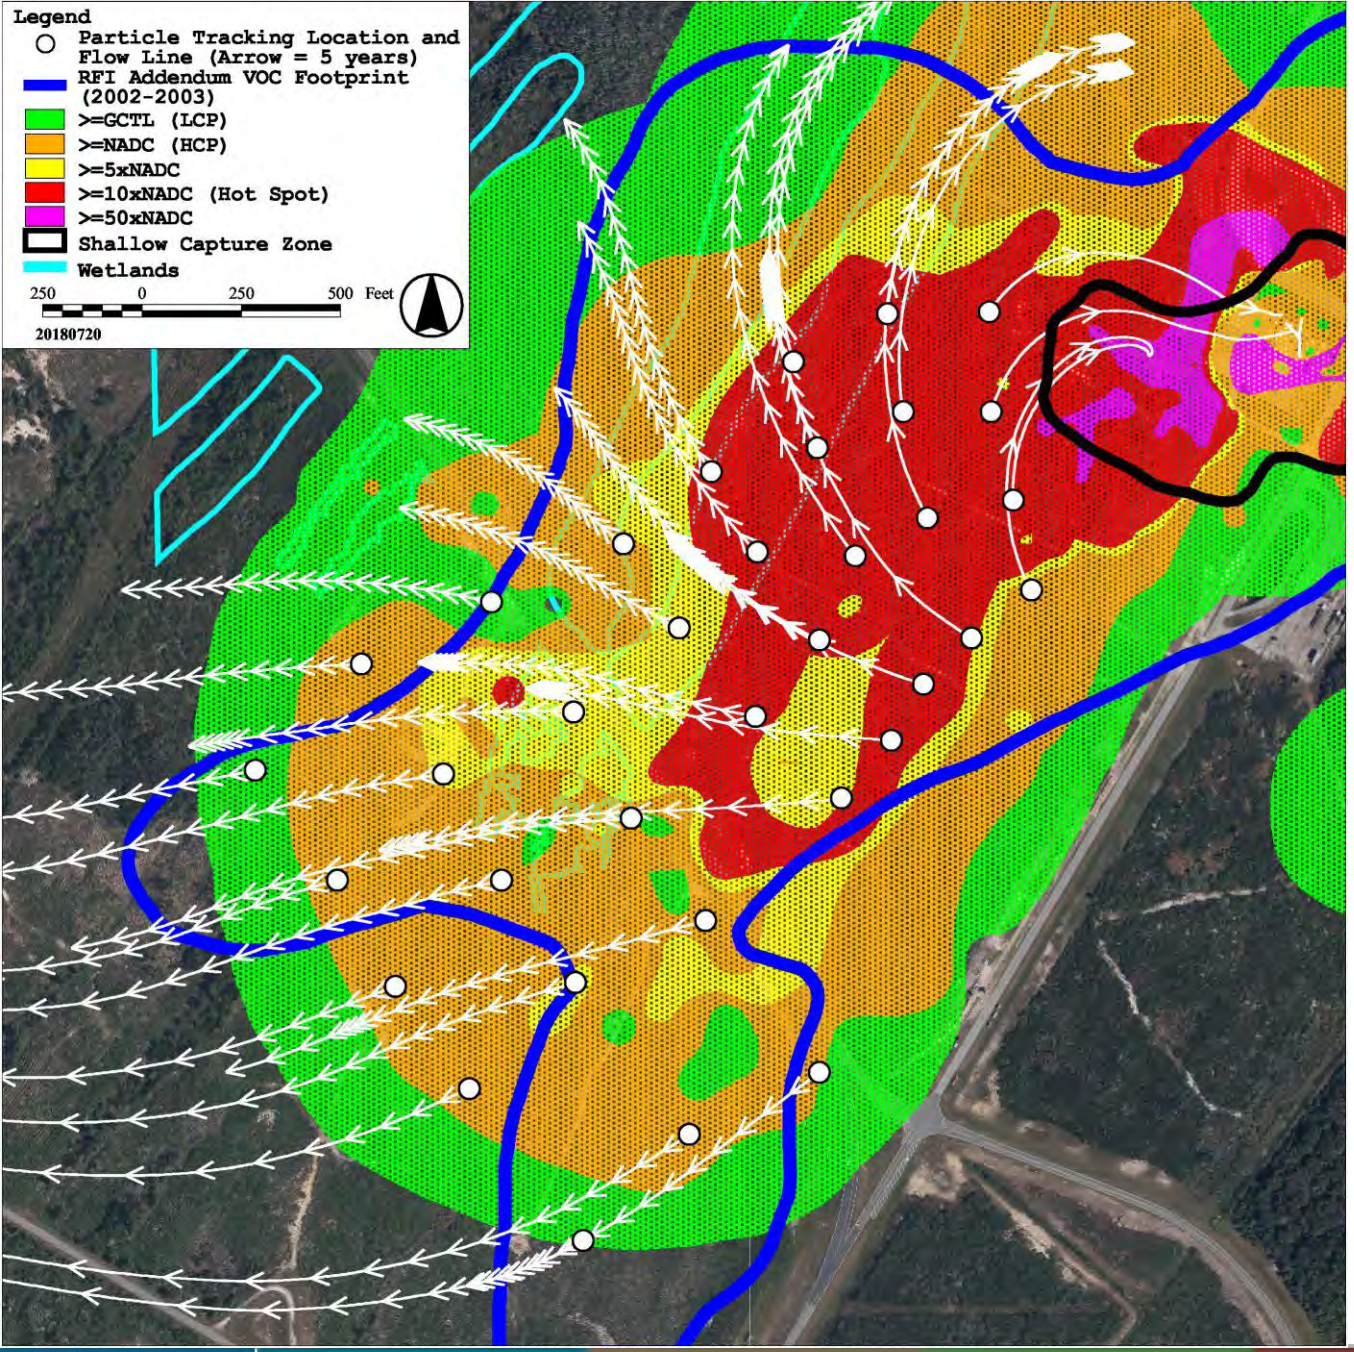
- Construction of Complex 34 began in 1959, designed to support NASA's Saturn 1 and1B programs
- Seven launches between 1961 and 1968
  - Historical records suggest TCE used to flush rocket engines and for precision cleaning of spaceflight hardware
- 1971: Complex mothballed
- 1972: Service structures and operational equipment scrapped, leaving majority of on-site buildings and structures abandoned-in-place
- 1984: Declared part of the Man In Space National Historic Landmark
- 1990s: Environmental investigations revealed chlorinated solvent contamination including DNAPL in groundwater
- 1999 to 2003: In situ remediation demonstration projects at the Engineering Support Building included test cells for Chemical Oxidation, Six-Phase Heating, Steam Injection, in addition to emulsified zero-valent iron (EZVI) and bioaugmentation test plots
- 2004: Groundwater LTM and CMS initiated
- 2007: CMS selected hydraulic containment of DNAPL Source Zone (DSZ), ***supplemental investigation(s) of HCP***, and MNA of LCP



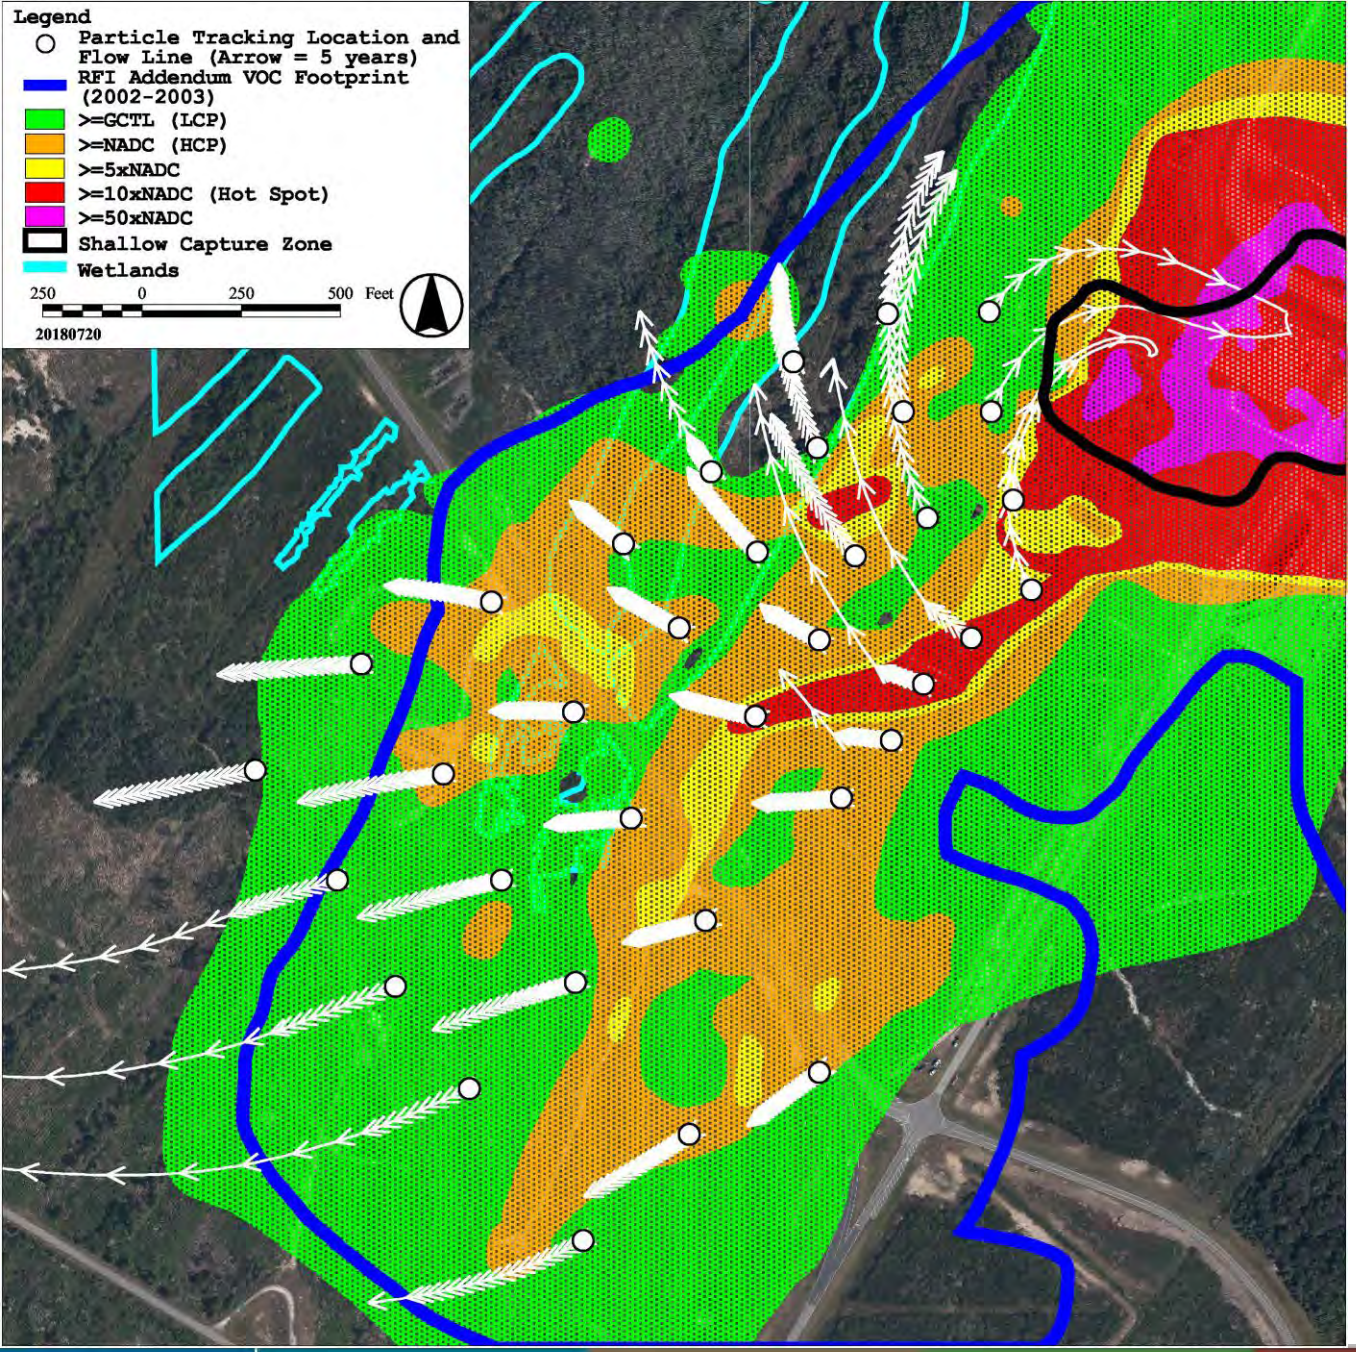


- LC34 is located on a barrier island bounded by the Banana River and Atlantic Ocean
- Plume footprint covers 327 acres (LCP), 162 acres (HCP), 63 acres (Hot Spots), and 11 acres (10x Hot Spots)
- DSZ is a 2.0-acre area that includes significant dissolved and sorbed mass, TCE > 300 mg/kg, and transition zone to 100 mg/kg, this area is controlled by the Hydraulic Containment System
- Site Characterizations ADPs:
  - 2009: Hot Spot 1
  - 2011: Hot Spots 3 and 4
  - 2016: Hot Spot 6
- Interim Measures:
  - 2009: Began operation of the DSZ HCS
  - 2011: PED Demonstration at Hot Spot 1
  - 2018: Began air sparging at Hot Spot 6
- Hot Spot 5 investigation area extends from the western edge of Hot Spot 2, 3, 4, and 7 southwest beyond Phillips Parkway





- Hot Spot 5 investigation area undeveloped with the exception of Phillips Parkway
- Ground surface ranges between 3.5 (wetlands) to 9.0 feet, DPTs 638, 722, 749, and 758 elevated at 11 feet MSL
- Depth to groundwater approximately 4 to 6 feet bls
- Contamination is within Layers 1, 2, & 3
- Historic Groundwater Flow (December 2011) in Hot Spot 5 area (yellow outline) generally southwest to south flow direction
- Hydraulic Conductivity 30 ft/d, 4 ft/d, and 3 ft/d in Layer 1 (sand), Layer 2 (silty sand), and Layer 3 (fine sand), respectively

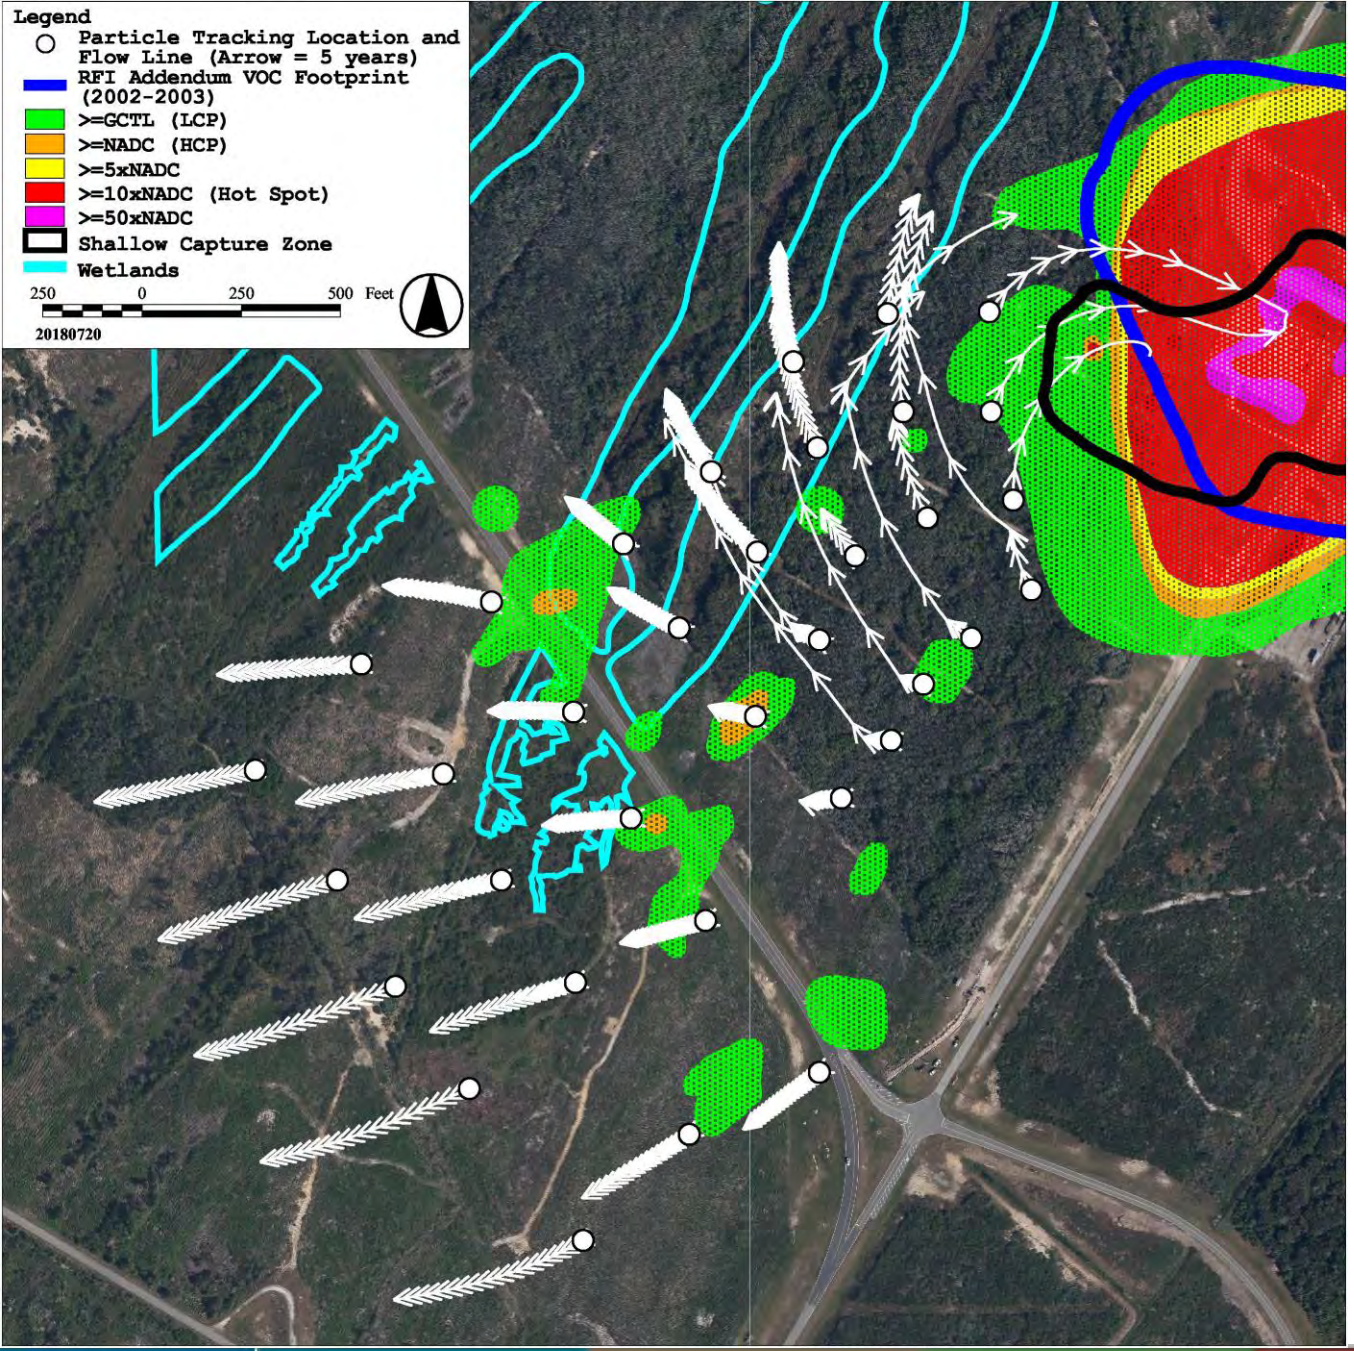


Jacobs Comment #1:

Based on the potentiometric maps shown and a review of some others, is groundwater flow direction better described as radial at the north end of the HS5 and generally west and southwest on its south side? We reviewed delineation with that in mind. Is information available regarding groundwater gradient and flow velocity along the axis of HS5? HS5 is large. Please include aquifer geochemistry information, particularly any that may change with distance from the source zone.

Tt response:

Particle tracking added to determine flow direction, generally to the west to the south of Phillips Parkway, northwest to north to the north of Phillips Parkway, and in the area of the hydraulic capture system (HCS) flow is north to east in the upper portion of HS5. Each arrow along the particle tracking lines represent five years. Flow velocity beyond the influence of the HCS over five years in Layers 1, 2, and 3 are ~100, 15, and 10 feet, respectively. Site-wide LTM sampling in the HS5 area indicate anaerobic conditions, dissolved oxygen readings were all less than 0.46 mg/L and oxidation redox potential readings were all negative with the exception of three wells with positive readings of 5.1, 6.2, and 130.4 mV (IW0010IR).

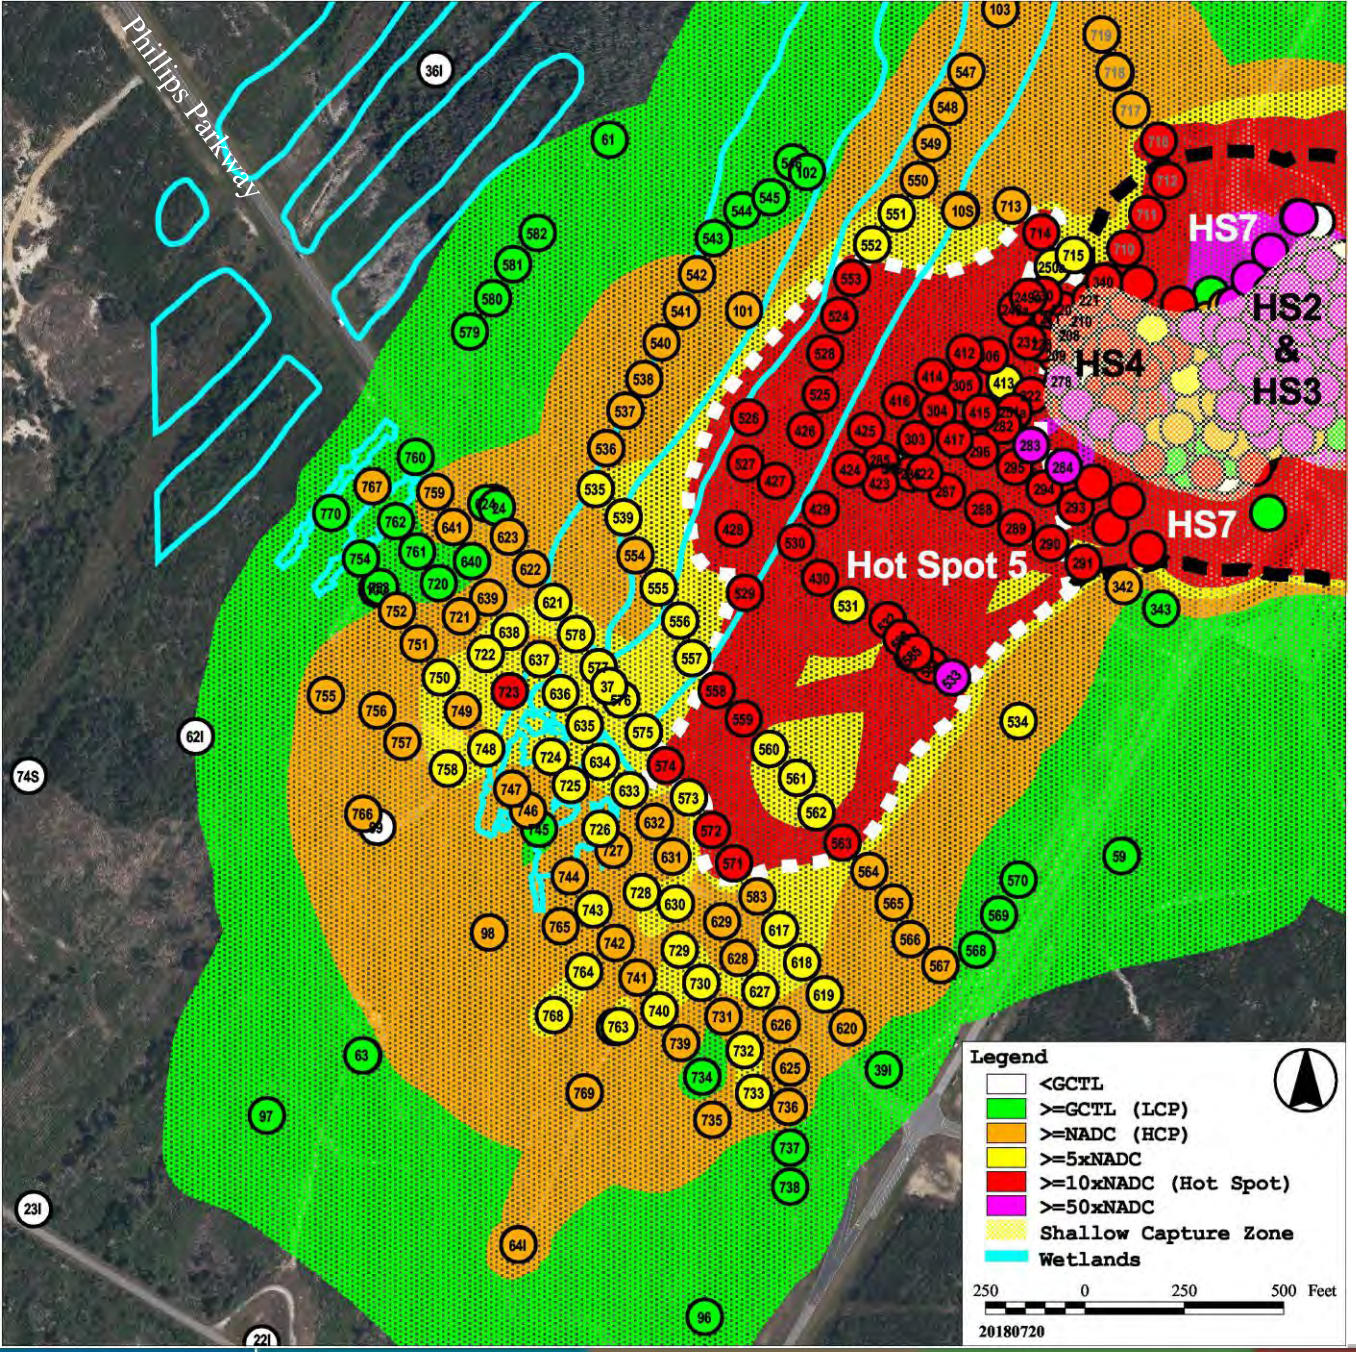


Geosyntec Comment #1:

It may be beneficial to include historic plume distribution maps for the dissolved plume in the general HS5 area/crossing Phillips Parkway time to assist with interpreting the Conceptual Site Model (CSM). Do current data indicate that the dissolved plume is stable, increasing, or decreasing in this area of the site as compared to the RFI and CMS data? Is the ratio of degradation products changing over time within HS5? This information may assist with decision making as it pertains to proposed remedial activities and how robust of remedial measures are warranted based upon plume dynamics.

Tt response:

The RFI Addendum 2002-2003 VOC footprints were added to the figures. The extents of the plumes have changed over time but occupy similar areas in Layers 1 and 2. The contamination in Layer 3 is most likely the result of refined vertical sampling in recent delineation events.



Geosyntec Comment #2:

Consider using water level maps/data to calculate the gradient and using hydraulic properties for the depth of primary dissolved plume transport and appropriate constituent retardation factors to calculate the groundwater flow velocity and anticipated contaminant transport velocity. If the plume has changed from the late 1990s to present in the Phillips Parkway area, how does the calculated transport velocity correspond to the change (if any) of plume extent? This information may assist in understanding plume movement in addition to the potential timing of intermittent operation of a future air sparge curtain. As an example, since we would anticipate seeing very rapid reductions within the ~40-50 ft wide sparge curtain zone, based upon groundwater flow velocity the system may then remain off for several months, which would avoid creating a hydraulic barrier that results in plume spreading around the barrier (which has been observed at other sites). Once the sparge curtain zone is "recharged" with upgradient dissolved flux, it could then be turned back on. This approach could greatly reduce the "on" cycle for the curtain and enable air distribution to other areas where mass removal is warranted.

Tt response:

Tt concurs with on/off cycling concept for the proposed sparging wall.

Delineate the horizontal and vertical extent of Hot Spot 5 (10xNADCs)

Determine plume conditions along Phillips Parkway, south of Phillips Parkway is beyond the geographic area of the permit the Air Force has issued to NASA, a Right of Entry from the Air Force was required.

Due to the hot spot size, KSCRT delineation rules of thumb are not tenable

Refinement within Hot Spot 5 will be coupled with future IMs

Groundwater Results provided on oversized figure provided with ADP

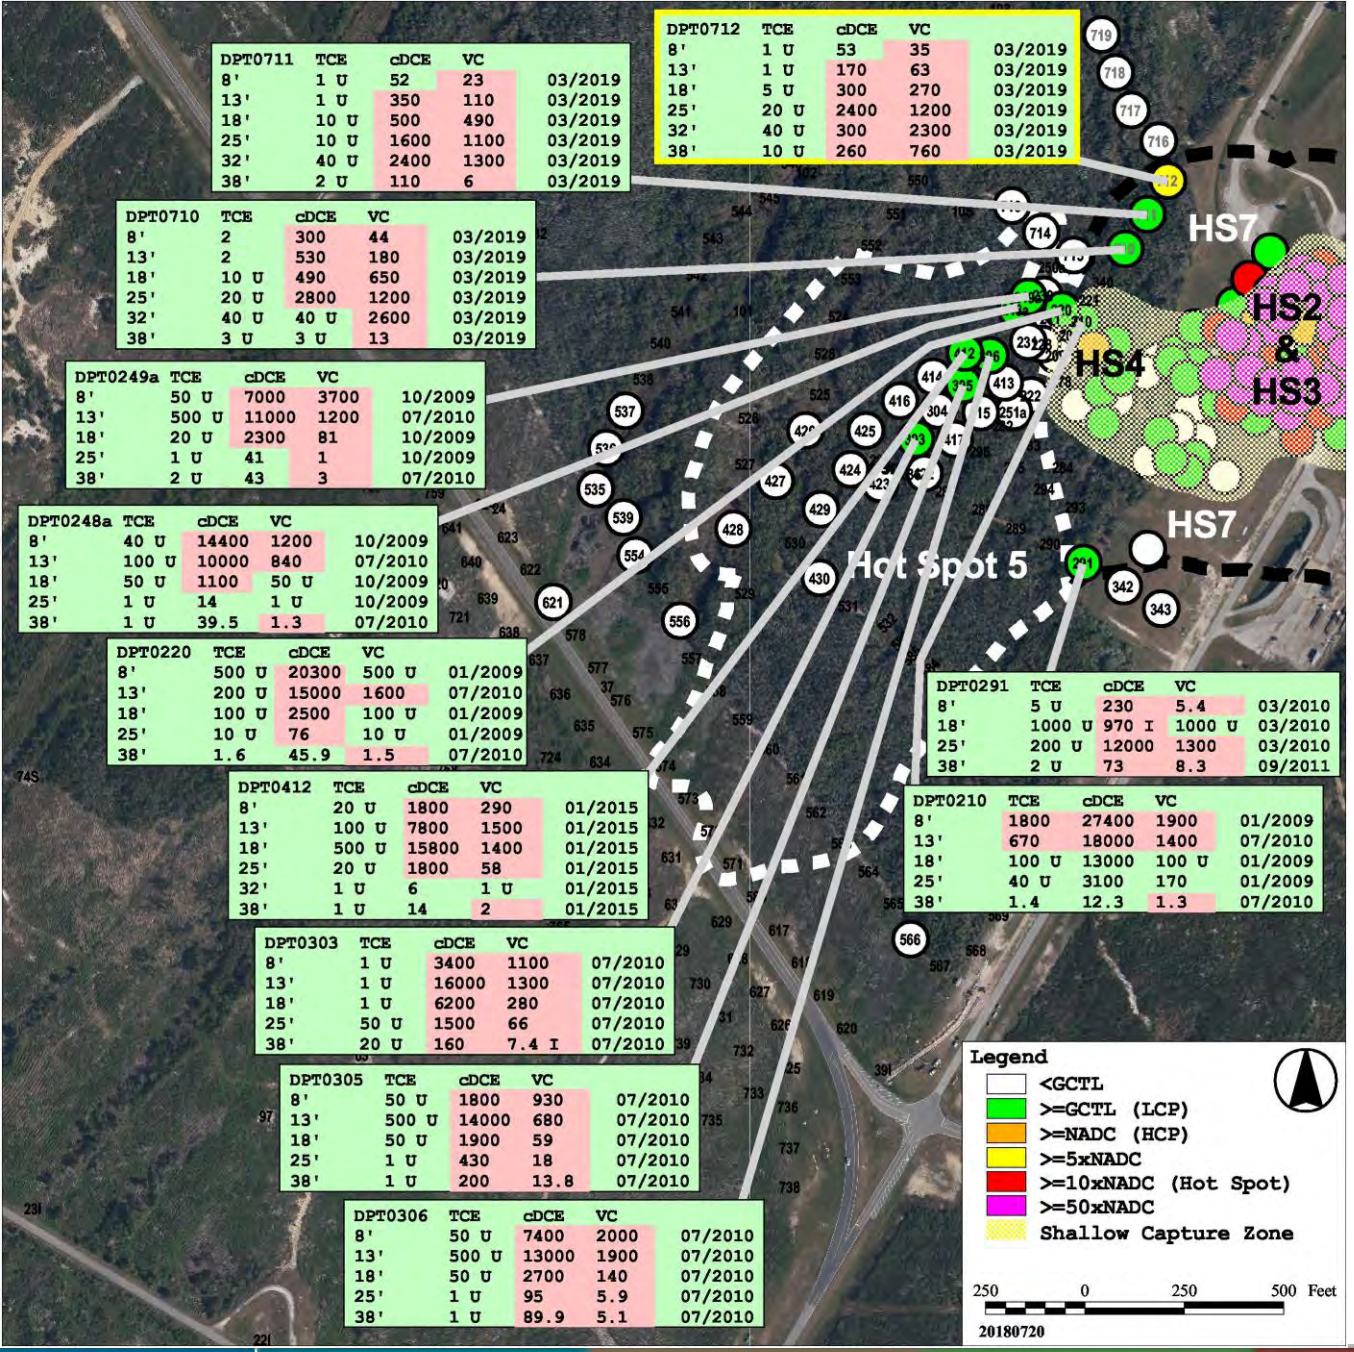
Dataset includes 953 samples from 200 locations collected via DPT in 2010, 2011, and 2015 to 2019

Data evaluation intervals: 0-10', 10'-15', 15'-20', 20'-28', 28'-34', >34' bls

TCE, cDCE, tDCE, and VC > GCTLs



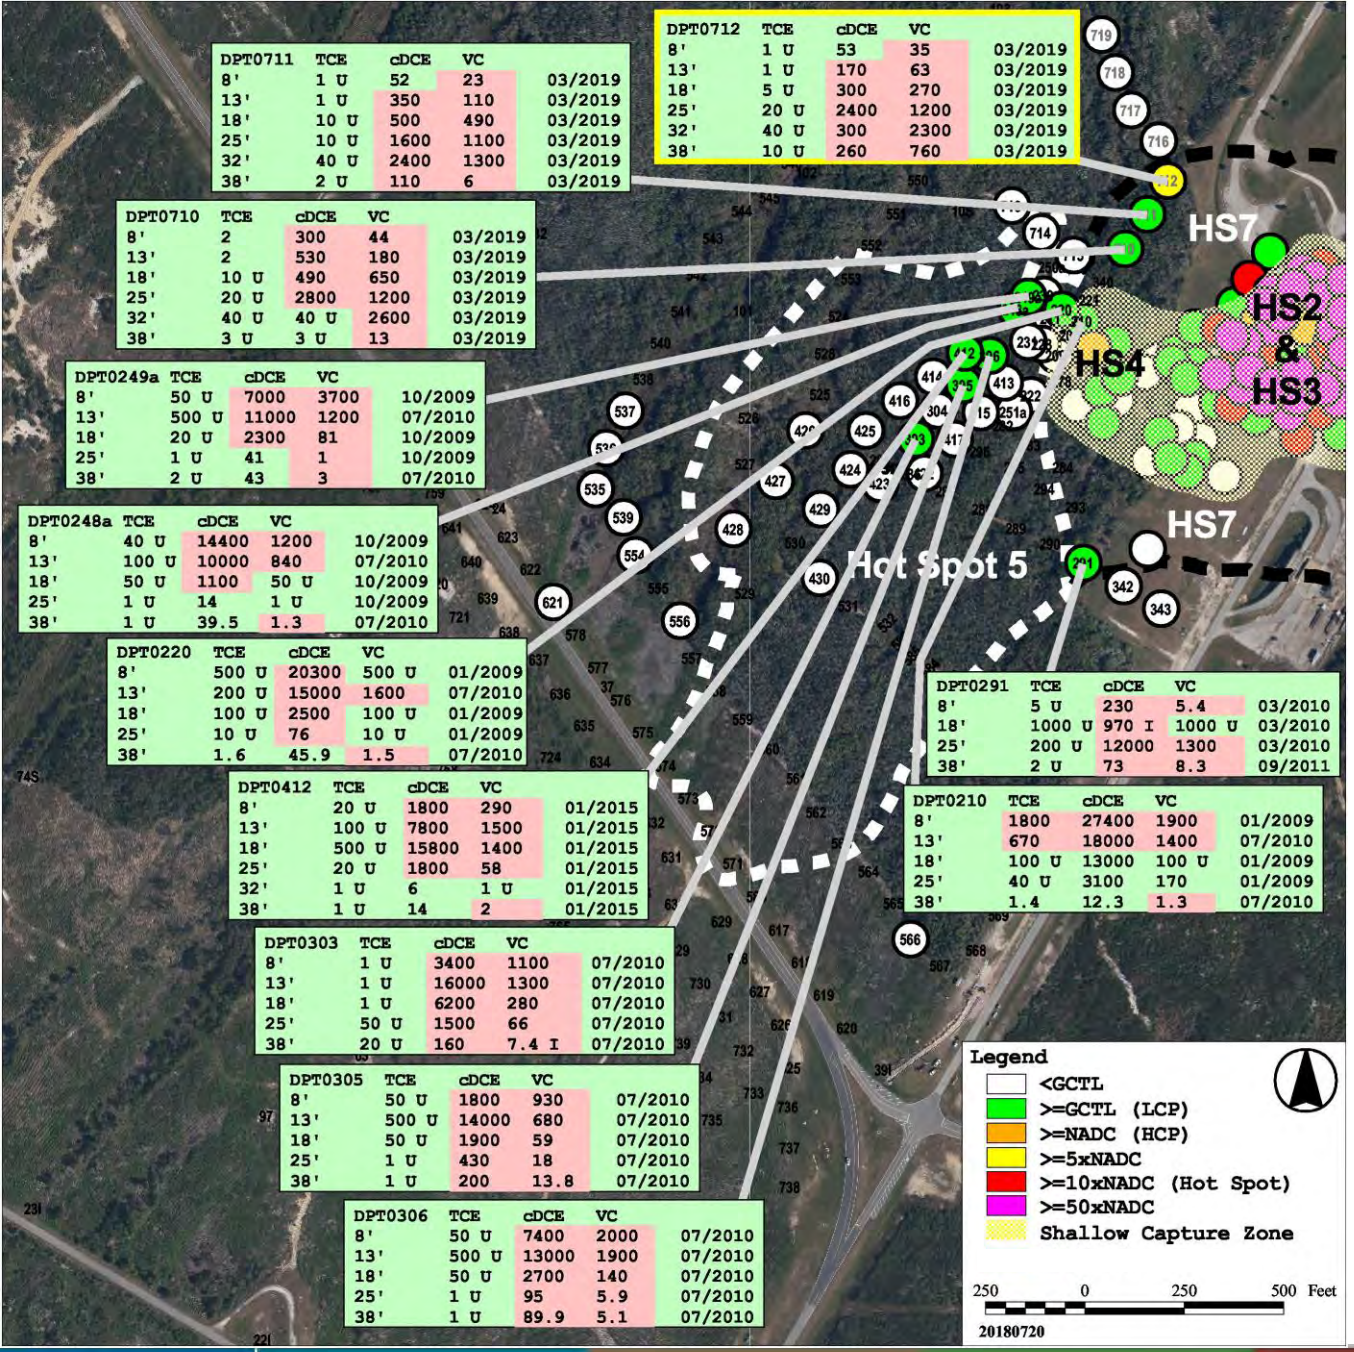
- tDCE not presented in this ADP, all tDCE > GCTL coincide cDCE > GCTLs
- Maximum detections
  - TCE 670 µg/L, DPT0210 in 13' sample
  - cDCE 64,000 µg/L, DPT0278 in 18' sample
  - tDCE 2,000 µg/L, DPT0278 in 18' sample
  - VC 9,200 µg/L, DPT0533 in 25' sample

cDCE and VC exceeded NADCs and 10x NADCs

Hot Spot and HCP extends to 34' bls with the exception of DPT0712 being the only location with 38' sample > NADC

No other compounds exceeded GCTLs in this area based on Biennially Site-wide LTM

Freon was analyzed in 440 samples, all samples were BDL



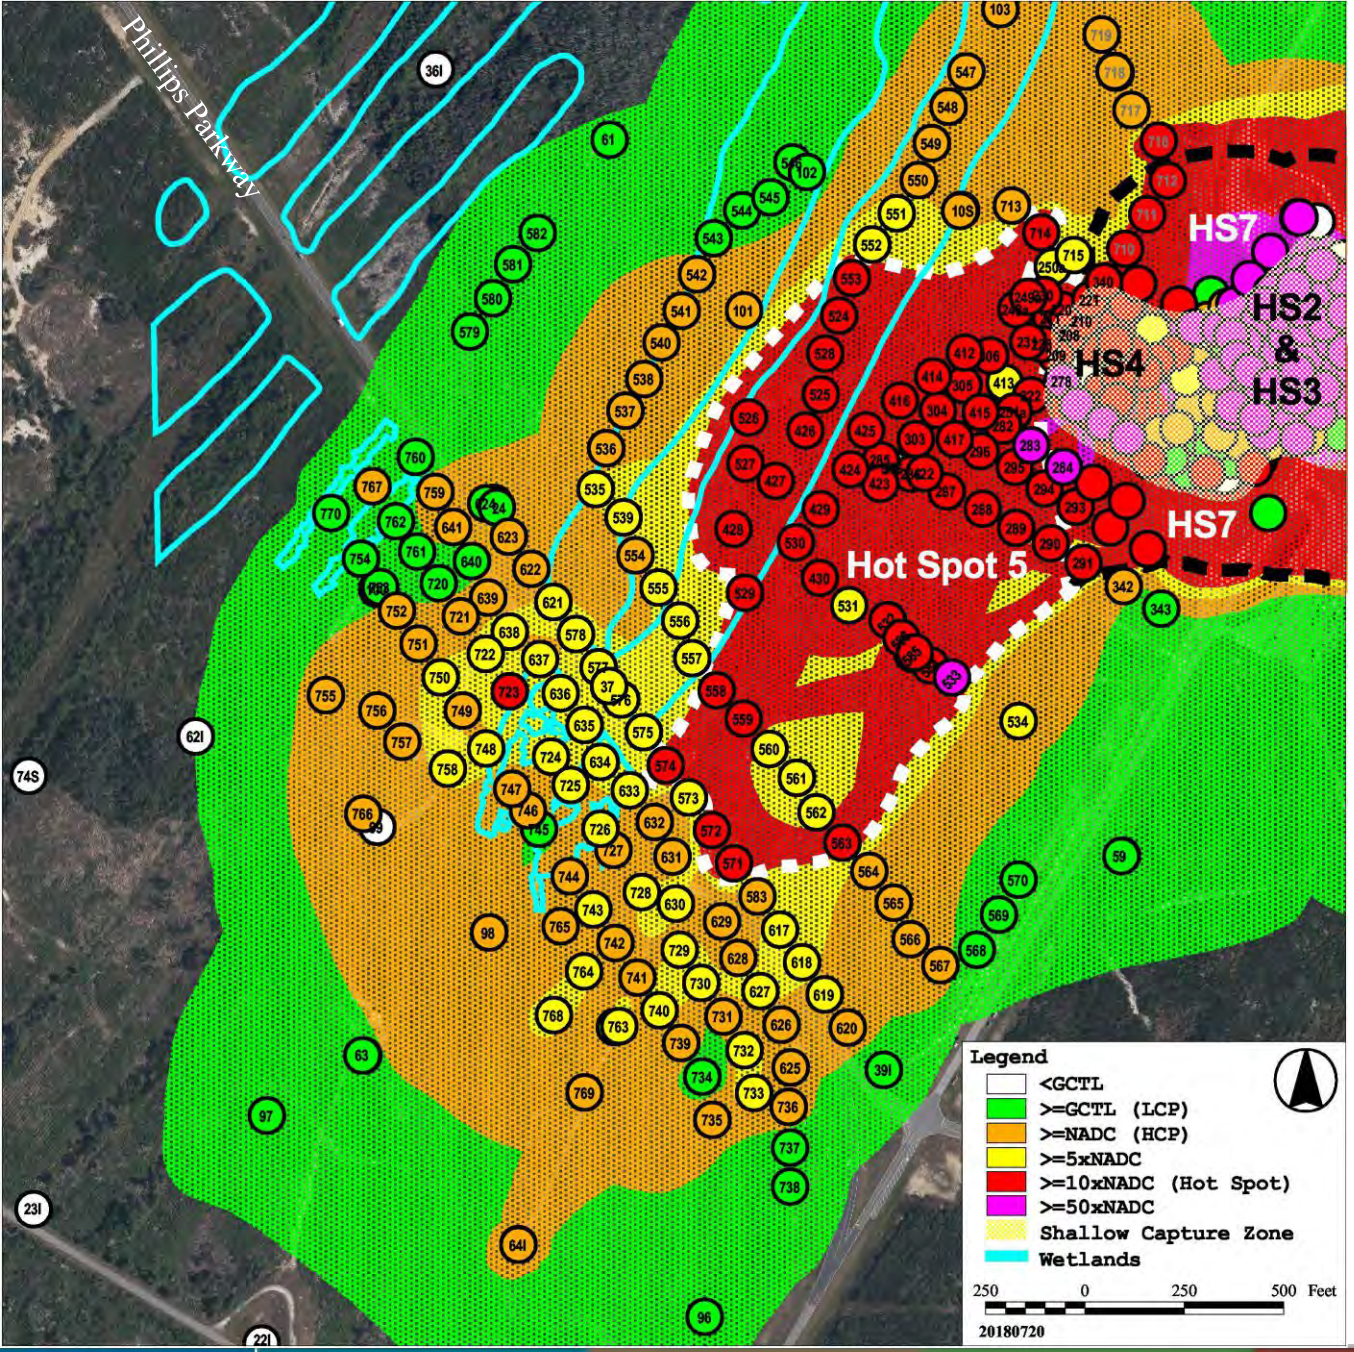
DPT0712:

- VC > 5xNADC at 760 µg/L
- cDCE = 260 µg/L

Other 38' samples ≥ GCTLs

- VC maximum is 13.8 µg/L
- Remaining VC > GCTLs are 13, 8.3, 7.4, or 5.1 µg/L or less
- cDCE detected in five samples at 73, 89.9, 110, 160, and 200 µg/L

GCTL exceedances deeper than 34 feet bls



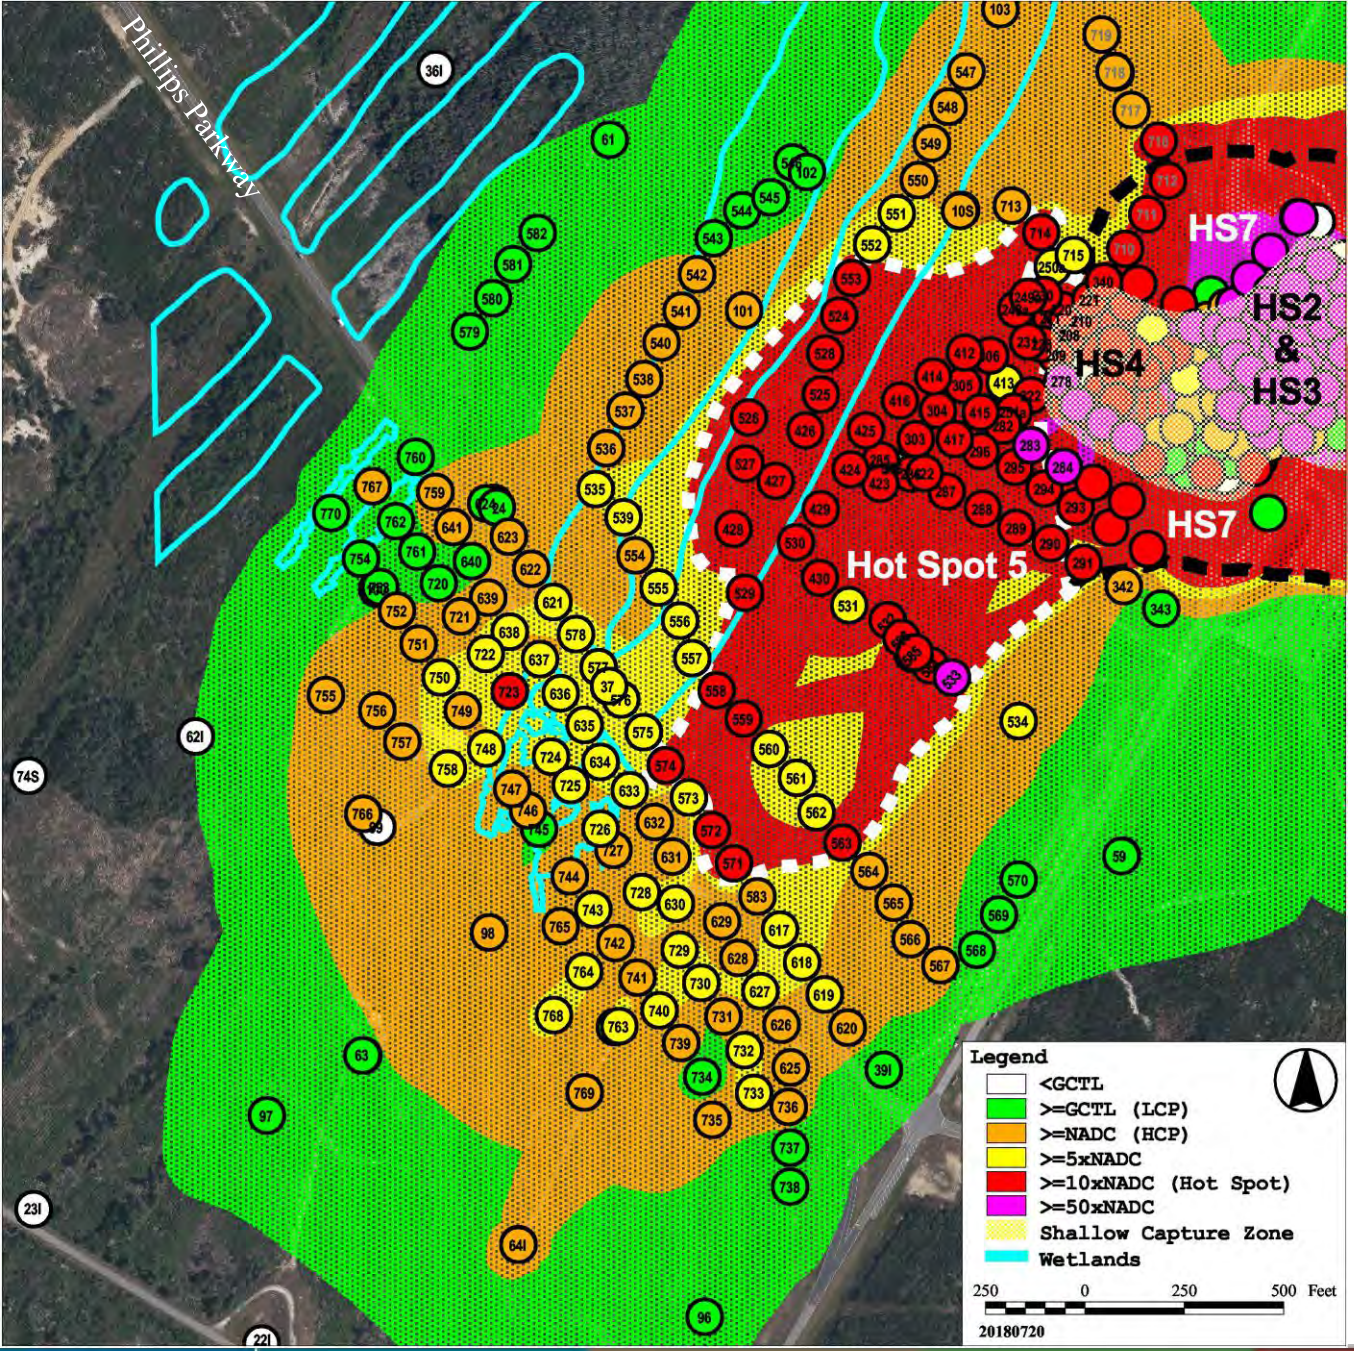
Geosyntec Comment #3:

Slides7/10/14/26: DPT0210, DPT249a – VC at 1 µg/L and 1.3 µg/L is not a GCTL exceedance per FDEP rounding allowances.

Tt response:

Tt concurs that these concentrations do not exceed the GCTL, the highlighting indicates the concentration is equal to or greater than the GCTL. The legend for Figure 1 has been update to indicate >= for the color coding.

Intervals:



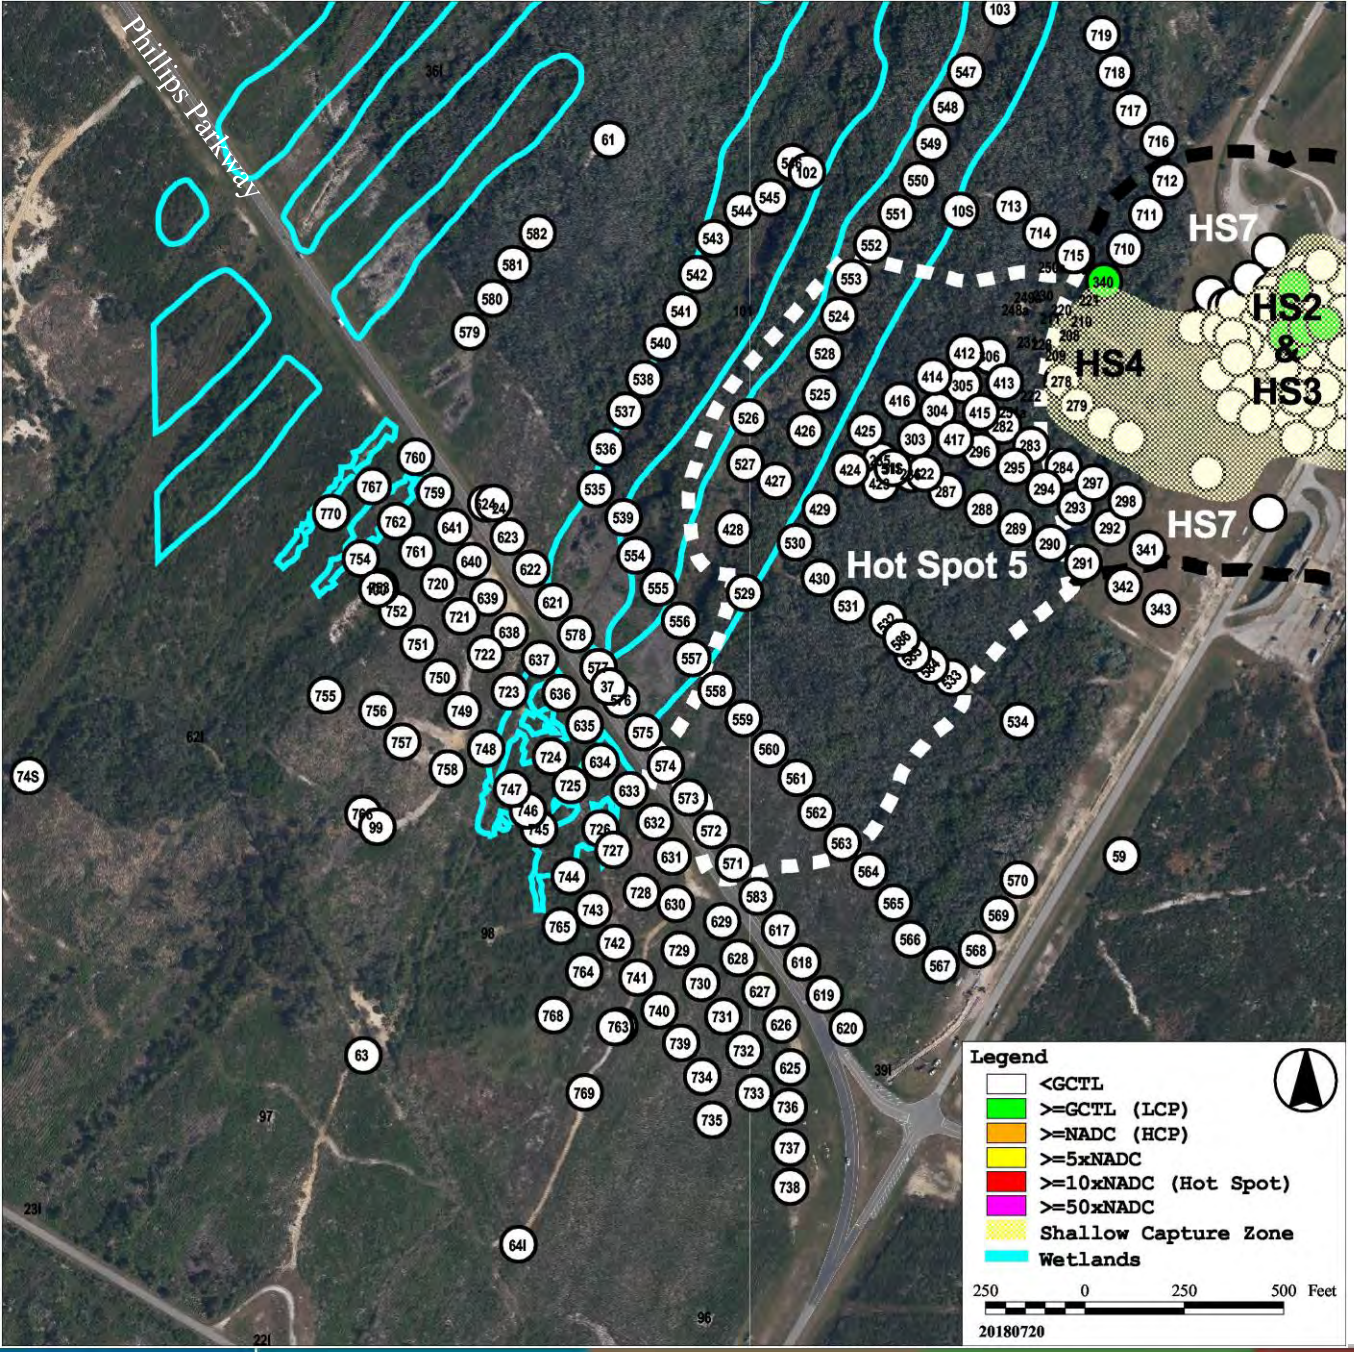
- 0-10', 10'-15', 15'-20', 20'-28', 28'-34', >34' bls
- 0-10' included all data from ground surface to and including 10' bls
- 10'-15' included all data greater than 10' bls to and including 15' bls
- Deeper intervals followed same logic

If an interval had multiple results, maximum was used for contouring

Elevated non-detect values for cDCE > 140 and VC > 20 were not used in contouring, non-detect values less than those values were assumed to be zero

All sample locations in HS5 have labels; only locations with symbol used in contouring

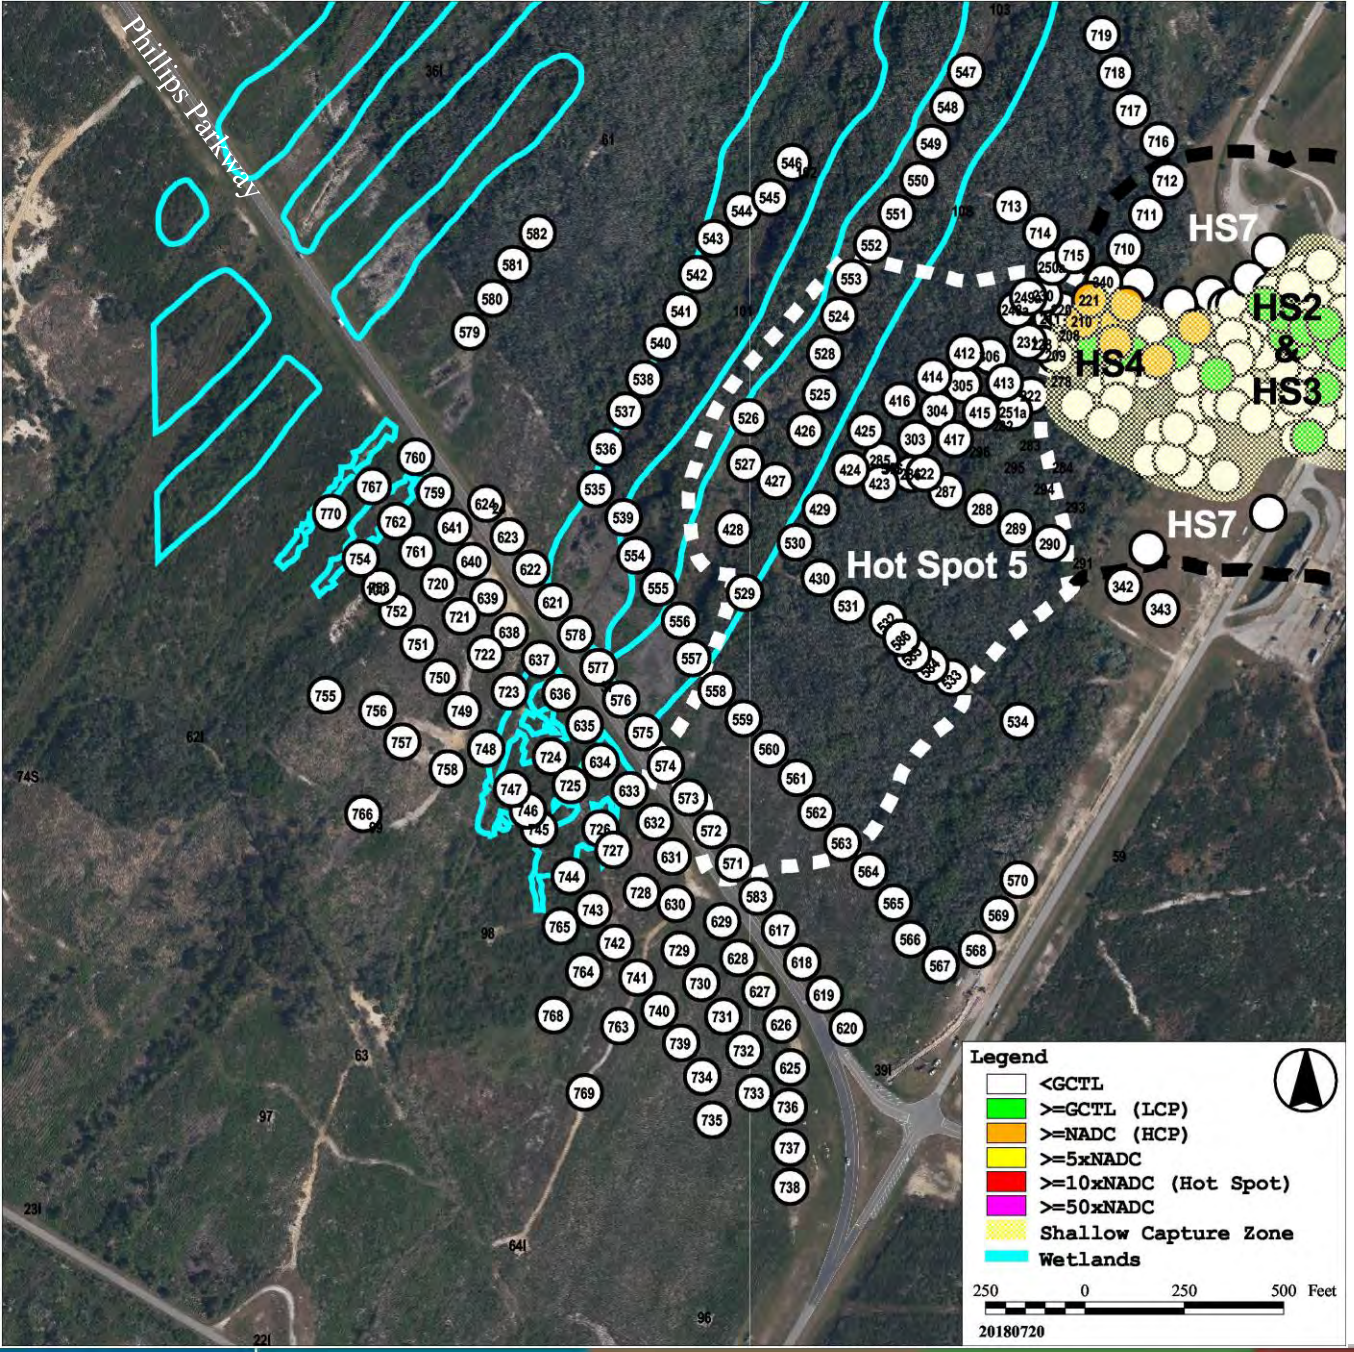
Cross-sections provided for vertical evaluation



Jacobs Comment #3:

What was the cause of the elevated detection limits mentioned? Similar question: DPT0751 had a 500 J result for vinyl chloride. What caused the estimated value?

Tt response:



The reference to elevated non-detect values was not directed at any particular result, but rather indicated how elevated non-detect values were handled during contouring. In most cases the elevated non-detections were within the HCS capture zone and were caused by high TCE detections. Excluding those results, cDCE had no elevated non-detect values within Hot Spot 5 and VC had 8 elevated non-detect values in samples that had high cDCE detections. The onsite lab did not provide a reason for the estimated VC result of 500 J.

DPT0340	TCE	cDCE	VC

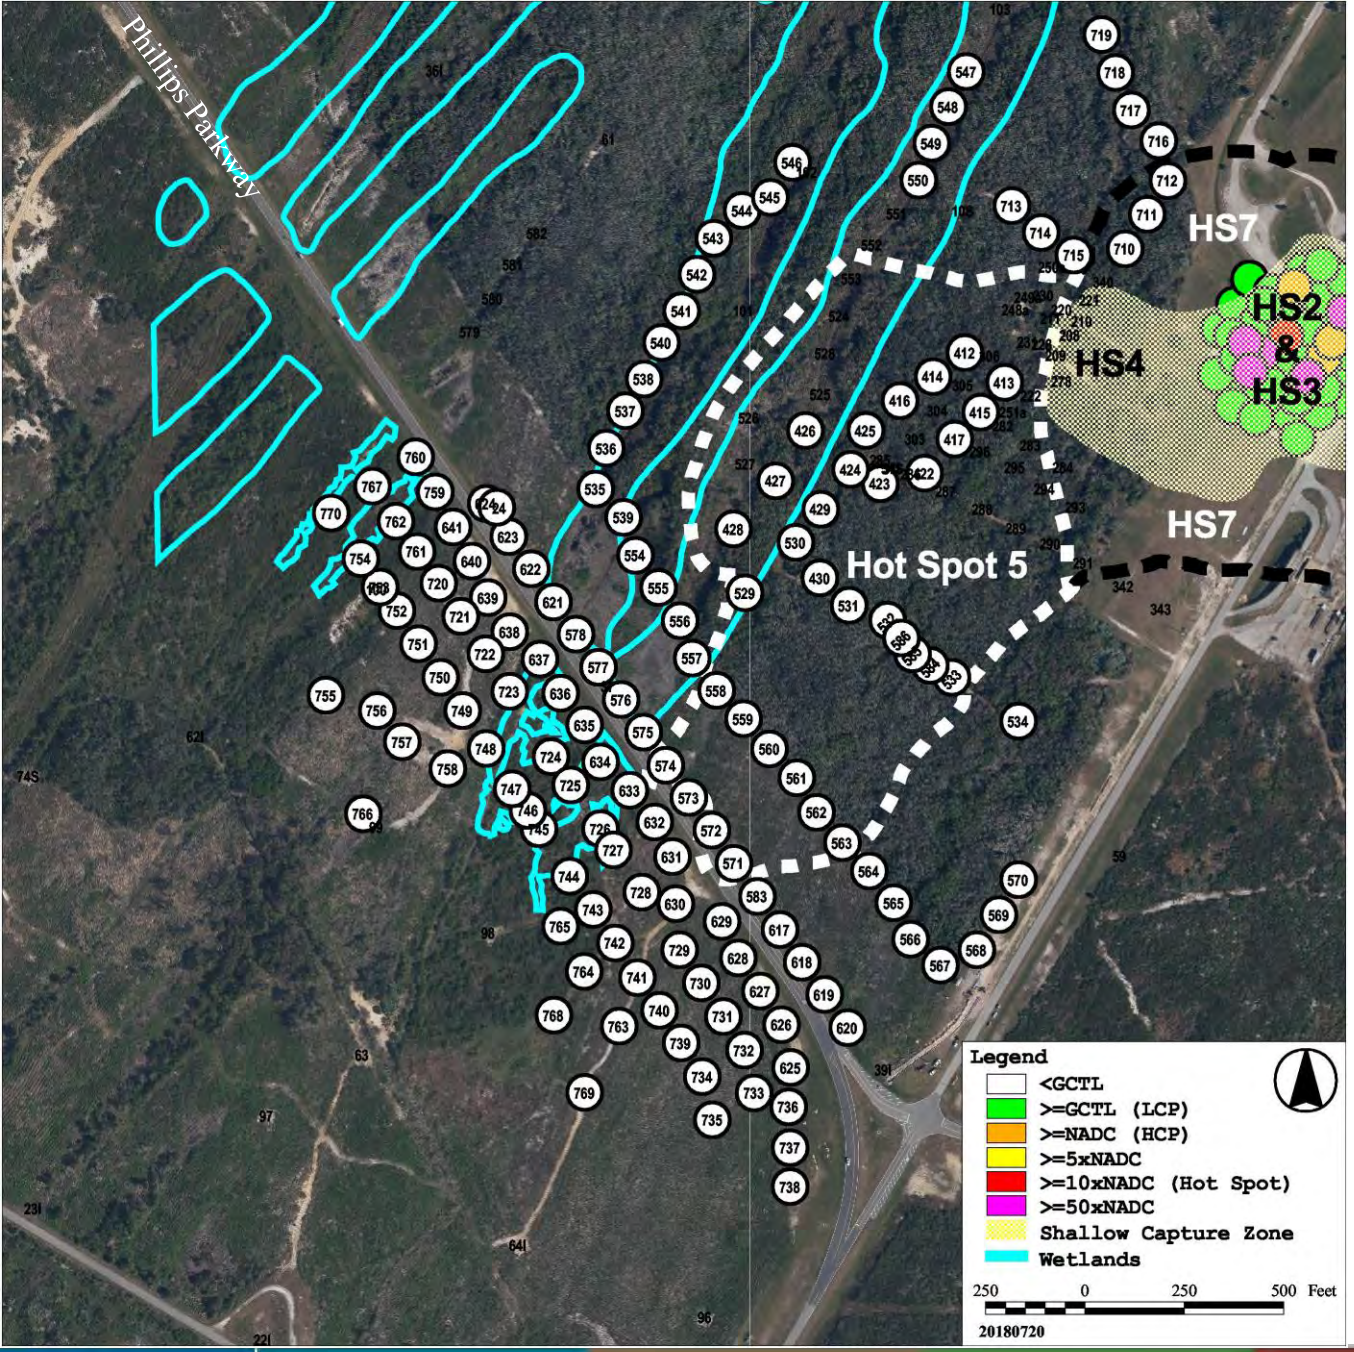
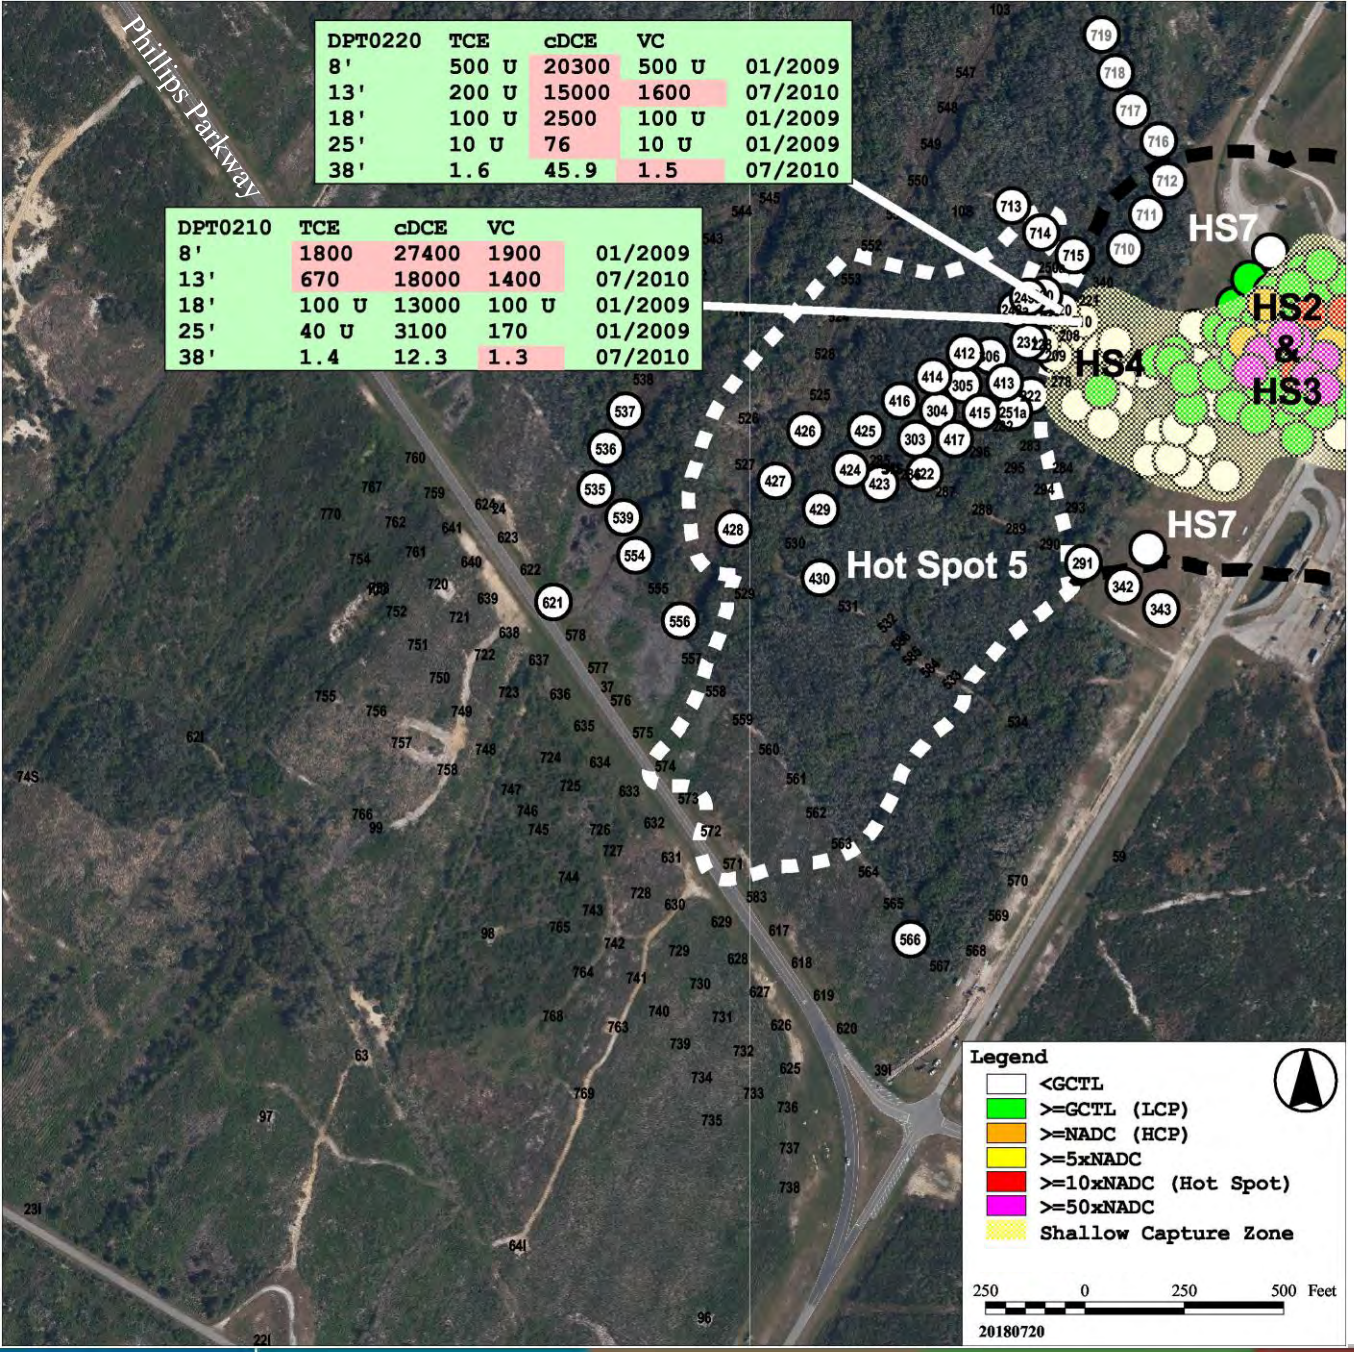
DPT0210:

- On the fringe of the Shallow Capture Zone
- Sample collected 07/2010

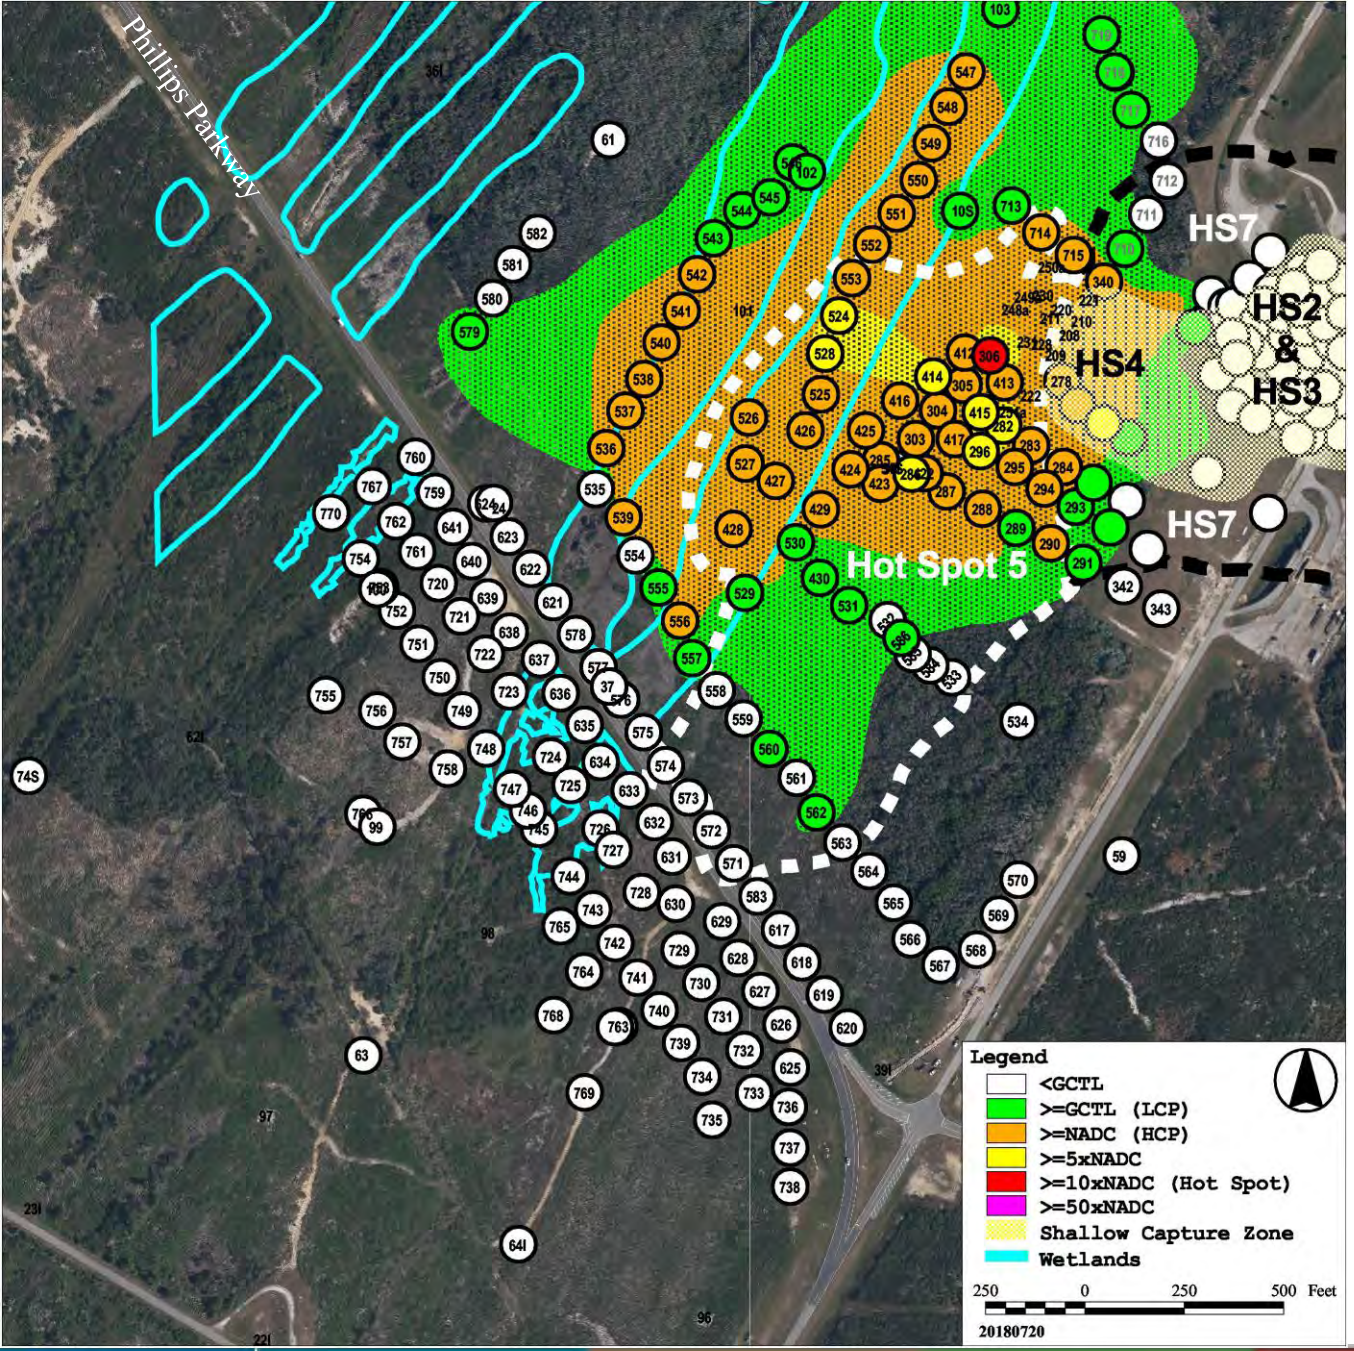


TCE, Interval: 10 to 15 feet bls



All results BDL

All results BDL



All results BDL

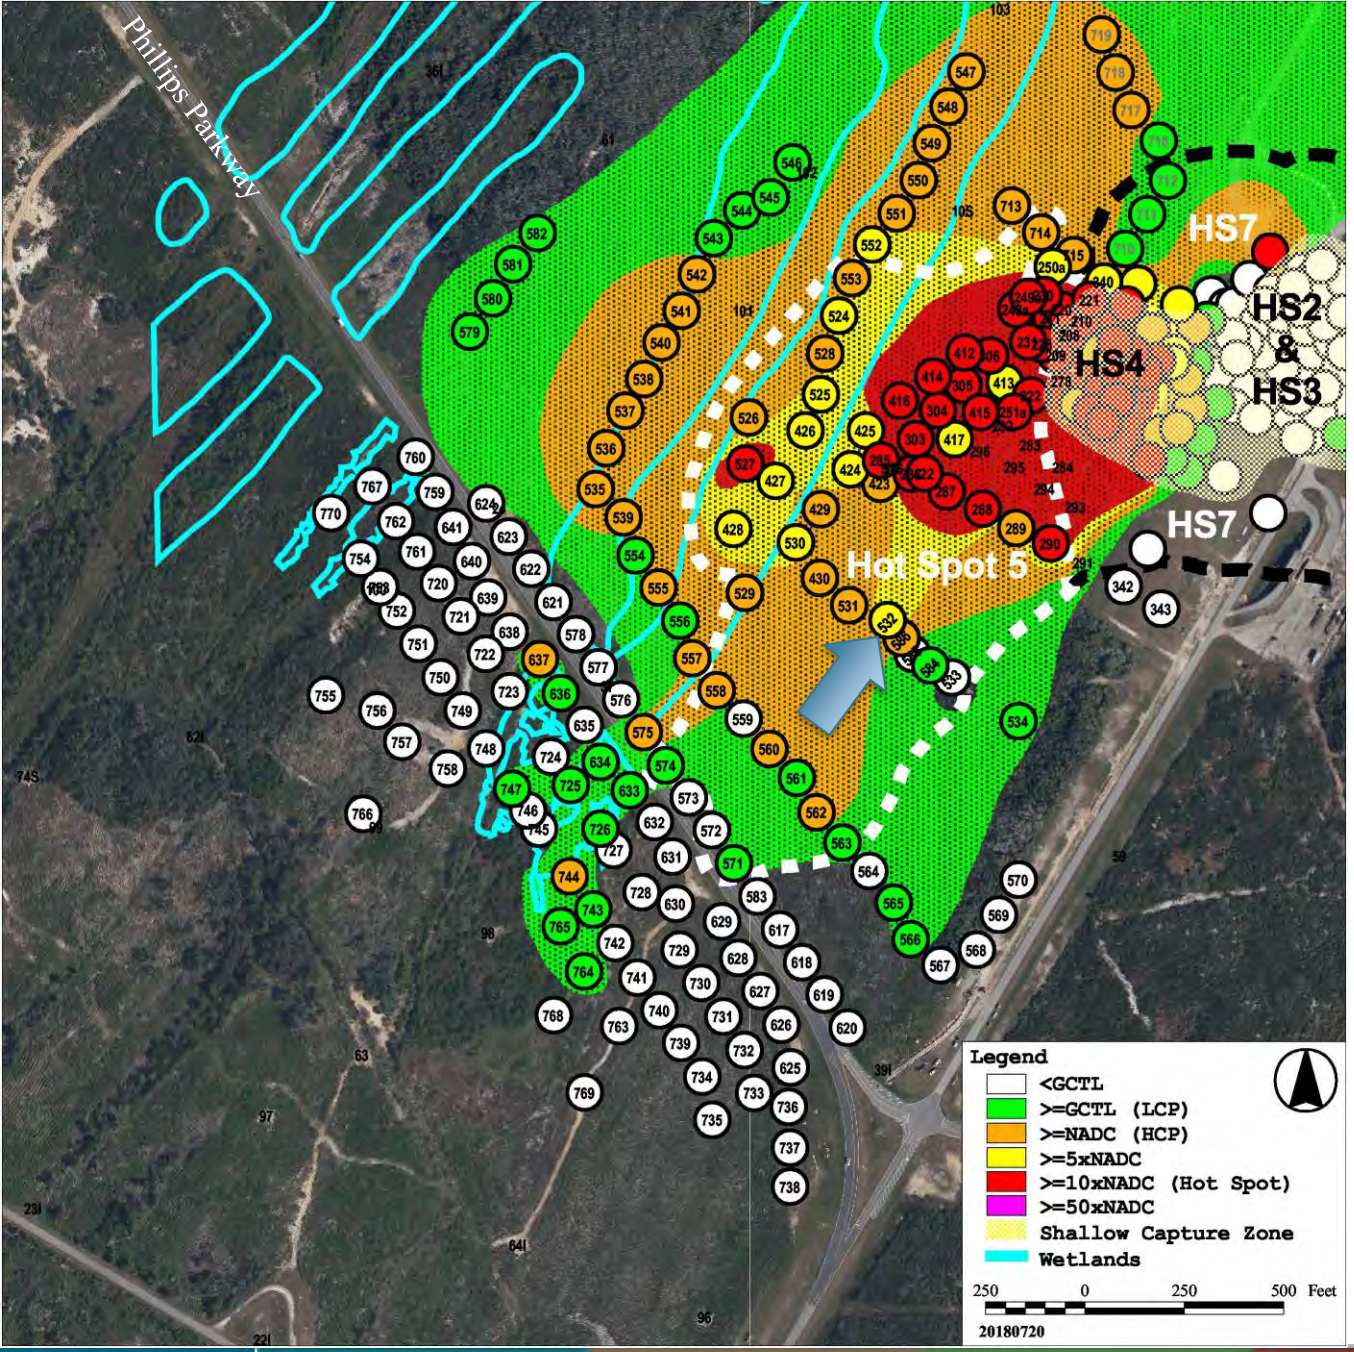
Two detections of TCE less than GCTL in DPTs 210 and 220

TCE, Interval: 34 to 40 feet bls

DPT0306	TCE	cDCE	VC	
8'	50 U	7400	2000	07/2010
13'	500 U	13000	1900	07/2010
18'	50 U	2700	140	07/2010
25'	1 U	95	5.9	07/2010
38'	1 U	89.9	5.1	07/2010

DPT0306 only sample that exceed Hot Spot criteria

No detections adjacent to and south of Phillips Parkway



Geosyntec Comment #4:

DPT718 has a results of 570 µg/L cDCE at the 8 ft depth. Should the location be green? If for some reason the next depth interval (13 ft) was considered, surrounding DPTs would need to follow the same rationale.

Tt response:

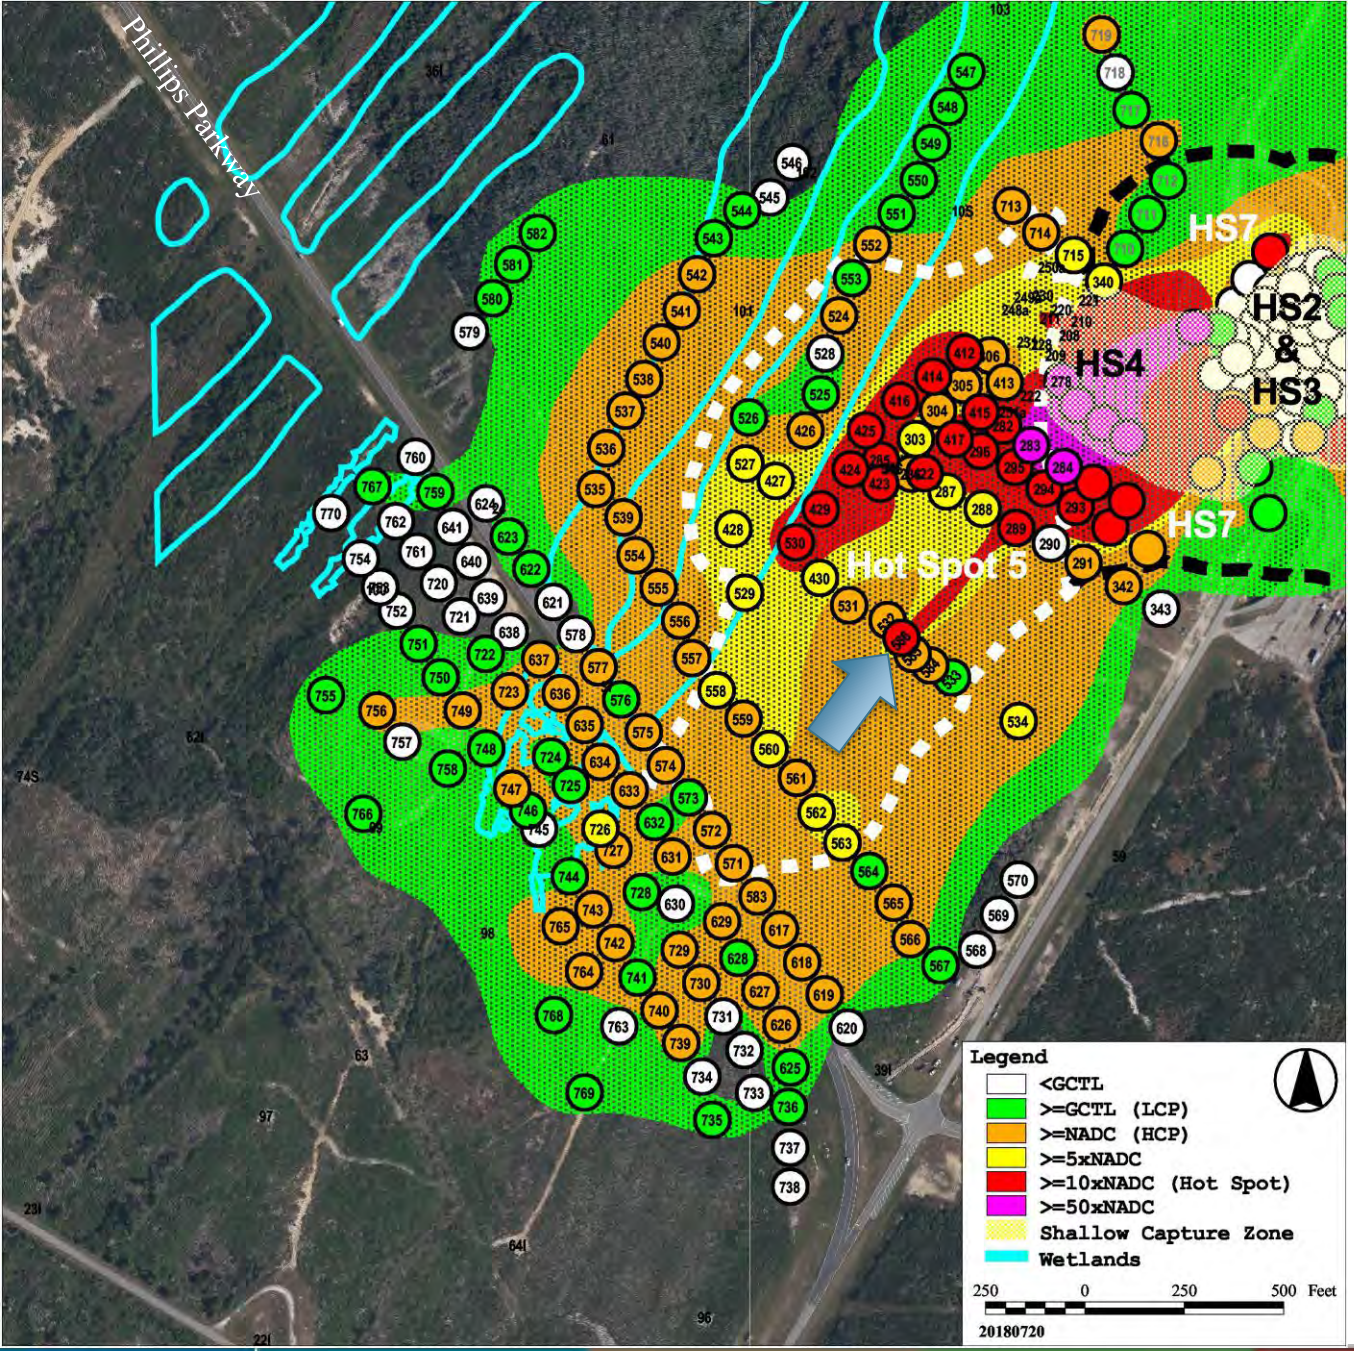
DPT0718 is co-located with IW0054S. During the 2009 and 2010 sample events, IW0054S had concentrations of cDCE that exceeded the NADC, causing the location to be color coded as exceeding the NADC. cDCE has been less than the NADC in IW0054S since 2011, and therefore the location should be green and has been changed in the presentation.

cDCE, Interval: 0 to 10 feet bls

Twenty-eight detections equal to or greater than Hot Spot criteria ranging from 7,000 to 24,000 µg/L

All horizontally bounded

Detections equal to or greater than GCTL and NADC south of Phillips Parkway



Geosyntec Comment #5:

Based upon the 3,900 µg/L cDCE at DPT532, consider extending the >5xNADC contour located to the northeast of this area ~250 ft down to this location.

Tt response:

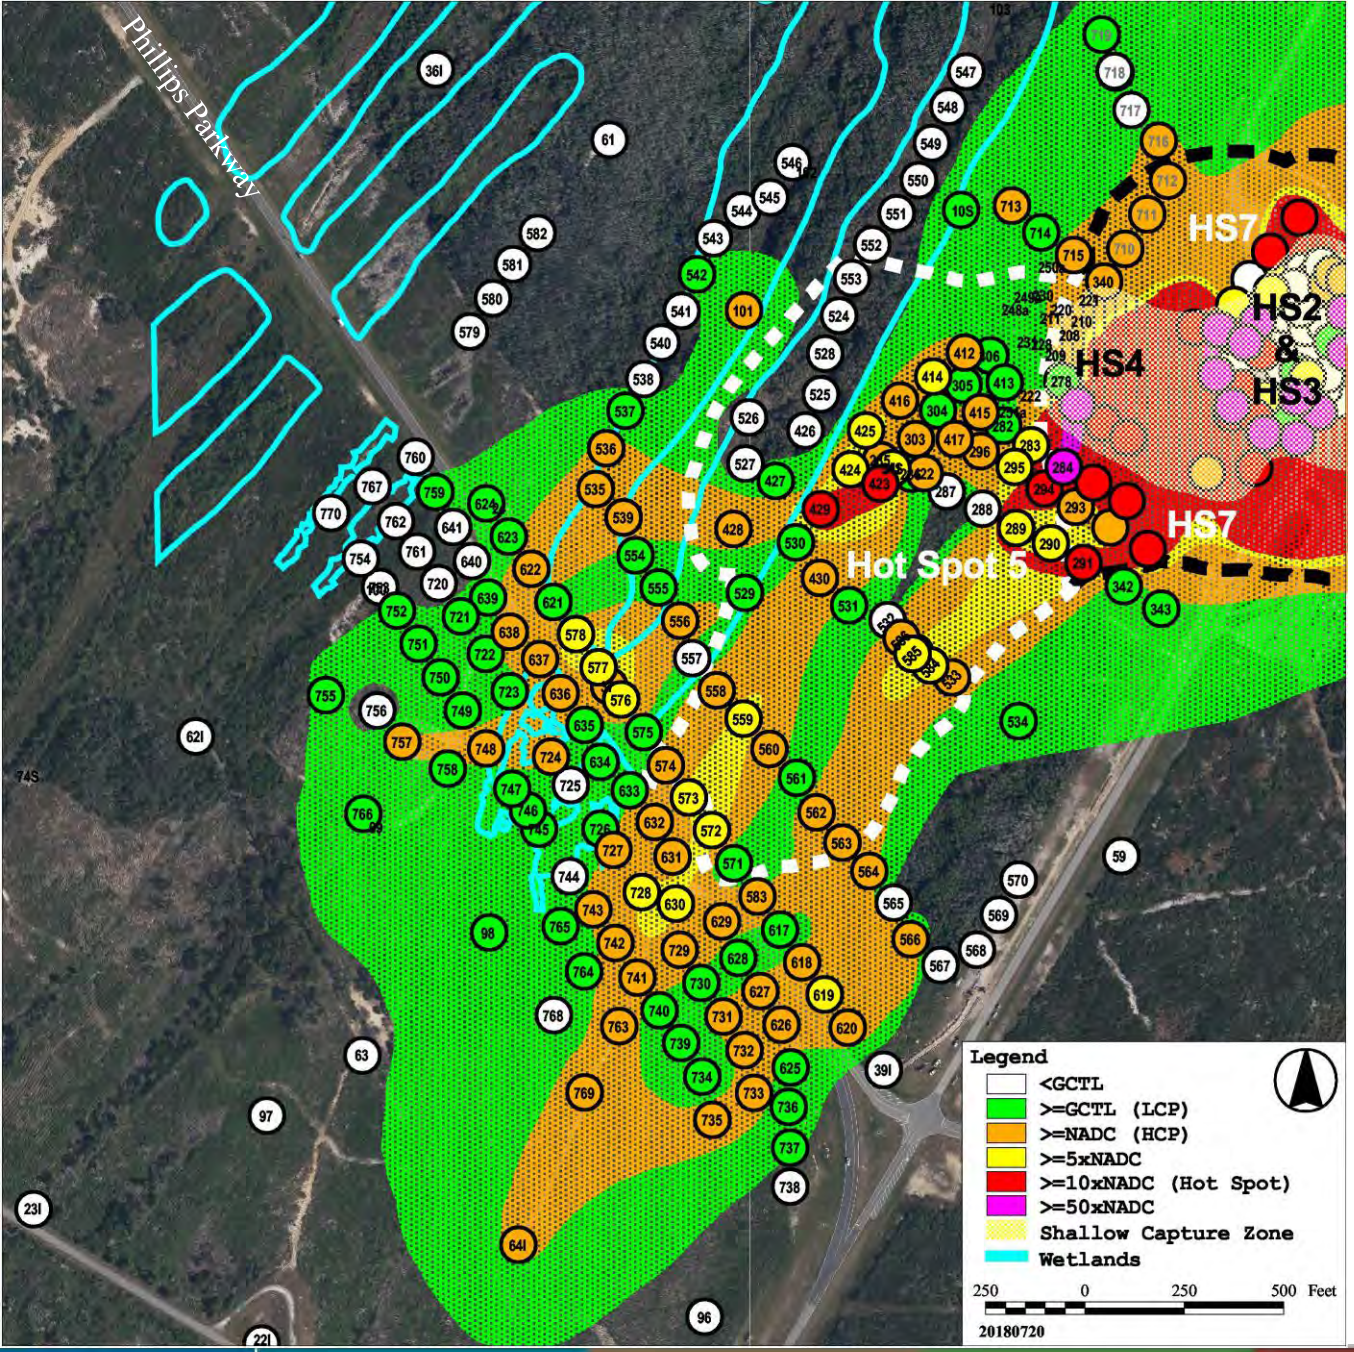
Tt concurs, the >5xNADC contour has been modified to incorporate DPT0532 as shown.

cDCE, Interval: 10 to 15 feet bls

Twenty-two detections greater than Hot Spot criteria ranging from 9,200 to 64,000 µg/L

All horizontally bounded

Larger area of detections equal to or greater than GCTL and NADC south of Phillips Parkway



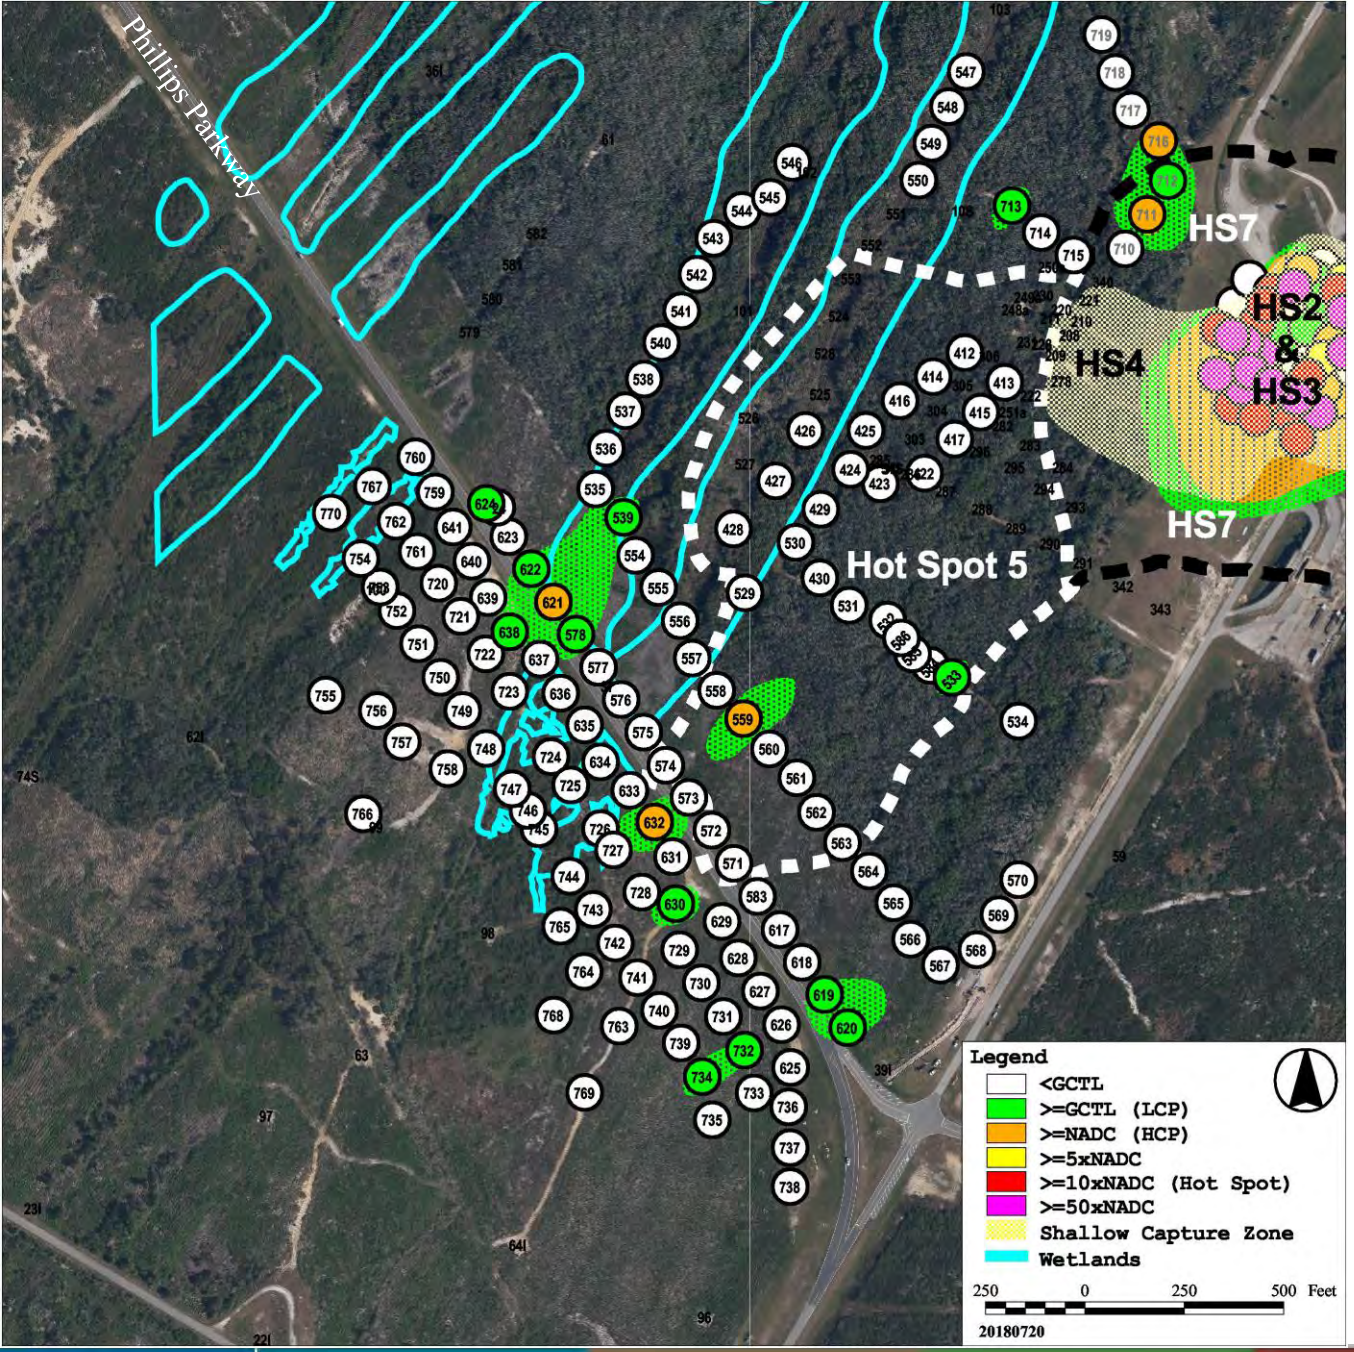
Geosyntec Comment #6:

Similar to Slide 16, consider extending the >5xNADC and >10xNADC contours to the northeast (288, 289 area) to the southwest toward DPT586.

Tt response:

Tt concurs, the >5xNADC and >10xNADC contours have been modified to incorporate DPT0288 and DPT0289 as shown.

cDCE, Interval: 15 to 20 feet bls



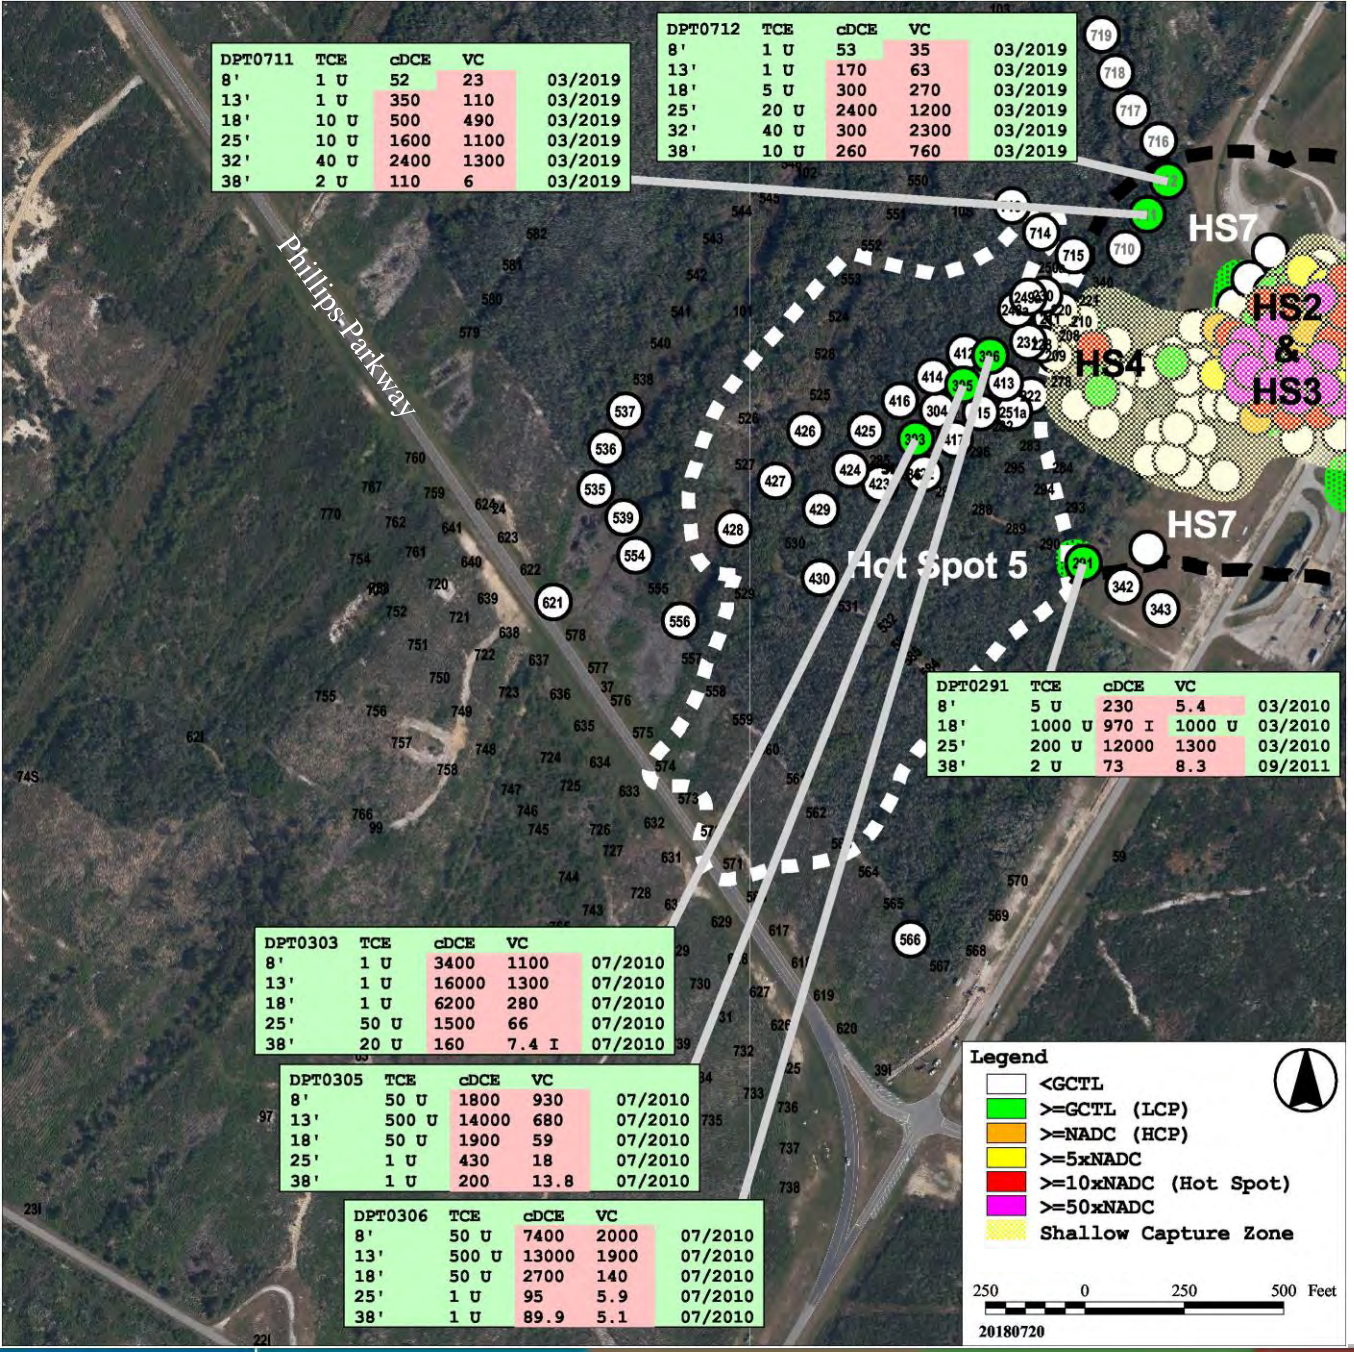
Five detections greater than Hot Spot criteria ranging from 8,000 to 35,000 µg/L

All horizontally bounded

Larger area of detections equal to or greater than GCTL and NADC south of Phillips Parkway

cDCE, Interval: 20 to 28 feet bls

No detections greater than Hot Spot criteria



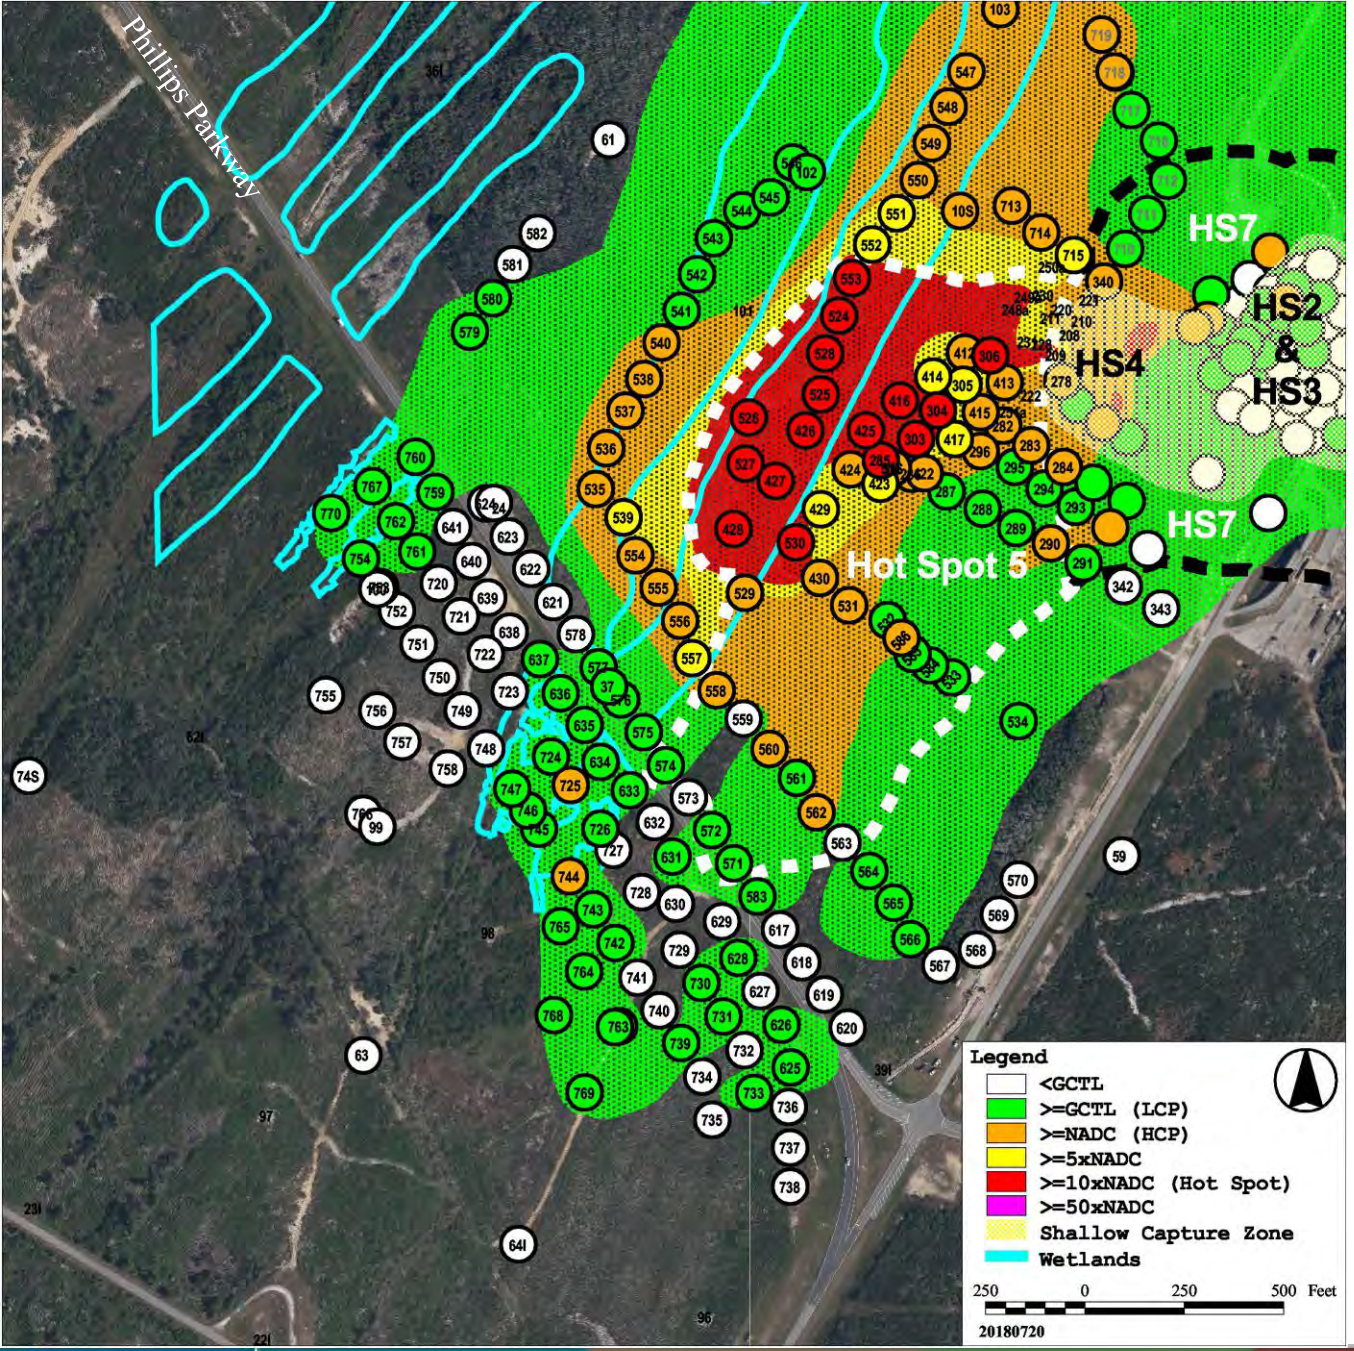
Five detections greater than NADC ranging from 930 to 3,300 µg/L

All horizontally bounded

South of Phillips Parkway:

- DPT0632 @ 2,100 µg/L
- DPT0630 @ 210 µg/L
- DPT0734 @ 140 µg/L
- DPT0638 @ 100 µg/L
- DPT0732 @ 87 µg/L

cDCE, Interval: 28 to 34 feet bls

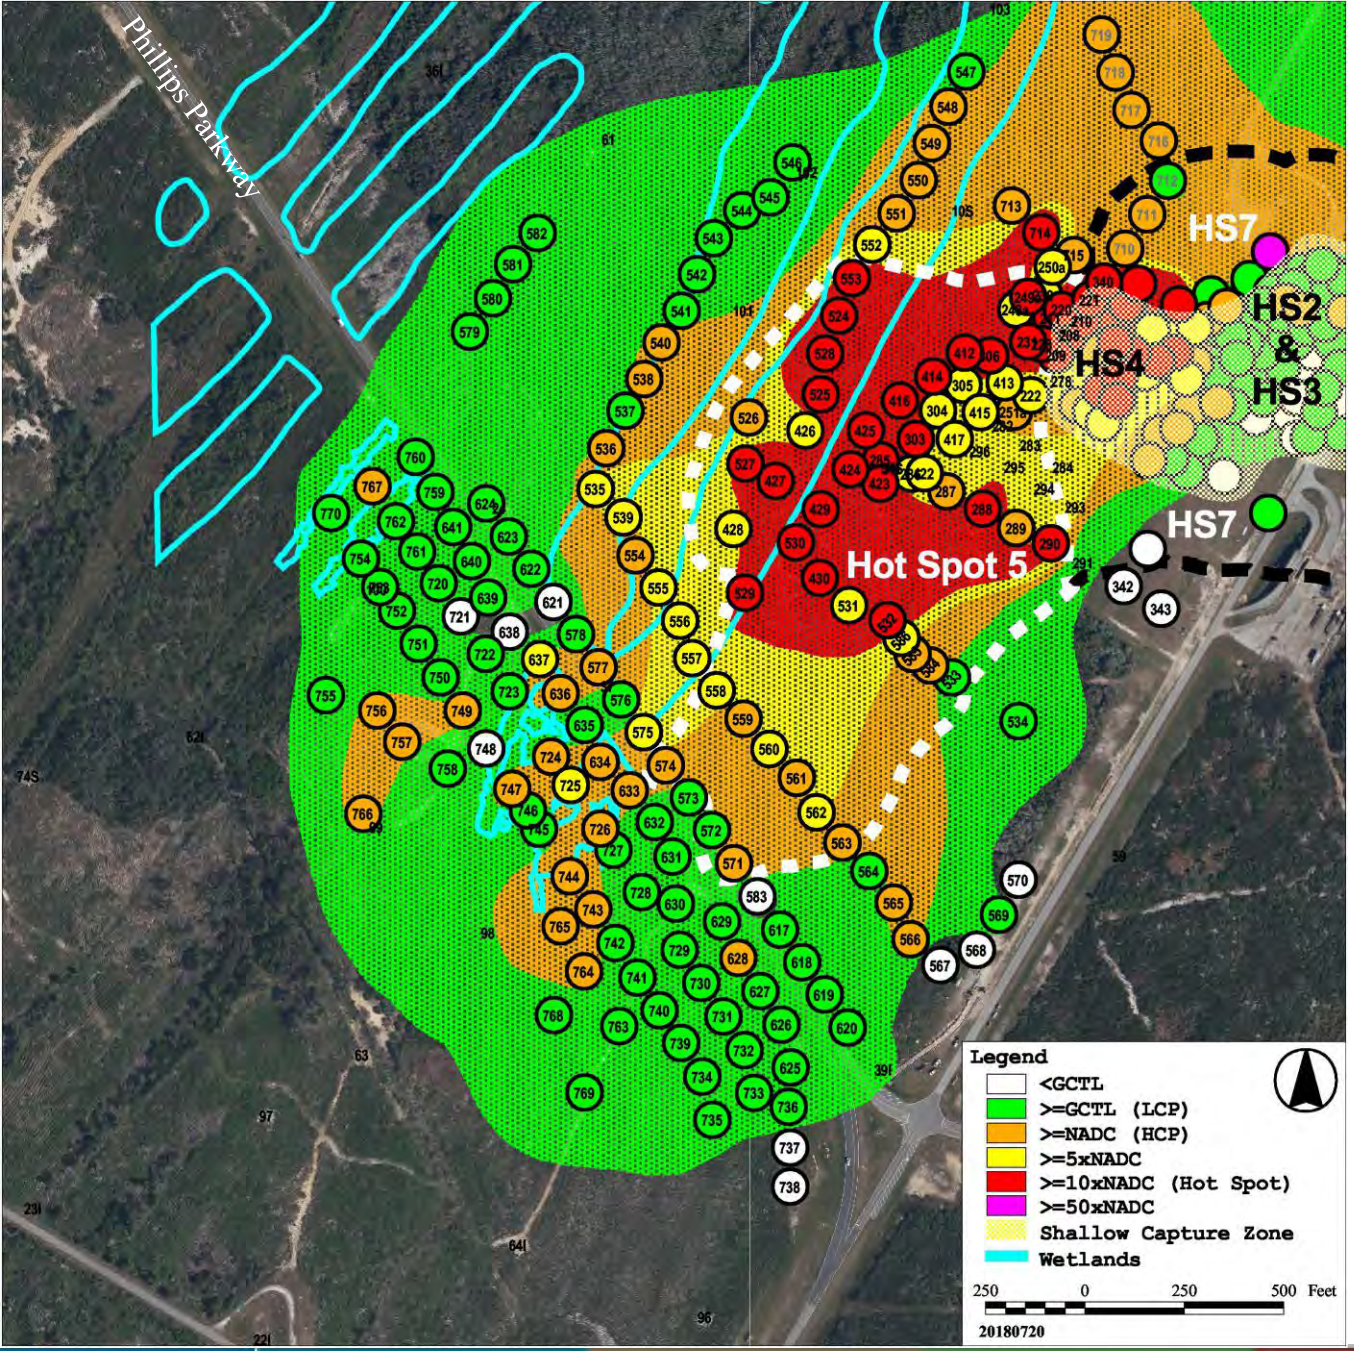


No detections greater than Hot Spot or NADC criteria

Six detections greater than GCTL ranging from 73 to 260 µg/L

All horizontally bounded

cDCE, Interval: 34 to 40 feet bls

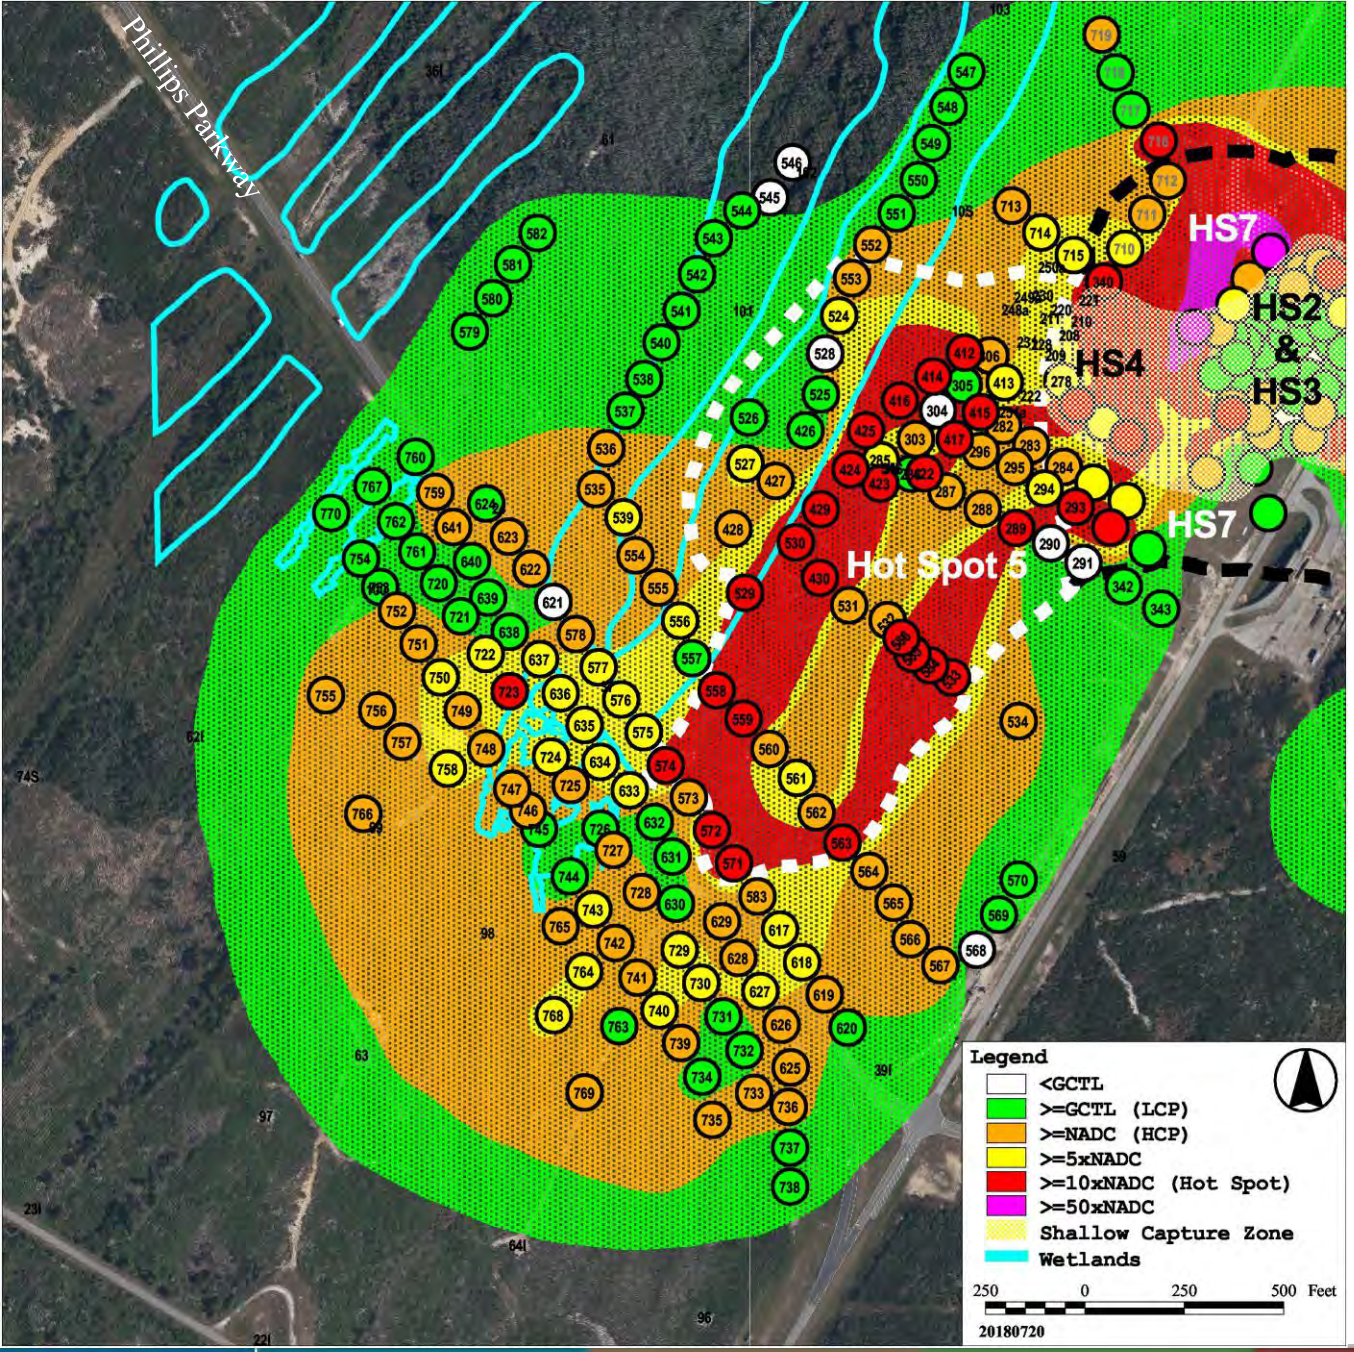


Sixteen detections greater than Hot Spot criteria ranging from 1,100 to 2,700 µg/L

All horizontally bounded

VC plume south of Phillips Parkway much larger than cDCE plume in this interval, two detections equal to or greater than NADC at 100 and 120 µg/L

VC, Interval: 0 to 10 feet bls

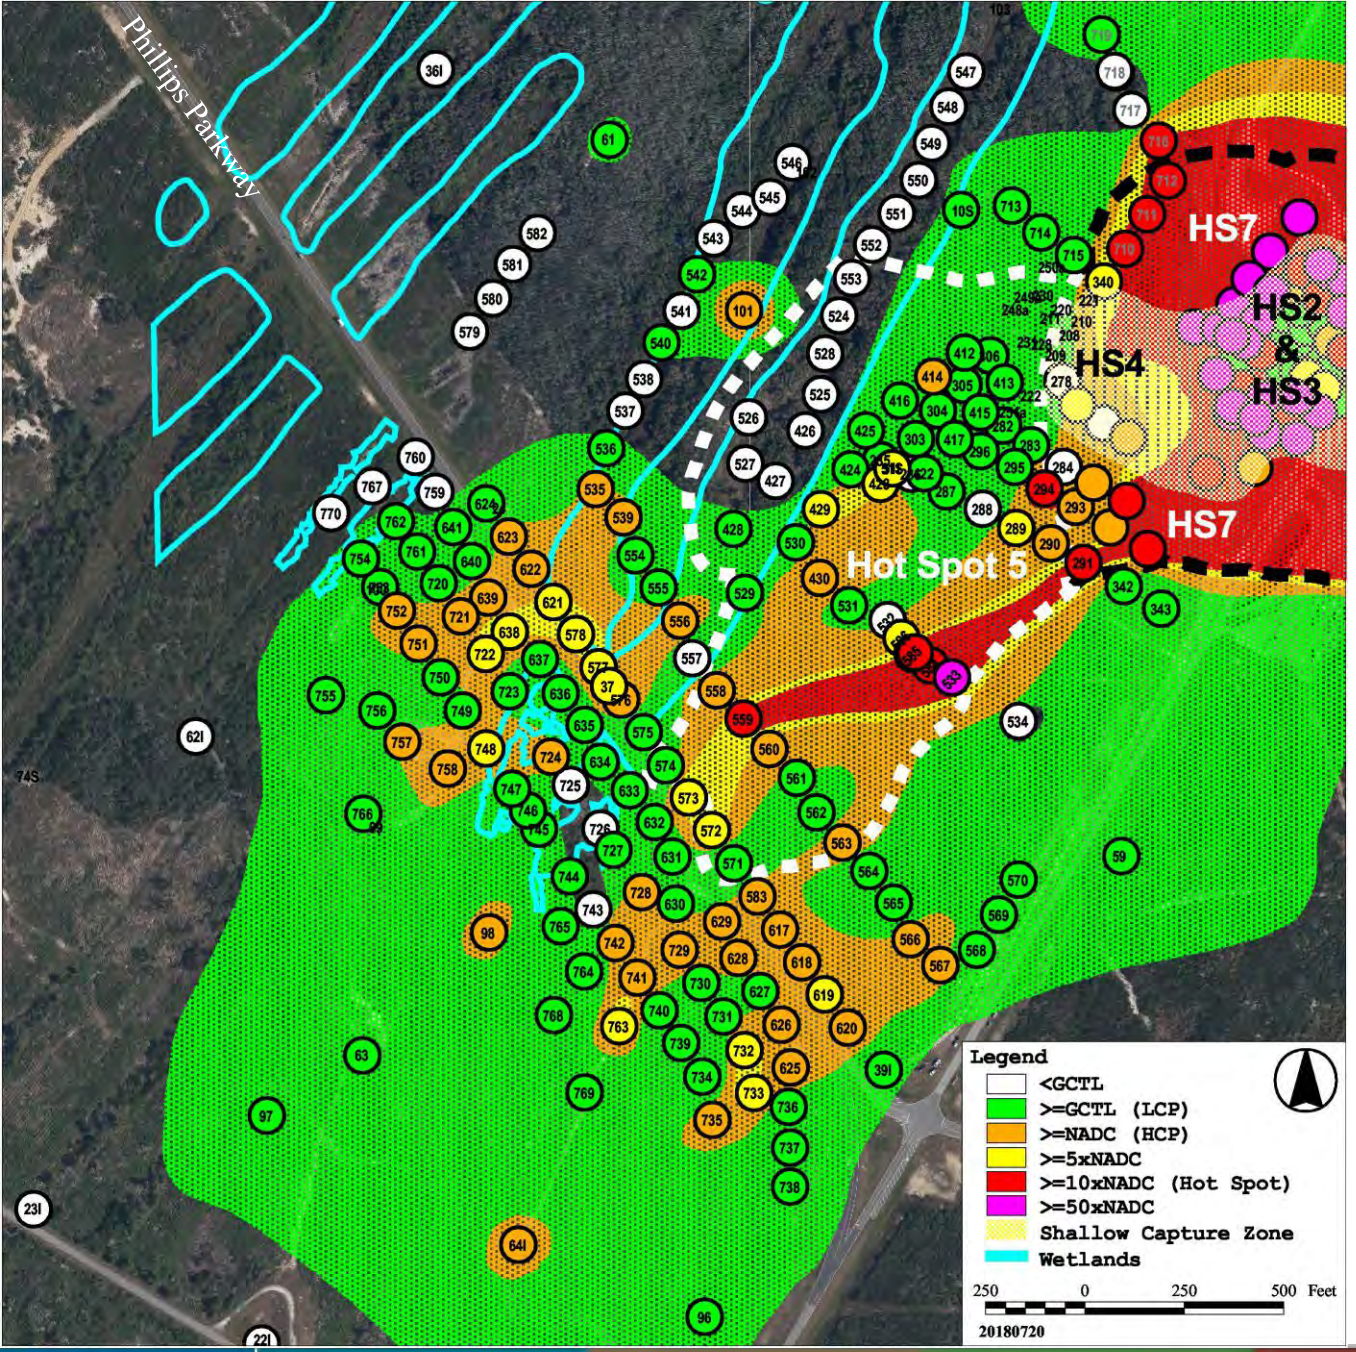


Thirty-three detections equal to or greater than Hot Spot criteria ranging from 1,000 to 2,800 µg/L

All horizontally bounded

VC plume south of Phillips Parkway much larger than cDCE plume in this interval, sixteen detections equal to or greater than NADC ranging from 100 to 890 µg/L

VC, Interval: 10 to 15 feet bls

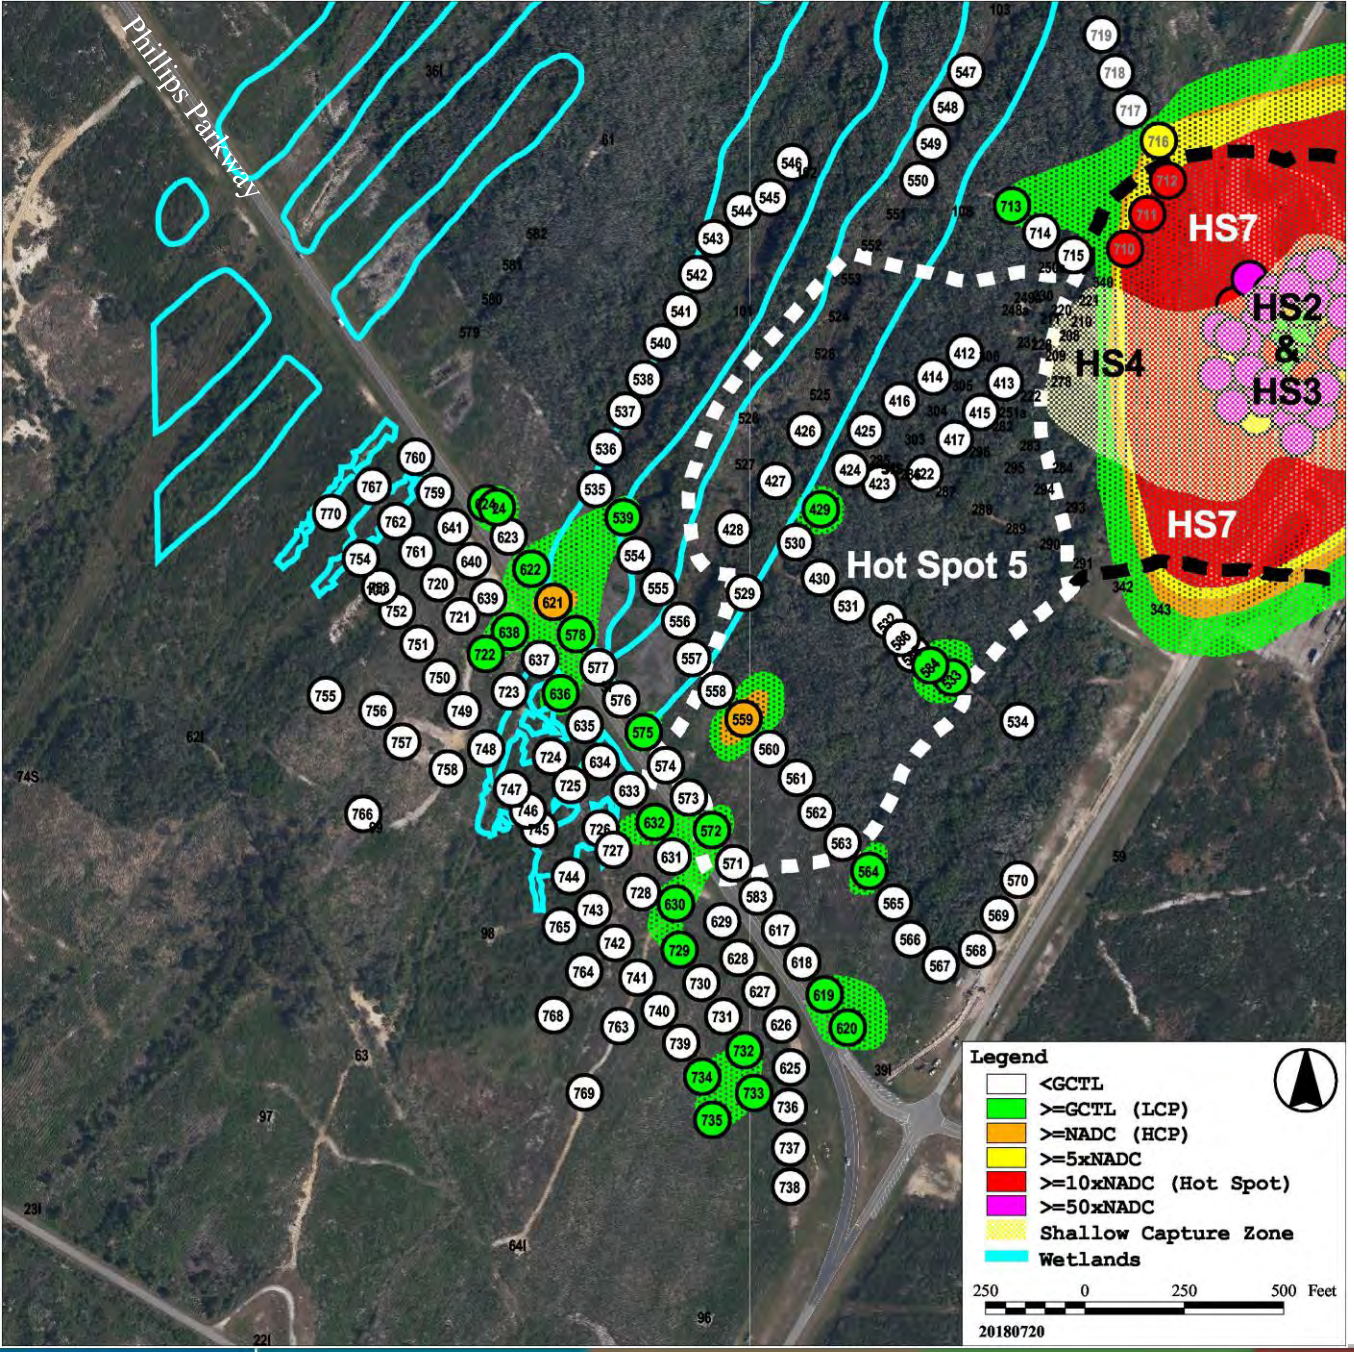


Twenty-eight detections equal to or greater than Hot Spot criteria ranging from 1,000 to 4,600 µg/L

All horizontally bounded

VC plume south of Phillips Parkway much larger than cDCE plume in this interval, one detection greater than Hot Spot at DPT0723 @ 1,300 µg/L and forty-three detections equal to or greater than NADC ranging from 100 to 970 µg/L

VC, Interval: 15 to 20 feet bls



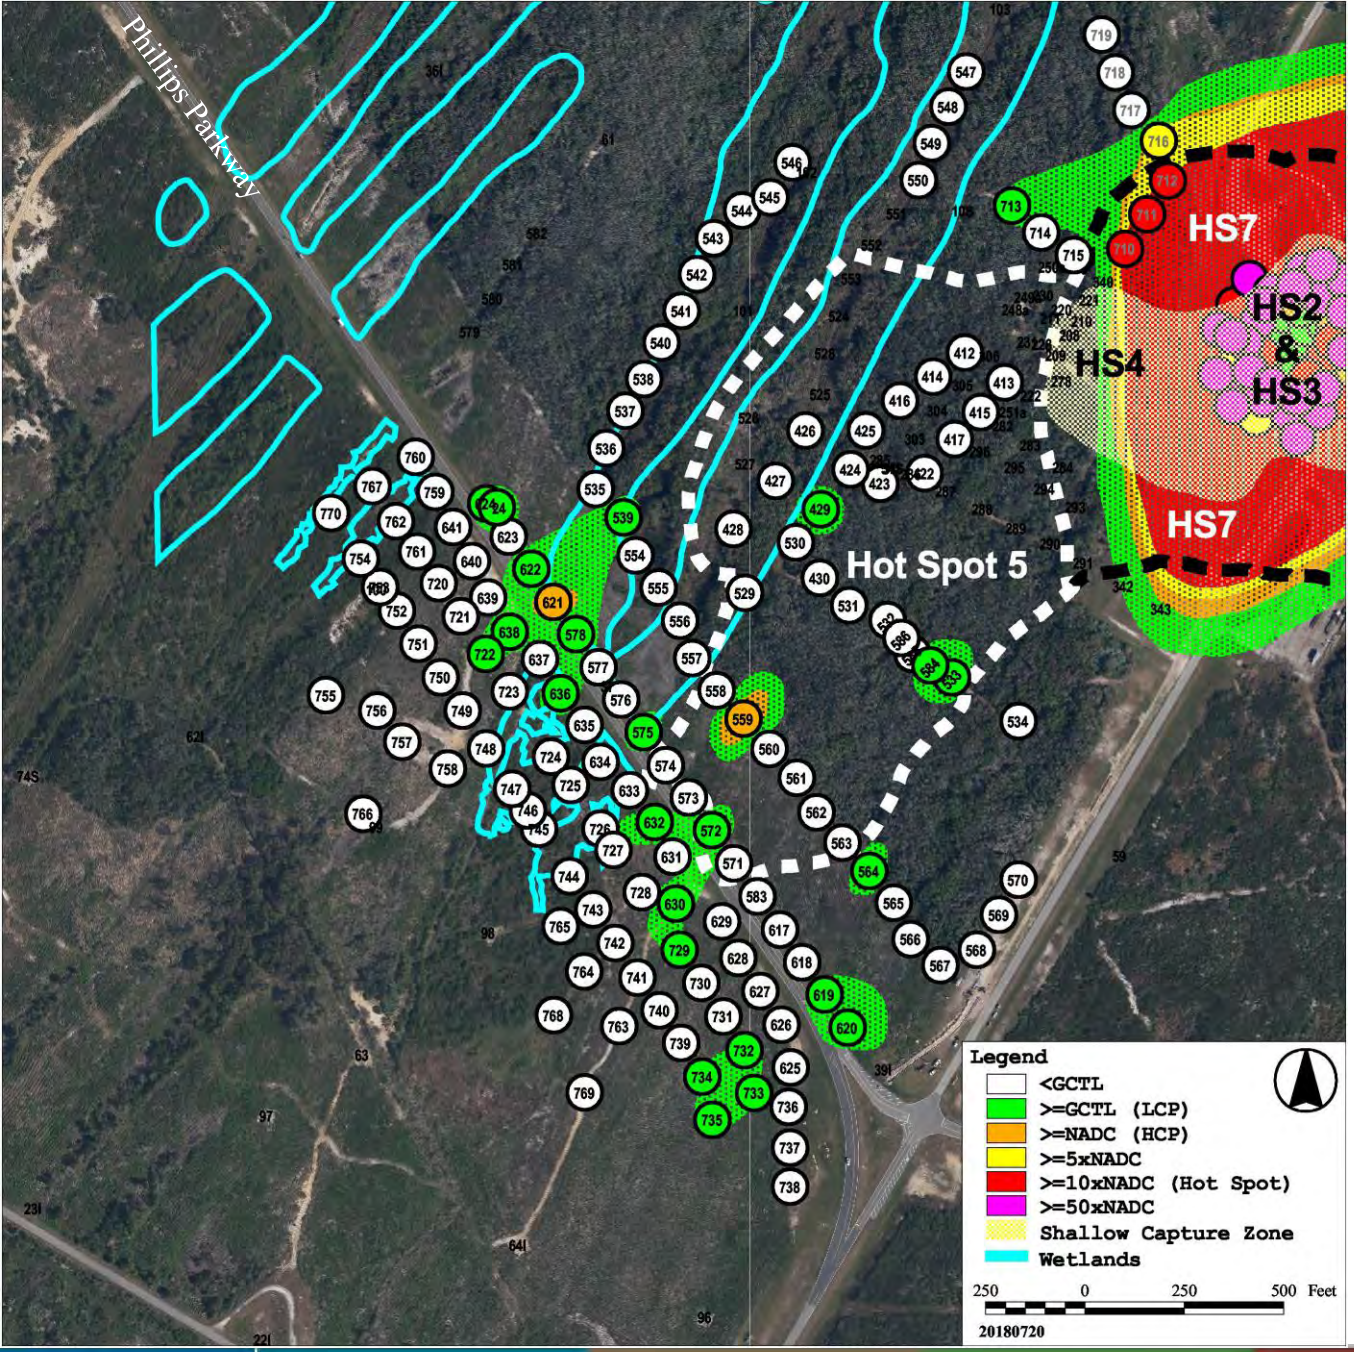
Eleven detections greater than Hot Spot criteria ranging from 1,100 to DPT0533 maximum detection of 9,200 µg/L

All horizontally bounded

VC plume south of Phillips Parkway larger than cDCE plume in this interval, twenty-four detections greater than NADC ranging from 110 to 860 µg/L

VC, Interval: 20 to 28 feet bls

Three detections greater than Hot Spot criteria in DPTs 711, 712, and 710 at 1,300, 2,300, and 2,600 µg/L in Hot Spot 5/7 area



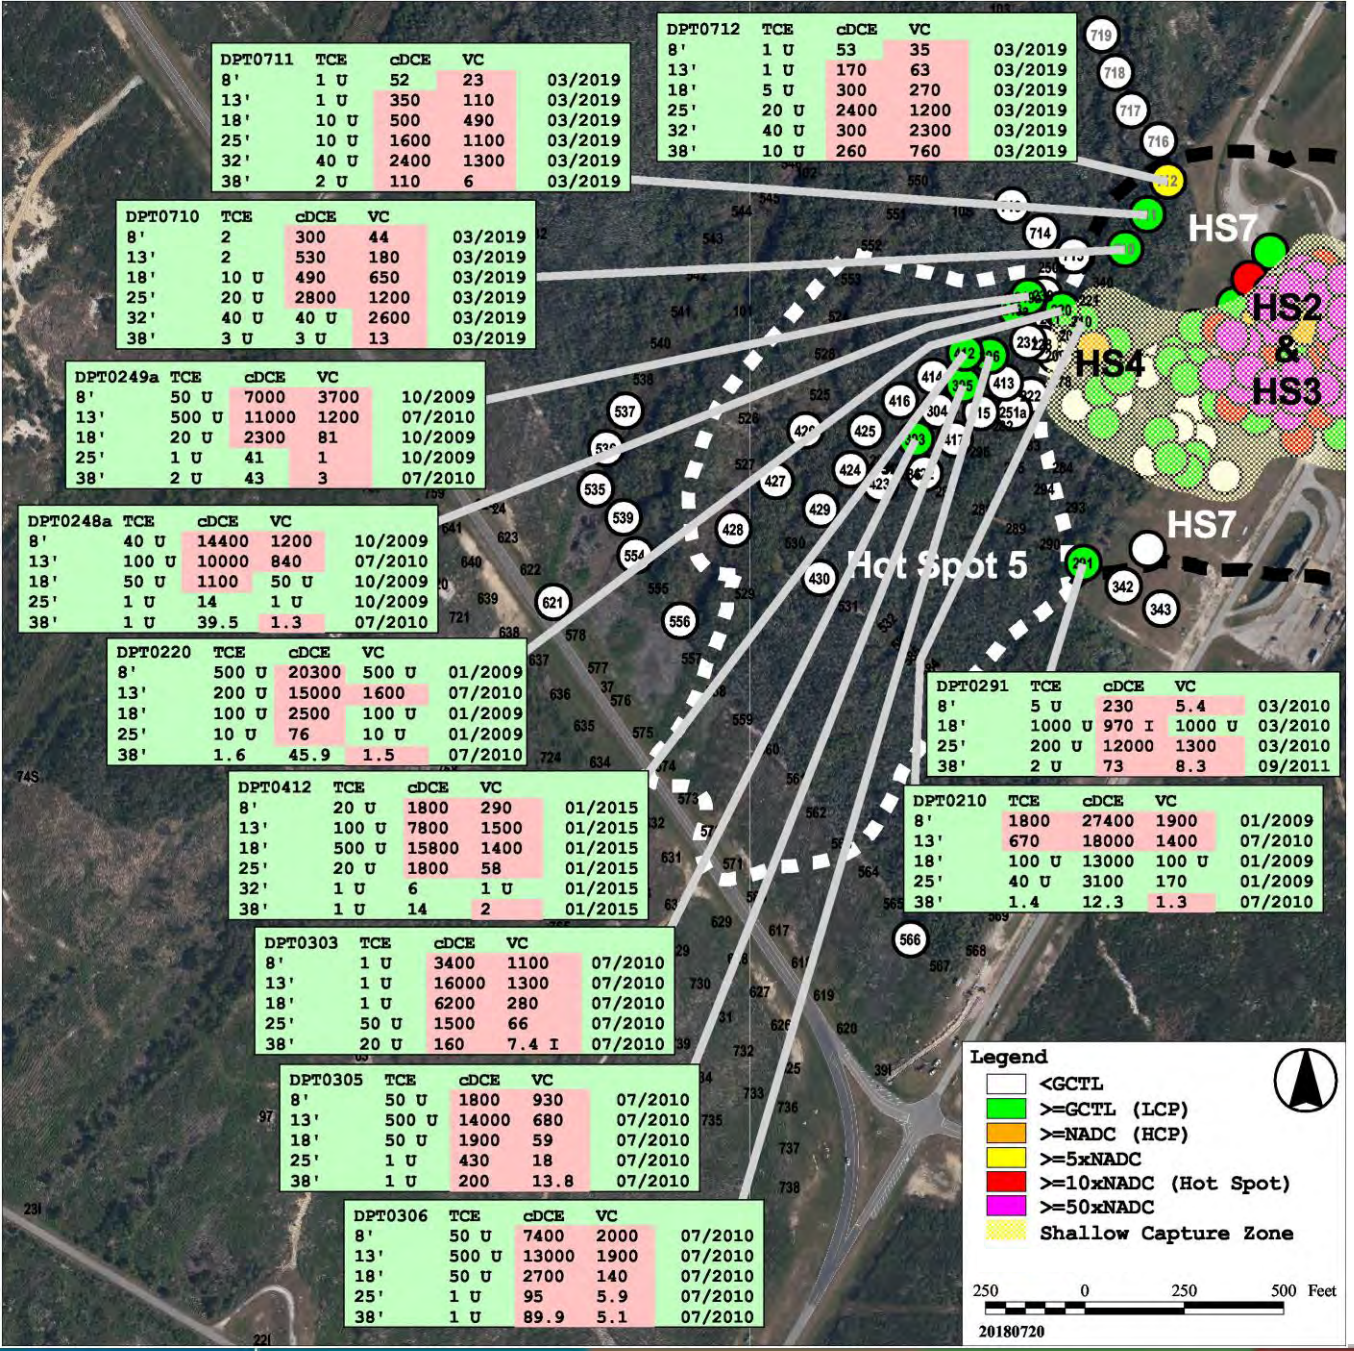
Three detections greater than NADC criteria in DPTs 559, 621, and 716 at 160, 130 and 590 µg/L, respectively

All horizontally bounded

South of Phillips Parkway:

- DPT0732 @ 26 µg/L
- DPT0632 @ 12 µg/L
- DPT0630 @ 4 µg/L
- DPT0733 @ 4 µg/L
- DPT0735 @ 4 µg/L
- DPT0638 @ 3 µg/L
- DPT0734 @ 2 µg/L
- DPT0729 @ 2 µg/L
- DPT0636 @ 1 µg/L
- DPT0722 @ 1 µg/L

VC, Interval: 28 to 34 feet bls

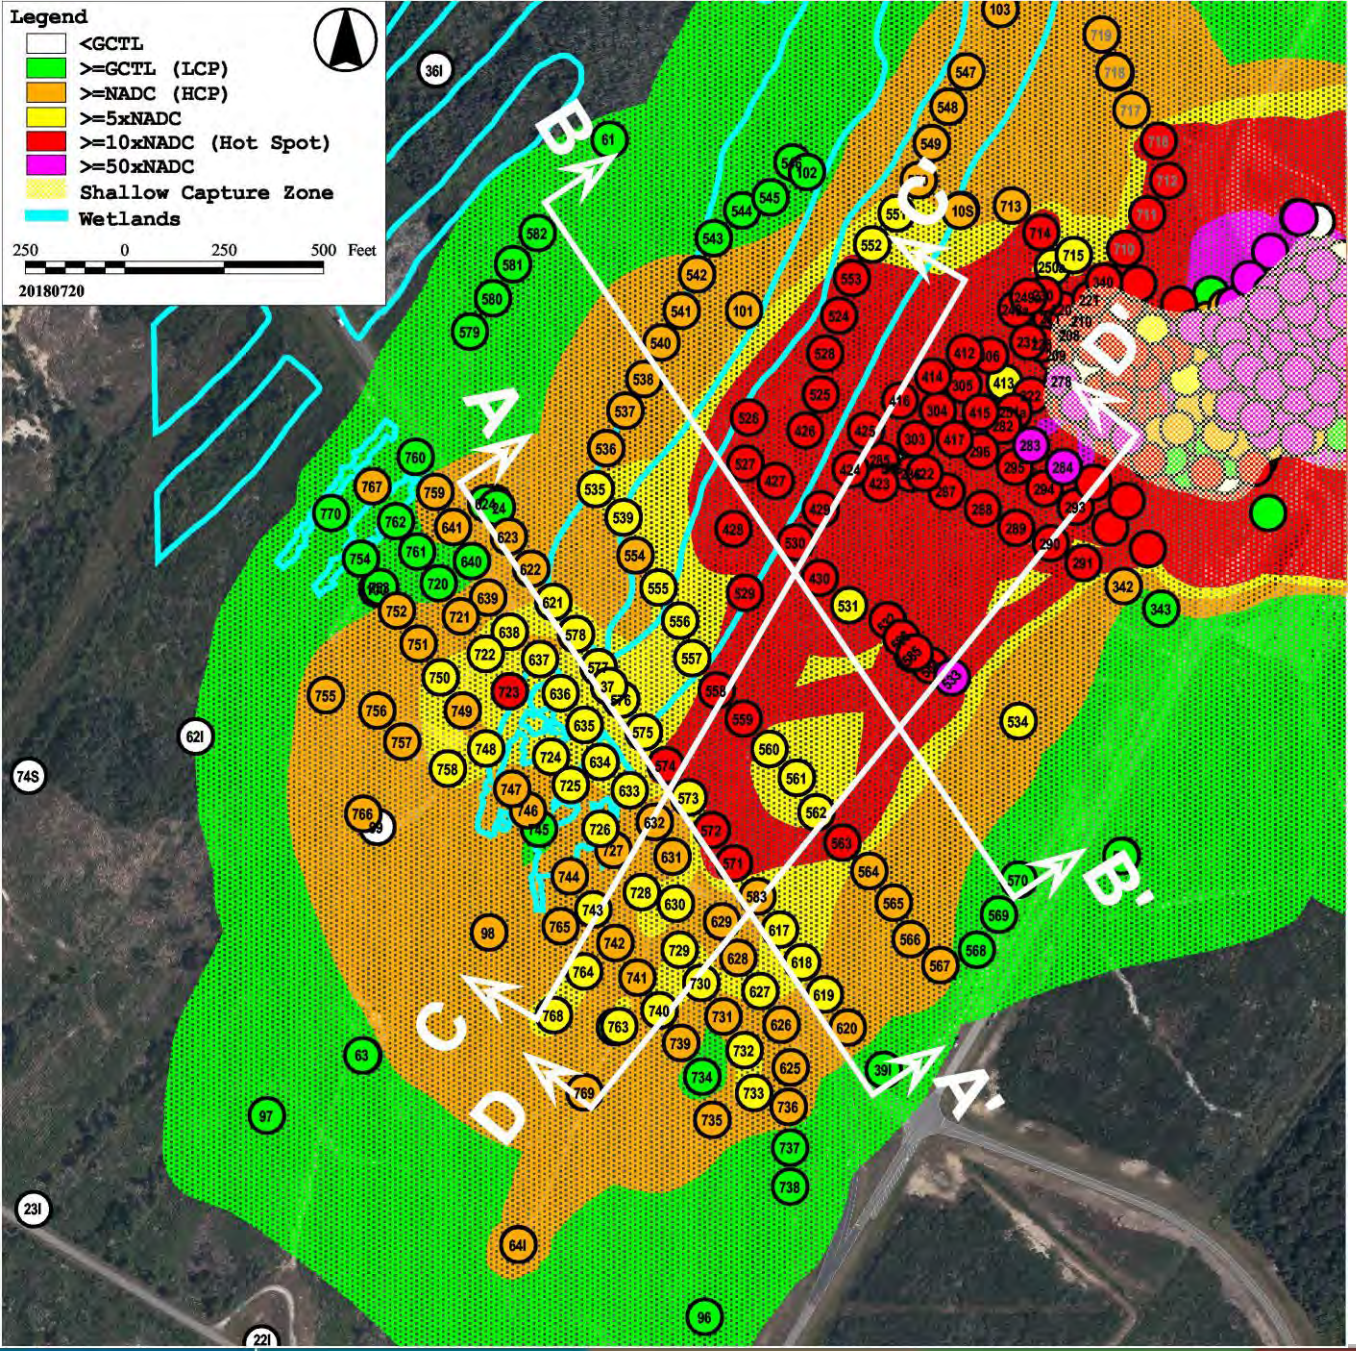


Geosyntec Comment #7:

DPT0636 and DPT0722 at 1 µg/L do not exceed the GCTL as indicated on the Figure.

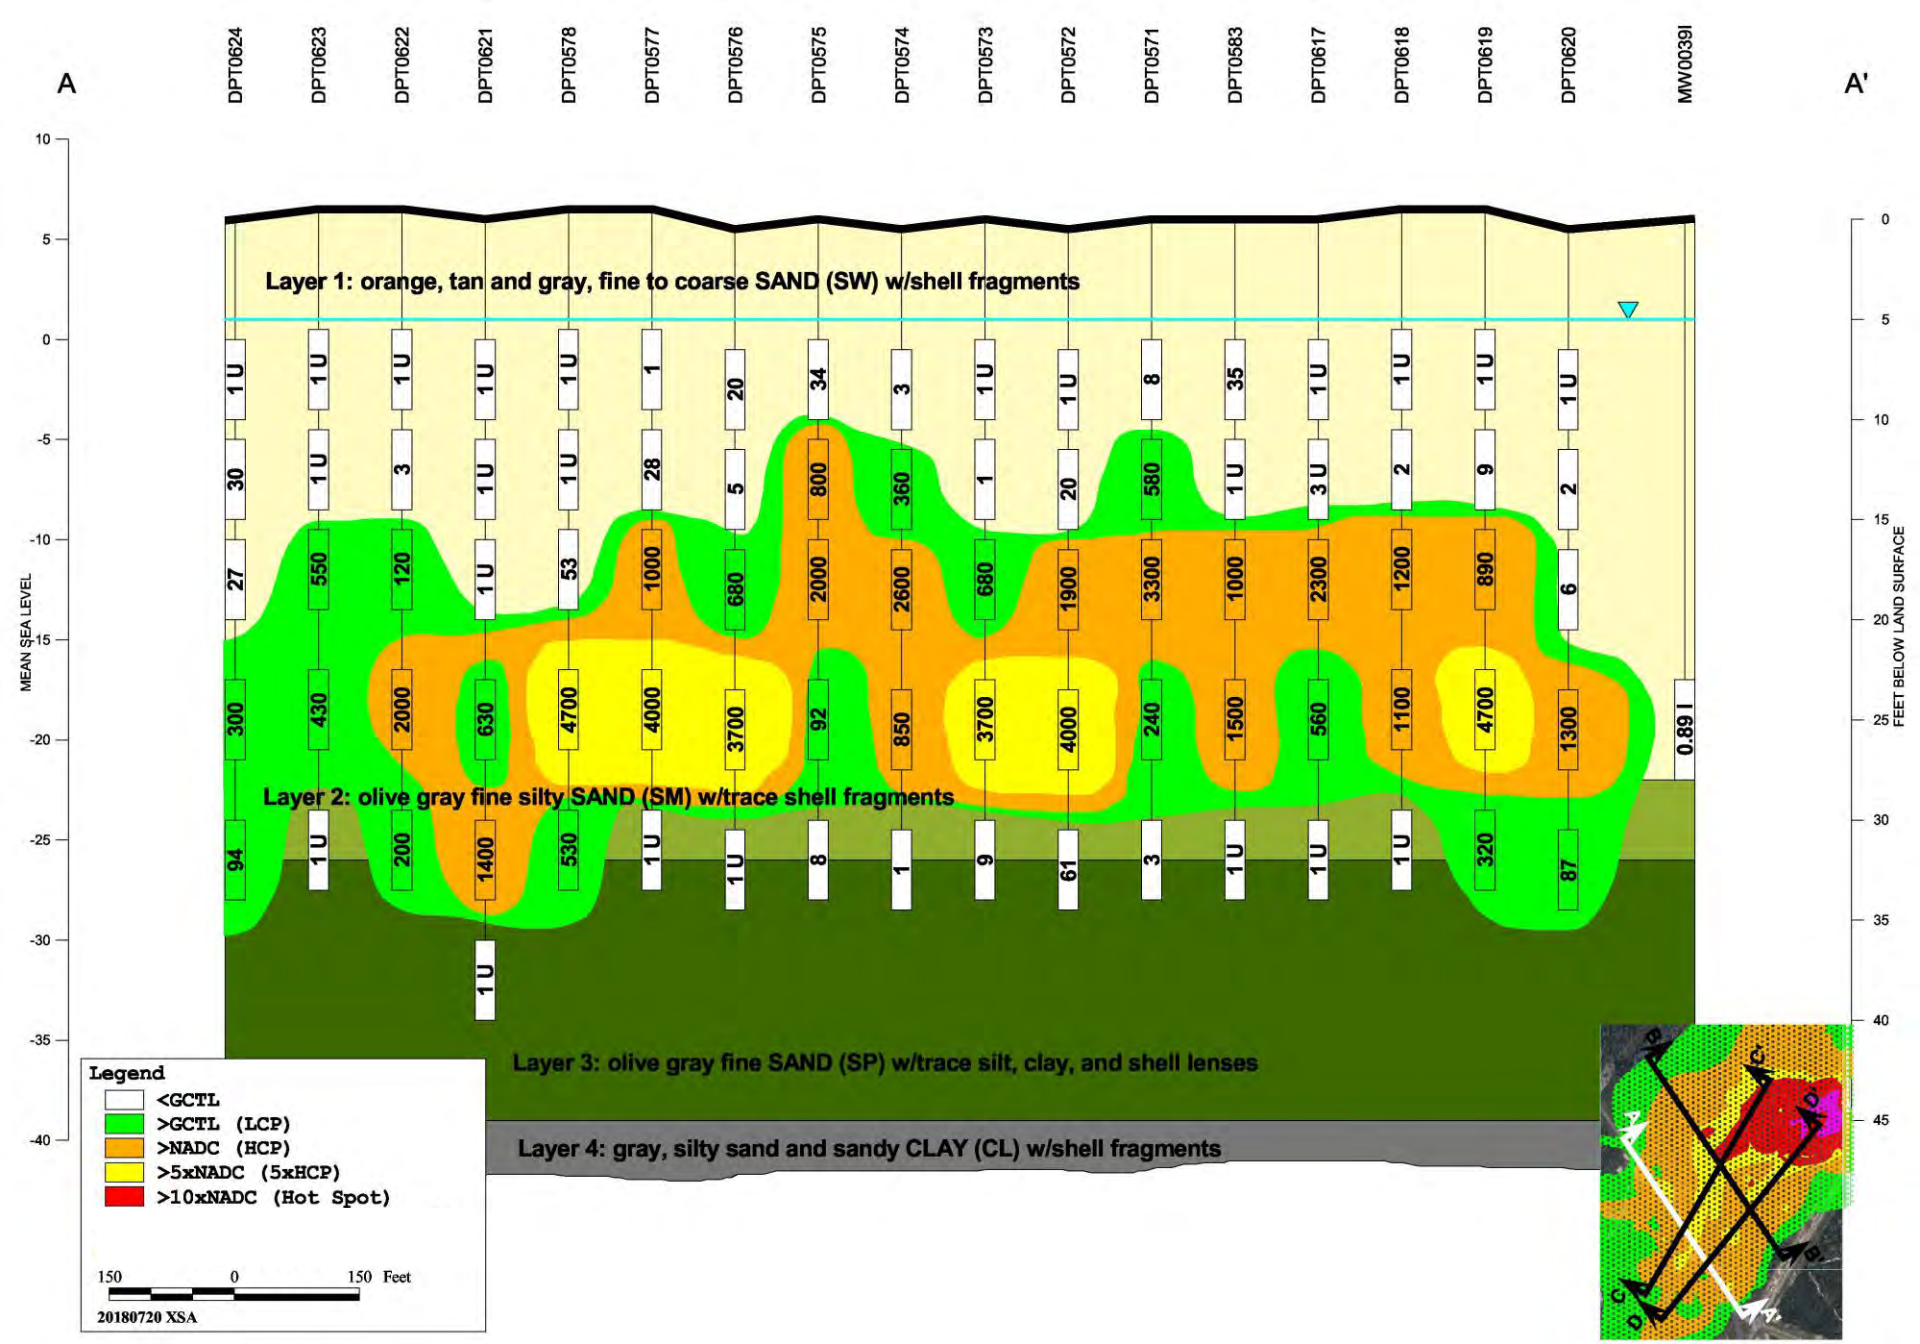
Tt response:

Tt concurs, the color coding indicates if a sample is equal to or greater than GCTL.

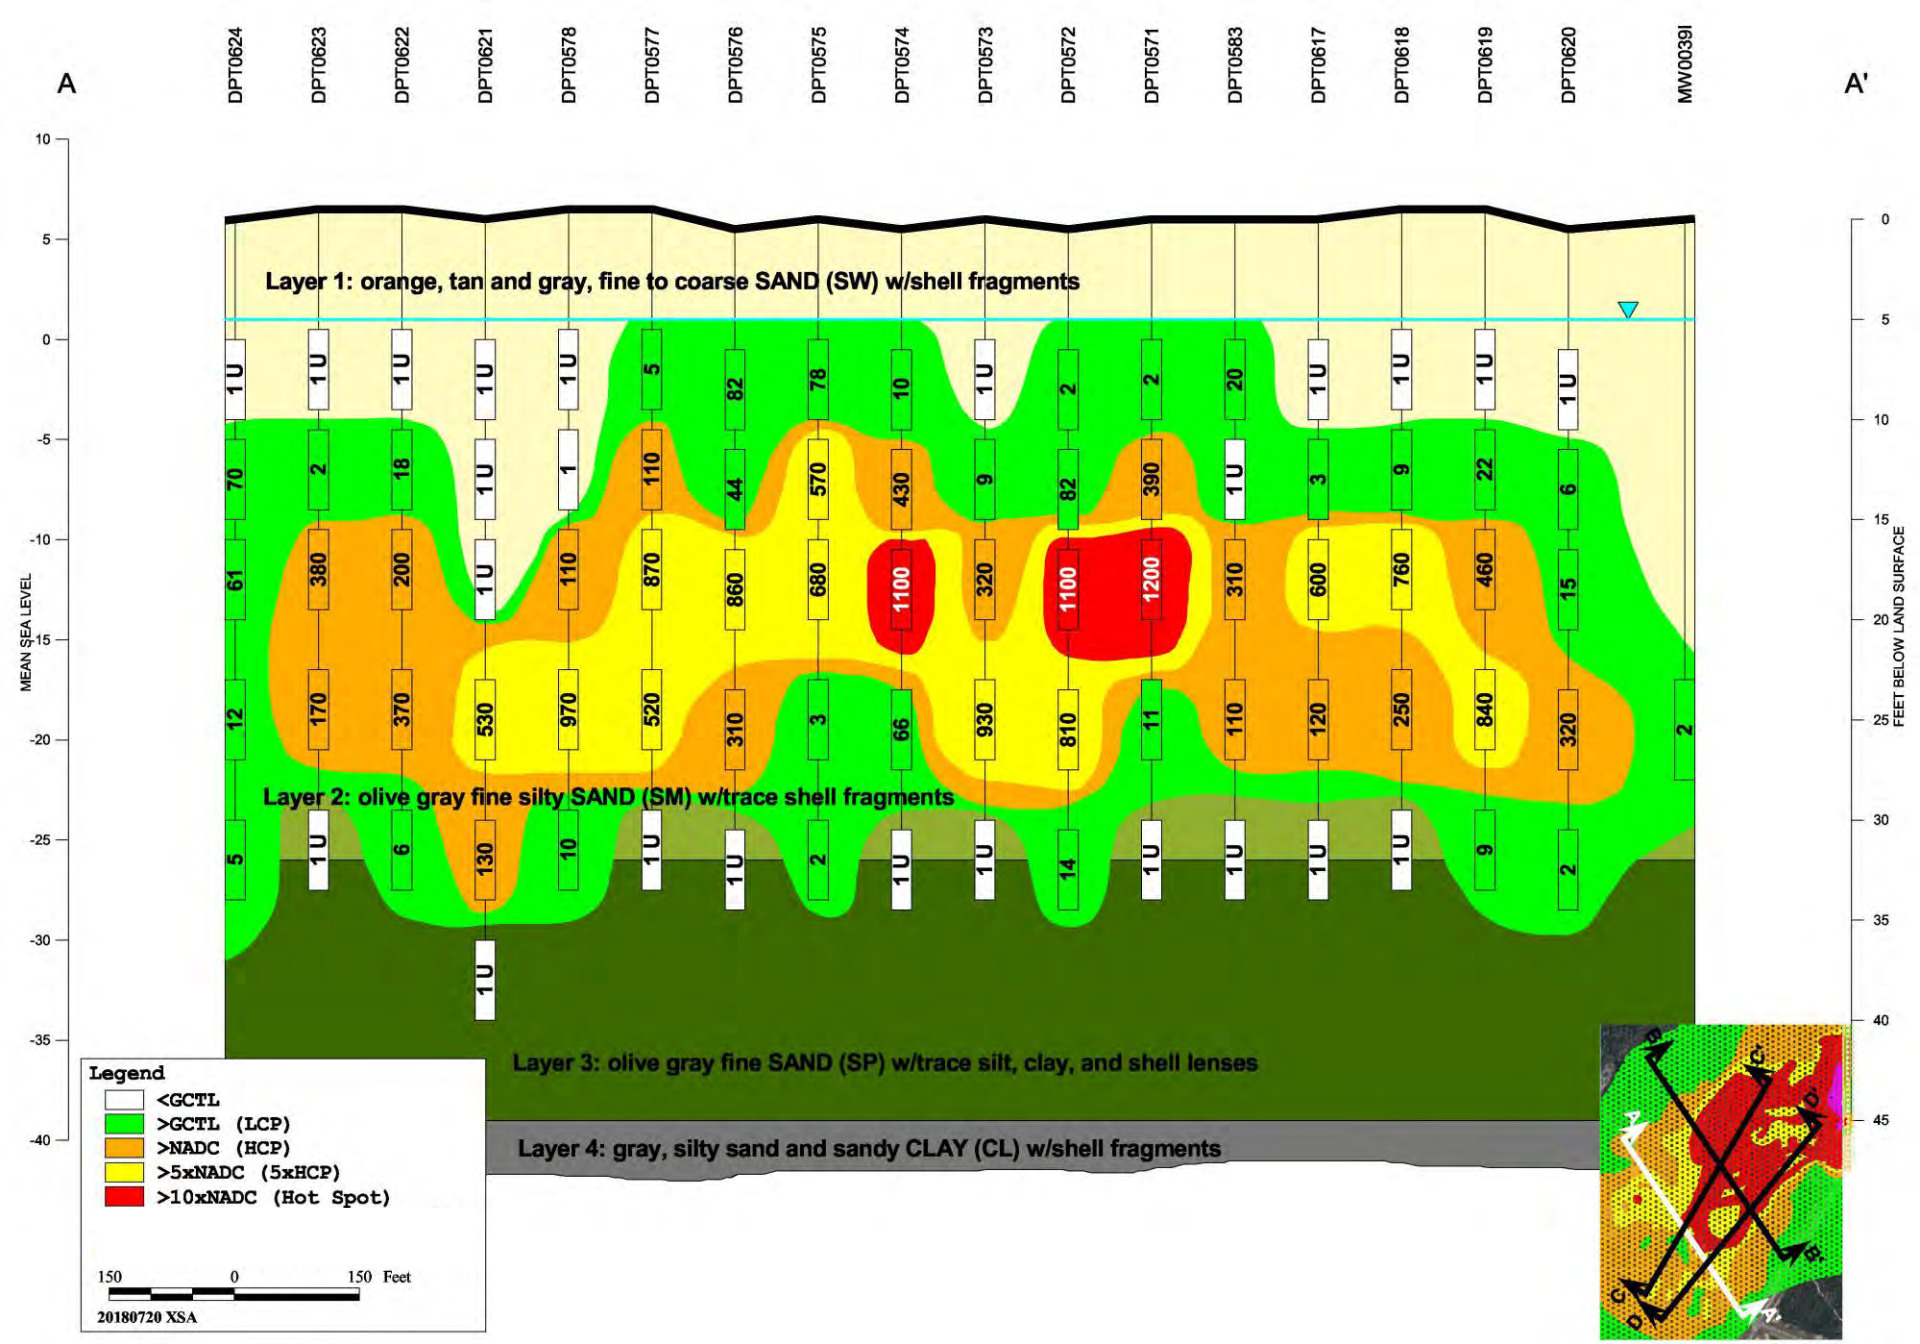


VC at DPT0712 exceeded NADC at 760 µg/L in Hot Spot 5/7 area

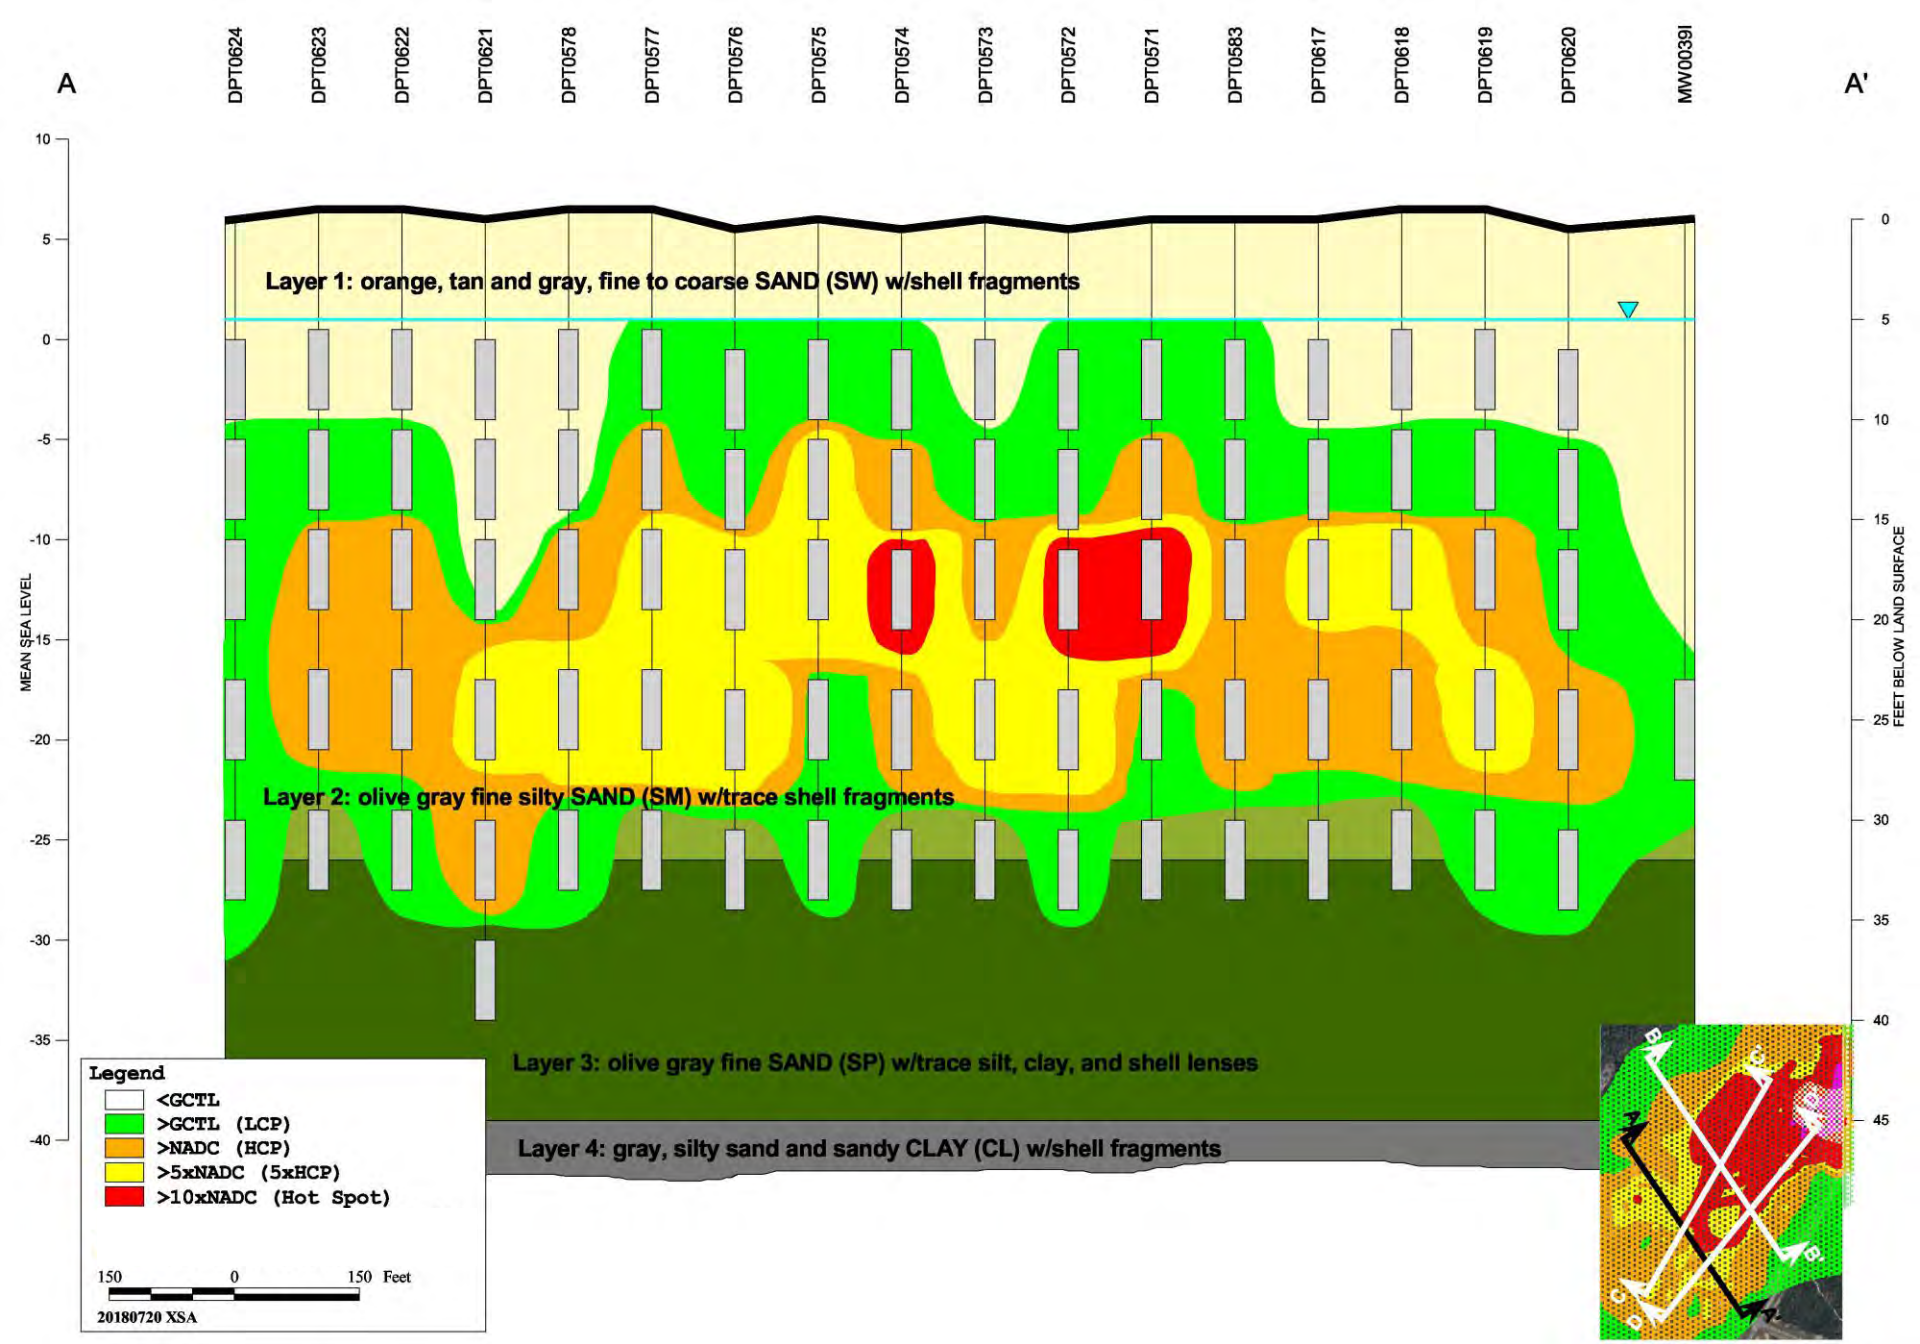
Eleven detections equal to or greater than GCTL ranging from 1.3 to 13.8 µg/L

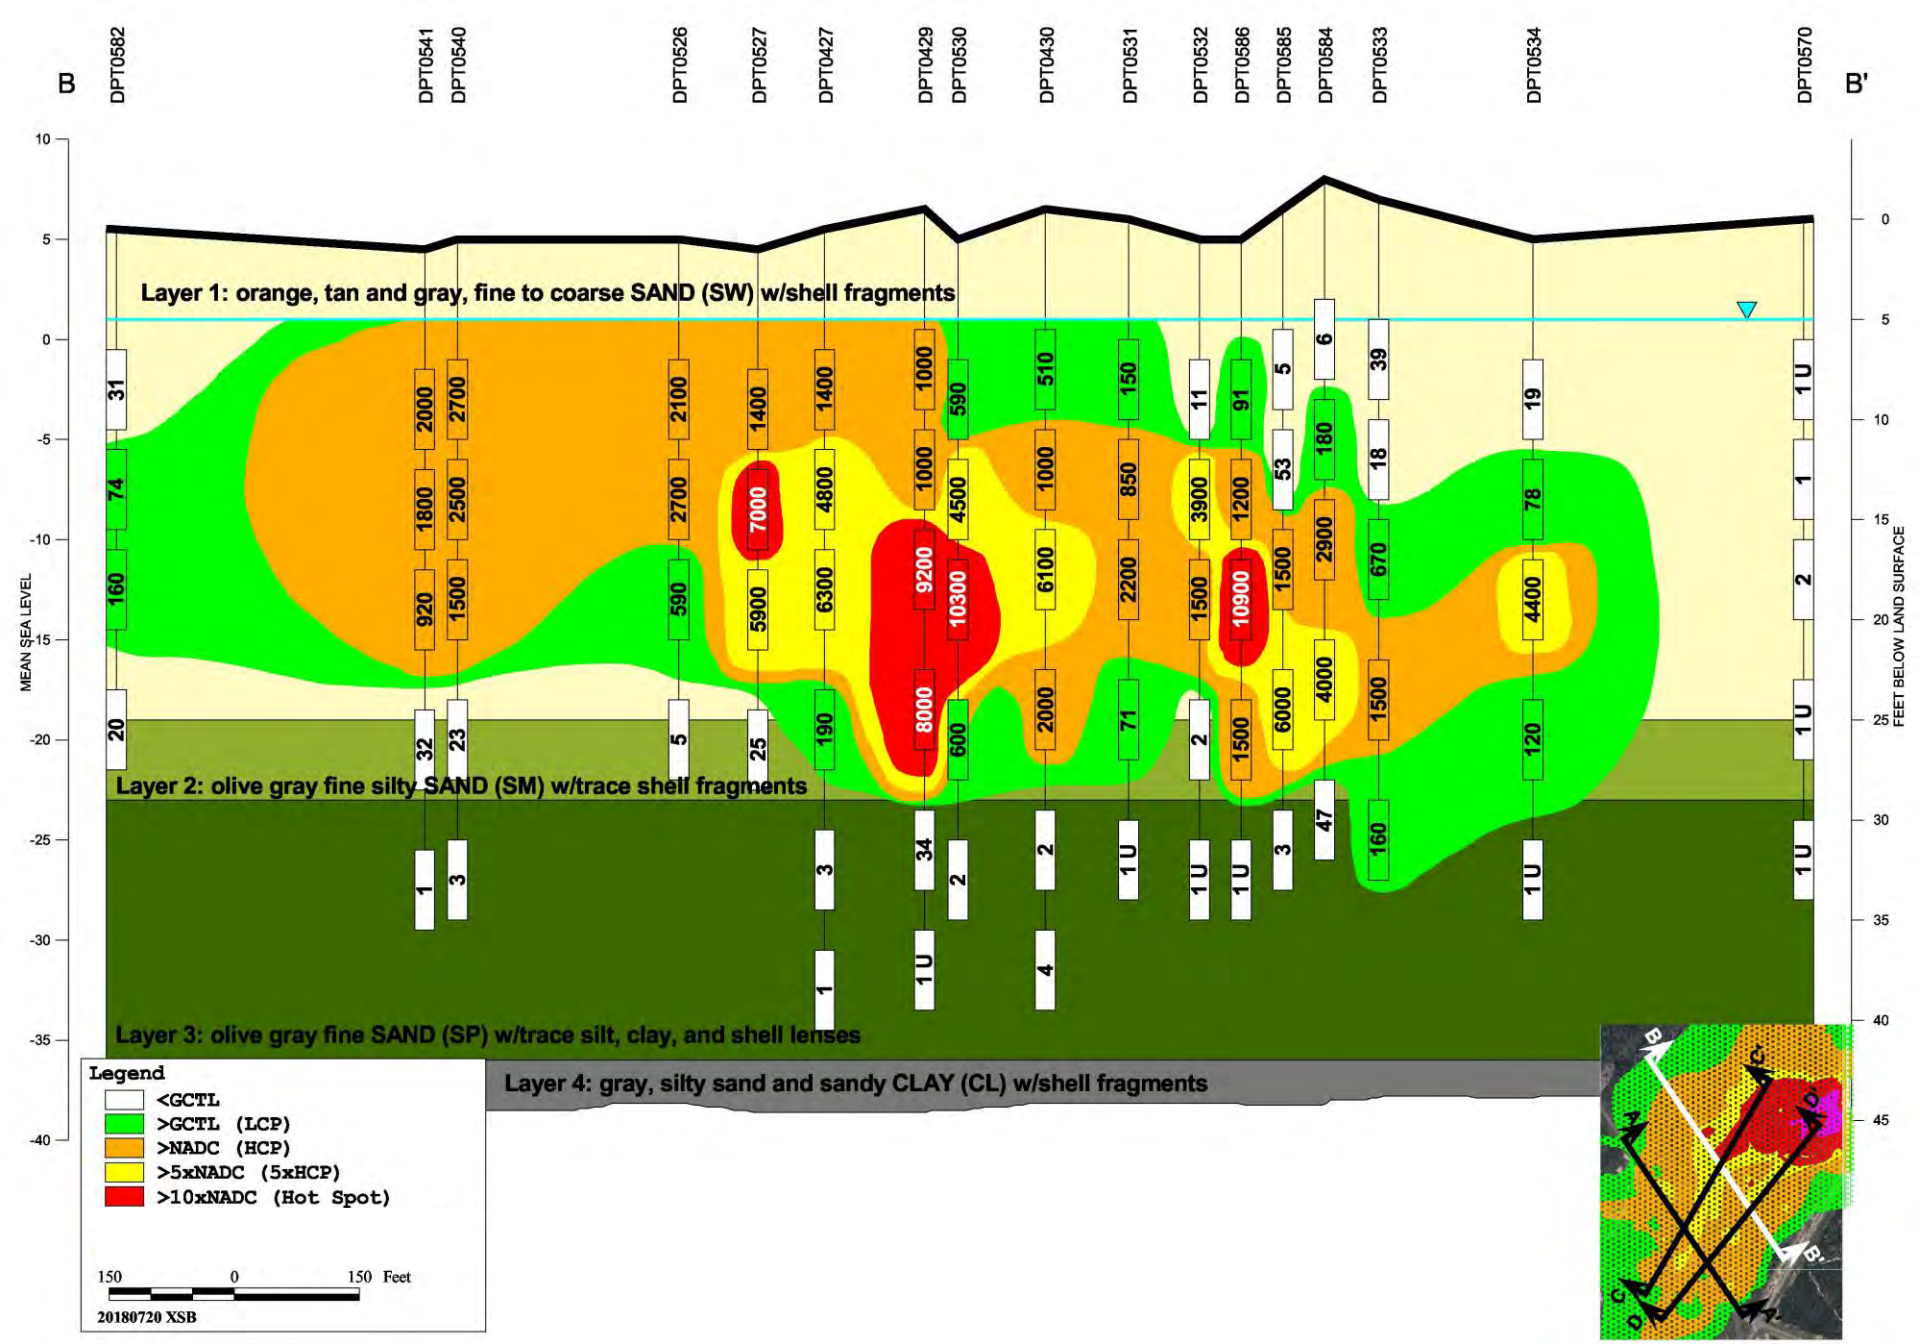


All horizontally bounded

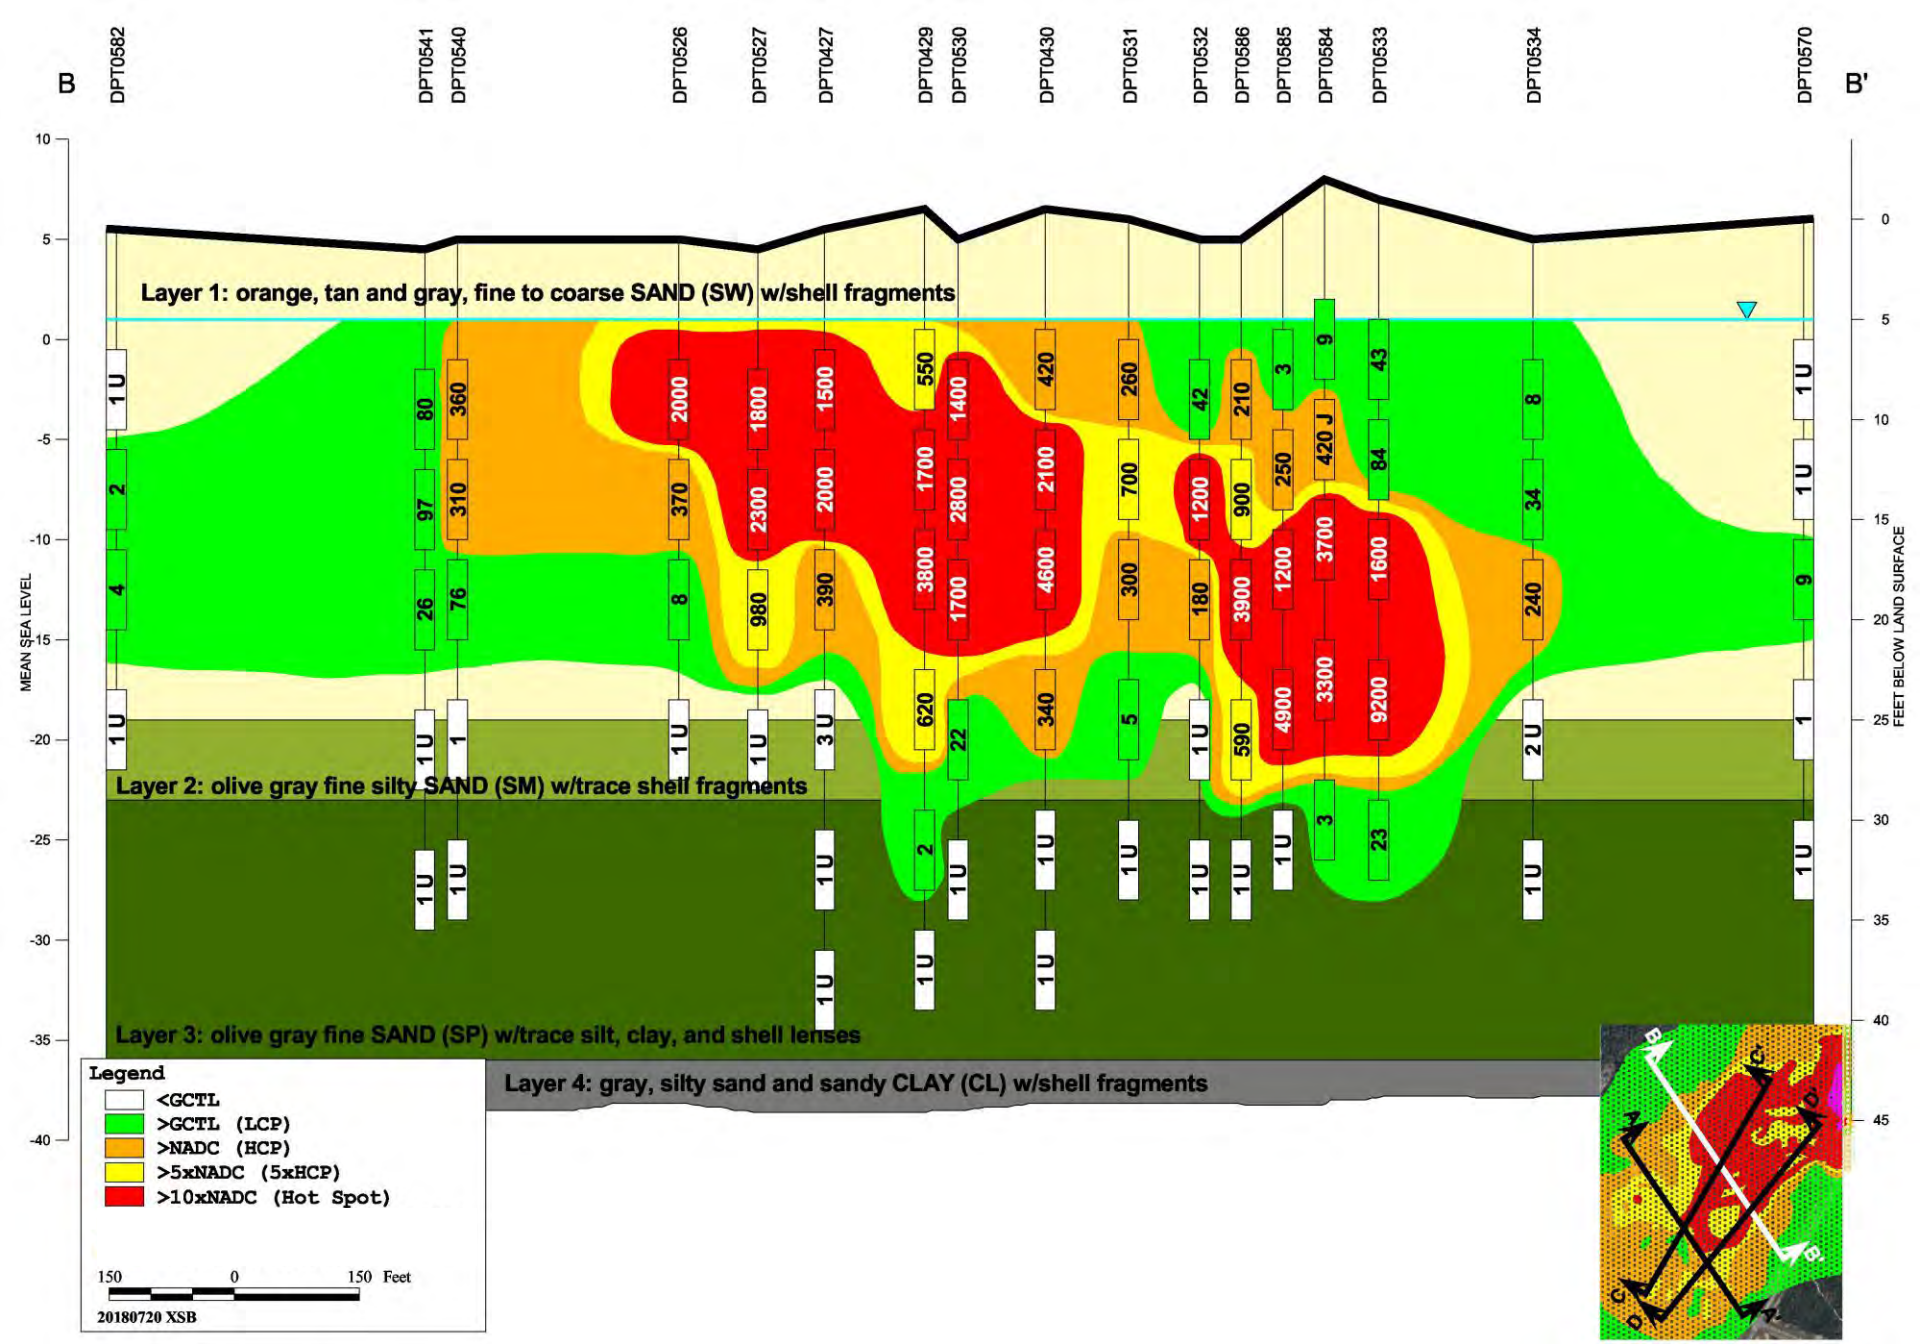


VC, Interval: 34 to 40 feet bls





Hot Spot 5 Area of Investigation plume has very little TCE and is comprised of cDCE and VC exceeding NADCs to a depth of 34 feet bls with the exception of DPT0712 760 µg/L in Hot Spot 5/7 area



Cross Sections generated for cDCE and VC to demonstrate vertical extents of Hot Spot and HCP with the exception of DPTs 281, 290, 293, and 297 shown on D-D'. Note these samples are adjacent to the Shallow Capture Zone

Hot Spot 5 boundary is west of the upgradient source and adjacent to the Shallow Capture Zone of the Hydraulic Capture IM system, to date over 65,000 pounds of VOCs have been destroyed

The investigation area for Hot Spot 5 has very little TCE and is comprised of cDCE and VC exceeding NADCs to a depth of 34 feet bls with the exception of DPT0712 760 µg/L in Hot Spot 5/7 area

Hot Spot 5 is 23.5 acres and DPT0723 VC @ 1,300 µg/L, with 1,205 and 374 pounds of cDCE and VC, respectively

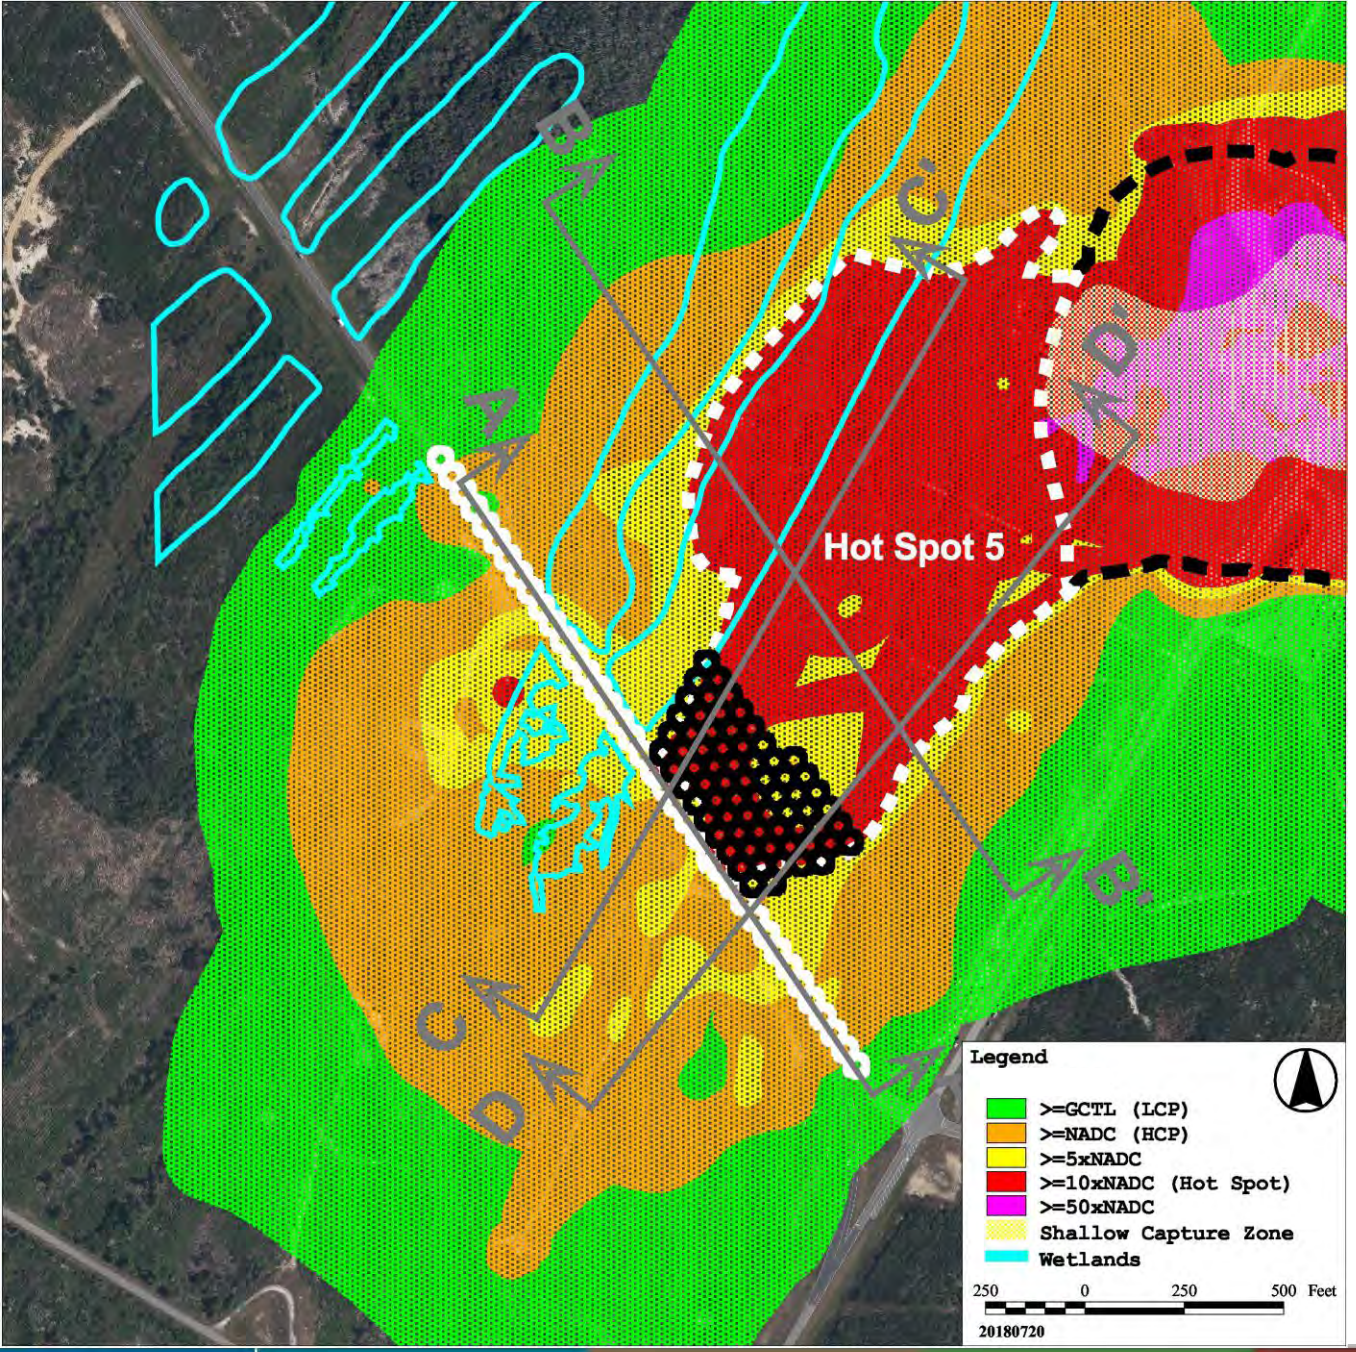
Team consensus that Hot Spot 5 is adequately horizontally and vertically delineated?

Jacobs comment #4: Please present the mass calculations so that the assumptions are understood.

Geosyntec comment #8: No mass calculations/estimates for the HS5 area and/or mass distribution were provided in the ADP

Mass of Contaminants Calculation:

To determine the mass of a contaminant in the aqueous phase, the volume of groundwater was first estimated by multiplying the area of the footprint of the plume by the thickness of the plume by the porosity. This volume was multiplied by the estimated average concentration of the contaminant to yield the mass in the aqueous phase.



To determine the mass of a contaminant in the sorbed phase, the mass of soil was first estimated by multiplying the area of the footprint of the plume by the thickness of the plume by the bulk density of the soil. The concentration of the contaminant in the sorbed phase was estimated by multiplying the average groundwater concentration by the organic carbon partition coefficient by the estimated fraction organic carbon. The mass of the soil was multiplied by the estimated average concentration in the sorbed phase to yield the mass in the sorbed phase.

Organic carbon coefficients used in mass calculation are cDCE = 45 and VC = 17 L/kg (Principles and Practices of Enhanced Anaerobic Bioremediation of Chlorinated Solvents, AFCEE, 2004)

Porosity and Bulk Density assumed to be 0.3 and 110 lb/ft^3, respectively

FOC values from LC34-SBs 1002-028.0, 1003-028.0, 1002-034.0, 1003-034.0, and 1003-034.0 collected in January 2011

	cDCE				VC				
Interval (ft bls)	Dissolved (lb)	Sorbed (lb)	Total (lb)		Dissolved (lb)	Sorbed (lb)	Total (lb)		Total (lb)
0 - 10	1.00	0.00	1.01	0%	59.89	0.09	59.98	16%	60.98

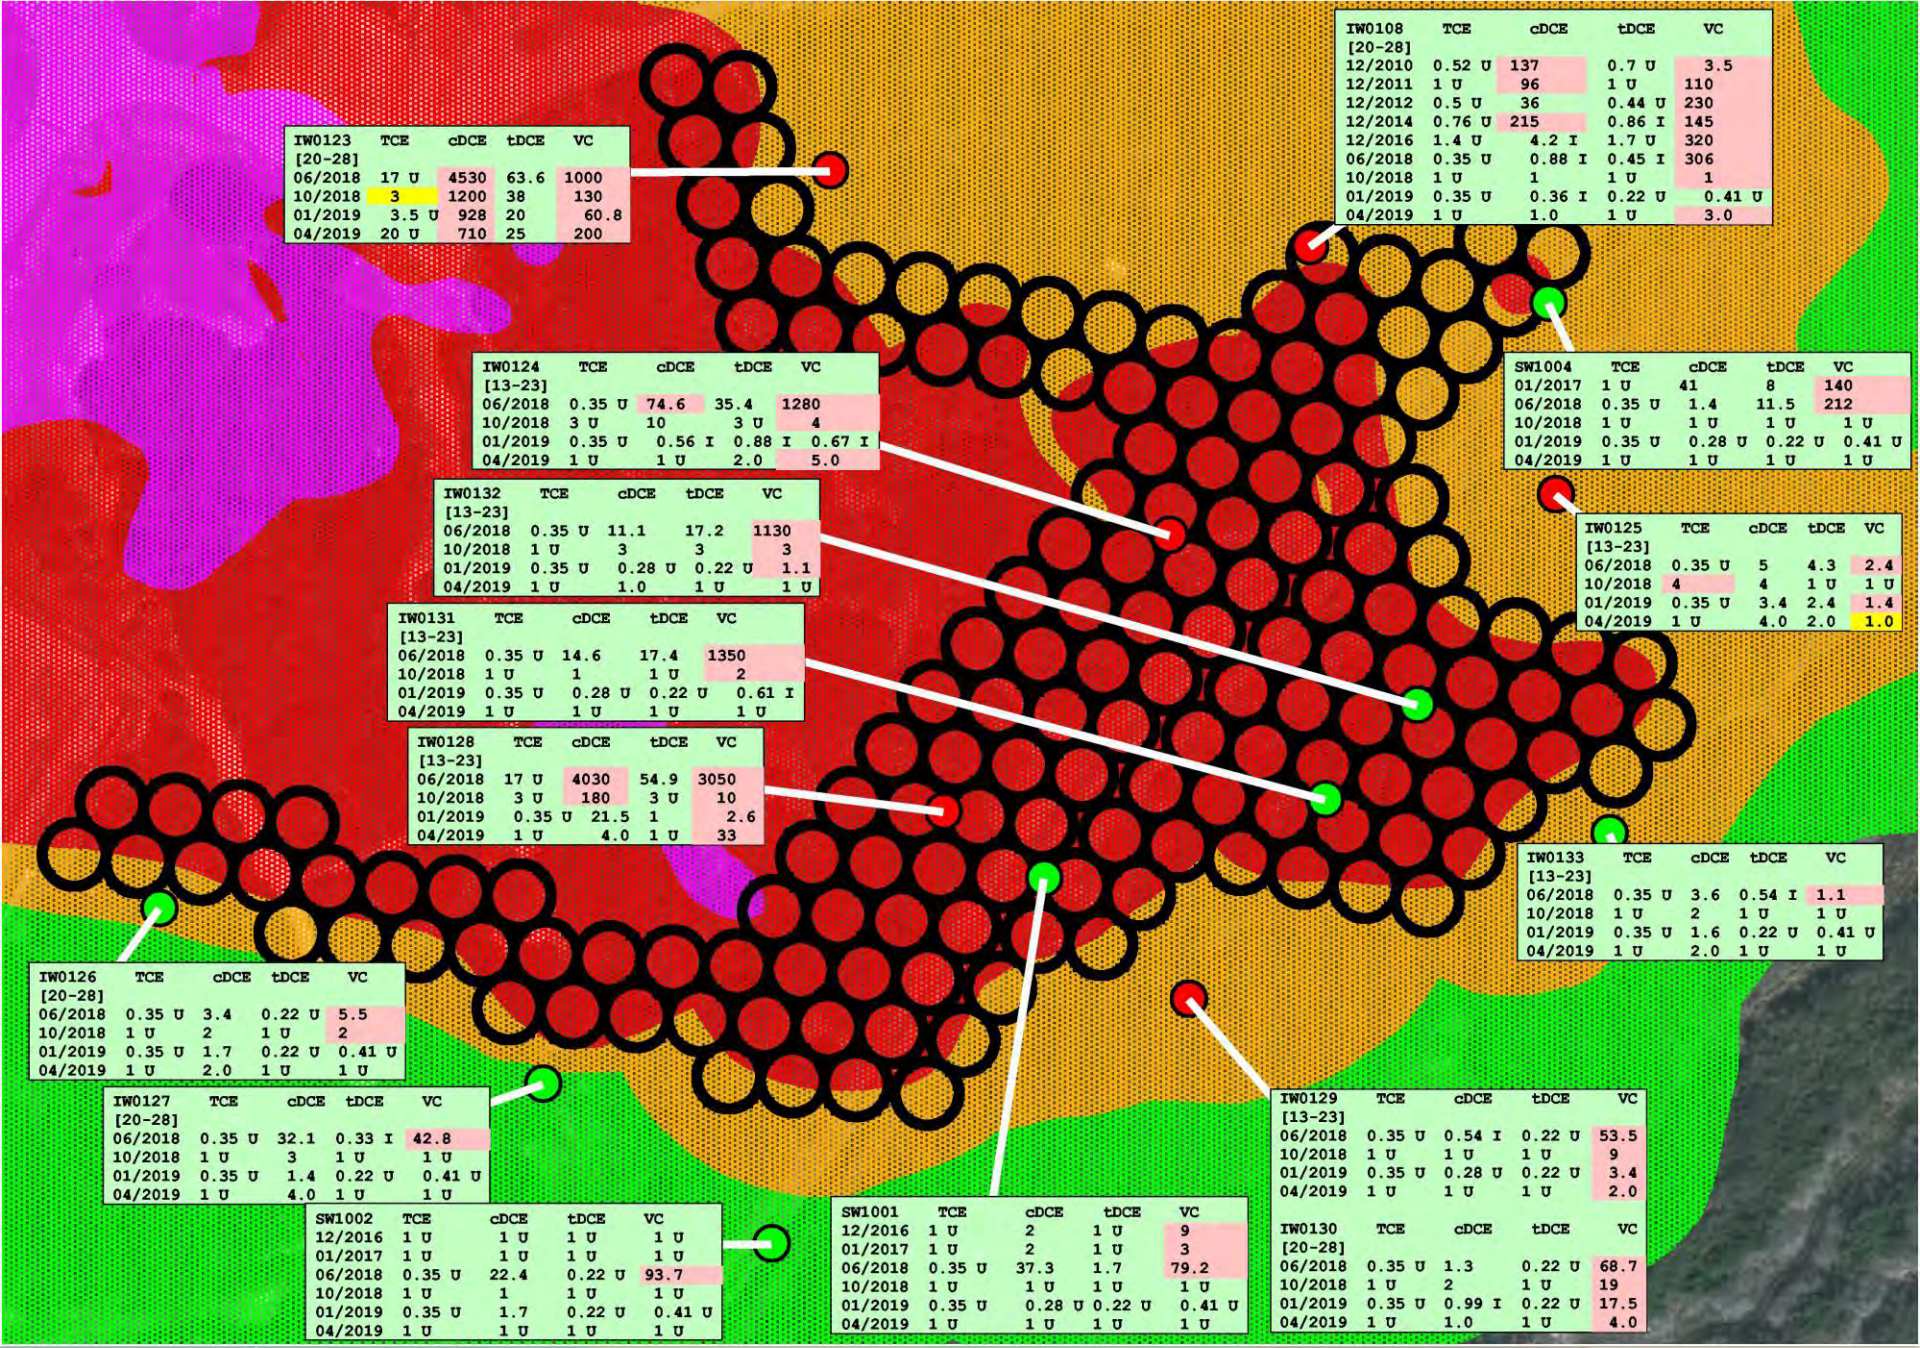
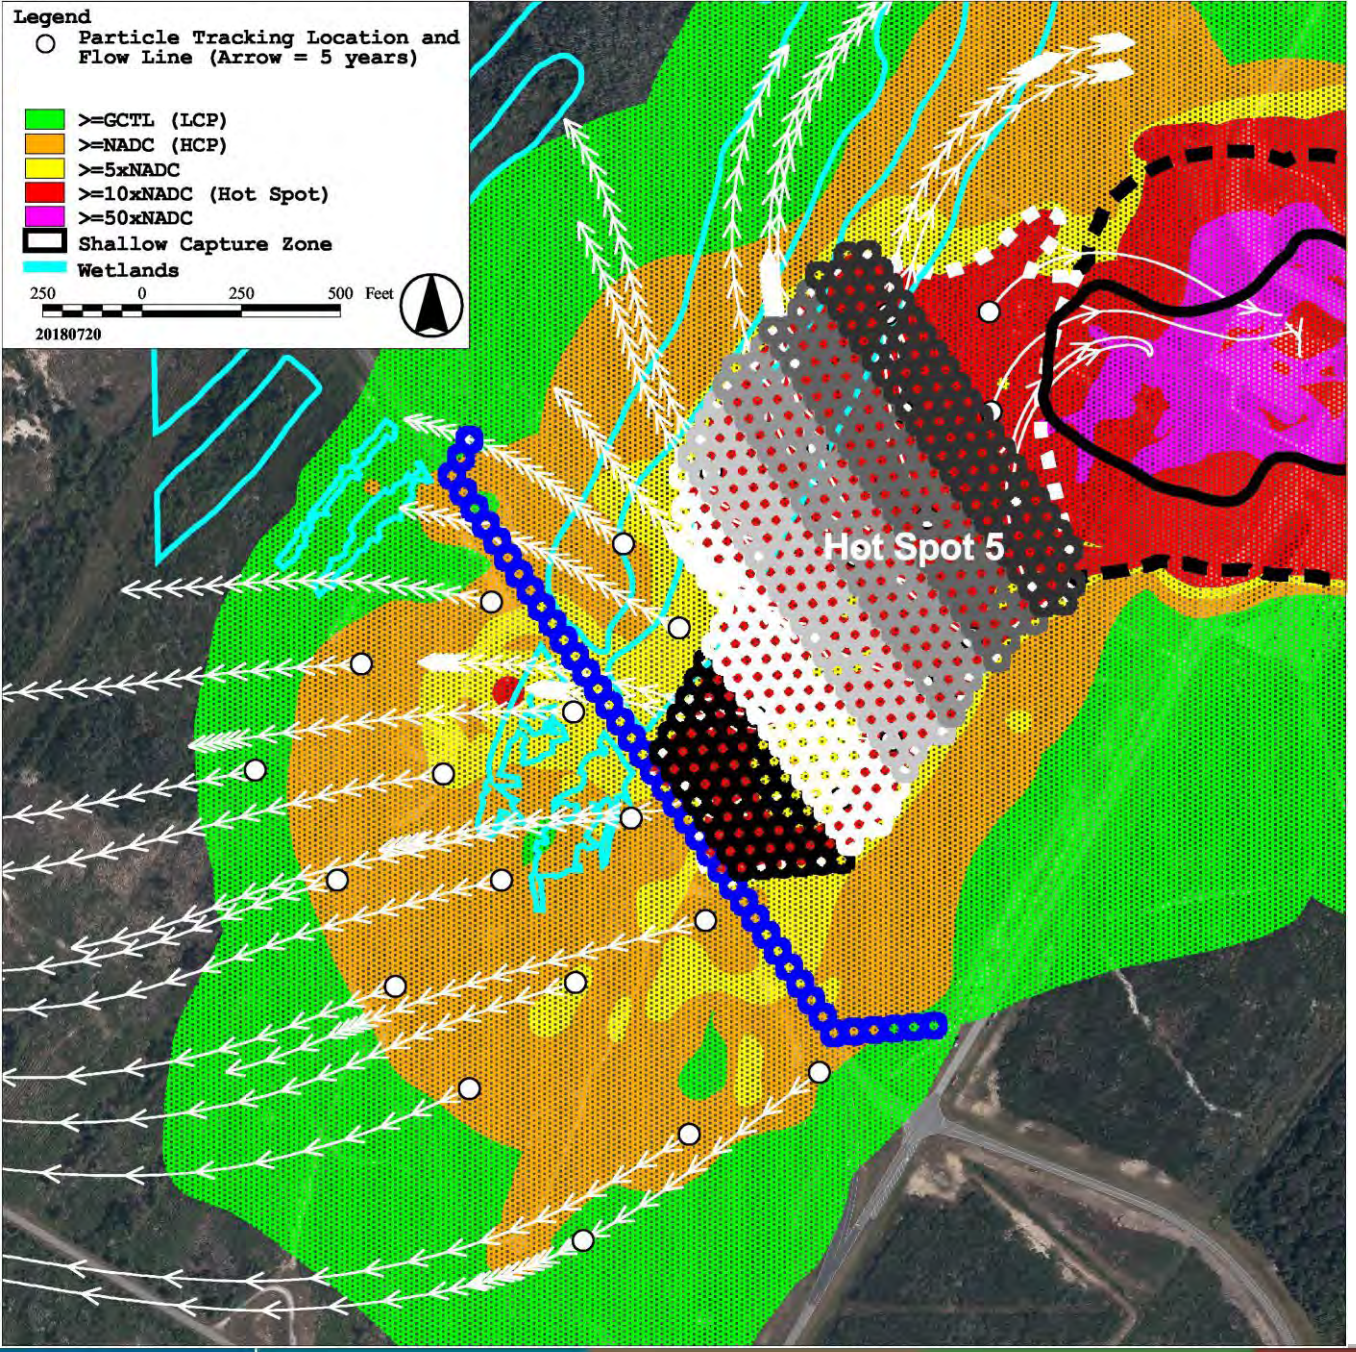
15 - 20	654.45	12.67	667.13	55%	128.22	0.94	129.16	34%	796.28
20 - 30	150.42	2.91	153.33	13%	90.81	0.66	91.47	24%	244.80
Totals:	1187.97	17.07	1205.04		372.56	1.83	374.39		1579.43

Hot Spot 5:



- upgradient source is being treated by Hydraulic Capture IM
- has very little TCE
- is cDCE and VC plume,
- above Layer 4 in sandy units



Hot Spot 5 is a prime candidate for air sparging based on success of LC34 HS6, 516S, CCB, FDSA IMs

~~Propose HS5 IM would be an expansion to the HS6 IM, compressor trailer at HS6 would provide compressed air to the HS5 ASWs:~~

- ~~38 ASWs HCP Barrier to prevent additional contaminant migration beyond Phillips Parkway~~
- ~~70 ASWs as initial phase of Hot Spot remediation~~

~~Team consensus to implement HS5 air sparging expansion as described?~~

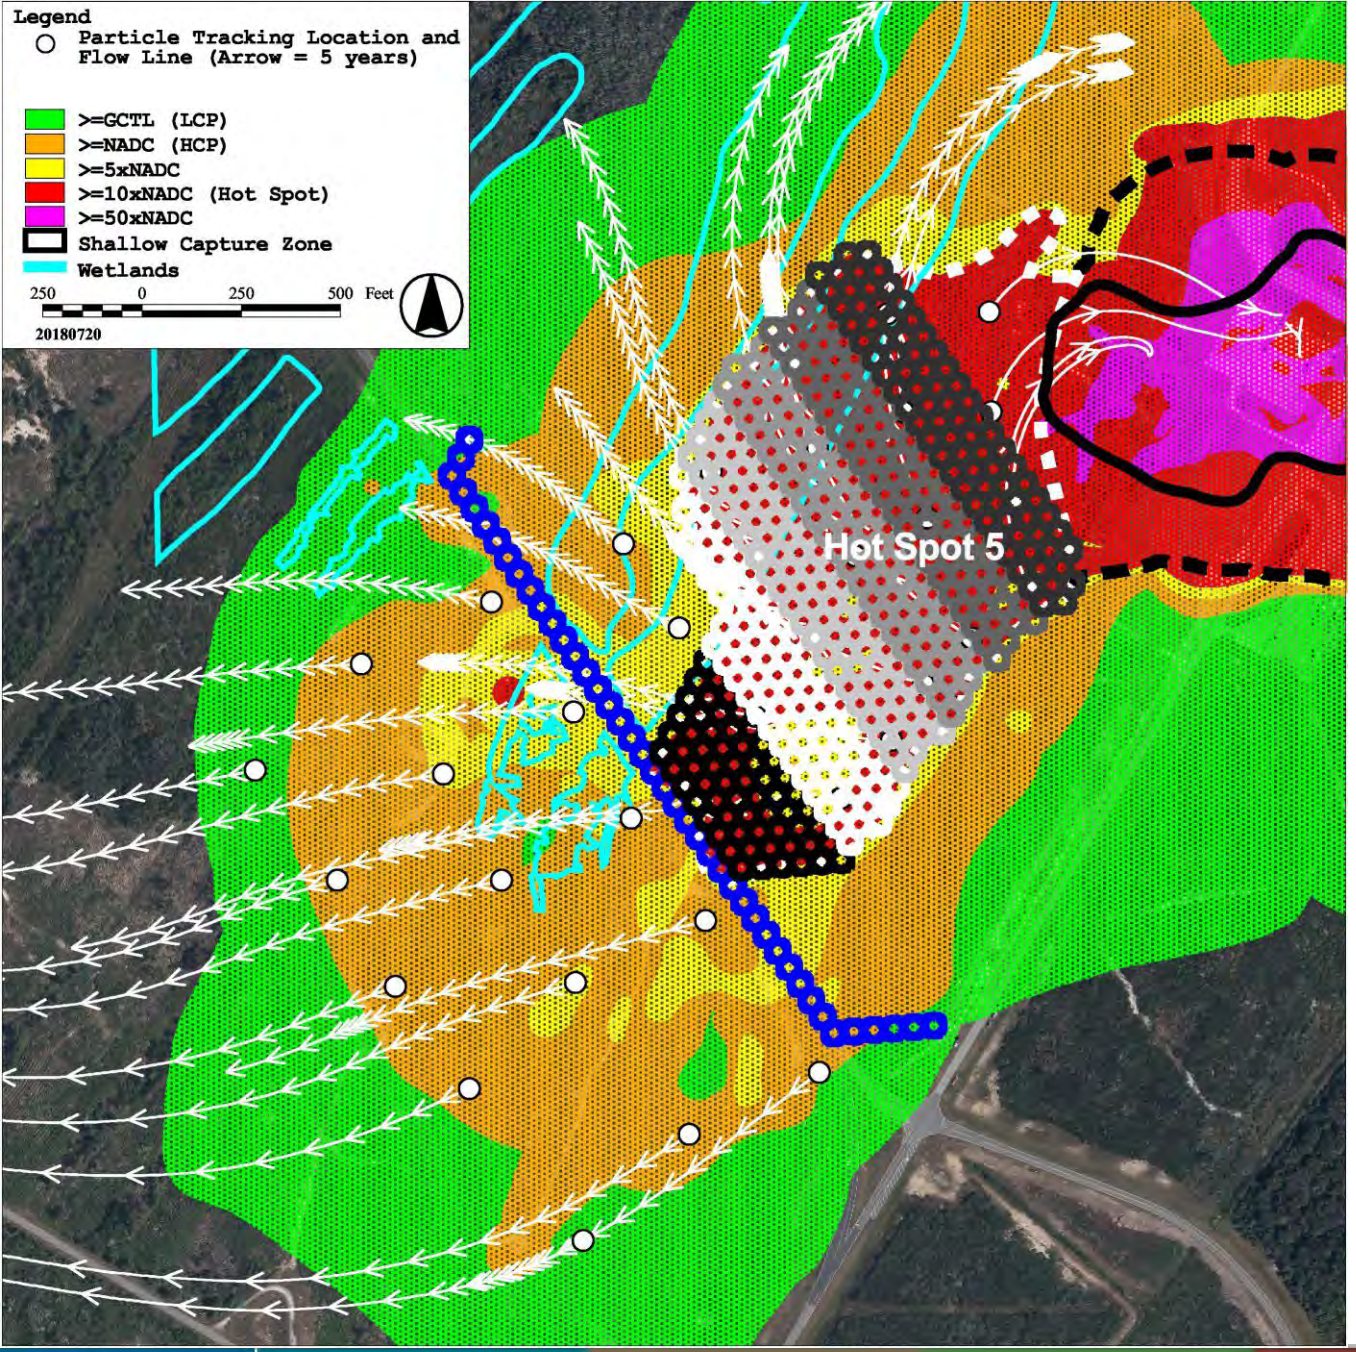
Jacobs Comment #5:

It is not clear from the information presented in the ADP that the southwesterly side of the LC 34 VOC plume is expanding at this time. The data over time for most monitoring wells in the southwest plume are stable or fluctuating for the most part. Consider evaluating whether expansion is occurring and at what rate, because that may affect the design and operating parameters of a treatment system. For the conceptual air sparge well layout presented, the westward groundwater flow direction in Layers 1 and 2 may warrant lengthening the sparge well line in that direction.

Tt response:

Based on the particle tracking, groundwater flow south of Phillips Parkway appears to be very slow suggesting any expansion occurring would be limited. The site-wide LTM trend analysis in this area indicated increasing trends in two of 16 monitoring wells (IW0064I and IW0096) while the remaining monitoring wells had stable trends. NASA's intent for the sparging wall is to control the plume at the edge of the permit boundary area, for the permit the Air Force has issued NASA, which is Phillips Parkway and allow the remaining portion of the plume beyond Phillips Parkway to naturally attenuate. Design details will be provided in the Hot Spot 6 Expansion Implementation Work Plan, consideration for westerly expansion will be considered.

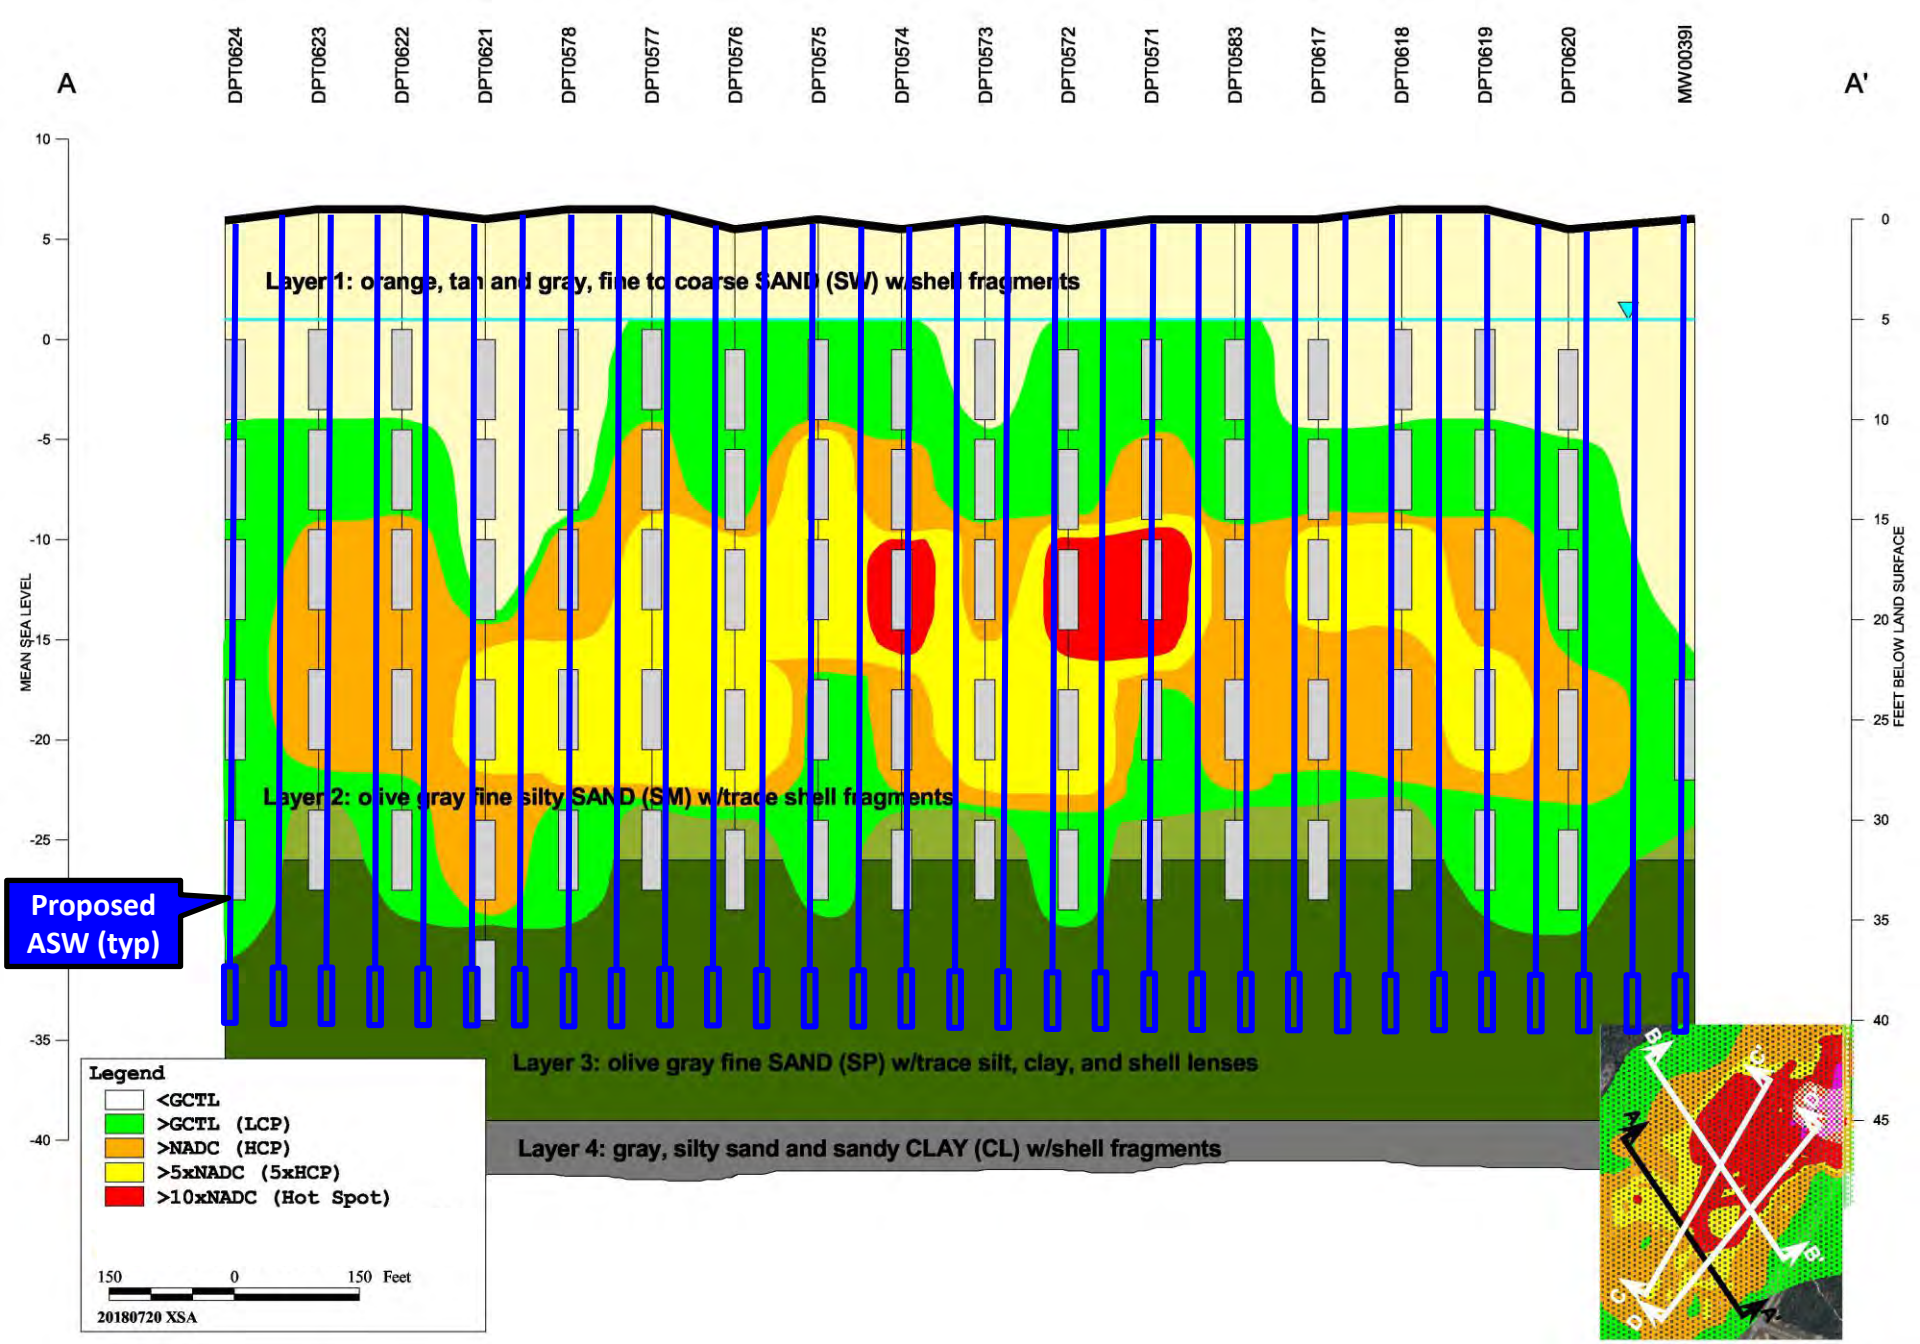


Geosyntec Comment #9:

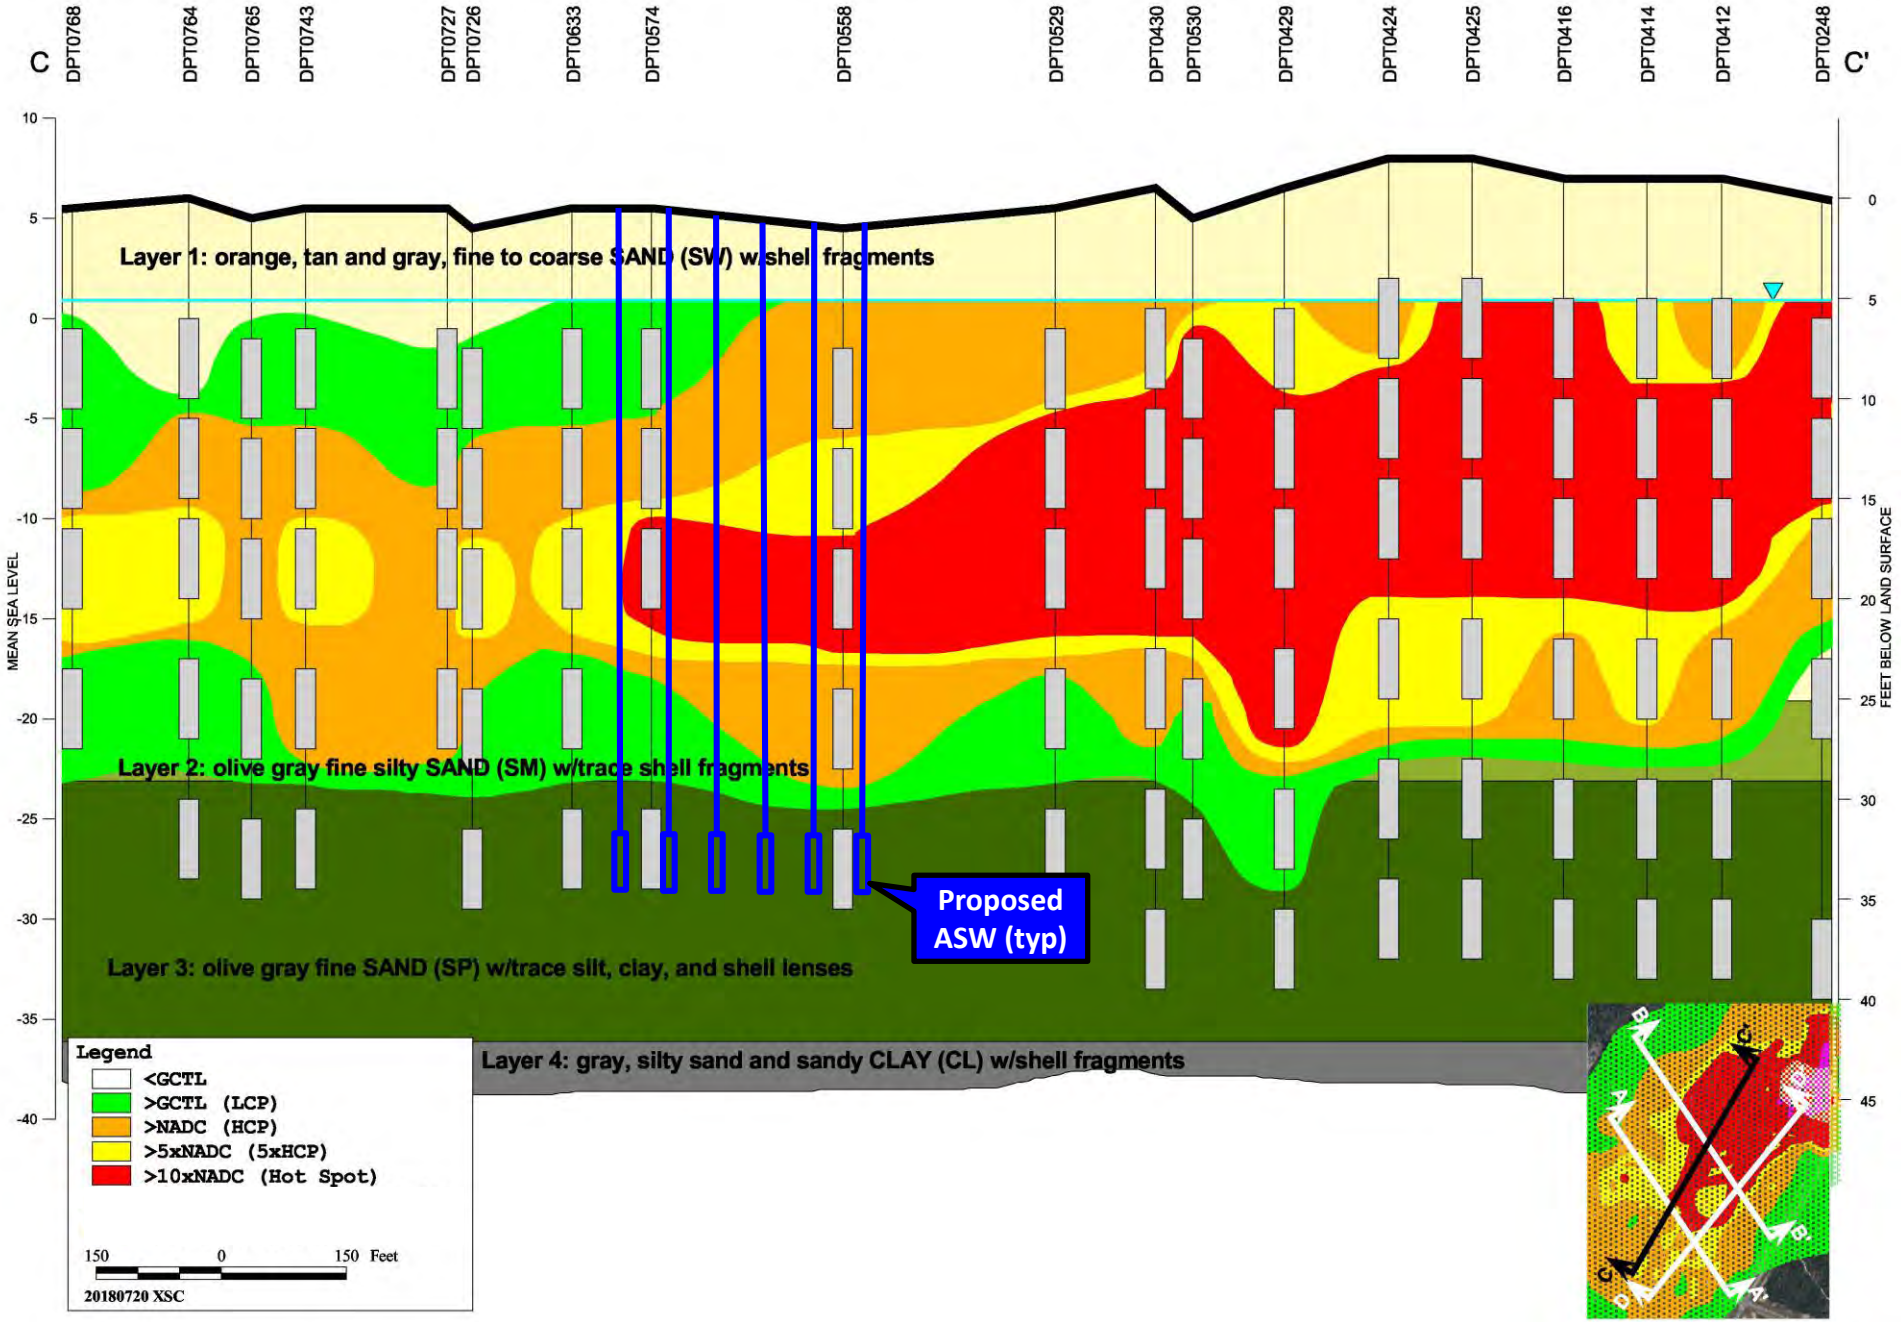
Air sparging is appropriate if the plume is expanding and dissolved flux is continuing to contribute to the plume south of Phillips Parkway. If the plume is not expanding and the groundwater flow velocity is low, the positive effect of sparging may not be measured south/west of Phillips Parkway. In this instance, sparging will not serve a purpose (other than treating an area of groundwater represented by the ROI of the curtain) and may be better deployed elsewhere (see Slide 4 comment). It may be beneficial to make this determination before designing and implementing an air sparge curtain as opposed to focusing on maximizing HS5 area mass removal. It is recommended that in the IM design that the two ends of the curtain include sparge wells extending perpendicular from the curtain to mitigate plume expansion based upon groundwater mounding. In consideration of the very large number of AS wells that will likely ultimately be installed at LC34, a detailed evaluation of existing sparge well performance at similar depths to those anticipated is recommended to obtain site-specific ROI information (an increase in ROI of as few as 5 ft at the time of design may result in a significant reduction in sparge wells needed – particularly if the apparent trend of treating HS area by area using sparging continues). The purpose of the 70 ASWs is not clear and how they work in combination with the proposed curtain. If the 70 ASWs rapidly clean up this area will the barrier wall operation be terminated? If the 70 ASWs meet some established remedial objective, how soon will upgradient areas have to be treated to prevent recontamination of the area of the 70 ASWs. Was placement of the 70 ASWs to coincide with the highest mass within the core of the HS5 plume considered in lieu of the toe of the 10XNADC area to maximize mass reduction?

Tt response:

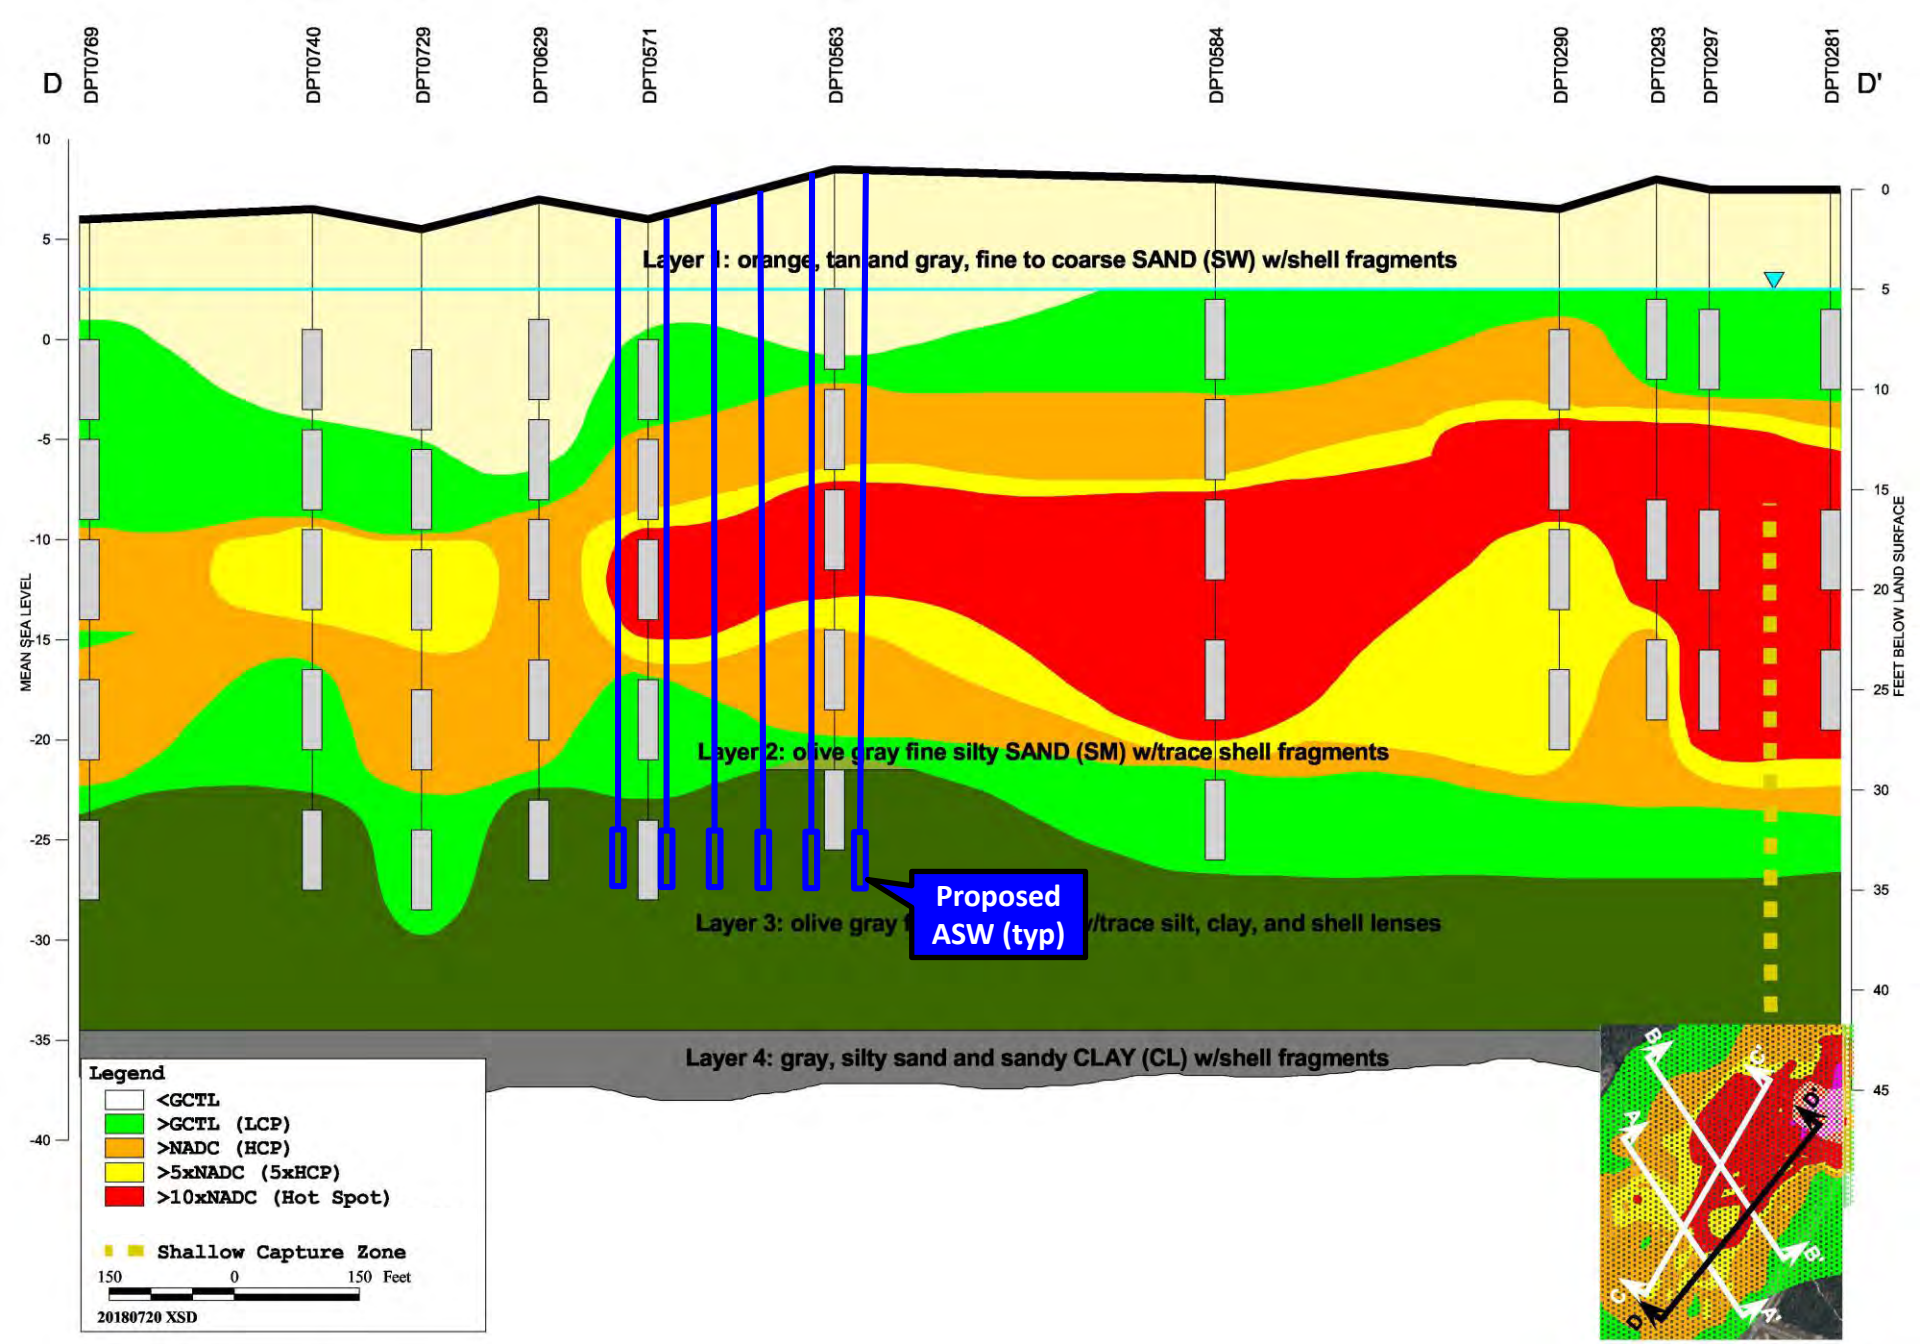
Based on the particle tracking, groundwater flow south of Phillips Parkway appears to be very slow suggesting any expansion occurring would be limited. The site-wide LTM trend analysis in this area indicated increasing trends in two of 16 monitoring wells (IW0064I and IW0096) while the remaining monitoring wells had stable trends. NASA's intent for the sparging wall is to control the plume at the edge of the permit boundary area, for the permit the Air Force has issued NASA, which is Phillips Parkway and allow the remaining portion of the plume beyond Phillips Parkway to naturally attenuate. The perpendicular extensions recommendation will be considered as well as the cycling discussed in Slide 4 comment response. The 70 ASWs proposed in the presentation are the initial phase to reduce the contamination in the toe of the Hot Spot (10xNADC). A phased approach is proposed for treatment of Hot Spot 5, the 70 ASWs is proposed in this presentation will be the first phase with additional expansions moving upgradient within the Hot Spot. For HS6 (where there is an existing air sparge system at the site), Tt increased the ASW spacing from 35 feet with overlap (which was completed with previous IMs at KSC) to 50 feet with no overlap. Based on performance monitoring data, this spacing has worked very well at HS6. The contaminated zone at HS5 is shallower and also has similar lithology to HS6; therefore the 50-foot spacing with no overlap is recommended for HS5.



IM Objective:



- To remediate contaminated groundwater within treatment zone to support transition to MNA and prevent additional contaminant migration beyond Phillips Parkway



Proposed expansions to the HS6 IM to include HS5:

- 42 ASWs HCP Barrier to prevent additional contaminant migration beyond Phillips Parkway
- 63 ASWs as initial phase of Hot Spot remediation
- Additional potential phases shown in group moving upgradient within the Hot Spot

Team consensus to implement the HCP Barrier and initial phase of ASWs Hot Spot remediation?

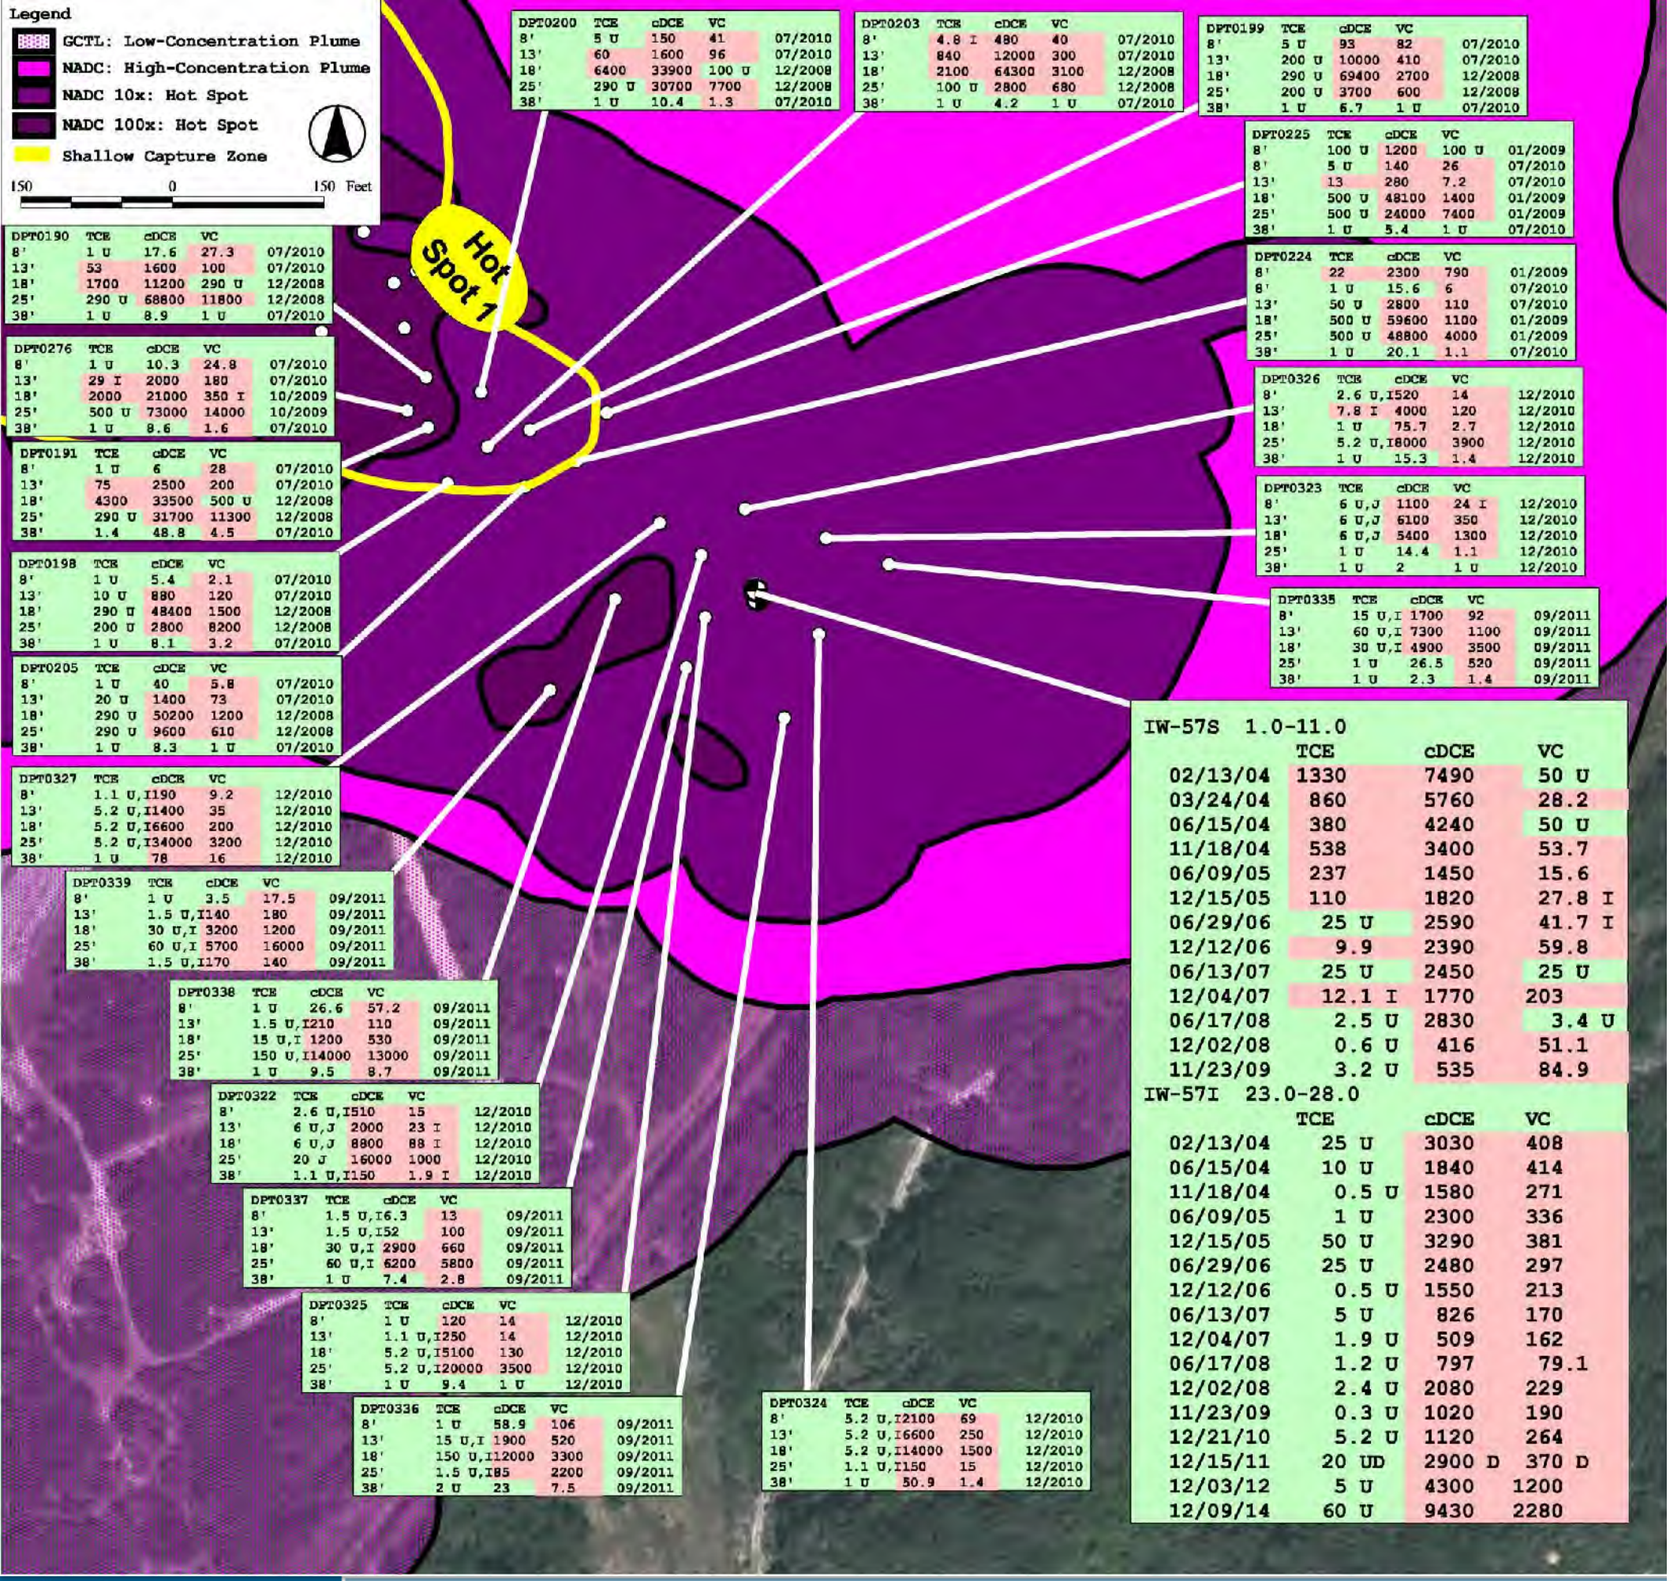
ADVANCED DATA PACKAGE

C.8 Hot Spot 6 Area of Investigation Site Characterization ADP



Launch Complex 34 (LC34), SWMU CC054
Hot Spot 6 Area of Investigation Site Characterization ADP
December 2016

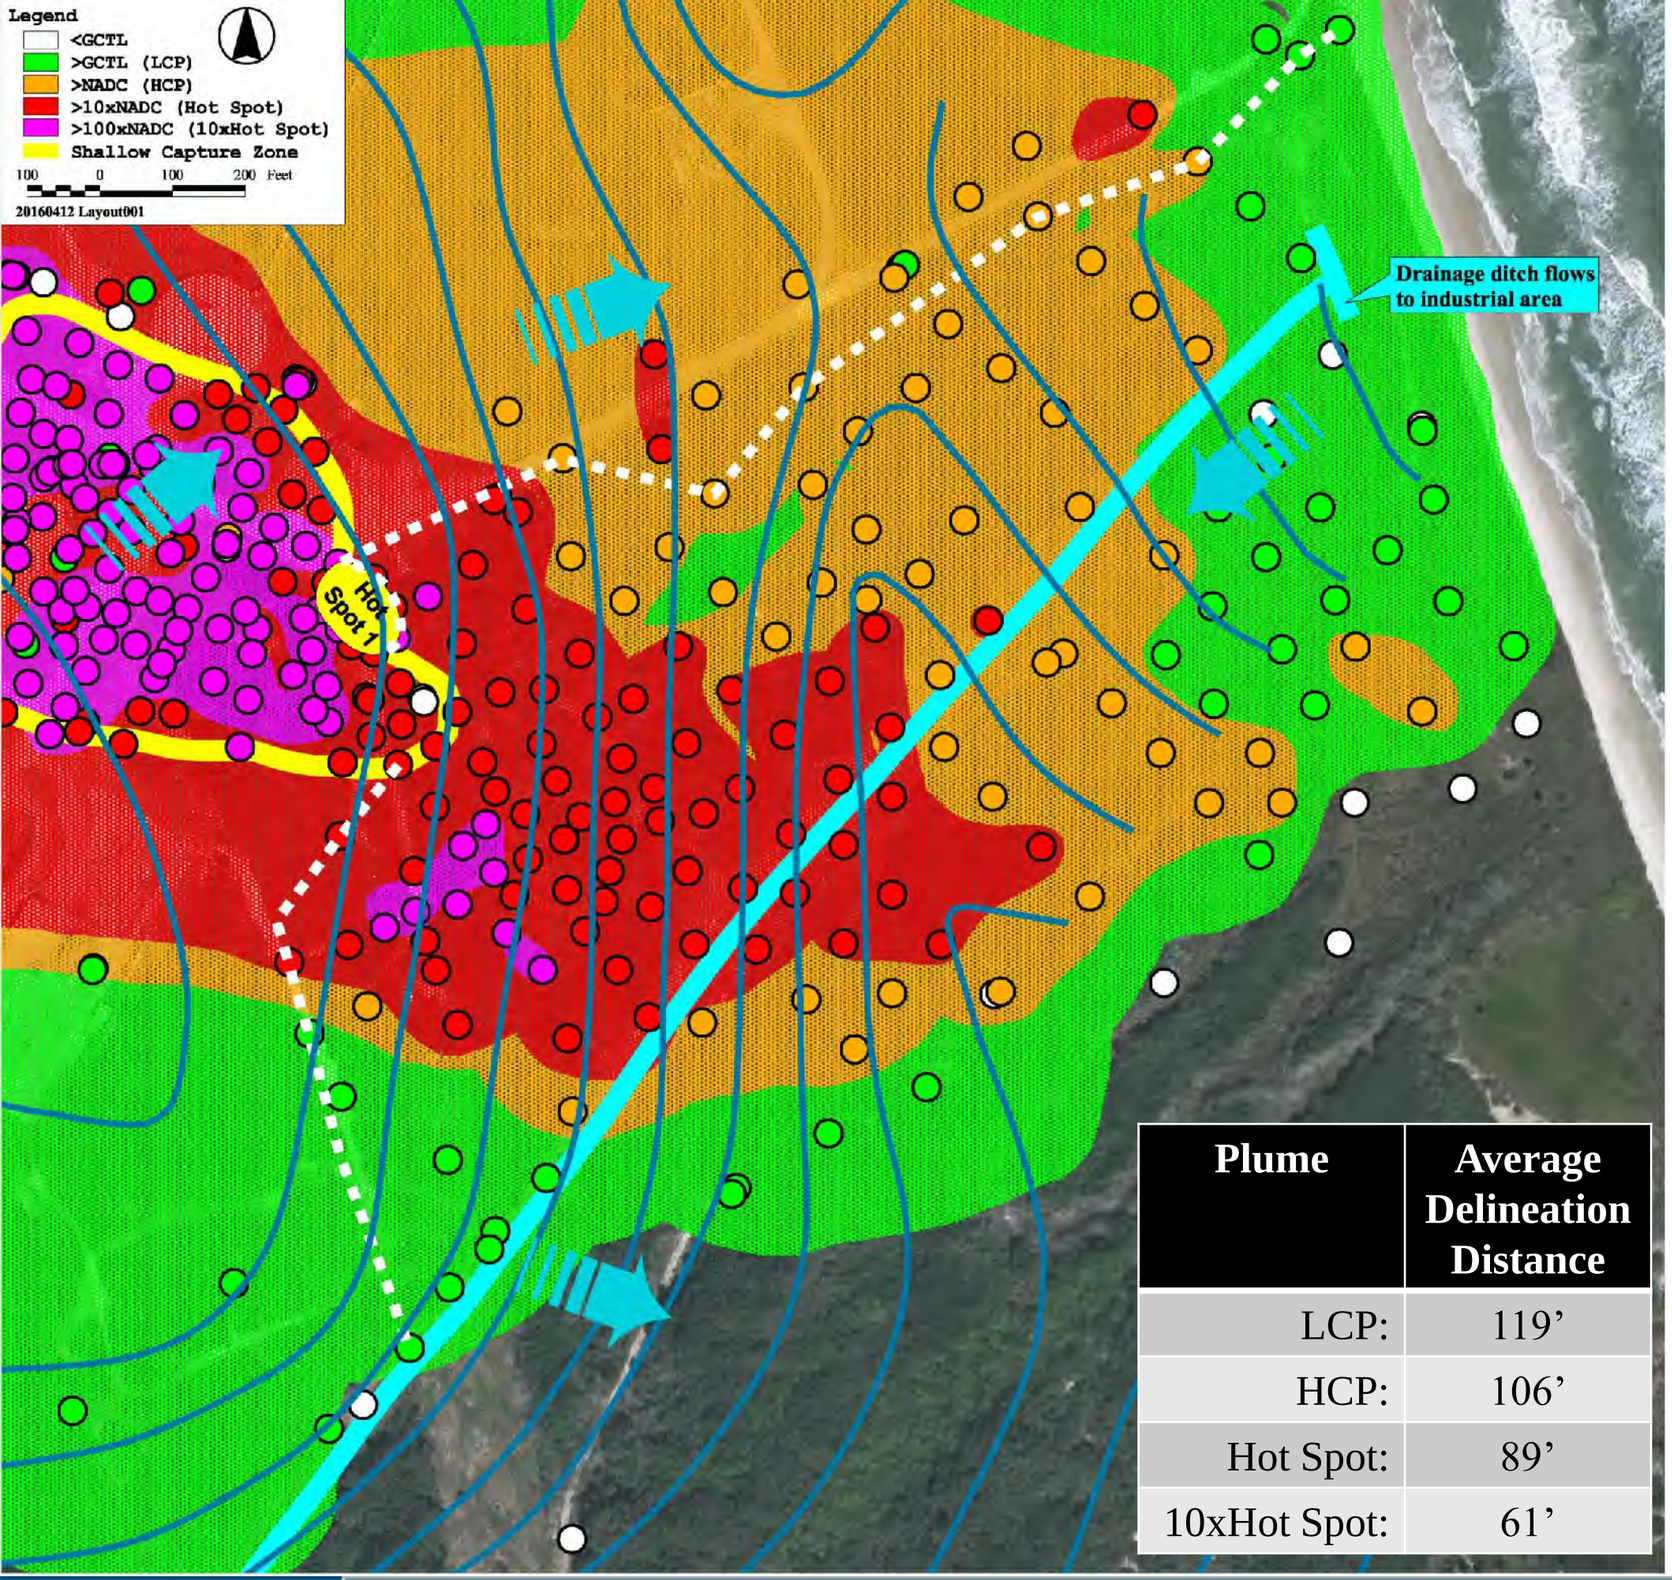
	Acres	Untreated
LCP (GCTL):	336.9	324.5
HCP (NADC):	122.1	109.7
Hot Spot (10x NADC):	56.0	43.6
10xHot Spot (100x NADC):	11.0	0
DNAPL Source Zone:	2.0	0
Hydraulic Capture Zone (HCZ):	12.4	
Plume delineation based on 2016 UEL evaluation		

Hot Spot 6 Investigation	Acres
LCP (GCTL):	40.4
HCP (NADC):	24.9
Hot Spot (10x NADC):	10.7
10xHot Spot (100x NADC):	0.6

Hot Spot Status: 1, 2, 3, and 4 are within the HCZ
5 delineation investigation is ongoing
6 investigated to determine if additional source was present
7 10xNADC daughter products surrounding HCZ

Hot Spot 6 designated as the area downgradient of Hot Spot 1, based on elevated concentrations in monitoring wells IW57S and IW57I

Goal of the investigation was to determine if any source was present and to delineate / refine Hot Spot and HCP, ~~and LCP~~ any refinement of the LCP should have been considered a benefit of investigation not a goal.



Preliminary investigation began during the Hot Spots 3 and 4 investigation in 2010 and 2011. Sampling depths were 8', 13', 18', 25', 38' bls.

Initial results indicated daughter products of TCE downgradient of Hot Spot 1 with very little TCE present

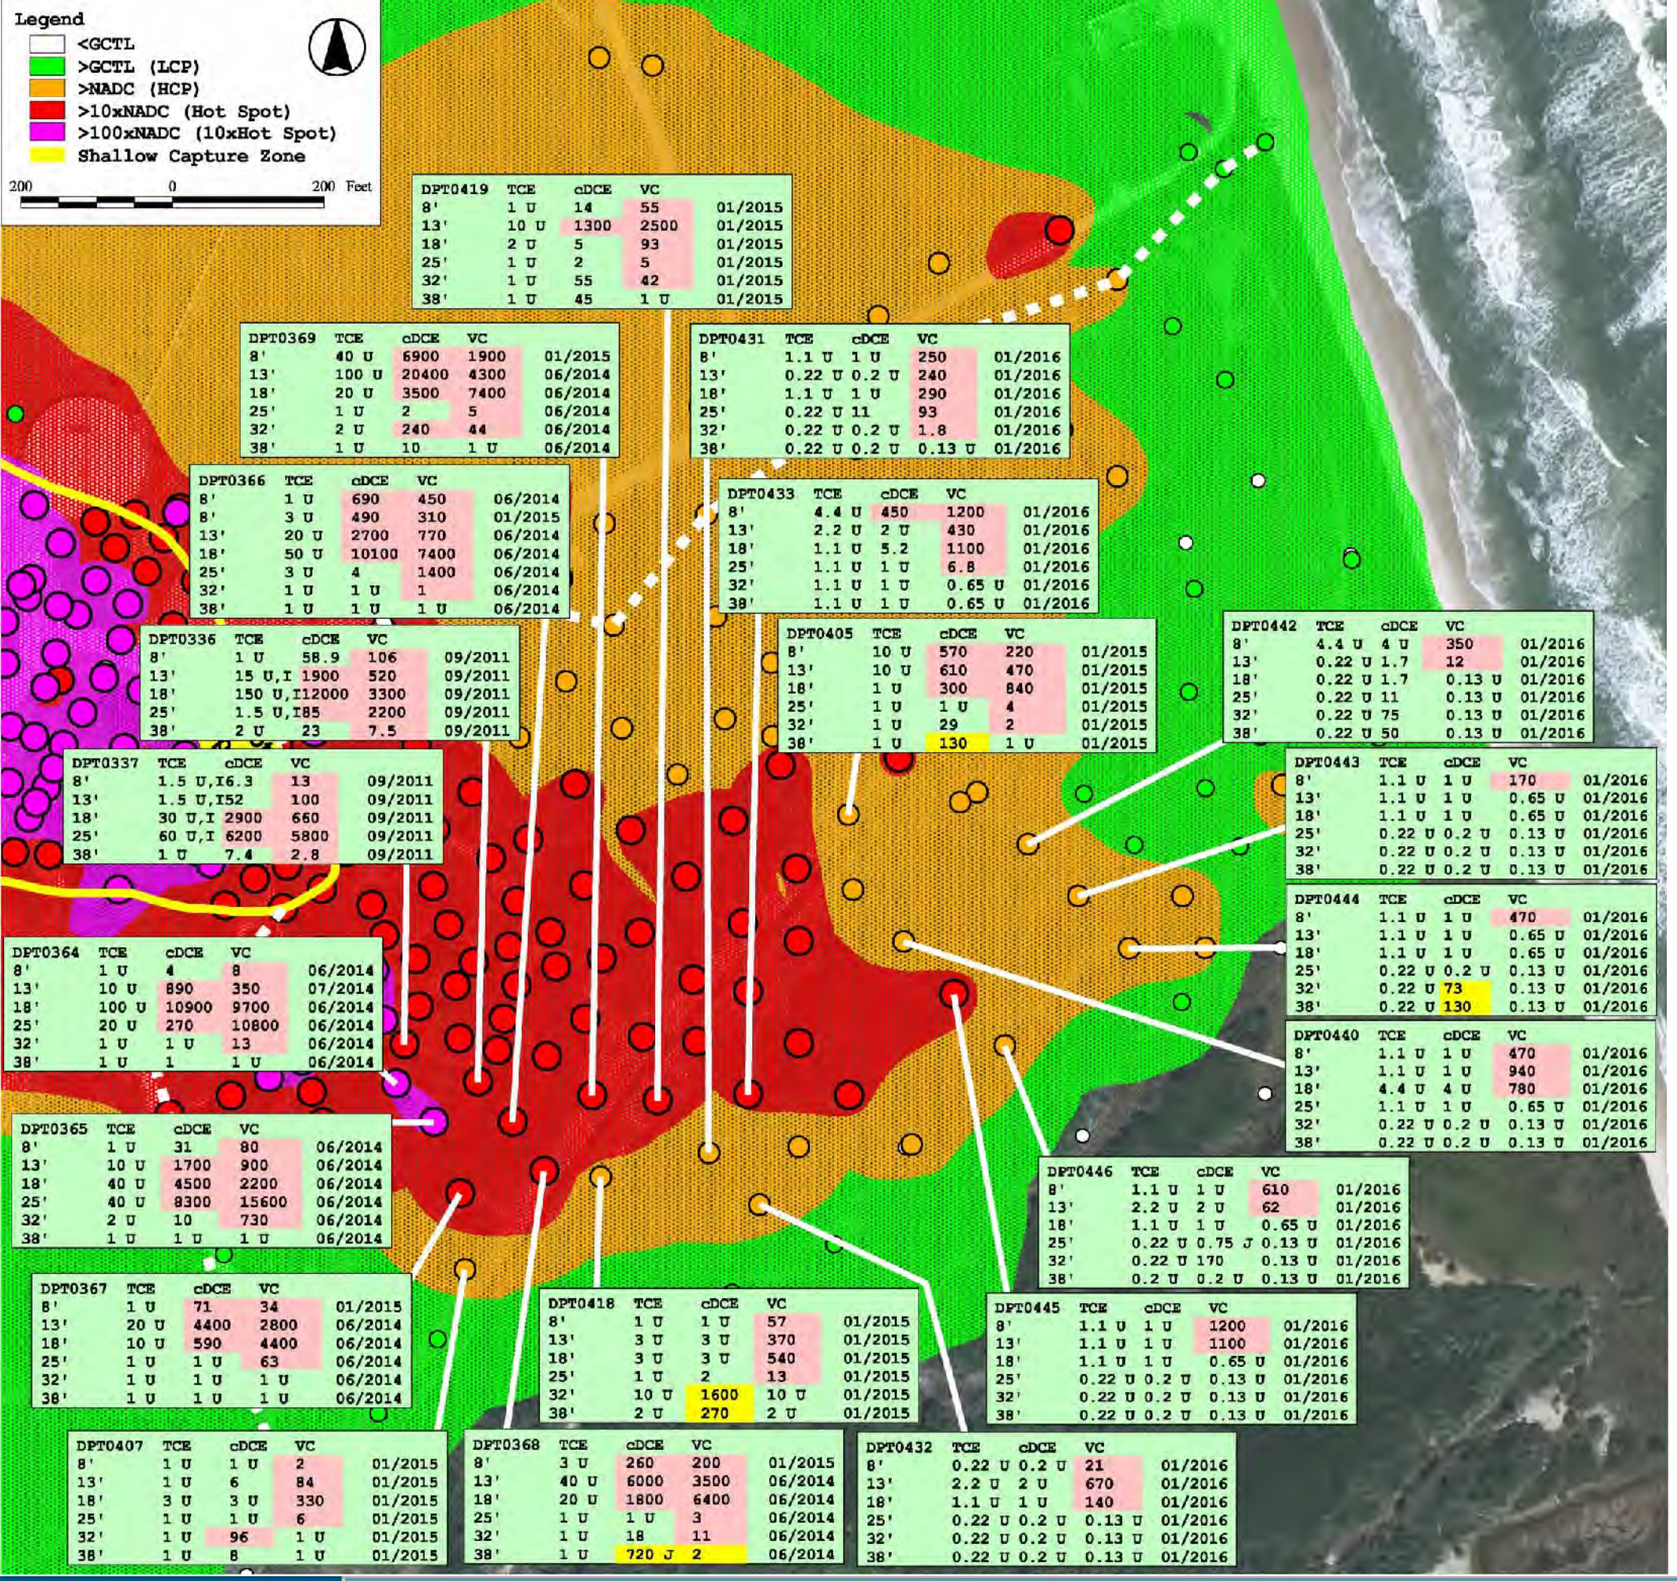
NASA proceeded with investigation in 2014 to determine if any source was present beyond the Shallow Capture Zone (SCZ)

In addition to the initial sampling depths the 32' depth was added to refine the vertical delineation.

Why was Hot Spot 6 investigated?

Plume	Average Delineation Distance
LCP:	119’
HCP:	106’
Hot Spot:	89’
10xHot Spot:	61’

This ADP addresses the area within the investigation boundaries to include the area south and east of the white dashed lines and extent of the SCZ and Hot Spot 1



Hot Spot 6 delineation is based on results from 745 DPT samples collected from 150 locations

Data set includes the 2010/2011 samples and 681 samples collected from 2014 to 2016

Hot Spot 6 Groundwater Results figure provided includes DPT and monitoring well sample results

Due to the plume size, KSCRT delineation rule of thumb is not tenable

Sample Locations Used to Delineate Hot Spot 6

DPT0368 38’ sample has results for cDCE and VC that could be attributed to drag down, these results were not used in delineation efforts

DPTs 0418 and 0444 cDCE results in 32’ and 38’ samples appear to be suspect, surrounding samples do not have similar results therefore these results were not used in delineation efforts

DPT0405 38’ sample has cDCE result that could be attributed to drag down, these results were not used in delineation efforts

Suspect Results Not Used in Delineation

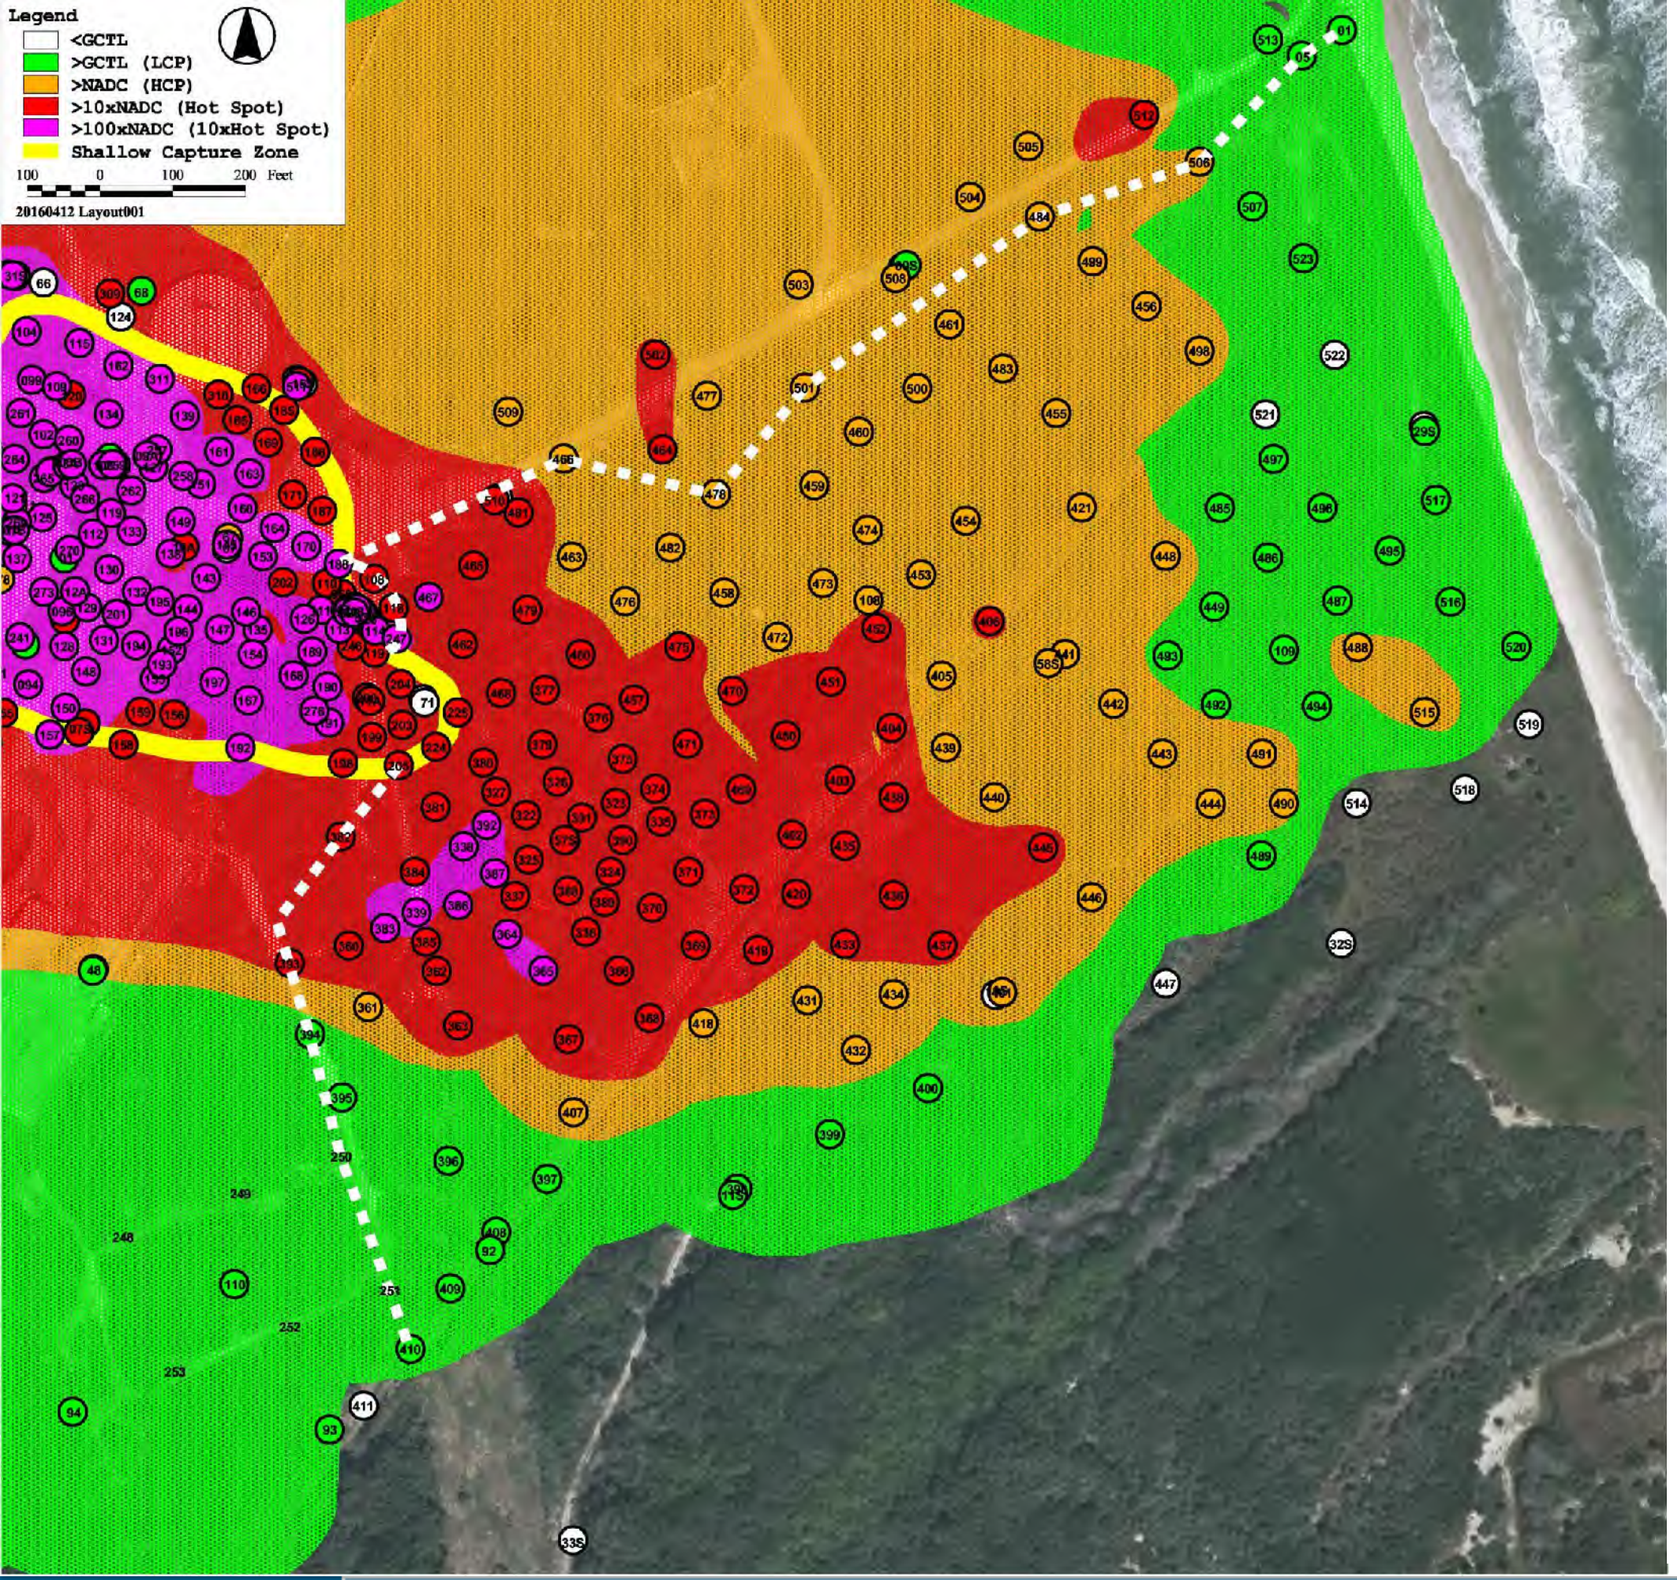
Dataset includes 745 samples from 150 locations collected via DPT 2010/2011 and 2014 to 2016



Data evaluation intervals: 0-10’, 10’-15’, 15’-20’, 20’-28’, 28’-34’, >34’ bls

TCE, cDCE, tDCE (not presented in this ADP), and VC exceeded GCTLs

cDCE and VC exceeded NADCs and 10x NADCs

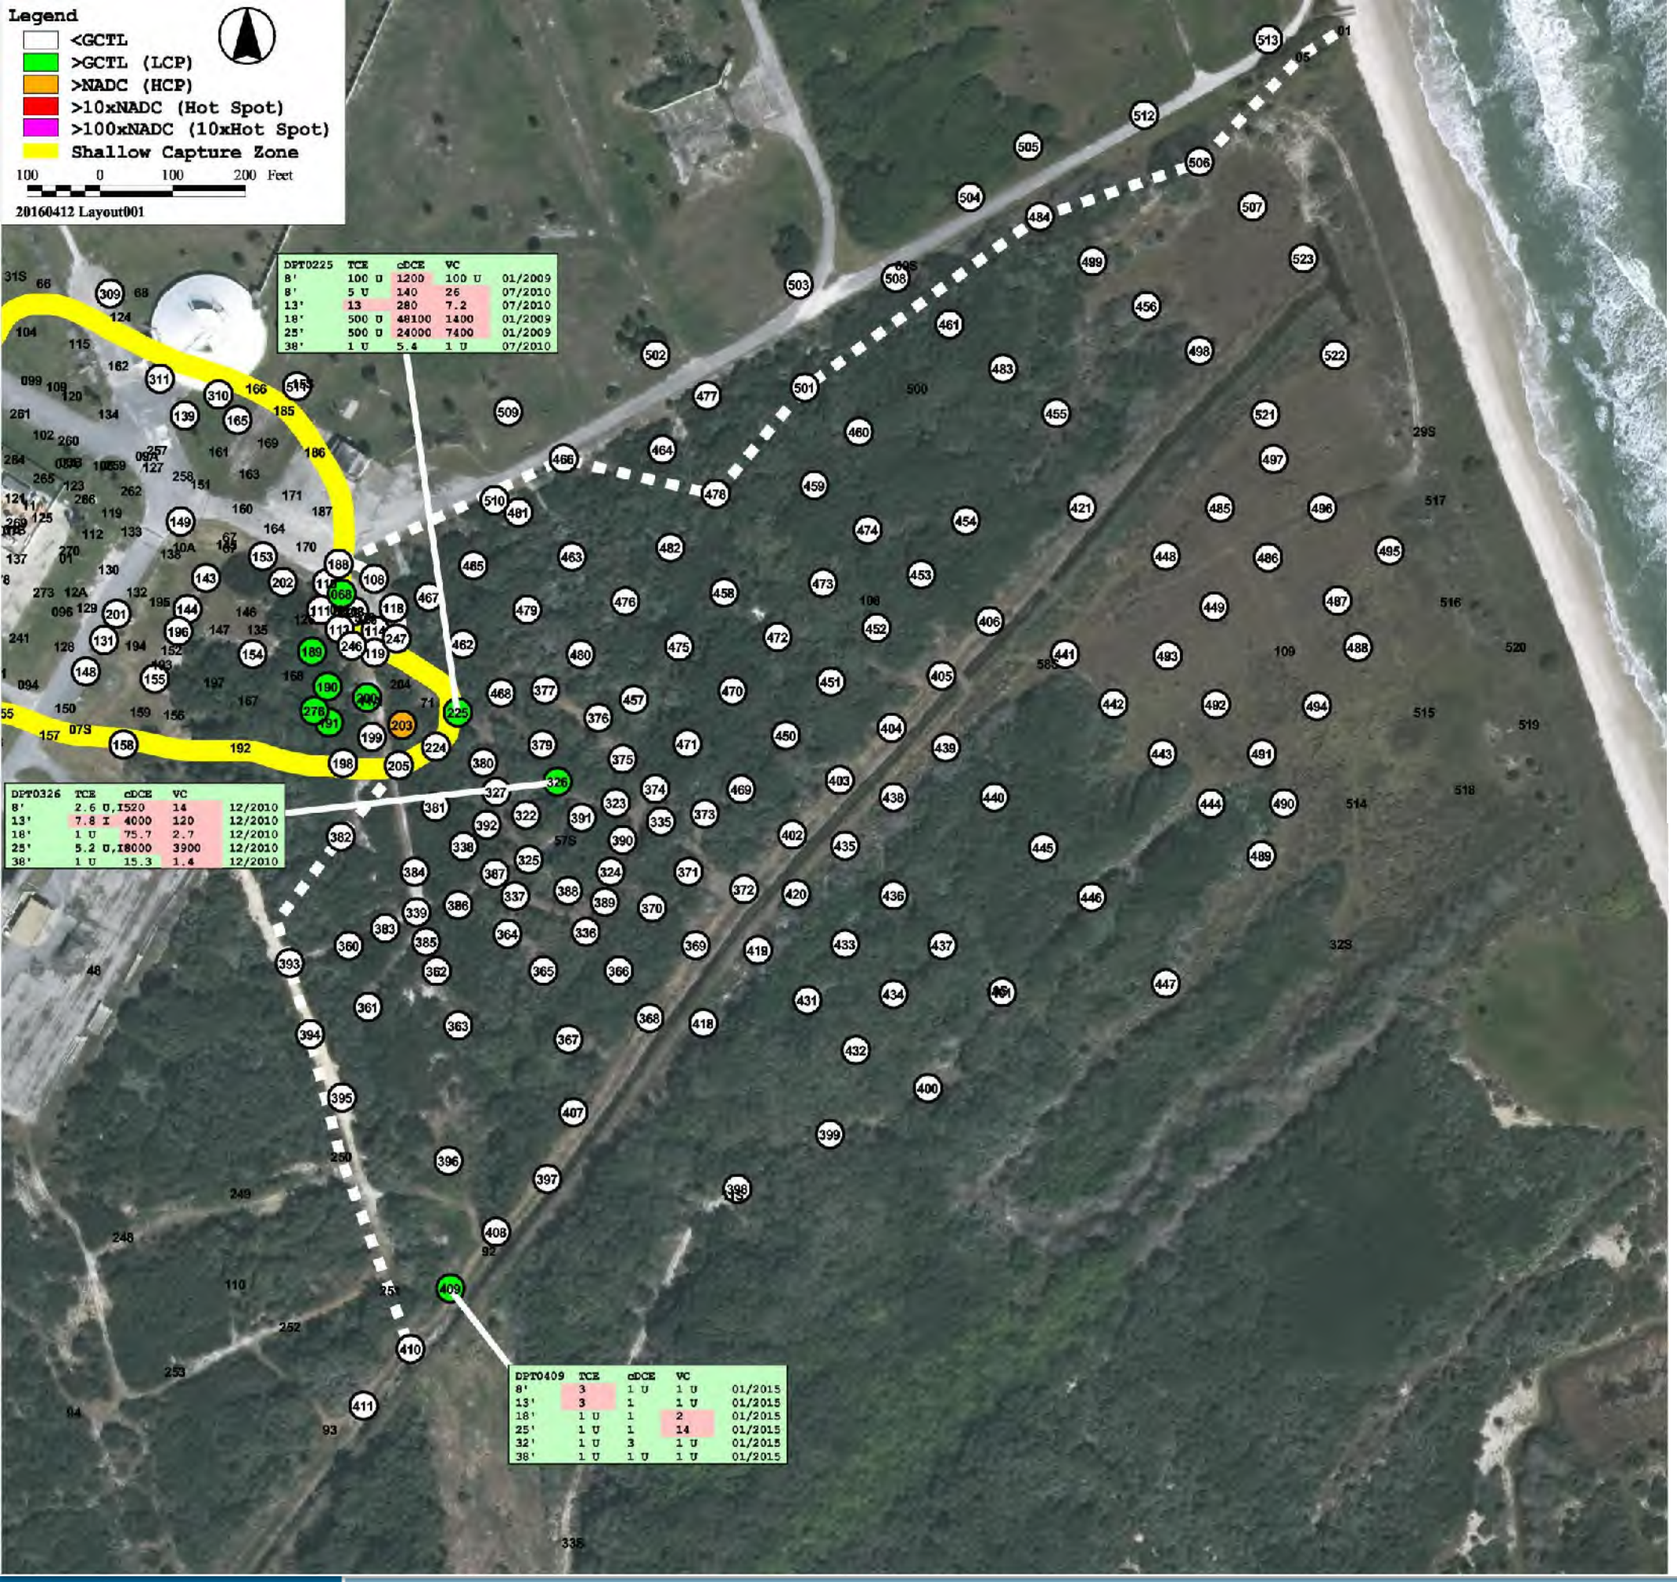
Hot Spot and HCP extends to 34’ bls with the exception of DPT0339 being the only location with 38’ sample > NADC

Intervals:

- 0-10’, 10’-15’, 15’-20’, 20’-28’, 28’-34’, >34’ bls
- 0-10’ included all data from ground surface to and including 10’ bls
- 10’-15’ included all data greater than 10’ bls to and including 15’ bls
- Deeper intervals followed same logic

If an interval had multiple results, maximum was used for contouring

Elevated non-detected values for TCE > 20, cDCE > 140, and VC > 20 were not used in contouring, non-detected values less than those values were assumed to be zero



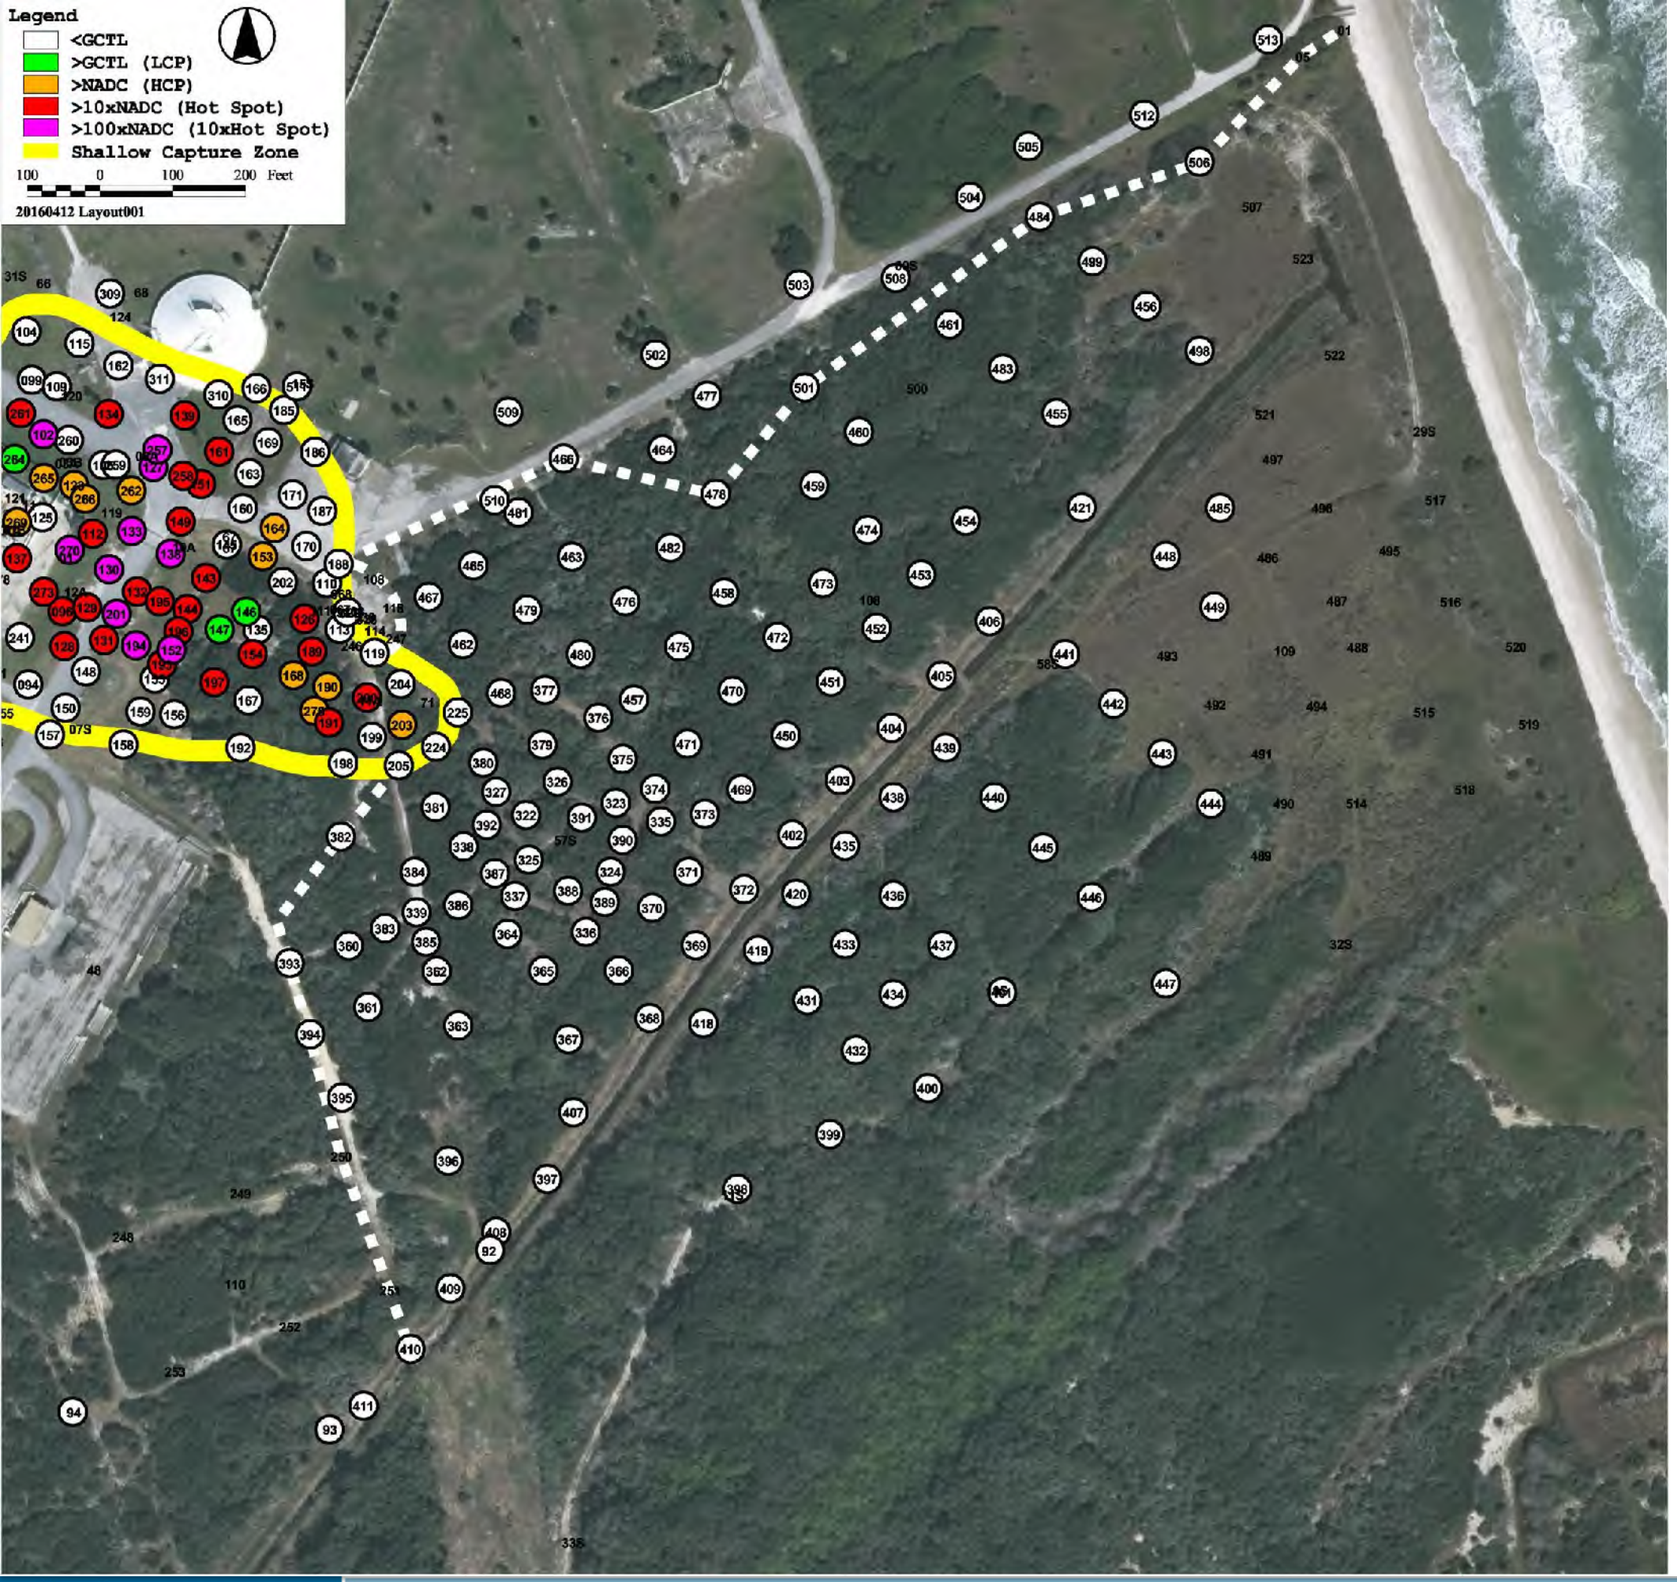
All sample locations have labels; only locations with symbol used in contouring

Cross-sections provided for vertical evaluation

DPT0360 is only sample in this interval that exceeded GCTL with concentration of 20 ug/L

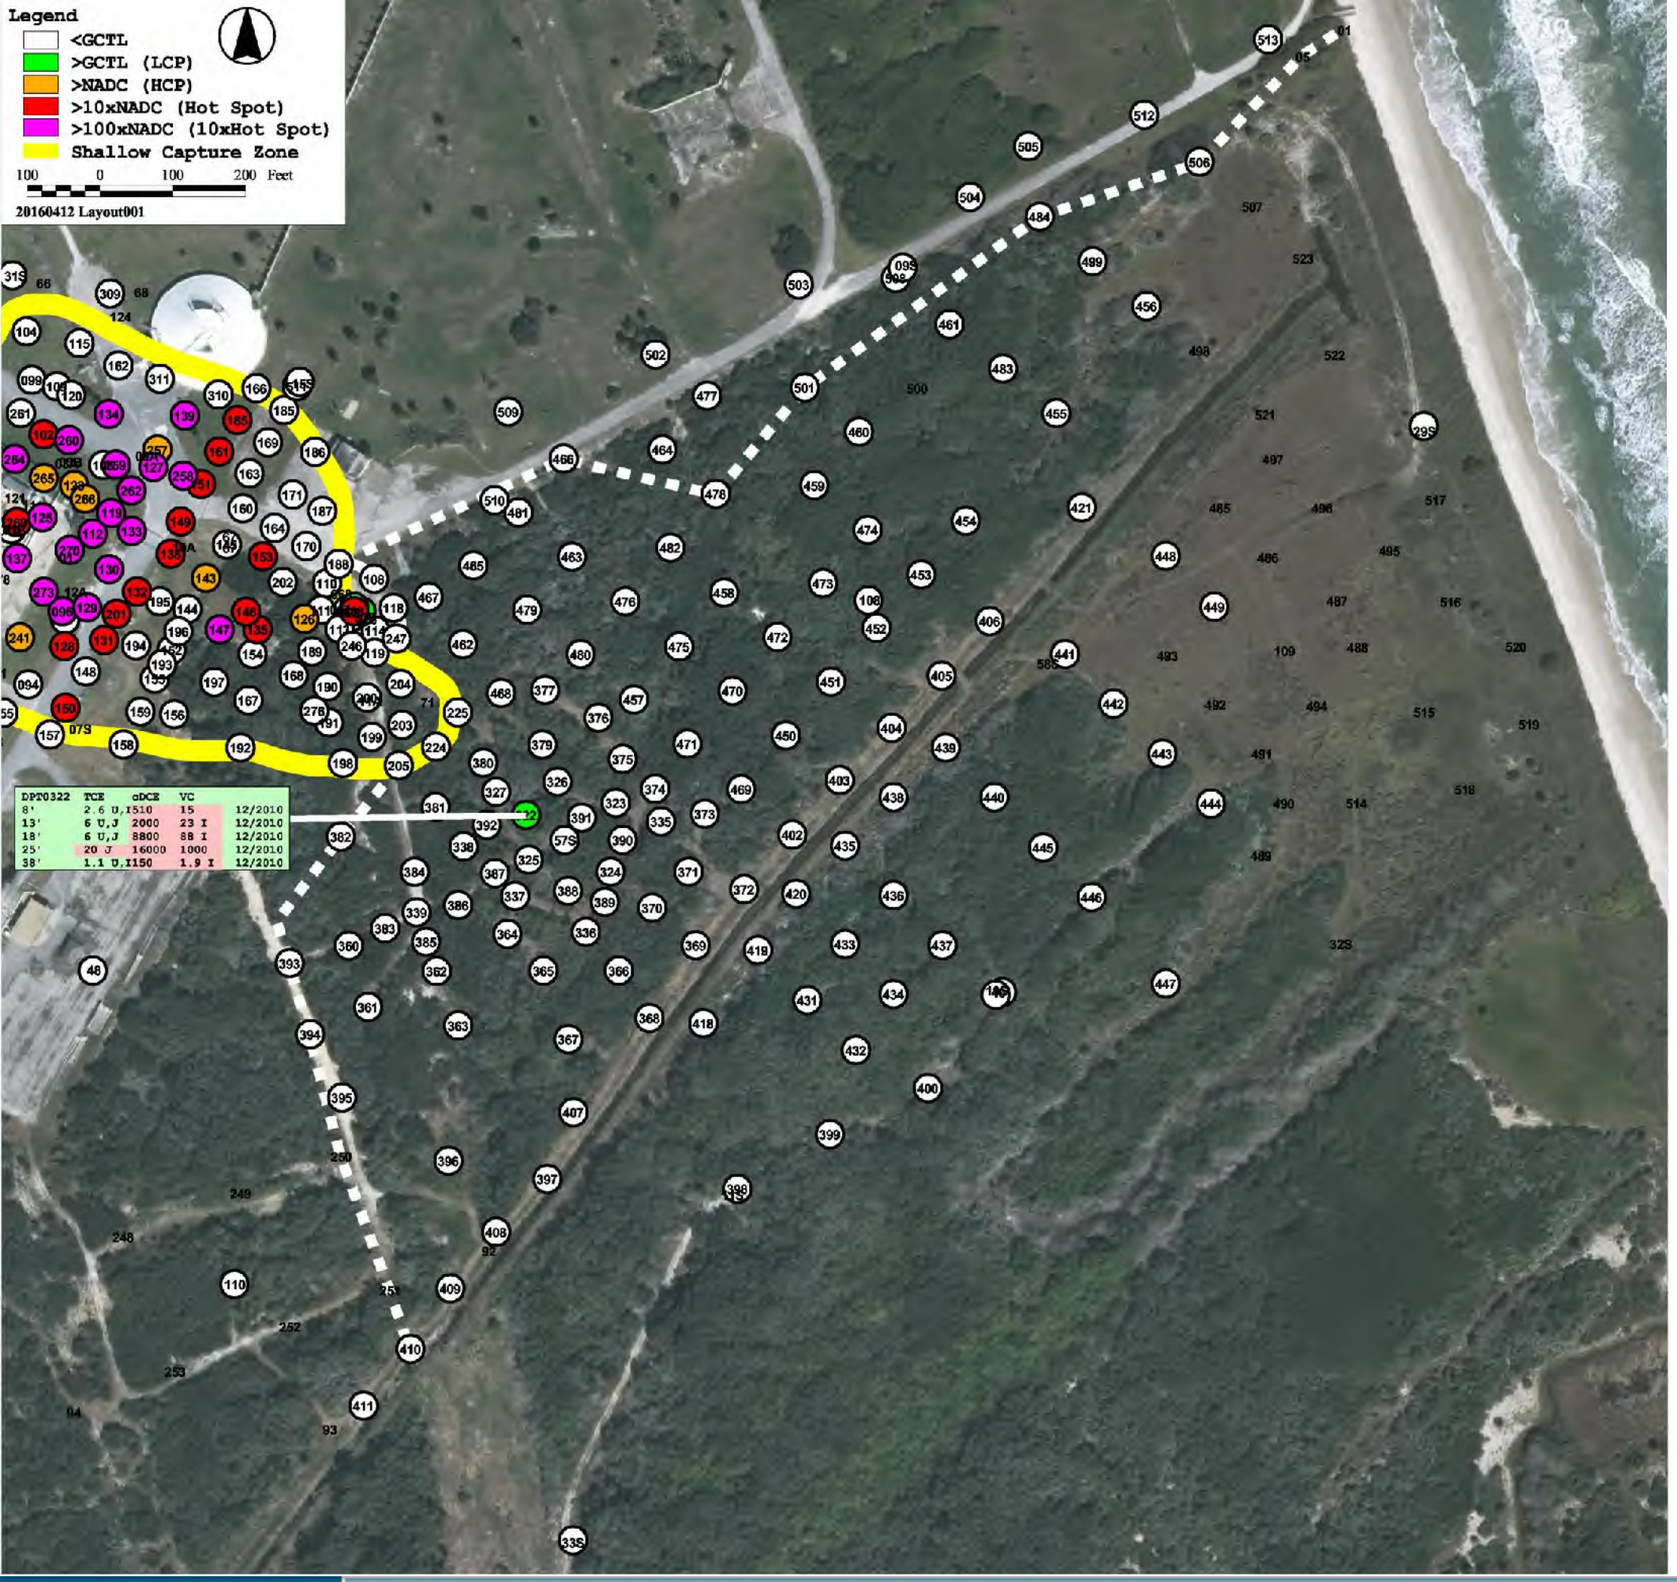
Other DPTs shown had TCE concentration at GCTL, therefore no contours were generated for this interval

Propose TCE delineation in this interval



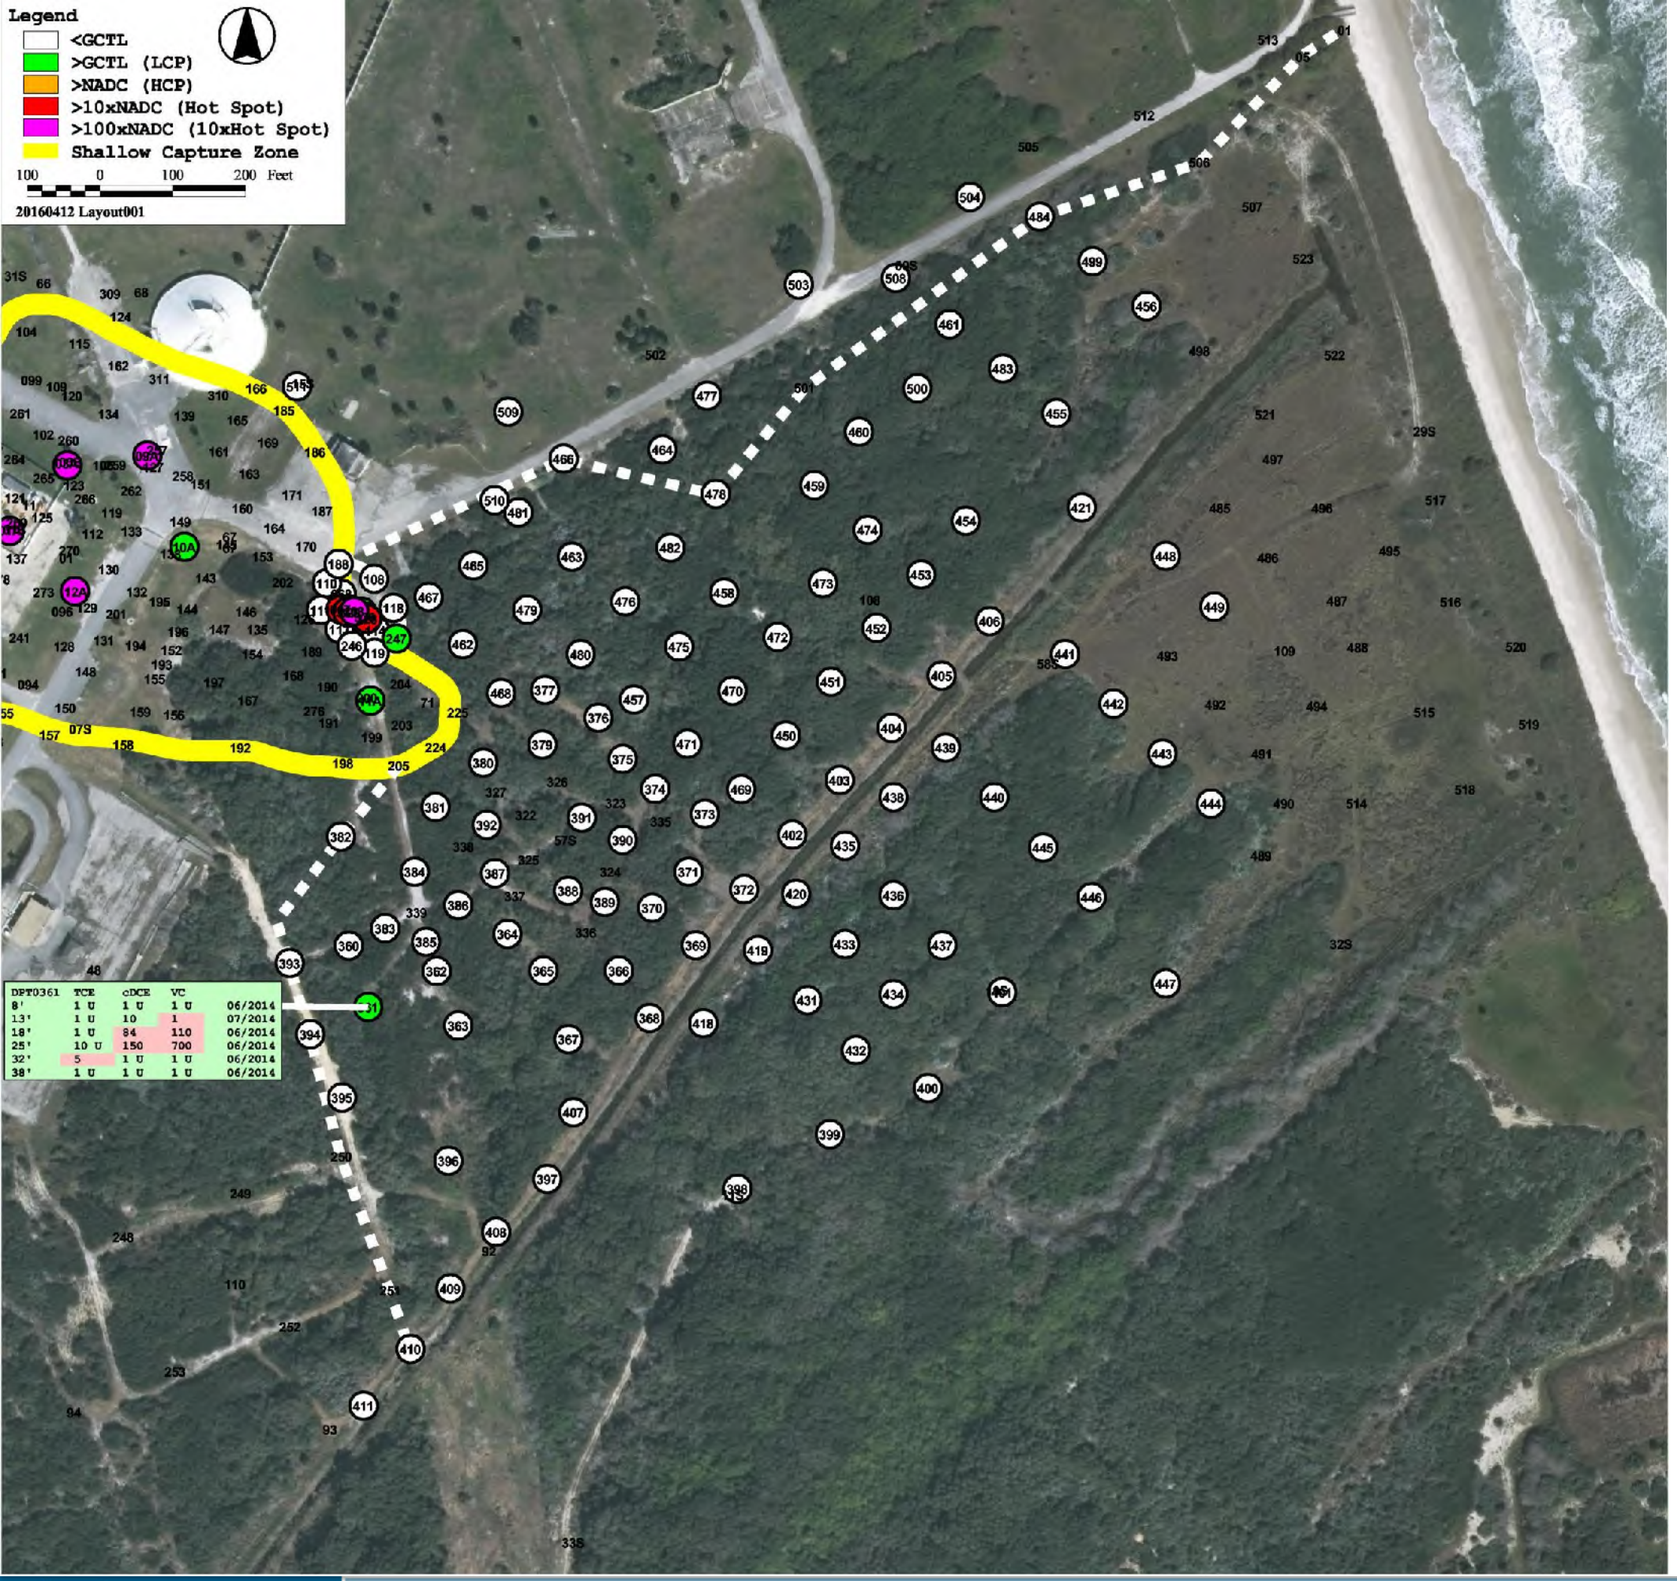
DPTs 0225 and 0326 are only samples in this interval that exceeded GCTL with concentrations of 13 and 7.8 ug/L

DPT0409 had TCE concentration at GCTL, therefore no contours were generated for this interval



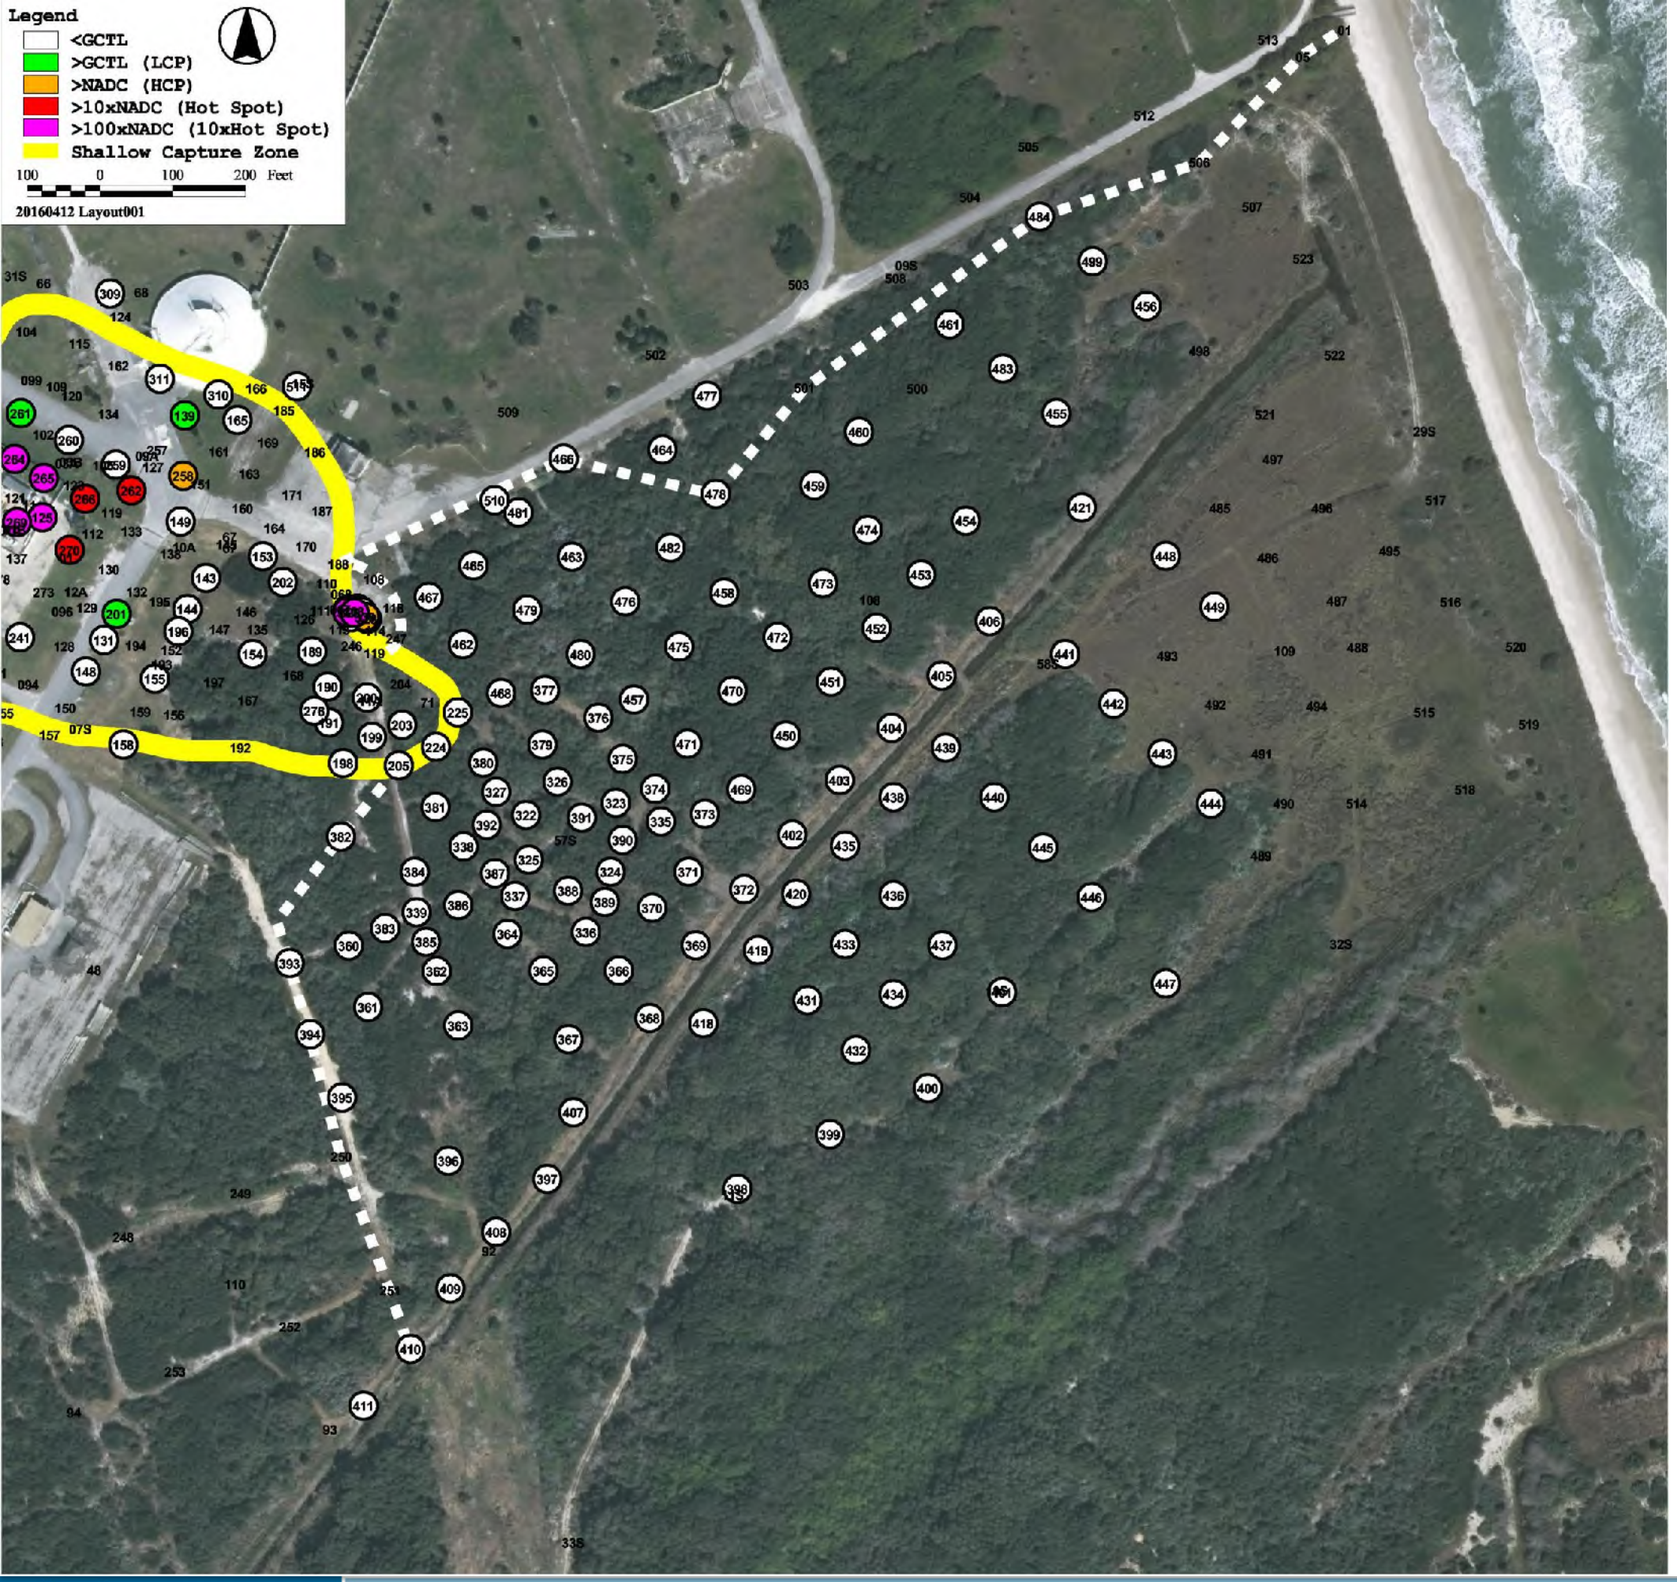
Propose TCE delineation in this interval

TCE, Interval: 10 to 15 feet bls



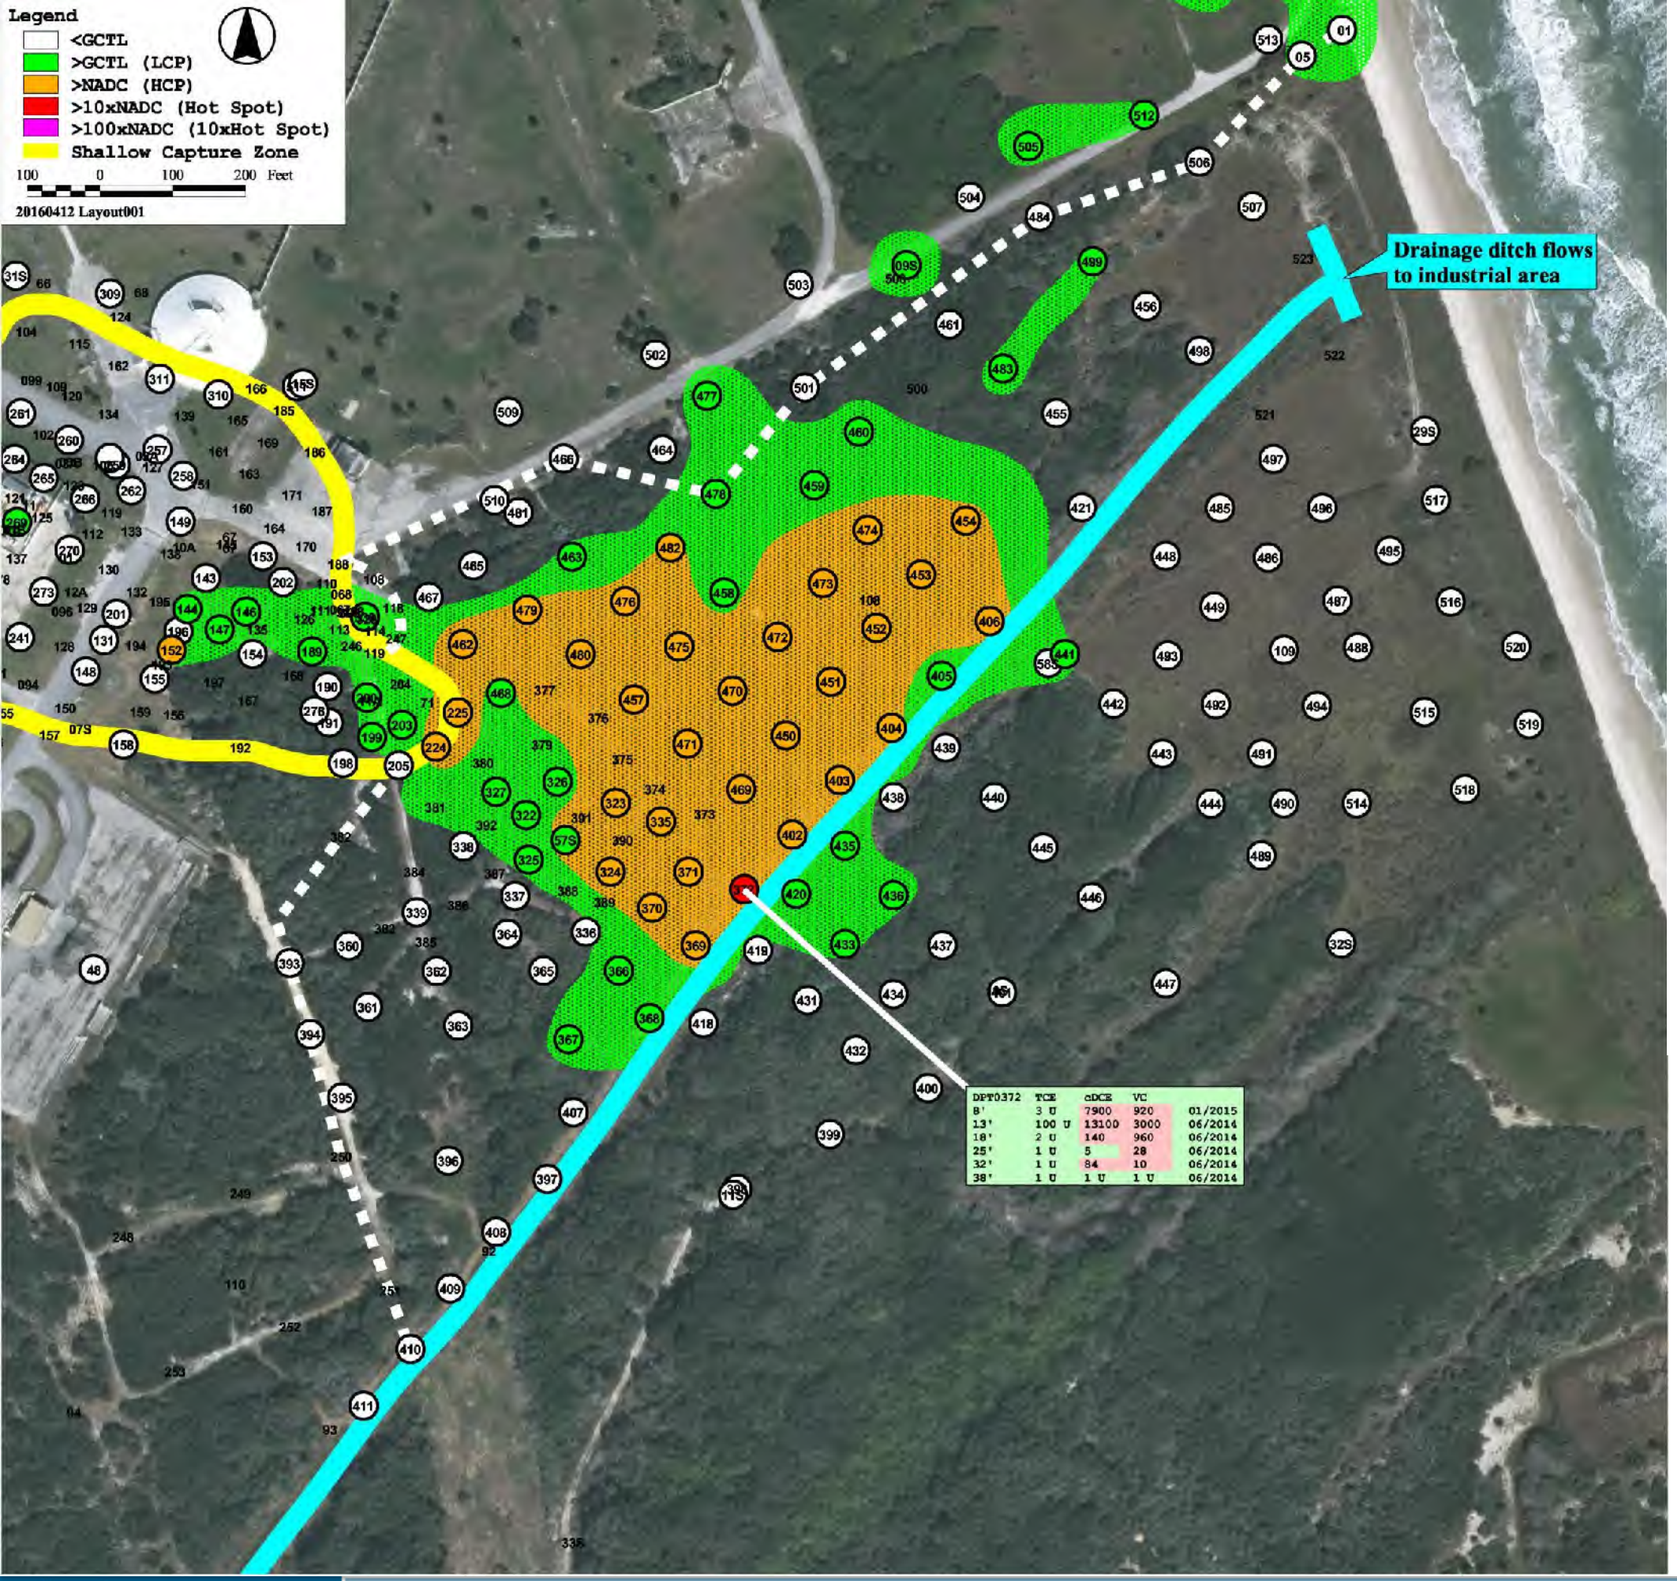
No samples exceeded TCE GCTL in this interval

Propose TCE delineation in this interval



DPT0322 is only sample in this interval that exceeded GCTL with concentration of 20 J ug/L

Propose TCE delineation in this interval

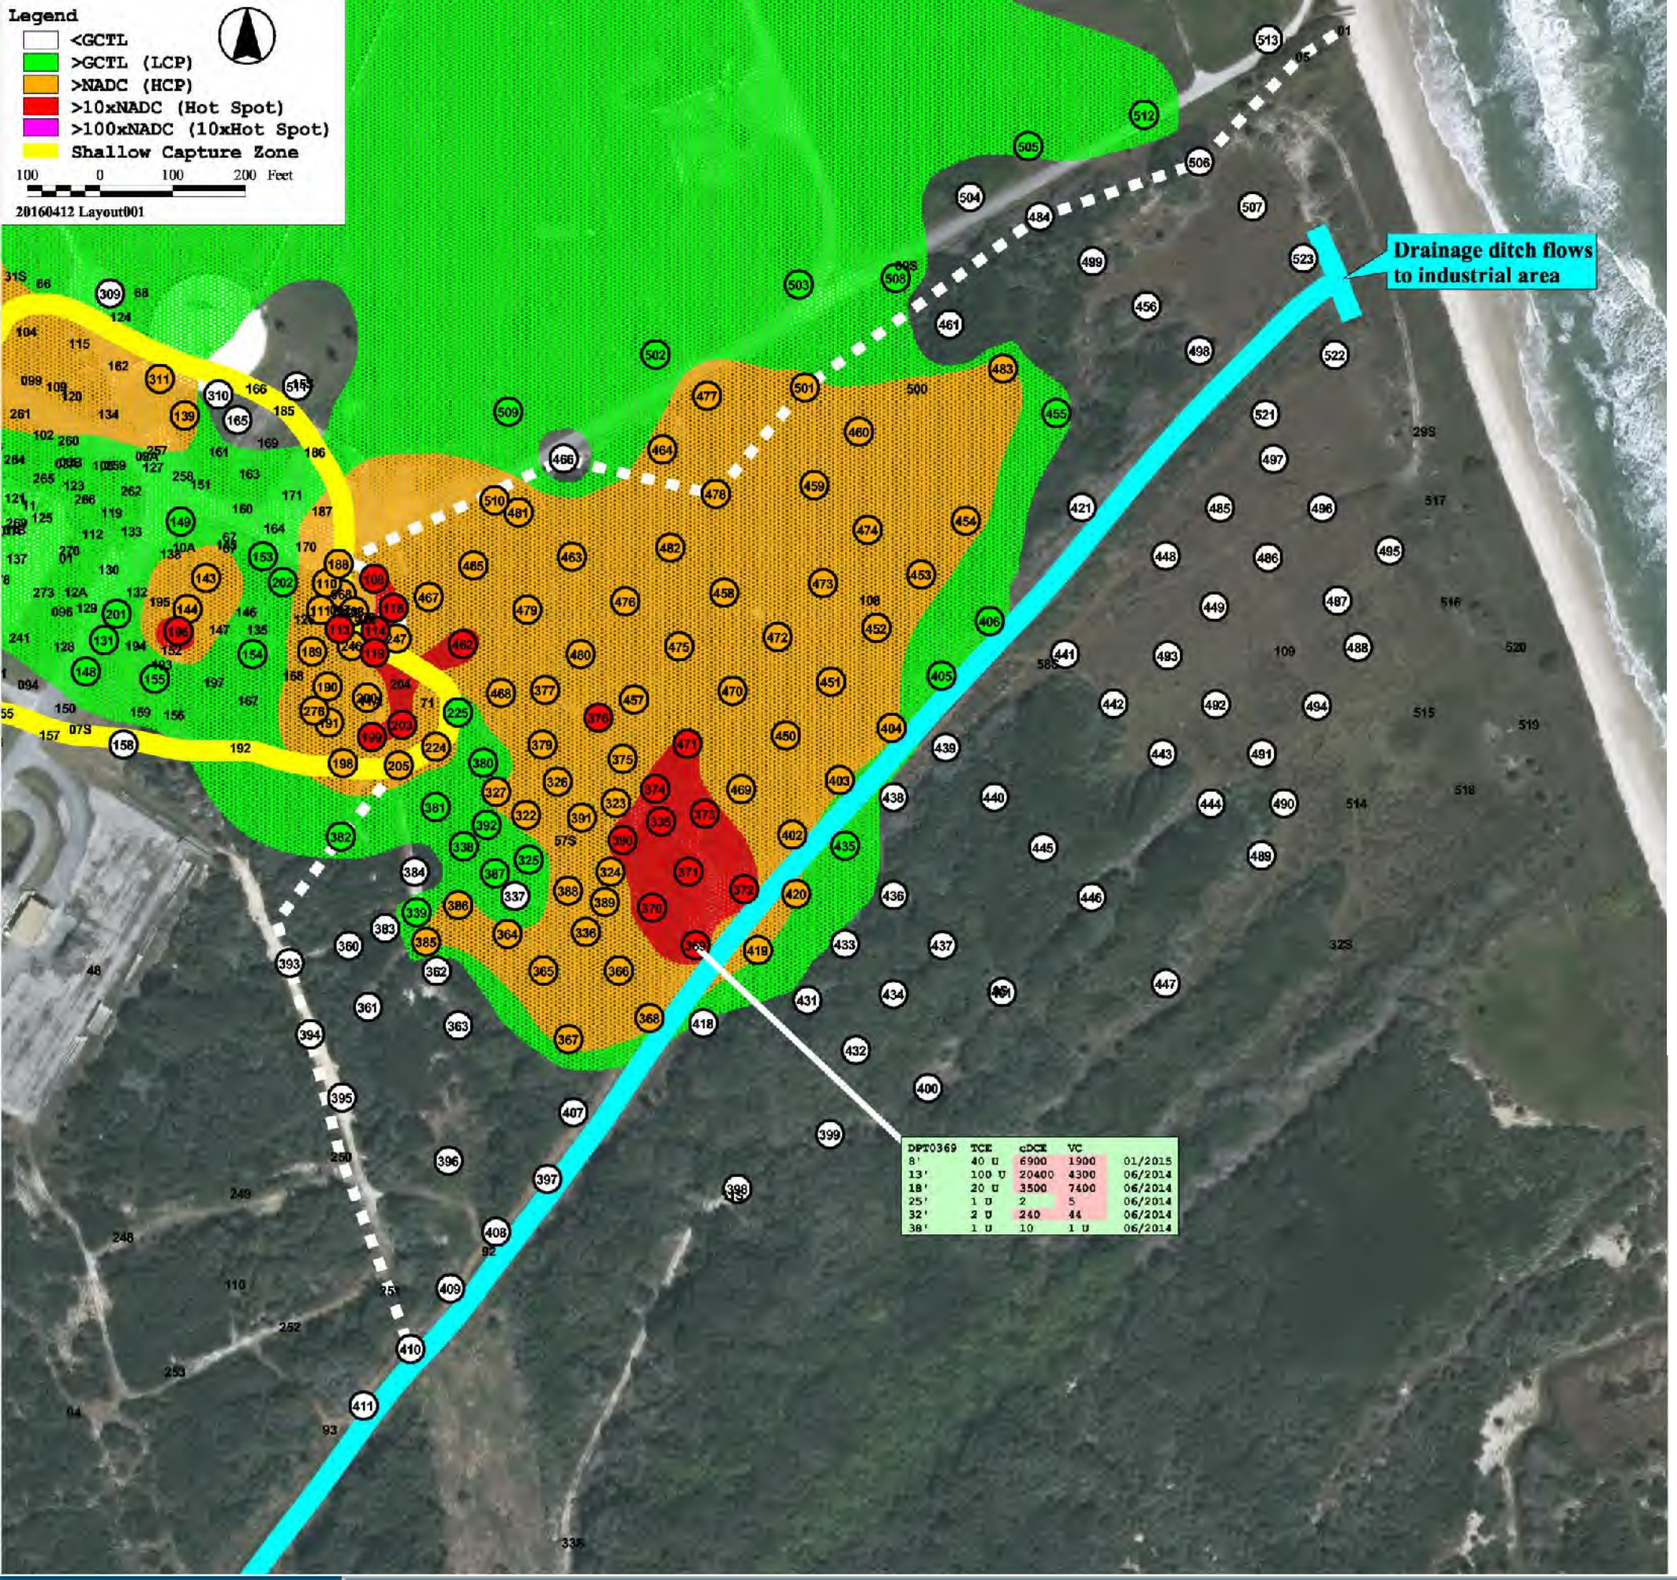


DPT0361 is only sample in this interval that exceeded GCTL with concentration of 5 ug/L

Propose TCE delineation in this interval

No samples exceeded TCE GCTL in this interval

Propose TCE delineation in this interval



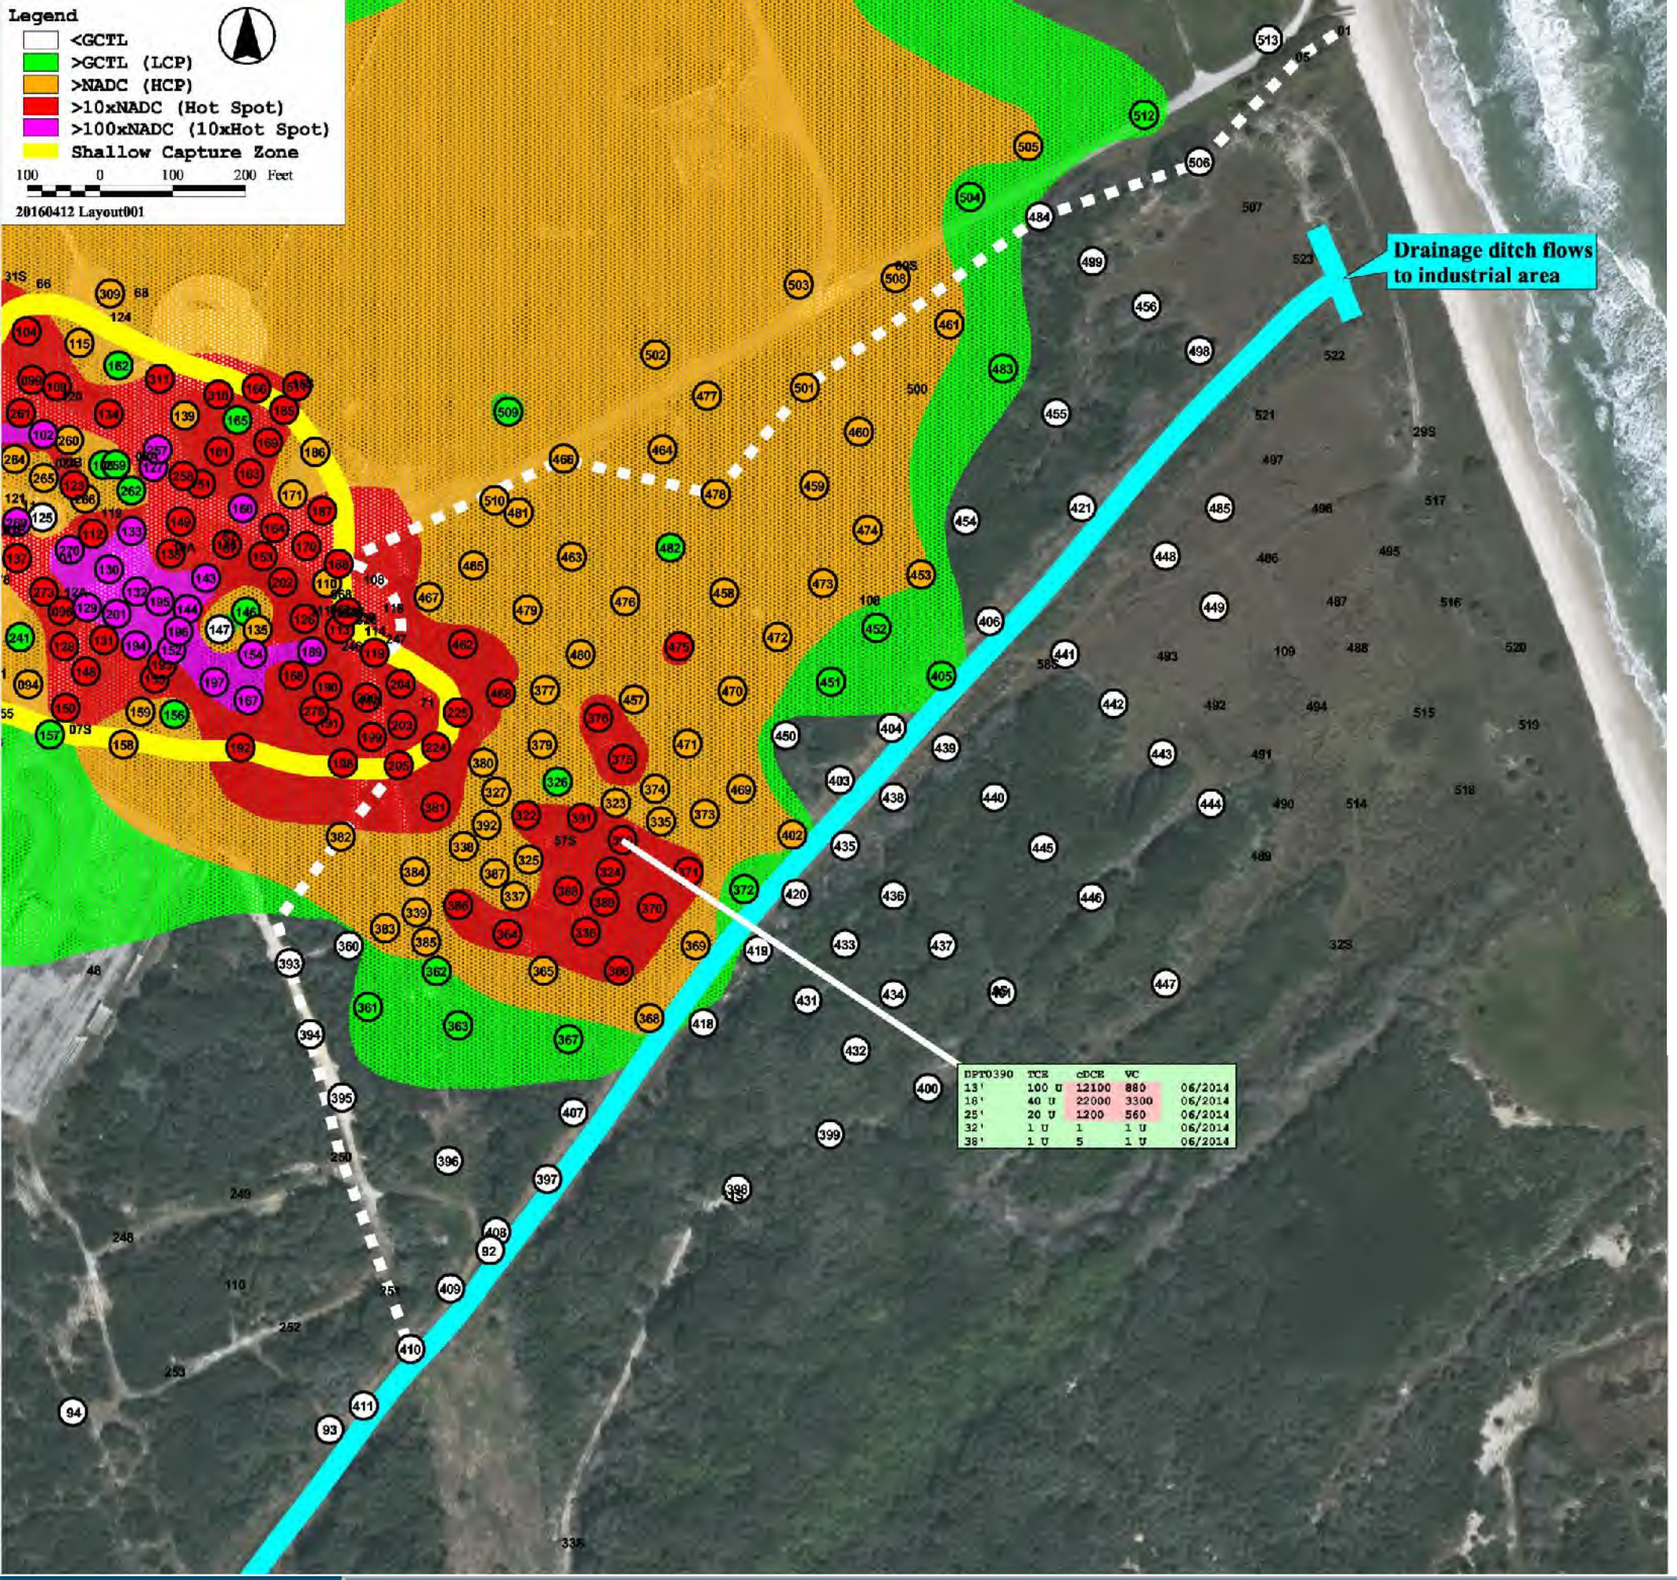
LCP and HCP present in this interval

DPT0372 has maximum cDCE (7,900 ug/L) detected in this interval that exceeds 10xNADC

Drainage ditch appears to be influencing plume, wet and dry seasons likely influence hydraulic recharge and discharge

Propose cDCE delineation in this interval

cDCE, Interval: 0 to 10 feet bls

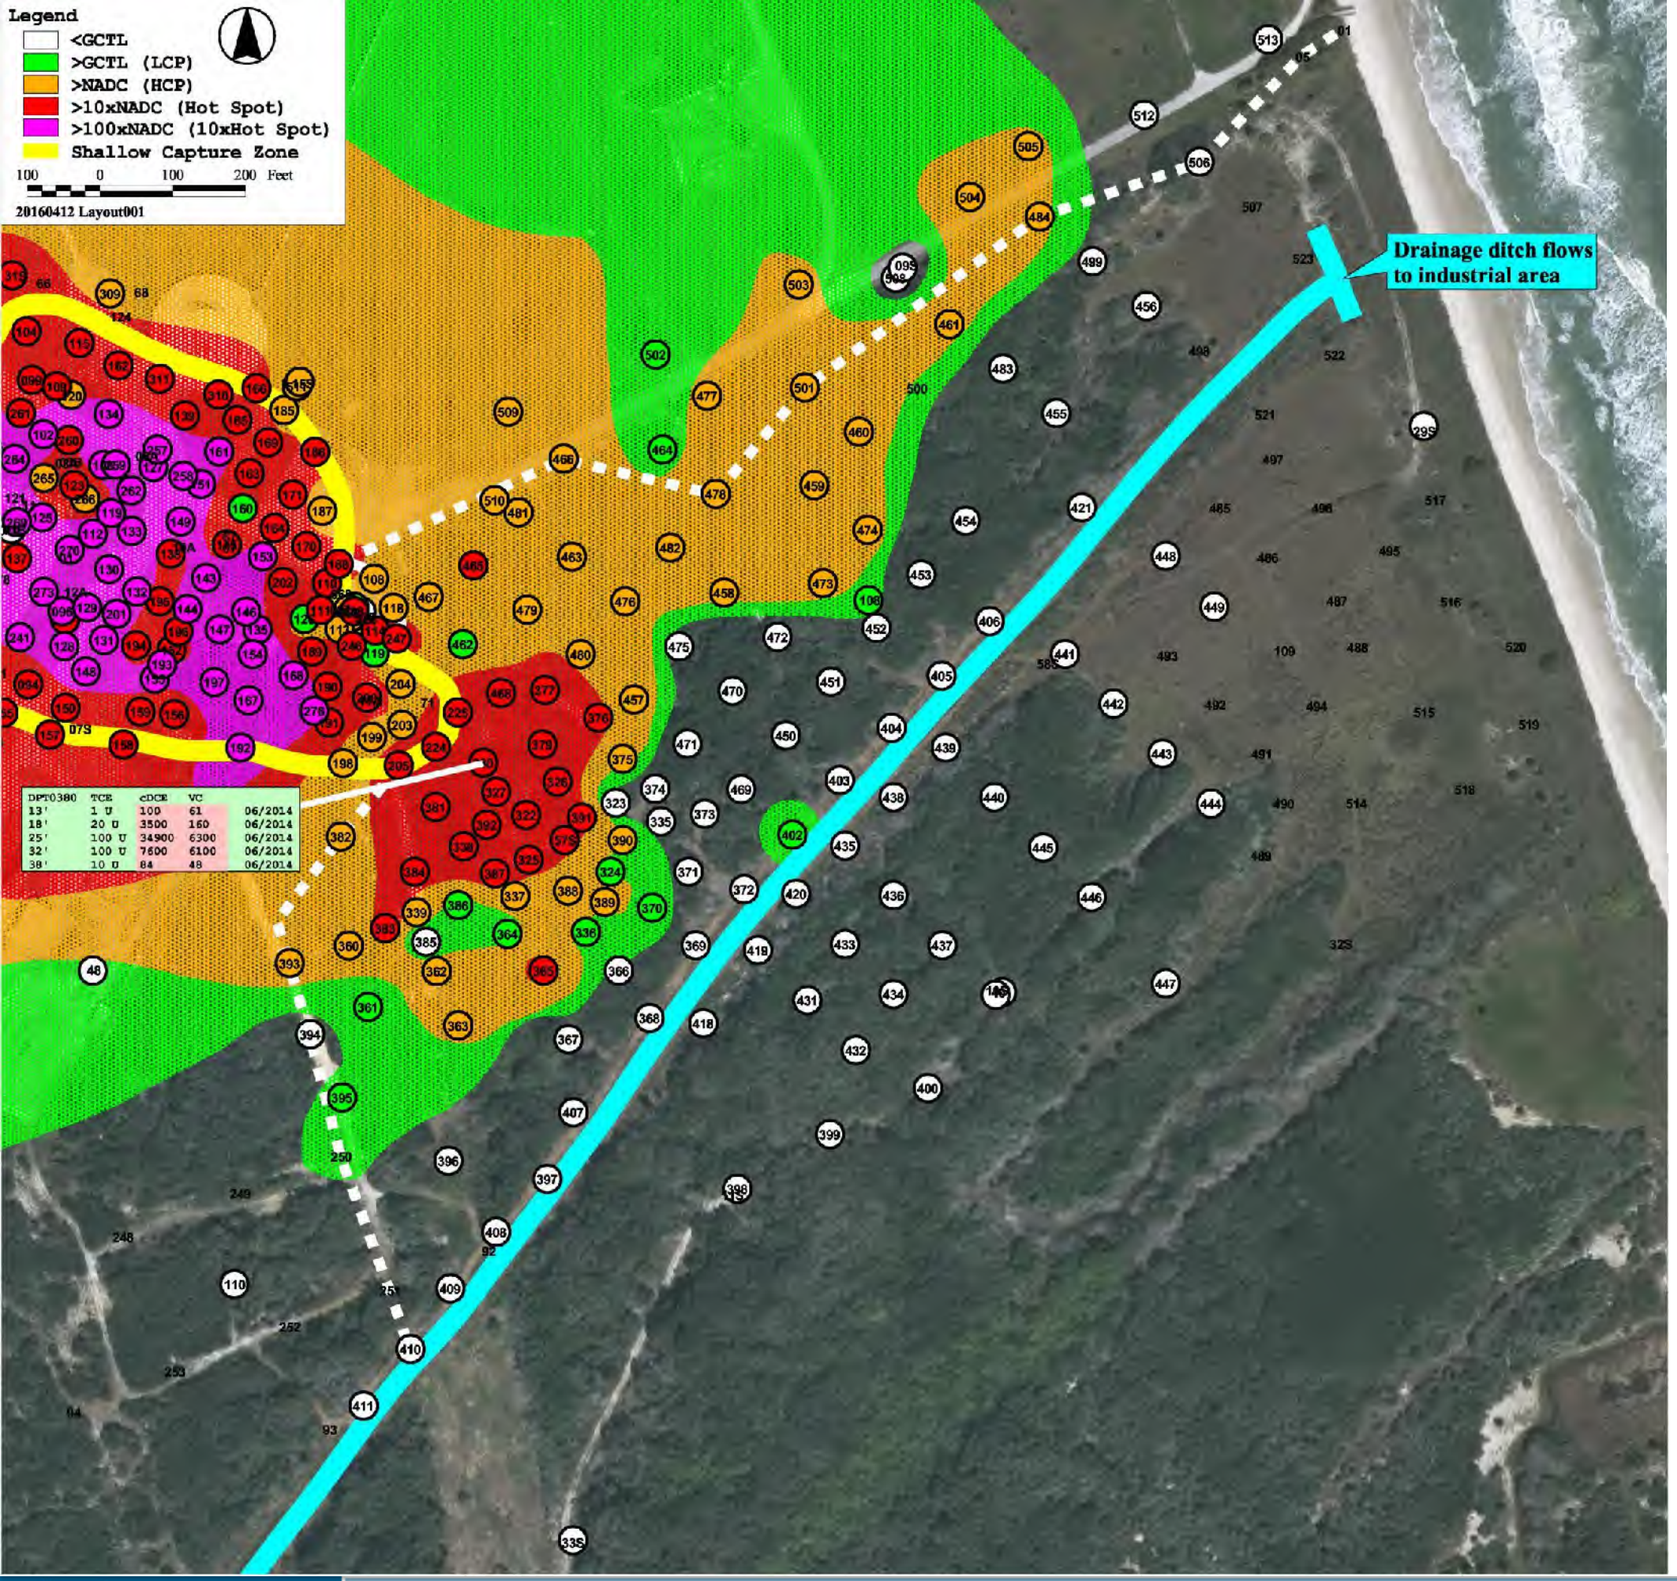


LCP, HCP, and Hot Spot present in this interval

DPT0369 has maximum cDCE (20,400 ug/L) detected in this interval that exceeds 10xNADC

Drainage ditch appears to be influencing plume, wet and dry seasons likely influence hydraulic recharge and discharge

Propose cDCE delineation in this interval



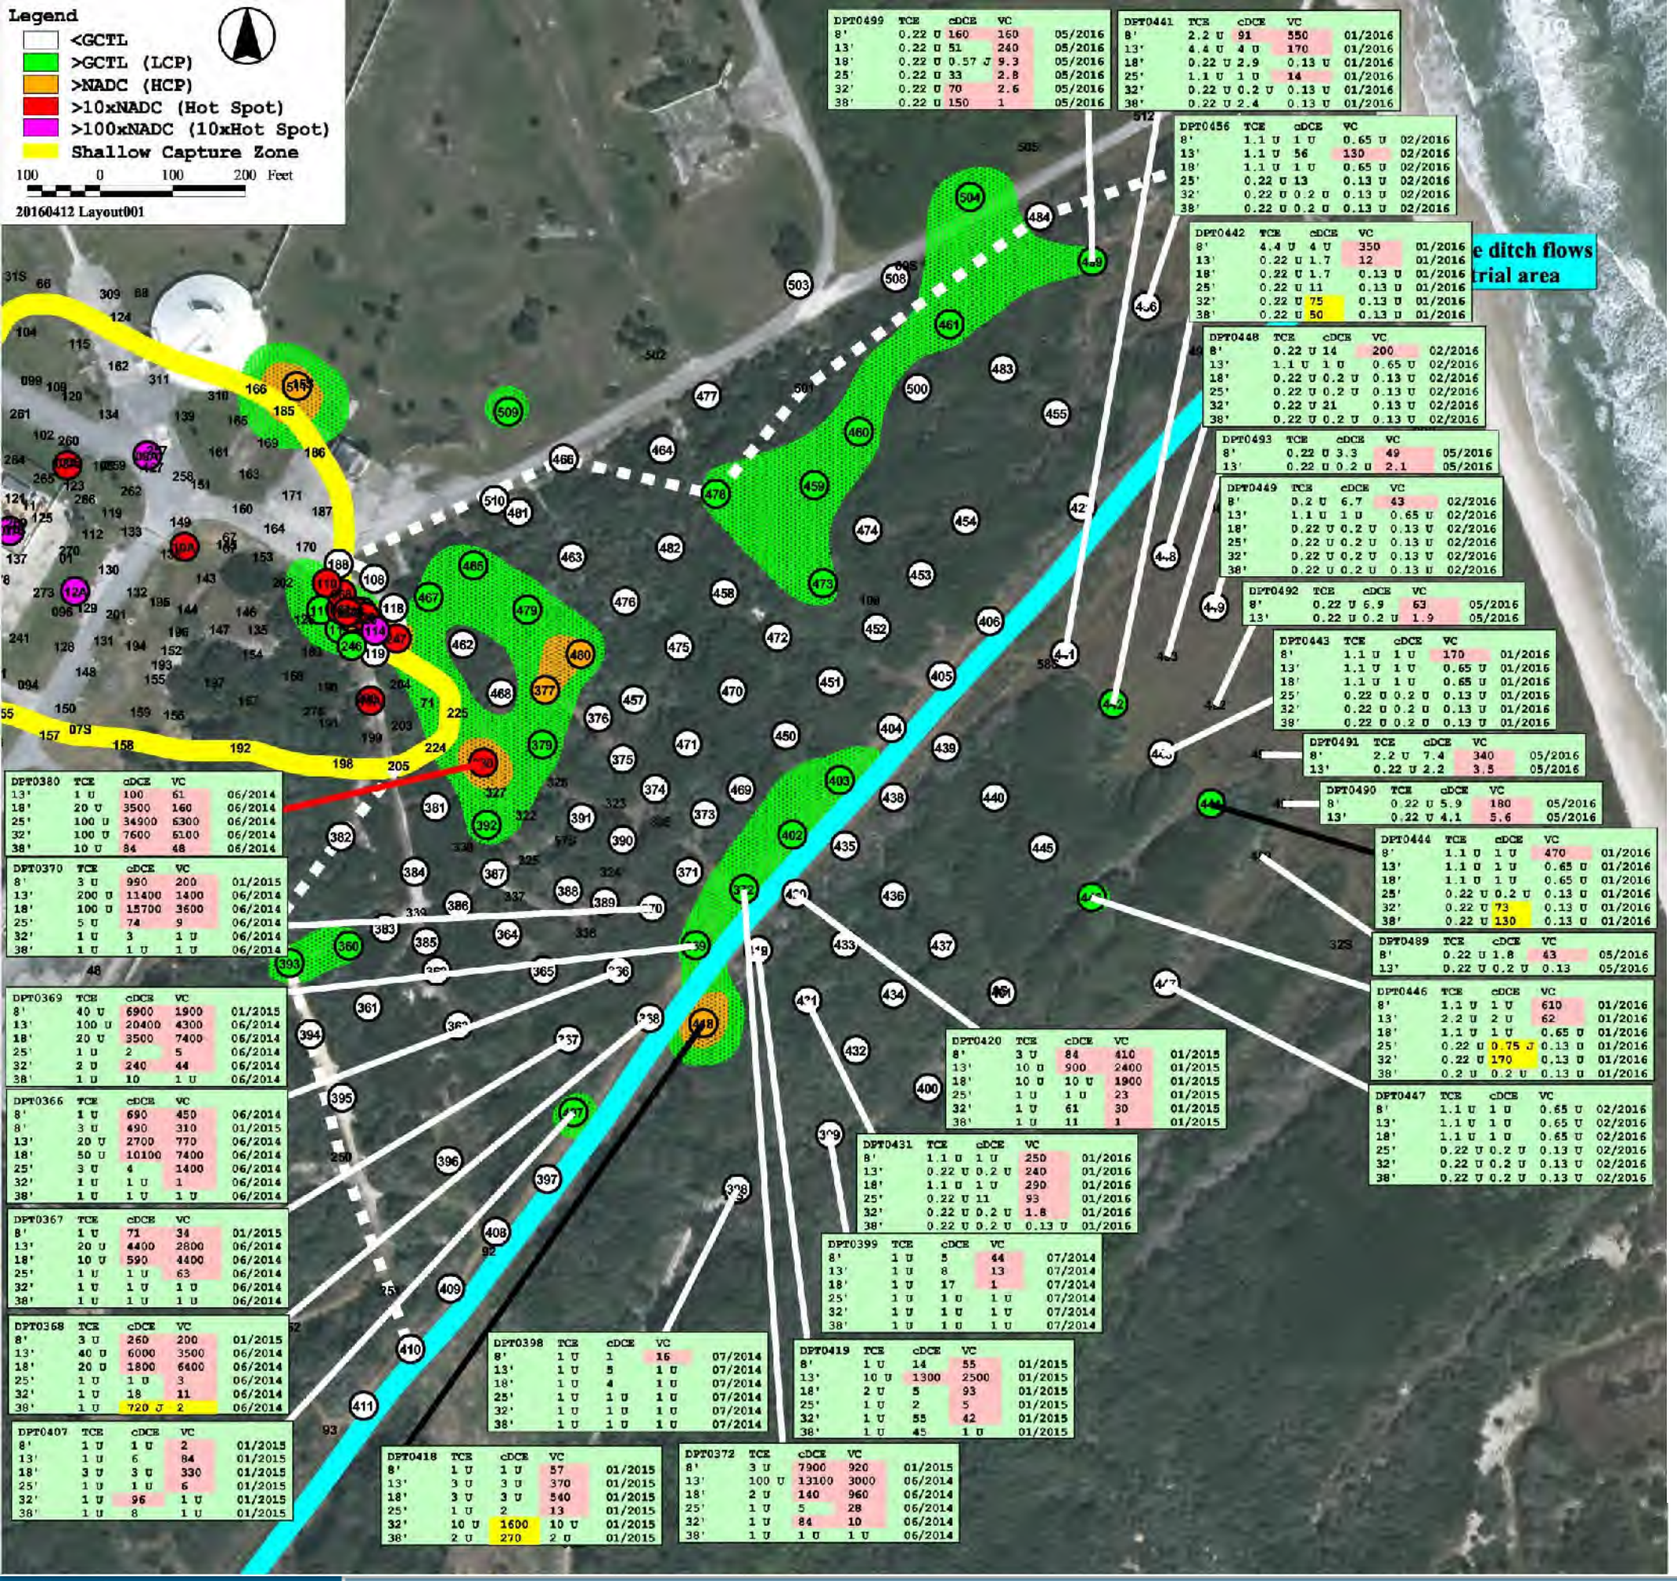
LCP, HCP, and Hot Spot present in this interval

DPT0390 has maximum cDCE (22,000 ug/L) detected in this interval that exceeds 10xNADC

Drainage ditch appears to be influencing plume, wet and dry seasons likely influence hydraulic recharge and discharge

Propose cDCE delineation in this interval

cDCE, Interval: 15 to 20 feet bls



LCP, HCP, and Hot Spot present in this interval

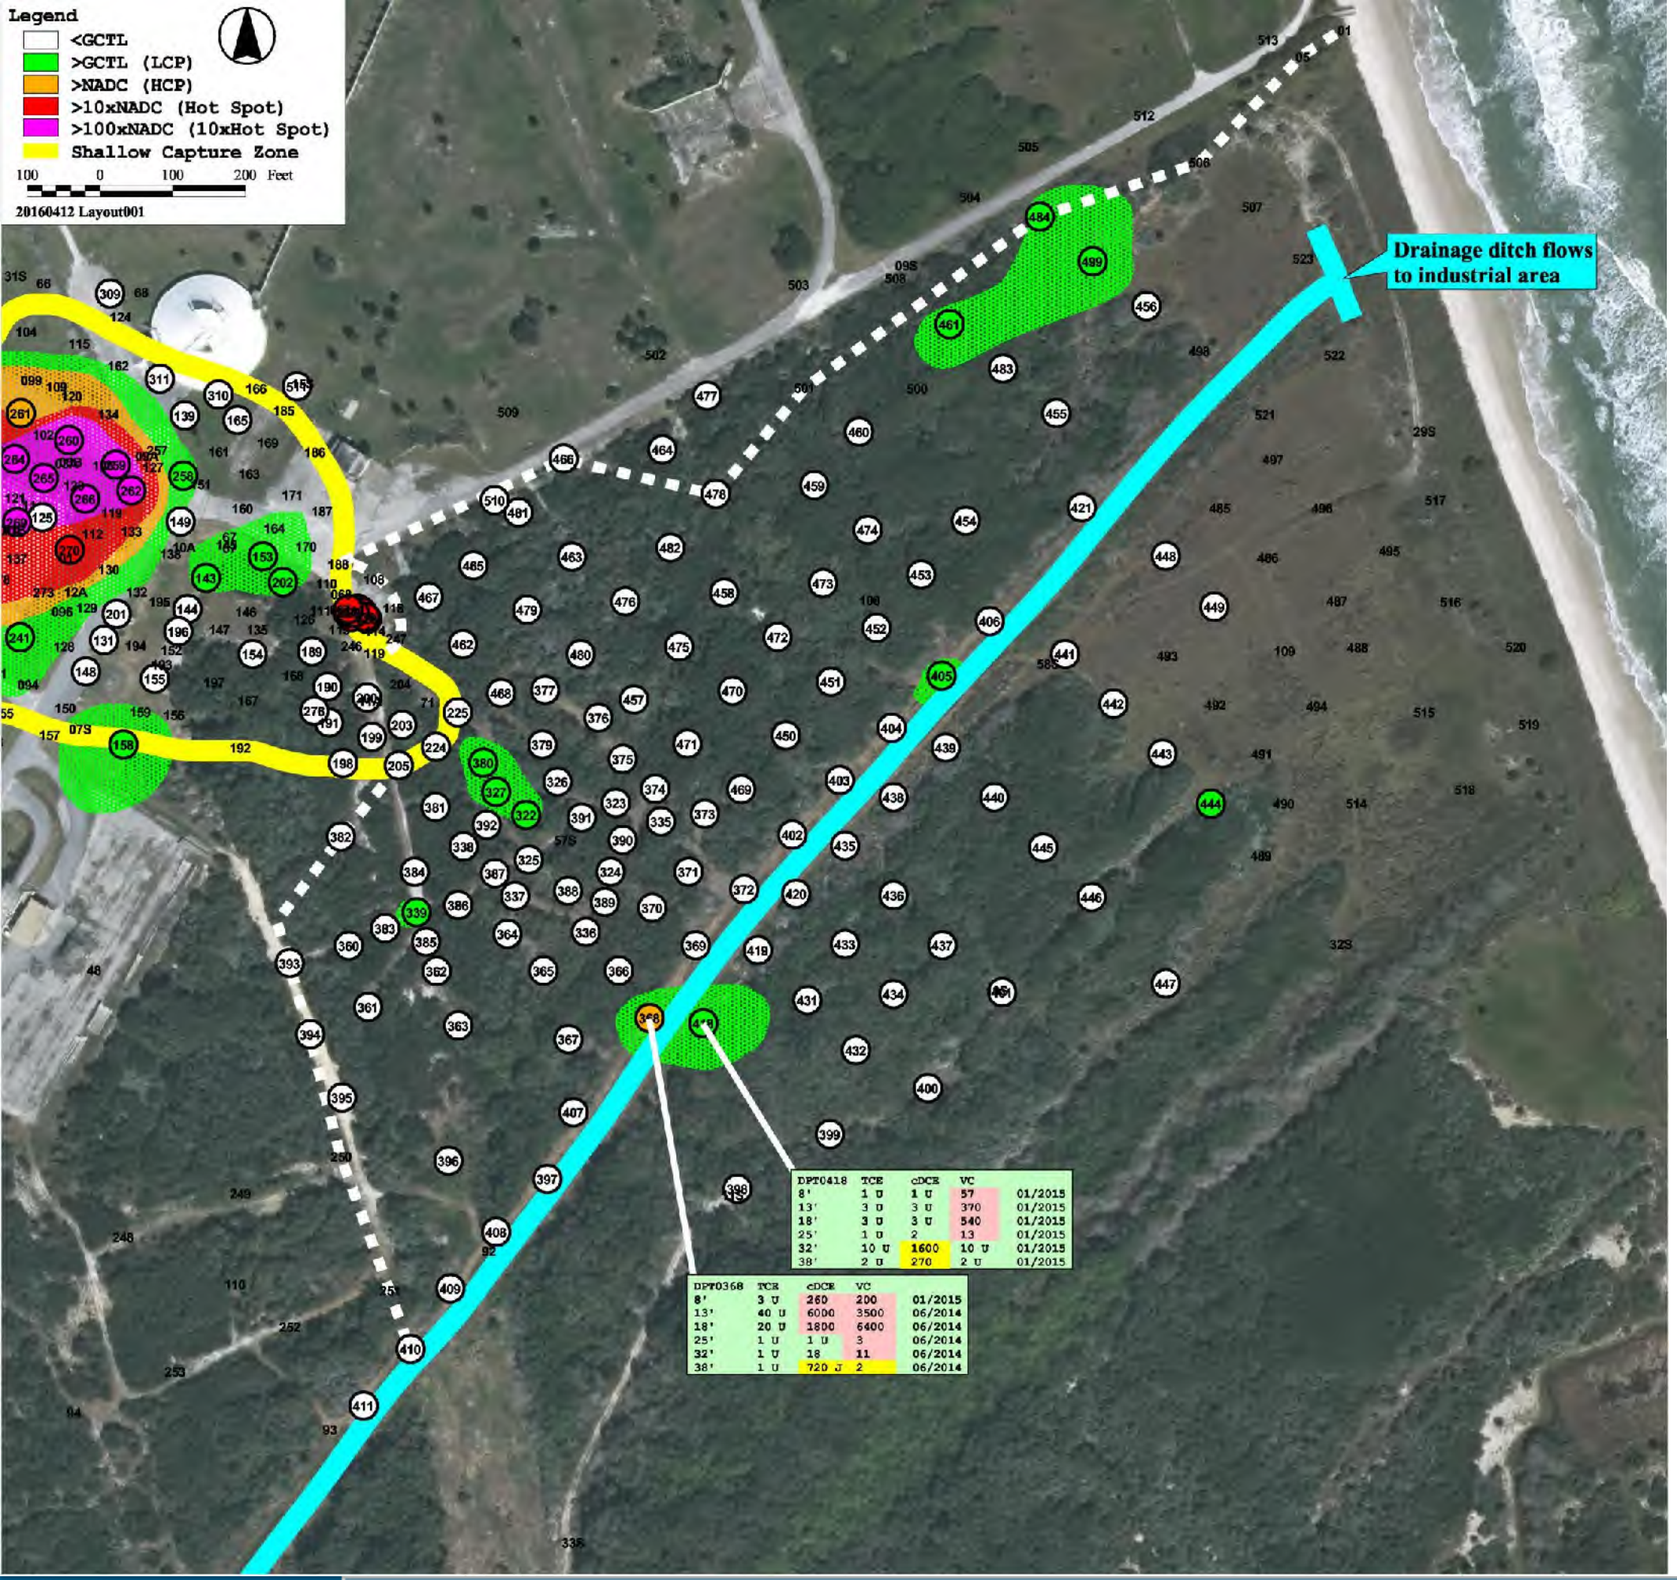
DPT0380 has maximum cDCE (34,900 ug/L) detected in this interval that exceeds 10xNADC

cDCE stops prior to drainage ditch

Propose cDCE delineation in this interval

cDCE, Interval: 20 to 28 feet bls

LCP and HCP present in this interval, only DPT0380 exceeds 10xNADC

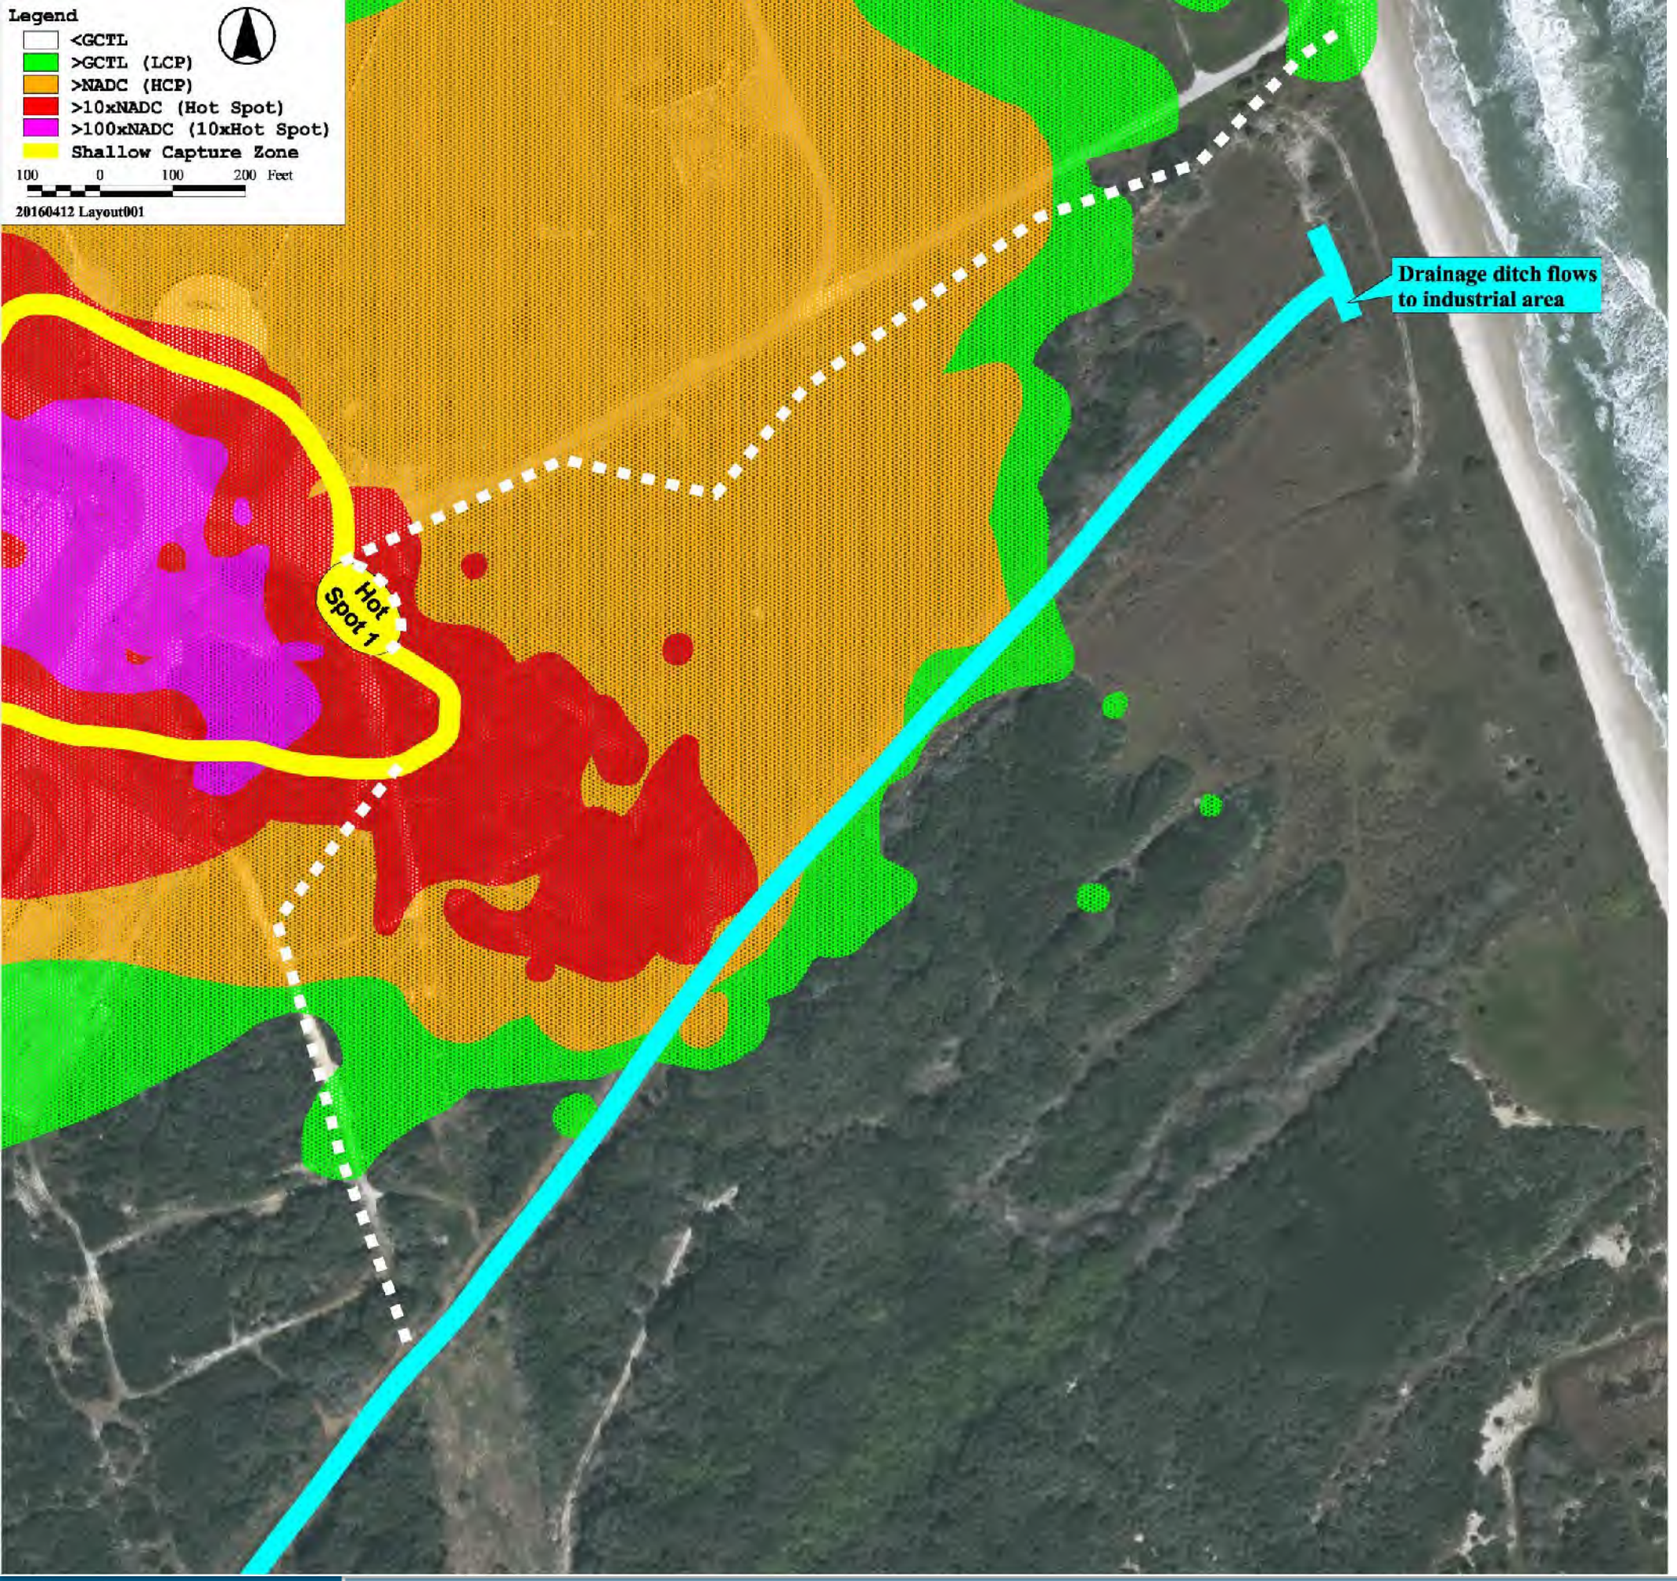


LCP along drainage ditch

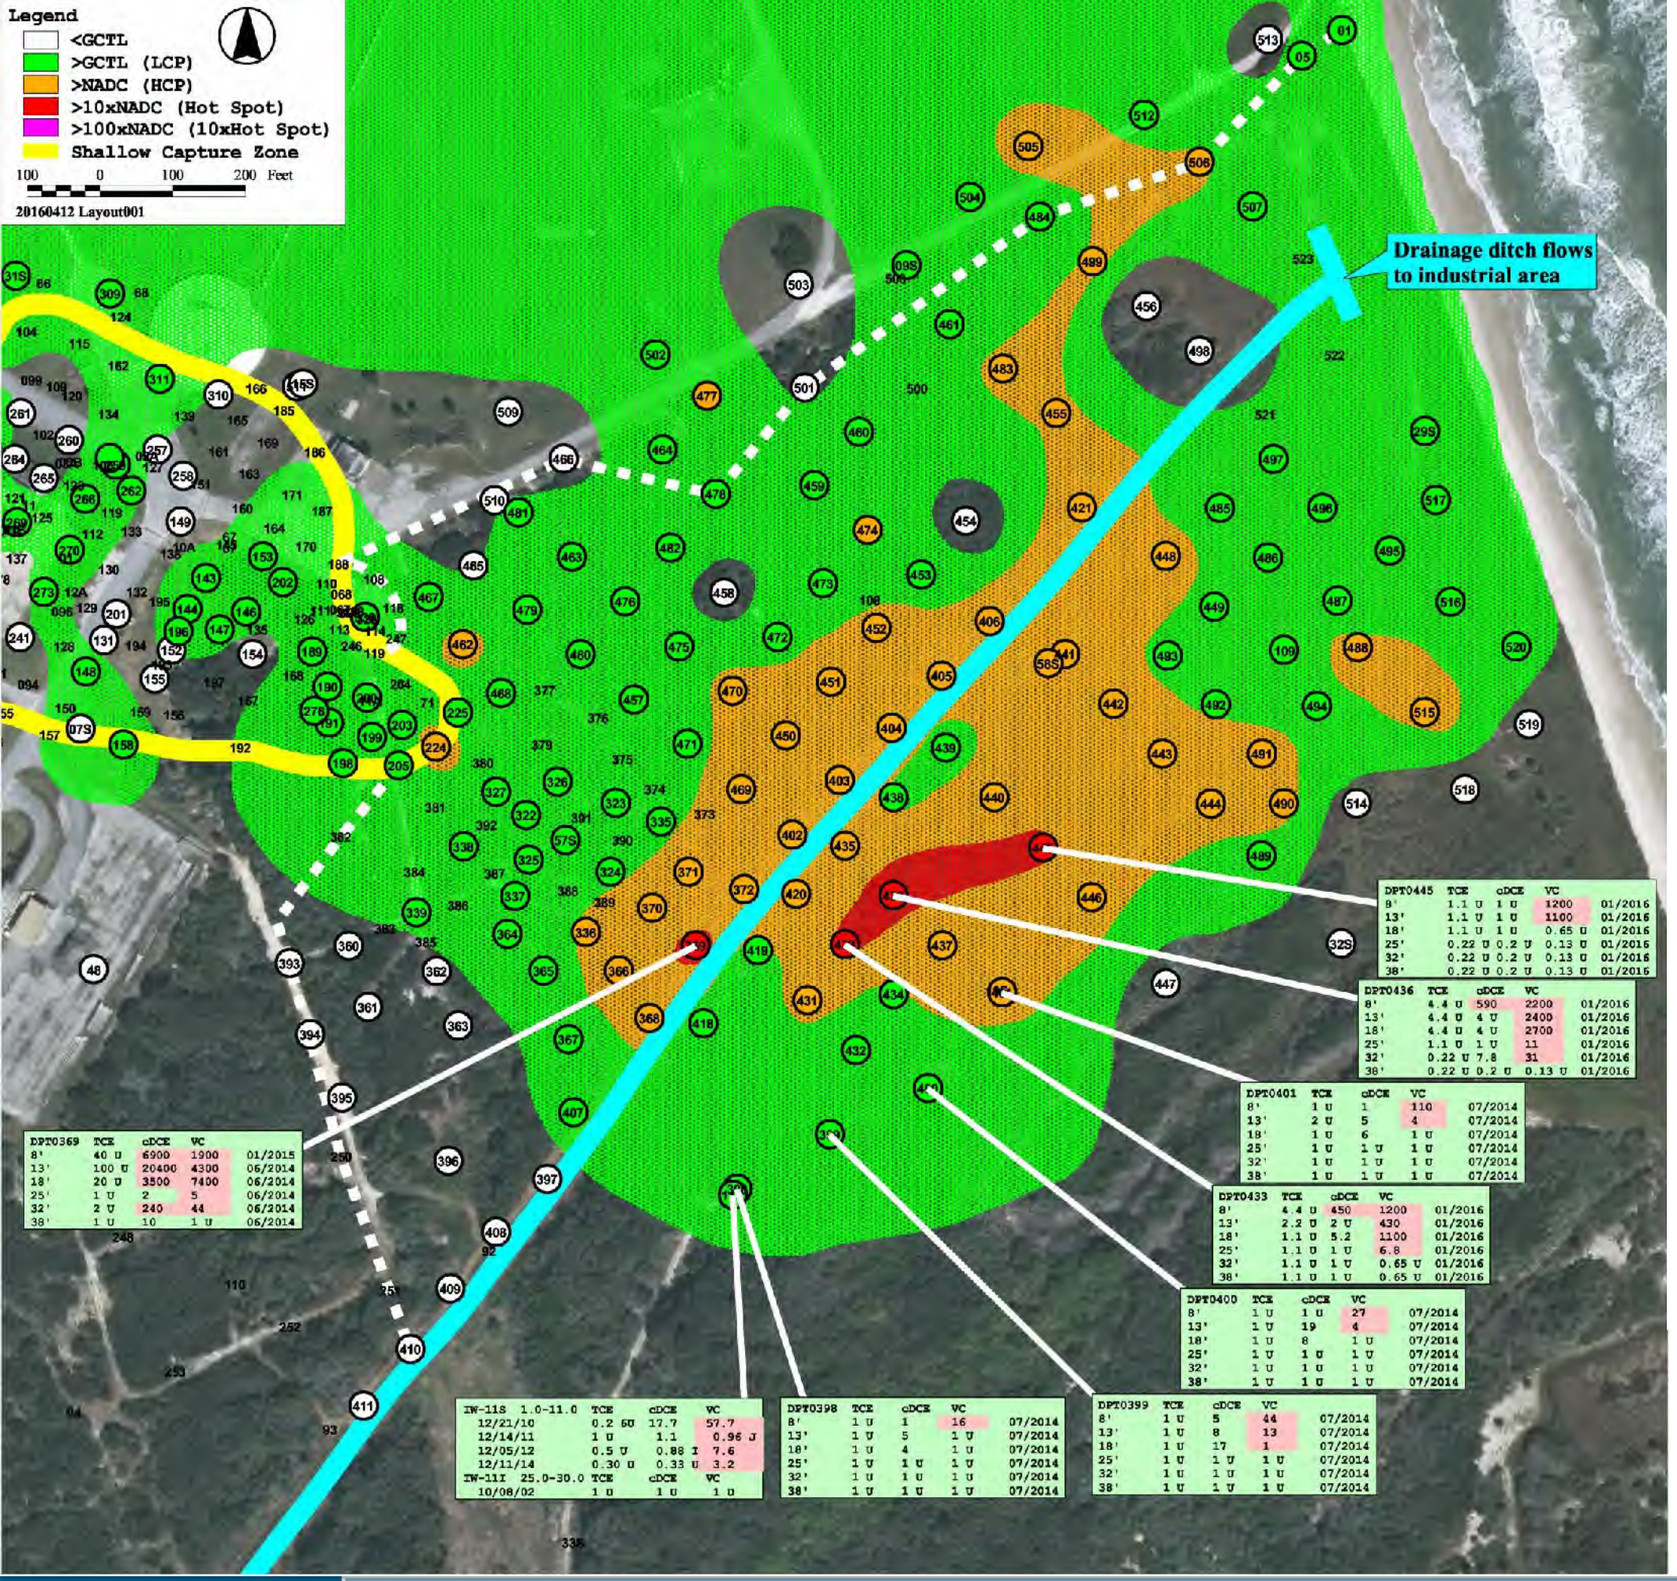
DPT0380 has maximum cDCE (7,600 ug/L) detected in this interval that exceeds 10xNADC

DPT0418 32’ cDCE detection of 1,600 ug/L appears to be suspect, propose not using for delineation and eliminating LCP and HCP around this sample

Propose cDCE delineation in this interval



cDCE, Interval: 28 to 34 feet bls

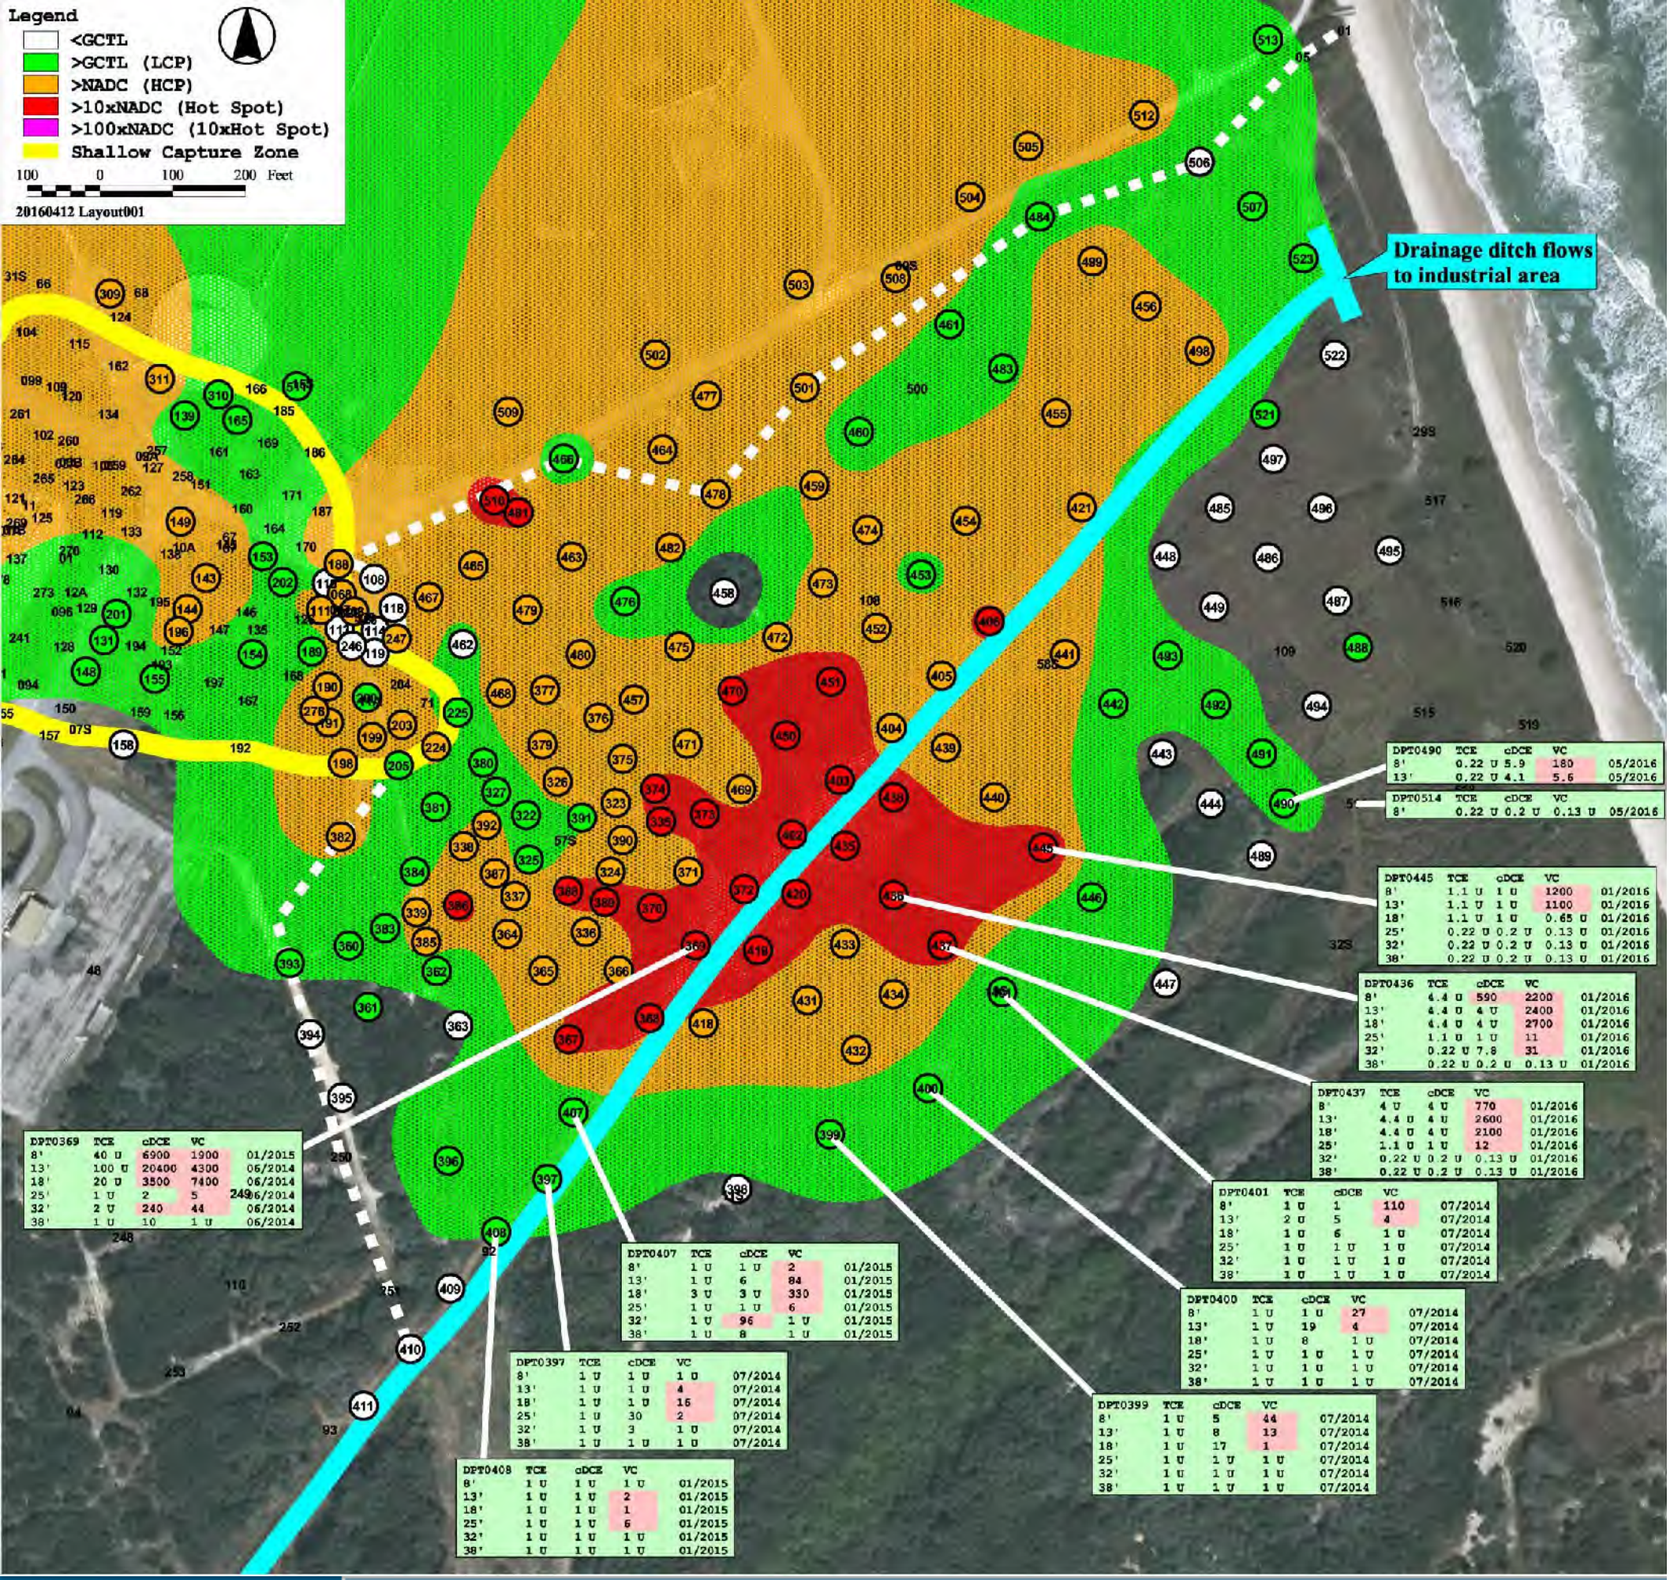


LCP and HCP present in this interval

DPTs 0368 and 0418 38' cDCE detections of 720 J and 270 ug/L appear to be suspect, propose not using for delineation and eliminating LCP and HCP around these samples

Propose cDCE delineation in this interval

All intervals combined for cDCE plume



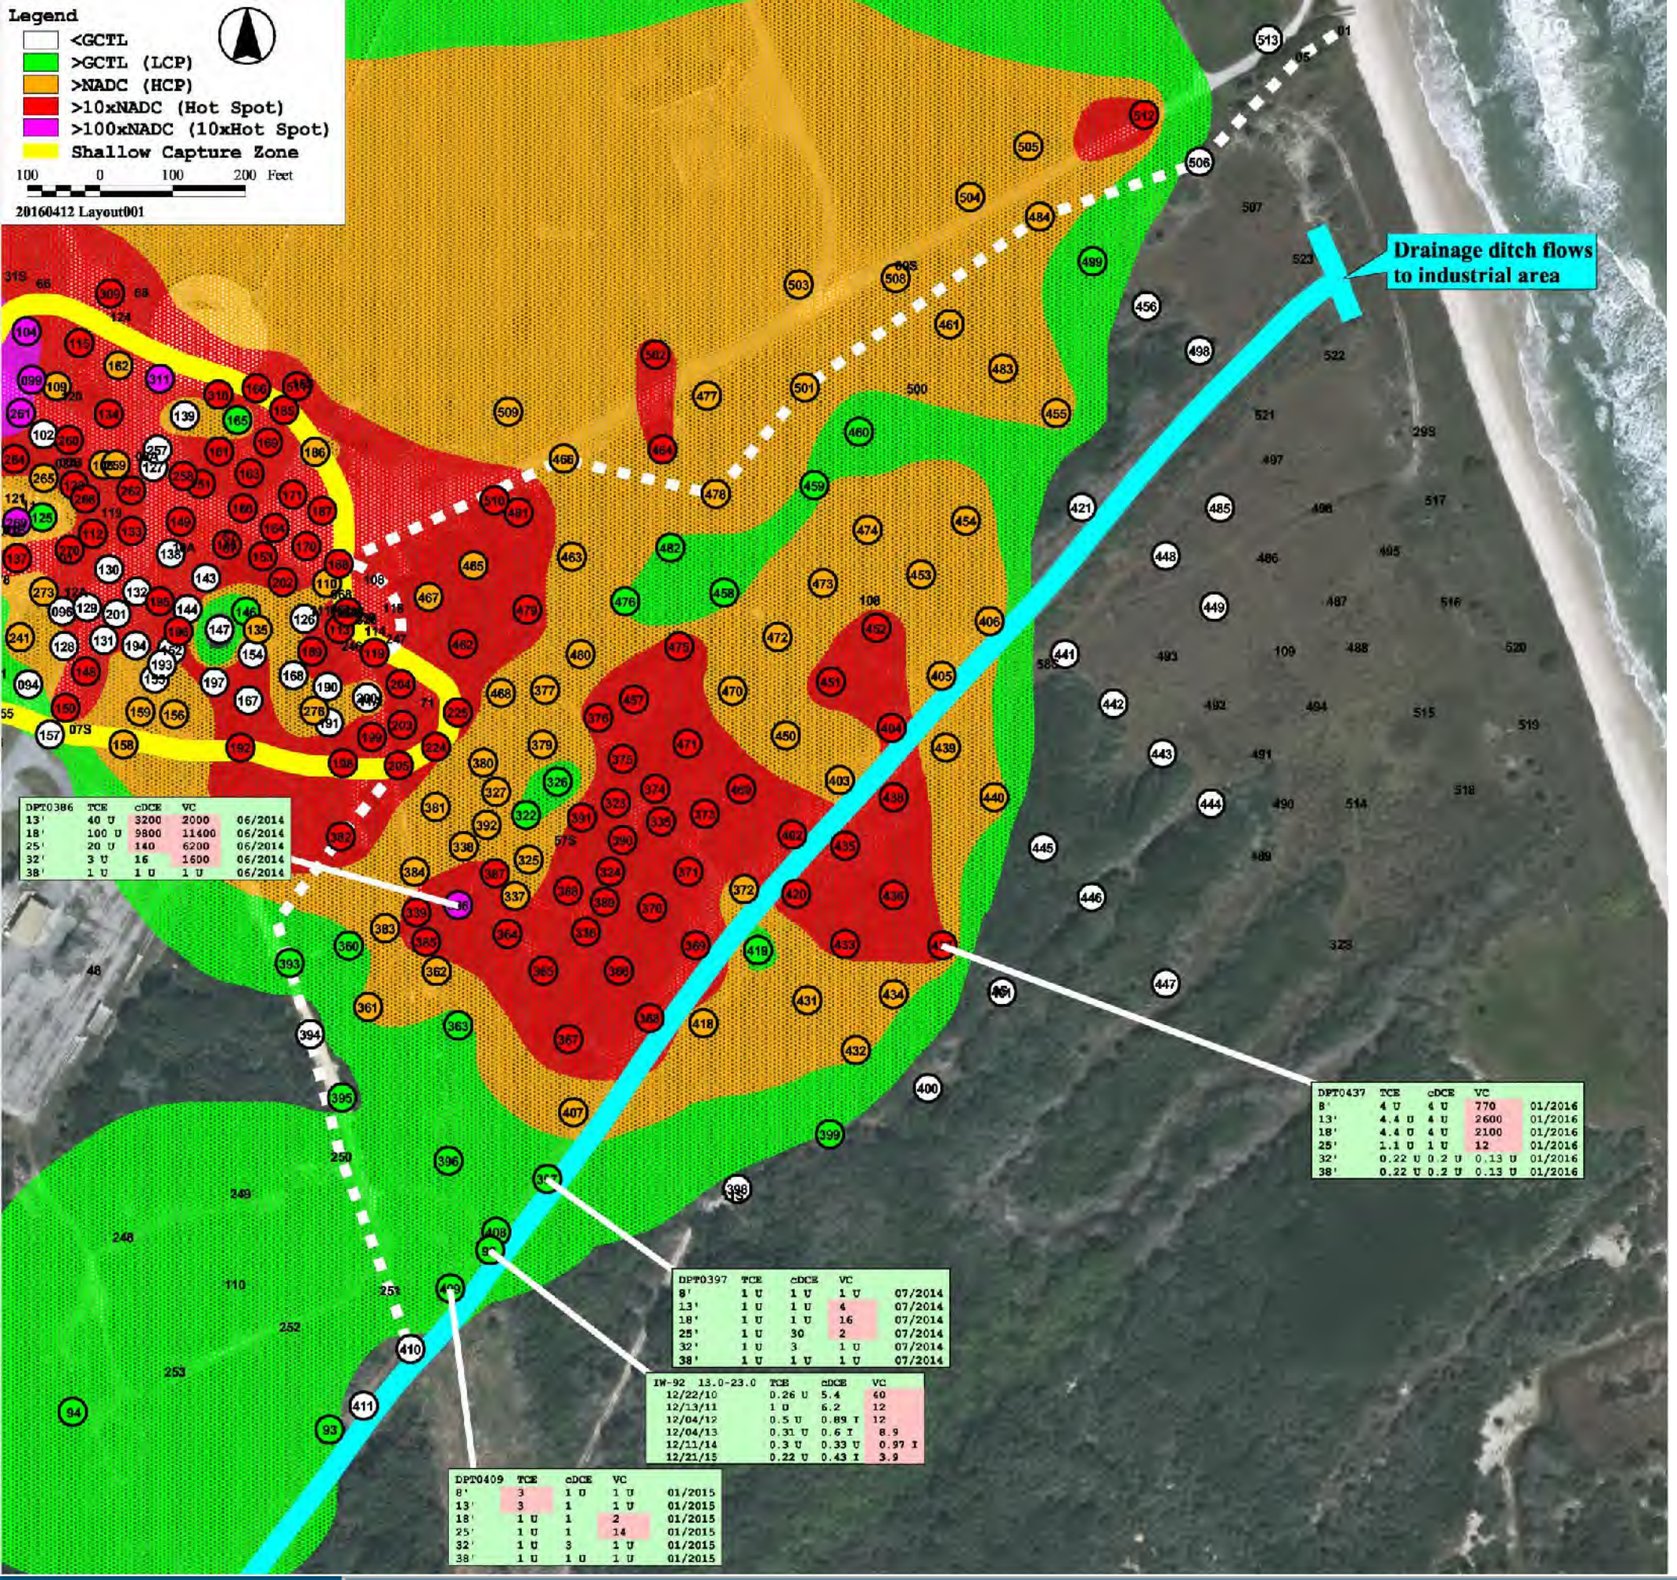
LCP, HCP, and Hot Spot are present in this interval and have passed beyond the drainage ditch

DPT0369 upstream of ditch and DPTs 0433, 0436, and 0445 downstream of ditch have VC detections exceeding 10xNADC at 1900, 1200, 2200, and 1200 ug/L

Access issues precluded collecting clean samples beyond IW11S and DPTs 0398, 0399, and 0400, VC detections are low level at 3.2, 16, 44, and 27 ug/L, propose these are adequate for LCP delineation in this interval

Propose VC delineation in this interval

LCP, HCP, and Hot Spot are present in this interval and have passed beyond the drainage ditch



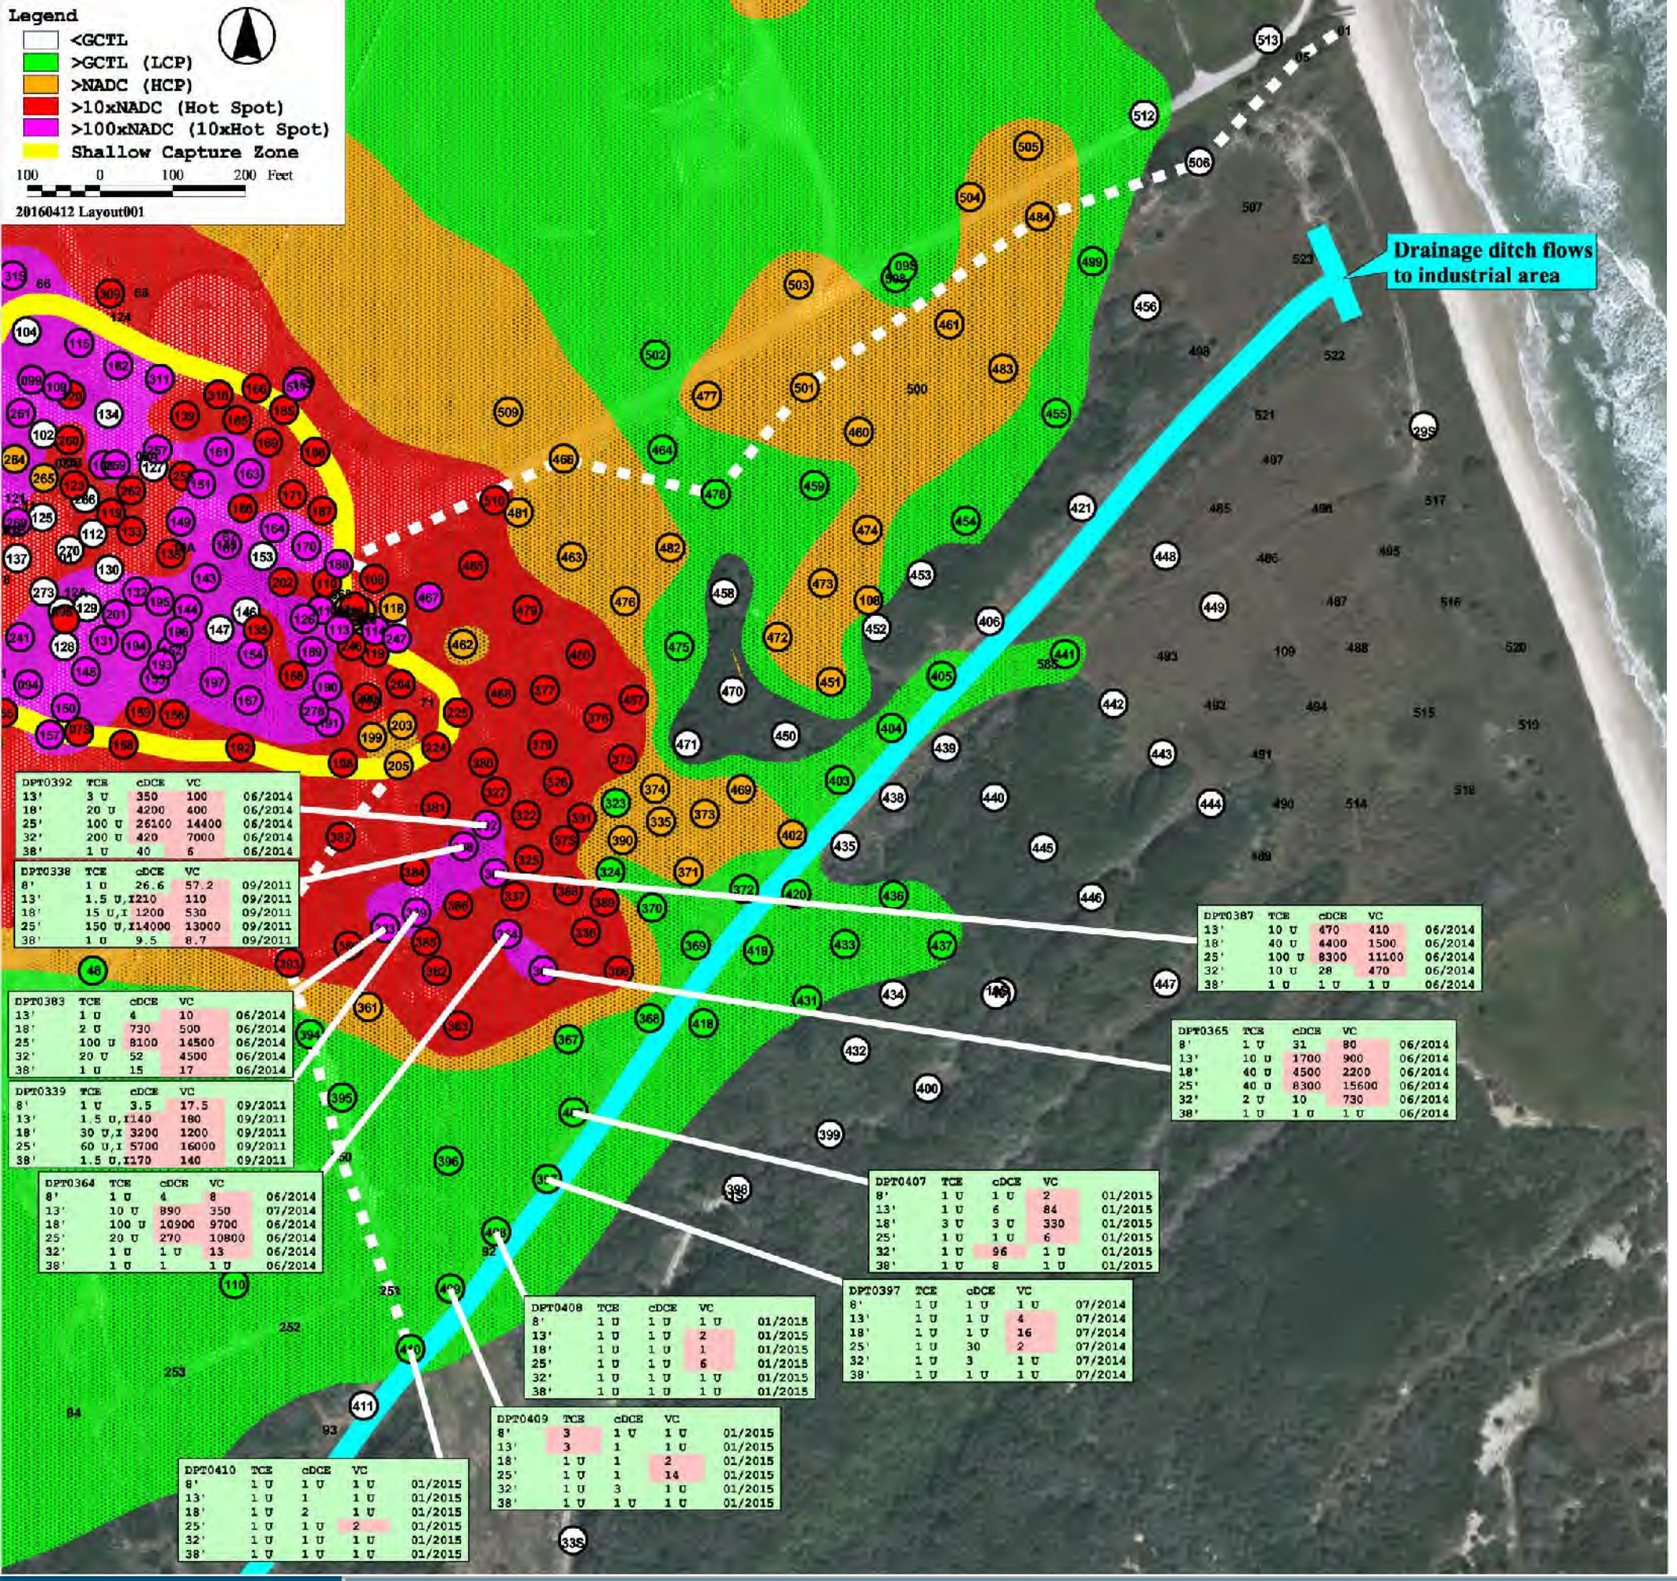
DPT0369 has maximum VC detection of 4300 ug/L in this interval, downstream detections in DPTs 0437, 0436, and 0445 shown exceed 10xNADC at 2600, 2400, and 1100 ug/L

Access issues precluded collecting clean samples beyond DPTs 0399, 0400, and 0401, VC detections are low level at 13, 4, and 4 ug/L, propose these are adequate for LCP delineation in this interval

Propose DPTs 0408, 0397, and 0490 are adequate for LCP delineation

Propose VC delineation in this interval

VC, Interval: 10 to 15 feet bls



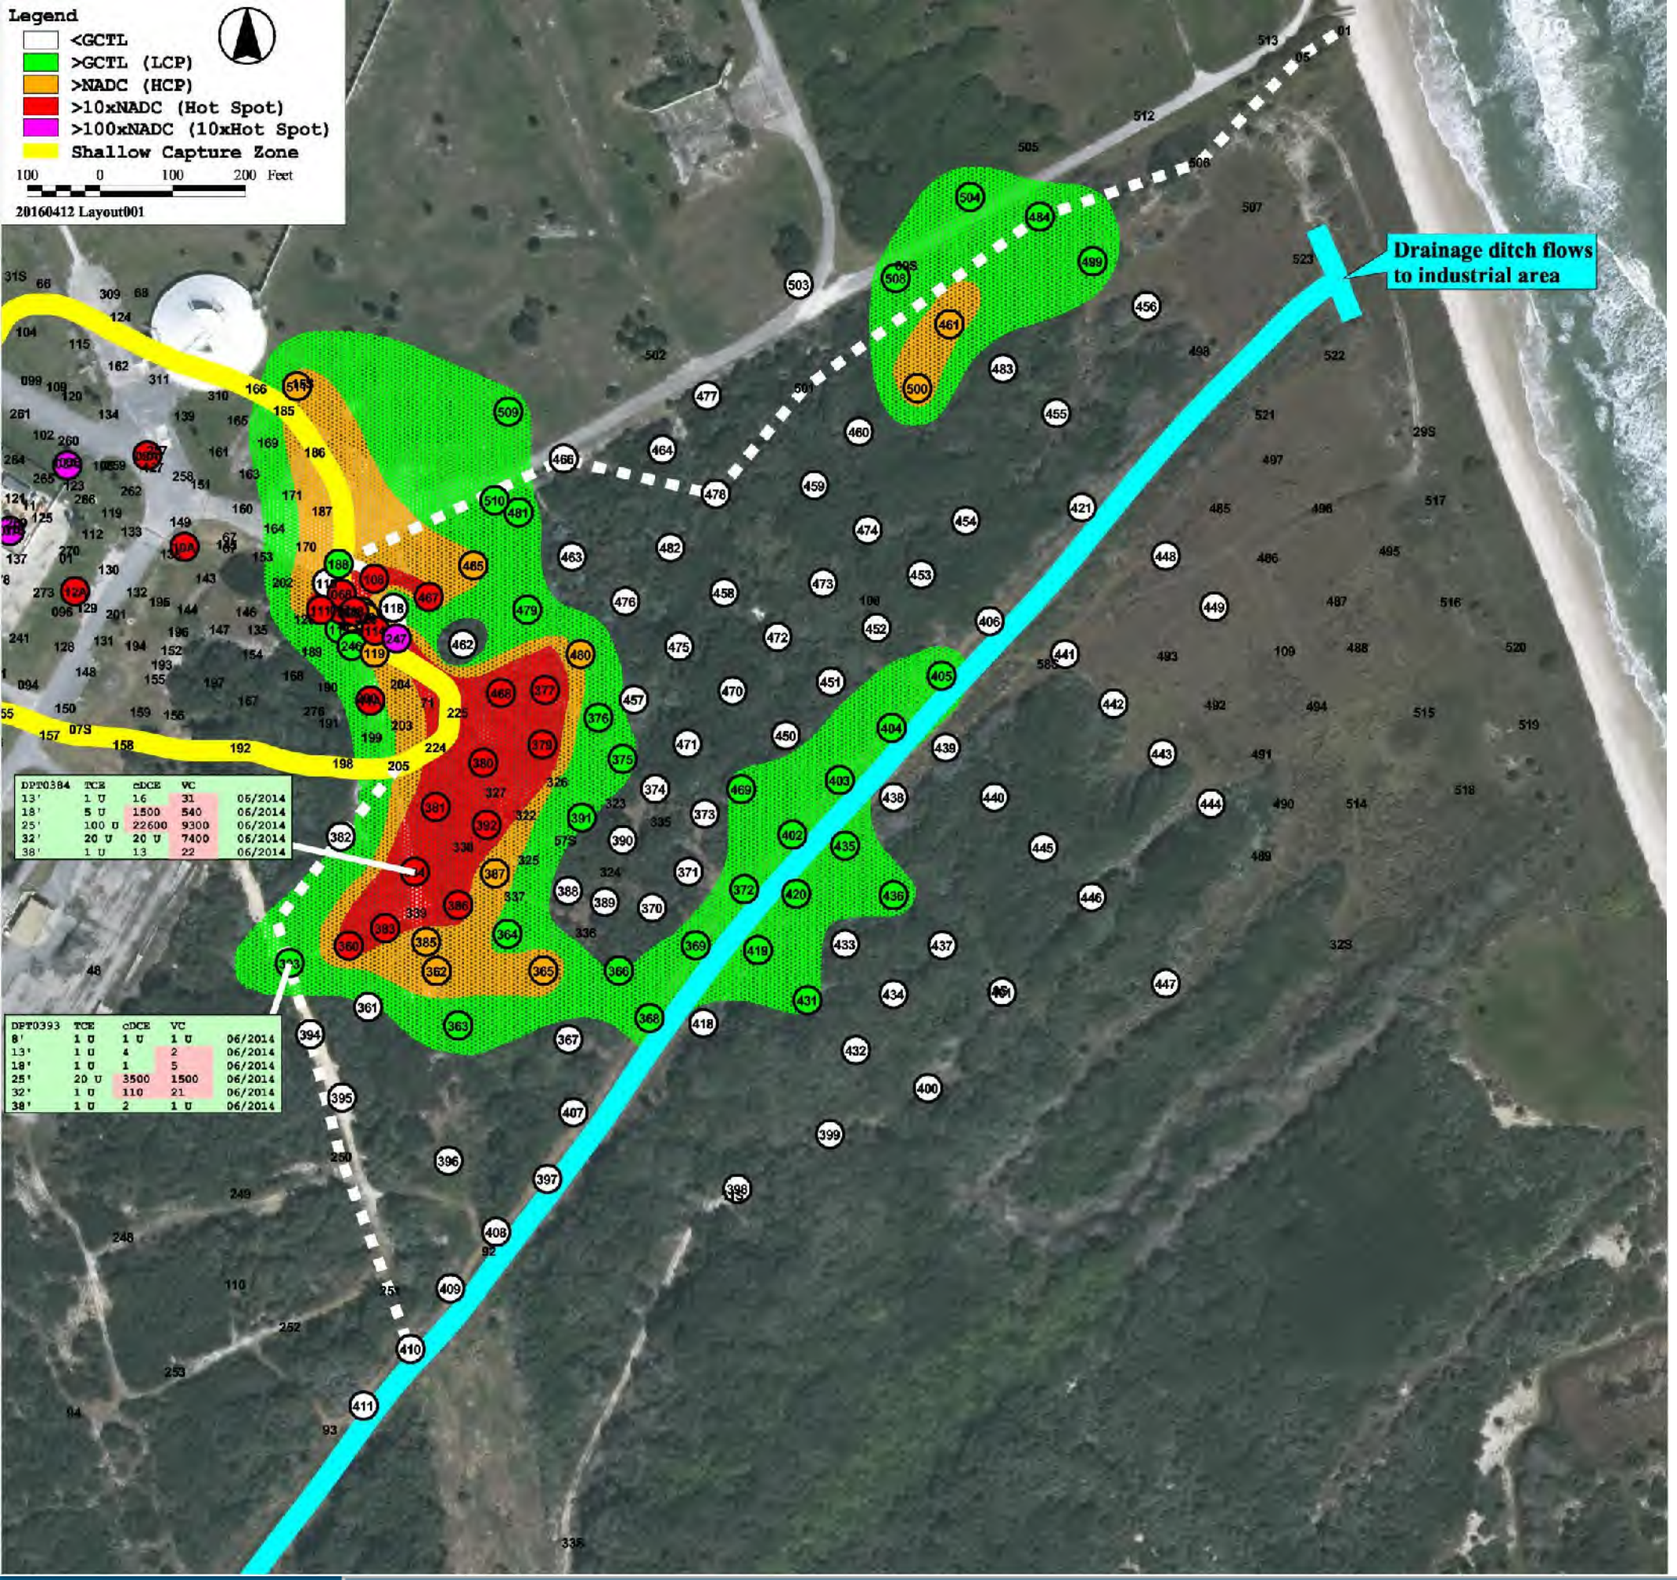
LCP, HCP, and Hot Spot are present in this interval and have passed beyond the drainage ditch

DPT0386 has maximum VC detection of 11,400 ug/L in this interval

Propose DPTs 0409 and 0397 are adequate for LCP delineation

Propose VC delineation in this interval

VC, Interval: 15 to 20 feet bls

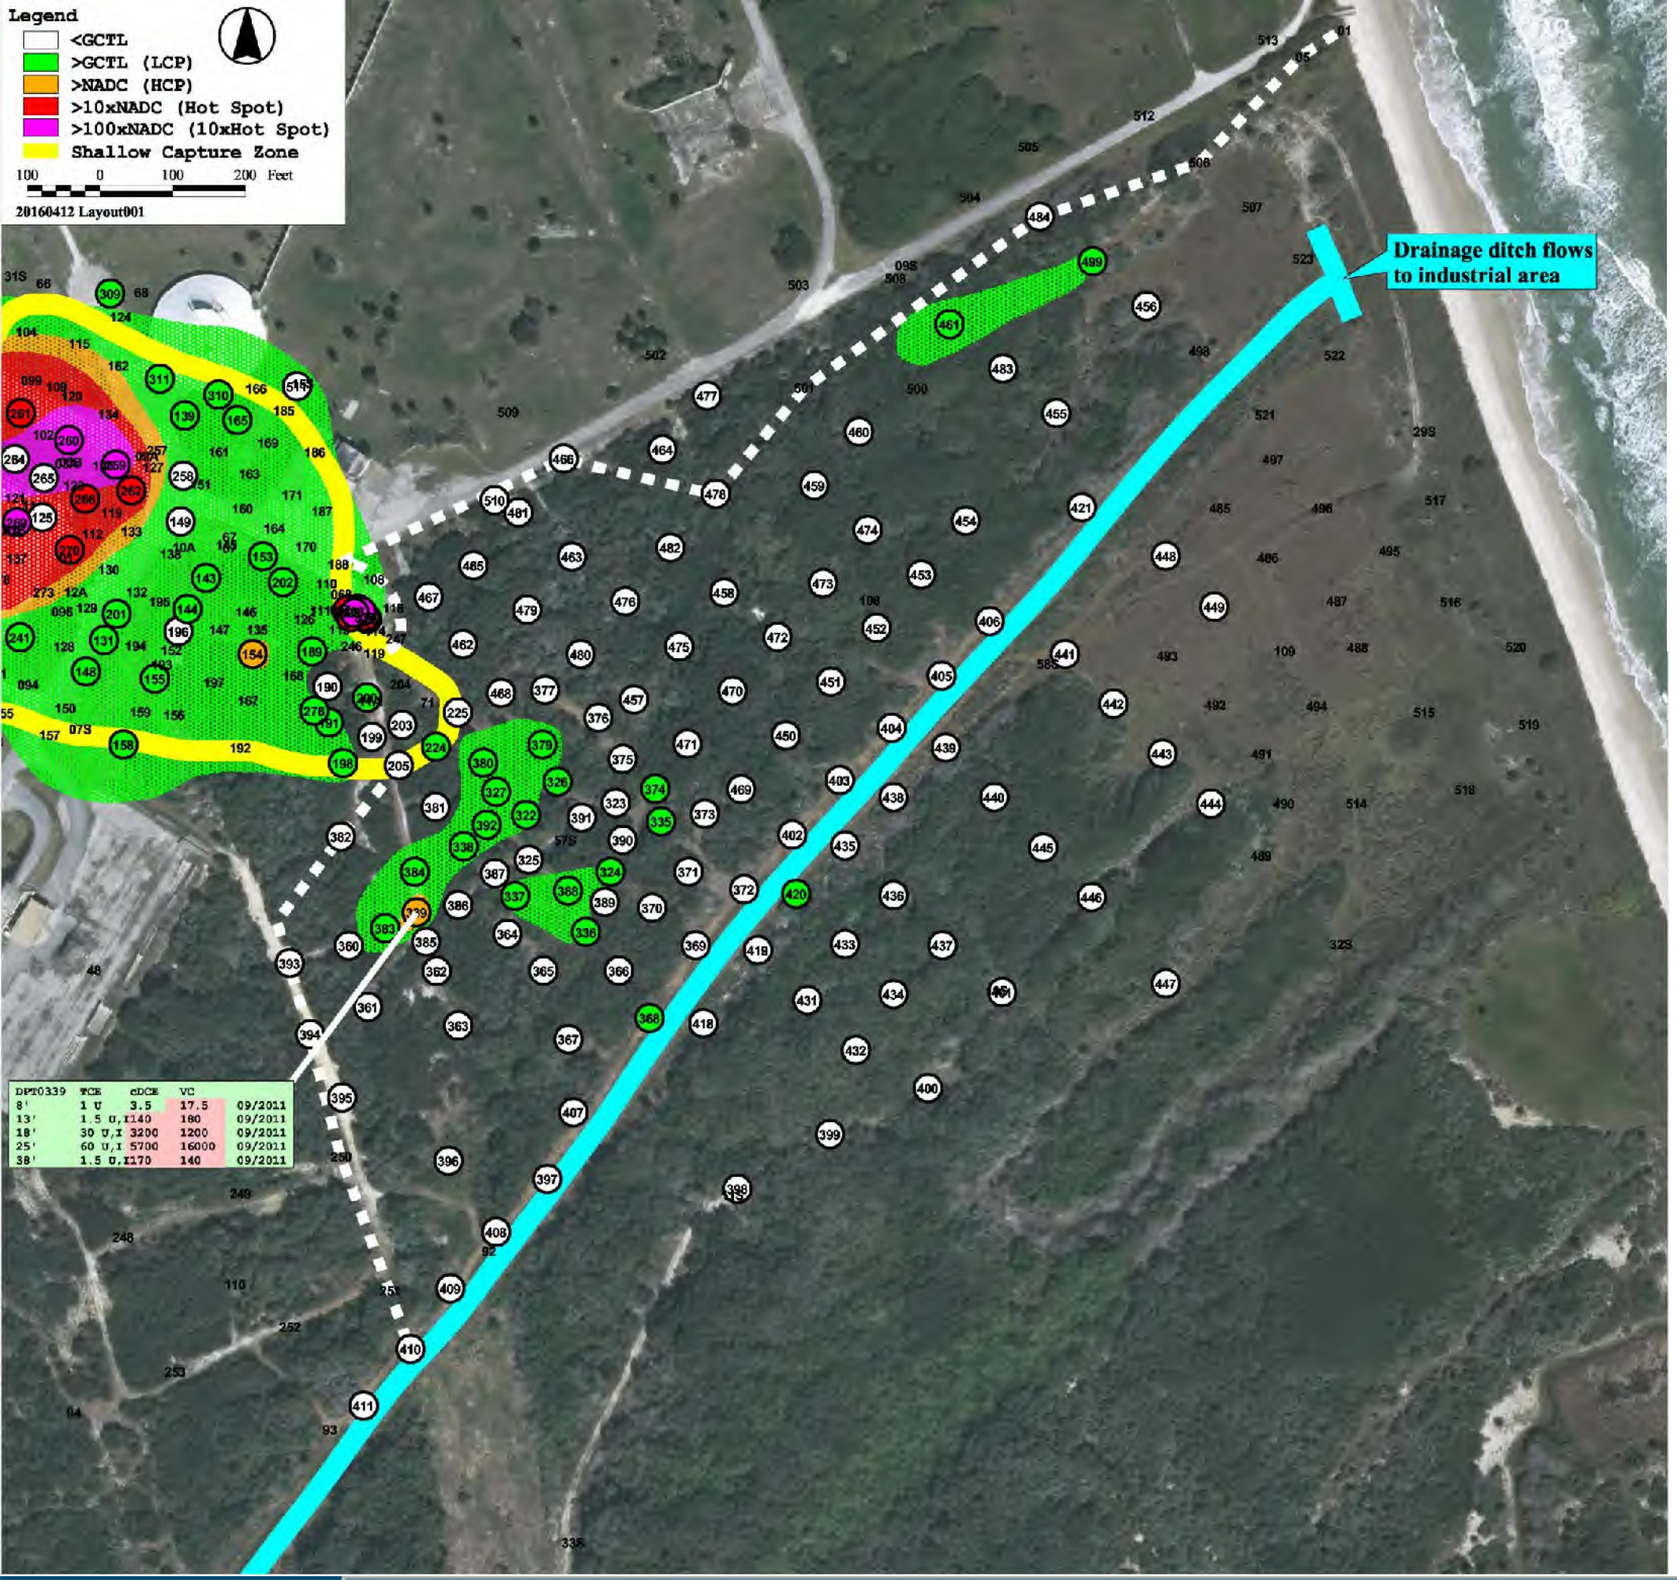


LCP, HCP, Hot Spot, and 10xHot Spot are present in this interval, only LCP has passed beyond the drainage ditch

DPTs 0338, 0339, 0364, 0365, 0383, 0387, and 0392 have VC detections exceeding 100xNADC, maximum of 16000 ug/L at DPT0339

Propose DPTs 0410, 0409, 0408, 0397, and 0407 are adequate for LCP delineation

Propose VC delineation in this interval

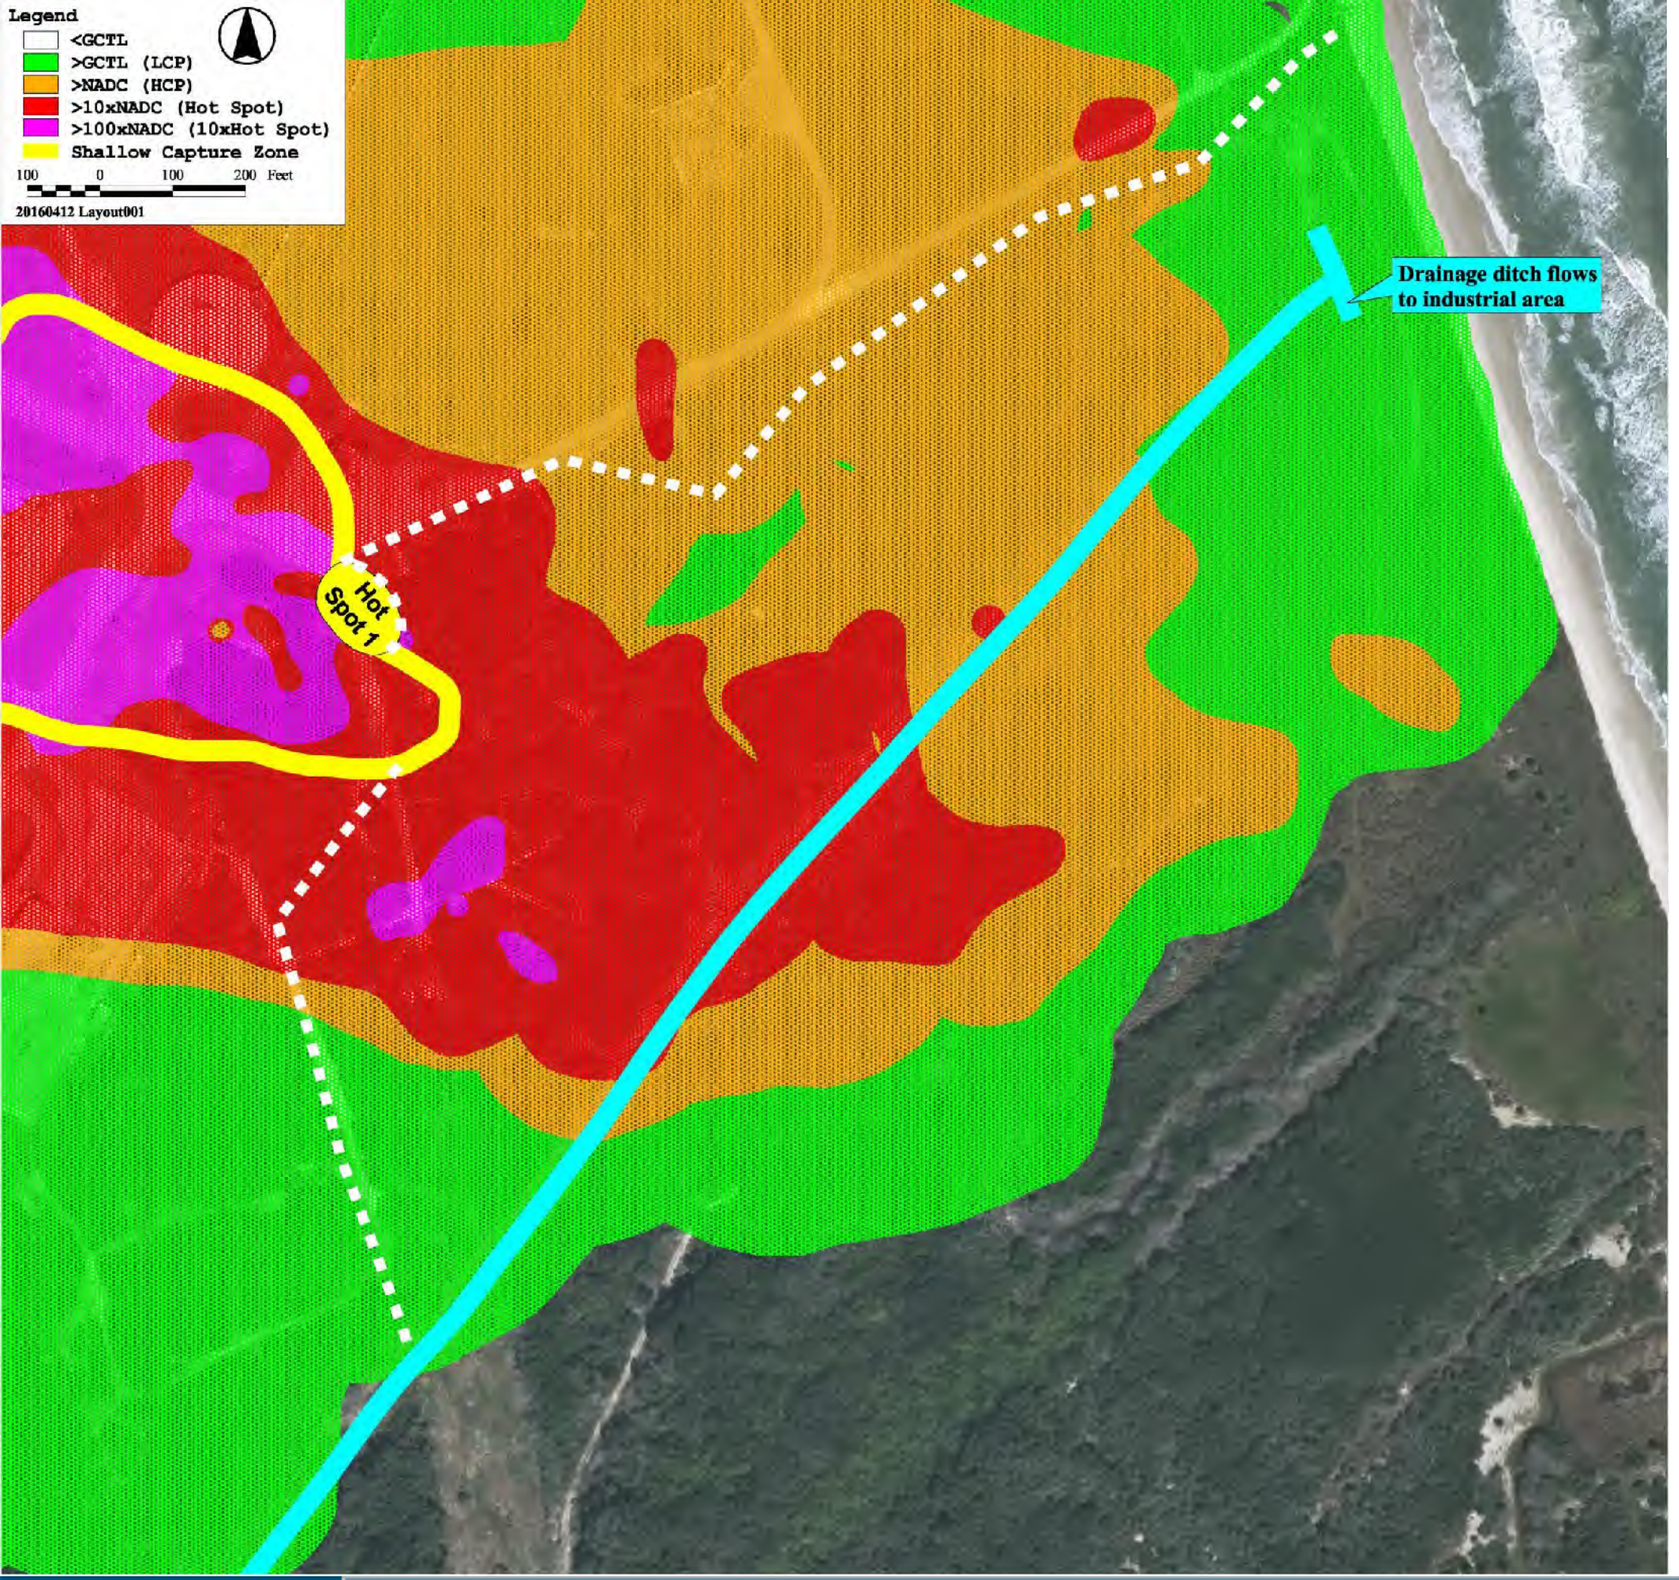


LCP, HCP, and Hot Spot are present in this interval, only LCP has passed beyond the drainage ditch

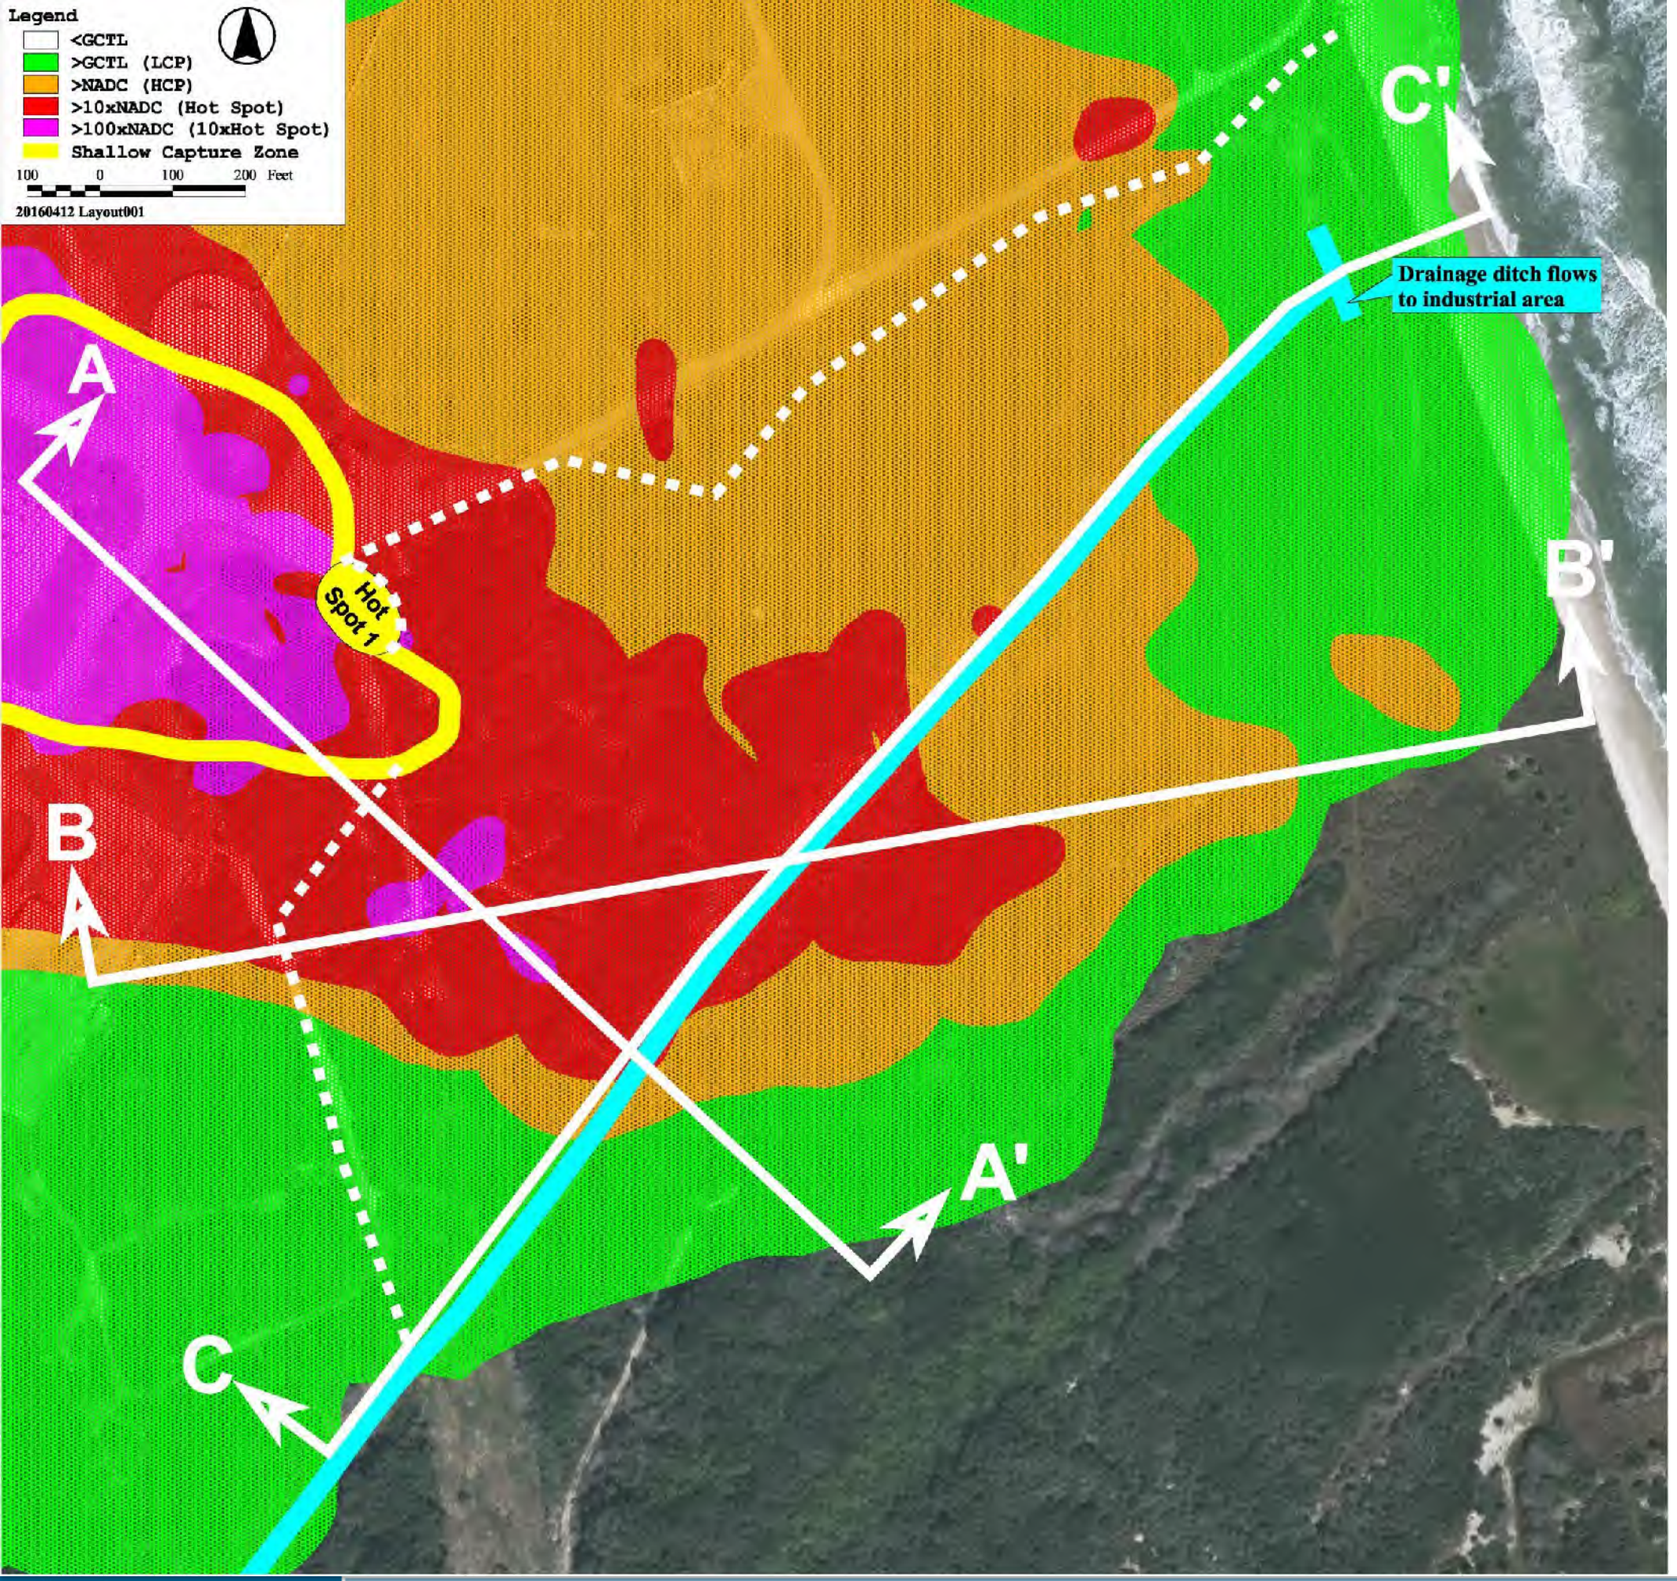
DPT0384 has maximum VC detection 7400 ug/L exceeding 10xNADC

Propose DPT0393 is adequate for LCP delineation

Propose VC delineation in this interval



LCP present in this interval

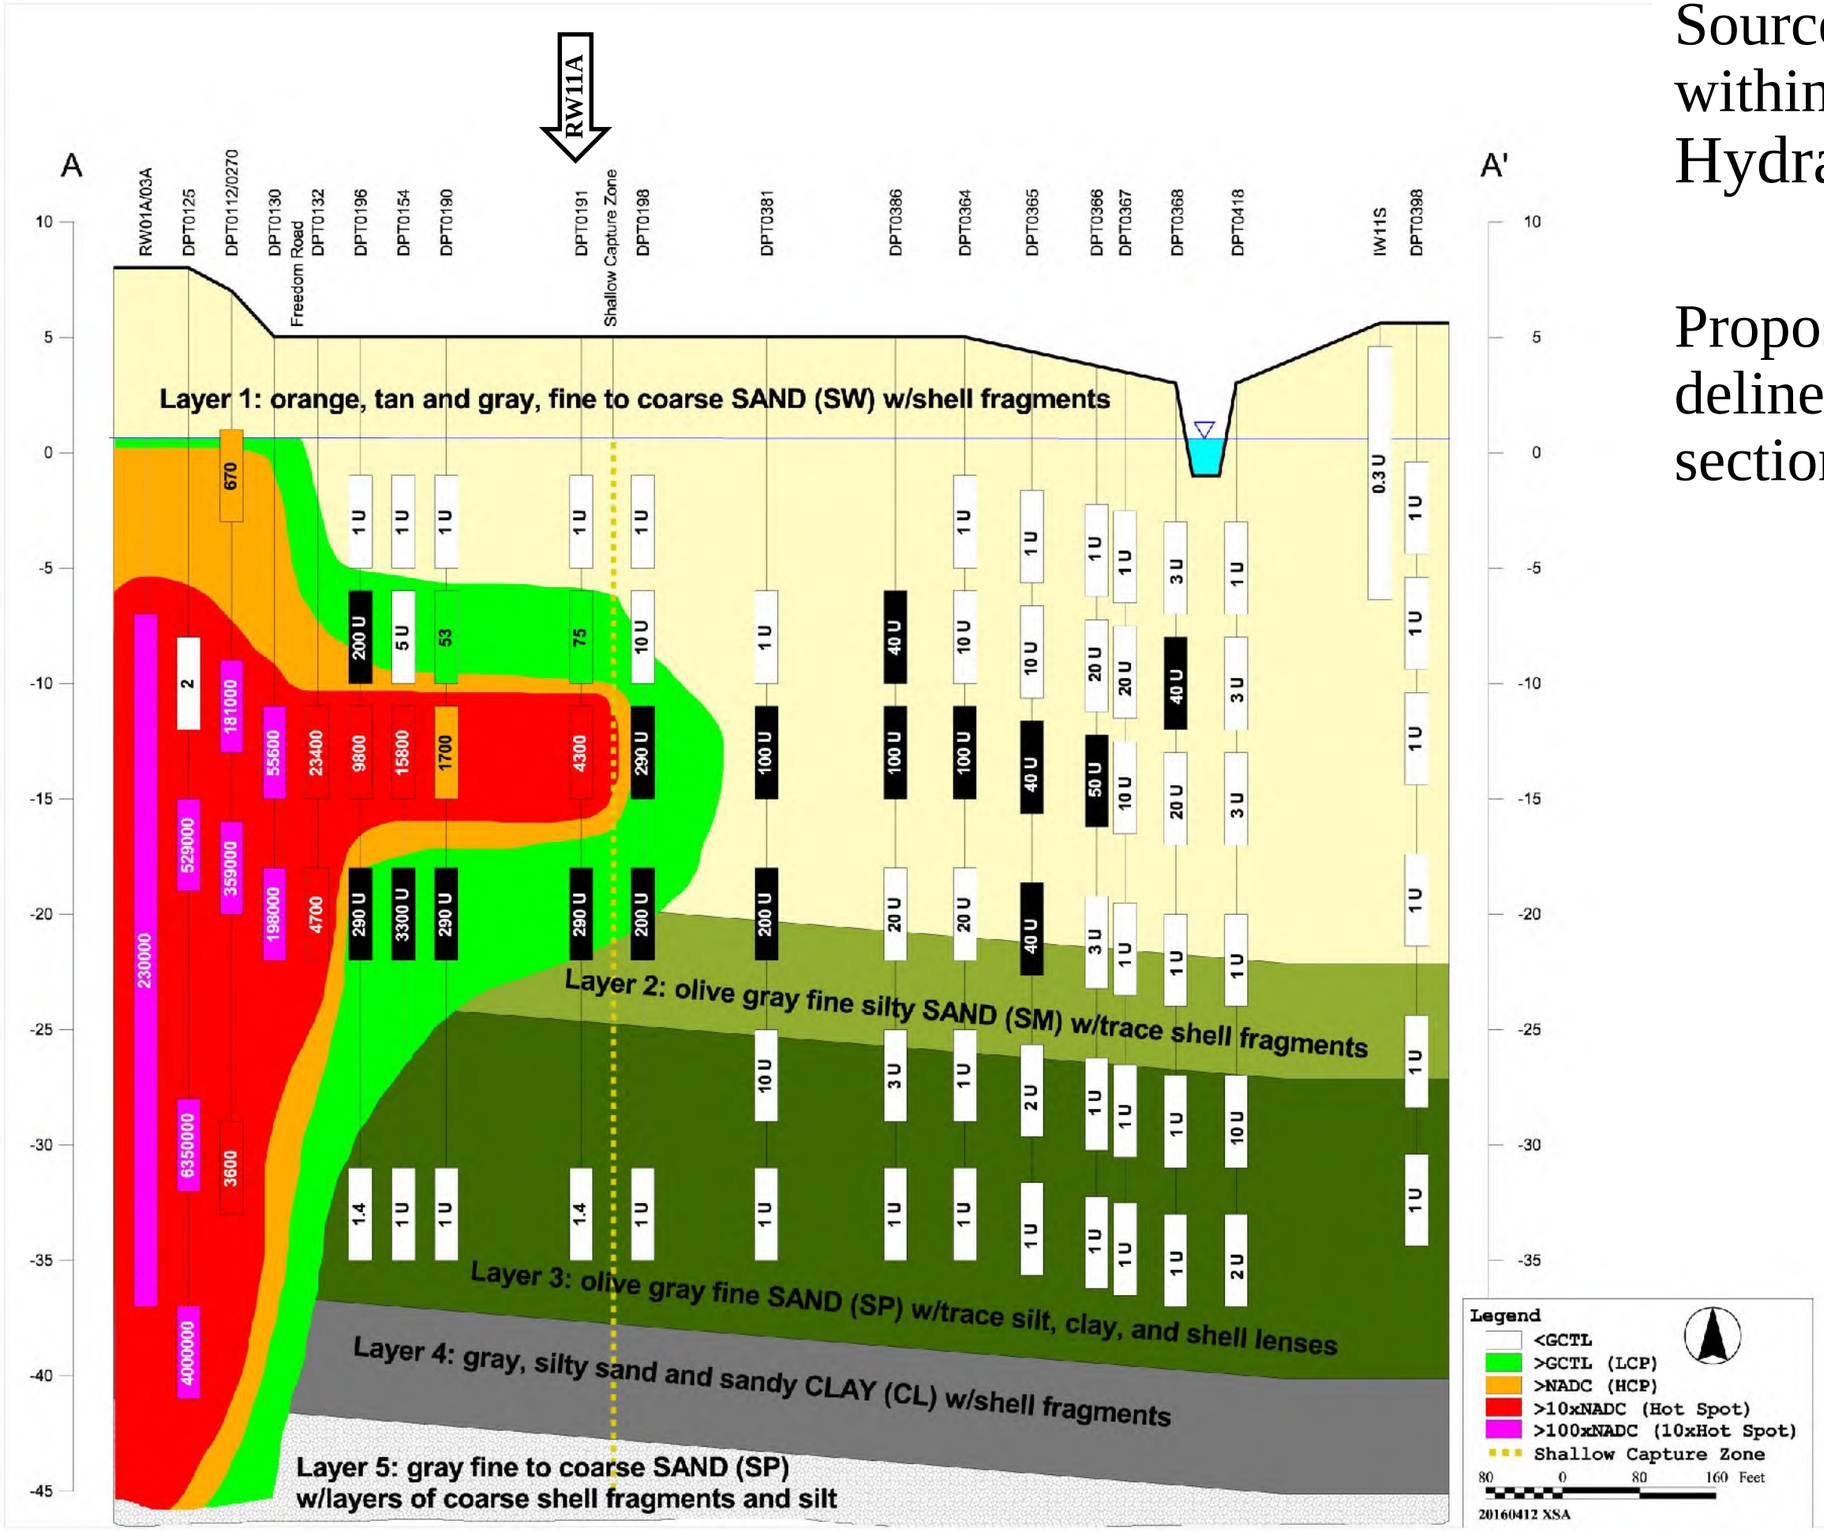


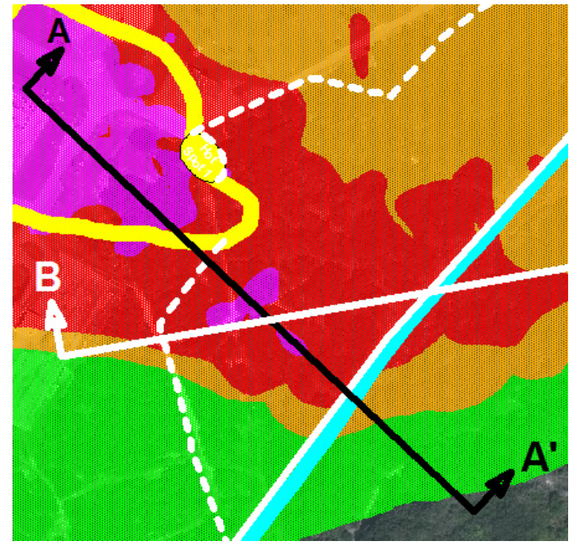
DPT0339 has only VC detection exceeding NADC at 140 ug/L, this location also had the highest detection in 20’ to 28’ interval

Propose VC delineation in this interval

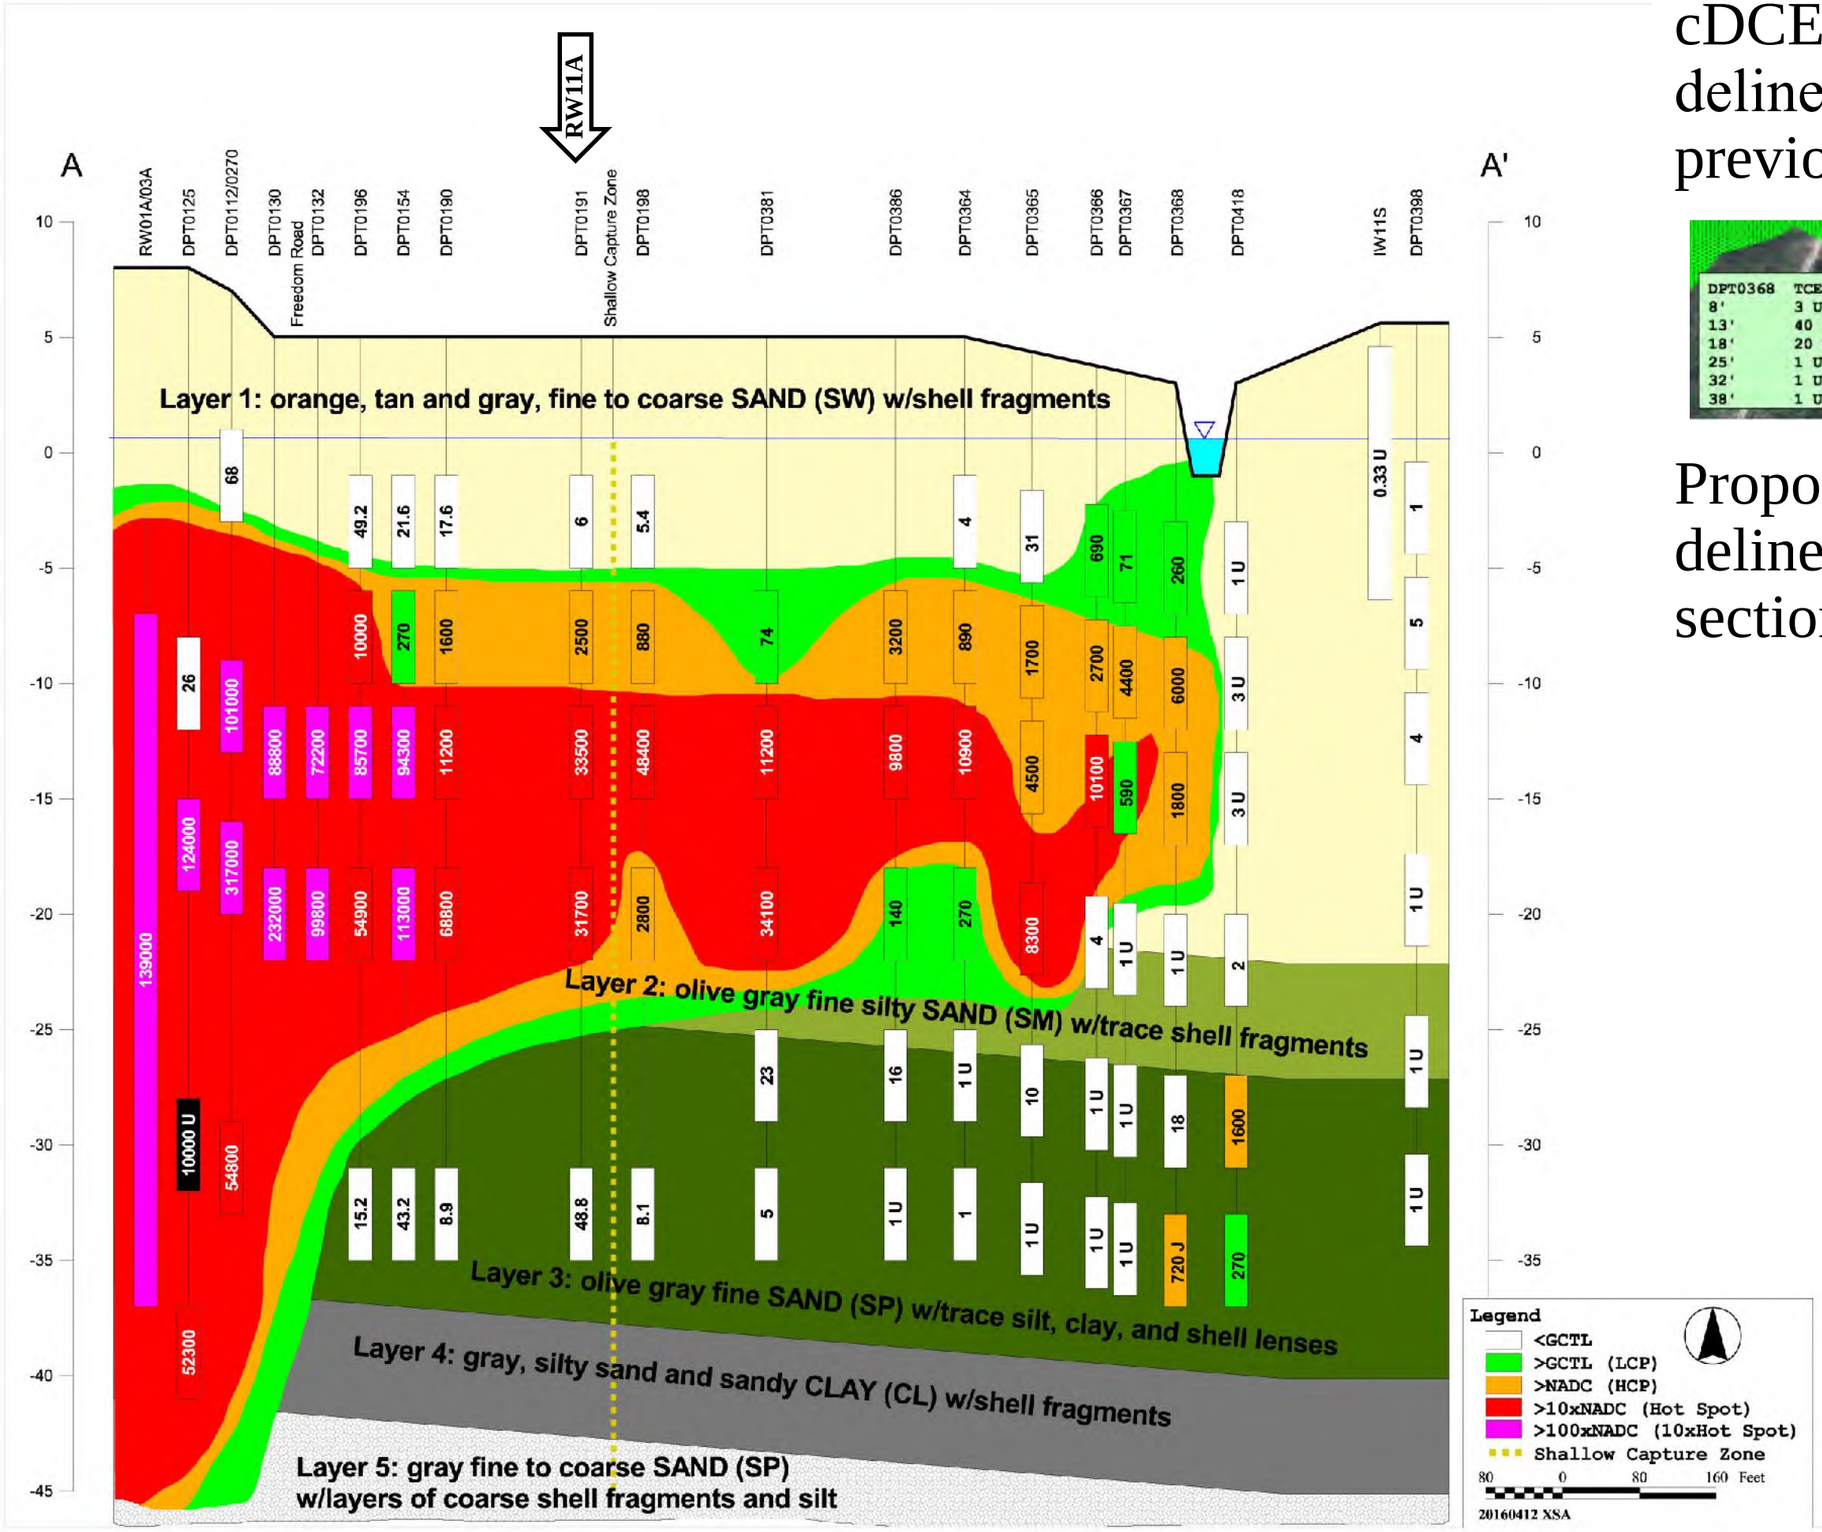
VC, Interval: 34 to 40 feet bls

All intervals combined for VC plume



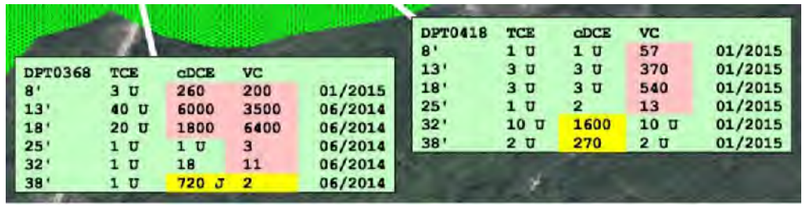


Hot Spot 6 Area of Investigation (HS6) plume has very little TCE and is comprised of cDCE and VC to a depth of 40’ BLS

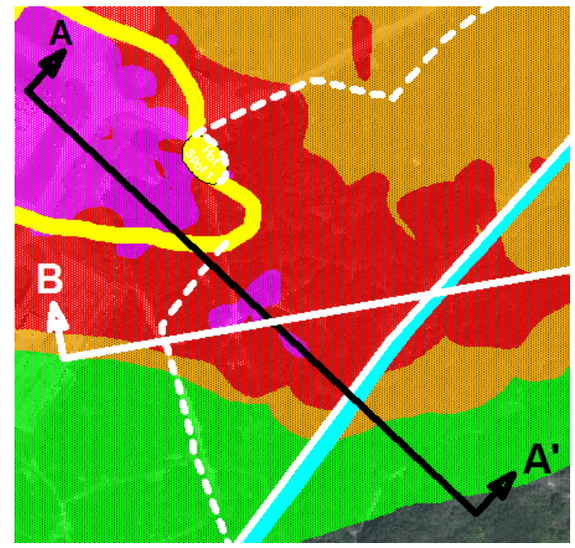


Upgradient source is within and being treated by the Hydraulic Capture IM system, to date over 50,000 pounds of VOCs have been destroyed

Source upgradient to HS6 is within and being treated by Hydraulic Capture IM system



Propose TCE is vertically delineated for HS6 on this cross section



cDCE "Suspect results not used in delineation" results discussed previously

Propose VC is vertically delineated for HS6 on this cross section

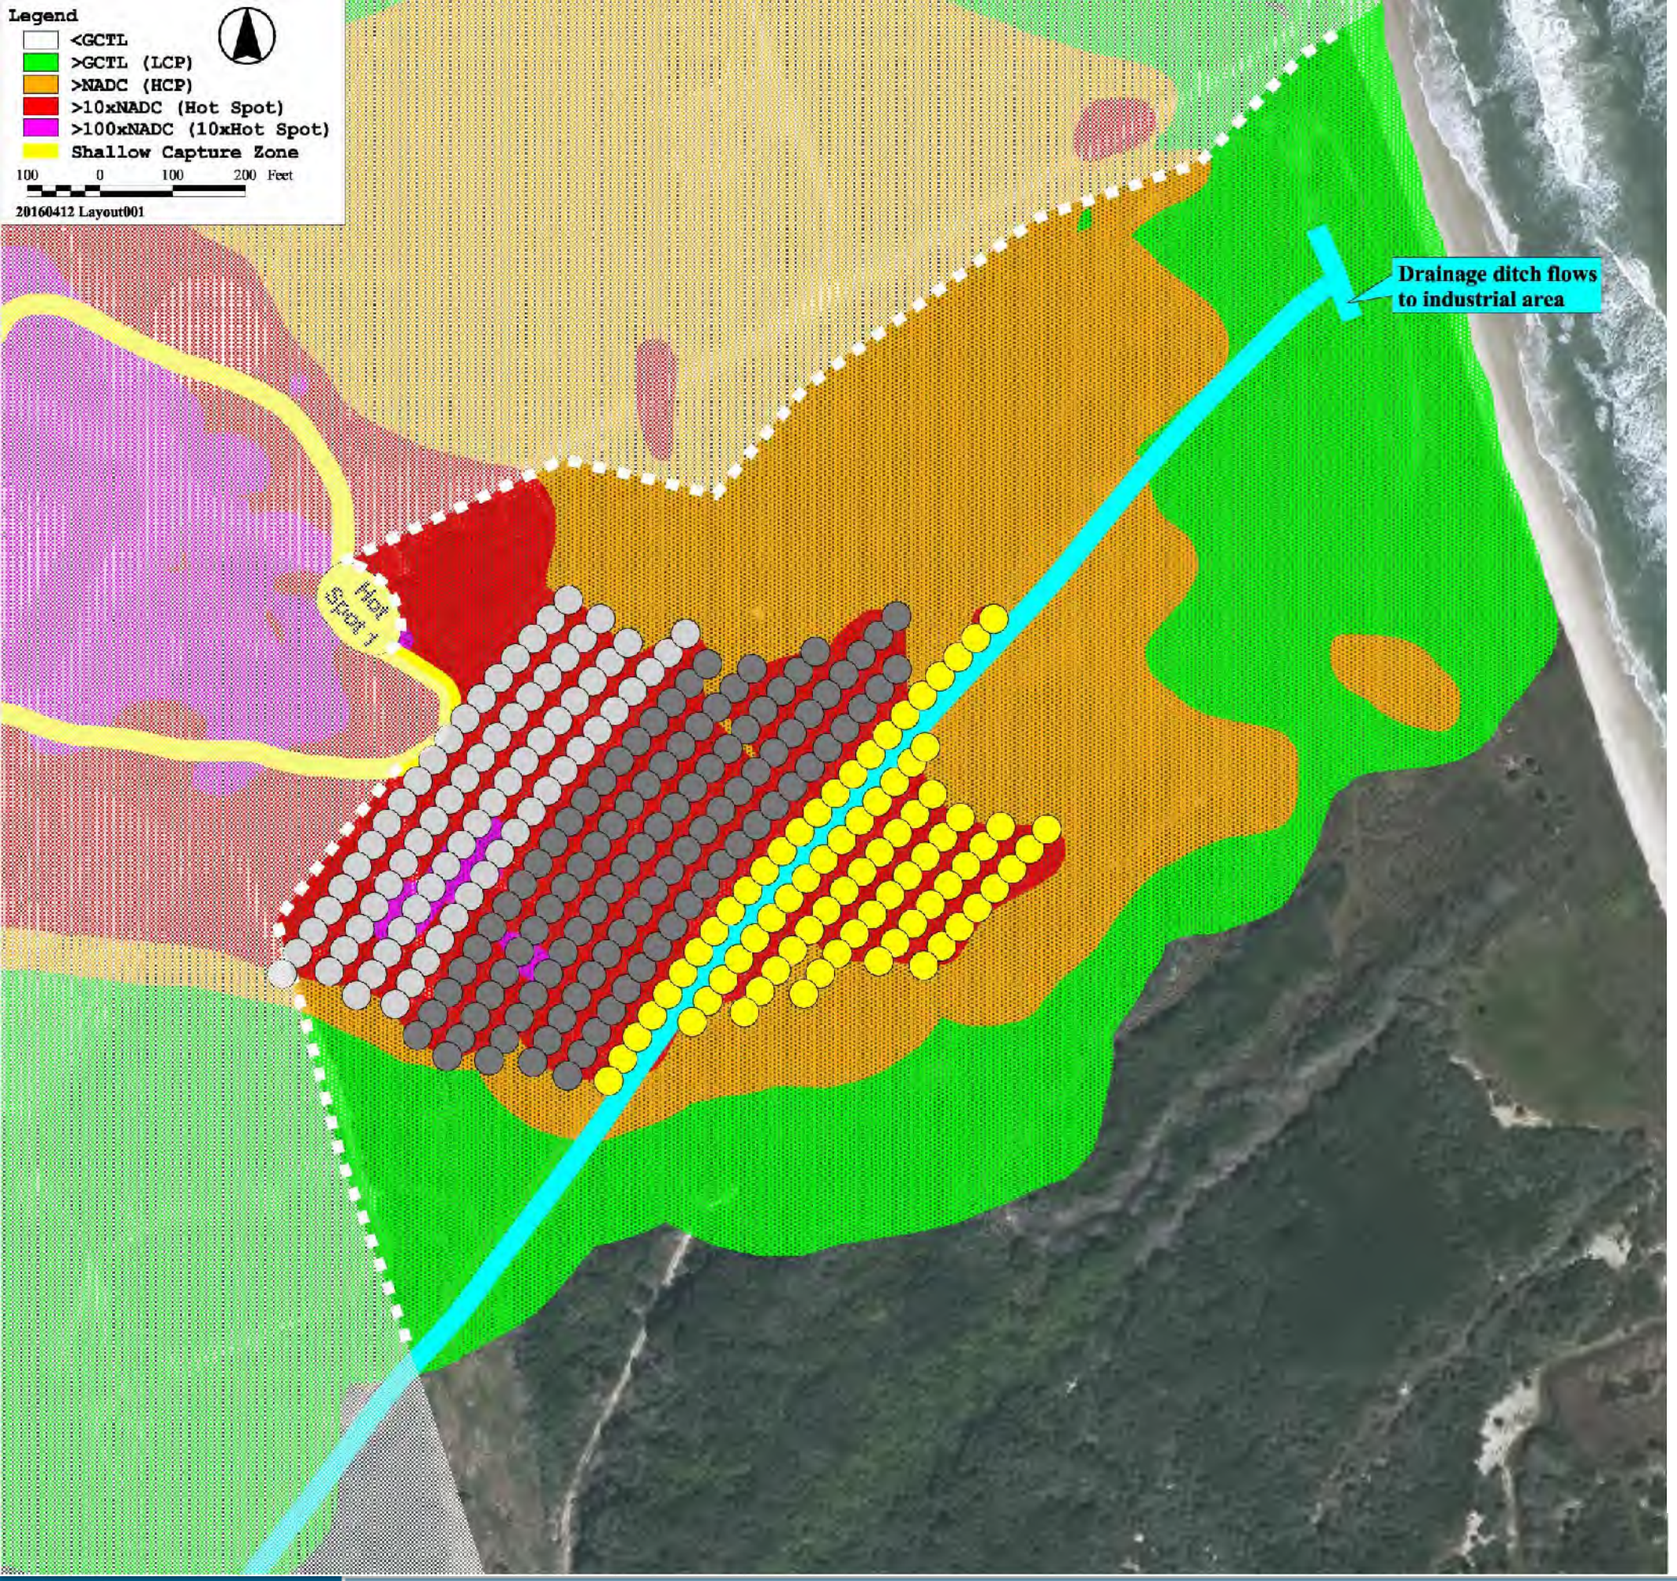
HS6 plume is above Layer 4

Upgradient source is within and being treated by the Hydraulic Capture IM system, to date over 50,000 pounds of VOCs have been destroyed



Hot Spot 6 Area of Investigation (HS6) plume has very little TCE and is comprised of cDCE and VC to a depth of 40’ BLS

Mass was not calculated based on the absence of source in HS6

~1500# cDCE

~ 430# VC

Team consensus that HS6 is adequately delineated?

HS6:

- upgradient source is being treated by Hydraulic Capture IM,
- has very little TCE,
- is cDCE and VC,
- above Layer 4 in sandy units

HS6 is a prime candidate for air sparging based on success of 516S, CCB, FDSA IMs and LC34 sandy lithology

Propose eliminating Step 2 EE and developing HS6 air sparging IMWP:

- Use CCB compressor trailer
- Phased approach (77 yellow ROIs) to eliminate discharge to drainage ditch

Team consensus to prepare an IMWP for air sparging at HS6 as described?

MEMO

To:	Mr. Mike Deliz, P.G.
From:	Mark Jonnet; Mark Speranza, PE;
Date:	December 5, 2016
Subject:	Hot Spot 6 (HS 6) Site Characterization Launch Complex 34 (SMWU 054)

Jacobs-CORE 28Nov2016 Comments:

Jacobs-CORE concurs that the characterization of Hot Spot 6 (HS 6) at Launch Complex 34 is adequate to proceed to the Step 2 evaluation. We offer the following comments for your consideration.

1. The sampling depths for the DPT were chosen based on the previous intervals used. Were these intervals based on lithology (soil cores)? If other criteria were used, what were they?

   Response: The sampling intervals are based on previous investigations at LC34, including soil cores, MIPs, and HPT. For example the 16' to 20' interval was based on elevated MIPs responses. The 30' to 34' interval was added during the 2014 to 2016 sampling events based on previous results where 23' to 27' had high detections when 36' to 40' results were much lower or below detections limits. The purpose for the 36' to 40' was to vertically refine delineation.

2. We have some concern about dismissing the COCs found at 32 and 38 ft. bls in some of the DPTs (e.g. DPT0368, DPT0405, DPT0418, and DPT0444). The presence of a relatively clean fine sand (SP) that is represented as Layer 3 overlying a silty sand and sandy clay (CL) that is represented as Layer 4 represents a potential "zone of accumulation" of COCs. As such, the absence of these compounds higher in the section, but the presence of them here may not suggest either "drag down" or "suspect" data. Is there additional information that led to the conclusion that these data are suspect? Consider a complete evaluation of the data set with this condition in mind prior to writing off these analytes as spurious for whatever reason.

   Response: The goal of this investigation was primarily to determine if any source was present in the Hot Spot 6 area, then to delineate the Hot Spot and HCP. The ADP had included delineation of the LCP which was an error, any refinement of the LCP during this investigation should have been considered as a benefit rather than a goal of the investigation. Tt proposes resampling the 32' and 38' intervals at DPT0418 to confirm results. DPTs 368, 405, and 444 will be discussed at the KSCRT meeting.

3. Slide 17 – Do DPT0489, DPT0490 and/or DPT0491 provide delineation of LCP downgradient of DPT0444? If so, suggest you add to figure.

   Response: Slide 17 depicts the 28' to 34' interval for cDCE. Samples were not collected below the 11' to 15' interval at DPTs 489, 490, and 491 therefore they do not provide LCP delineation of DPT0444 in this interval. Sample result labels will be added to Slide 17 for discussion purposes at the meeting.

Tetra Tech
Foster Plaza 7, 661 Andersen Drive
Pittsburgh, PA 15220-2745
Tel 412.921.7090 Fax 412.921.4040 tetratech.com

4. Slide 17 – DPT0368, DPT0369, and DPT0407, located to the east, north, and southwest, respectively of DPT0418 all have detections of cDCE. Two of the three exceed the GCTL. What is the basis for considering the 32 ft. bls value at DPT0418 to be suspect?

   Response: The surrounding DPTs 368, 369, 372, 419 have cDCE detections of 18, 240, 84, and 55 respectively. The cDCE concentration in DPT0418 is much higher at 1,600 ug/L. Tt proposes resampling the 32', & 38' at DPT0418 to confirm results.

5. Slide 21 - Does DPT0514 at 10 to 15 ft. bls support placement of delineation line east of DPT0490?

   Response: Samples were not collected below the 6' to 10' interval at DPT0514. VC decreased from 180 ug/L at DPT0490 to 0.13 U at DPT0514 in the 10' to 15' interval. Tt proposed that a similar decrease would be observed in the 11' to 15' interval where DPT0490 VC is 5.6 ug/L therefore the LCP was drawn conservatively halfway between DPTs 490 and 514. Sample result labels will be added to Slide 17 for discussion purposes at the meeting.

6. General – Do the access issues west-southwest of DPT0398, DPT0399, and DPT0400 extend all the way to the coast?

   Response: The access issue beyond IW11S and DPTs 0398, 0399, and 0400 referenced on Slide 20 should have identified that the issue was in the southeastern direction for LCP delineation purposes. As stated previously LCP delineation should not have been considered a goal but rather a benefit of this investigation. In addition to access issues Tt did not further delineate the LCP beyond DPTs 398, 399, and 400.

7. Slide 28 – Suggest saying "TCE is vertically delineated <u>for HS6</u> on this cross section" on this slide and others, as applicable.

   Response: "for HS6" has been added to the appropriate slides

8. Slide 34 – Any plans to sample below 38 ft. at DPT0339?

   Response: At this time Tt proposes that the 170 ug/L cDCE and 140 ug/L VC results are drag down based on a comparison of the concentrations reductions of 6400, 4500, 1600, and 5800 to 1 U, 17, 1 U, and 2.8 in DPTs 360, 383, and 337.

<u>Geosyntec 29Nov2016 Comments:</u>

Geosyntec offers the following comments for consideration based upon our review of the Advanced Data Package (ADP) slides for the LC-34 HS6 Area of Investigation Site Characterization.

- General: In general, vertical and horizontal delineation appears complete, we provide several specific comments on delineation below, but overall agree with delineation and path forward approach.

  Response: Concur

- General: For Step 1 Engineering Evaluations, groundwater flow rates and directions are typically provided and included as a part of the CSM discussion. Granted that LC34 has an extensive network of monitoring wells and this data may not be necessary for this ADP, however it should be noted that the apparent groundwater flow direction is to the southeast toward the drainage canal and that the general lithology and hydrogeology are similar to HS1.

  Response: Groundwater flow layers will be added to the presentation for discussion purposes at the meeting, groundwater flow is to the southeast towards the drainage canal.

- Based on review of the data and cross sections, and as noted by TT, it appears that the drainage ditch is playing a role

in the CSM with groundwater flow, as it appears to be a partial discharge for groundwater, as the projected groundwater flow path is upwards towards the drainage ditch based on upward trending concentrations of cDCE and VC towards the canal as shown on the cross sections on slides 33 to 35. Has the surface water in the drainage ditch been sampled? Near DPT 369 or DPT 372, these points were located near the drainage ditch and had concentrations above 1,000 ppb for cDCE and VC at the 10-foot interval which may be similar depth to the canal bottom (see slides 37 and 38). Is the drainage ditch typically dry or wet? Also, the note on the Drainage ditch indicates flow to the Industrial Area; is this correct that it flows to the SW toward the Industrial Area versus toward the ocean?

Response: Surface water has not been sampled. The drainage ditch has had water in it during each field event. The drainage ditch flows towards the Industrial Area and not towards the ocean.

- Slide 4: Suspect results for DPT418 and 368 - both of these points show elevated concentrations of cDCE and VC at 32 and 38 ft. bls and are adjacent to one another, as well as down gradient from a 100XNADC hot spot; the 1,600 ppb cDCE at 32 ft. bls in 418 would not likely be considered drag down as concentrations above that interval are low to ND for cDCE. Is it possible that affected groundwater from DPT364/365 (100XNADCs) may be contributing to the DPT 368/418 locations?

  Response: See response to Jacob's comment #2.

- Slide 17: DPT444 and DPT418 appear to have elevated concentrations above GCTLs and NADCs, respectively. However, the proposed AS wells on Slide 41 appear to encompass the 10XNADC areas. It might be beneficial to overlay the DPT locations on Slide 41 to help ensure that the 10XNADC (hot spot) is being addressed with the AS path forward proposal.

  Response: See response to Jacob's comment #2.

- Slide 23 – DPT339 is located within the 100XNADC hot spot and exhibited 140 ppb of VC at 38 feet; while this could be drag down, the 25-foot interval had 16,000 ppb of VC and it doesn't appear that a groundwater sample was collected at 32 ft. Why wasn't the 32 ft sample collected at this location (same comment for DPT0338)? Is a deeper sample at DPT339 warranted?

  Response: DPTs 338 and 339 were collected in 2011, during the June 2014 event DPTs 382 to 387 and 392 were collected as offsets to DPTs 338 and 339. June 2014 event included the 32' interval, Tt determined that 32' samples at DPTs 338 and 339 would not be collected and proposes that the 170 ug/L cDCE and 140 ug/L VC results are drag down based on a comparison of the concentrations reductions of 6400, 4500, 1600, and 5800 to 1 U, 17, 1 U, and 2.8 in DPTs 360, 383, and 337.

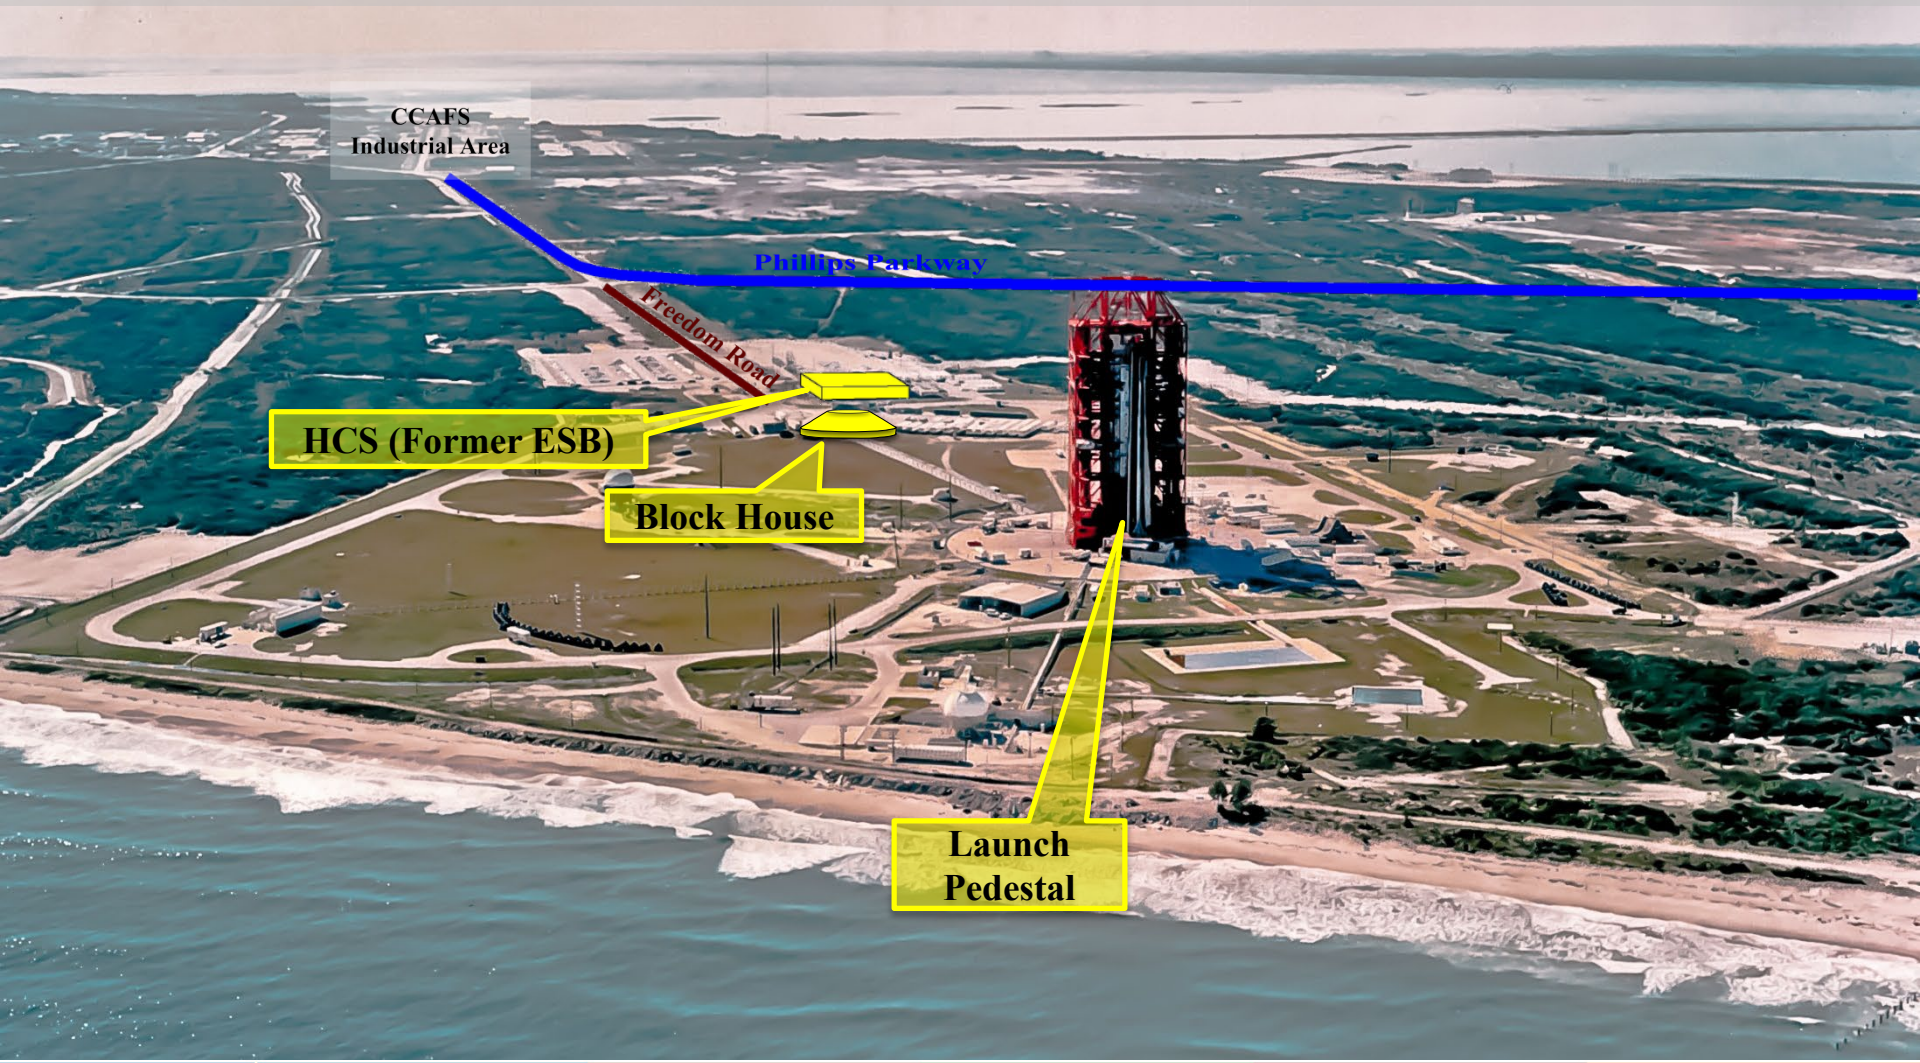
- Slide 27: There is a 100XNADC "hot spot" in HS6, right downgradient from HS1 and the shallow zone capture zone; this elevated concentrations of cDCE and VC could still be contributing dissolved flux to the HS6 plume and toward the drainage canal.

  Response: Concur

- Slide 40: Agree with horizontal and vertical delineation of 100X, 10X NADCs, HCP and HS. The LCP is technically not delineated laterally to GCTLs; however, concur that the delineation meets the intent of the Step process (no additional step-outs are warranted) if the various limitations on the LCP delineation are listed out and included as part of the consensus statement and meeting minutes.

  Response: Concur, Tt agrees that the LCP is technically not delineated laterally to GCTLs and the delineating LCP

should have been considered as a benefit of the investigation and not a goal of the investigation. The investigation was to determine if any source was present and refinement of the Hot Spot and HCP to determine if remediation is warranted.



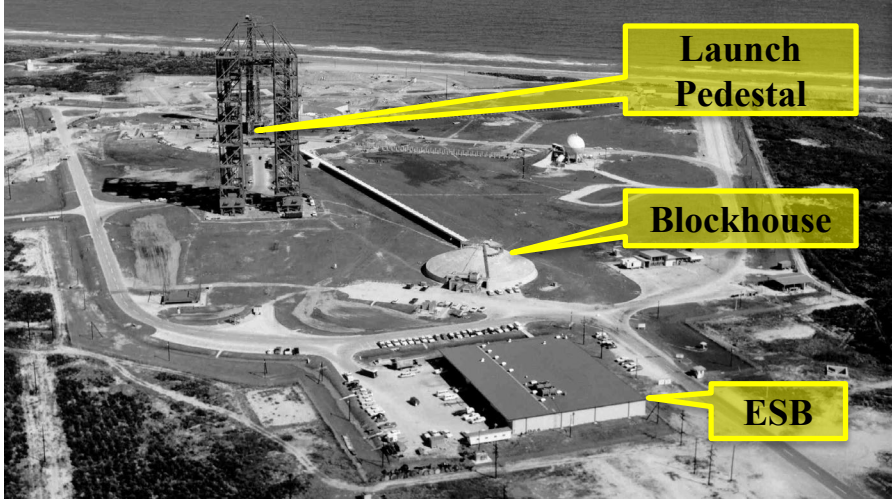
- Slide 41: For the Phases of AS remediation, it would beneficial to color code the various phases of AS in the legend; we assume Phase 1 is yellow and that would be implemented as the first phase through Phase 3 being light gray/white. Note that if the drainage ditch is dry, it may be appropriate to initiate AS actions in the area of highest concentrations first in lieu of the toe of the proposed treatment area (i.e. the purple area (100XNADC) in HS6 in the first phase of AS remediation) to cut off higher concentrations feeding the migration toward the drainage canal. Also on slide 41, there is a portion of red (100XNADC), adjacent to the hydraulically captured area (HS1) and HS6 that isn't getting any remediation, should that small red area be included for AS wells in Phase 3?

  Response: An Air Sparging IMWP will be prepared for the initial phase and presented to the KSCRT. Subsequent phases will be presented during annual OMM ADPs for consideration.

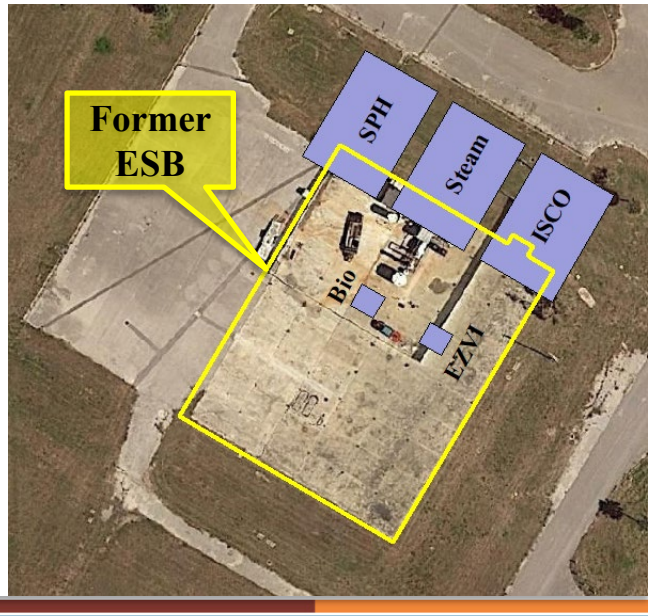
ADVANCED DATA PACKAGE

C.9 DSZ Site Characterization Engineering Evaluation ADP

Launch Complex 34 (LC34), SWMU CC054
DSZ Site Characterization Engineering Evaluation
October 2019



- Site History
- Site Description
- Site Geology
- Hydraulic Containment System (HCS)
  - TCE Prior to HCS compared to Site Characterization
  - Year 9 Pumping Rates
- Site Characterization Sampling
- TCE Contours
- TCE Delineation
- Cross Sections
- Mass Calculation
- Layer 7 Aquifer Testing
- HCS revised pumping rates



- Path Forward

- Construction of Complex 34 began in 1959, designed to support NASA's Saturn 1 and 1B programs
- Seven launches between 1961 and 1968
  - Historical records suggest TCE used to flush rocket engines and for precision cleaning of spaceflight hardware
- 1967: Apollo 1 cabin fire during a launch rehearsal test taking the lives of Grissom, White, and Chaffee

- 1972: Service structures and operational equipment scrapped, leaving majority of on-site buildings and structures abandoned-in-place
- 1984: Declared part of the Man In Space National Historic Landmark
- 1990s: Environmental investigations revealed chlorinated solvent contamination including dense non-aqueous phase liquid (DNAPL) in groundwater
- 1999 to 2003: In situ remediation demonstration projects at the Engineering Support Building (ESB) included test cells for:
  - Chemical Oxidation (ISCO), TCE reduction of 12,700 pounds (43' bls)
  - Six-Phase Heating (SPH), TCE reduction of 22,719 pounds (43' bls)
  - Steam Injection, TCE reduction of 23,629 pounds (43' bls)
  - Emulsified zero-valent iron (EZVI), TCE reduction of 40 pounds
  - Bioaugmentation, TCE reduction of 60 pounds
- 2004: Groundwater long-term monitoring (LTM) and corrective measures study (CMS) initiated

- 2007: CMS
  - Solids model developed to determine mass of TCE DNAPL ≥ 300 mg/kg and the transition zone to 100 mg/kg; 74,000 and 12,000 pounds, respectively
  - The 2-acre area to 75 ft bls encompassing the extent of TCE DNAPL was designated the DNAPL source zone (DSZ)

Table 4-5. Summary of Technology Screening

Technology	Treatment Zones		
	DNAPL Source Zone	High Concentration Plume	Low Concentration Plume
ISCO with $KMnO_4$	✚	NA	NA
SPH™	✚	NA	NA
Steam Injection	✚	NA	NA

Enhanced Bioremediation	✚	✚	✚
MNA	✚	✚	✚

Notes:
1) ISCO = In Situ Chemical Oxidation
2) $KMnO_4$ = potassium permanganate
3) SPH™ = Six-Phase Heating™
4) EZVI™ = Emulsified Zero Valent Iron™
5) LDA = Large-Diameter Auger
6) AS/SVE = Air Sparging/Soil Vapor Extraction
7) DPE/MPE = Dual-Phase Extraction/Multi-Phase Extraction
8) PRB = Permeable Reactive Barrier
9) MNA = Monitored Natural Attenuation
10) NA = Not applicable
11) ✚ = A potentially effective technology in the specified Treatment Zone.
12) shade = Not retained after screening.

  - Developed Alternatives
    - DSZ-1: Pump and Treat
    - DSZ-2: Permeable Reactive Barrier
    - DSZ-3: Enhanced Bioremediation
    - DSZ-4: Conventional Excavation to 55 ft bls, Enhanced Bioremediation 55 to 85 ft bls
    - DSZ-5: Large Diameter Auger with Steam to 55 ft bls, Enhanced Bioremediation 55 to 85 ft bls
    - HCP-1: Monitored Natural Attenuation
    - HCP-2: Pump and Treat
    - HCP-3: Enhanced Bioremediation
    - HCP-4: Air Sparging/Soil Vapor Extraction to 45 ft bls, Enhanced Bioremediation 45 to 85 ft bls
    - LCP-1: Monitored Natural Attenuation
  - The recommended corrective measure alternative included a LUCIP for groundwater use at LC34. The recommended technology for LC34 is P&T in the DSZ, MNA with IMs in the high concentration plume (HCP), and MNA in the low concentration plume (LCP)

The 6th International Conference on Remediation of Chlorinated and Recalcitrant Compounds

Remediation Costing and Interim Measures Selection for NASA's Launch Complex 34

May 19, 2008

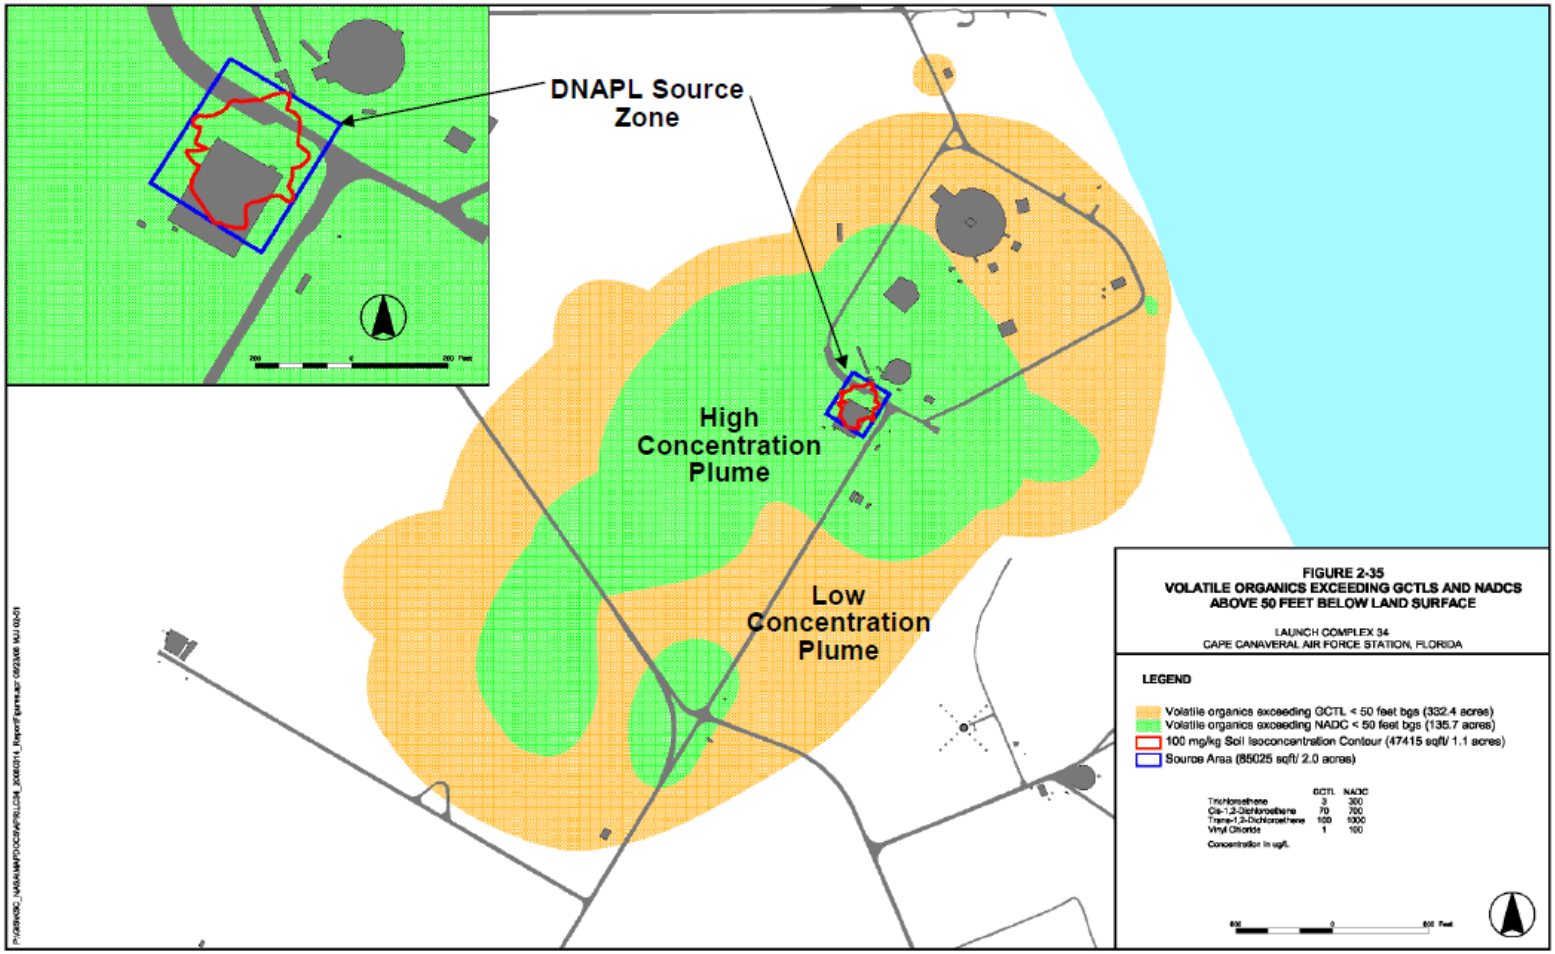
Michael Deliz, P.G.

Jim Langenbach, P.E.

Geosyntec consultants

Key Points Regarding Site Impacts

- No complete exposure pathway
  - Site located on a barrier island
  - Unlikely source of future potable groundwater
  - No surface water present
  - Engineering Support Building removed (slab left behind)
- Dissolved groundwater plume of ~330 acres
- Radial groundwater flow
- 2 acre source area with significant mass, ~100,000 lbs
- Large variations in hydraulic conductivity ($1x10^{-3}$ cm/sec to $1x10^{-8}$ cm/sec
- DNAPL extending to 80 ft bls (12,900 mg/kg @ 78 ft bls)
- 40+ yr old release



Technology Screening

- Divided site into three areas
  - DNAPL Source Zone (DSZ)
  - High Concentration Plume
  - Low Concentration Plume
- Aquifer was split vertically based upon technology limitations and lithology (<55 ft bls and 55-85 ft bls)
- Presentation focuses on DNAPL Source Zone

Kennedy Space Center
Center Operations Directorate

Geosyntec consultants

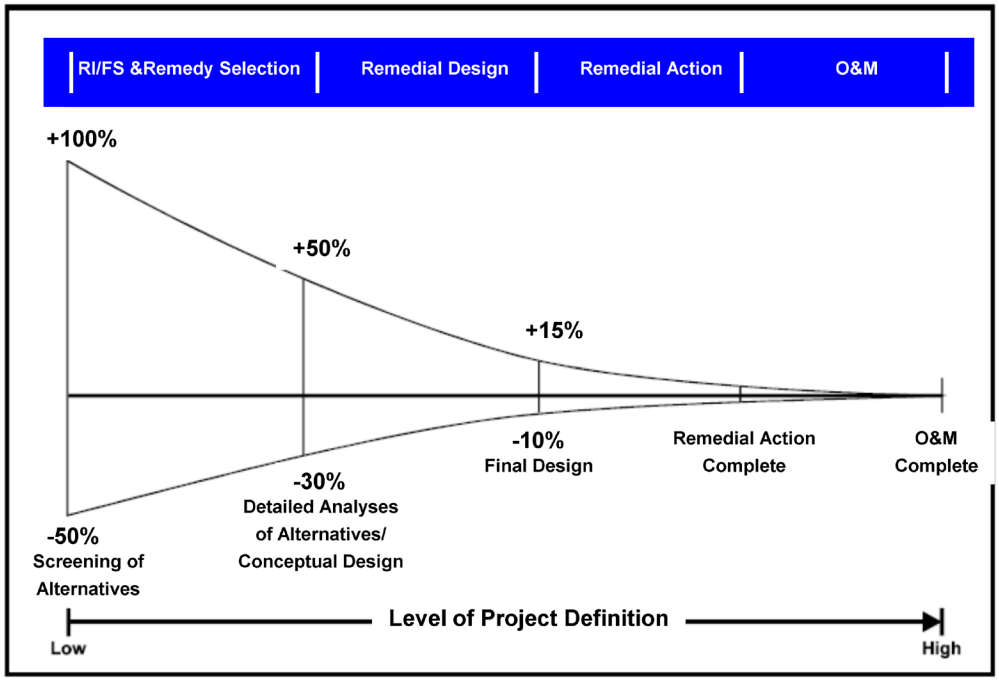
Treatment Zones

Modeling Considerations

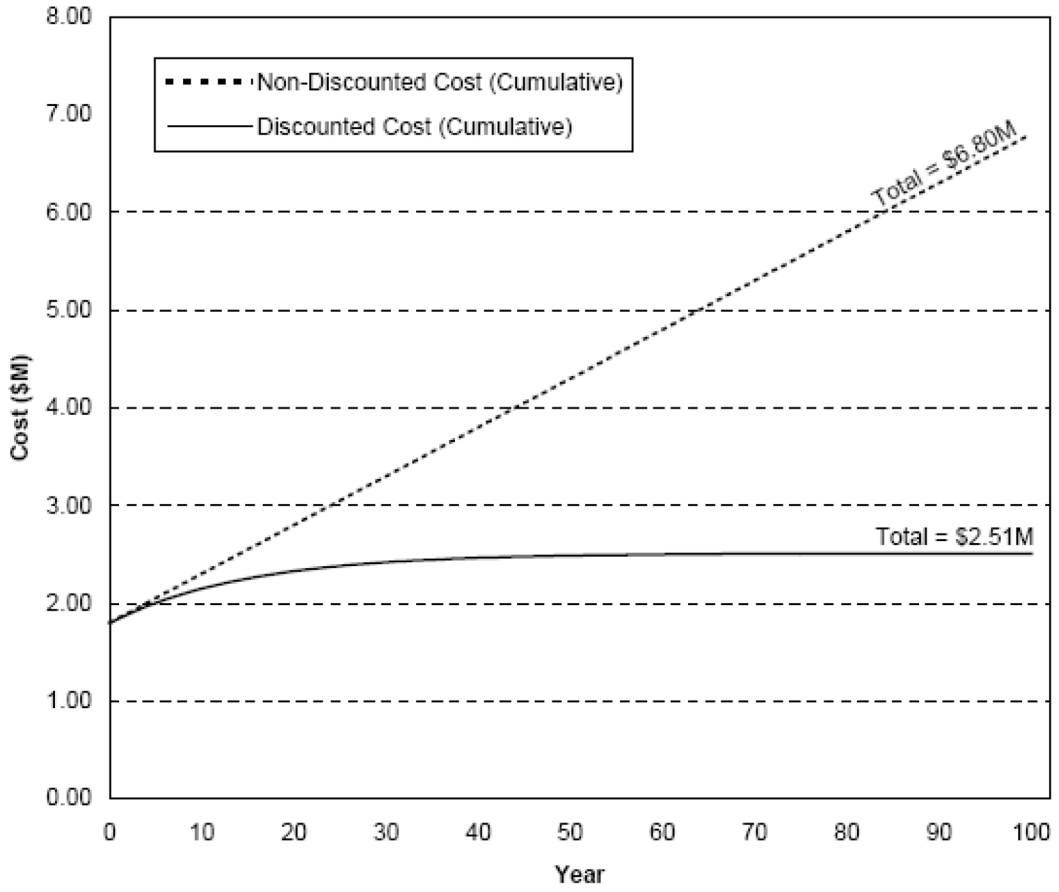
- Groundwater modeling results
  - No Action – >900 yrs to reach MCLs
  - 85% DNAPL Source Removal and Dissolved Plume Hydraulic Control – 750 yrs to reach MCLs
  - 99% DNAPL Source Removal (feasible?) and Dissolved Plume Hydraulic Control – 250 yrs to reach MCLs

- So how much $ do you spend to reduce the cleanup timeframe from "very long" to "long" on a barrier island with no exposure pathway?

Retained Technologies



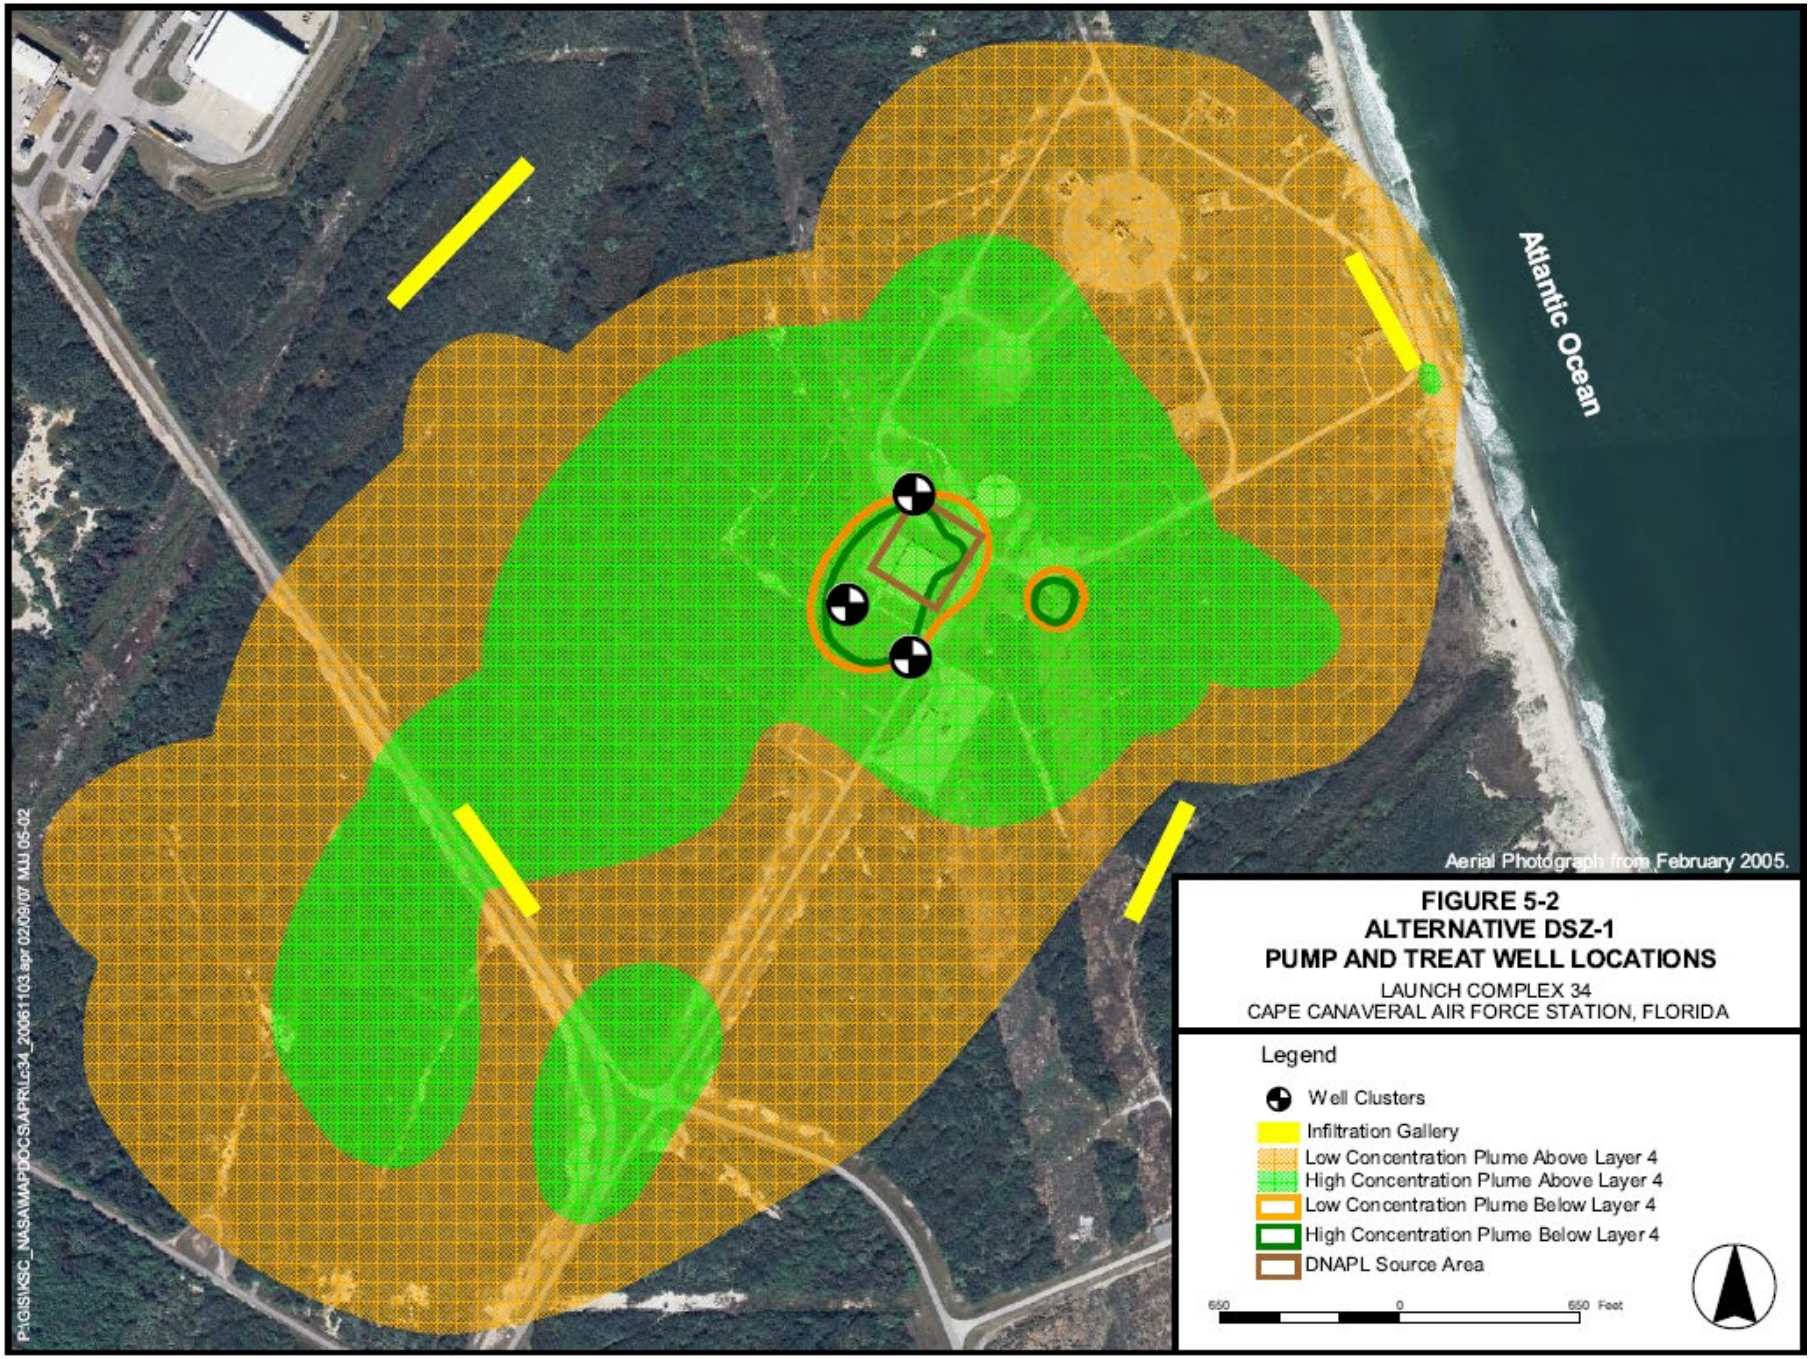
- DNAPL Source Zone
  - Hydraulic containment via P&T to 85 ft bls
  - Permeable Reactive Barrier to 85 ft bls
  - Enhanced Bioremediation to 85 ft bls
  - Excavation to 55 ft bls/Enhanced Bioremediation 55-85 ft bls
  - Large Diameter Auger (LDA)/Steam/Iron to 55 ft bls/ Enhanced Bioremediation to 85 ft bls
  - ZVI Clay or Slurry Wall Barrier to 85 ft bls*



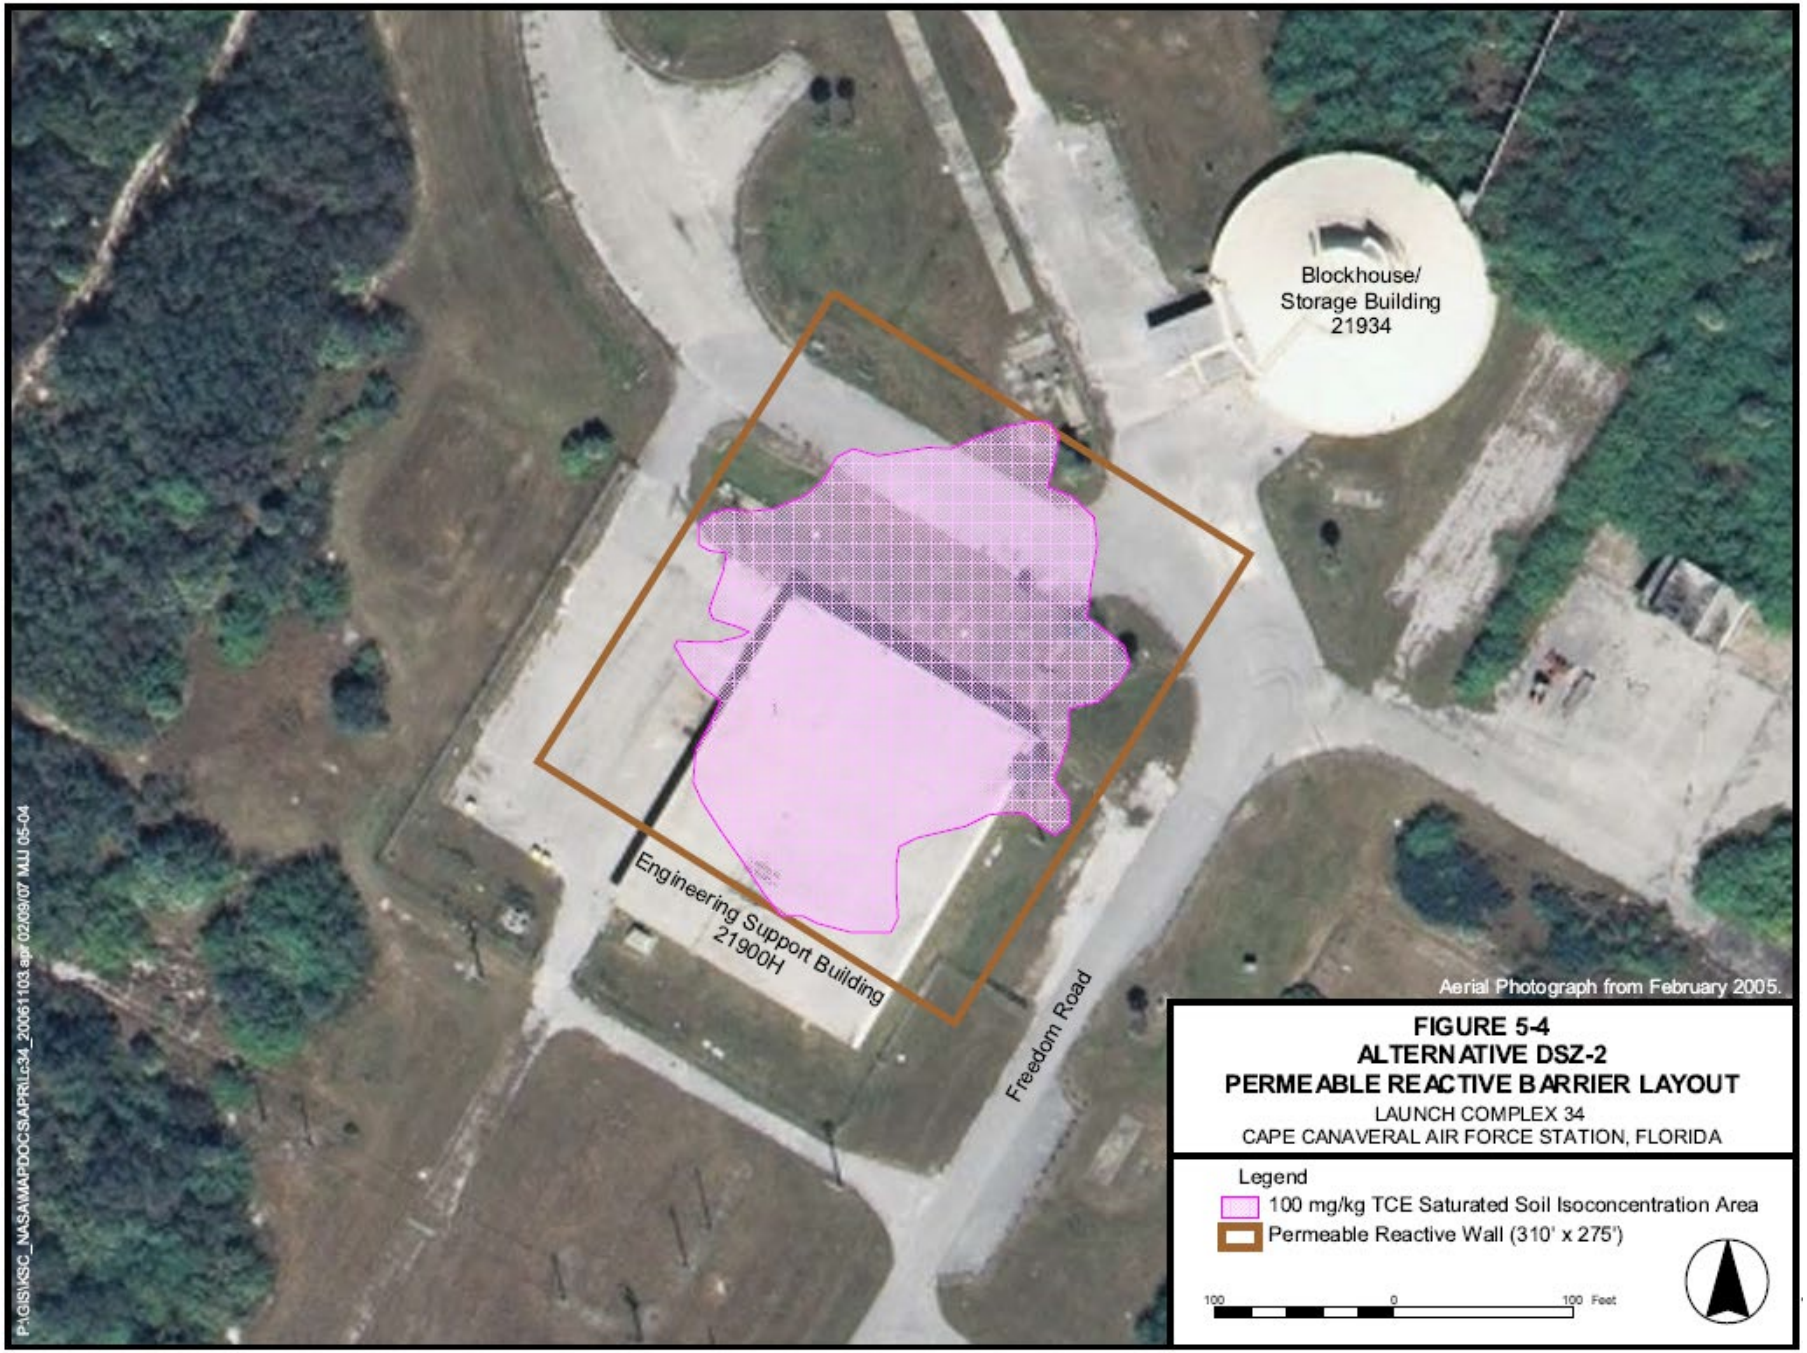
* barrier technologies evaluated independent from CMS

Costing

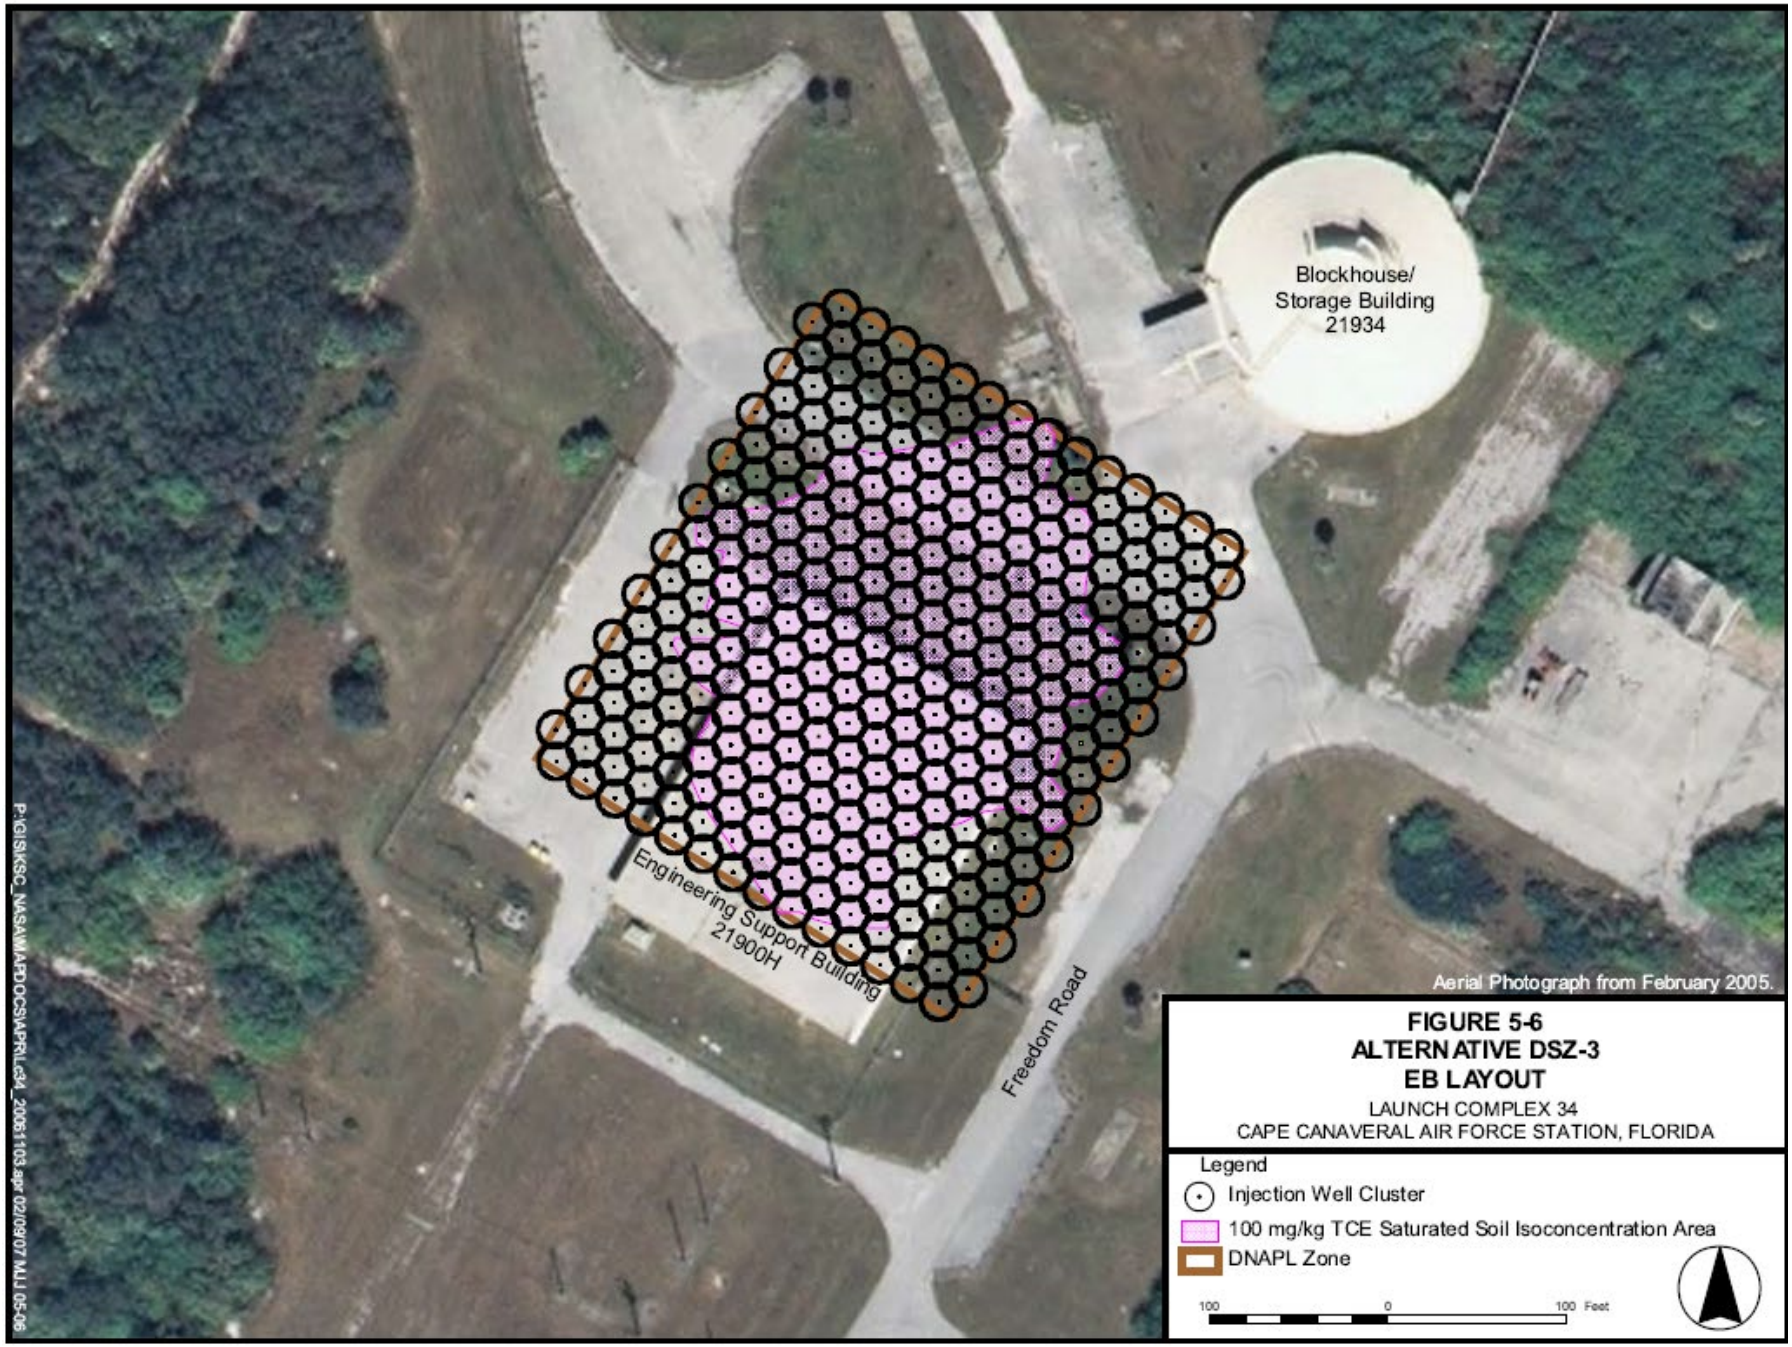
- CMS and/or FS costs are typically presented as +50% to -30% and NPV is utilized
- LC34 costs were based upon vendor quotes and/or best practical engineering estimates
- Costs included 20% contingency



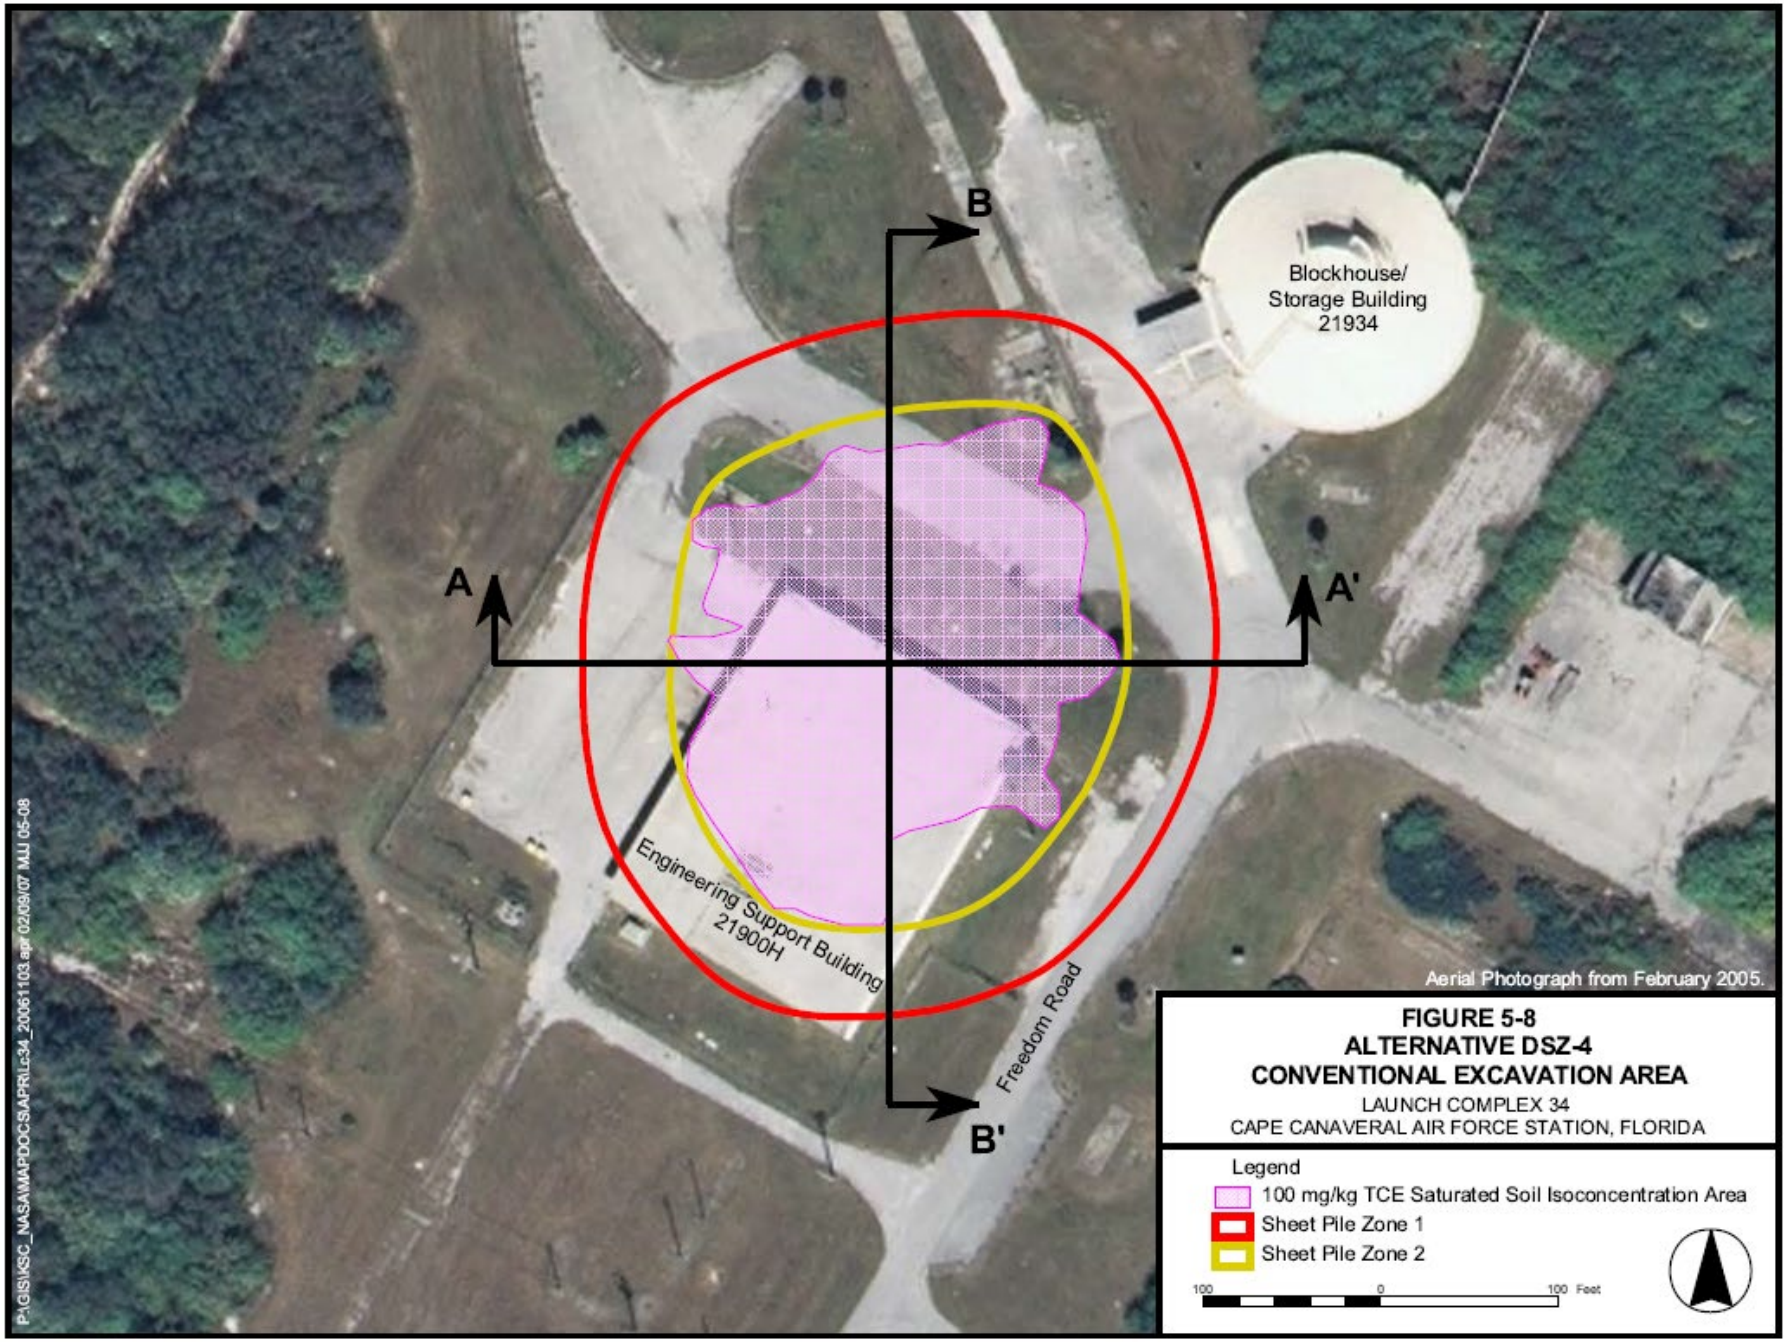
NPV vs "Pay as You Go"



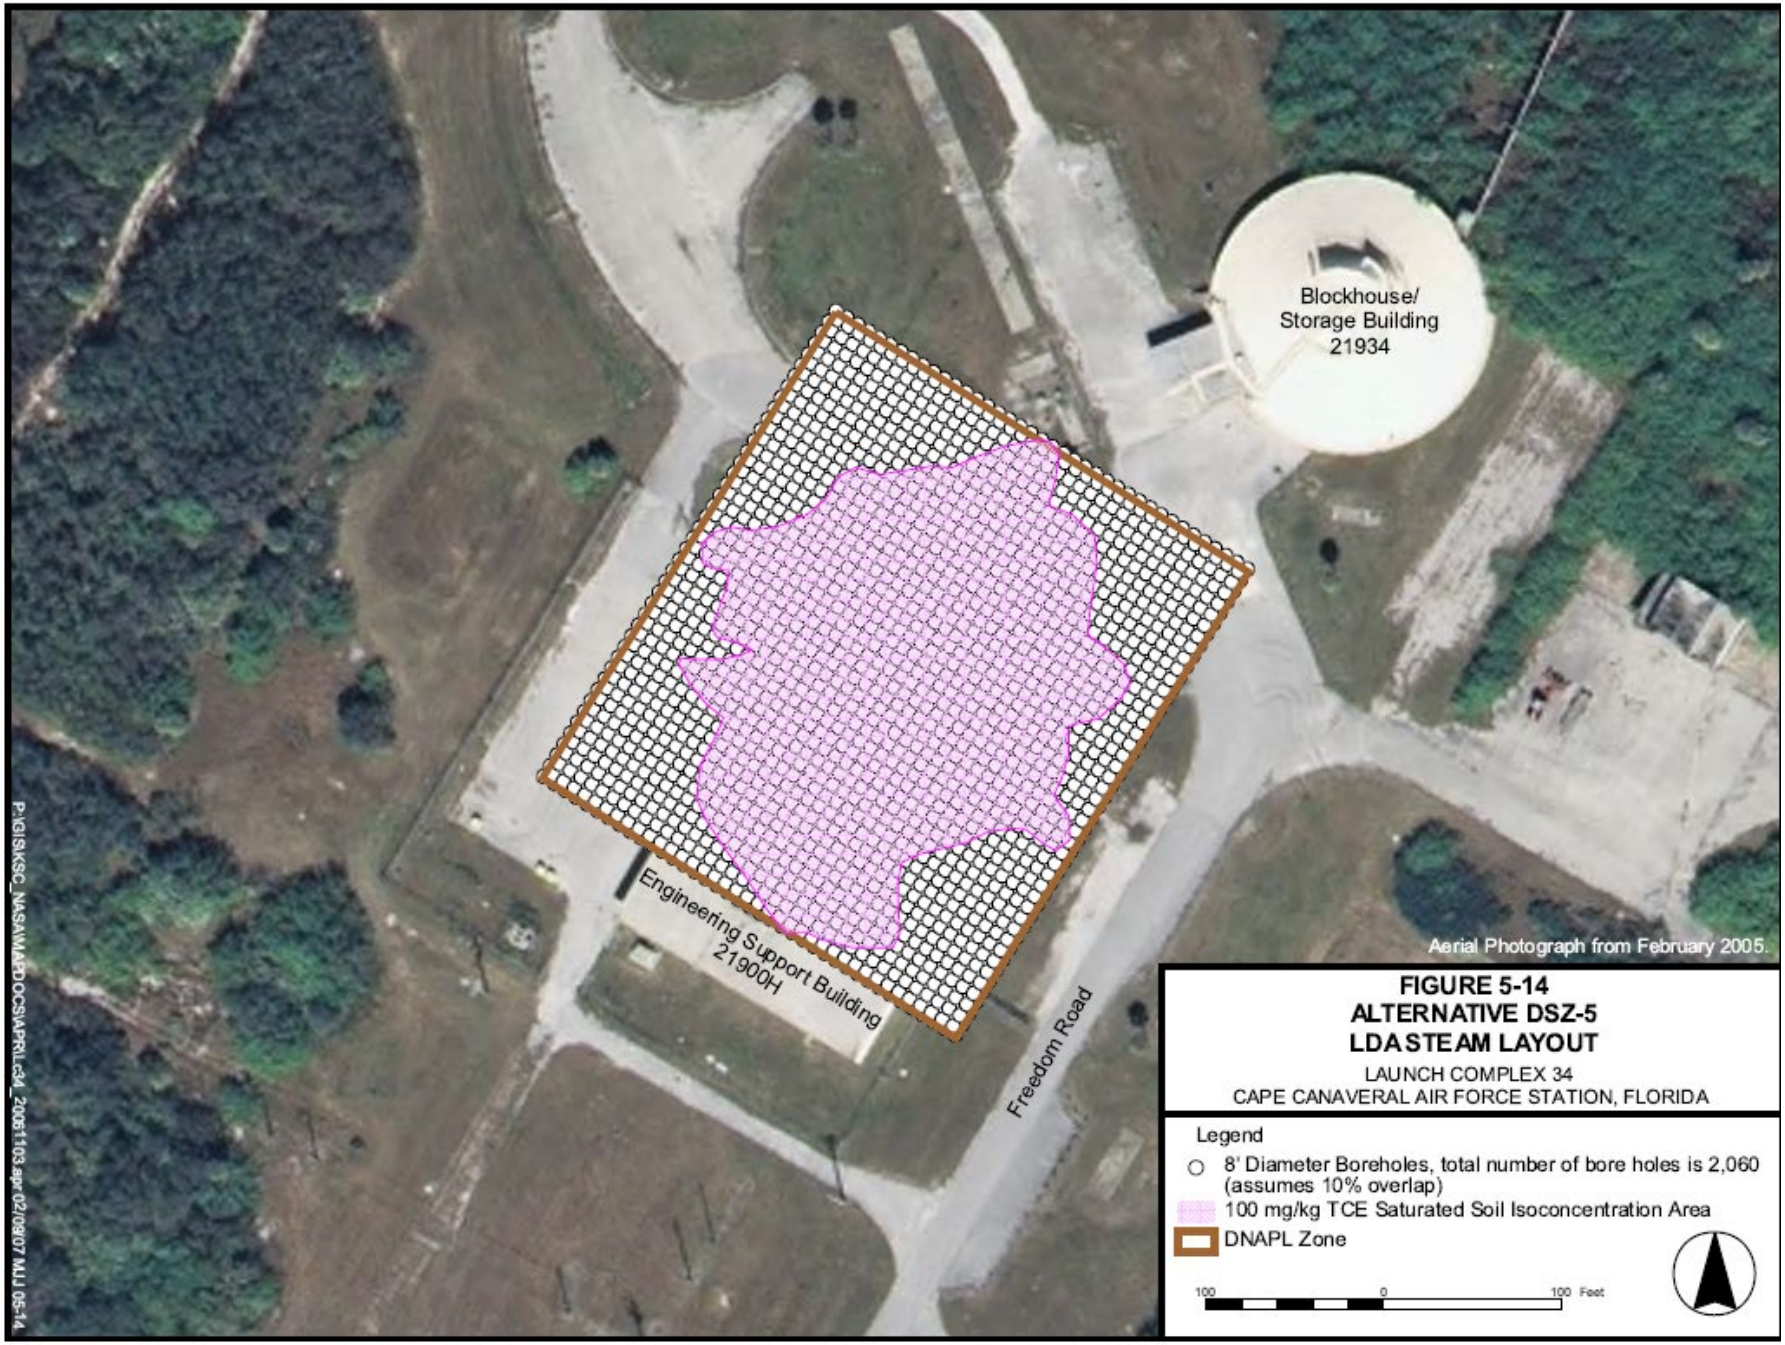
Source: USEPA July 2000, A Guide to Developing and Documenting Cost Estimated During The Feasibility Study

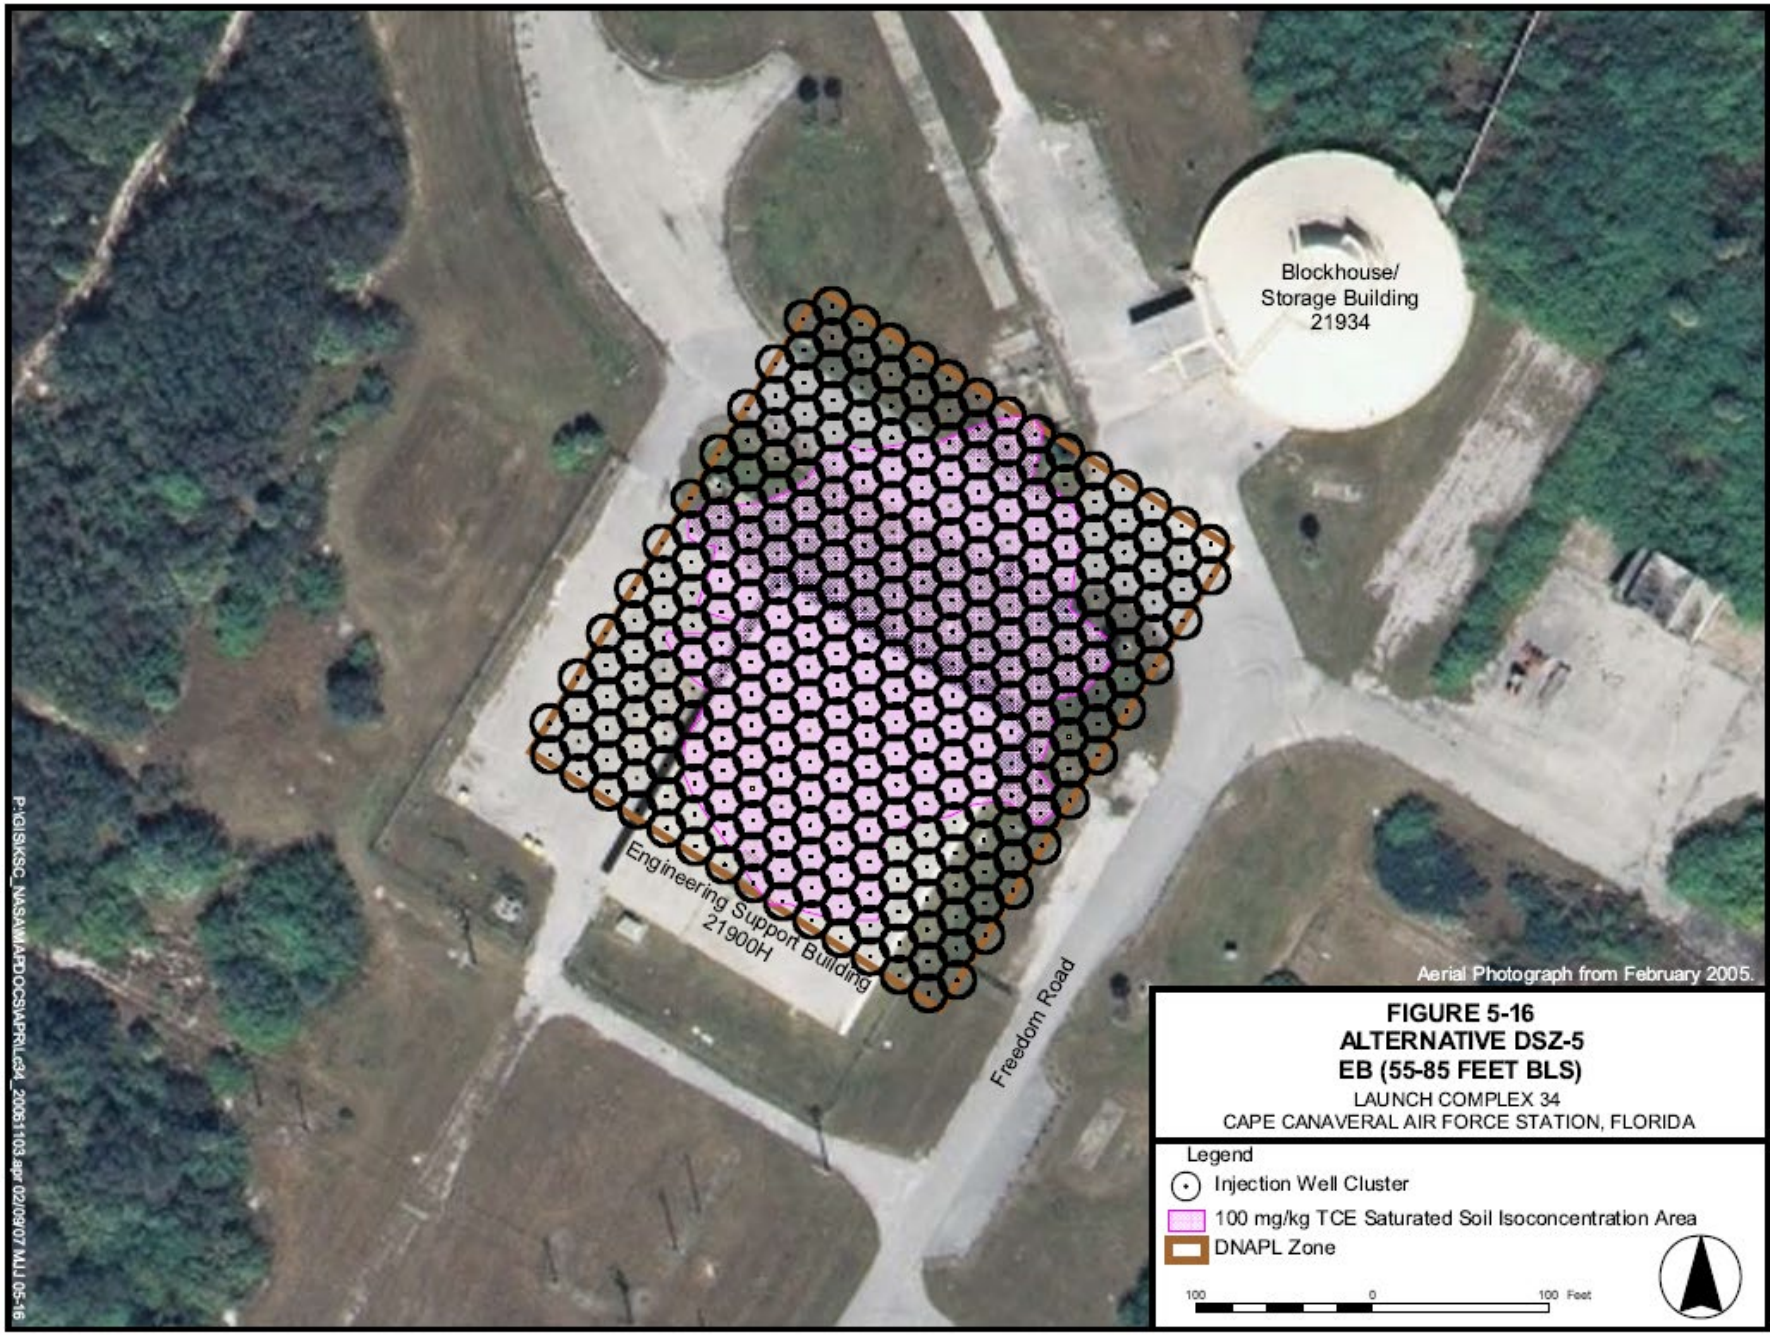


LC34 DNAPL Source Zone Costs



Treatment Zones and Alternatives	First Year Cost (Capital Cost + First Year O&M&M Cost)	Total "Pay As You Go" Cost (First Year Cost + Total Non-Discounted O&M&M)	Total NPV (First Year Cost + Total O&M&M NPV)
DNAPL Source Zone			
Hydraulic Containment via Pump and Treat	$1M	$100M	$4M
Permeable Reactive Barrier	$12M	$60M	$15M
Enhanced Bioremediation	$5M	$45M	$10M
Conventional Excavation to 55 feet bls, Enhanced Bioremediation 55-85 feet bls.	$40 - $50M	$54M	$42 - $50M
LDA/Steam/Iron to 55 feet bls, Enhanced Bioremediation 55-85 feet bls	$50 - $70M	$100M	$55 – 75$M
ZVI Clay or Slurry Wall Barrier to 85 ft bls (Containment - No Treatment Provided)	$5 - $6M	$5 - $7M (based upon 30 yrs)	$5 - $6M (based upon 30 yrs)





Developed Alternative: DSZ-1: Pump and Treat

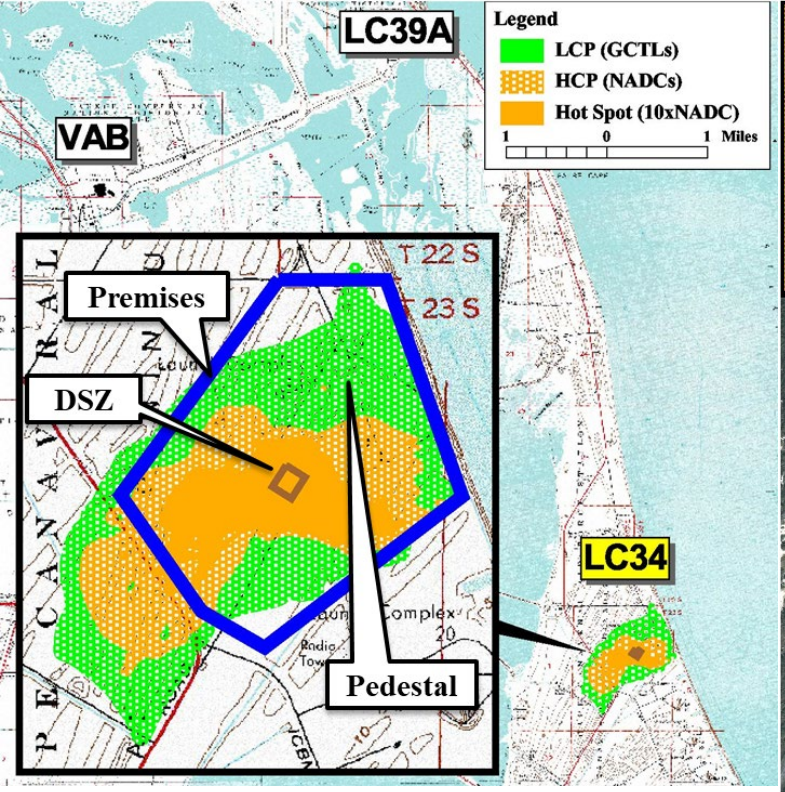
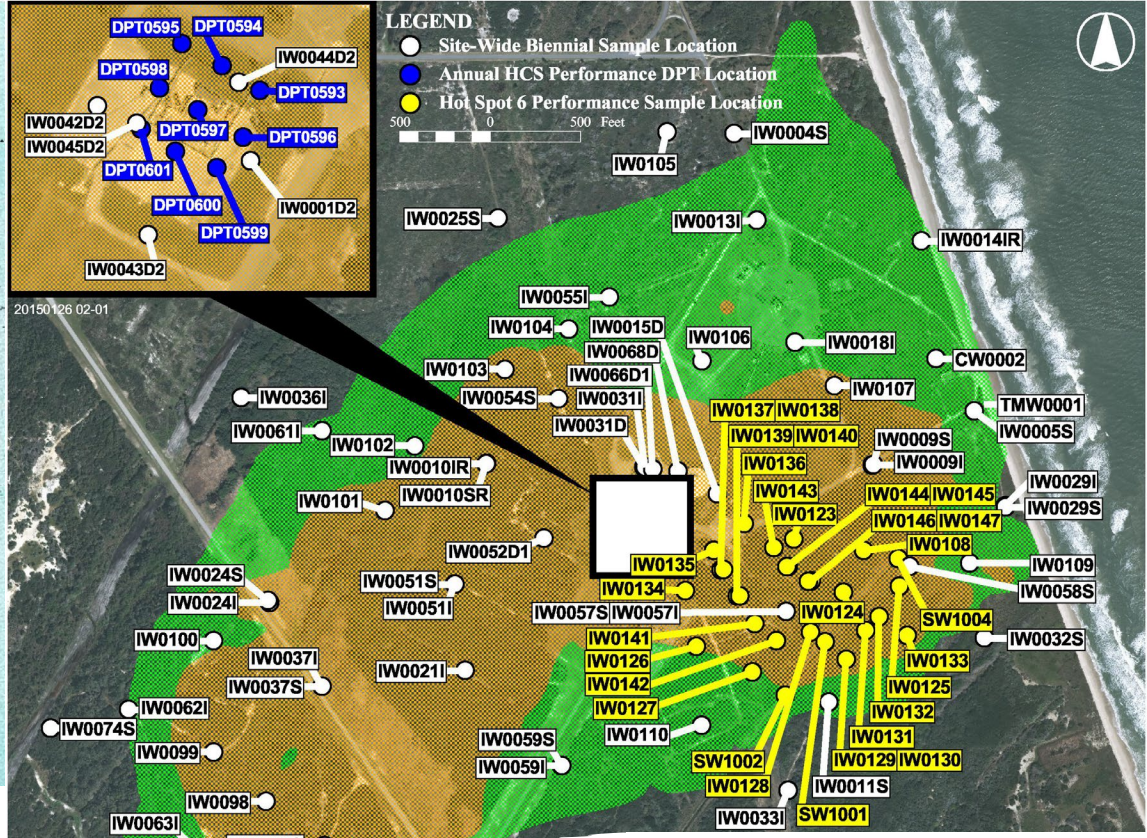
Investigation/Remediation Timeline:

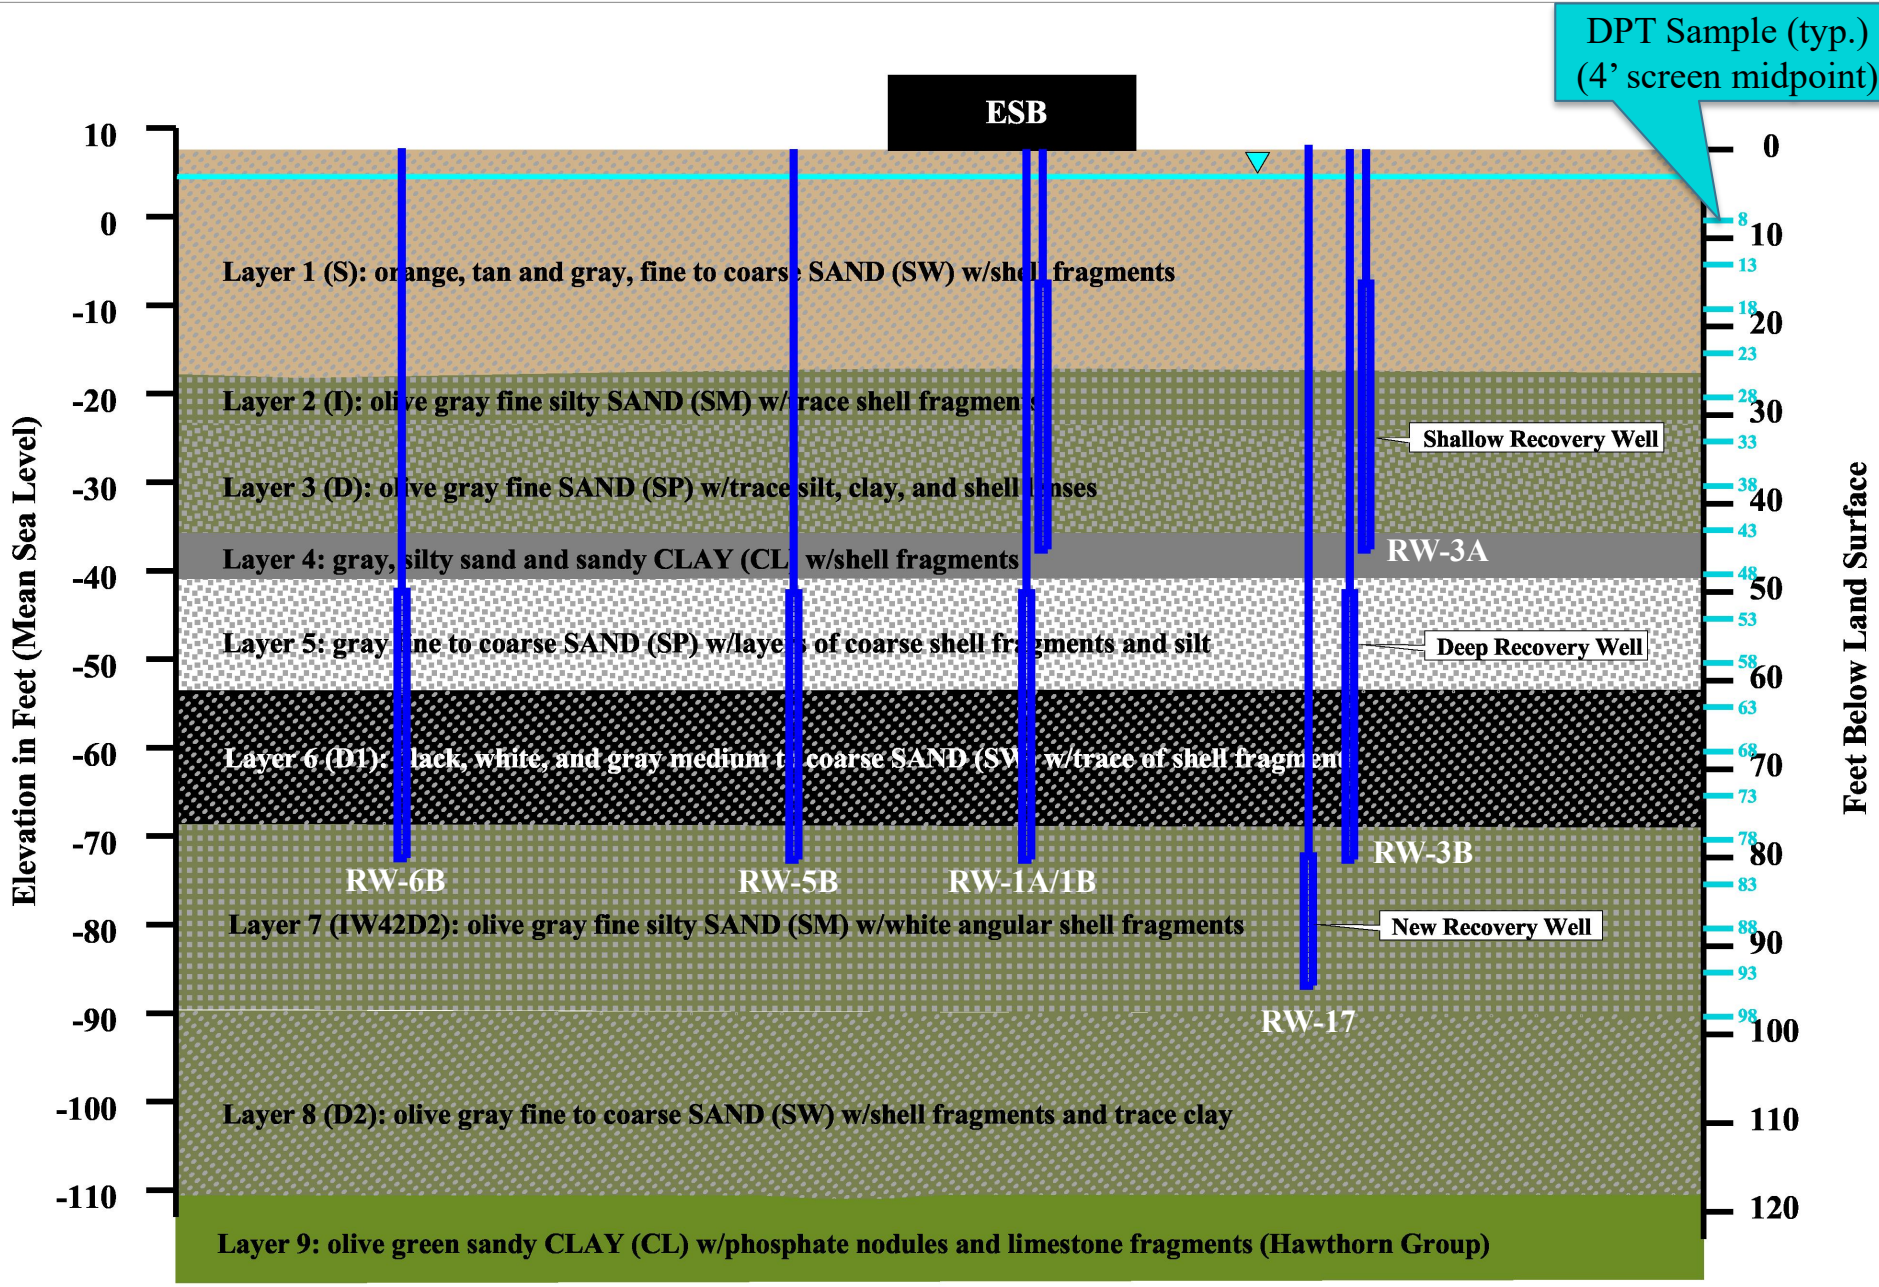
- 2008: IM Design for Hydraulic Containment of the DSZ and Deep TCE Groundwater Plume
- 2009: Installation and operation of the DSZ Hydraulic Containment System (HCS)
- 2014: Soil Re-Assessment initiated
- 2015: Cat-Ox Refurbishment and HCS Expansion
- 2018:
  - Hot Spot 6 Air Sparging IM implemented
  - Soil Excavation IM completed
- 2019:
  - Hot Spot 5 Site Characterization
  - Hot Spot 6 IM Expansion
  - Electrical Substation T-2 Soil IM
  - DSZ Supplemental Investigation



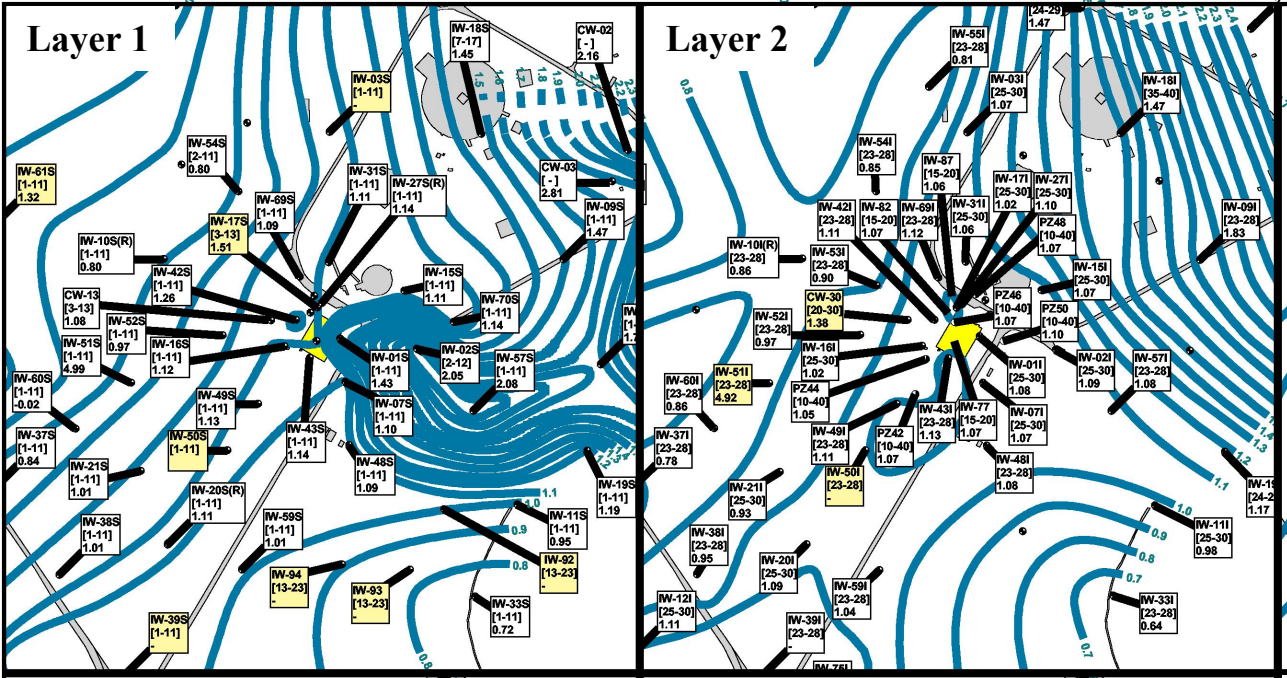


- IM Objective: Hydraulically control the DSZ and TCE HCP within Hot Spots 2, 3, and 4 by hydraulic containment and ex-situ treatment
- Current process system components:
  - 10 shallow recovery wells (~15 to 45 ft bls)
  - 7 deep recovery wells (~50 to 80 ft bls)
  - Equalization tank and discharge pump
  - Air stripping, discharge pump, and carbon treatment
  - Catalytic oxidizer and scrubbing unit
  - Deep well injection and infiltration gallery discharge
- To date 205 million gallons have been processed and 67,000 pounds of VOCs have been destroyed

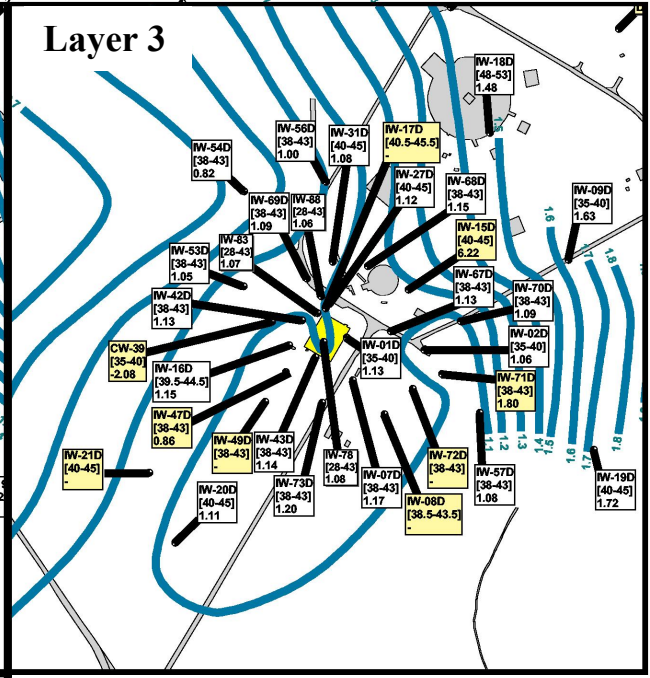
- IM Objective: Excavate contaminated soil with PCBs, TRPH, and/or dioxins/furans (TCDD TEQ) at concentrations greater than RSCTLs
  - 1,622 yd^3 excavated from 20 areas and disposed off-site
  - NFA approved for 20 areas
  - Further investigation required for Electrical Substation T-2 (LOC 2); PCBs > 50 mg/kg



- LC34 is located on Cape Canaveral Air Force Station which is a barrier island bounded by the Banana River and Atlantic Ocean
- The Air Force has issued NASA a permit granting the privilege for the use of real property and facilities referred to as the "Premises" for environmental restoration
- KSC Visitor Bus Tour and CCAFS tours regularly stop at the launch pedestal
- Current plume footprint covers 327 acres (LCP), 162 acres (HCP), 63 acres (Hot Spots), and 11 acres (10x Hot Spots)



Monitoring:



- Monthly Sampling:
  - HCS effluent sampling
    - Air strippers
    - GAC when online
- Quarterly Sampling:
  - HCS total system influent / effluent
  - HCS individual recovery wells
  - Hot Spot 6 performance sampling
- Annual Sampling:
  - HCS CatOx influent and effluent
  - HCS DPT samples from 9 locations
- Biennial Sampling:
  - Site-wide LTM

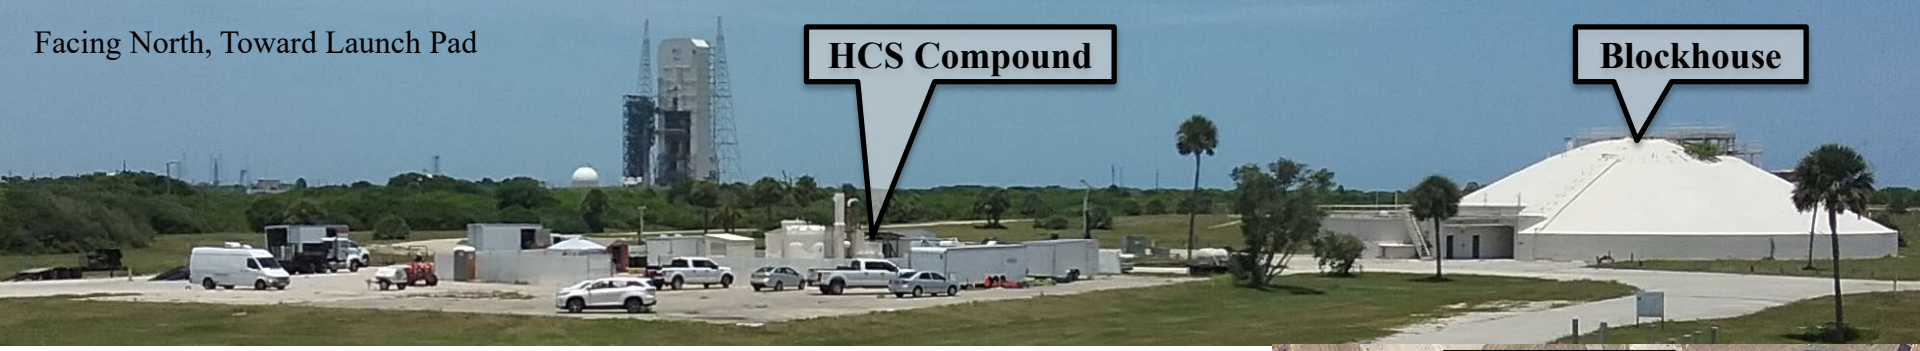
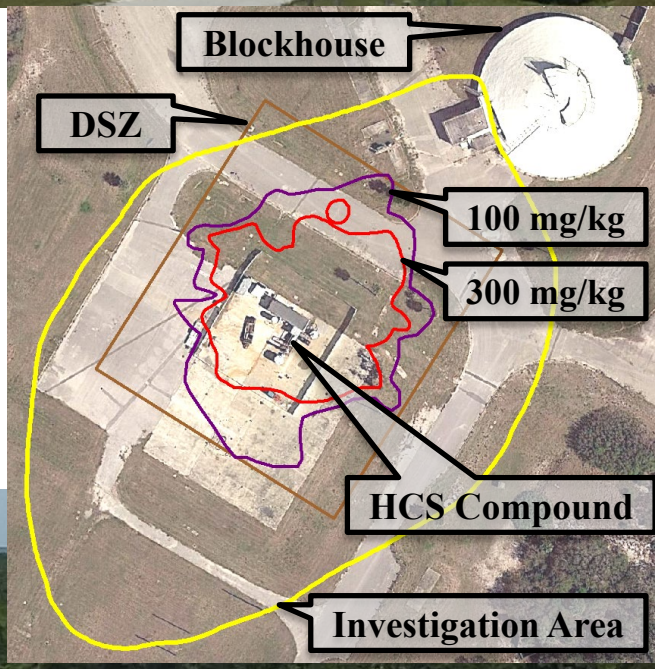
7	olive gray fine silty SAND (SM) w/white angular shell fragments	
8 (D2)	olive gray fine to coarse SAND (SW) w/shell fragments and trace clay	Description from Deep Soil Coring completed in 2002, no photos available
9	olive green sandy CLAY (CL) w/phosphate nodules and limestone fragments (Hawthorn Group)	

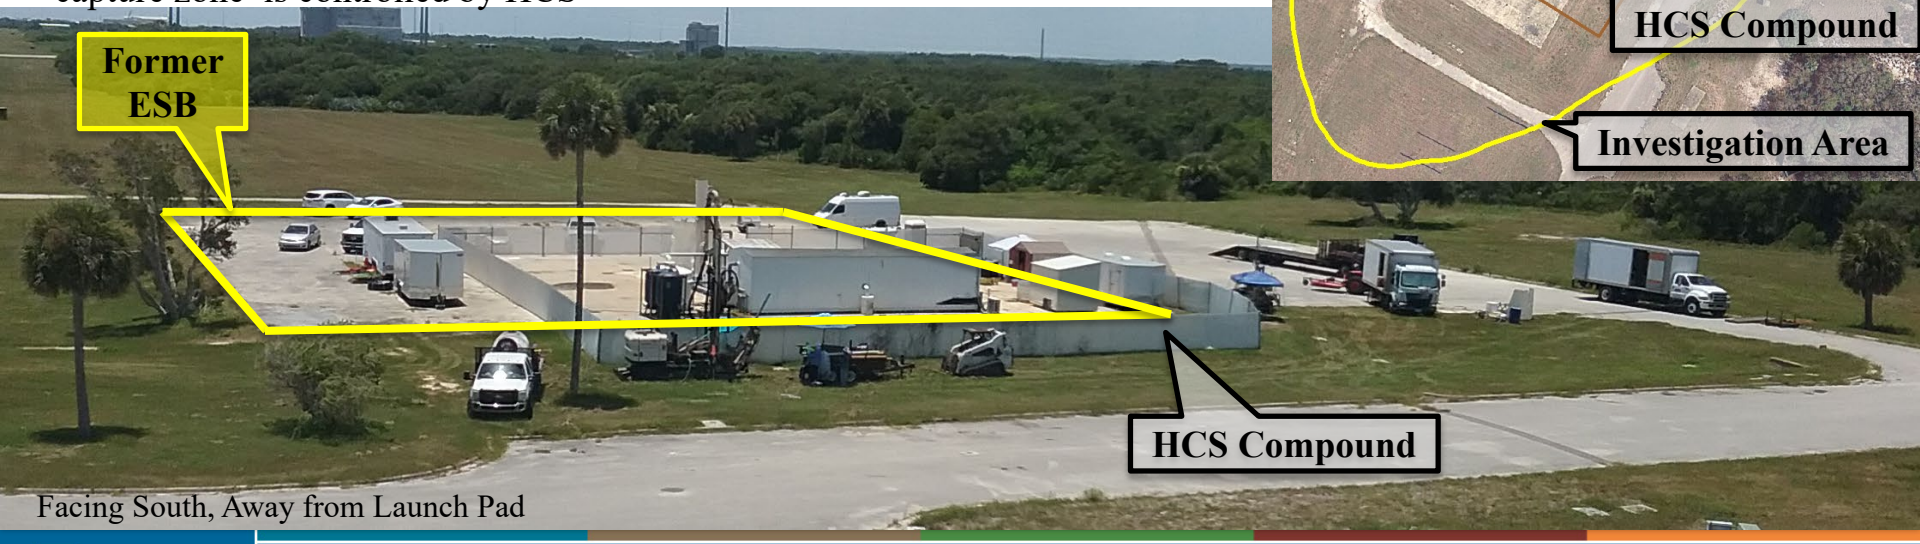


- Prior to HCS operation in December 2009 groundwater flow patterns in the shallow groundwater flow system (Layers 1, 2, and 3) localized source area groundwater mounding near the HCS Compound and in the deeper groundwater flow system (Layers 6 and 8) flow generally to the southeast, southwest, and west.
- Hydraulic Conductivity:

Layer	ft/d
1	30
2	4
3	3
4	1.67×10^{-4}
5	0.4
6	7.5
7	0.4
8	3
9	Hawthorn

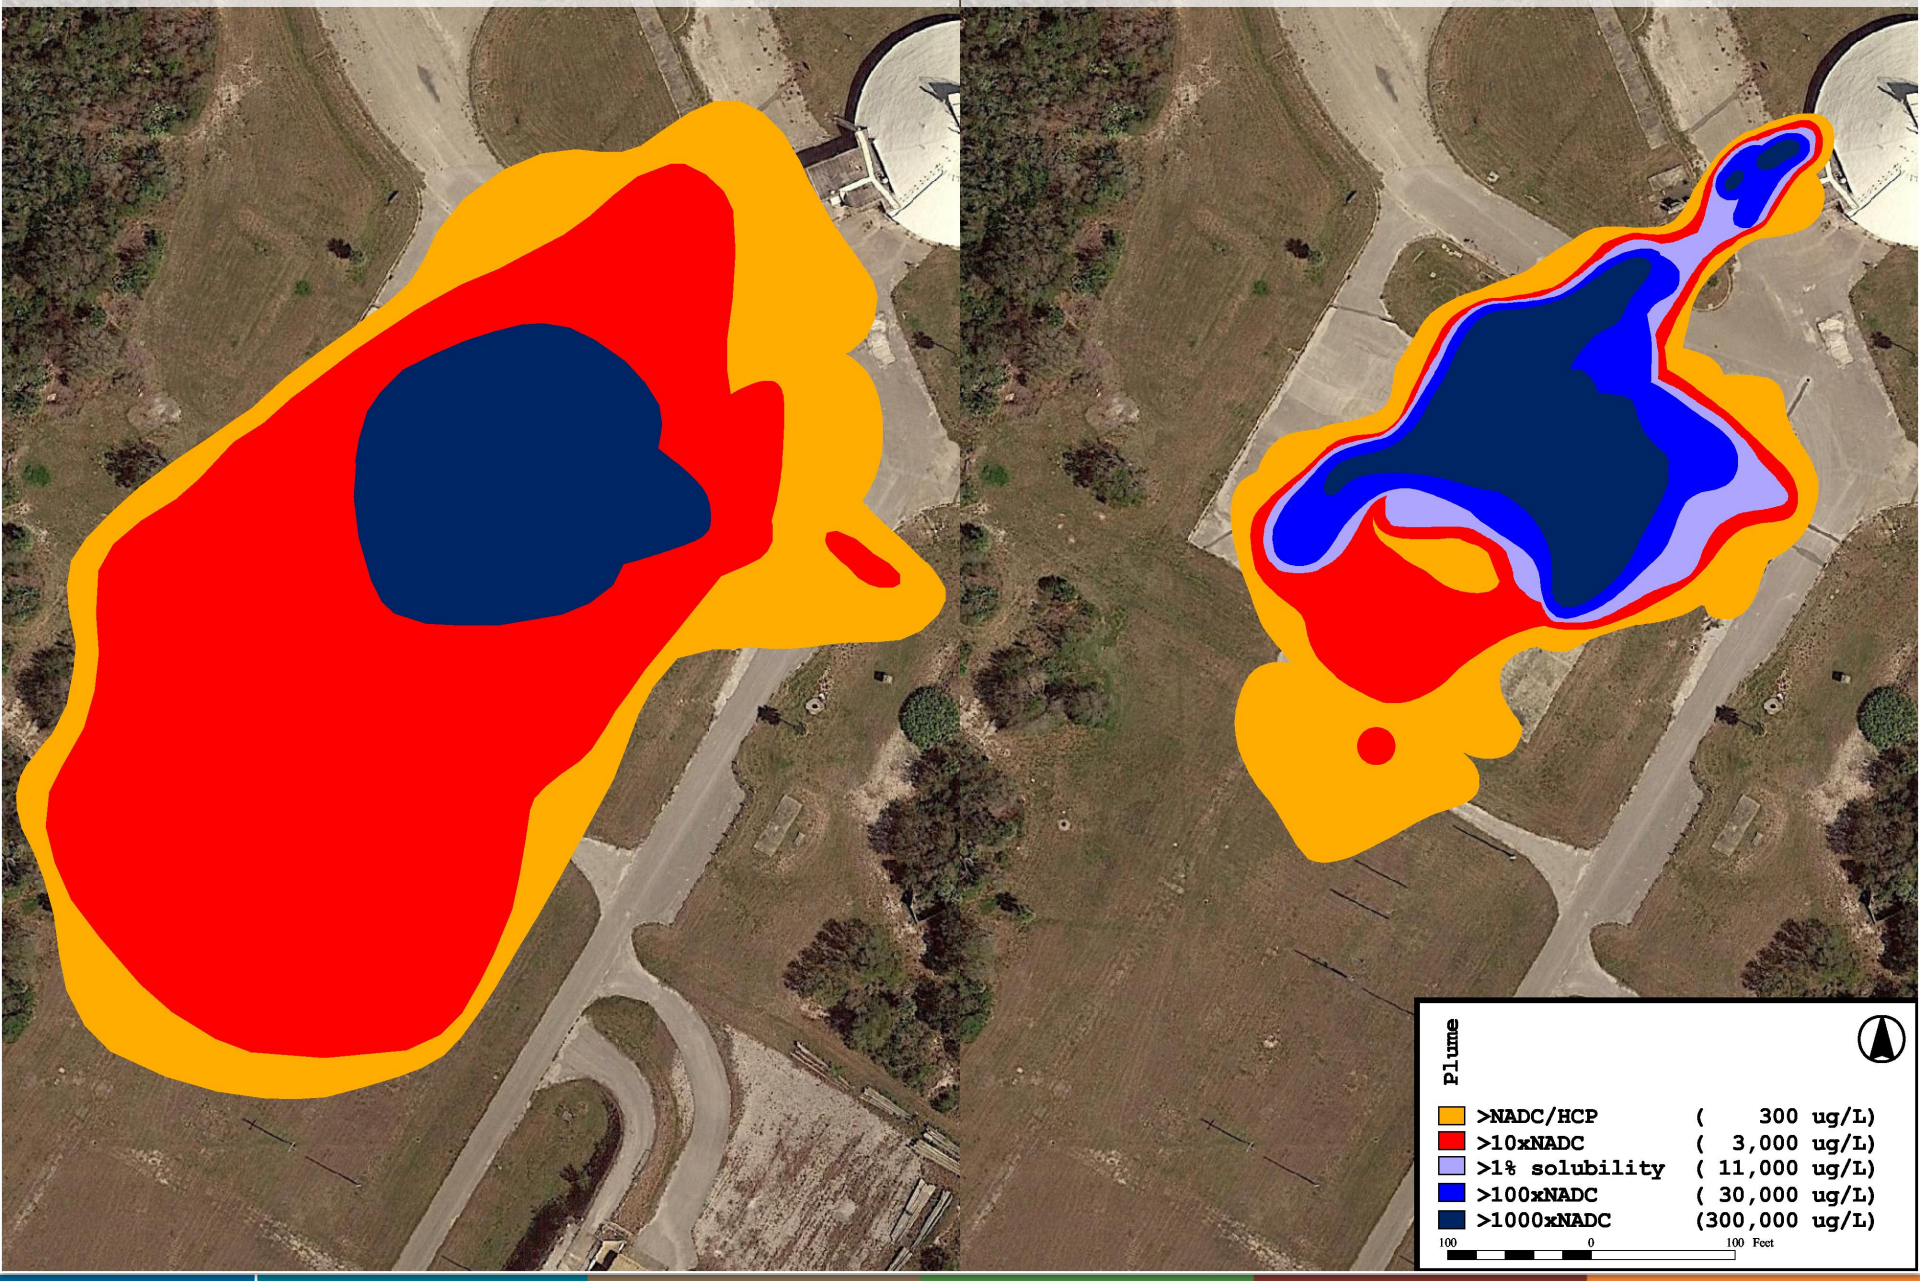


Response to AECOM Comments



3. **Slides 11 and 39 Lithology Transects: AECOM suggests adding labels to each Layer that provides the estimated hydraulic conductivity value.**

   Response: The estimated hydraulic conductivity was provided on Slide 7 for the individual layers.



- DSZ defined in the CMS as a 2-acre area to 75' bls encompassing the extent of TCE DNAPL determined by soil concentrations TCE ≥ 300 mg/kg and the transition zone to 100 mg/kg, calculated mass of 74,000 and 12,000 pounds respectively
- Investigation area footprint 4.5 acres, including 2.5 acres mowed and maintained and the remainder paved or covered by Blockhouse
- Elevation of former ESB pad is 10 ft and there is a 2 to 3-foot elevation change in ditches and field to southwest
- Depth to groundwater approximately 5 ft bls and groundwater flow within the capture zone is controlled by HCS

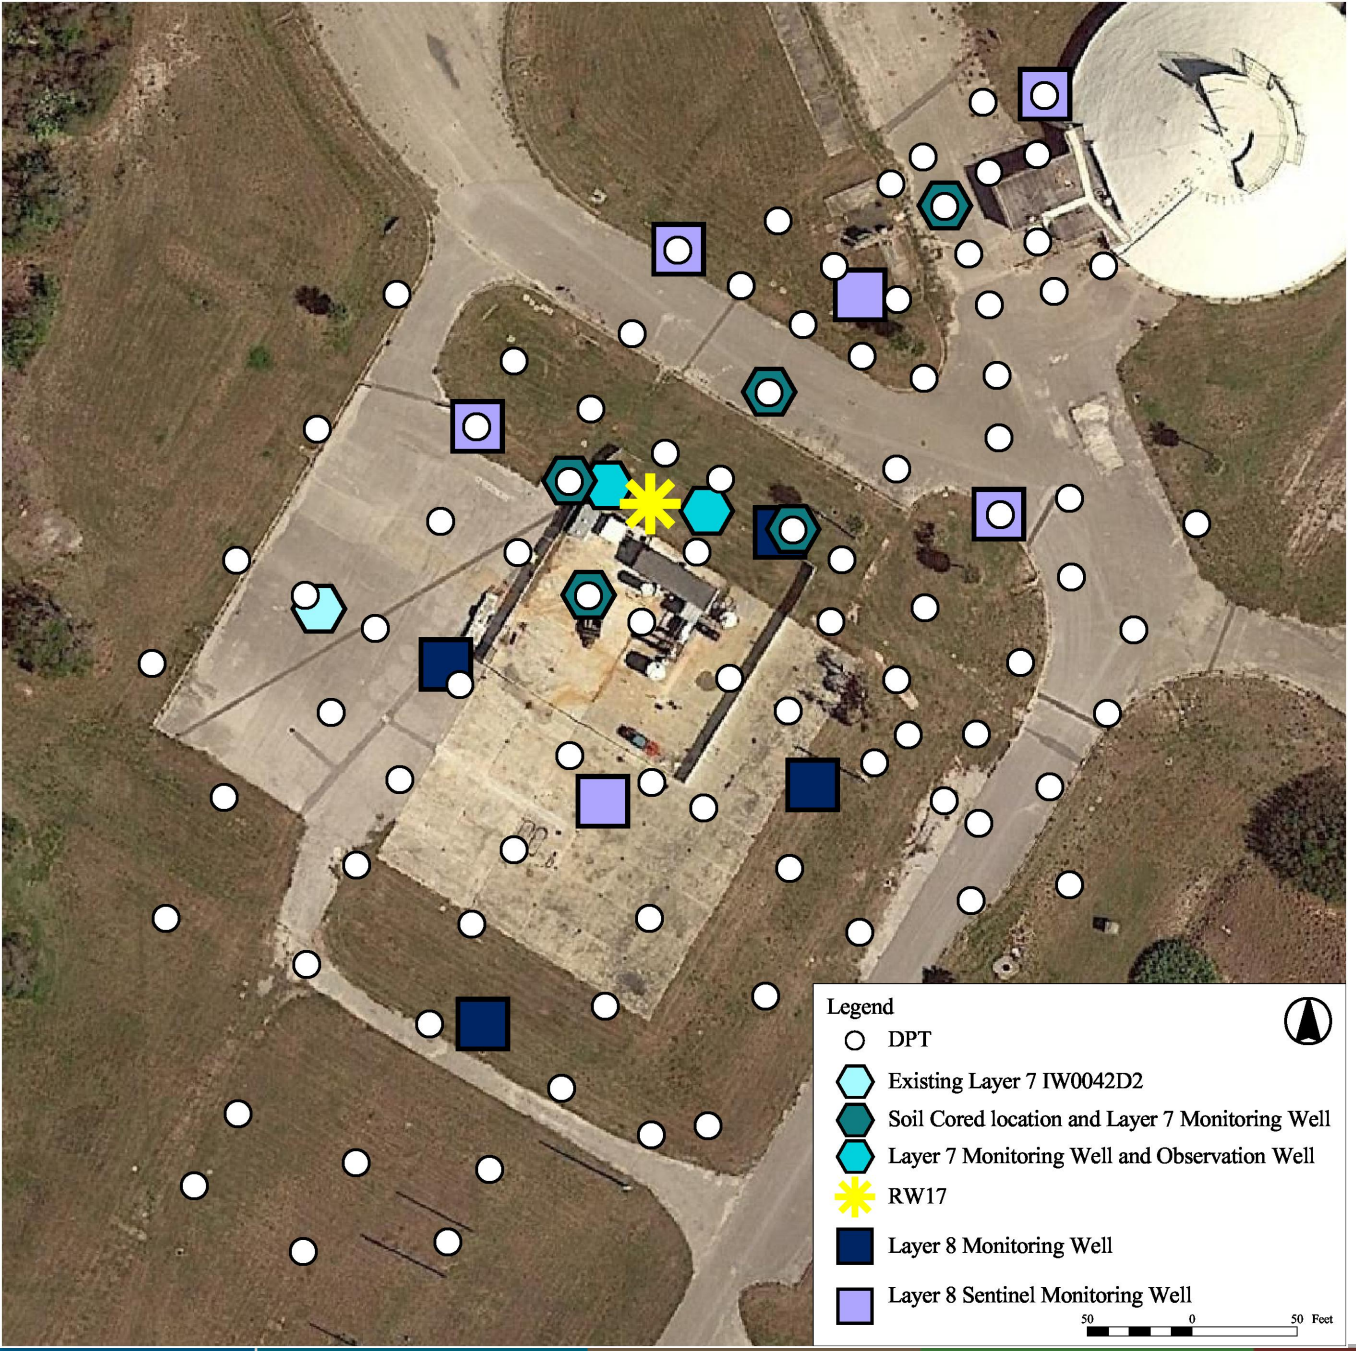
- DNAPL Source Zone
- 100 mg/kg TCE Saturated Soil Isoconcentration Contour



50 0 50 Feet

Site Characterization Spacing:

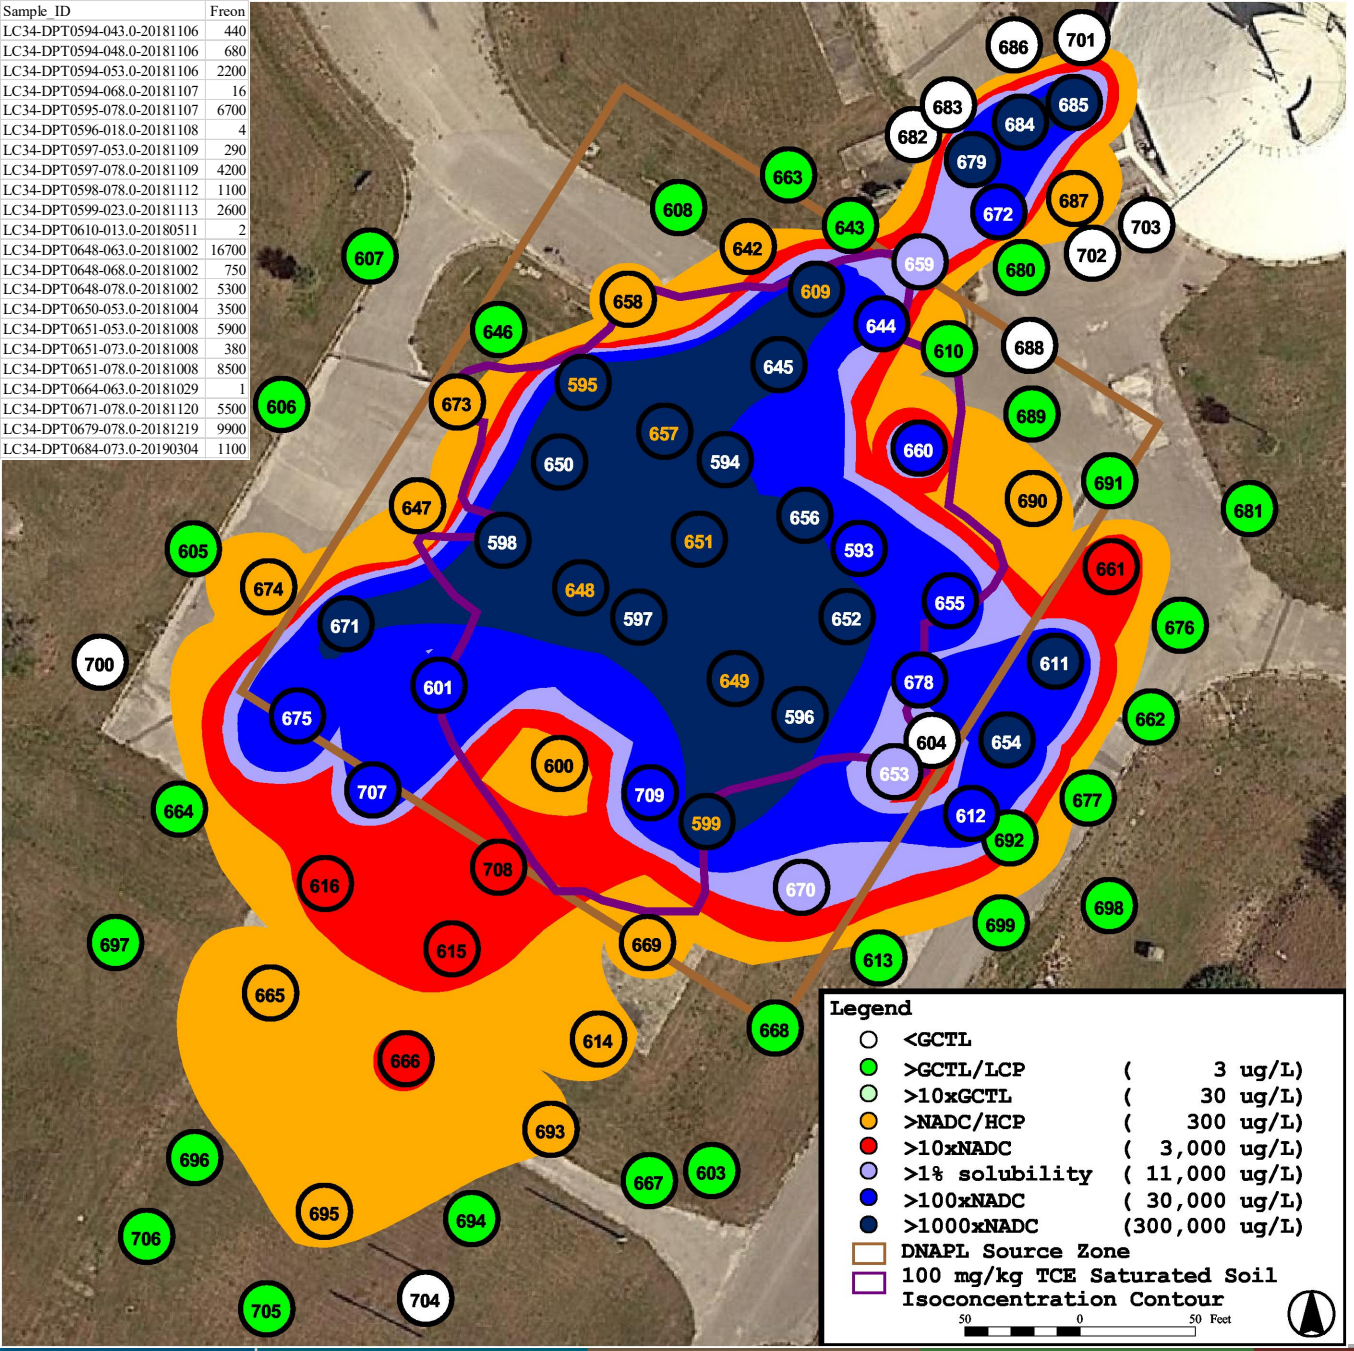
- Following the DPD recommended sampling frequency spacing for HCP (50-ft), HS (25-ft), and SZ (10-ft) delineation could have resulted in 59, 63, and 670 locations, respectively
- White locations represent the actual 89 DPT locations sampled from May 2018 to March 2019
  - 1196 groundwater samples
  - 5-ft intervals from 8 to 98 ft bls
  - Onsite lab analysis of Freon, TCE, DCE, and VC
  - TCE is being presented for this Site Characterization
- Sampling strategy was developed to support the following RAE Source Area Alternatives:
  - LDA with Steam
  - Thermal Treatment
  - P&T with amendment addition
- The current LC34 SZ, defined as 1% solubility of TCE, is ~1.4 acres is much larger than CHP, HMFN, and WC SZs

	CHP	HMFN	WC
SZ:	PCE	TCE	TCE
% solubility:	4%	1%	1%
SZ in acres:	0.05	0.26	0.23
LC34 comparison:	28x	5.4x	6.1x

Background:

- HCS DPT performance sampling conducted in November 2017 had results orders of magnitude higher than previous MW results, maximum detections in µg/L:

	MW	DPT
TCE	22,700	1,580,000
cDCE	65,300	662,000
VC	31,500	107,000



Purpose:

- Focused to delineate TCE to 300 µg/L by collecting a robust horizontal and vertical dataset to support optimization of HCS and DSZ RAE

Investigation:

- In addition to the DPT collected groundwater samples, soil cores were collected from five locations to 80' bls
  - PID screening conducted
  - Soil samples collected for VOC and TOC analyses
  - DPT groundwater sampling within the drive casing from 80' to 100' bls to confirm previous results
  - Five monitoring wells were installed
- Six Layer 8 sentinel (vertical) wells were installed and sampled
- A recovery well and two observation wells installed in Layer 7 to support pump test

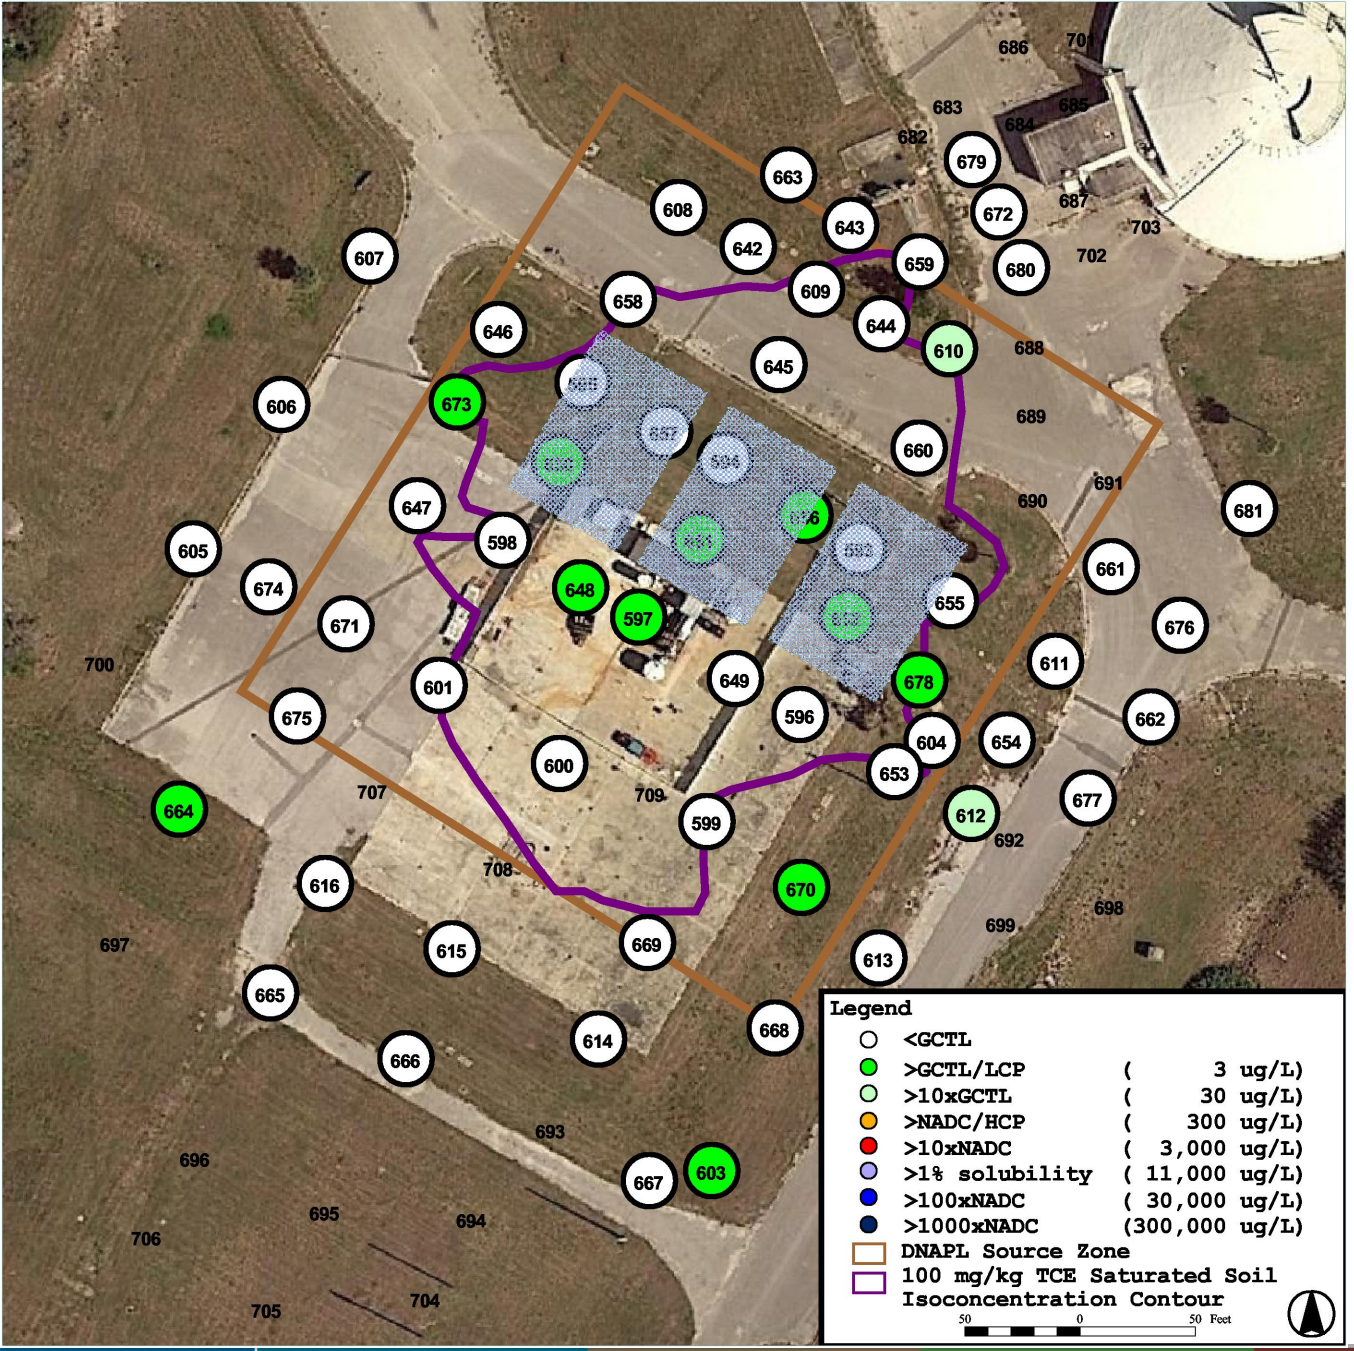
TCE based on 2018/2019 DPT Investigation

Response to AECOM Comments

2. **Slide 15 DNAPL Observation: Please describe how observation of DNAPL was performed. Was an oleophilic dye used?**

   Response: DNAPL observation was visual. No additional testing was performed other than VOC analyses by the mobile lab.



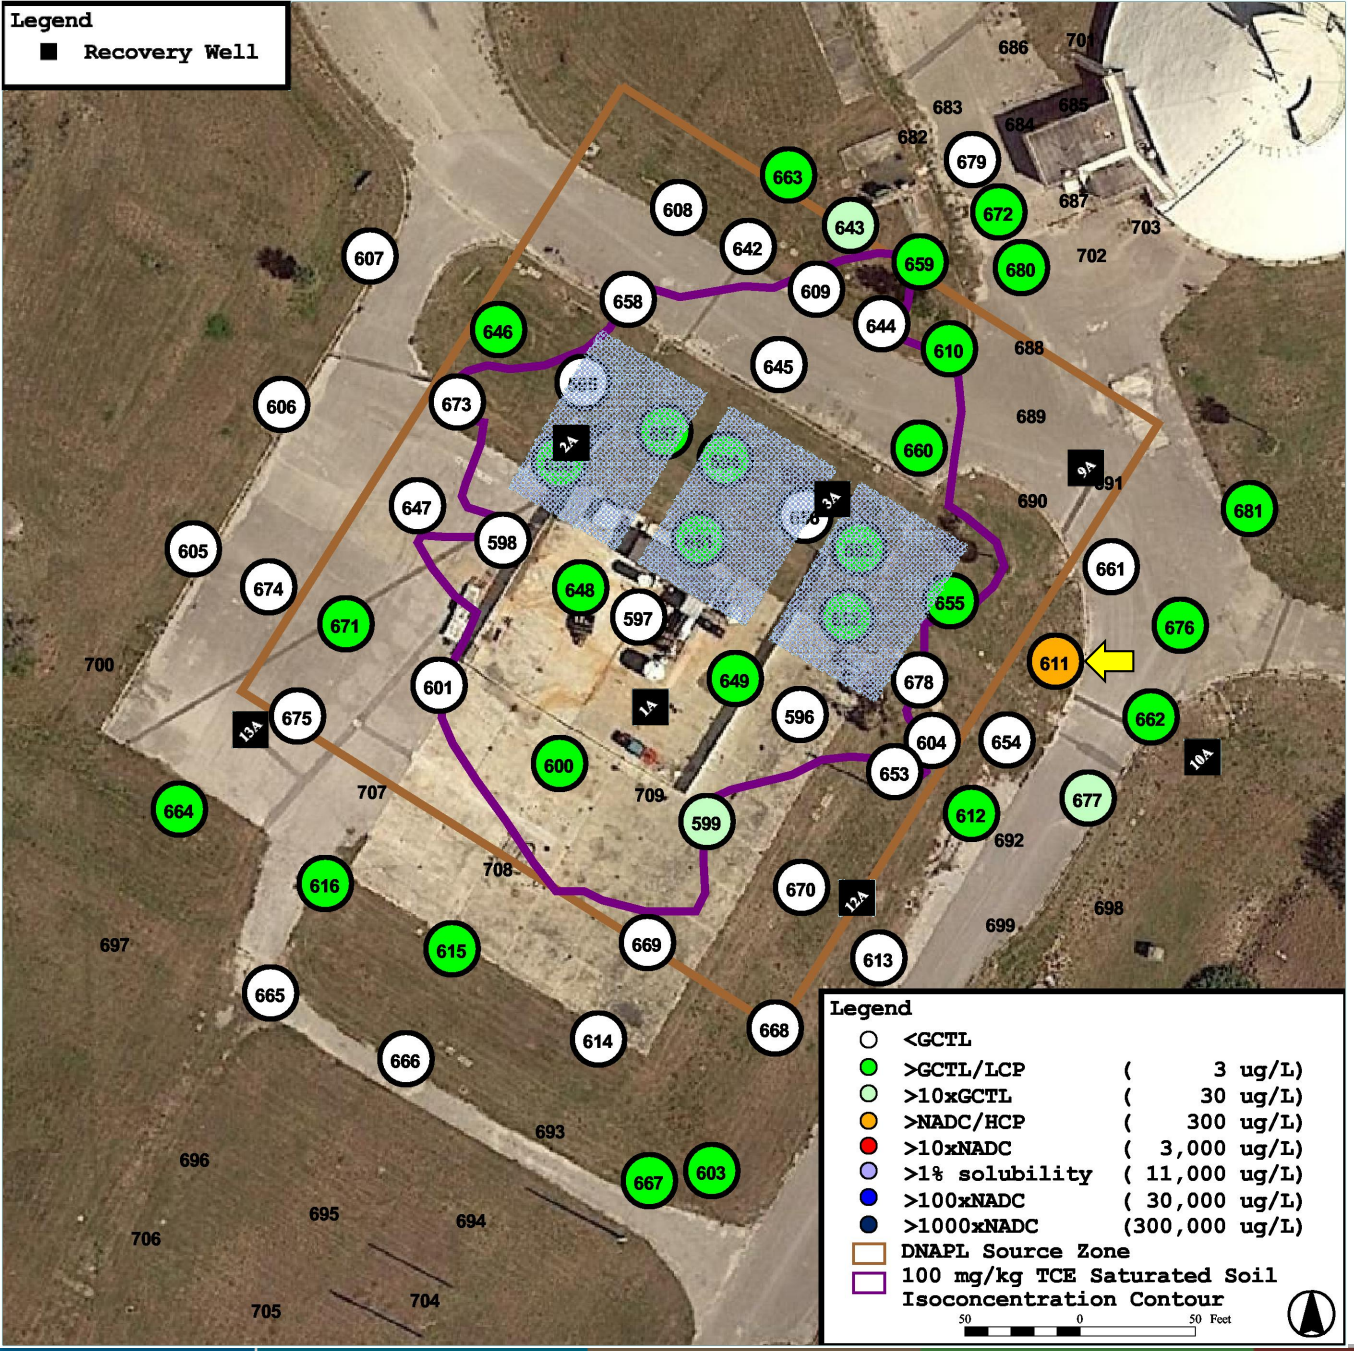
TCE interval slides:

- All sample locations have labels; only locations with symbol used in contouring
- If an interval had multiple results, maximum was used for contouring
- Contouring included all detections and treated non-detect values as detections.
  - 634 of 1196 TCE results BDL
  - Two results of 1000 U
  - One result of 500 U
  - 52 results of 290 U
  - Two results of 250 U
  - 10 results of 200 U
  - 32 results of 100 U
  - 535 results less than 70 U
- Contours were generated for these intervals:
  - 300 µg/L
  - 3,000 µg/L
  - 11,000 µg/L
  - 30,000 µg/L
  - 300,000 µg/L

8’ BLS interval:

- Maximum concentration 105 µg/L at DPT610
- All results less than 300 µg/L
- Team consensus: TCE does not exceed 300 µg/L in this interval

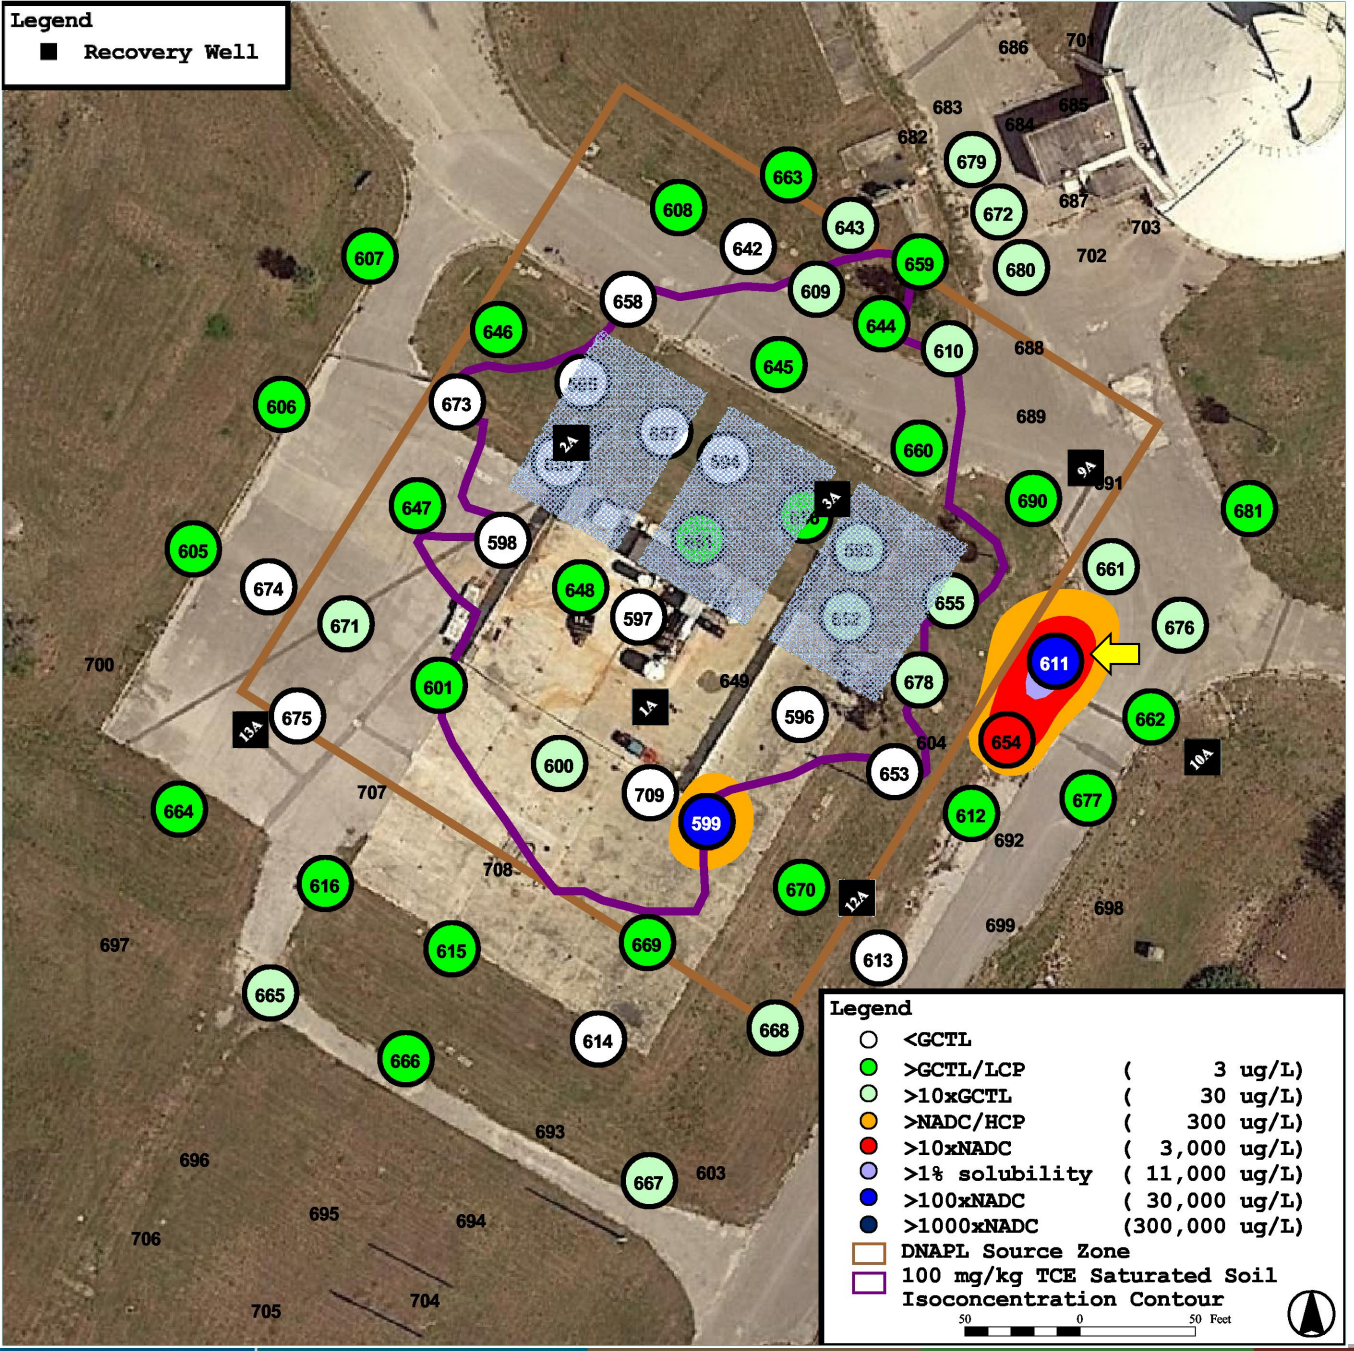
13' BLS interval:



- Maximum concentration 220 µg/L at DPT610
- All results less than 300 µg/L

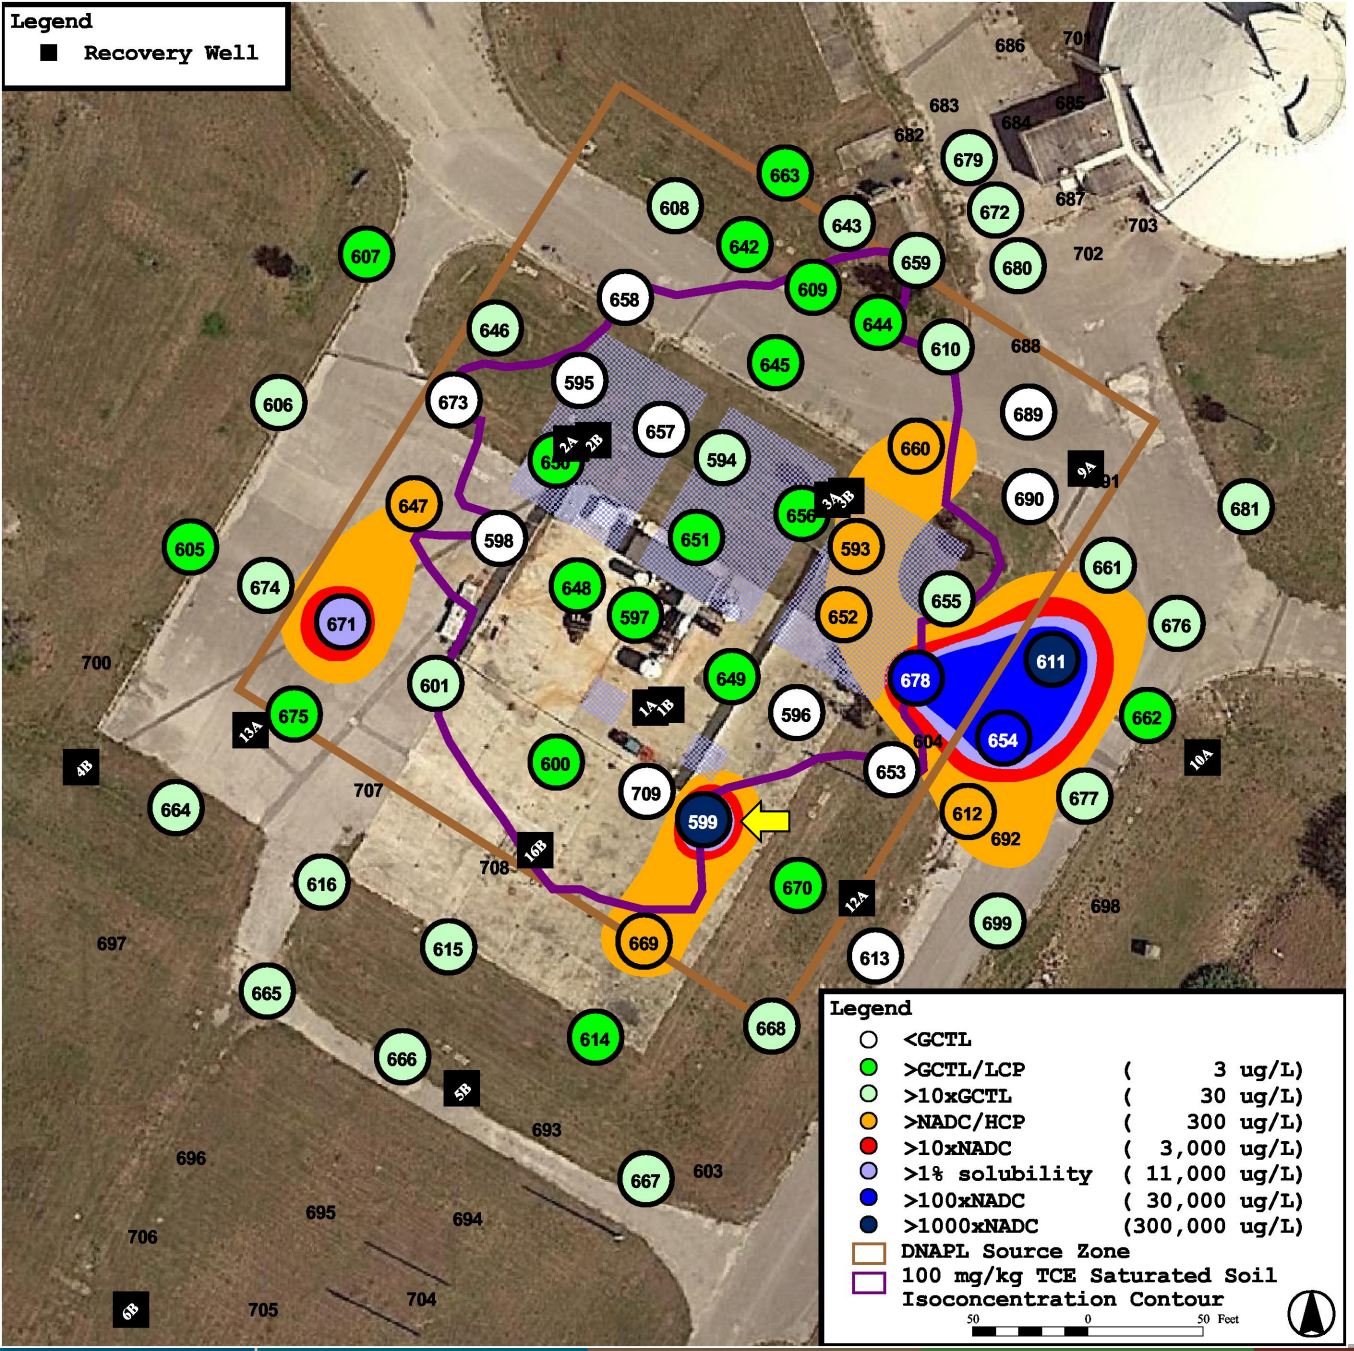
- Team consensus: TCE does not exceed 300 µg/L in this interval

Response to HydroGeoLogic, Inc. Comments



1. **Slides 21 thru 34 - DPT TCE Results: Consider showing the RWs on the DPT TCE Result Figures, which will allow the reader to visualize where the shallow and deep RWs are located in relation to the TCE results.**

   Response: Tt concurs, recovery wells have been added to slides 18 to 23 and 25 to 30.



18' BLS interval:

- Maximum concentration 1,500 µg/L at DPT611, only result greater than TCE 300 µg/L
- Team consensus: TCE is adequately delineated horizontally to 300 µg/L in this interval

23' BLS interval:

- Maximum concentration 67,000 µg/L at DPT611, two additional results greater than TCE 300 µg/L at DPTs 654 (10,100) and 599 (54,700)
- Team consensus: TCE is adequately delineated horizontally to 300 µg/L in this interval

28' BLS interval:

- Maximum concentration 479,000 µg/L at DPT599, ten additional results greater than TCE 300 µg/L:
  - 316,000 at DPT611
  - 184,000 at DPT654
  - 37,400 at DPT678
  - 26,300 at DPT671
  - 1,200 at DPT593
  - 1,000 U at DPT669
  - 670 at DPT660
  - 340 at DPT647
  - 330 at DPT652
  - 330 at DPT612*

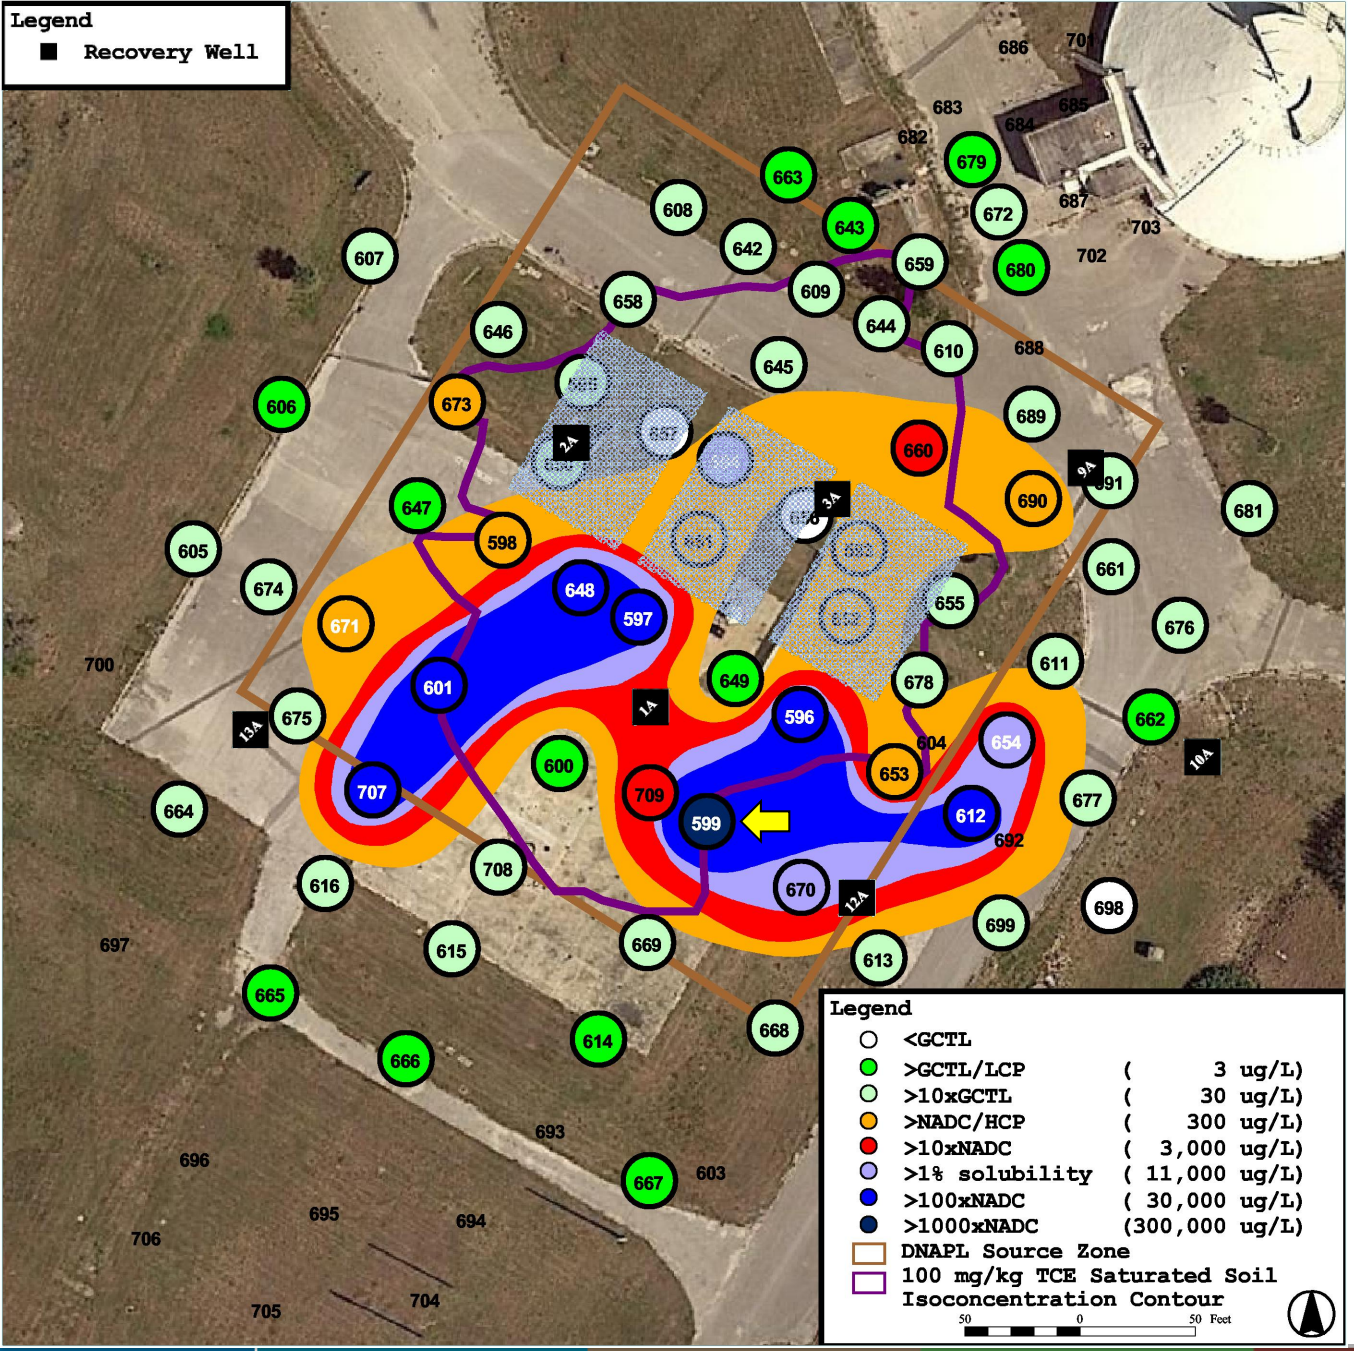
  * Additional delineation not conducted at DPT612, slide has been update with new sample results at DPT699

- Team consensus: TCE is adequately delineated horizontally to 300 µg/L in this interval

Response to HydroGeoLogic, Inc. Comments

2. **Slides 21, 29 and 30 - DPT TCE Results: The high concentration area extending toward the Blockhouse (Slides 29 and 30) between Layers 6 and 7 is relatively narrow and perhaps the result of migration through a narrow feature at the interface of these two layers. Please review the current and historic data to confirm that a similar narrow extension of contamination (Slide 21) is not occurring at DPT location 661.**

   Response: Tt concurs that the 100 mg/kg TCE Saturated Soil Isoconcentration Contour and perhaps a sublte change in the interface between Layers 6 and 7 support the TCE detected in DPTs 659, 672, 684, and 685 on slides 29 and 30. The elevated TCE detected in DPTs 654 and 612 shown on slide 21 could be related to the proximity of the 100 mg/kg TCE Saturated Soil Isoconcentration Contour near DPT 653 and review of existing data suggests decreasing concentrations towards DPTs 661 and the three DPTs (690, 691, and 681) surrounding DPT 661 indicate very low levels of TCE and/or less than detection limits.

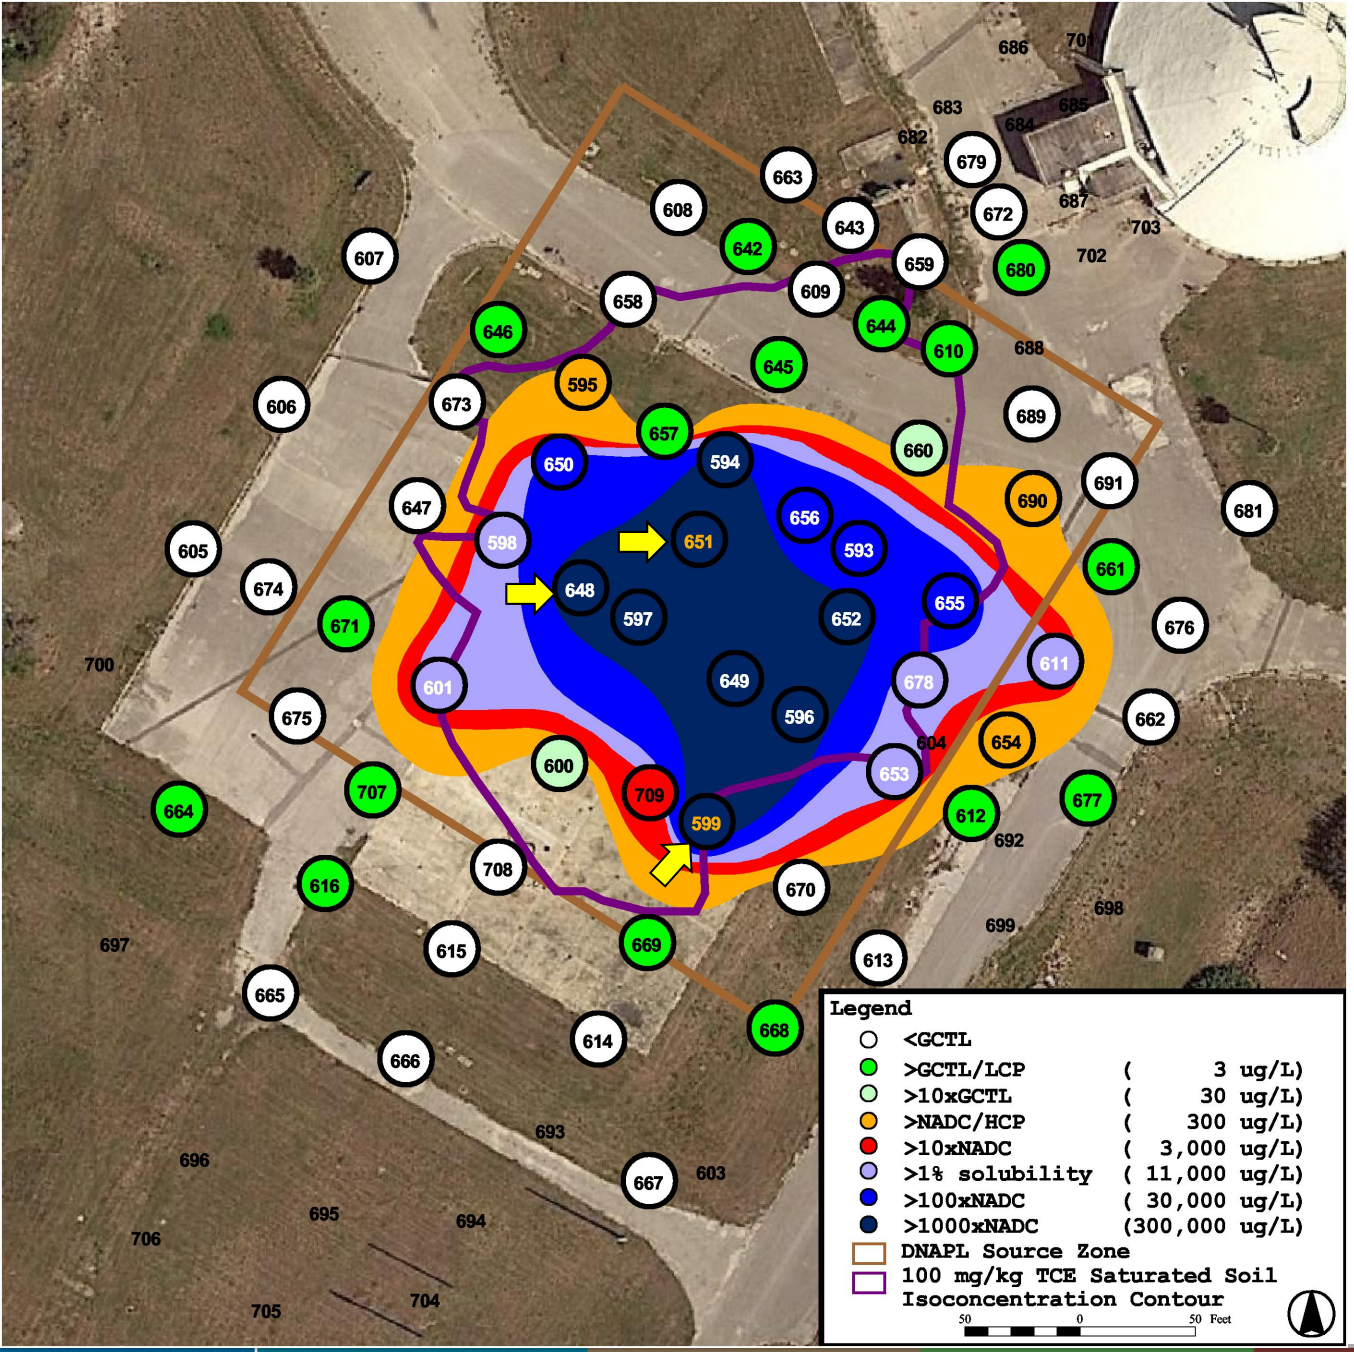


33' BLS interval:

- Maximum concentration 683,000 µg/L at DPT599, 12 additional results greater than TCE 300 µg/L:
  - 356,000 at DPT654
  - 145,000 at DPT660
  - 71,500 at DPT671
  - 68,100 at DPT612
  - 54,400 at DPT707
  - 33,800 at DPT601
  - 13,000 at DPT648
  - 8,400 at DPT611
  - 6,200 at DPT661
  - 810 at DPT596
  - 360 at DPT652
  - 350 at DPT658*

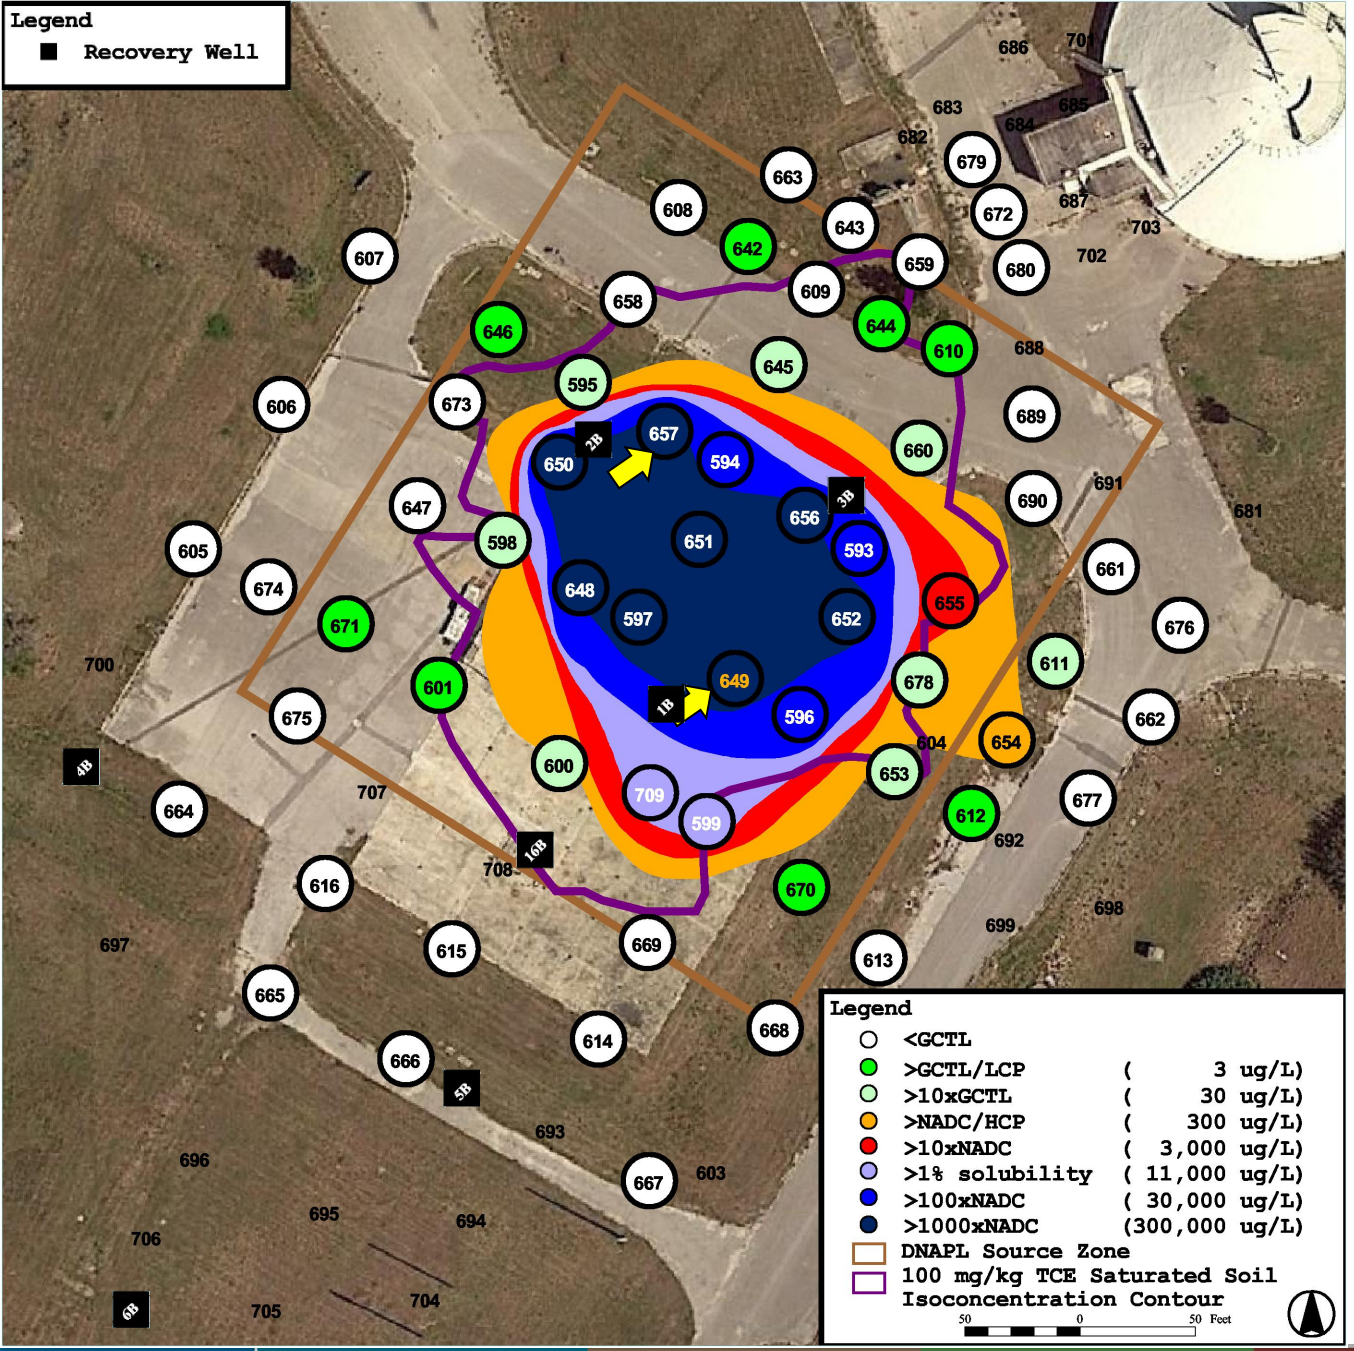
  * Additional delineation not conducted at DPT658, slide has been update with new sample results at DPT771

- Team consensus: TCE is adequately delineated horizontally to 300 µg/L in this interval



38' BLS interval:

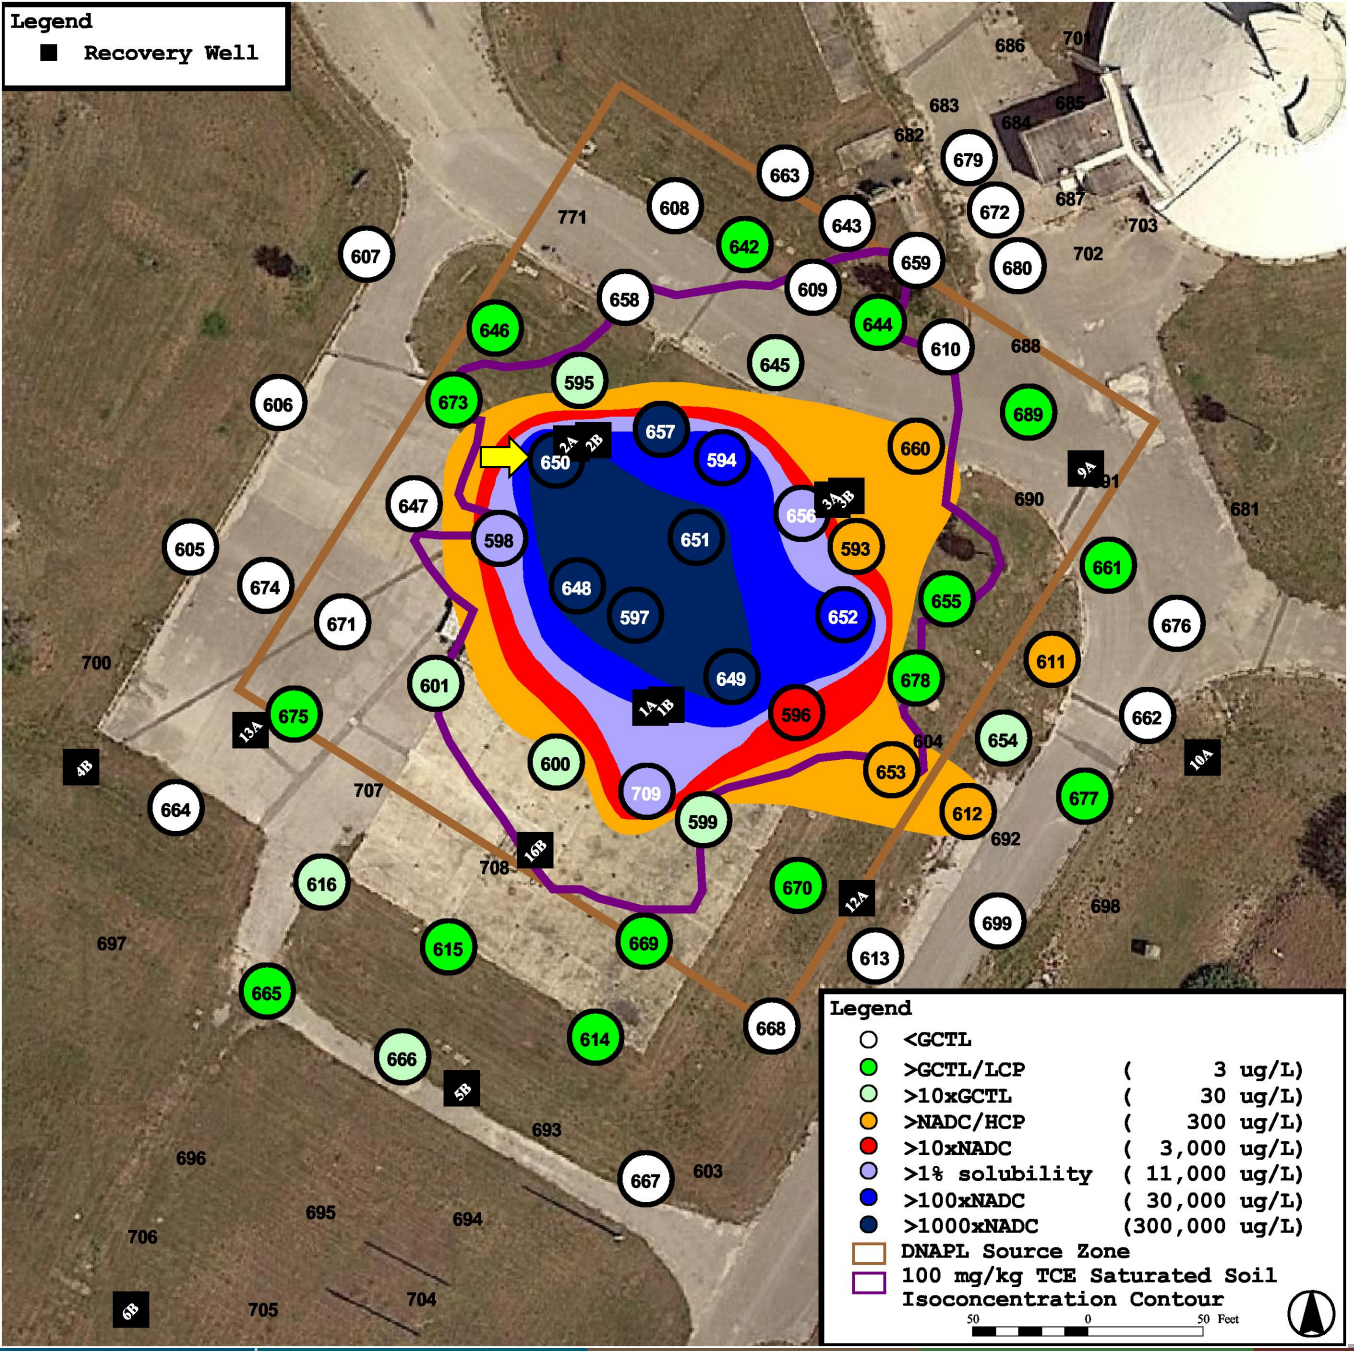
- Maximum concentration 759,000 µg/L at DPT599, 19 additional results greater than TCE 300 µg/L:
  - 188,000 at DPT648
  - 153,000 at DPT596
  - 103,000 at DPT601
  - 79,500 at DPT597
  - 73,300 at DPT707
  - 59,800 at DPT612
  - 28,100 at DPT654
  - 25,800 at DPT670
  - 11,500 at DPT594
  - 10,300 at DPT709
  - 3,900 at DPT660
  - 2,200 at DPT598
  - 2,100 at DPT593
  - 1,600 at DPT653
  - 1,500 at DPT671
  - 1,000 U at DPT690
  - 660 at DPT651
  - 500 U at DPT673
  - 420 at DPT652
- Team consensus: TCE is adequately delineated horizontally to 300 µg/L in this interval



43' BLS interval:

- Maximum concentration 1,200,000 µg/L at DPT648, 19 additional results greater than TCE 300 µg/L:
  - 781,000 at DPT594
  - 413,000 at DPT649
  - 213,000 at DPT599
  - 166,000 at DPT709
  - 142,000 at DPT651
  - 121,000 at DPT596
  - 101,000 at DPT593
  - 97,900 at DPT601
  - 97,000 at DPT656
  - 89,300 at DPT597
  - 36,300 at DPT650
  - 28,700 at DPT653
  - 20,100 at DPT670
  - 6,900 at DPT655
  - 1,800 at DPT652
  - 1,600 at DPT595
  - 1,400 at DPT654
  - 320 at DPT598
  - 310 at DPT707
- Team consensus: TCE is adequately delineated horizontally to 300 µg/L in this interval

48' BLS interval:



- Maximum concentration 1,810,000 µg/L at DPT648, 20 additional results greater than TCE 300 µg/L:
  - 1,110,000 at DPT599 (**DNAPL**)
  - 842,000 at DPT651 (**DNAPL**)
  - 790,000 at DPT596

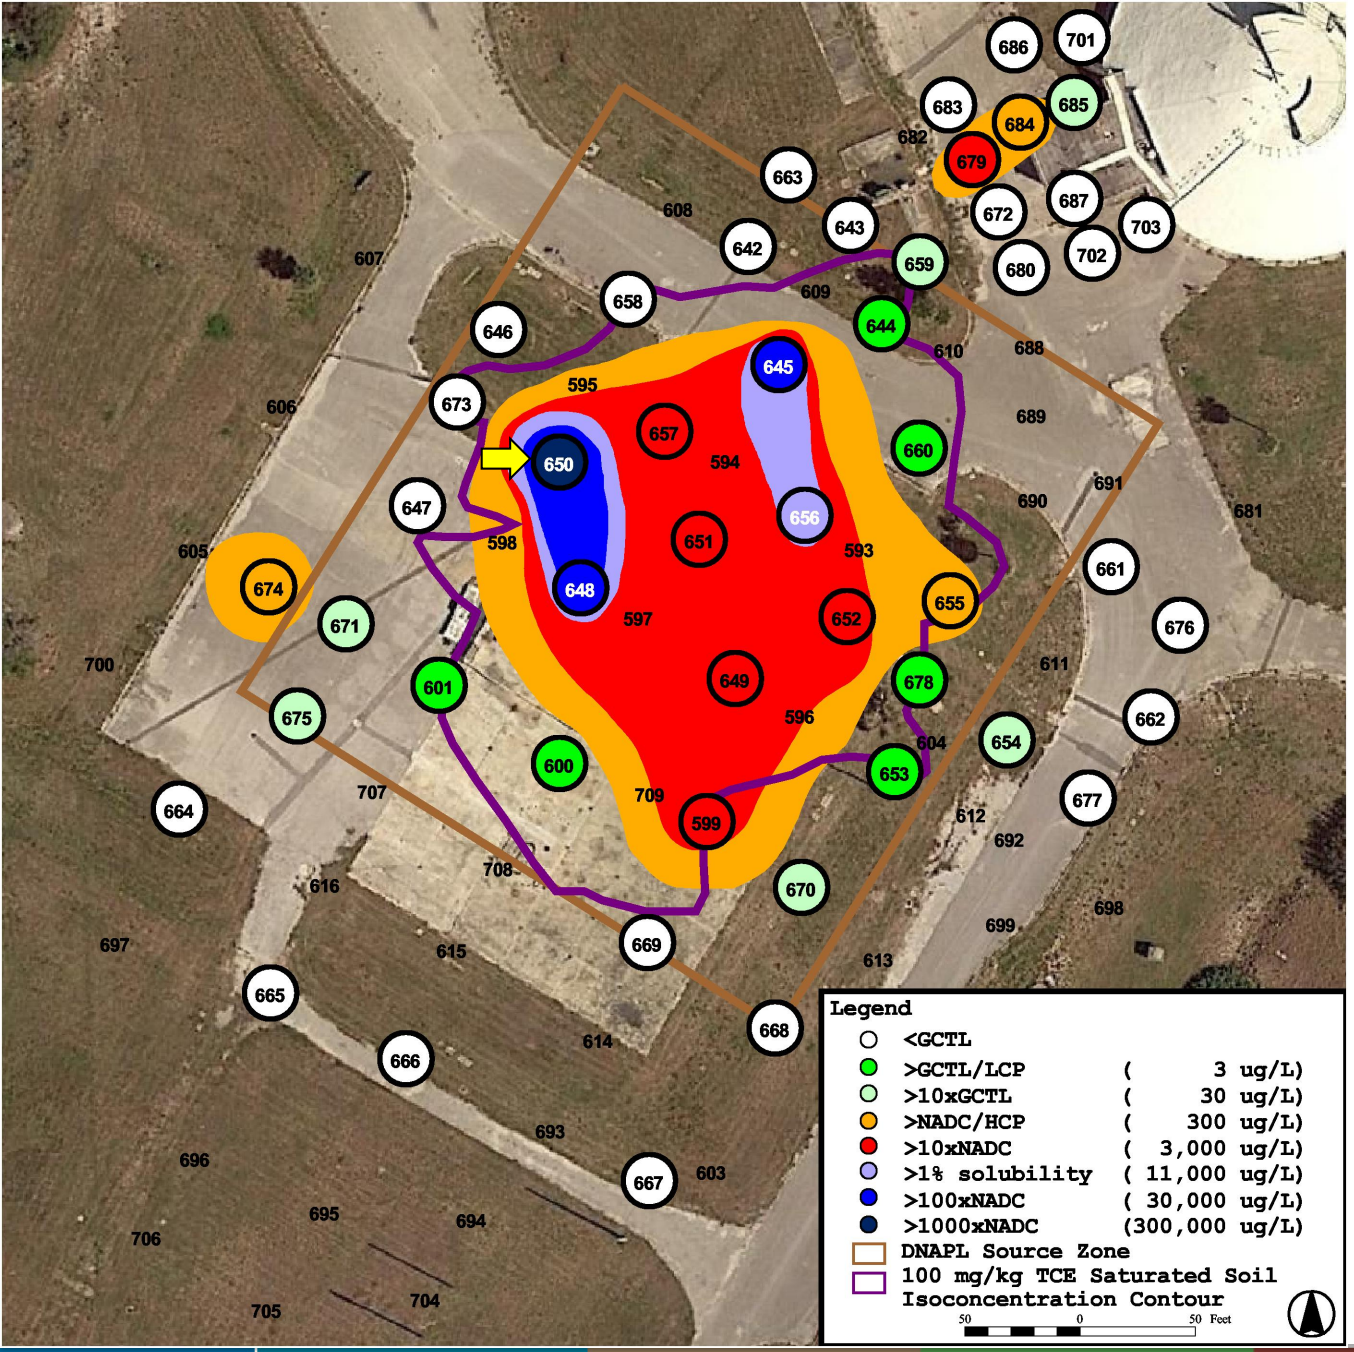
  - 4,200 at DPT652
  - 3,400 at DPT649
  - 2,100 at DPT656
  - 1,400 at DPT654*

  * Additional delineation not conducted at DPT654, slide has been update with new sample results at DPT699

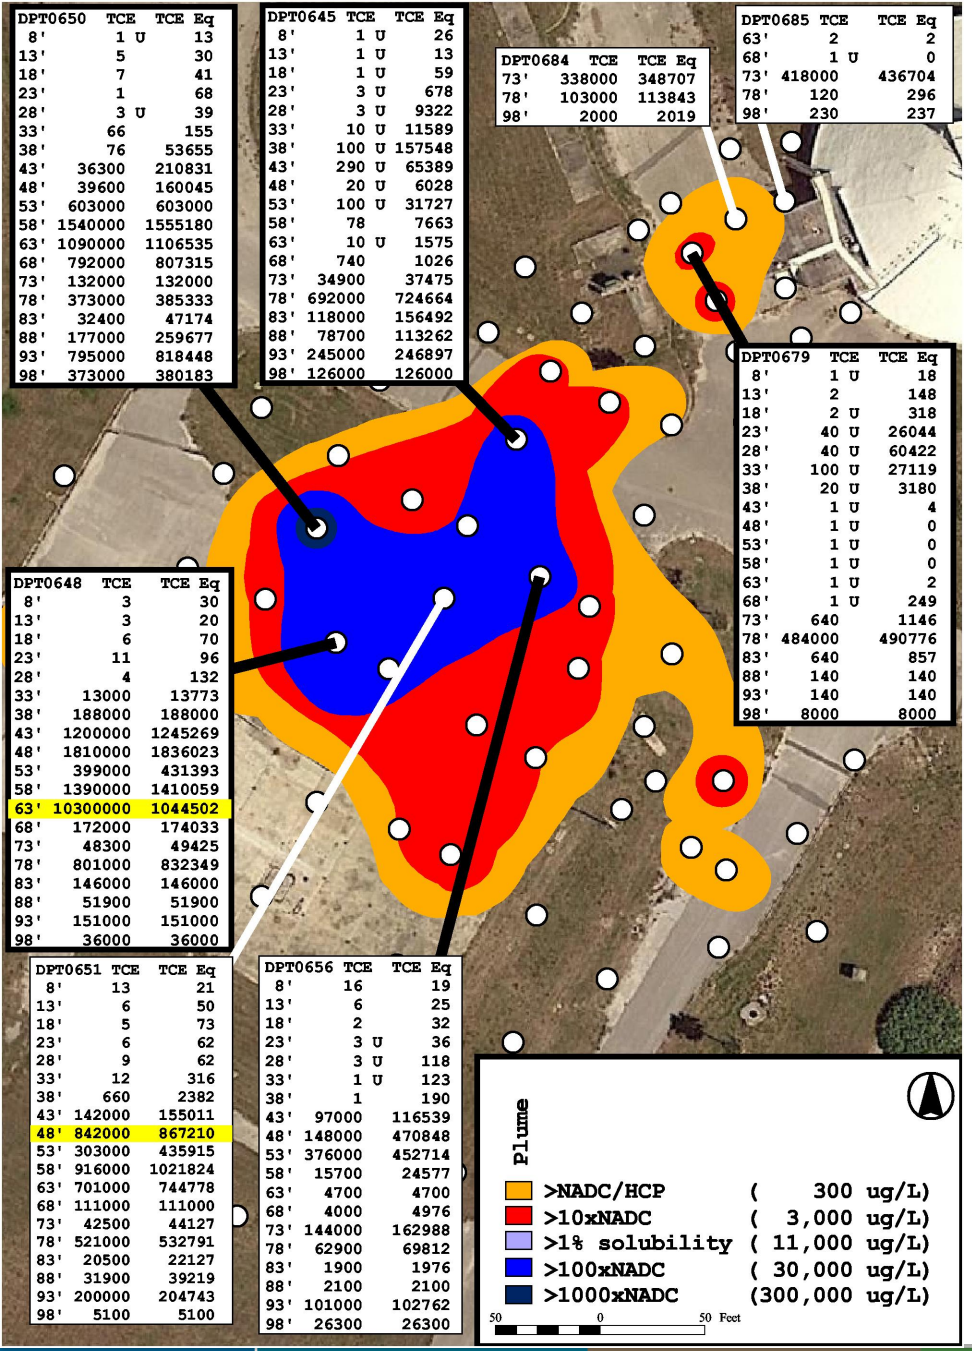


- Layer 7:
  - TCE concentrations similar to 83' interval

- Team consensus: TCE is adequately delineated horizontally to 300 µg/L in this interval

93' BLS interval:

- Maximum concentration 795,000 µg/L at DPT650, 10 additional results greater than TCE 300 µg/L:
  - 245,000 at DPT645
  - 200,900 at DPT651
  - 151,000 at DPT648
  - 101,000 at DPT656
  - 12,100 at DPT649
  - 5,400 at DPT599 and 654
  - 4,400 at DPT657
  - 1,900 at DPT652
  - 780 at DPT655
- Layer 7:
  - TCE concentrations higher than 88' interval
- Team consensus: TCE is adequately delineated horizontally to 300 µg/L in this interval



98' BLS interval:

- Maximum concentration 373,000 µg/L at DPT650, 12 additional results greater than TCE 300 µg/L:
  - 126,000 at DPT645
  - 36,000 at DPT648
  - 26,300 at DPT656
  - 8,700 at DPT599
  - 8,000 at DPT679
  - 6,100 at DPT657
  - 5,100 at DPT651
  - 4,900 at DPT649
  - 4,500 at DPT652
  - 2,000 at DPT684
  - 980 at DPT674*
  - 400 at DPT655

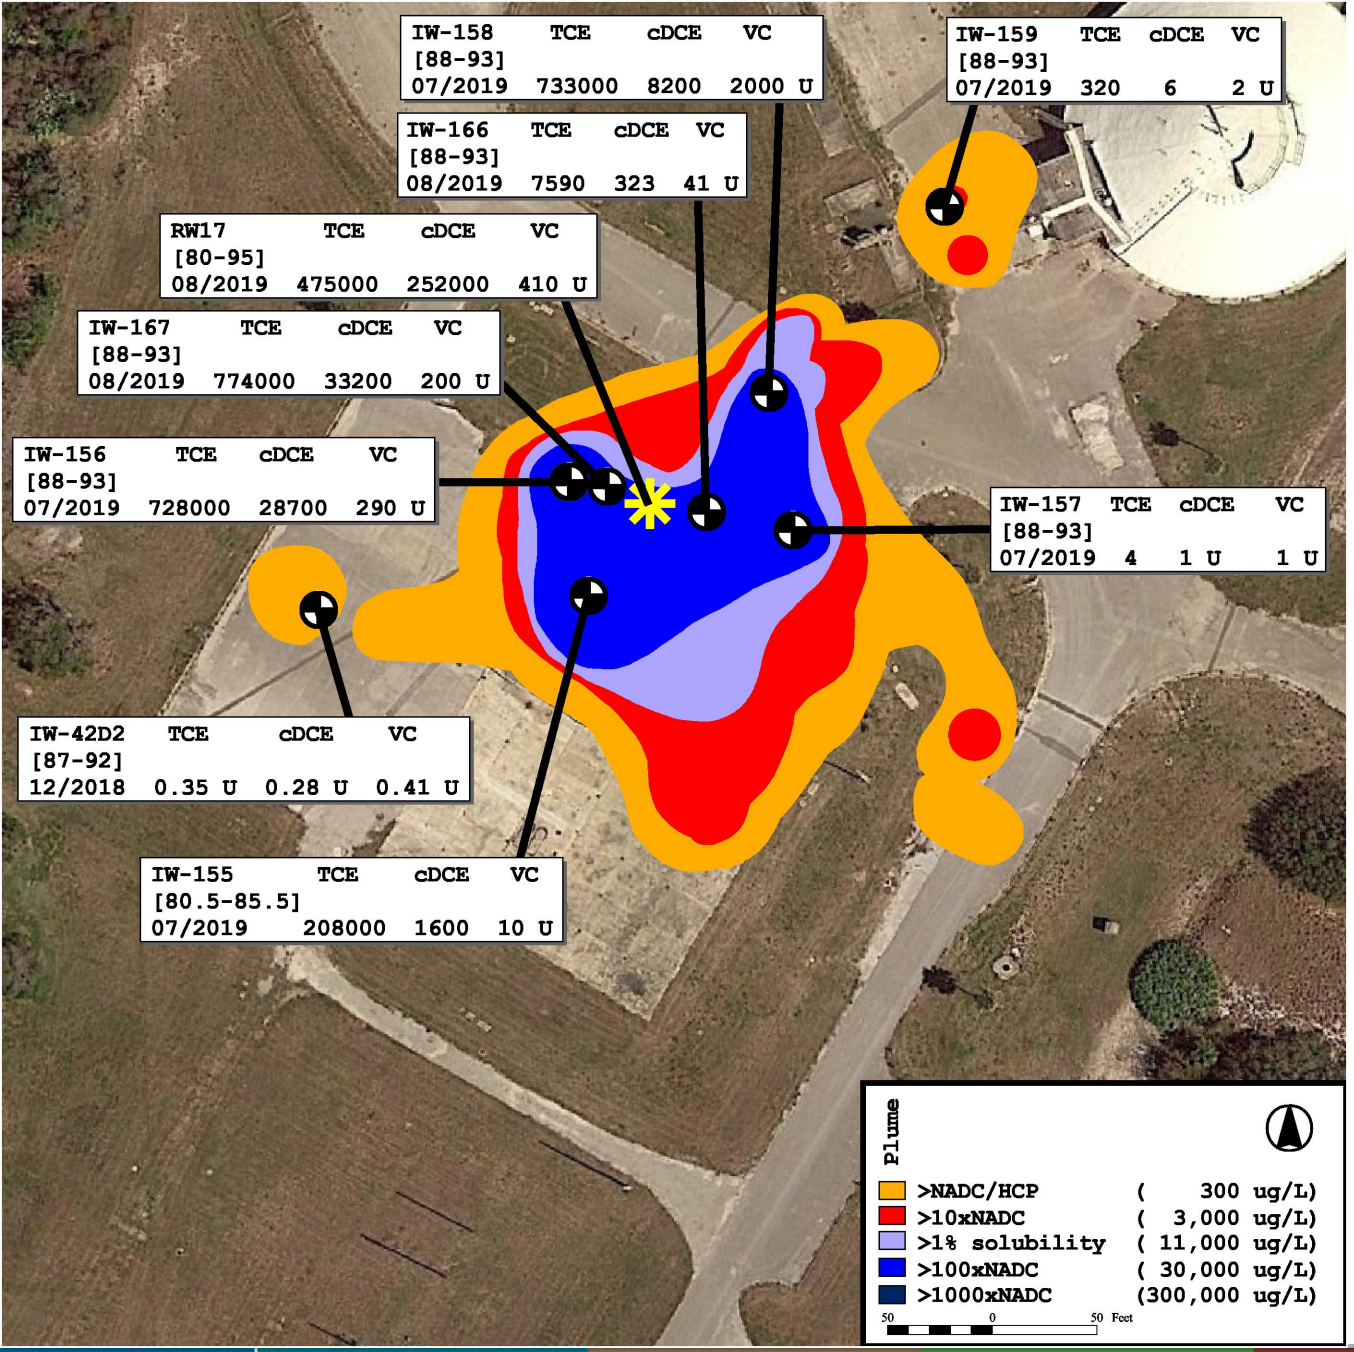
  * Additional delineation not conducted at DPT674, DPT674 was sampled on 20Nov19 to confirm TCE detection of 980 µg/L in 12Dec18. 20Nov19 TCE result of 290 U µg/L did not confirm TCE.

- Layer 7:
  - DPT650 continues to have elevated TCE concentration similar to 93' interval

- Team consensus: TCE is adequately delineated horizontally to 300 µg/L in this interval

Verification sampling:

- DPTs 645, 648, 650, 656, and 679 were selected for verification sampling of the 80' to 100' bls interval
- At each location:
  - Soil cored from ground surface to 80' bls using sonic rig 3" core barrel
    - Boring logs generated
    - PID screening conducted
    - Soil samples collected for VOC and TOC analyses
  - 4" override barrel followed the core barrel to 80'
  - DPT rig collected 83', 88', 93', and 98' samples inside the 4" override barrel
  - Monitoring well was installed in each borehole
  - July 2019 DPT and well samples confirmed high levels of TCE present in deeper intervals with the exception of DPT656 / IW157



DPT645	TCE Prior to July 2019		TCE July 2019		IW158 TCE
83'	118000		253000	J

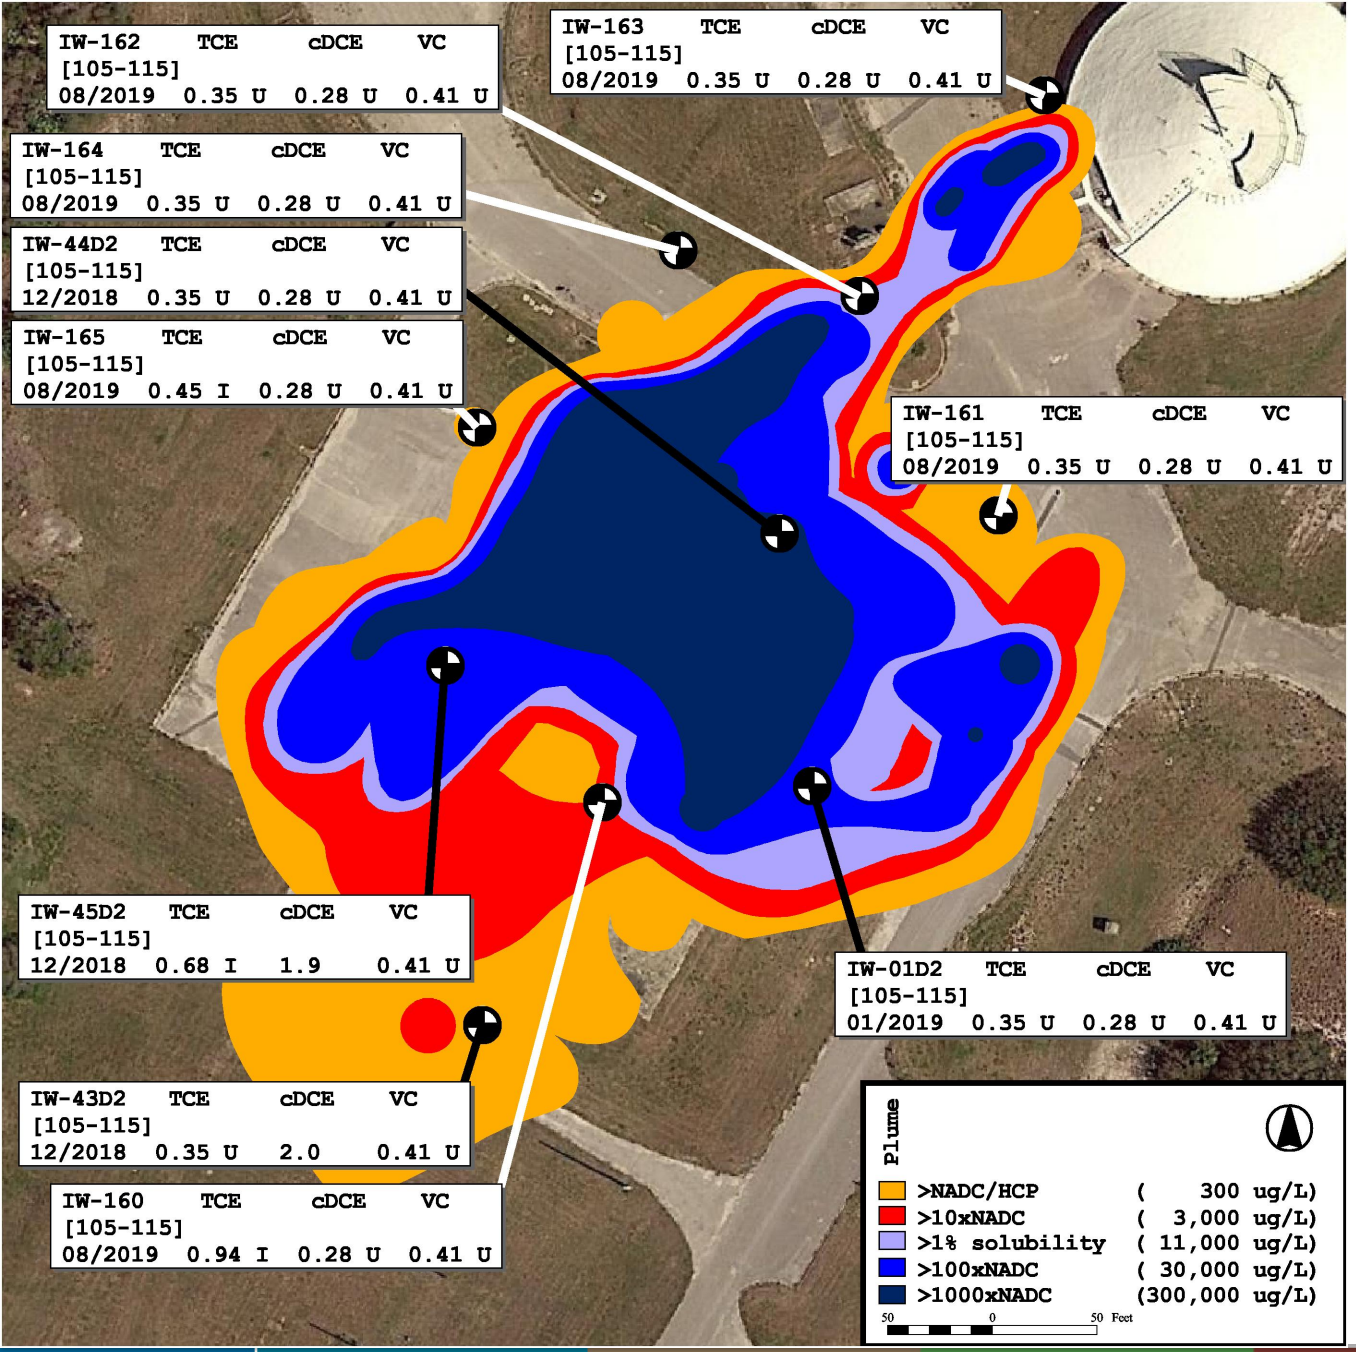
DPT650	TCE Prior to July 2019		TCE July 2019		IW156 TCE
83'	32400		92900		
88'	177000	J	122000		728000
93'	795000	J	205000		
98'	373000	J	59000		

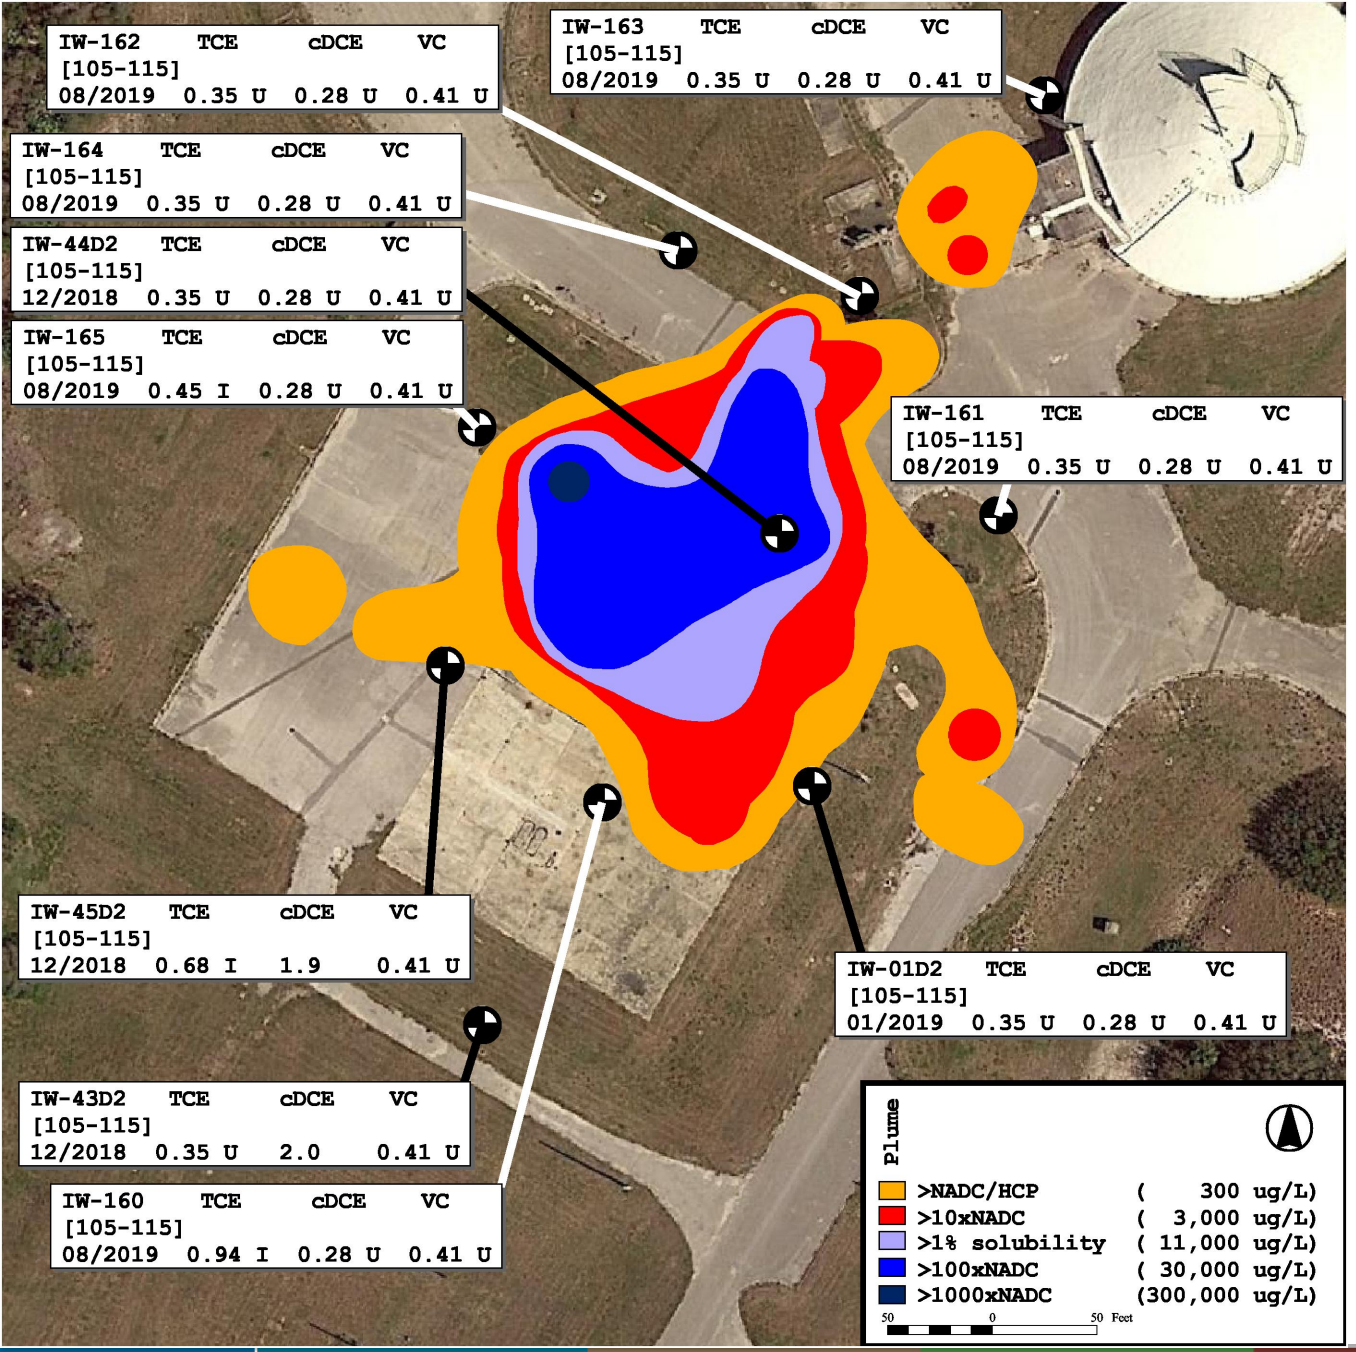
DPT656	TCE Prior to July 2019		TCE July 2019		IW157 TCE
83'	1900		300		
88'	2100		73		4
93'	101000		500		
98'	26300		60		



DPT679	TCE Prior to July 2019		TCE July 2019		IW159 TCE
83'	640		1700		
88'	140		4300		320
93'	140		3500		
98'	8000		1000		

Layer 7 wells:

- IW42D2 was the only existing well in Layer 7
- IWs 155 to 159 installed at soil core locations
- IWs 166 and 167 installed as observation wells for pump test
- RW17 installed for pump test
- With the exception of IWs 42D2, 157, and 159 elevated TCE concentrations confirmed in Layer 7

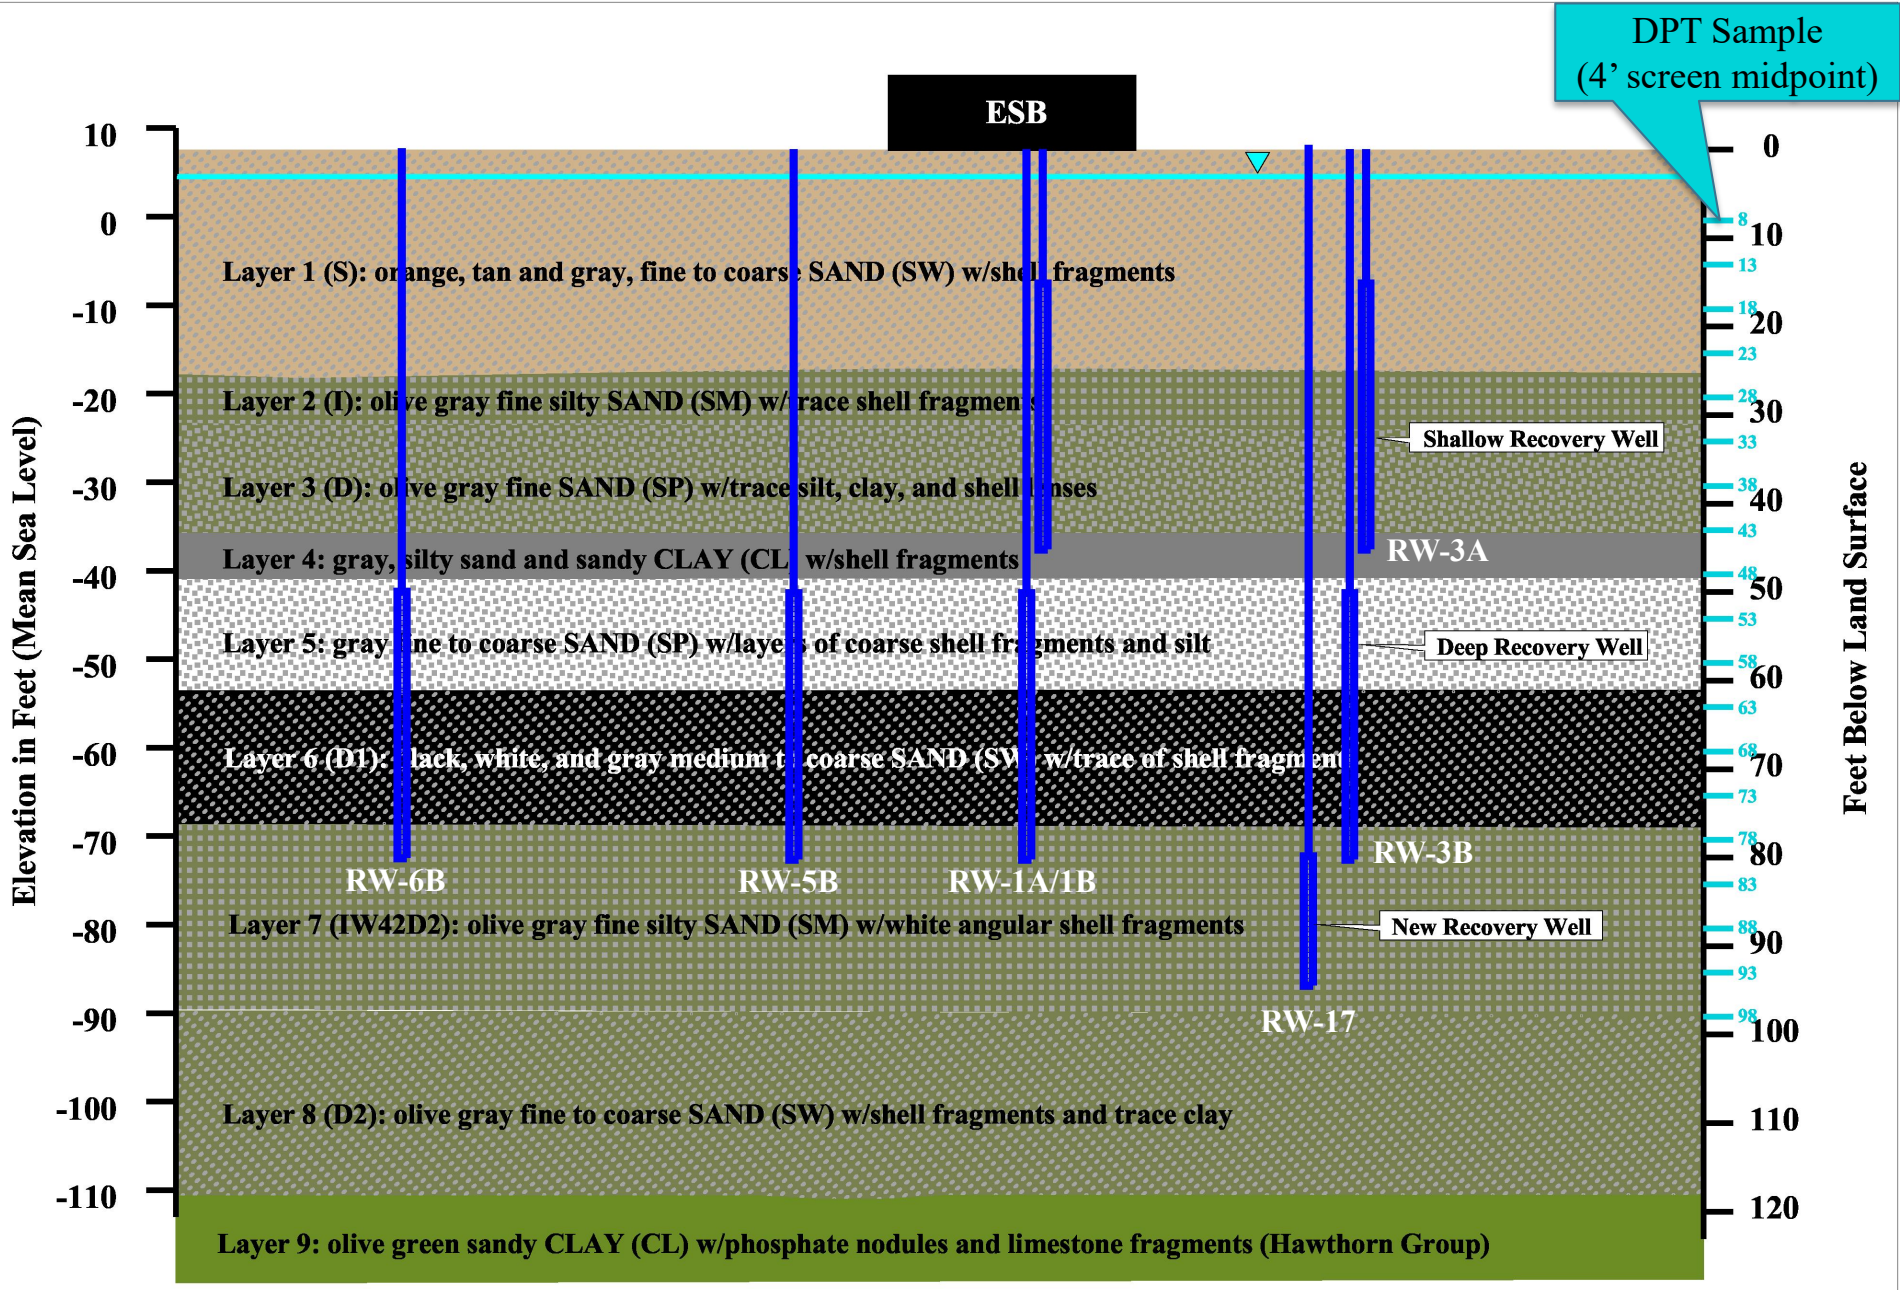


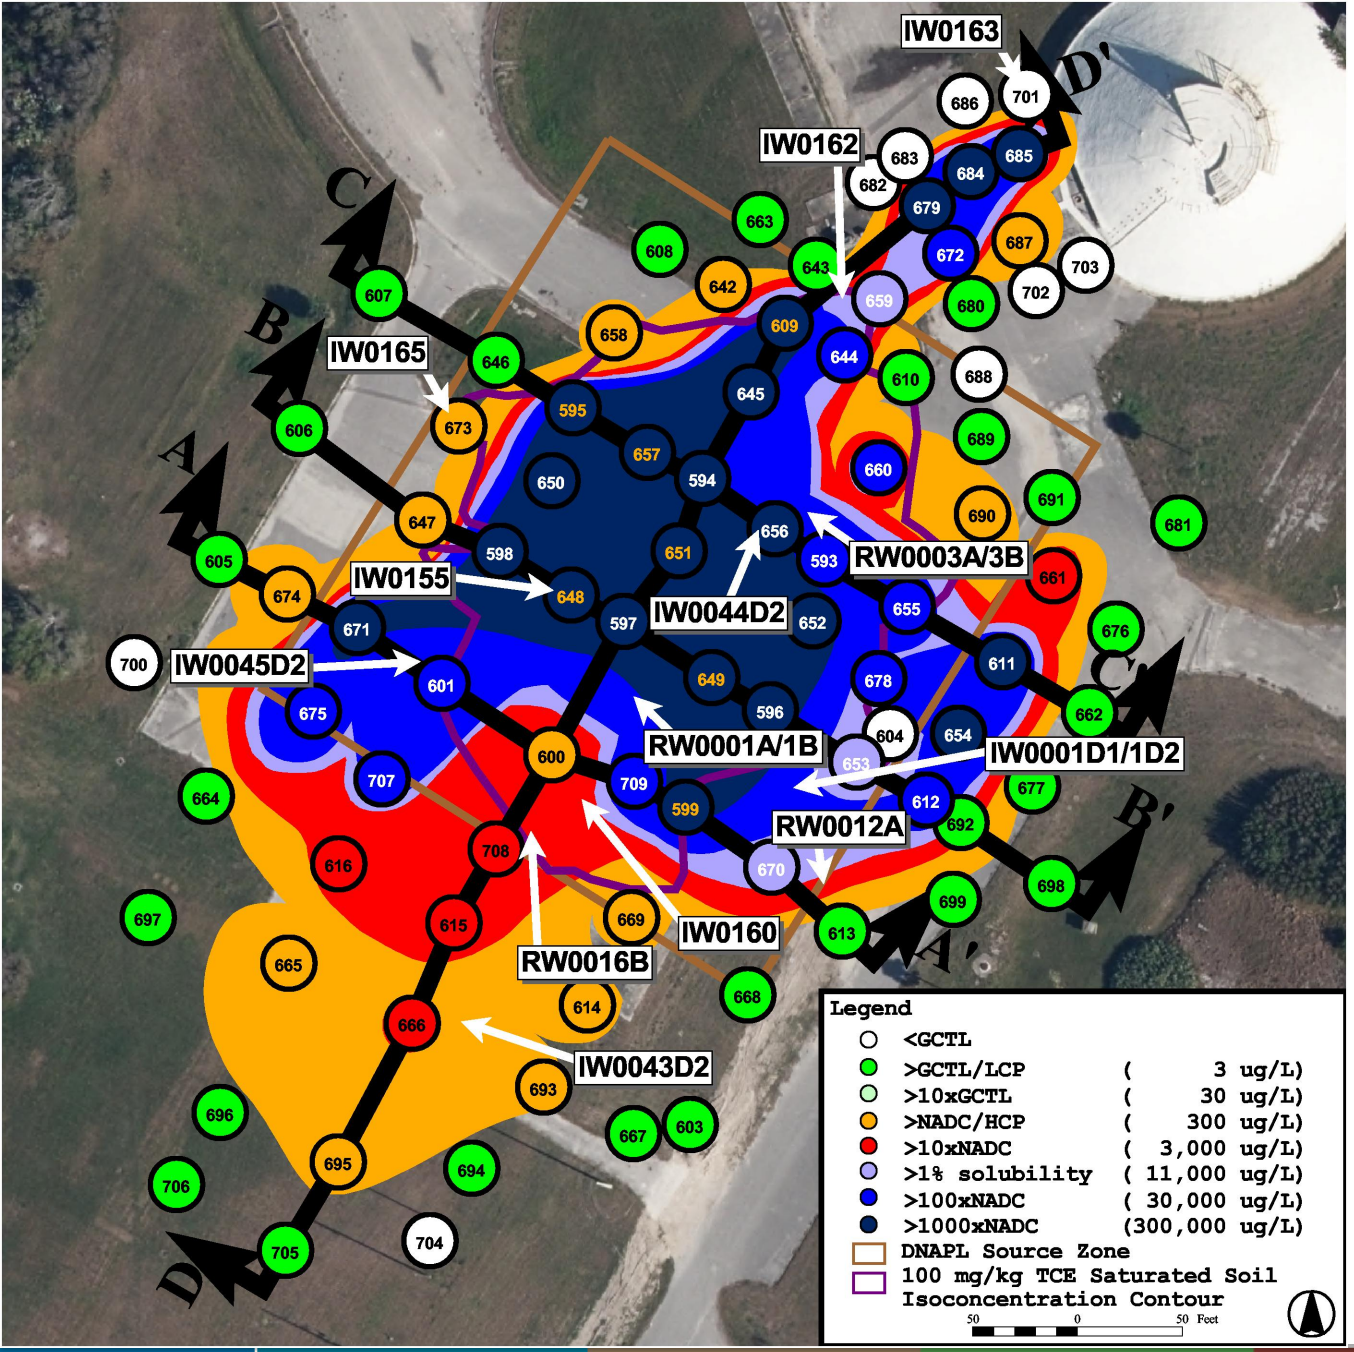
Layer 7 Wells with TCE Delineation greater than 80' BLS

Layer 8 wells:

- IWs 160 to 163 were installed outside TCE > 11,000 µg/L less than 80' BLS

Layer 8 Wells with TCE Delineation less than 80' BLS





Layer 8 wells:

- Four existing wells 01D2, 43D2, 44D2, and 45D2 have been sampled historically to vertically delineate the DSZ
- IWs 160 to 163 were installed to complement the existing four wells
  - Locations were based on current TCE contouring (see next slide)
  - These Layer 8 wells will serve as vertical delineation locations for TCE in Layer 7
  - TCE less than GCTLs all wells, the only TCE detections are:
    - 0.94 I µg/L in IW160
    - 0.45 I µg/L in IW165
    - 0.68 I µg/L in IW01D2

Team consensus: Monitoring wells in Layer 8 vertically delineate TCE

Layer 8 Wells with TCE Delineation greater than 80' BLS

DPT Sample
(4' screen midpoint)
ESB
Layer 1 (S): orange, tan and gray, fine to coarse SAND (SW) w/shell fragments
Layer 2 (I): olive gray fine silty SAND (SM) w/trace shell fragments
Layer 3 (D): olive gray fine SAND (SP) w/trace silt, clay, and shell lenses
Layer 4: gray, silty sand and sandy CLAY (CL) w/shell fragments
Layer 5: gray fine to coarse SAND (SP) w/layers of coarse shell fragments and silt
Layer 6 (D1): black, white, and gray medium to coarse SAND (SW) w/trace of shell fragments
Layer 7 (IW42D2): olive gray fine silty SAND (SM) w/white angular shell fragments
Layer 8 (D2): olive gray fine to coarse SAND (SW) w/shell fragments and trace clay
Layer 9: olive green sandy CLAY (CL) w/phosphate nodules and limestone fragments (Hawthorn Group)

A-A', B-B', C-C', and D-D' generated to demonstrate vertical extent of TCE, Layer 8 wells are assumed to satisfy vertical delineation

Subsequent B-B', C-C', and D-D' present results for the saturated soil samples collected from soil cored locations

- Saturated soil results and equivalent results in groundwater are presented
- Saturated soil results coincide and support the DPT groundwater sample results

Response to AECOM Comments

4. **Slide 41 Data Transects: AECOM suggests adding the locations of the wells to the plan view where concentration data is presented in the subsequent transects.**

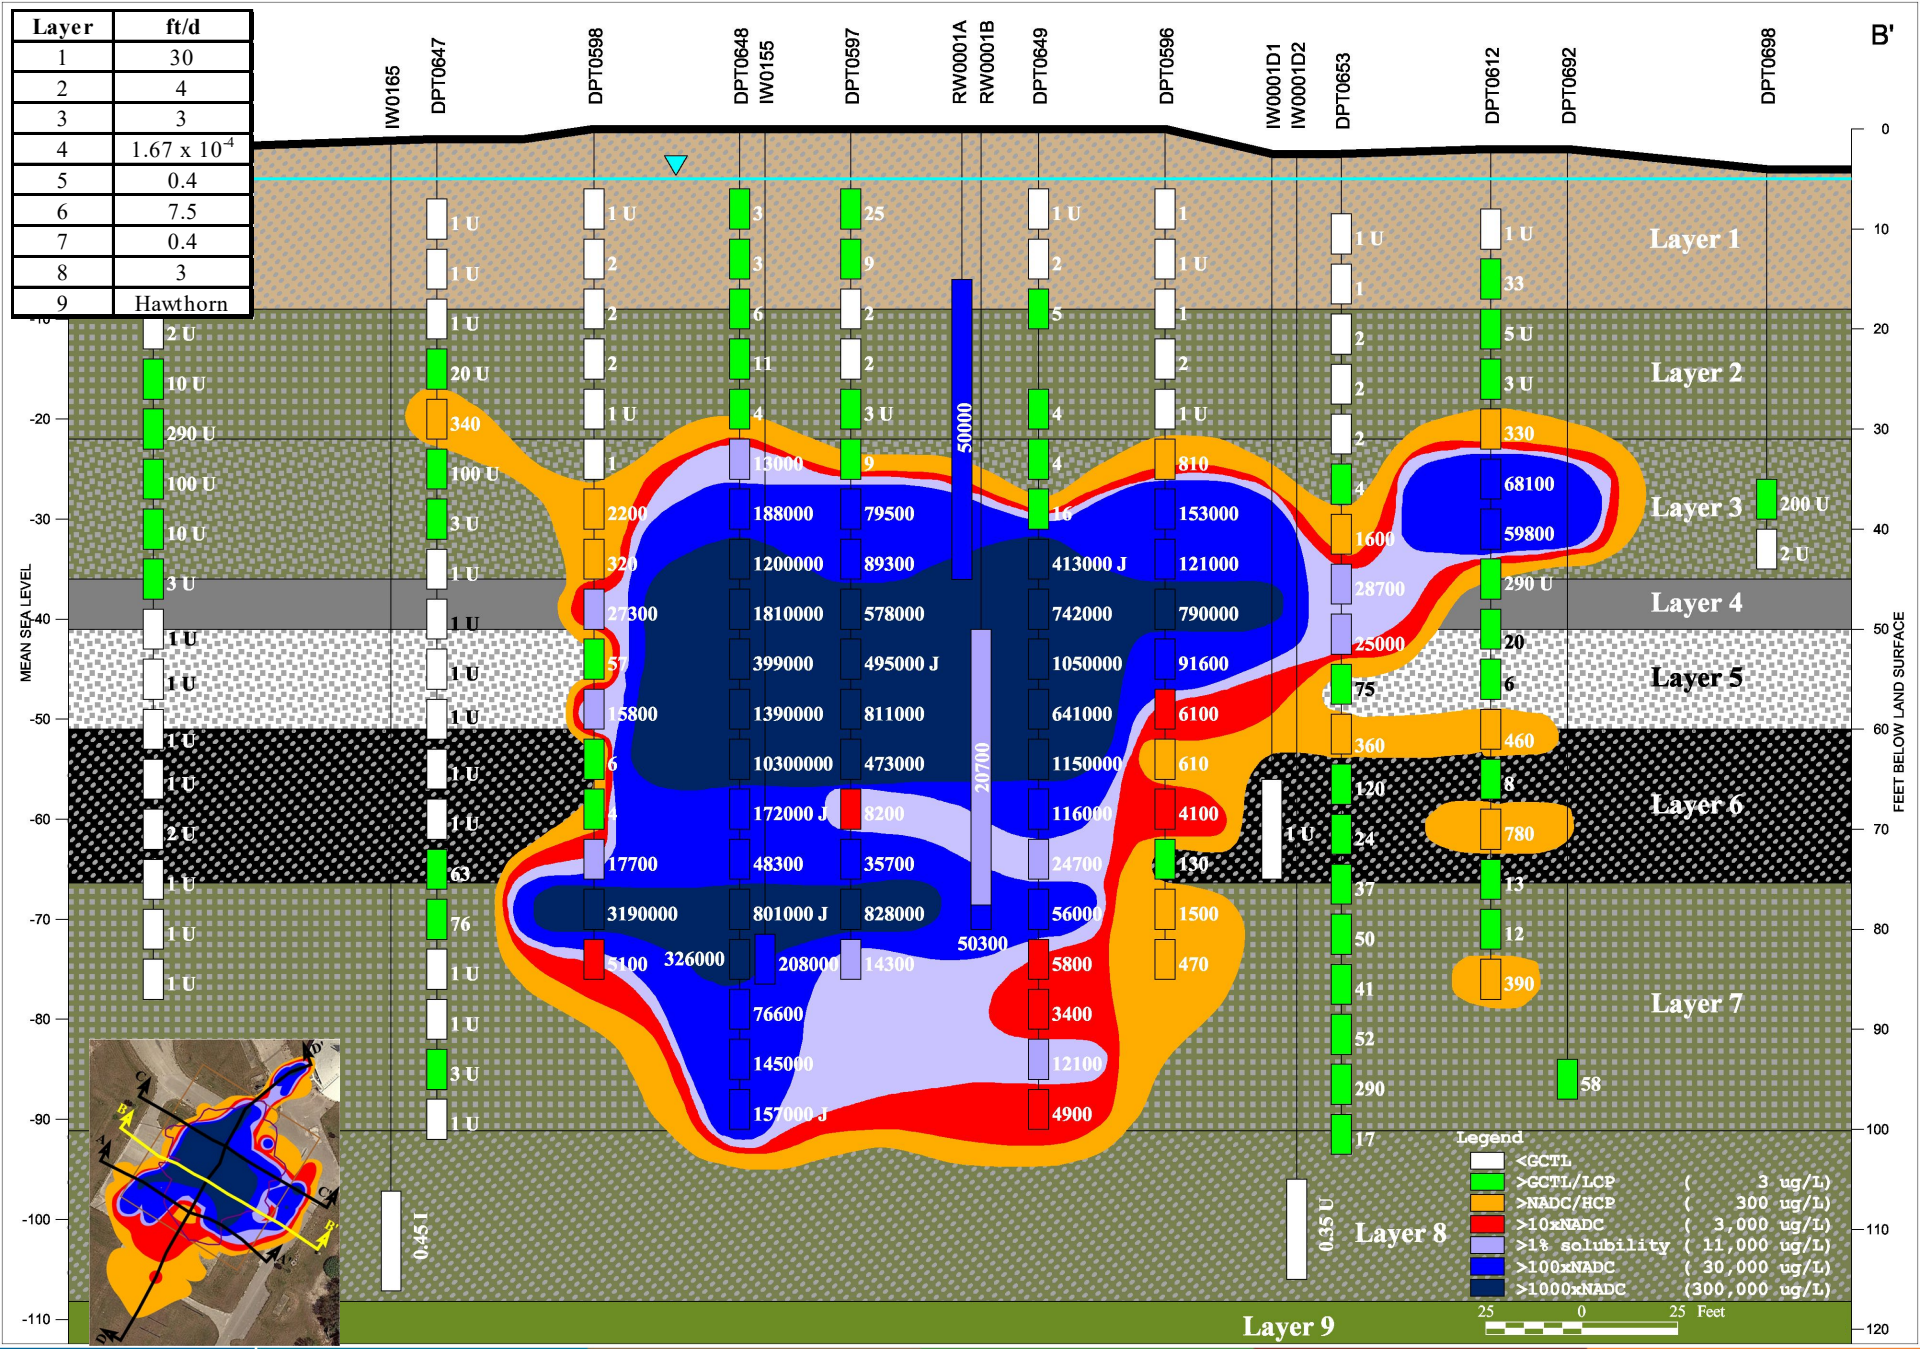
   Response: Monitoring wells and recovery wells shown in the tranects have been added to Slide 40.

Response to HydroGeoLogic, Inc. Comments

3. **Slides 40 thru 47 – Cross Sections: The geology on the cross-sections is very uniform for presentation purposes, and it is clear from these cross-sections that the highest contaminant concentrations and mass are in the lower permeability units. For example, concentrations are high in Layers 4 and 5, are lower in the more permeable Layer 6, and then are higher again in Layer 7. Information about fine sand, silt, or clay content and their correlation to concentrations may be helpful when evaluating remedial options. To support the engineering evaluation, it would be helpful to provide more information about the geology from soil cores where soil samples were collected.**

   Response: The February 2007 CMS established the stratigraphic nomenclature presented on the cross-sections, descriptions of Layers 1 to 9 are provided below. In July 2019 soil cores were extracted at DPTs 645, 648, 650, 656, and 679 to a depth of 80' bls. Each core was screened with a PID and soil samples were collected above, within, and below Layers 1 to 7. All samples were submitted for TOC analysis and samples corresponding to elevated PID readings were also analyzed for VOCs. Table 1 attached to this memo presents the soil sample results with the lithology specific the area where each sample was collected.

Response to HydroGeoLogic, Inc. Comments



CMS Layer Descriptions:

- Layer 1: Historically referred to as the "S" Zone or upper sand unit (USU), Layer 1 is located from land surface to approximately 25 ft bls, and encompasses the water table and represents shallow groundwater conditions in the surficial sands. The hydraulic conductivity of Layer 1 is approximately 30 ft/day and is based upon an average of slug test and pumping test data
- Layer 2: Historically referred to as the "I" Zone or middle fine-grained unit (MFGU), Layer 2 is located from approximately 25 to 30 ft bls and consists of very fine-grained, silty sands between the water table and the aquitard. The hydraulic conductivity of Layer 2 is approximately 4 ft/day and is based upon an average of slug test and pumping test data. Note: Many Layer 2 monitoring wells are partially screened within the basal portion of Layer 1; accordingly, measured groundwater concentrations and hydraulic characteristics from wells within this layer are likely a representation of groundwater conditions at the interface of Layer 1 and 2.
- Layer 3: Historically referred to as the "D" Zone or lower sand unit (LSU), Layer 3 is located from approximately 30 to 45 ft bls and consists of very coarse sands and silty sands immediately above the aquitard. The hydraulic conductivity of the Layer 3 is approximately 3 ft/day and is based upon an average of slug test and pumping test data.
- Layer 4: Historically referred to as the confining unit, aquitard, semi-confining unit or lower clay unit (LCU), Layer 4 is located from approximately 45 to 48 ft bls (thickness varies) and consists of silty clay to clayey silt with minor amounts of sand and shell fragments. The vertical hydraulic conductivity of Layer 4 has been previously reported at 1.67×10^{-4} ft/day (5.89×10^{-8} cm/sec), based upon Shelby-tube collected samples in the immediate vicinity of the ESB.
- Layer 5: Depth interval from approximately 48 to 60 ft bls; consists of medium light gray, medium to coarse-grained silty sand with abundant shell fragments. The hydraulic conductivity of the 48 to 60 ft bls interval is 0.4 ft/day and is based upon numeric optimization of the aquifer pumping test results.
- Layer 6: Depth interval from approximately 60 to 80 ft bls ("D1" Zone); consists of light olive gray homogeneous "salt and pepper" sand. The hydraulic conductivity of Layer 6 is approximately 7.5 ft/day and is based upon aquifer pumping test and slug test results.
- Layer 7: Depth interval from approximately 80 to 95 ft bls; consists of yellowish gray to light olive gray, silty sand to clayey sand with abundant white shell fragments. Numeric optimization of the aquifer pumping test results resulted in a model derived hydraulic conductivity estimate of 0.4 ft/day.
- Layer 8: Depth interval from approximately 95 to 118 ft bls ("D2" Zone); consists of yellowish gray to light gray, fine- to coarse-grained sands. The hydraulic conductivity of Layer 8 is approximately 3 ft/day and is based upon slug test results.
- Layer 9: Depth interval below 118 ft bls to a maximum exploratory depth of 140 ft bls, clays and sandy clays of the regional confining unit. An evaluation of soil cores by the Florida Geologic Survey verified that the Hawthorn Group begins at approximately 125 ft bls (interval from 118 to 125 ft bls identified as Tamiami Equivalent).

Mass of Contaminants Calculation:

To determine the mass of TCE exceeding NADC in the aqueous phase, the volume of groundwater was first estimated by multiplying the area of the footprint of the plume by the thickness of the plume by the porosity. This volume was multiplied by the estimated average concentration of TCE to yield the mass in the aqueous phase. The dissolved phase and DNAPL masses were consider to be concentrations up to 11 mg/L and equal to or exceeded 11 mg/L (1% of TCE solubility (110 mg/L), a threshold where DNAPL may occur).

To determine the mass of TCE in the sorbed phase, the mass of soil was first estimated by multiplying the area of the footprint of the plume by the thickness of the plume by the bulk density of the soil. The concentration of TCE in the sorbed phase was estimated by multiplying the average groundwater concentration by the organic carbon partition coefficient (TCE = 107, Principles and Practices of Enhanced Anaerobic Bioremediation of Chlorinated Solvents, AFCEE, 2004) by the estimated fraction organic carbon. The mass of the soil was multiplied by the estimated average concentration in the sorbed phase to yield the mass in the sorbed phase.

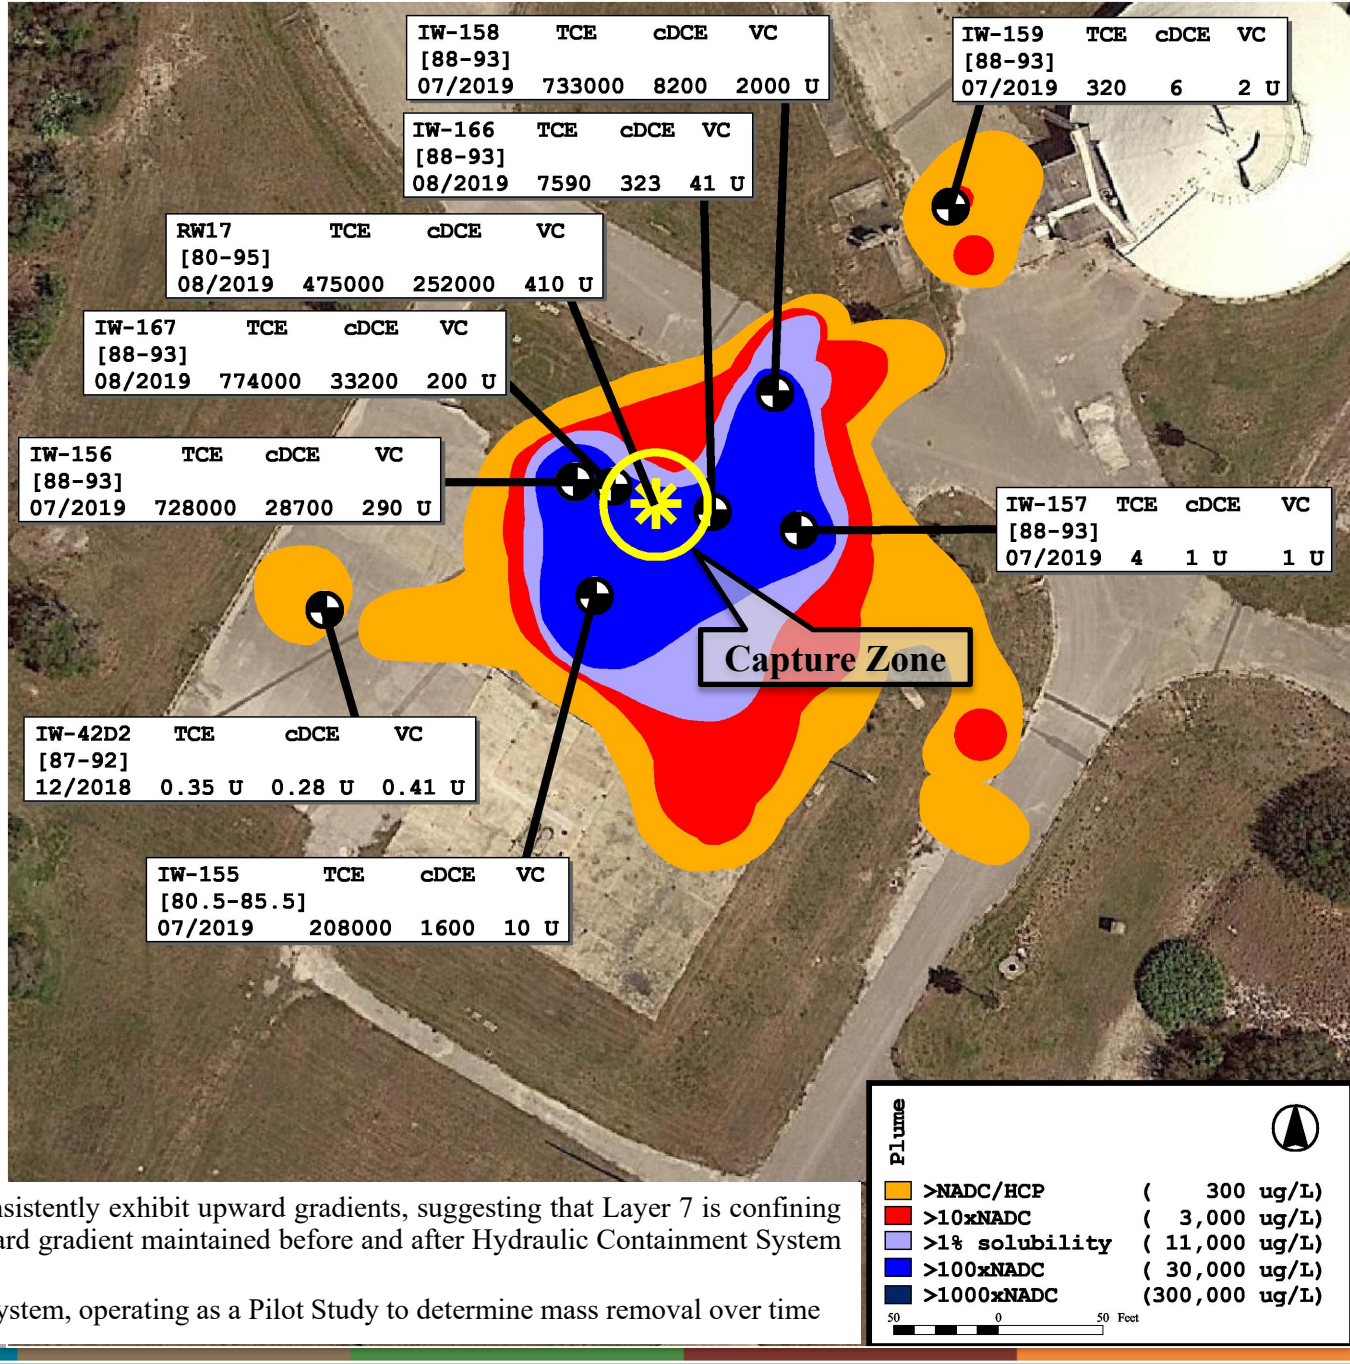
FOC and Bulk Density from site specific data with the exception of Bulk Density assumed to be 110 lb/ft3 for intervals below 45' bls and Porosity assumed to be 0.3

The presence of DNAPL in 7 of the 1,196 samples creates challenging conditions to accurately estimate TCE mass. Uncertainty exists when DNAPL is present, the mass calculation assumes uniform concentrations defined by DPT samples. The estimate cannot take into account pockets of DNAPL that could represent considerable mass, therefore the mass estimate presented should be considered underestimated



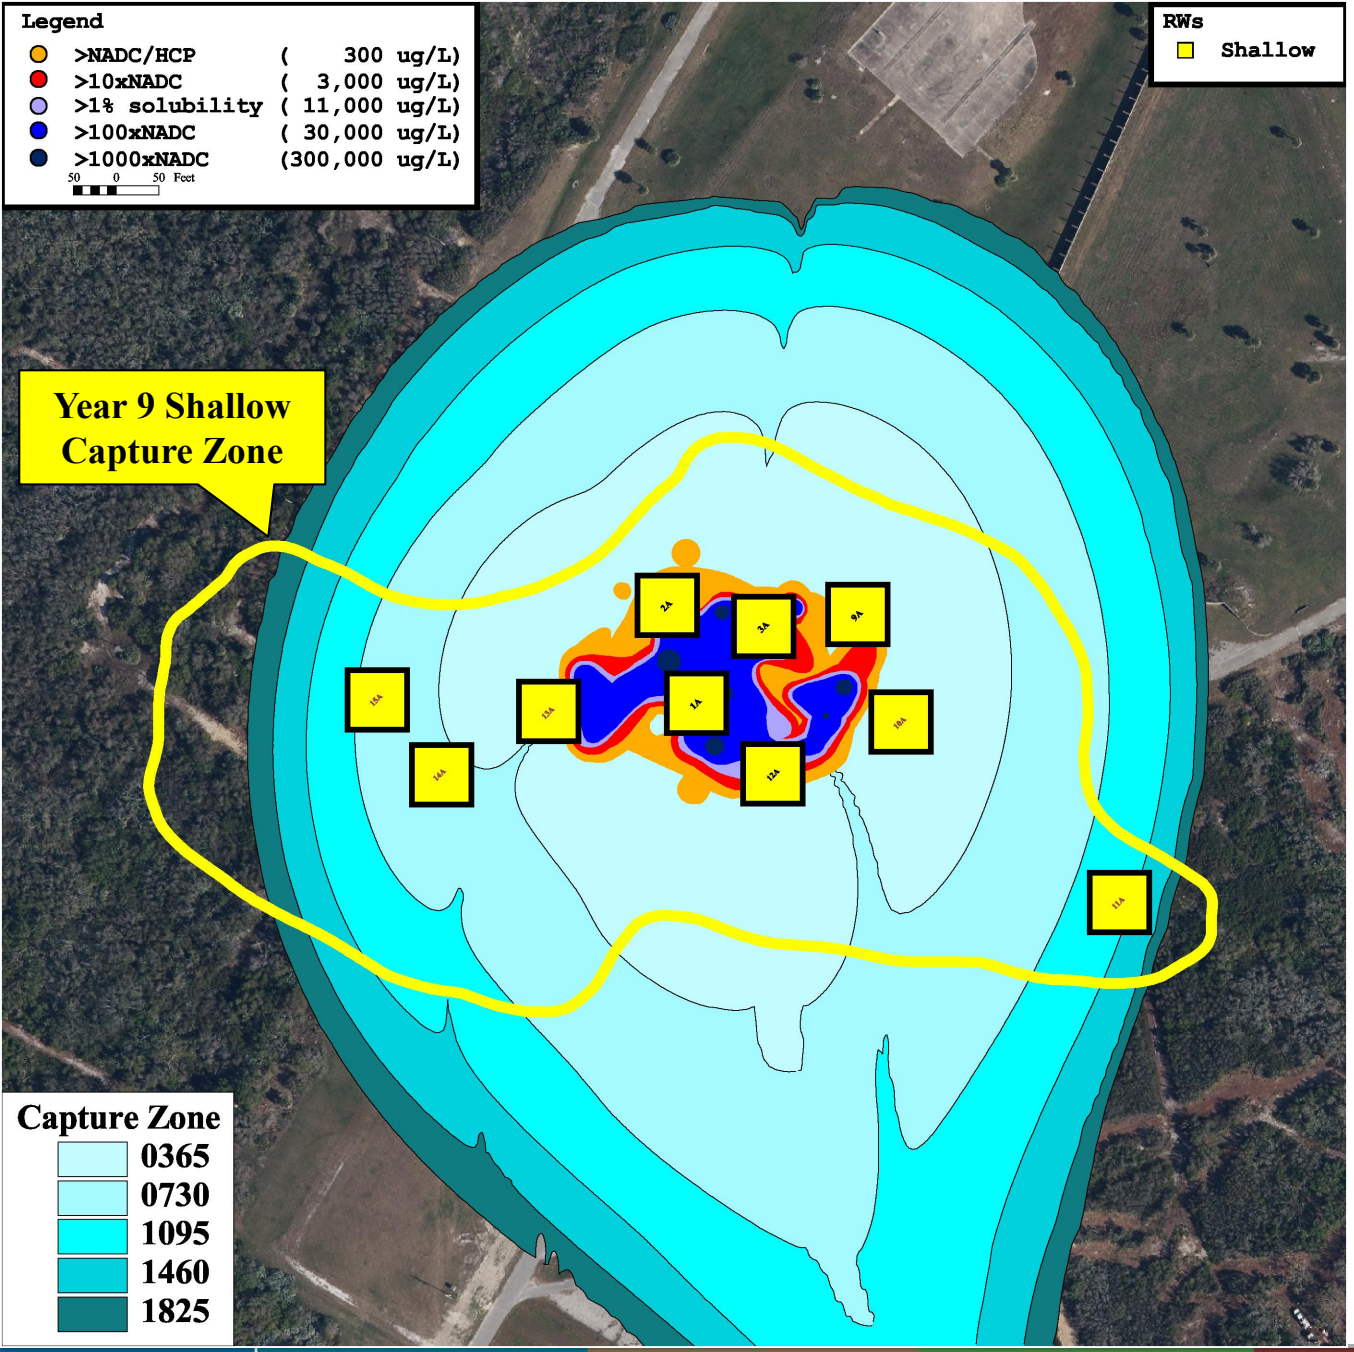
Response to AECOM Comments

5. **Slide 48 Mass Estimates: The "DNAPL mass" estimate is an estimate of the dissolved mass, not DNAPL mass, within the subsurface volume where TCE concentrations are greater than 1% of it's solubility in water. DNAPL mass is unknown but is expected to be much higher than the estimated dissolved and sorbed mass. The mass recovery plots suggested above may provide an estimate of total mass that could potentially be recovered from operation of the HCS at the site.**

   Response: Tt concurs with the uncertainty associated with estimating DNAPL mass. Tt Subject Matter Experts concluded that calculating estimates of DNAPL mass includes numerous variables, many of which are difficult or nearly impossible to quantify in situ and that assuming groundwater TCE concentrations equal to or greater than 11,000 µg/L (1% TCE solubility) provides DNAPL presence. The column previously called out as "DNAPL" has been renamed "Dissolved DNAPL" in the table on Slide 48 to categorize DNAPL presence, Tt concurs that this estimate is most likely low due to the assumption of uniform values over the investigation area and that this simplification disregards the spatial variability of DNAPL. Tt suggests that the mass estimate be considered a reference to the source area where over 67,000 pounds of cVOCs have been recovered via the Hydraulic Capture System and over 59,000 pounds of cVOCs during the in-situ remediation demonstration projects.

48 Hour Constant Rate Pumping Test:

- Layer 7 wells shown with estimated 25' capture zone based on pump test
- 20 wells monitored with pressure transducers from August 5th to 20th
- 17 wells monitored every 1 minute
  - 8 wells screened within Layer 7
  - 9 wells screened above or below Layer 7
- IWs 166 and 167 were monitored every 30 seconds
- RW17 was monitored every 20 seconds
- Wells monitored varied from ~25 feet to ~200 feet from RW17 and generally occurred radially from well to evaluate potential anisotropic conditions
- Test performed from August 13th to 15th
- Test initially started at 1.5 gpm, reduced to 1.25 gpm after 4 hours when drawdown projections suggested responses were not stabilizing. Rate reduced to 1.25 gpm and ran for 48 hours
- Drawdown Observed
  - 62.5' in RW0017
  - 2.18' in IW-167
  - 1.75'in IW-166
  - 0.5' to 1.0' at other Layer 7 wells
  - 0.2 to 0.7' at other wells



- Analysis of Layers 6 and 8 well pairs consistently exhibit upward gradients, suggesting that Layer 7 is confining or possibly semi-confining based on upward gradient maintained before and after Hydraulic Containment System wells turned on and off in the area
- RW-17 added to the Hydraulic Capture System, operating as a Pilot Study to determine mass removal over time

Response to AECOM Comments

6. **Slide 49 - Pump Test:**
    - **Indicate in the title that the pump test was in Layer 7**
    - **If the test results were used to estimate hydraulic conductivity, please present the estimated values**
    - **Indicate if the drawdowns at the observation wells were stable or increasing at the end of the pump test**

Response: The pump test was conducted on Layer 7 via extracting groundwater from RW17. Hydraulic conductivity ranged from 0.13 to 0.29 ft/day, lower than 0.4 ft/day presented in the CMS, and drawdown rates at the end of the 48 hour test continued to slowly increase. While the rates did not completely stabilize indicating true static conditions the majotiry of drawdown (1.5 to 2.0 feet) occurred during the initial 3 hours of the test. Over the last 40 hours of the test the drawdown was minimal (0.1 to 0.2 feet).

Hydraulic Capture Zone:

- Region where groundwater particles will eventually reach a recovery well, can be up to 10 years
- 1825 day (5 year) region considered capture zone for the revised pumping rates

HCS:

- Groundwater extraction from 10 shallow recovery wells (15' to 45' BLS) and 7 deep recovery wells (50' to 80' BLS)
- Shallow zone shown on this slide

Revised pumping rates:

- RWs 10A, 11A, 13A, 14A, 15A have been shut off based on TCE
- GPM reduced from 42 to 24

	Yr 9 GPM			Revised

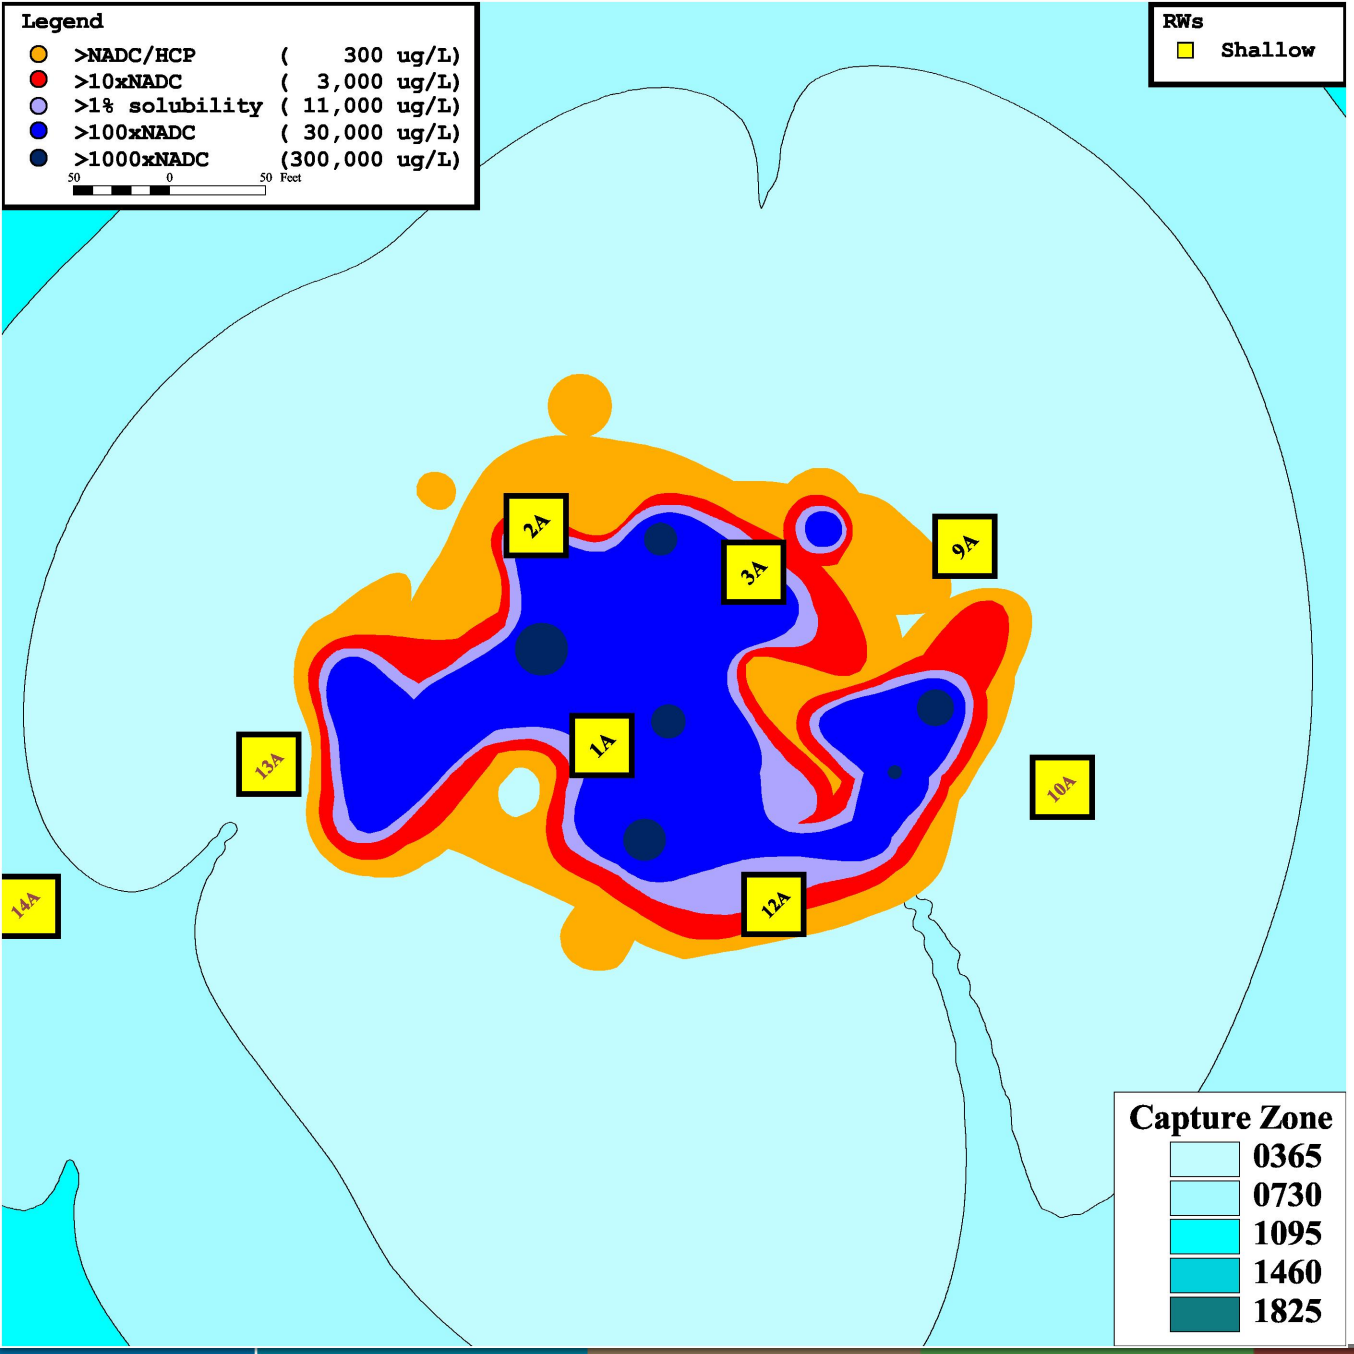
Response to AECOM Comments

7. **Slides 50 and 52 Capture Zones: Please explain if the thick lines labeled as the capture zones are based on field observations of drawdown or model results.**

Response: Prior to the development of the Interim Measure Design dynamic testing was conducted on Recovery Wells 1A, 1B, 2A, 2B, 3A, and 3B to collect data to refine the model used to develop the original capture zones. Once the system was installed a Hydraulic Capture Study was conducted to verify the proposed capture zones. The results of the study indicated the operating as design conditions encompassed the designed capture zones. In 2015 during the system expansion the data collected from previous studies was used to model the capture zones. The Year 9 capture zones shown on Slides 50 and 52 were the zones based on the pumping rates prior to the revised flows rates implemented 23-Aug-19. The colored capture zones displayed by days are based on the revised pumping rates and were developed using the LC34 groundwater model using MODFLOW to simulate the groundwater flow field and MODPATH for particle tracking to delineate the extent of hydraulic capture. The groundwater model was calibrated based on a complete set of site-wide water level measurements, recovery well rates, injection well rates, and rate of discharge sent to the infiltration gallery

Response to HydroGeoLogic, Inc. Comments



5. **Slides 50 thru 52 – Information about aquifer test interpretation is limited.**

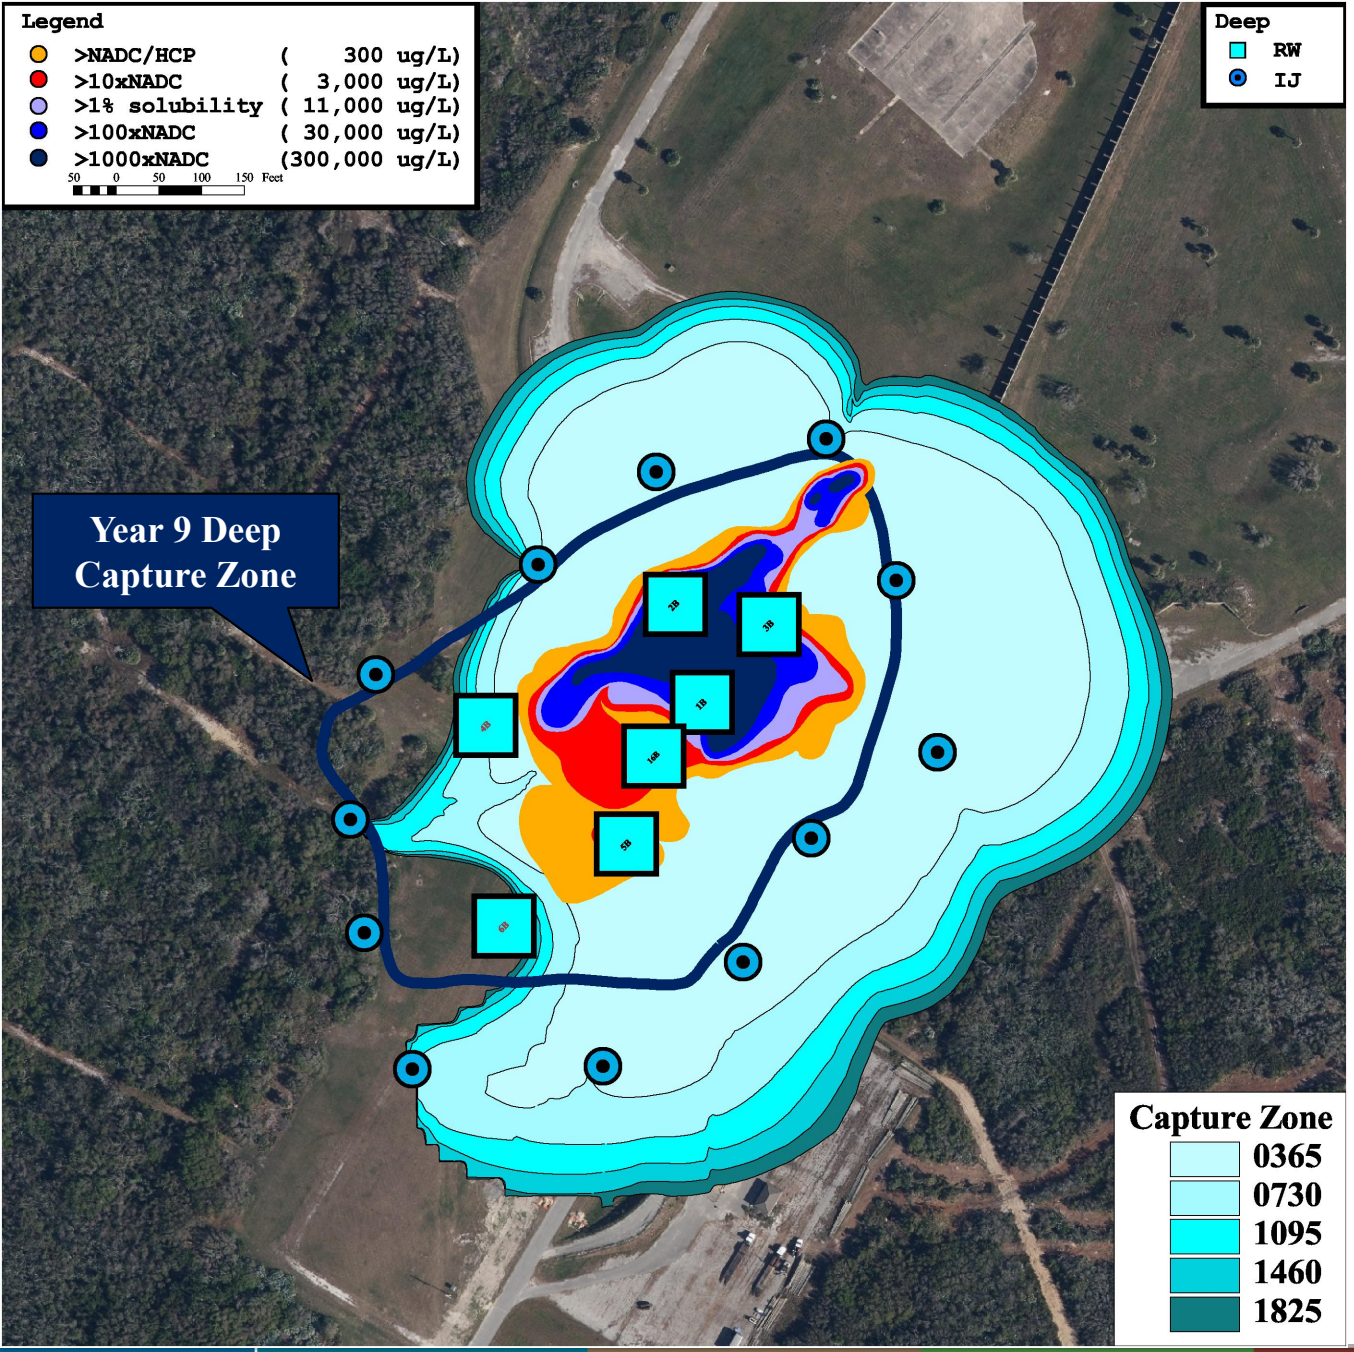
   - **There are two types of depicted capture zones, and the development of these capture zones is unclear. What is the difference in meaning between the Year 9 capture zone in yellow and the contoured capture zones for various time frames on slide 50? They have different shapes, and it does not look like one follows from the other. A similar question applies to the navy and contoured capture zones on slide 52**

     Response: See response to AECOM's comment #7 for additional clarification. The Year 9 catpure zones shown on Slides 50 and 52 were the capture zones based on the pumping rates prior to the revised flows rates implemented 23-Aug-19.

   - **When were the flow rates revised? Are the depicted capture zones associated with the original or revised extraction rates?**

     Response: The flow rates were revised on 23-Aug-19. The capture zones are based on the revised pumping rates.

HCS:



- Groundwater extraction from 10 shallow recovery wells (15' to 45' BLS) and 7 deep recovery wells (50' to 80' BLS)
- Shallow zone shown on this slide

Revised pumping rates:

	Yr 9 GPM			Revised

	42	8.7	5.3	24	7.6	5.7

- Mass removal based on June 2019 sample results
- GPM reduced from 42 to 24
- TCE mass removal increased from 5.3 to 5.7 #/day
- TCE HCP within 365/720 day capture zone

HCS Shallow Zone (15' to 45' BLS) Revised Pumping Rates

Hydraulic Capture Zone:

- Region where groundwater particles will eventually reach a recovery well, can be up to 10 years
- 1825 day (5 year) region considered capture zone for the revised pumping rates

HCS:

- Groundwater extraction from 7 deep recovery wells (50' to 80' BLS)
- Treated groundwater discharged at 80 GPM, reinjected into 12 injection wells (50' to 80' BLS) at 2 GPM per well with remaining treated groundwater discharged to infiltration gallery

Revised pumping rates:

- RWs 04B and 06B have been shut off based on TCE
- GPM increased from 41 to 49

	Yr 9 GPM			Revised		
RW	GPM	VOCs #/day	TCE #/day	GPM	VOCs #/day	TCE #/day

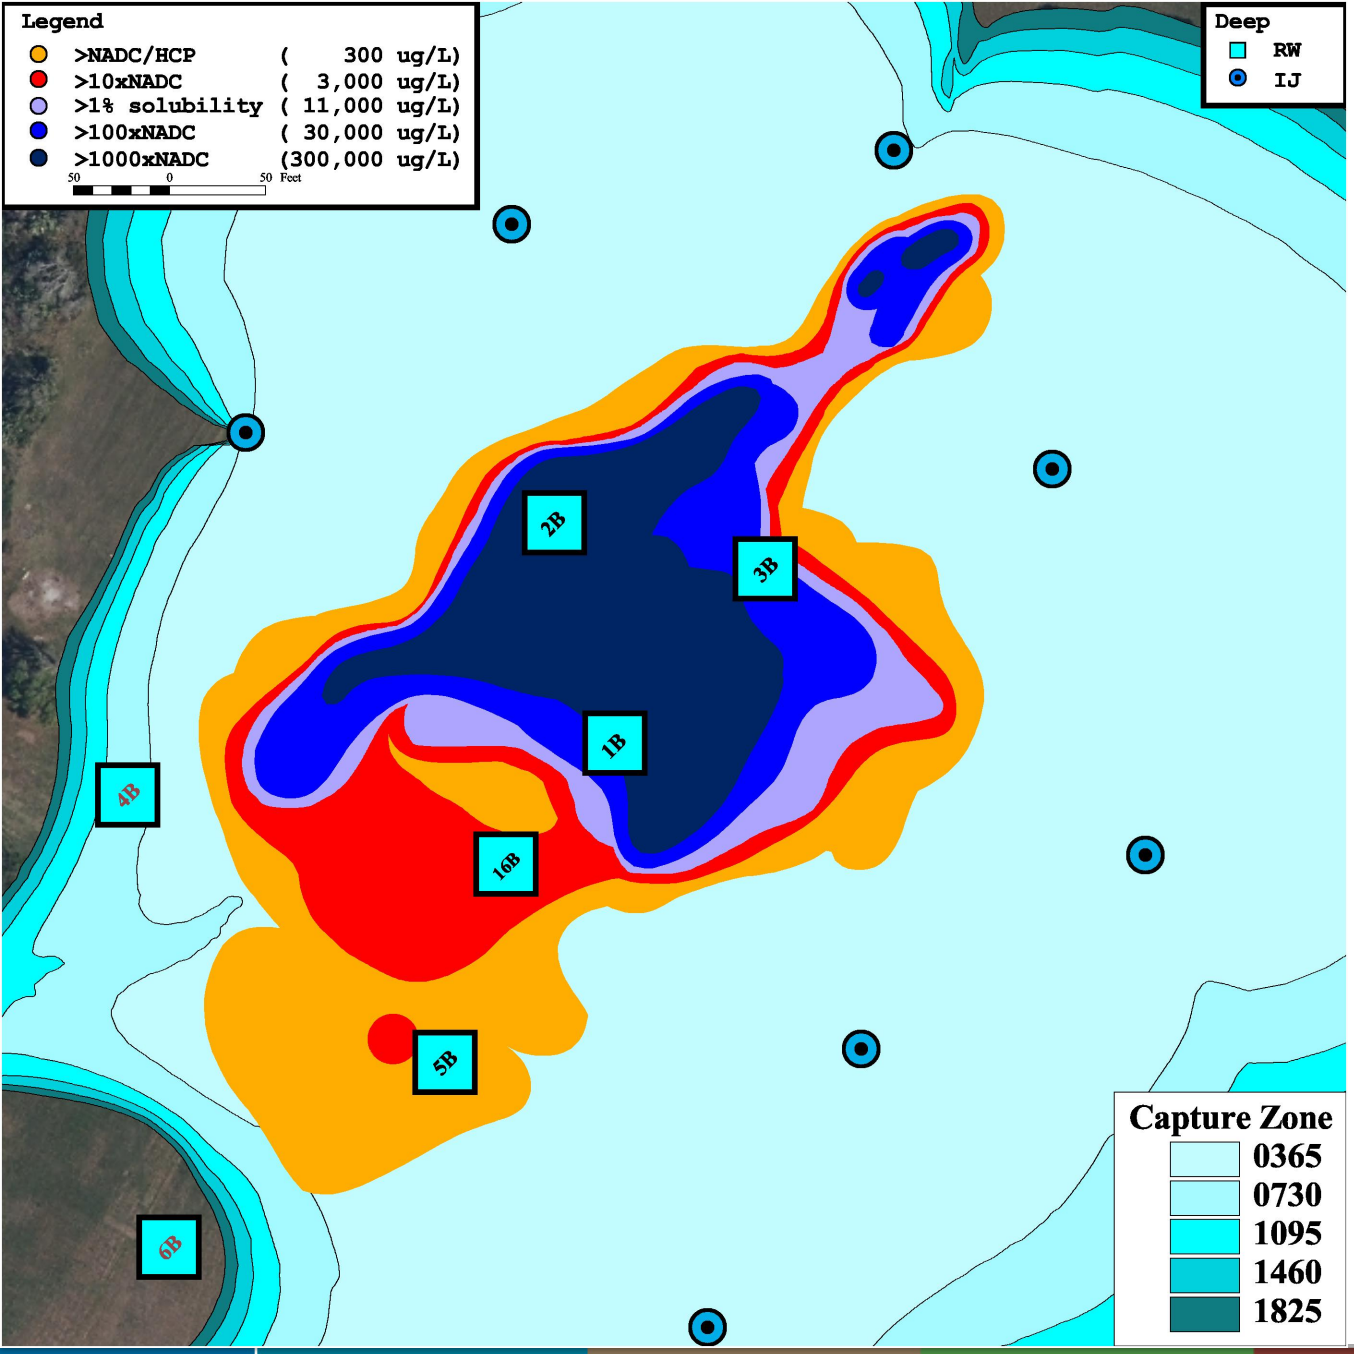
	41	10.5	9.5	49	10.8	9.8

HCS Deep Zone (50' to 80' BLS) Revised Pumping Rates



Response to HydroGeoLogic, Inc. Comments

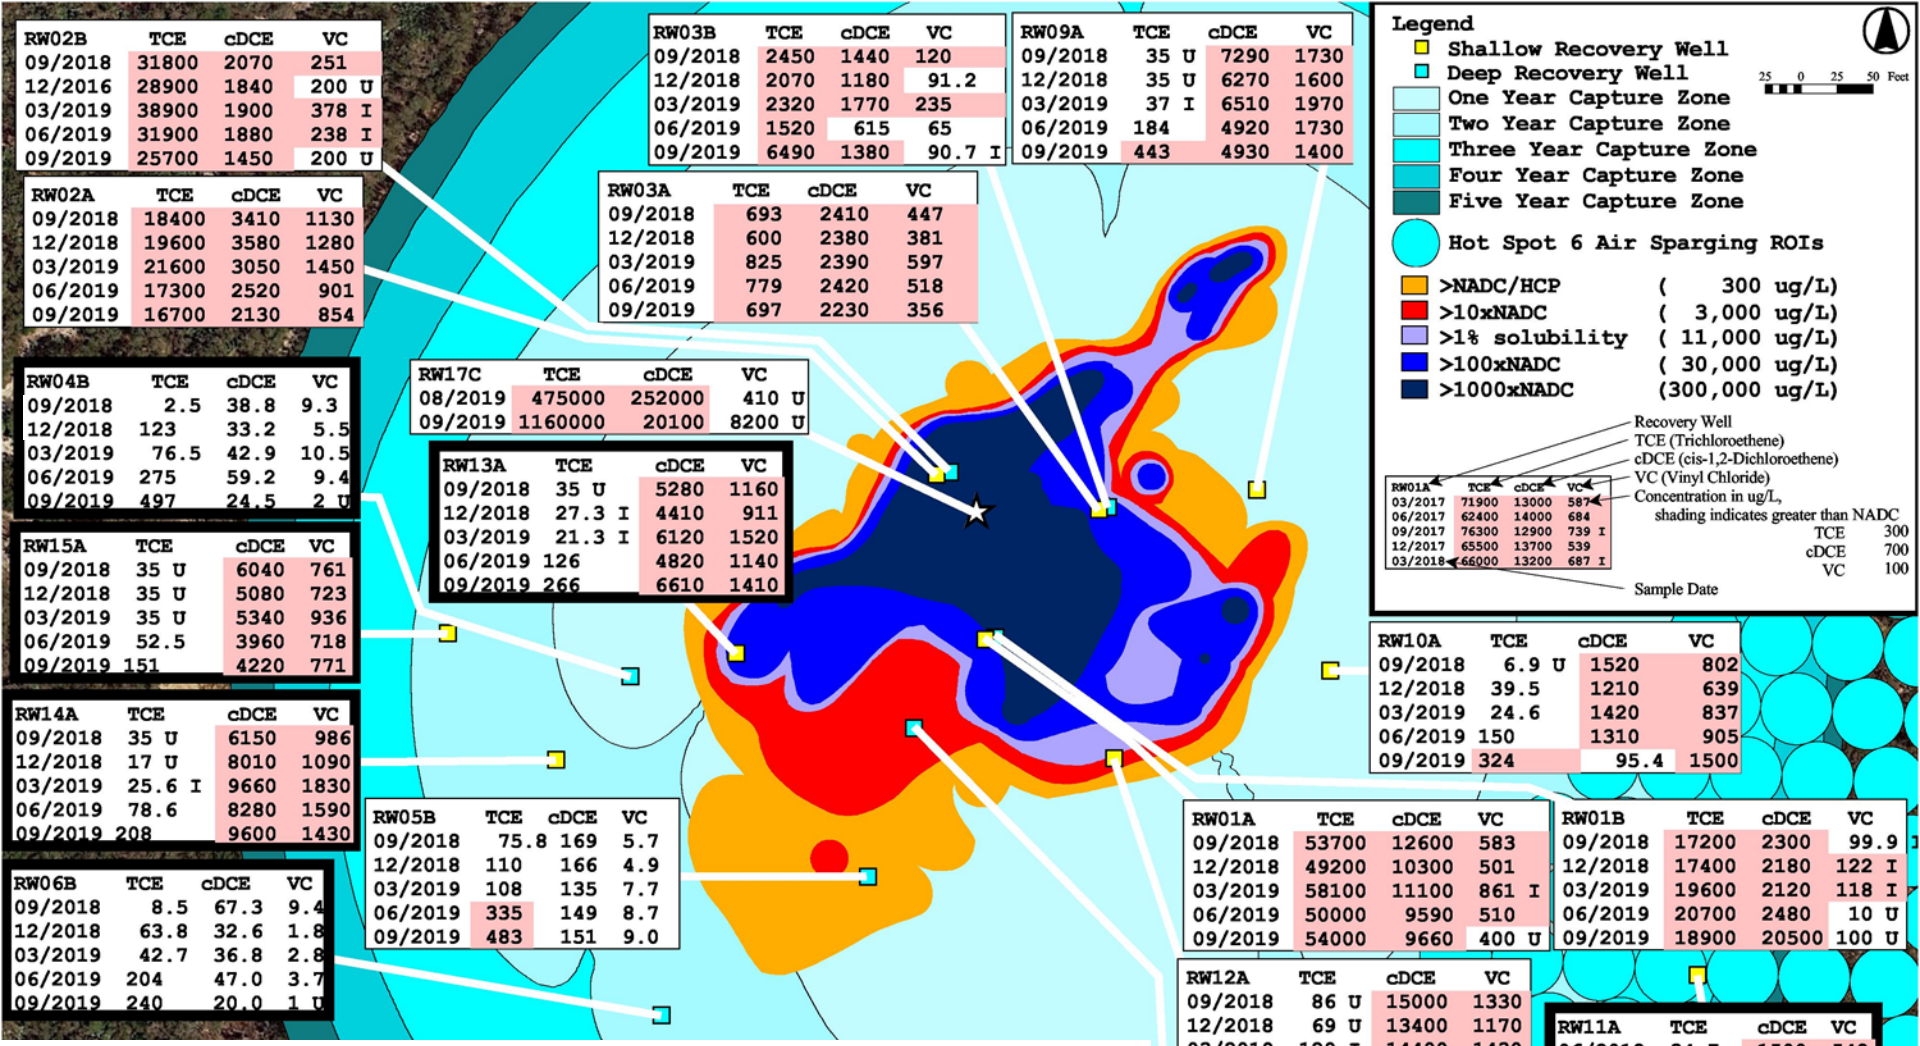
6. **Slide 52 – Revised Pumping Rates: Can operation of well 5B be discontinued? Although low level contamination remains in this area, the location appears to be within the capture zone, and 5B may be competing with 16B. Turning off 5B may be more practical if the extraction rate from 16B is increased.**

   Response: Pumping rates were recently adjusted in August 2019, the June and September 2019 recovery well sample results indicate TCE increasing in both recovery wells. Based on this increase Tt recommends continued operation of both these wells and to evaluate mass recovery rates during the quarterly sampling events.

7. **Slides 29, and 30 - DPT TCE Results – and Slides 52 and 53 - Revised Pumping Rates: Consider installing RW near DPT672 and DPT684 to capture the TCE mass from 70 to 85 ft bgs.**

   Response: This area is within the 365 day Capture Zone for the HCS Deep Zone (50' to 80' bls) therefore no additional recovery wells are being proposed at this time. Tt will consider additional recovery wells during the RAE.

HCS:



- Groundwater extraction from 7 deep recovery wells (50' to 80' BLS)
- Treated groundwater reinjected into 12 injection wells (50' to 80' BLS) at 2 GPM per well with remaining treated groundwater discharged to infiltration gallery
- Discharge is 80 GPM

Revised pumping rates:

	Yr 9 GPM			Revised		
RW	GPM	VOCs #/day	TCE #/day	GPM	VOCs #/day	TCE #/day
01B	15	4.2	3.7	15	4.2	3.7
02B	15	6.1	5.7	15	6.1	5.7
03B	2	0.1	0.04	15	0.4	0.3

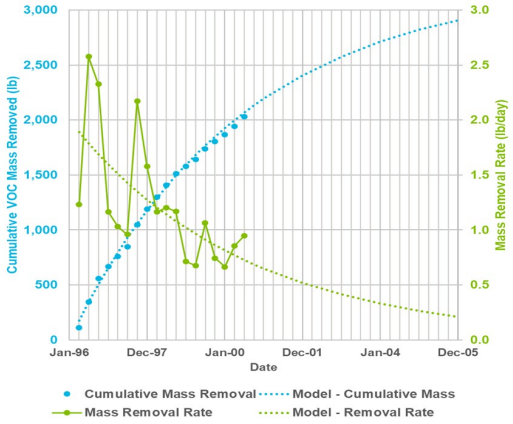
16B	3	0.04	0.01	2	0.02	0.00
	41	10.5	9.5	49	10.8	9.8

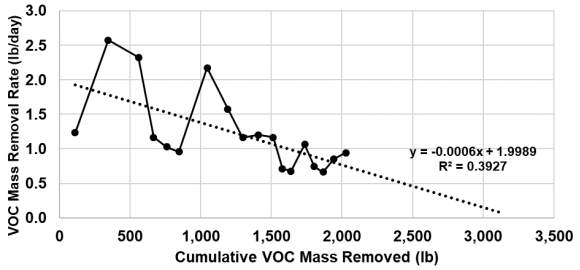
- Mass removal based on June 2019 sample results
- GPM increased from 42 to 49
- TCE mass removal increased from 9.5 to 9.8 #/day
- TCE HCP within 365/720 day capture zone
- Overall HCS GPM reduced from 83 to 73 GPM while increasing TCE mass removal rate from 14.9 to 15.5 #/day, Total VOCs rate decreased from 19.2 to 18.4 #/day

HCS Deep Zone (50' to 80' BLS) Revised Pumping Rates

- Including RW17 operating at 1 GPM overall pumping rate is 74 GPM
- RW11 turned off within the influence of Hot Spot 6 Air Sparging Treatment Zone
- RWs 04B and 06B remain off based on low concentrations
- Based on cDCE and VC concentrations RWs 13A, 14A, and 15A operating at 3 GPM each increasing system GPM to 83 GPM
- Based on June 2019 sampling results current daily VOC mass removal is 19.2 pounds including 15.5 pounds of TCE, prior pumping rate were 19.1 and 14.9



Response to AECOM Comments

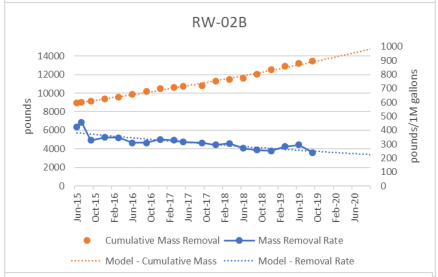


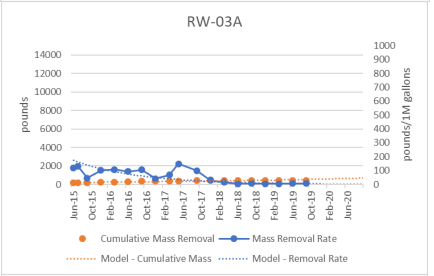
1. **Slide 10 Mass Recovery: To better understand past and approximate future mass recovery behavior that could be used to optimize operation of the HCS, AECOM suggests preparing and presenting the following trend plots:**

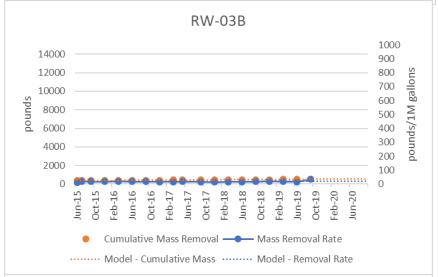
   - **Cumulative TCE mass removed versus time at each extraction well and for the whole HCS system**
   - **TCE mass removal rate versus time at each extraction well and for the whole HCS system**
   - **TCE mass removal rate versus cumulative TCE mass removed at each extraction well and for the whole HCS system**

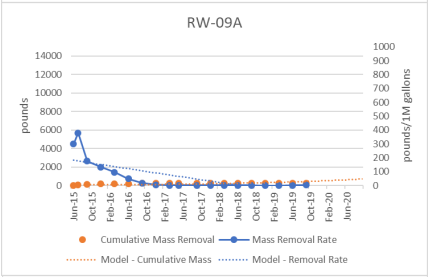
   Trends in the suggested plots can provide insight into past transport behavior (mass removal from advective zones versus mass removal controlled by matrix diffusion) and can be extrapolated to approximate potential future behavior. Plots for a non-NASA site are provided at the end of this memo as examples of the suggested trend plots.

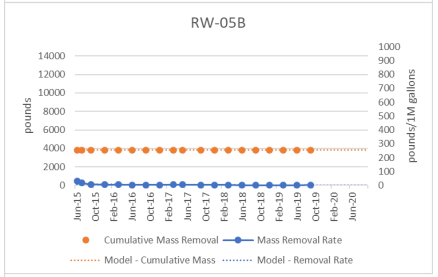
   ***Response*:** Trend graphs are being generated and will be incorporated into the presentation.

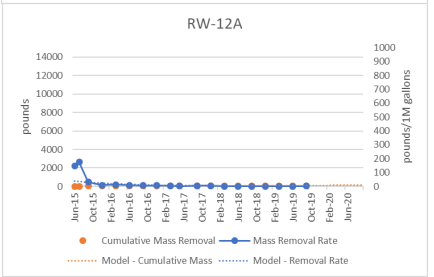


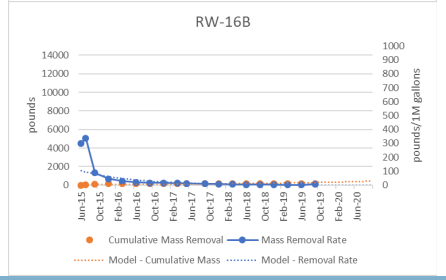




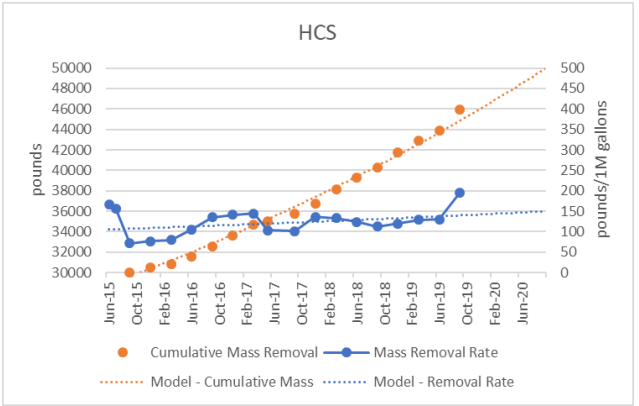








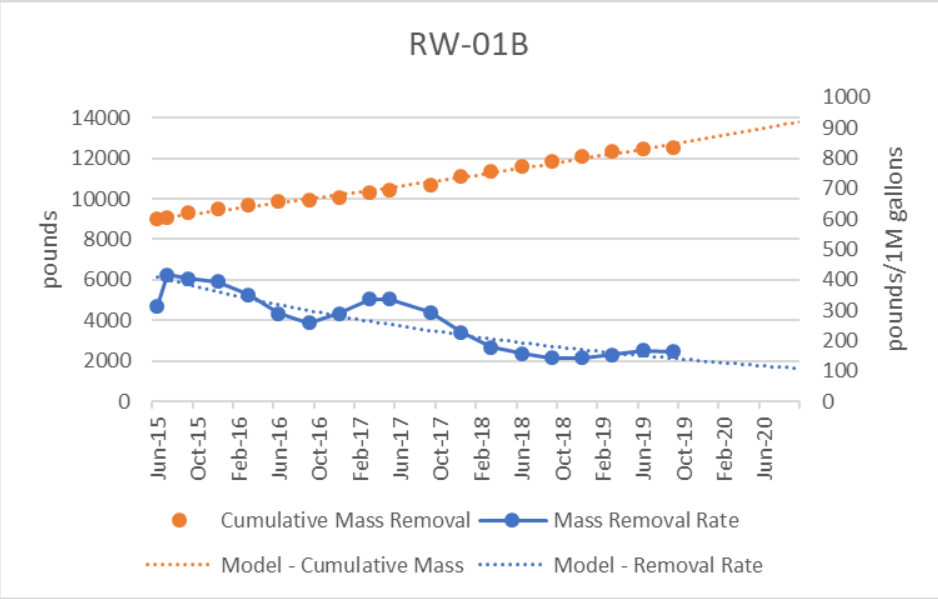
Trend Graphs:



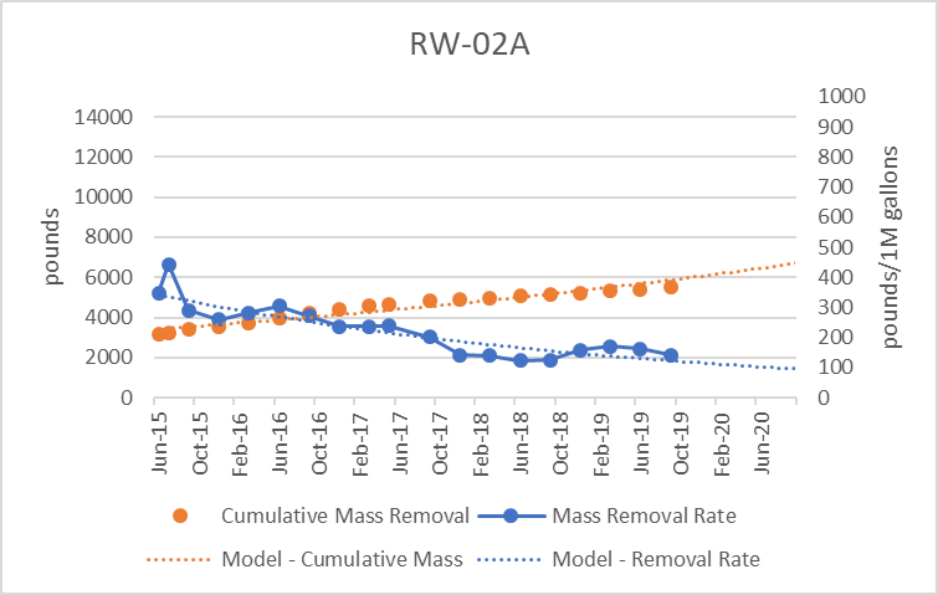
- Prepared for RWs within the TCE HCP
- Data range from System Expansion to present
- Revised pumping rates implemented 23-Aug-19
- Graph not prepared for RW17C

RW17C	TCE	cDCE	VC
08/2019	475000	252000	410 U
09/2019	1160000	20100	8200 U

  - Operating at 1 GPM
  - 16,970 gallons processed containing 116# of TCE



Observations:



- RWs 1A, 1B, 2A, 2B, and 17C remove the majority of TCE mass
- RWs 1A, 1B, 2A, and 2B trends indicate recovery rates of 80 to 375 pounds of TCE per 1,000,000 gallons over the next year of operation
- TCE concentrations less in RWs 4B, 5B, 6B, 9A, 10A, 12A, 13A, 14A, 15A, 16B, TCE in these wells have increased during June and Sept sampling events

Model - Removal Rate

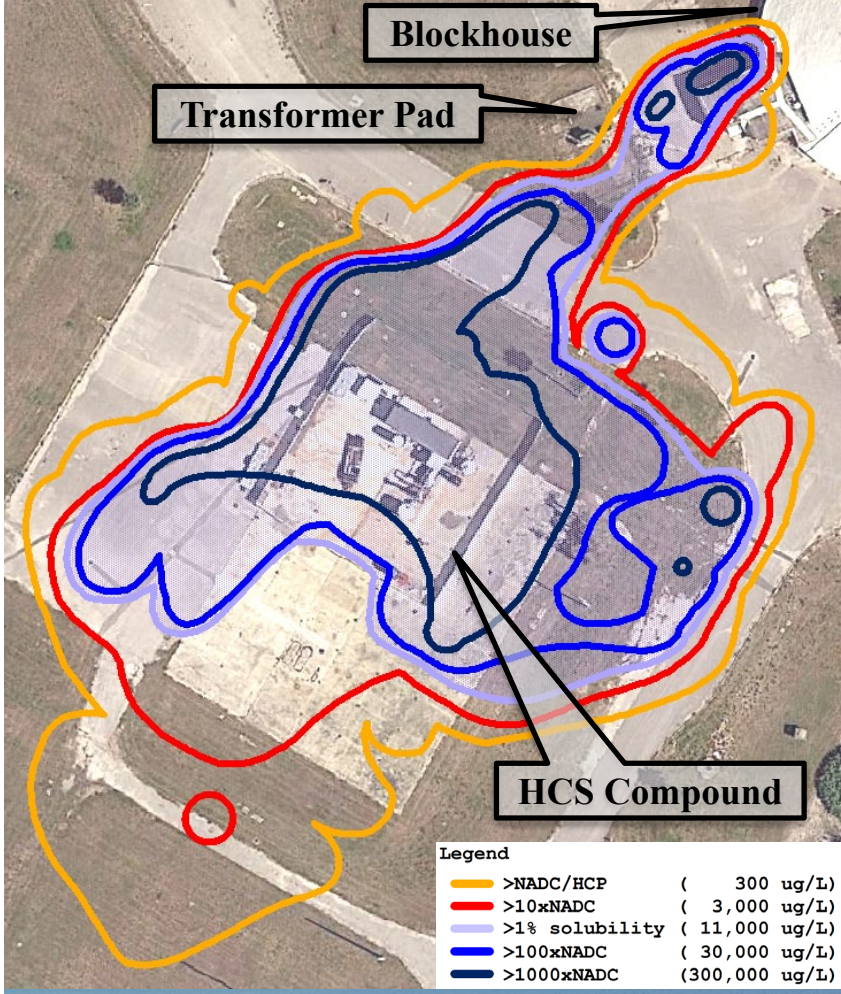
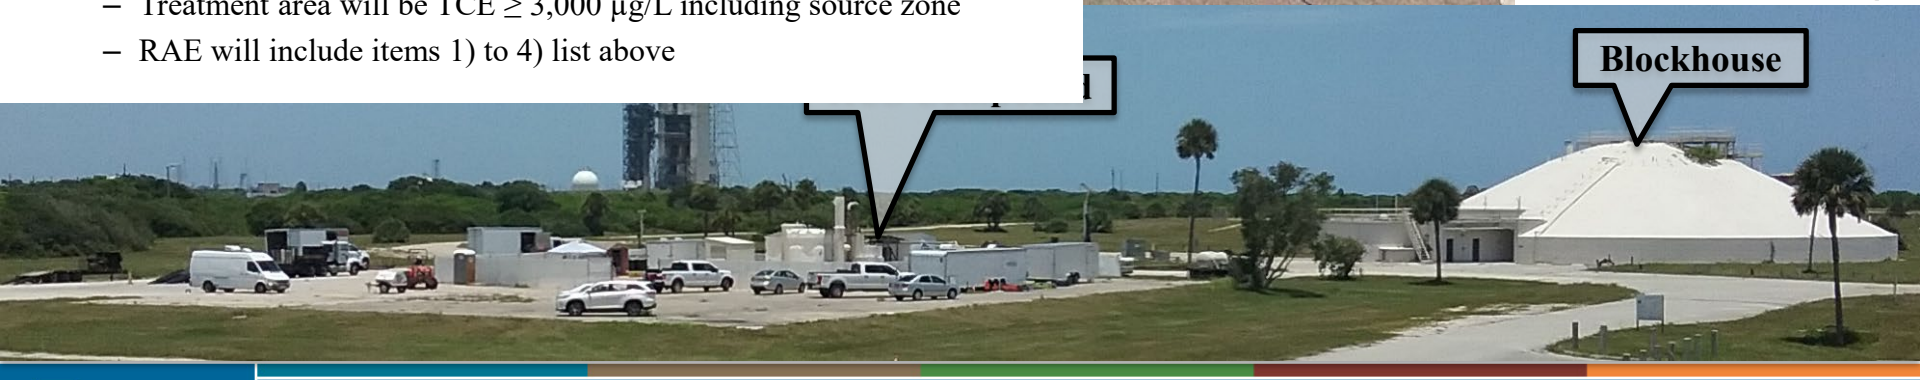
Site conditions:

- Source zone (TCE ≥ 11,000 µg/L) underlies surface obstructions portion of the Blockhouse, transformer pad, roadways, utilities (electric, comm line, water line), former ESB pad, parking area, and HCS
- Layers 4 and 7 fine grained units storing mass

NASA's RAE expectations:



- NASA and Tt met to evaluate the next phase of the treatment train
- Aggressive technology for treatment (eviscerate) of DNAPL source material that can be implemented in a reasonable timeframe that treat mass including the fine-grained units in Layers 4 and 7
- Develop alternatives in RAE with costing accurate to IMWP standards
- Preliminary discussions have included:
  1) LDA with Steam and ZVI
  2) In-situ Thermal
  3) Pump and Treat with amendments
  4) HCS expansion to control Layer 7



Data Gaps:

- TCE delineation to 3,000 µg/L completed during SA
- Several samples identified to delineate TCE to 300 µg/L

Team consensus:

- Treatment area will be TCE ≥ 3,000 µg/L including source zone
- RAE will include items 1) to 4) list above

Response to AECOM Comments

8. **Slide 55 Summary: In additions to Layers 4 and 7, dissolved concentrations and observations of DNAPL indicate that Layer 5 may also contain significant DNAPL mass.**

   Response: Tt concurs that Layer 5 contains significant mass in addition to Layers 4 and 7. Layers 4 and 7 drive the need for aggressive technologies evaluated in the RAE due to the presence of fine-grained units.

9. **General Comment: AECOM recognizes that defining the subsurface volume that is the source area for the RAE is difficult. However, in our experience the use of 1% TCE solubility is overly conservative for delineating the extent of DNAPL. In general, source zone delineation is site-specific and should use direct observation of DNAPL in samples, soil concentrations indicative of DNAPL, and dissolved concentrations much greater than 1% TCE solubility. Note that the 1% solubility guidance was developed to indicate that NAPL could be present at a site if aqueous concentrations exceeded 1% solubility in wells that typically had long screens. Since development of this guidance, high-frequency/density subsurface sampling and short well screens as implemented at LC34 are more common and provide data density that can better delineate DNAPL source areas based on concentrations in groundwater that are near solubility limits.**

   Response: Tt concurs that an alternative concentration can be used to determine extents of potential source areas. The DPD indicates that a source zone may be defined using a different percent solubility when consensus from the KSCRT has been obtained. Tt reviewed the definitions used to identify source areas at Wilson Corners, HMFN and CCF East, each used 1% TCE solubility to define the source zone.

Response to HydroGeoLogic, Inc. Comments

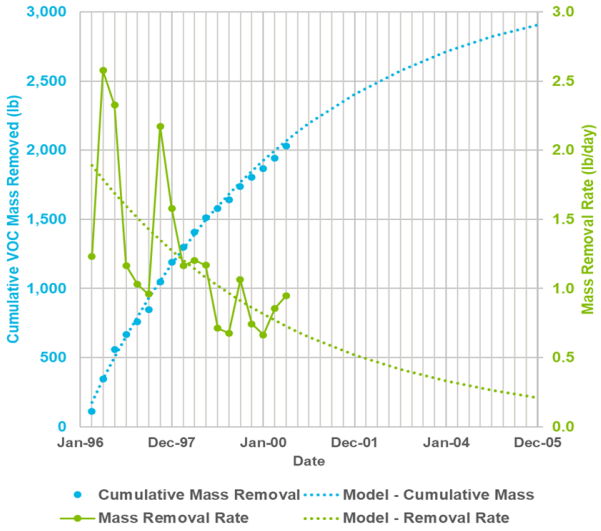
8. **Slide 55 – Remedial Alternatives Evaluation: Will consideration of the remedial technologies and development of alternatives include the evaluation of multiple technologies that might complement each other? For example, would LDA or thermal be used for aquifer volumes over 11,000 ug/L and P&T with amendments (or another form of in situ bioremediation) be used for volumes between 3,000 and 11,000 ug/L?**

   Response: Aggressive technologies have been recently implemented at Wilson Corners (LDA w/steam and ZVI) and CCF East (ERH). At Wilson Corners Hot Spot 1 the treated area was greater than or equal to 3,000 ug/L and at CCF East the treatment area was greater than or equal to 3,000 ug/L from 40 to 50' bls, HCP between 50' to 60' bls and the combined area projected upward from ground surface to 40' bls. In each case the treatment area using the aggressive technology treated at least TCE greater than or equal to 3,000 ug/L, therefore the RAE will provide treatment costs for greater than or equal to 3,000 ug/L and greater than or equal to 11,000 ug/L for selected technologies for NASA's consideration. Coupling hydraulic capture with the aggressive technologies will be considered during the RAE.

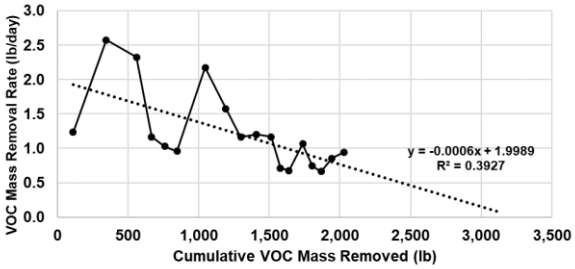
TETRA TECH

MEMO

To:	Ms. Lindsay Morgan
From:	Mark Speranza, PE; Mark Jonnet
Date:	October 15, 2019
Subject:	Response to Comments Launch Complex 34, SWMU CC054, DSZ Site Characterization Advanced Data Package



Below are Tetra Tech's responses to comments provided by AECOM and HydroGeoLogic, Inc. from review of the Launch Complex 34 (LC34), SWMU CC054, DSZ Site Characterization ADP.



Response to AECOM Comments

The following slide-specific and general comments are provided for the Engineering Evaluation of the DSZ Site Characterization ADP for LC34.

1. **Slide 10 Mass Recovery: To better understand past and approximate future mass recovery behavior that could be used to optimize operation of the HCS, AECOM suggests preparing and presenting the following trend plots:**
    - **Cumulative TCE mass removed versus time at each extraction well and for the whole HCS system**
    - **TCE mass removal rate versus time at each extraction well and for the whole HCS system**
    - **TCE mass removal rate versus cumulative TCE mass removed at each extraction well and for the whole HCS system**

    Trends in the suggested plots can provide insight into past transport behavior (mass removal from advective zones versus mass removal controlled by matrix diffusion) and can be extrapolated to approximate potential future behavior. Plots for a non-NASA site are provided at the end of this memo as examples of the suggested trend plots.

***Response*:** Trend graphs are being generated and will be incorporated into the presentation.

Tetra Tech, Inc.
Foster Plaza 7, 661 Andersen Drive
Tel 412.921.7090 Fax 412.921.4040 tetratech.com

2. **Slide 15 DNAPL Observation: Please describe how observation of DNAPL was performed. Was an oleophilic dye used?**

   Response: DNAPL observation was visual. No additional testing was performed other than VOC analyses by the mobile lab.

3. **Slides 11 and 39 Lithology Transects: AECOM suggests adding labels to each Layer that provides the estimated hydraulic conductivity value.**

   Response: The estimated hydraulic conductivity was provided on Slide 7 for the individual layers.

4. **Slide 41 Data Transects: AECOM suggests adding the locations of the wells to the plan view where concentration data is presented in the subsequent transects.**

   Response: Monitoring wells and recovery wells shown in the transects have been added to Slide 40.

5. **Slide 48 Mass Estimates: The "DNAPL mass" estimate is an estimate of the dissolved mass, not DNAPL mass, within the subsurface volume where TCE concentrations are greater than 1% of it's solubility in water. DNAPL mass is unknown but is expected to be much higher than the estimated dissolved and sorbed mass. The mass recovery plots suggested above may provide an estimate of total mass that could potentially be recovered from operation of the HCS at the site.**

   Response: Tetra Tech concurs with the uncertainty associated with estimating DNAPL mass. Tt Subject Matter Experts concluded that calculating estimates of DNAPL mass includes numerous variables, many of which are difficult or nearly impossible to quantify in situ and that assuming groundwater TCE concentrations equal to or greater than 11,000 µg/L (1% TCE solubility) provides DNAPL presence. The column previously called out as "DNAPL" has been renamed "Dissolved DNAPL" in the table on Slide 48 to categorize DNAPL presence, Tt concurs that this estimate is most likely low due to the assumption of uniform values over the investigation area and that this simplification disregards the spatial variability of DNAPL. Tt suggests that the mass estimate be considered a reference to the source area where over 67,000 pounds of cVOCs have been recovered via the HCS and over 59,000 pounds of cVOCs during the in-situ remediation demonstration projects.

6. **Slide 49 - Pump Test:**

   - **Indicate in the title that the pump test was in Layer 7**
   - **If the test results were used to estimate hydraulic conductivity, please present the estimated values**
   - **Indicate if the drawdowns at the observation wells were stable or increasing at the end of the pump test**

   Response: The pump test was conducted on Layer 7 via extracting groundwater from RW17. Hydraulic conductivity ranged from 0.13 to 0.29 ft/day, lower than 0.4 ft/day presented in the CMS, and drawdown rates at the end of the 48 hour test continued to slowly increase. While the rates did not completely stabilize indicating true static conditions the majority of drawdown (1.5 to 2.0 feet) occurred during the initial 3 hours of the test. Over the last 40 hours of the test the drawdown was minimal (0.1 to 0.2 feet).

7. **Slides 50 and 52 Capture Zones: Please explain if the thick lines labeled as the capture zones are based on field observations of drawdown or model results.**

   Response: Prior to the development of the Interim Measure Design dynamic testing was conducted on Recovery Wells 1A, 1B, 2A, 2B, 3A, and 3B to collect data to refine the model used to develop the original capture zones. Once the system was installed a Hydraulic Capture Study was conducted to verify the proposed capture zones. The results of the study indicated the operating as design conditions encompassed the designed capture zones. In 2015 during the system expansion the data collected from previous studies

was used to model the capture zones. The Year 9 capture zones shown on Slides 50 and 52 were the zones based on the pumping rates prior to the revised flows rates implemented 23-Aug-19. The colored capture zones displayed by days are based on the revised pumping rates and were developed using the LC34 groundwater model using MODFLOW to simulate the groundwater flow field and MODPATH for particle tracking to delineate the extent of hydraulic capture. The groundwater model was calibrated based on a complete set of site-wide water level measurements, recovery well rates, injection well rates, and rate of discharge sent to the infiltration gallery

8. **Slide 55 Summary: In additions to Layers 4 and 7, dissolved concentrations and observations of DNAPL indicate that Layer 5 may also contain significant DNAPL mass.**

   Response: Tt concurs that Layer 5 contains significant mass in addition to Layers 4 and 7. Layers 4 and 7 drive the need for aggressive technologies evaluated in the RAE due to the presence of fine-grained units.

9. **General Comment: AECOM recognizes that defining the subsurface volume that is the source area for the RAE is difficult. However, in our experience the use of 1% TCE solubility is overly conservative for delineating the extent of DNAPL. In general, source zone delineation is site-specific and should use direct observation of DNAPL in samples, soil concentrations indicative of DNAPL, and dissolved concentrations much greater than 1% TCE solubility. Note that the 1% solubility guidance was developed to indicate that NAPL could be present at a site if aqueous concentrations exceeded 1% solubility in wells that typically had long screens. Since development of this guidance, high-frequency/density subsurface sampling and short well screens as implemented at LC34 are more common and provide data density that can better delineate DNAPL source areas based on concentrations in groundwater that are near solubility limits.**

   Response: Tt concurs that an alternative concentration can be used to determine extents of potential source areas. The DPD indicates that a source zone may be defined using a different percent solubility when consensus from the KSCRT has been obtained. Tt reviewed the definitions used to identify source areas at Wilson Corners, HMFN and CCF East, each used 1% TCE solubility to define the source zone.

<u>Response to HydroGeoLogic, Inc. Comments</u>

We have reviewed the Site Characterization Engineering Evaluation for Launch Complex 34 (SWMU CC054). The delineation work, both horizontal and vertical, is comprehensive. We do offer the following comments for your consideration:

1. **Slides 21 thru 34 - DPT TCE Results: Consider showing the RWs on the DPT TCE Result Figures, which will allow the reader to visualize where the shallow and deep RWs are located in relation to the TCE results.**

   Response: Tt concurs, recovery wells have been added to slides 18 to 23 and 25 to 30.

2. **Slides 21, 29 and 30 - DPT TCE Results: The high concentration area extending toward the Blockhouse (Slides 29 and 30) between Layers 6 and 7 is relatively narrow and perhaps the result of migration through a narrow feature at the interface of these two layers. Please review the current and historic data to confirm that a similar narrow extension of contamination (Slide 21) is not occurring at DPT location 661.**

   Response: Tt concurs that the 100 mg/kg TCE Saturated Soil Isoconcentration Contour and perhaps a subtle change in the interface between Layers 6 and 7 support the TCE detected in DPTs 659, 672, 684, and 685 on slides 29 and 30. The elevated TCE detected in DPTs 654 and 612 shown on slide 21 could be related to the proximity of the 100 mg/kg TCE Saturated Soil Isoconcentration Contour near DPT 653 and review of existing data suggests decreasing concentrations towards DPTs 661 and the three DPTs (690, 691, and 681) surrounding DPT 661 indicate very low levels of TCE and/or less than detection limits.

3. **Slides 40 thru 47 – Cross Sections: The geology on the cross-sections is very uniform for presentation purposes, and it is clear from these cross-sections that the highest contaminant concentrations and mass are in the lower permeability units. For example, concentrations are high in Layers 4 and 5, are lower in the more permeable Layer 6, and then are higher again in Layer 7. Information about fine sand, silt, or clay content and their correlation to concentrations may be helpful when evaluating remedial options. To support the engineering evaluation, it would be helpful to provide more information about the geology from soil cores where soil samples were collected.**

Response: The February 2007 CMS established the stratigraphic nomenclature presented on the cross-sections, descriptions of Layers 1 to 9 are provided below. In July 2019 soil cores were extracted at DPTs 645, 648, 650, 656, and 679 to a depth of 80' bls. Each core was screened with a PID and soil samples were collected above, within, and below Layers 1 to 7. All samples were submitted for TOC analysis and samples corresponding to elevated PID readings were also analyzed for VOCs. Table 1 attached to this memo presents the soil sample results with the lithology specific the area where each sample was collected.

CMS Layer Descriptions:

- Layer 1: Historically referred to as the "S" Zone or upper sand unit (USU), Layer 1 is located from land surface to approximately 25 ft bls, and encompasses the water table and represents shallow groundwater conditions in the surficial sands. The hydraulic conductivity of Layer 1 is approximately 30 ft/day and is based upon an average of slug test and pumping test data
- Layer 2: Historically referred to as the "I" Zone or middle fine-grained unit (MFGU), Layer 2 is located from approximately 25 to 30 ft bls and consists of very fine-grained, silty sands between the water table and the aquitard. The hydraulic conductivity of Layer 2 is approximately 4 ft/day and is based upon an average of slug test and pumping test data. Note: Many Layer 2 monitoring wells are partially screened within the basal portion of Layer 1; accordingly, measured groundwater concentrations and hydraulic characteristics from wells within this layer are likely a representation of groundwater conditions at the interface of Layer 1 and 2.
- Layer 3: Historically referred to as the "D" Zone or lower sand unit (LSU), Layer 3 is located from approximately 30 to 45 ft bls and consists of very coarse sands and silty sands immediately above the aquitard. The hydraulic conductivity of the Layer 3 is approximately 3 ft/day and is based upon an average of slug test and pumping test data.
- Layer 4: Historically referred to as the confining unit, aquitard, semi-confining unit or lower clay unit (LCU), Layer 4 is located from approximately 45 to 48 ft bls (thickness varies) and consists of silty clay to clayey silt with minor amounts of sand and shell fragments. The vertical hydraulic conductivity of Layer 4 has been previously reported at 1.67×10^{-4} ft/day (5.89×10^{-8} cm/sec), based upon Shelby-tube collected samples in the immediate vicinity of the ESB.
- Layer 5: Depth interval from approximately 48 to 60 ft bls; consists of medium light gray, medium to coarse-grained silty sand with abundant shell fragments. The hydraulic conductivity of the 48 to 60 ft bls interval is 0.4 ft/day and is based upon numeric optimization of the aquifer pumping test results.
- Layer 6: Depth interval from approximately 60 to 80 ft bls ("D1" Zone); consists of light olive gray homogeneous "salt and pepper" sand. The hydraulic conductivity of Layer 6 is approximately 7.5 ft/day and is based upon aquifer pumping test and slug test results.
- Layer 7: Depth interval from approximately 80 to 95 ft bls; consists of yellowish gray to light olive gray, silty sand to clayey sand with abundant white shell fragments. Numeric optimization of the aquifer pumping test results resulted in a model derived hydraulic conductivity estimate of 0.4 ft/day.
- Layer 8: Depth interval from approximately 95 to 118 ft bls ("D2" Zone); consists of yellowish gray to light gray, fine- to coarse-grained sands. The hydraulic conductivity of Layer 8 is approximately 3 ft/day and is based upon slug test results.
- Layer 9: Depth interval below 118 ft bls to a maximum exploratory depth of 140 ft bls, clays and sandy clays of the regional confining unit. An evaluation of soil cores by the Florida Geologic Survey

verified that the Hawthorn Group begins at approximately 125 ft bls (interval from 118 to 125 ft bls identified as Tamiami Equivalent).

4. **Slides 50 thru 52 – Information about aquifer test interpretation is limited.**

   - **There are two types of depicted capture zones, and the development of these capture zones is unclear. What is the difference in meaning between the Year 9 capture zone in yellow and the contoured capture zones for various time frames on slide 50? They have different shapes, and it does not look like one follows from the other. A similar question applies to the navy and contoured capture zones on slide 52**

     Response: See response to AECOM's comment #7 for additional clarification. The Year 9 capture zones shown on Slides 50 and 52 were the capture zones based on the pumping rates prior to the revised flows rates implemented 23-Aug-19.

   - **When were the flow rates revised? Are the depicted capture zones associated with the original or revised extraction rates?**

     Response: The flow rates were revised on 23-Aug-19. The capture zones are based on the revised pumping rates.

5. **Slide 52 – Revised Pumping Rates: Can operation of well 5B be discontinued? Although low level contamination remains in this area, the location appears to be within the capture zone, and 5B may be competing with 16B. Turning off 5B may be more practical if the extraction rate from 16B is increased.**

   Response: Pumping rates were recently adjusted in August 2019, the June and September 2019 recovery well sample results indicate TCE increasing in both recovery wells. Based on this increase Tt recommends continued operation of both these wells and to evaluate mass recovery rates during the quarterly sampling events.

6. **Slides 29, and 30 - DPT TCE Results – and Slides 52 and 53 - Revised Pumping Rates: Consider installing RW near DPT672 and DPT684 to capture the TCE mass from 70 to 85 ft bgs.**

   Response: This area is within the 365-day Capture Zone for the HCS Deep Zone (50' to 80' bls) therefore no additional recovery wells are being proposed at this time. Tt will consider additional recovery wells during the RAE.

7. **Slide 55 – Remedial Alternatives Evaluation: Will consideration of the remedial technologies and development of alternatives include the evaluation of multiple technologies that might complement each other? For example, would LDA or thermal be used for aquifer volumes over 11,000 ug/L and P&T with amendments (or another form of in situ bioremediation) be used for volumes between 3,000 and 11,000 ug/L?**

   Response: Aggressive technologies have been recently implemented at Wilson Corners (LDA w/steam and ZVI) and CCF East (ERH). At Wilson Corners Hot Spot 1 the treated area was greater than or equal to 3,000 ug/L and at CCF East the treatment area was greater than or equal to 3,000 ug/L from 40 to 50' bls, HCP between 50' to 60' bls and the combined area projected upward from ground surface to 40' bls. In each case the treatment area using the aggressive technology treated at least TCE greater than or equal to 3,000 ug/L, therefore the RAE will provide treatment costs for greater than or equal to 3,000 ug/L and greater than or equal to 11,000 ug/L for selected technologies for NASA's consideration. Coupling hydraulic capture with the aggressive technologies will be considered during the RAE.

ADVANCED DATA PACKAGE

C.10 Soil Interim Measures ADP

Launch Complex 34 (LC34), SWMU CC054
Soil Excavation Interim Measure

December 2018

TETRA TECH

Objectives

- Introduction and Background
- Interim Measure Objective
- IM Implementation
- Conclusions and Recommendations
- Questions/Comments

Introduction and Background

- LC34 is a former launch pad located at CCAFS which operated from the late 1950s until 1968
- Previous IM conducted in 2000 to excavate soil with PCBs greater than FDEP ISCTL from three areas
- Soil re-assessment sampling (2014 to 2018)
  - Goal: To confirm the presence or absence of PCBs, TRPH, and/or dioxins/furans and delineate contamination to FDEP RSCTLs at 9 LOCs
    - 8 LOCs not previously investigated
    - 1 LOC previously delineated to ISCTL
  - Team consensus reached on 20 excavation areas presented in March 2018 IMWP

IM Objective

- Excavate contaminated soil with PCBs, TRPH, and/or dioxins/furans (TCDD TEQ) at concentrations greater than RSCTLs from 20 areas and dispose of off-site
  - Total volume: 1,622 yd^3
  - Total area: 64,407 ft^2 (1.48 acres)

Area[a]	Contaminant(s) of Concern	Area of Excavation (ft^2)	Depth Interval (ft bls)	Volume (yd^3)	Comments
Area 1	Total PCBs/ Total TCDD TEQs/ TRPH	5173	2.0	383	See notes b, c, and d
Area 2	Total PCBs/ Total TCDD TEQs	186	0.5	3.5	See notes b and c
Area 3	Total PCBs/ Total TCDD TEQs	6440	0.5	119	See notes b and c
Area 4	Total PCBs/ Total TCDD TEQs	1930	0.5	36	See notes b and c
Area 5	Total PCBs	496	0.5	9.2	See note b
Area 6	Total PCBs	2255	0.5	42	See note b
Area 7	Total PCBs/ Total TCDD TEQs	13387	0.5	248	See notes b and c
Area 8	Total PCBs/ Total TCDD TEQs	2051	0.5	38	See notes b and c
Area 9	Total PCBs	403	0.5	7.5	See note b
Area 10	Total PCBs	211	0.5	3.9	See note b
Area 11	Total PCBs/ Total TCDD TEQs	3904	0.5	72	See notes b and c
Area 12	Total PCBs/ Total TCDD TEQs	1186	0.5	22	See notes b and c

Area[a]	Contaminant(s) of Concern	Area of Excavation (ft^2)	Depth Interval (ft bls)	Volume (yd^3)	Comments
Area 13A	Total PCBs/ Total TCDD TEQs	200	2.0	15	See notes b and c
Area 13B	Total PCBs/ Total TCDD TEQs	20886	0.5	387	See notes b and c
Area 14	Total PCBs/ Total TCDD TEQs	35.5	5.0	6.6	See notes b and c
Area 15	Total PCBs/ Total TCDD TEQs	213	0.5	3.9	See notes b and c
Area 16	Total PCBs	87	0.5	1.6	See note b
Area 17	Total PCBs	72	0.5	1.3	See note b
Area 18	Total PCBs	116	0.5	2.2	See note b
Area 19A	Total PCBs	781	2.0	58	See note b
Area 19B	Total PCBs	2931	0.5	54	See note b
Area 20	Total PCBs/ Total TCDD TEQs	1463	2.0	108	See notes b and c

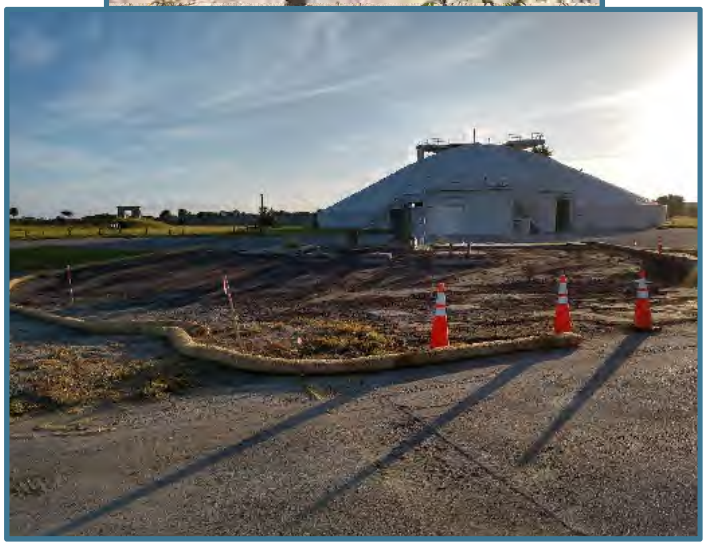
Notes:
a) Figures 2 through 21 show each excavation area with coordinates and soil sample results.
b) PCB samples exceed FDEP RSCTL and are less than TSCA
c) Total TCDD TEQs exceed FDEP RSCTL
d) TRPH exceed FDEP RSCTL

IM Timeline

Task	Dates
Soil Interim Measures Work Plan	March 2018
Site-Specific Health and Safety Plan	June 2018
SHPO Coordination	July 12 – August 10, 2018
Ecological & Endangered Species Survey	July 25, 2018
Waste Profile Sampling	June 28, 2018
Nuts & Bolts Meeting	August 17, 2018
Mobilization	August 20, 2018
Soil Excavations, Backfill, and T&D	August 21 – September 7, 2018
Restoration/Demobilization	September 10-14, 2018

IM Implementation

Premobilization



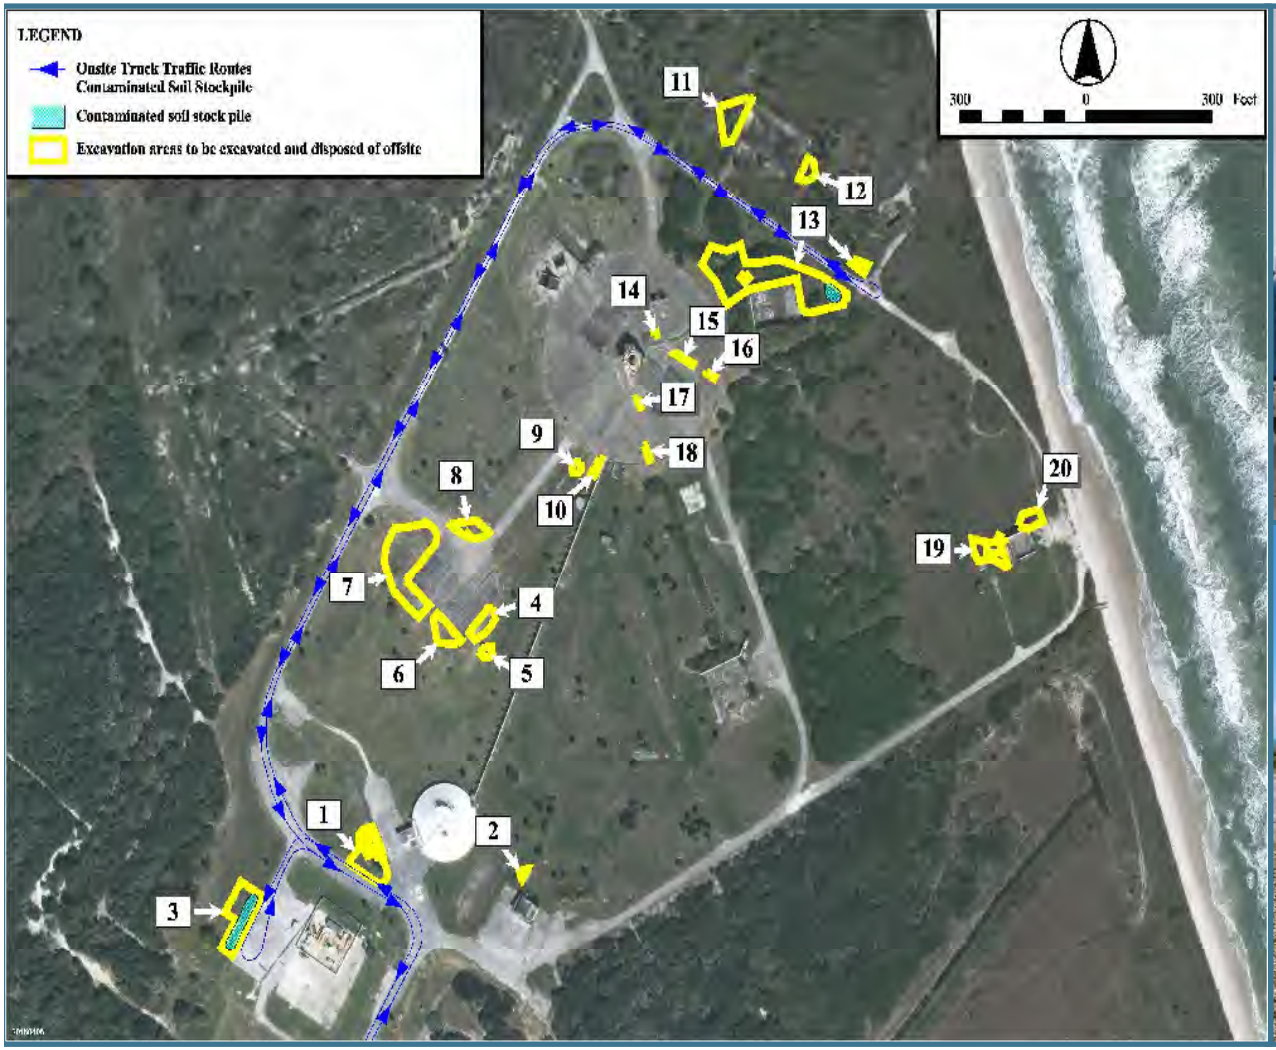
- Preparation of Implementation Work Plan per the approved IMWP
- National Historic Preservation Act Section 106 Consultation completed
  - SHPO concurred that proposed undertaking will have no adverse effect on the National Historic Landmark District
- Compliance with KSC REC
  - Dig Permit, Biological Survey, NPDES Permit, 45th Space Wing Biological Opinion (Beach Mice)
- Notified KSC tour buses regarding equipment and truck traffic on site
- Composite samples collected to characterize waste for disposal in coordination with OMNI Landfill
- Secured badging for subcontractors
- Nuts and bolts meeting held onsite with NASA RPM and H&S personnel on August 17, 2018 prior to work
- Procurement of materials and equipment
  - Sampling performed to verify topsoil is clean
  - Prior sampling data on file to verify fill soil is clean

IM Implementation

Mobilization and Site Preparation

- Horizontal excavation limits of each excavation area surveyed and staked
- Equipment and materials delivered to site

IM Implementation



Excavation

- Performed Aug. 21 – Sept. 7, 2018
- 1,622 yd^3 of soil to be removed per IMWP
  - Depths varying 0.5 to 5 ft bls
- Equipment used:
  - Mini excavator
  - Mid-sized excavator
  - Large excavator
  - Wheel loader
  - Articulated dump truck
  - Skid steer
  - Water truck

IM Implementation

Area 1

- COCs: PCBs, TCDD TEQs, TRPH
- Depth: 2.0 ft
- Area: 5,173 ft^2
- Volume: 383 yd^3

Area 2

- COCs: PCBs, TCDD TEQs
- Depth: 0.5 ft
- Area: 186 ft^2
- Volume: 3.5 yd^3

Area 3

- COCs: PCBs, TCDD TEQs
- Depth: 0.5 ft
- Area: 6,440 ft^2
- Volume: 119 yd^3

Areas 4, 5, & 6

Area 4
- COCs: PCBs, TCDD TEQs
- Depth: 0.5 ft
- Area: 1,930 ft^2
- Volume: 36 yd^3

Area 5
- COC: PCBs
- Depth: 0.5 ft
- Area: 496 ft^2
- Volume: 9.2 yd^3

Area 6
- COC: PCBs
- Depth: 0.5 ft
- Area: 2,255 ft^2
- Volume: 42 yd^3

Areas 7 & 8

Area 7

- COCs: PCBs, TCDD TEQs
- Depth: 0.5 ft
- Area: 13,387 ft^2
- Volume: 248 yd^3

Area 8

- COCs: PCBs, TCDD TEQs
- Depth: 0.5 ft
- Area: 2,051 ft^2
- Volume: 38 yd^3

Areas 9 & 10

Area 9
- COC: PCBs
- Depth: 0.5 ft
- Area: 403 ft^2
- Volume: 7.5 yd^3

Area 10
- COC: PCBs
- Depth: 0.5 ft
- Area: 211 ft^2
- Volume: 3.9 yd^3

Areas 11 & 12

Area 11
- COCs: PCBs, TCDD TEQs
- Depth: 0.5 ft
- Area: 3,904 ft^2
- Volume: 72 yd^3

Area 12
- COCs: PCBs, TCDD TEQs
- Depth: 0.5 ft
- Area: 1,186 ft^2
- Volume: 22 yd^3

Area 13 (A/B)

Area 13A
- COCs: PCBs, TCDD TEQs
- Depth: 2.0 ft
- Area: 200 ft^2
- Volume: 15 yd^3

Area 13B
- COCs: PCBs, TCDD TEQs
- Depth: 0.5 ft
- Area: 20,886 ft^2
- Volume: 387 yd^3

Areas 14, 15, & 16

Area 14
- COCs: PCBs, TCDD TEQs
- Depth: 5.0 ft
- Area: 35.5 ft^2
- Volume: 6.6 yd^3

Area 15
- COCs: PCBs, TCDD TEQs
- Depth: 0.5 ft
- Area: 213 ft^2
- Volume: 3.9 yd^3

Area 16
- COC: PCBs
- Depth: 0.5 ft
- Area: 87 ft^2
- Volume: 1.6 yd^3

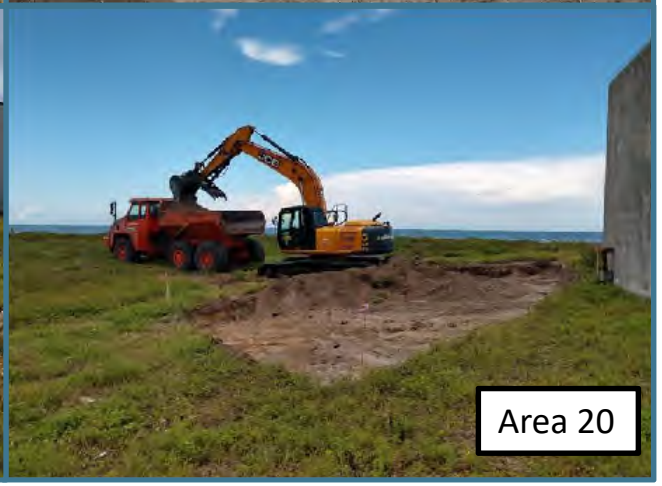
Areas 17 & 18

Area 17
- COC: PCBs,
- Depth: 0.5 ft
- Area: 72 ft^2
- Volume: 1.3 yd^3

Area 18
- COC: PCBs,
- Depth: 0.5 ft
- Area: 116 ft^2
- Volume: 2.2 yd^3

Areas 19 (A/B) & 20

Area 19A
- COC: PCBs
- Depth: 2.0 ft
- Area: 781 ft^2
- Volume: 58 yd^3



Area 19B
- COC: PCBs
- Depth: 0.5 ft
- Area: 2,931 ft^2
- Volume: 54 yd^3

Area 20
- COCs: PCBs, TCDD TEQs
- Depth: 2.0 ft
- Area: 1463 ft^2
- Volume: 108 yd^3

IM Implementation

- Disposal
  - 2,328.1 tons of soil (77 truckloads) sent to OMNI Landfill
  - Each truck inspected before site exit; manifested, inspected and weighed at landfill
- Backfilling
  - 52 truckloads of backfill, 32 truckloads of topsoil placed
    - Clean fill soil used to backfill area
    - Clean topsoil used as backfill for last several inches
- Restoration/Demobilization
  - Activities conducted Sept. 10-14, 2018
  - Applicable areas hydroseeded and watered
  - Equipment removed from site

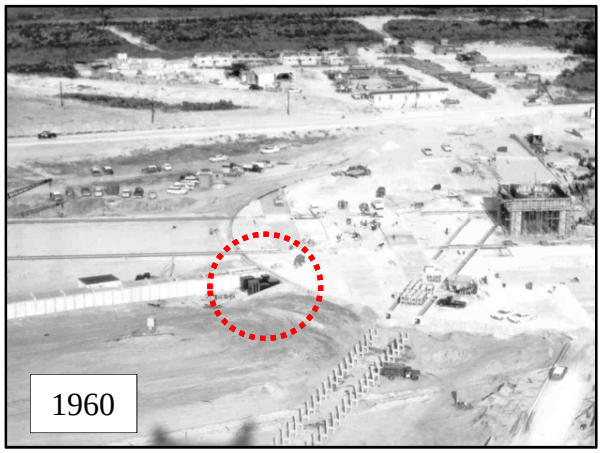
Deviations from IWP

- Area 1
  - Hand excavated around tight areas rather than using vacuum truck
- Area 13
  - Track machine needed to be used in some portions of area due to flat tire on wheel loader from rebar
- Area 14
  - Excavated soil to 2 ft; metal debris encountered
  - Minimal amount of soil below 2 ft
- Area 20
  - Access issues due to sand

Conclusions and Recommendations

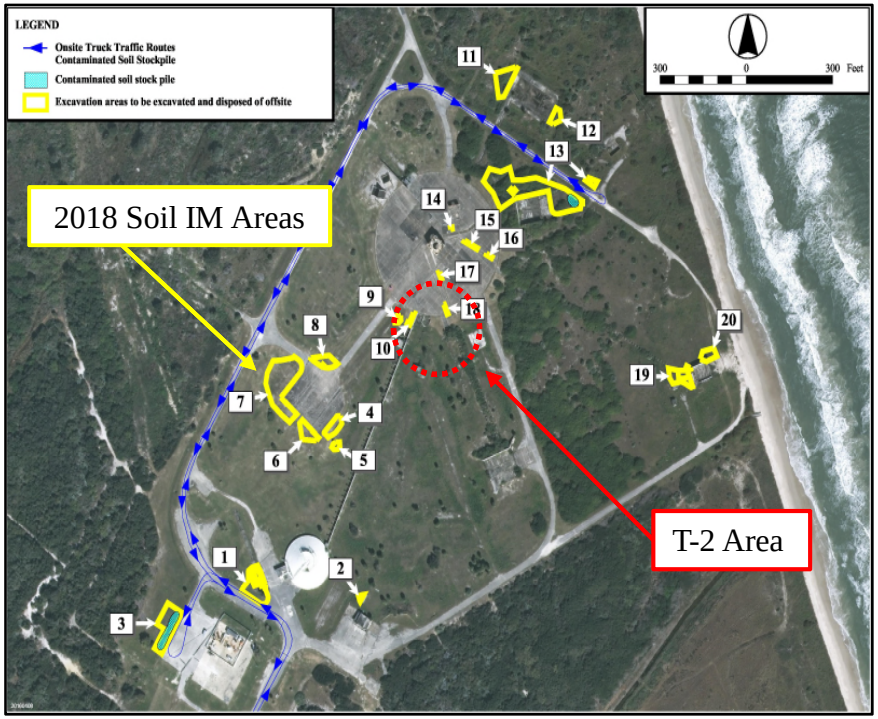
- **<u>Test Consensus</u>**: No further action for 20 areas excavated in this IM
- Note – Further investigation into Electrical Substation T-2 (LOC 2) is ongoing due to PCB concentrations greater than 50 mg/kg and being conducted as a separate IM

ADVANCED DATA PACKAGE



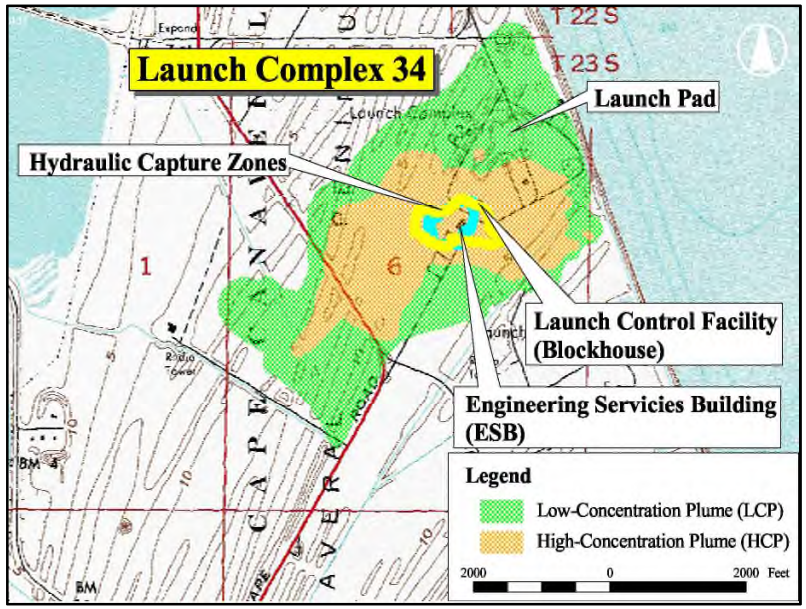
C.11 T-2 Area Soil Interim Measures ADP

Launch Complex 34 (LC34), SWMU CC054
T-2 Area Soil Interim Measure
February 2020



Objectives

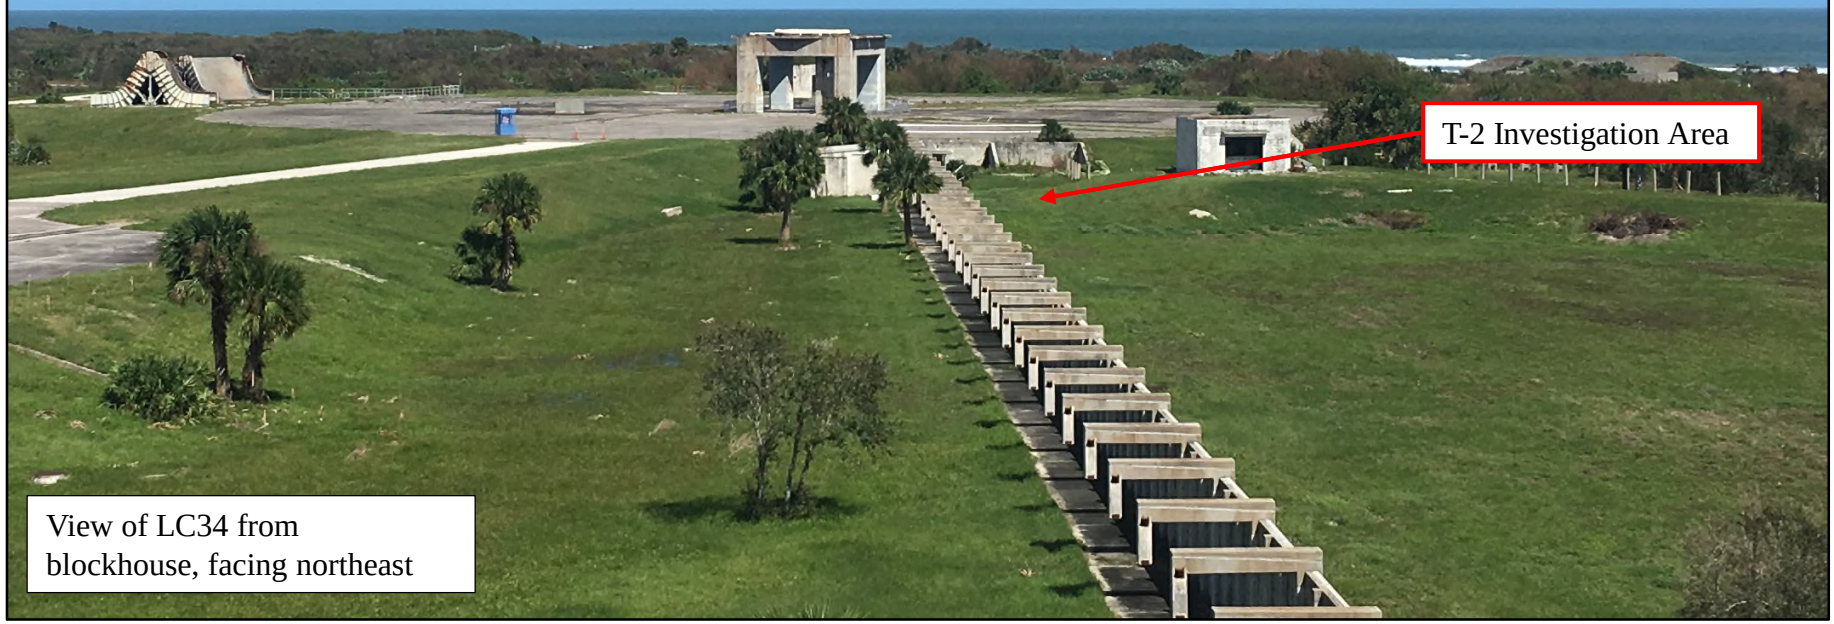
- Introduction and Background
- T-2 Area Interim Measure (IM) Objective
- T-2 Area IM Implementation
- Conclusions and Recommendations



Introduction and Background

- LC34 is a former launch pad located at CCAFS which operated from the late 1950s until 1968
- The launch pad was shutdown in 1968 and LC34 has remained largely inactive
  - Most operational equipment has been dismantled
  - On-site buildings and structures abandoned in place
- Site became part of the Man In Space National Historic Landmark in 1984
  - NASA coordination with State Historic Preservation Office (SHPO)
  - Because of historic significance and high visibility, maintaining physical site features is a high priority

- Site wide polychlorinated biphenyl (PCB), total recoverable petroleum hydrocarbons (TRPH), and dioxin/furan contamination in soil from former electrical substations and paint releases has been addressed, except for T-2 Area
- Land Use Controls (LUCs) in place for soil and volatile organic compound (VOC) groundwater plume

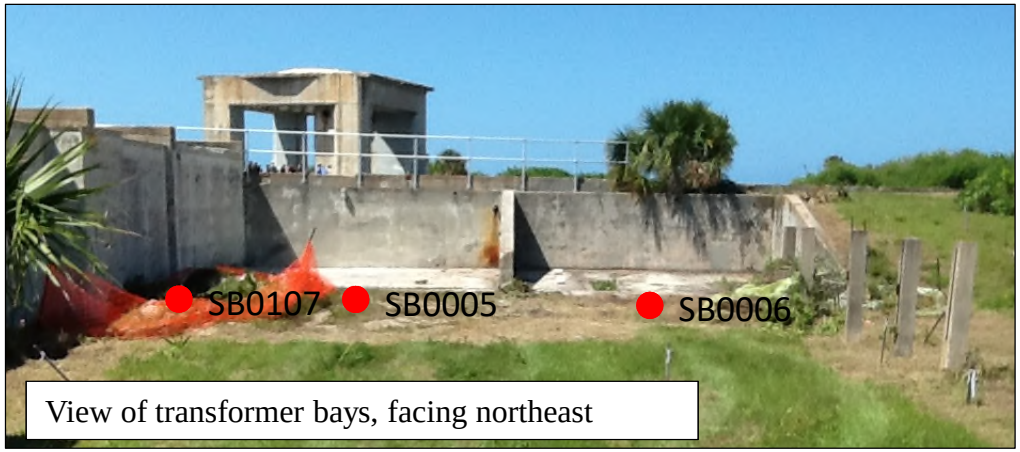


Summary of Soil Investigations

- RCRA Facility Investigation (RFI) (June 1999)
  - Identified PCB-impacted soil at three areas (Hydrocarbon Recovery Facility, Liquid Oxygen Storage Area, and Petroleum Shed
- CMS Work Plan (August 1999)
  - Recommended additional sampling
  - Recommended IMWP for removal of soil with PCB concentrations greater than FDEP ISCTL (2.1 mg/kg at time of investigation)
- Soil IM (December 2000)
  - 263 tons of soil excavated and disposed of from three areas identified during the RFI
- Soil Re-Assessment (2014 to 2018)
  - Soil sampling effort to confirm the presence or absence of PCBs, TRPH, and/or dioxins/furans and delineate contamination to FDEP RSCTLs at 9 Locations of Concern (LOCs)
  - LOC 2 (Electrical Substation T-2) identified PCB concentrations greater than the Toxic Substances Control Act (TSCA) screening level of 50 mg/kg in soil
  - IMWP approved by KSCRT in March 2018 to excavate 20 areas with PCB contamination greater the RSCTLs but less than 50 mg/kg
- Soil IM (August/September 2018)
  - 2,328 tons of soil with PCBs (less than 50 mg/kg), TRPH, and/or dioxins/furans excavated and disposed of off site
- T-2 Area Investigation and IM (2018 to 2019)
  - Soil, groundwater, and concrete samples collected to delineate PCBs
  - IMWP approved by FDEP in September 2019 and EPA in October 2019

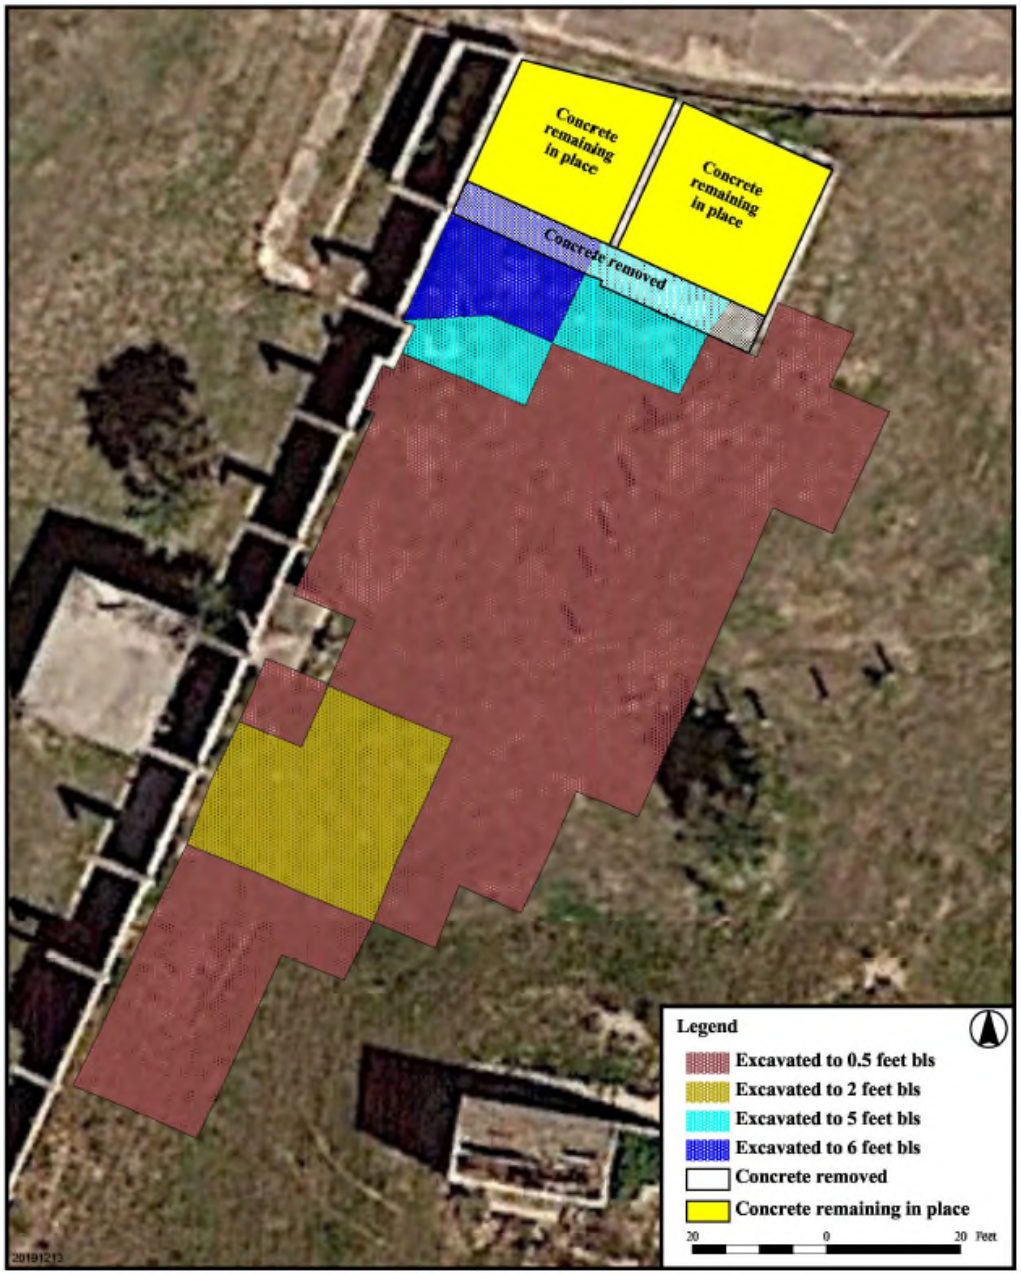
T-2 Area Investigation

Soil Re-assessment results identified PCB concentrations exceeding 50 mg/kg



- Assessment objectives adjusted to delineate to PCB Bulk Remediation Waste Cleanup Level for High Occupancy, Unrestricted Use (1.0 mg/kg) per PCB Generic Work Plan
- Interim Measures objective is to remove all soil exceeding 1.0 mg/kg that is accessible without altering the transformer bays and cable wall based on the National Historic Landmark status. Land Use Controls will be implemented to address contamination left in place and engineering control (fence)

View of LC34 from blockhouse, facing northeast



T-2 Area Investigation

- During Soil Re-Assessment, soil samples collected in front of transformer bays (PCBs > 50 mg/kg)
  - September 2014:
    - SB0005 = 6,050 mg/kg
    - SB0006 = 9.6 mg/kg
  - December 2014:
    - SB0107 = 20,900 mg/kg
- May 2018 – April 2019, a total of 529 additional soil samples and 25 concrete samples collected to delineate PCBs (including hold samples)
- Samples collected on a 10-ft grid
- All PCB samples extracted using Method 3540C (Soxhlet extraction)
- Delineation achieved to the PCB Bulk Remediation Waste Cleanup Level for High Occupancy, Unrestricted Use (1.0 mg/kg) per PCB Generic Work Plan

View of transformer bays, facing northeast

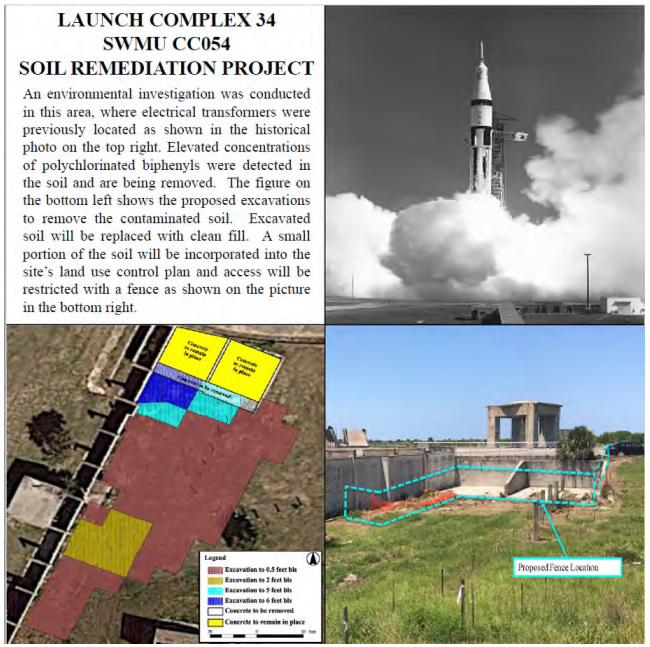
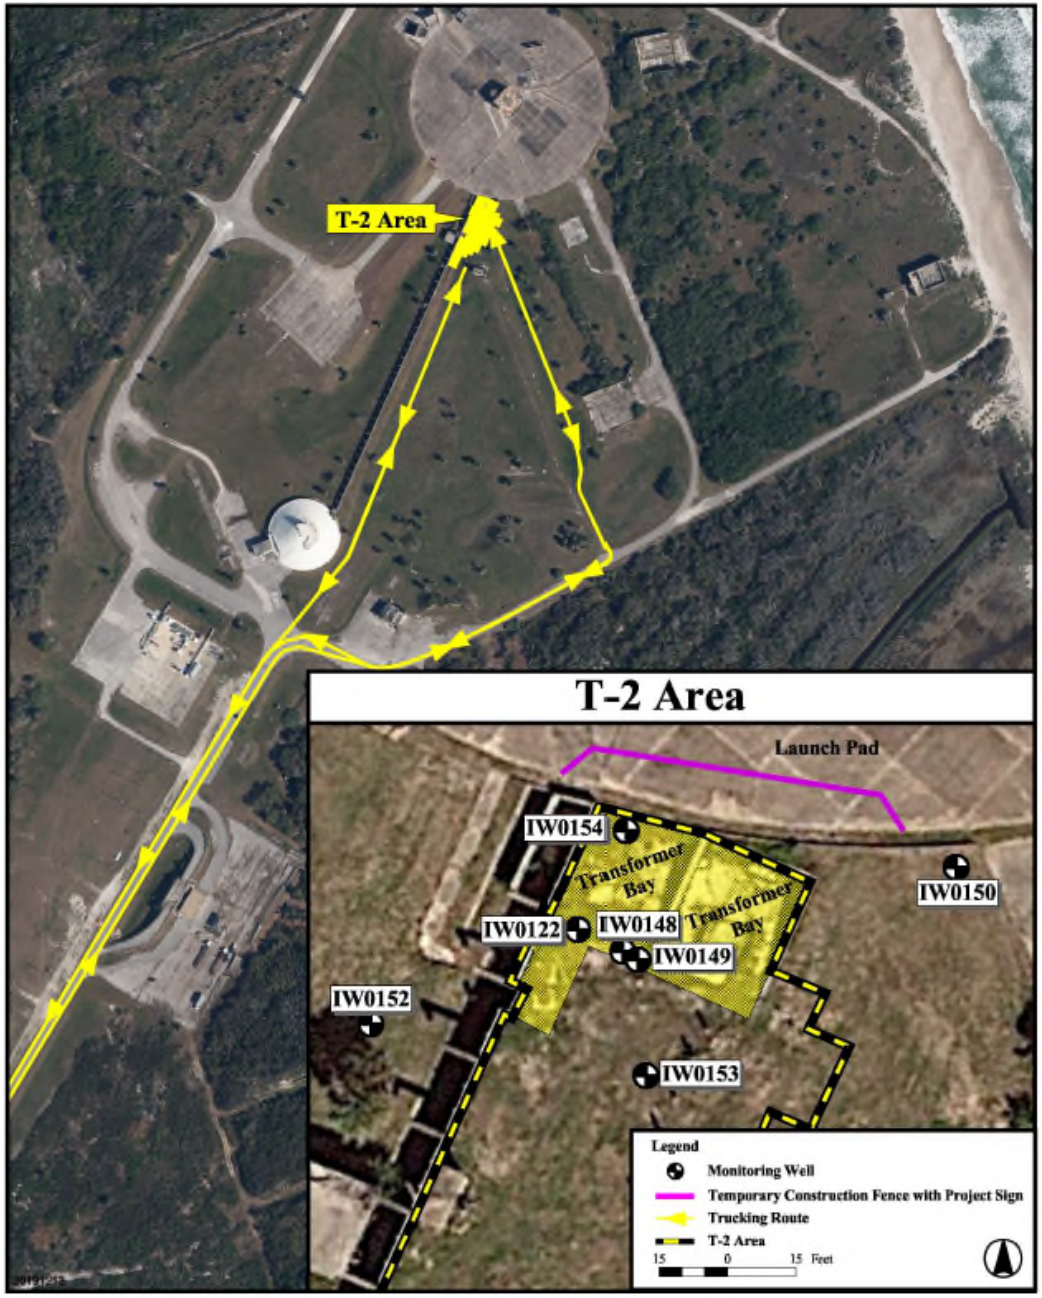
	18	218	8.2
4-5	19	921	34.2
5-6	20	410	15.3

Notes:



- Waste from grey areas are classified as PCB remediation waste ≥ 50 mg/kg
- Waste from unshaded areas are classified as PCB remediation waste < 50 mg/kg but >1 mg/kg



T-2 Area IM Overview

Task	Dates
IMWP Submission	August 12, 2019
Waste Profile Sampling	September 9, 2019
Monitoring Well Sampling	September 13, 2019
Informal Approval to Proceed from EPA	September 17, 2019
Nuts and Bolts Safety Kick-Off Meeting	September 23, 2019
FDEP Approval for IMWP	September 24, 2019
Concrete Surface Decontamination	September 24-25, 2019
Mobilization	September 26, 2019
Excavation	September 30 – October 7, 2019
PCB Remediation Waste T&D (JED Landfill)	October 2-8, 2019
EPA Formal Approval Letter for IMWP	October 3, 2019
Backfilling	October 4-10, 2019
TSCA Waste T&D (to Emelle Landfill)	October 9-23, 2019
Monitoring Well Installation	October 21, 2019
Restoration Inside Fenced Area	November 5, 2019
Fence Installation	November 21-26, 2019
Restoration	December 5, 2019
Demobilization	December 6, 2019

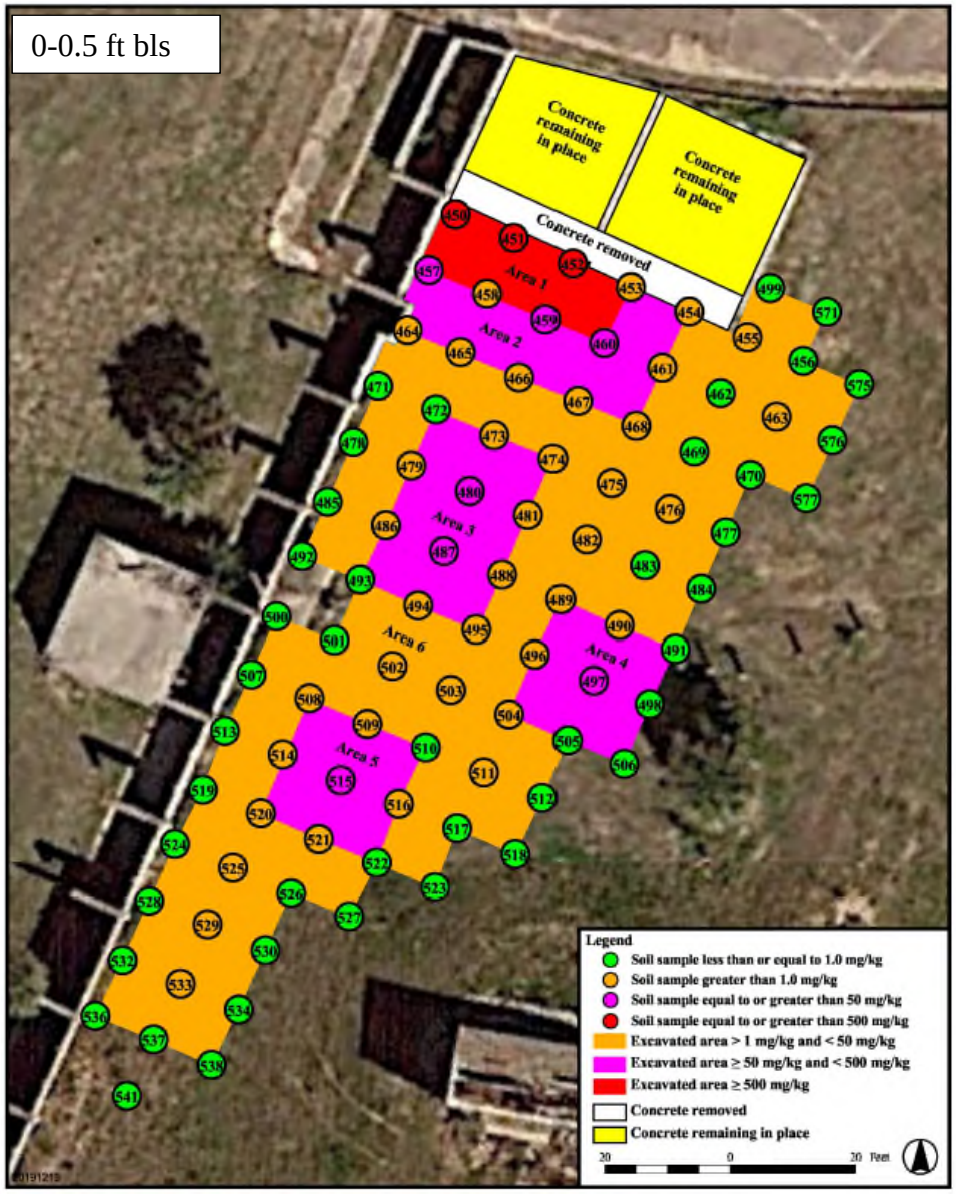
T-2 Area IM Implementation

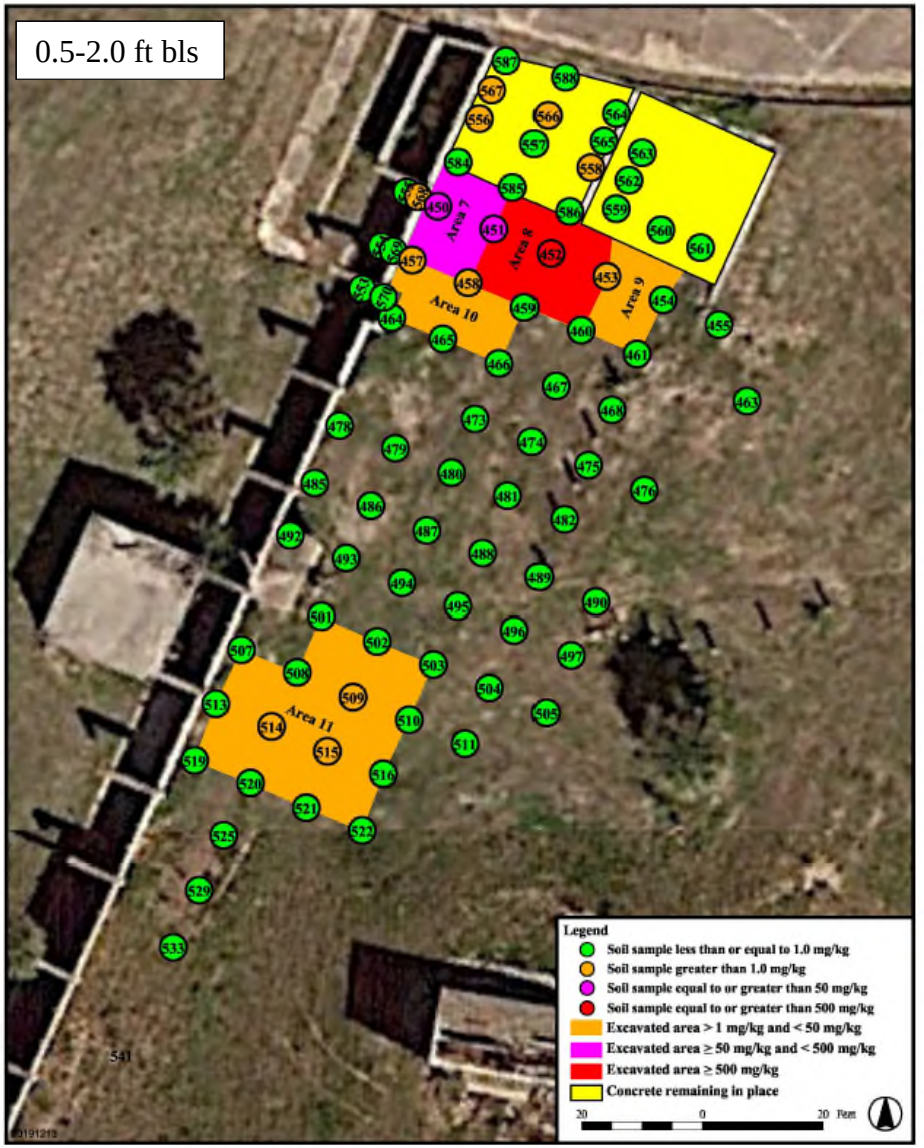
- Premobilization
  - Secured site access for field crew and subcontractors
  - Obtained all permits required by KSC Environmental Checklist
    - KSC Record of Environmental Consideration, Utility Locate/Excavation Permit, National Pollutant Discharge Elimination System (NPDES)
  - Project boundary set up to prevent tours from accessing T-2 Area
    - Project board sign to inform visitors of the activities occurring
  - Nuts and bolts meeting held on September 23, 2019
    - Field personnel, NASA Safety, NASA Remediation Project Manager

- Premobilization (con't)
  - Two composite samples collected to characterize waste for disposal in coordination with landfills
    - TSCA Waste – Chemical Waste Management Emelle Landfill (Emelle, AL)
    - PCB Remediation Waste – Waste Connections of Osceola County, LLC – JED Landfill (St. Cloud, FL)
  - Groundwater samples collected at IW0122 and IW0148 prior to abandonment during the excavation

T-2 Area IM Implementation

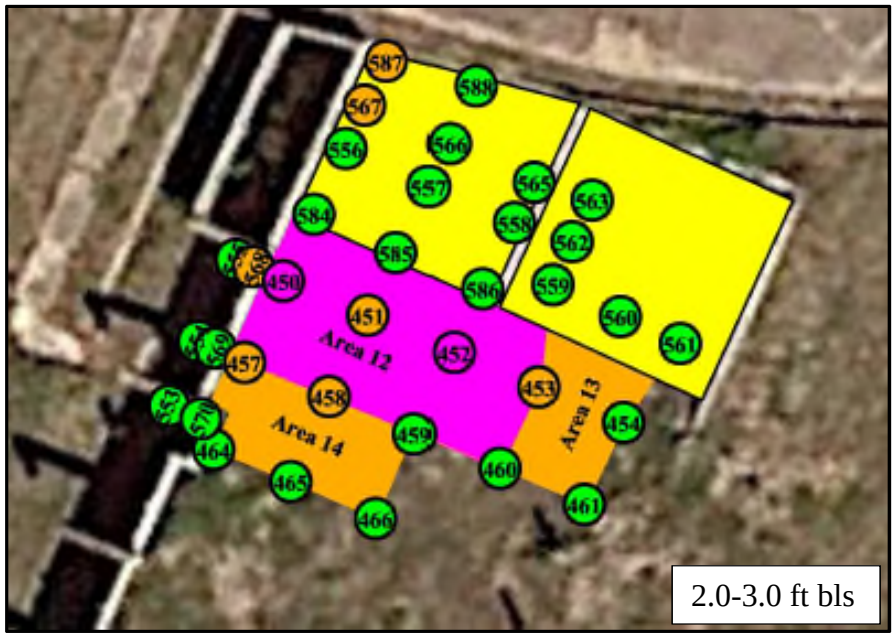
- Concrete Surface Decontamination on September 24-25, 2019
  - Portion of concrete transformer bay was removed as outlined in IMWP
  - Portions to remain, with PCBs greater than or equal to 50 mg/kg, were washed in accordance with *Subpart S—Double Wash/Rinse Method for Decontaminating Non-Porous Surfaces 40 CFR §761.375*
- All residual water, detergent, and solvent were vacuumed into drums and sampled for waste characterization and disposal
- Equipment mobilized to site on September 26, 2019

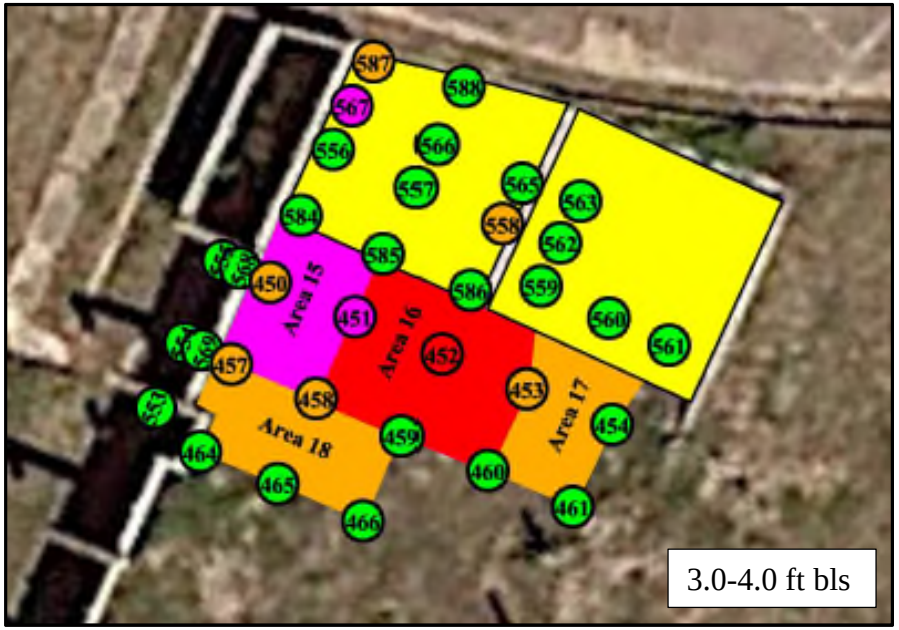


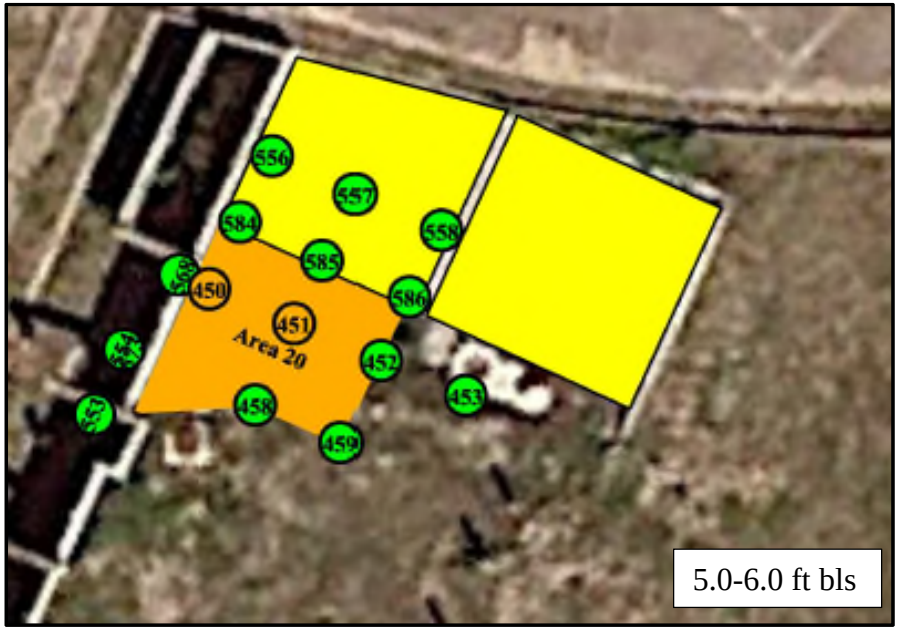


T-2 Area IM Implementation

- Excavation
  - Performed September 30 to October 7, 2019
  - Excavation details:
    - Approximately 6,800 ft^2
    - Depths varied from 0.5 to 6.0 ft bls
    - 116 tons with PCBs ≥ 50 mg/kg
    - 227 tons with PCBs < 50 mg/kg
  - Equipment used:
    - Mini-excavator
    - Mid-sized excavator
    - Hydraulic breaker attachment
    - Wheel loader
    - Skid steer
    - Water truck







Areas Excavated from Ground Surface to 2.0 feet bls

Areas Excavated from 2.0 to 6.0 feet bls

T-2 Area IM Implementation

- Disposal
  - 116 tons of TSCA waste (7 truckloads) sent to Emelle Landfill
  - 227 tons of soil (11 truckloads) sent to JED Landfill
  - Each truck inspected and manifested before site exit; weighed at landfill
- Backfilling
  - 14 truckloads of backfill soil
    - 6 inch lifts, starting with areas of deepest excavation
    - Lifts continued until ground surface was reached
  - 10 truckloads of topsoil were used for the final six inches of backfill
  - Fill materials sampled to verify they were certified clean

T-2 Area IM Implementation

- Monitoring Well Installation
  - A new monitoring well was installed on October 21, 2019 to monitor PCB concentrations in groundwater within T-2 Area
  - Replaced well IW0122, which was abandoned prior to excavation
- Fence Installation
  - To prevent potential PCB exposure due to the concrete transformer bays and soil under the concrete remaining in place with concentrations greater than 50 mg/kg
  - Prepared area for fence installation
    - Plastic sheeting was placed for weed control
    - 8 cubic yards of ¾-inch granite gravel
  - Chain-link fence installed on November 21, 2019
    - Fence buried 18” to present gopher tortoise entry
  - Large PCB Mark was placed on the gate and each transformer bay in accordance with *40 CFR §761.30(p) Continued use of porous surfaces contaminated with PCBs regulated for disposal by spills of liquid PCBs*

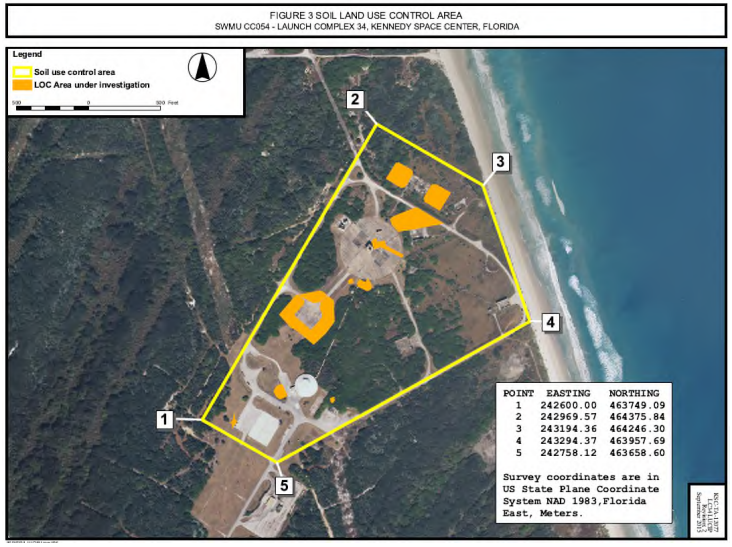
T-2 Area IM Implementation

- Restoration/Demobilization
  - Restoration activities completed various dates throughout November and December 2019
  - Sod was replaced on remaining disturbed area on December 5, 2019
  - Equipment, materials, and project support area were demobilized on December 6, 2019
- Reporting
  - IM Report for the T-2 Area scheduled to be submitted to EPA and FDEP in January 2020
  - Submitted within 60 days of completion of IM activities per EPA approval letter

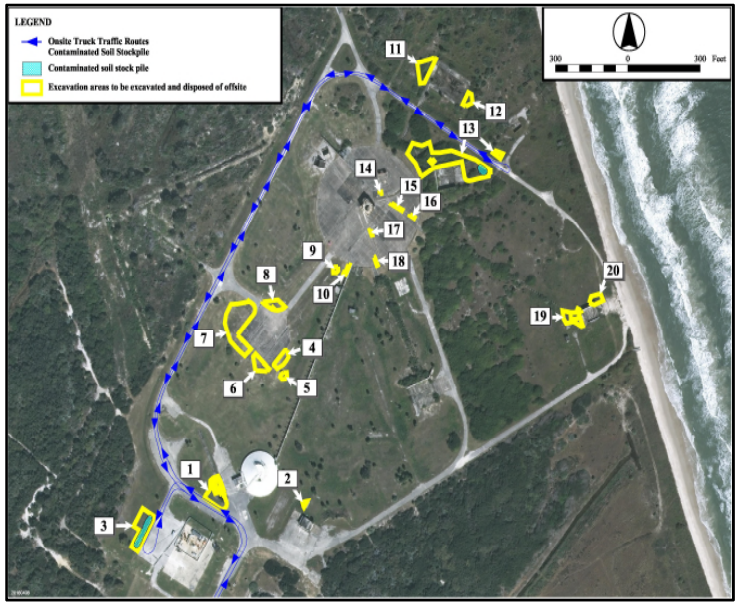
Lessons Learned

- Fence installation was delayed due to lead time for ordering materials; will place order sooner in the future

Conclusions



- Remediation of the T-2 Area has been completed in accordance with the risk-based approach outlined in the IMWP
  - Test Consensus: NFA for the 20 areas remediated during the T-2 Area IM
- PCB concentrations greater than the FDEP RSCTL of 0.5 mg/kg, but less than 1 mg/kg, remain in the soil at the T-2 Area in addition to the PCB concentrations greater than or equal to 1 mg/kg left in place at the transformer bays
- PCB concentrations in groundwater exceed the GCTL



Recommendations

- Newly installed monitoring well to be incorporated into the LC34 biennial long-term monitoring program as concluded during June 2019 KSC Remediation Team Meeting (1906-M13, 1906-D83)
- Revise the LUCIP

LUCIP Revision

- Existing LUCIP submitted during Soil Re-Assessment in 2015
- Site-wide soil IM conducted in Fall 2018
  - All 20 areas remediated
  - NFA achieved
- T-2 Area IM conducted in Fall 2019
  - Areas delineated to 1 mg/kg
  - Fence and signage installed as an engineering control to prevent potential exposure to PCBs left in place

LUCIP Revision

- Soil with PCB concentrations > 0.5 mg/kg and ≤ 1 mg/kg left in place outside of the fenced area
- A 95% Upper Confidence Limit (UCL) evaluation was conducted
  - 1 Exposure Unit < 1/4 acre
  - Intervals: 0-0.5, 0.5-2.0, and 2.0-4.0 ft bls
- Samples that were excavated, as well as non-detect results, were replaced with a concentration of 0.01 mg/kg and considered to be non-detected for the UCL calculations
  - All other sample concentrations were used as reported
- All calculated UCLs are less than 0.5 mg/kg

LUCIP Revision

- Summary tables
  - Calculated 95% UCL for 0-0.5, 0.5-2.0, and 2.0-4.0 ft bls
  - Samples left in place with PCBs > 0.5 and ≤ 1 mg/kg

Data Set	Frequency of Detection	Minimum Detected Concentration (mg/kg)	Maximum Detected Concentration (mg/kg)	95% UCL (Distribution) (mg/kg)	Statistic	Rationale
Surface Soil, 0 - 0.5 ft bls	30/85	0.0072	0.95	0.13 (G)	95% KM Approximate Gamma UCL	ProUCL 5.1.002
Surface Soil, > 0.5 - 2 ft bls	47/52	0.01	1	0.25 (AL)	KM H-UCL	ProUCL 5.1.002
Subsurface Soil, > 2 ft - 4 ft bls	17/20	0.02	0.58	0.23 (G)	95% KM Adjusted Gamma UCL	ProUCL 5.1.002

AL = Approximate Lognormal.
FDEP = Florida Department of Environmental Protection.
G = Gamma.
mg/kg = milligram per kilogram.
SCTL = Soil Cleanup Target Level.
UCL = Upper Confidence Limit.

Sample ID	Total Aroclor Result (mg/kg)
LC34-SB0459-002.0-20180531	0.97000
LC34-SB0461-002.0-20180531	0.52000
LC34-SB0486-002.0-20180605	1.00000
LC34-SB0487-002.0-20180605	0.65000
LC34-SB0492-000.5-20180606	0.54600
LC34-SB0502-003.0-20180814	0.58000
LC34-SB0503-002.0-20180720	0.81000
LC34-SB0505-000.5-20180720	0.51000
LC34-SB0517-000.5-20180720	0.82000
LC34-SB0526-000.5-20180731	0.95000
LC34-SB0537-000.5-20180731	0.51000

- Test consensus:
  - Calculated UCLs are less than the RSCTL of 0.5 mg/kg, therefore, the samples are considered safe to remain onsite and the area outside the fence can be eliminated from the LUC boundary.
  - LUC boundary to include PCB-contaminated concrete and soil left in place inside the fence.

APPENDIX D

INTERIM LUCIP

INTERIM LAND USE CONTROL IMPLEMENTATION PLAN

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
CAPE CANAVERAL AIR FORCE STATION
BREVARD COUNTY, FLORIDA

FACILITY:	Launch Complex 34 Solid Waste Management Unit CC054
CONTAMINANTS:	Volatile Organic Compounds (VOCs) and Polychlorinated Biphenyls (PCBs) in Groundwater, and PCBs in Soil and Concrete
CONTROL:	Prohibit Groundwater Use and Residential and Industrial Exposure to Soil and Concrete

PURPOSE OF LAND USE CONTROL IMPLEMENTATION PLAN

This Interim Land Use Control Implementation Plan (LUCIP) has been prepared to inform current and potential future users of Launch Complex 34 (LC34) of institutional and engineering controls that have been implemented at the site[1]. Although most areas at LC34 do not pose current unacceptable risks to human health or the environment, areas of soil with contaminant concentrations exceeding Florida Department of Environmental Protection (FDEP) residential, industrial, and leachibility Soil Cleanup Target Levels (SCTLs) and groundwater with contaminant concentrations exceeding FDEP Groundwater Cleanup Target Levels (GCTLs) have been identified. Institutional land use controls (LUCs) are necessary to prohibit groundwater use, and institutional and engineering LUCs are necessary to prohibit residential and industrial exposure to soils and concrete at the site. Controls will include periodic inspection, fence maintenance, condition certification, and agency notification.

WHY LAND USE CONTROLS ARE NEEDED

From 1960 to 1968, during National Aeronautics and Space Administration's (NASA's) Apollo Space Program, the LC34 launch pad was used for launching Saturn rockets. Launch operations included the storage, transport, and use of nitrogen, helium, liquid oxygen, RP-1 fuel, liquid hydrogen, hydrazine, and nitrogen tetroxide. Historical information suggests that rocket engines and other parts were cleaned at the site using solvent degreasers, most notably trichloroethene (TCE). It is speculated that releases of solvents occurred during cleaning operations through both intentional and unintentional discharges to nearby areas. Based on groundwater sampling data, these releases occurred primarily in the immediate vicinity of the Engineering Support Building (ESB). Chlorinated solvents are present in groundwater at trace to high concentrations in dissolved form, and TCE is also present as a dense non-aqueous phase liquid (DNAPL) in the former ESB area. Several investigations were completed at the site under the Resource Conservation and Recovery Act (RCRA) program, and contaminants of concern (COCs) were identified in groundwater at concentrations greater than FDEP GCTLs.

[1] *This Interim LUCIP summarizes institutional and engineering controls regarding the NASA LC34 site. For detailed information on the site, consult the LC34 administrative file, which is available for review by contacting the KSC Environmental Assurance Branch at telephone number (321) 867-6971.*

A site-wide soil investigation began in September 2014 to evaluate contaminants in soil resulting from former launch activities. The investigation confirmed the presence of COCs in soil at concentrations greater than FDEP SCTLs, and additional investigations were conducted to determine the extent of contamination.

SITE DESCRIPTION

Solid Waste Management Unit (SWMU) CC054 consists of the LC34 launch pad and associated facilities surrounded by grassy and dense forested areas. Following deactivation of the launch pad in 1968, LC34 has remained largely inactive, although several buildings remained operational. Most operational equipment, including service towers, fuel storage tanks, and piping, was dismantled and the majority of the on-site buildings and structures were abandoned in place. LC34 was declared part of the Man in Space National Historic Landmark in 1984.

A number of site groundwater investigations, engineering studies, and pilot-scale in-situ remedial technology demonstrations have been performed since site investigations initiated in 1993. A hydraulic containment system (HCS) is currently operating in the former ESB area to hydraulically contain and treat the DNAPL source zone and deep high-concentration plume with TCE concentrations greater than 300 micrograms per liter (µg/L). Groundwater extracted from the HCS is treated via air strippers and polished through liquid-phase granular activated carbon, as needed, to meet GCTLs prior to discharge into on-site injection wells and infiltration galleries. Off-gas laden with volatile organic compounds (VOCs) is treated through a catalytic oxidizer and scrubber system to ensure emissions are less than Hazardous Air Pollution (HAP) requirements specified in the KSC Title V Air Permit for Remedial Activities. Outside of the DNAPL source zone, air sparging is used to treat high concentrations of TCE daughter products. The primary groundwater contaminants at LC34 are TCE and degradation daughter products, including cis-1,2-dichloroethene and vinyl chloride. A small area within the VOC plume also contains PCBs in groundwater at concentrations greater than the FDEP GCTL.

Soil interim measures were conducted in 2018-2019 to excavate soils contaminated with PCBs, total recoverable petroleum hydrocarbons (TRPH), and dioxins/furans. All areas were remediated to the FDEP residential SCTL, with the exception of one area where a bank of electrical equipment was previously located near the launch pad. In this area, PCBs remain above the FDEP residential SCTL in soil and concrete; this area is also where PCBs are present in groundwater above the FDEP GCTL. PCBs are the only remaining COC in soil and concrete at the site.

SITE LOCATION

LC34 is located on Cape Canaveral Air Force Station (CCAFS) and is bordered by the Atlantic Ocean to the east (Figure 1). LC34 is found in Section 6, Township 23S, Range 38E, as shown on the 7.5-minute False Cape topographic quadrangle map. The groundwater land use control area covered by this Interim LUCIP is shown on Figure 2. Figure 3 shows the soil excavation areas completed in 2018-2019. All excavation areas were remediated to the FDEP residential SCTL, with the exception of one area near the launch pad where PCBs remain in soil and concrete above the FDEP residential SCTL. The remaining soil and concrete land use control area covered by this Interim LUCIP is shown on Figure 4.

Coordinates of the corners for the groundwater, and soil and concrete LUC areas are provided on Figures 2 and 4 in the State Plane Coordinate System, North American Datum (NAD) 1983, Florida East, meters.

SITE CONTAMINATION AND CONTROL

Groundwater at the site contains VOCs and PCBs at concentrations greater than FDEP GCTLs. Soil and concrete in one area at the site has concentrations of PCBs greater than residential, industrial, and leachability SCTLs. The soil LUCs are located beneath a concrete bay where electrical equipment was previously located, and the concrete LUCs are associated with the concrete bay itself and a concrete footer for an adjacent cable tray wall. The soil and concrete was left in-place using a risk-based approach under 40 CFR 761.61(c) *(PCB remediation waste; Risk-based disposal approval)* due to the site's National Historic Landmark status. A fence is being used as an engineering control to prevent exposure to PCBs in soil and concrete in this area (Figure 4). Soils outside of the fenceline were removed or evaluated using a risk-based 95-percent upper confidence level (UCL) approach and are not part of the LUC.

The past, current, and projected future land use of LC34 is industrial in nature. Because concentrations of VOCs and PCBs in groundwater exceed GCTLs, and concentrations of PCBs in soil and concrete exceed residential, industrial, and leachability SCTLs, LUCs are required to prohibit the use of groundwater and to prohibit residential and industrial exposures to soil and concrete until cleanup levels are achieved. The current and projected future use of LC34 does not include the use of site groundwater; therefore, there are no current or projected exposures to contaminants in groundwater. Prior to any construction activities that may occur within the groundwater land use control area, potential exposure issues (i.e., from dewatering) and management of exposed groundwater will be evaluated. Indoor air quality will also be evaluated prior to any construction within the groundwater use control area.

DECISION DOCUMENT

The Kennedy Space Center (KSC) Remediation Team determined that interim institutional and engineering controls should be implemented at LC34 while investigation, interim measures, and corrective measures are in progress.

IMPLEMENTATION

Institutional and engineering controls will be implemented by the KSC Environmental Assurance Branch in accordance with their RCRA permit and Land Use Control Assurance Plan included in a Memorandum of Agreement (MOA)[2] between NASA, FDEP, and United States Environmental

[2] *By separate MOA effective February 23, 2001, with the EPA and FDEP, KSC, on behalf of NASA, agreed to implement Center-wide, certain periodic site inspections, condition certification, and agency notification procedures designed to ensure the maintenance by Center personnel of any site-specific LUCs deemed necessary for future protection of human health and the environment. A fundamental premise underlying execution of that agreement was that through the Center's substantial good faith compliance with the procedures called for herein, reasonable assurances would be provided to EPA and FDEP as to the permanency of those remedies which included the use of specific LUCs.*

Although the terms and conditions of the MOA are not specifically incorporated or made enforceable herein by reference, it is understood and agreed by NASA KSC, EPA and FDEP that the contemplated permanence of the remedy reflected herein shall be dependent upon the Center's substantial good faith compliance with the specific LUC maintenance commitments reflected herein. Should such compliance not occur or should the MOA be terminated, it is understood that the protectiveness of the remedy concurred in may be reconsidered and that additional measures may need to be taken to adequately ensure necessary future protection of human health and the environment.

Protection Agency (EPA), effective February 23, 2001. Property transfer (if conducted in the future) will be conducted in accordance with Section X of the MOA.

KSC's Environmental Assurance Branch will provide KSC's Master Planning Office and CCAFS Installation Restoration Program with survey coordinates of the LC34 LUC areas. Restrictions will specify limitations on development and reuse for the area for as long as LUCs are necessary to protect human health and the environment.

MONITORING

Quarterly inspections to monitor that the LUCs specified herein are in place and operating will be conducted by KSC's Environmental Assurance Branch. The inspections will verify that no groundwater use or residential or industrial exposure to soil and concrete is occurring at the site.

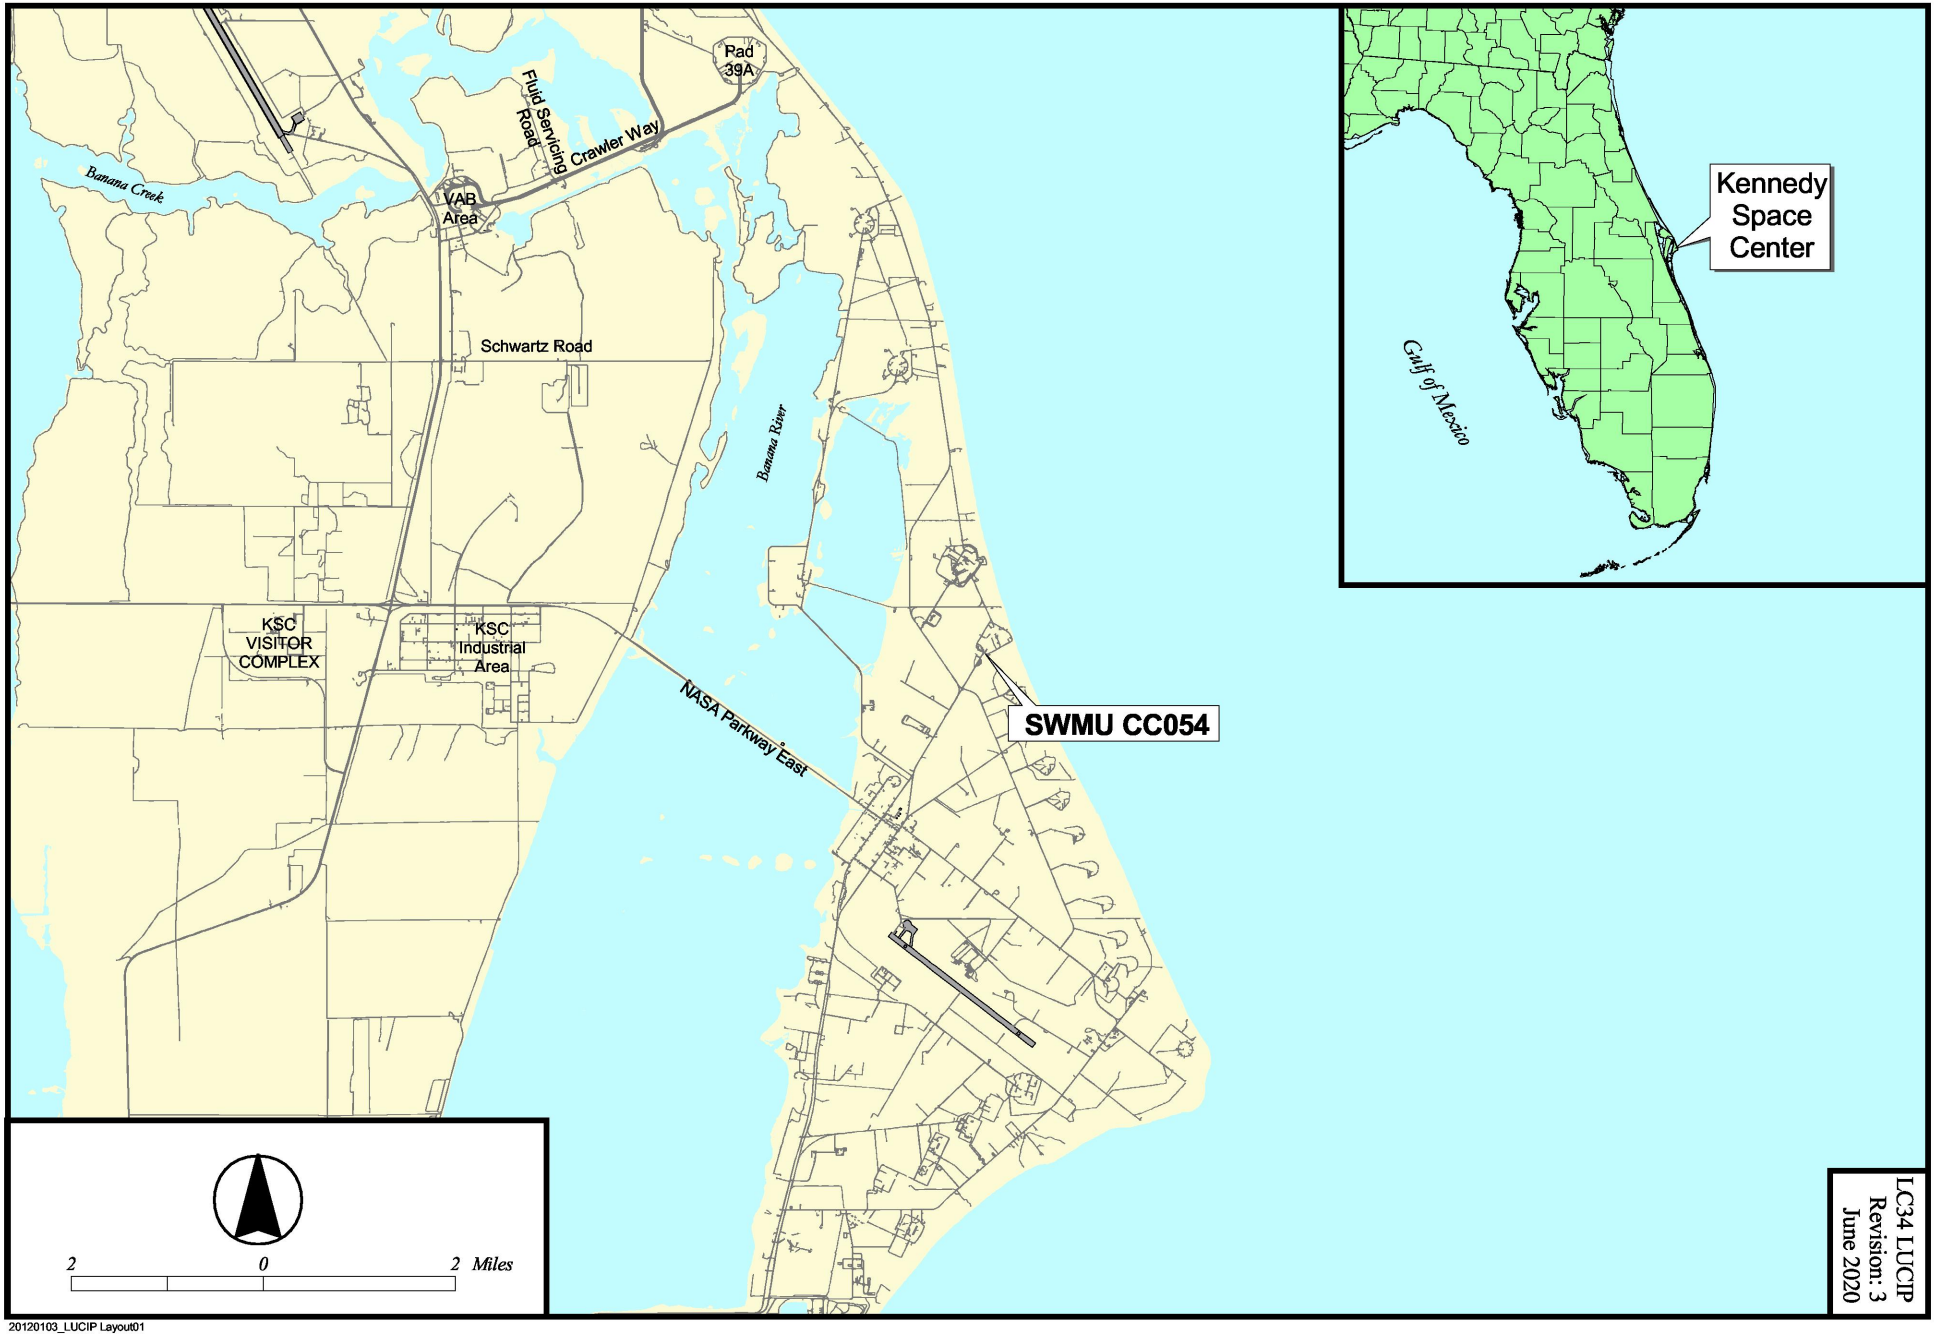
REPORTING

KSC's Environmental Assurance Branch will submit annual reports to FDEP certifying retention of the implemented LUCs.

ENFORCEMENT

KSC's Environmental Assurance Branch will be responsible for stopping any activities that are not compliant with this Interim LUCIP.

MAINTENANCE



The Interim LUCIP shall remain in place until a land use change is implemented or the concerns managed by the Interim LUCIP are mitigated; or until there is a discovery, based on analytical evidence, that scenarios managed by the Interim LUCIP are no longer a concern.

SITE-SPECIFIC DOCUMENT REFERENCES

Site-specific documentation is available for review by contacting the Environmental Assurance Branch at telephone number (321) 867-6971.

Project: LCP4 Date: 6/24/05
Project No.: FA0552 Task No.:
Contractors: Precision Sampling – Mike Fraer, Throw Stanford, Chris Harrell, Bill Hammond, Ray Aldave

Work Performed

Well Installation:
Soil Borings:
DPT:
Well Inventory:
Other: X MIP/CPT/cone sipper

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0600 – @ office – calibrate YSI
0700 – on-site – call Duty office → ok to dig
– brought out on CCAFS – crew delayed

First location → btwn IW42D1 & IW65D1 → directly ~~directly~~ next to IW42D1 – ~~MP001~~ MP001 (starting number)
run

→ start MP001 @ ~ 0930 completed logging @ ~1130
response ~18-24 ft & 65-80 ft
– no cone sipper sample b/c didn't have regulator for gas connection

1030 Security onsite to inform us they will be securing 34 area tomorrow → no one onsite → leave vehicles on slab of ESD building

1230 – left site for lunch | ~1310 return from lunch

Plans/Future Activities

MP002 → ~ 10ft btw MP001 towards IW0065D1
~1545 finished logging MP002 → heater for manual dipped wiring @ end of log → pulling rods up to investigate cause
– System down – water line broken → will be up & running on Thursday
– Grouted MP001 hole → left site ~ 1900

Signature/Date 6/24/05

Project: LCJ4 - Hot Spot Date: 6-26-08
Project No.: PO0552 Task No.:
Contractors: Precision Sampling - Mike Fraser, Dason Shuford, Chris Howell, Bill Hammond, Ray Alvarez

Work Performed

Well Installation:
Soil Borings:
DPT:
Well Inventory:
Other: MIP/CPT/DPT groundwater

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0700 - On site - Precision crew here
0720 - Called Duty office - ok to dig
- Set up on hole @ hot spot 4 - MP003
~10ft from IW 02D (west/southwest)

- MP004 → ~30-40ft towards ESD from MP003

Angel onsite ~1030

- MP005 → ~30 ft away from ESD & 30ft from MP003
→ DPT0067 → between MP003 & MP004 15ft, 30-34, 41-45
13:00 Rebecca leaves site
13:30 Jim leave site
15:30 Jermany leaves site
19:30 Angel & crew leave site
crew refuels one truck & brings it back

Plans/Future Activities

- start w/ DPT0067 (done) start w/ DPT 0066

Project: LCJ4
Project No.: FO0552
Date: 07/01/08
Task No.:
Contractors: Precision Sampling – Mike Fawl, Theron Stanford, Chris Howell, Bill Hammond, Ray Alfaro

Work Performed

Well Installation:
Soil Borings:
DPT:
Well Inventory:
Other: X MIP/CPT DPT GW sampling

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Influent sample IS-3-B
Effluent sample ES-2-B

Observations/Issues of Concern

0600 @ office – review samples, calibrate equipment, pack truck
0710 – onsite – Precision here
- hand augering MP013 location → on side of road off parking lot for ESB → hit cable – called Pete Naswadley & said nothing in here we are ok → He located area on NE corner of ESB slab where we removed the Brazilian pepper
- called Duty office 853-5211 – ok to dig
- ~0800 – driller powered driver into hydraulic fluid tank on DPT rig → rig down → taking it back to the shop (ORLANDO)
- reamed location for Hotspot 2 so we can make a ramp
- MIP down ~ 0830 → heating block needs repair
- took influent readings from air shipper ~0930
- added Decon wash to drum # 157259 on pallet # 157260
- 1130 – left site for lunch, MIP rig still down – onsite 1200

Plans/Future Activities

- spill pallets have holes in bottom → ID# 145995
  ID# 146000
  – 3 pallets w/ nothing on it
  – ID# 157260

1100 - set up on MP015 ; lows - Mike left site to pick up System Samples lunch → 1100 Mike returns to site
- MIP down - leak in system (1100) → bad heater block → need Geoprobe tools
- moved location MP016 to end of trench down off of slab
1500 - Chris & Thrown back onsite w/ rig & Geoprobe parts
- no MIP today will rebuild heater blocks so we have two for tomorrow

Plans/Future Activities

- collected final two samples (70-74) & 76-80 from DPT069
- total of 18 samples to ALF → 5 from pump test
- holding 4 samples on ice until Monday - 2 DPT
- Need to grout MP011, MP012, MP013, MP014, DPT069 - 1 RW 2 - 1 Effluent
- Left site 1830 - Mike, Chris & Bill onsite to continue repairing MIP

GeoSyntec Consultants **DAILY FIELD REPORT** Page 1 of 1

Project: LC34
Project No.: FØ552
Date: 7/3/08
Task No.:
Contractors: Precision Sampling - Mike Fraser, ~~Ray Gilmore~~, Bill Hammond, Theron Stanford, Chris Harrell

Work Performed

Well Installation:
Soil Borings:
DPT:
Well Inventory:
Other: X MIP/CPT

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0600 - @ office, calibrate equipment & fill samples, pack truck
0700 - on site - precision here - MIP repaired - starting w/ MP015
- DPT crew grouting holes
- called Duty office - ok to dig 0741
0740 - Collected Samples from pump test - influent IS-4-B-vial 25 0750
0755 effluent EC-8B - vial ~~23~~ 24
RW3 vial 25 & vial 27 - RW1, RW2, ~~RW3~~ (vial 26) 0745
1015 - set up on MP016 → end of trench drain - hottest location
~~IP~~ - next location between TW47 01 & TW49 cluster
1230 - left site for lunch
1250 - back onsite - called NOC weather phase II issued
- MIP down - cannot get trunk line flushed out → ECD detector still high → will have to zero out detector readings during next MIP - (using MeOH & hexane to flush lines)

Plans/Future Activities

1420 - phase II over → meeting up on MP016
1430 - Mike Deitz onsite - talked about plan for next week
~1535 - Mike Deitz offsite
Mike wanted us to step out in a grid from MP011 & MP014 on Monday morning - collect a shallow (10'), intermediate (20-25'), deep (45?)
- MP018 - on slab btwn PA110, PA109 & PA118

7/3/08
Signature/Date

- truck died ~7pm → left site 1900
- flow samples based on MP

Project: LCM
Project No.: FO9552
Date: 07/07/08
Task No.:
Contractors: Precision Sampling – Theron Stanford, Chris Harrell, Bill Hancock, Thomas Jones
EDS – Chris Phelps + Keith Otis ALF – Dale Schamp

Work Performed

Well Installation:
Soil Borings:
DPT: X GW
Well Inventory:
Other: X MIP/CPT

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0700 – Onsite – called daily office 0600 @ office calibrate equipment
0710 – Theron Stanford onsite Horiba pH meter not functioning
0720 – Chris Harrell onsite – crew will be late here ~ 9am
– begin pressure grouting old MIP locations
0750 – EDS onsite
0800 – Alex onsite
DPT 0700 – 6-10, 23-27, 38-42 ; based on MIP – 16-20, 56-60, 62-66, 76-80
– other precision crew member check @ badging station
No information submitted ; NAVFAC RPPOC in meeting?
0955 – ALF onsite
1000 – talked to Mike Bellz – submitted badging form + OK w/ sampling intervals
1140 – Chris, Keith, Alex, Horiba off site for lunch
1215 – returned to site – other precision team member on site – TJ
1615 – grout pump shows up @ badging station (closed) – Chris + Theron leave site to pick up pump

Plans/Future Activities

DPT sampling intervals – 6-10, 23-27, 38-42 based on CHS

DPT 0702 071 – 100 ft east from MP011 + MP014

1720 – Theron + Chris back onsite w/ grout pump
1745 – Chris + Keith leave site (collected 14 DPT samples)
1920 – both grout pumps locked → do not have 4 sets of screws
– leaving site

Project: LCD4 Date: 07/08/2008
Project No.: FO0552 Task No.:
Contractors: Previsic Drilling - Giovanni Botteo, Chris Hoyell, Bill Hancock, Thomas Jones, Trevor Stanford
EDS - Chris Phelps + Keith Olsen / ALF - Dale Stamp

Work Performed

Well Installation:		Sampling Soil:	
Soil Borings:		Sampling SW/Sediment:	
DPT:	X GW sampling	Sampling Monitor Wells:	
Well Inventory:		Sampling Hazardous Waste:	
Other:	X MIP/CPT	Sampling Drums:	

Observations/Issues of Concern

0545 - @ office calibrate equipment & pack vehicle
0700 - on-site - Previsic sampling onsite already
- called duty officer - OK to dig - Mayra onsite
0715 - EDS onsite
DPT 072 & 073 - 100 ft- shpoints from DPT 070 & 071
sampling intervals 16-20, 22-27, 56-60, 62-66, 76-80
- Not doing 6-10 or 32-42 based on data from yesterday (clean)
0825 - called Mike Deliz & left message about sampling intervals & locations
MP021 - ~100ft off corner of slab in direction of MP015 (in area that was cleared)
Attempted to grout MP015 - grout pump broke ~0930
1000 - ALF onsite
1145 - left site for lunch
1210 - back onsite
1400 - Mike Deliz onsite - discussed MIP plan for tomorrow -
1130 - Mayra & EDS offsite for lunch
1210 - Mayra & EDS onsite

Plans/Future Activities

will have on samples on slab - 3 MP samples
phase II ~1800 → over ~30min
1715 left site
16 DPT samples to ALF DPT 073, DPT072, DPT074, DPT075 (1 sample)

GeoSyntec Consultants **DAILY FIELD REPORT** Page 1 of 1

Project: LCJ4 Date: 07/09/02
Project No.: FØØ552 Task No.:
Contractors: Precision Sampling - Thomas Stanford, Giovanni _____, Thomas Jones, Bill
EDS - Chris Phelps & Keith Olsen ALF - Dale Schamp, Chris Harrell

Work Performed

Well Installation: _____
Soil Borings: _____
DPT: X GW sampling
Well Inventory: _____
Other: X MIP / CPT

Sampling Soil: _____
Sampling SW/Sediment: _____
Sampling Monitor Wells: _____
Sampling Hazardous Waste: _____
Sampling Drums: _____

Observations/Issues of Concern

0600 - @ office - calibrate equipment → email new data out
0715 - on site - precision sampling here (granted MP021)
- boring locations on slab
started DPT076 in woods on "road" ~ ft from MW52
Margo continuing step outs from MP011 & MP014
0930 - ALF on site
MP023 on slab (MP024 + MP025 on slab)
~1145 - left site for lunch
~1320 - left site

Mike Bellis on site to pick new locations

Plans/Future Activities

MIPs remaining to grant MP020 (trim); MP015, MP016, MP018 (on slab) → transducers

complete DPT076, DPT078, DPT077, DPT075
started DPT079 (20 samples for PST to mobile lab; 6 from air sparger system)
completed MP023 - MP025

Project: FO 0552 LC34 Date: 7-10-08
Project No.: Task No.:
Contractors: Precision sampling (Ground water) - EDR EDS - Chris Philp & Keith Olive Thrasher Shepherd, Bill Hannah ALE - Dale Schamp

Work Performed

Well Installation:
Soil Borings:
DPT: 079, 080, 081
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0600 @ office - calibrate equipment
0730 onsite drillers & mobile lab not on site & called duty station
Ground water protection
drill rig had to be jumped, hand auger 3 holes for DPT80
10:00am mobile lab onsite after fixing 2 flat tires
1215 - Angel offsite 1145 - Rebecca onsite
1300 - called Paul Bynam w/ Hyatt - will take generator off the shoulder tomorrow @ end of day but can't pick up until Mon or Tue
- Pam called Glover Oil & will pick up the AST tomorrow afternoon after 3pm
- left site ~ 1930

Plans/Future Activities

Completed DPT 079, DPT080, DPT081, DPT82, (21 samples)
shoot DPT080

GeoSyntec Consultants **DAILY FIELD REPORT** Page 1 of 1

Project: LC-34
Project No.: FO 0552
Contractors:

Date: 7-14-08
Task No.:

Work Performed

Well Installation:
Soil Borings: (67-71)
DPT: 088, 089, 085, 091
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0630 Myra & Angel at office to cal. equipment
0745 onsite Precision here, Renagade badgering issues
0830 Mobile Lab onsite
0915 Renagade drilling onsite

6:30 Renagade left
6:50 Precision, Myra & Angel left

- Glover on site to remove trunk - too much shrivel in trunk - spoke w/ Dan about it in the morning - decided to try to pick it up w/out pump truck - damaged side of AST

Plans/Future Activities

Grout 089 finish 091

- gave 12 samples to ALF

Angel Mata 7-14-08

GeoSyntec Consultants **DAILY FIELD REPORT** Page 1 of 1

Project: LCD4
Project No.: FOP552
Contractors: Renegade - Brett & Matt
Groundwater Pro: Dill Hammad, Throw Stanford ALF - Duke Schrimp
Date: 7/15/05
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT: 8 GW samples
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0600 - @ office calibrate equipment, load cars
0705 - on site - called duty office - ok to dig
- Renegade on site - Dill on site - 0725 - Throw on site

- DPT092 - location C on proposed sampling location map
- Maps finishing DPT091 - doing DPT075-069.0 & DPT090
- 0900 - ALF on site
- 1120 - called Mike w/ Precision to find out about second DPT rig/crew to grout holes on slab - left message
- 1230 - left site for lunch
- 1300 - back on site - Deanne badging Sasha (ant cleaning profile for tomorrow - should be on site ~ 1400
- 1345 - phase II
- 1415 - phase II over
- 1600 - phase II ⇒ 1700 phase II over
- 1645 - Throw & Dill off site
- 1700 - Off site

Plans/Future Activities

- Finish DPT093 (71-75 & 76-80)
- Finish DPT094 (56-60; 62-66; 71-75, 76-80)

- Completed DPT092, DPT090, DPT091, ⇒ (20 samples to ALF?)
Started DPT094 & DPT093

Project: FORMER 552 5 Date: 7/16/08
Project No.: 6624 Task No.:
Contractors: GROUNDWATER PROTECTION - THERON STANFORD, BILL HAMMOND
RENEGADE - ~~BILL~~ MATT ALF - DALE SCHAAP
SANTA CRUZ - JAKE

Work Performed

Well Installation: _____
Soil Borings: _____
DPT: X GW SAMPLING
Well Inventory: _____
Other: _____

Sampling Soil: _____
Sampling SW/Sediment: _____
Sampling Monitor Wells: _____
Sampling Hazardous Waste: _____
Sampling Drums: _____

Observations/Issues of Concern

0600 - at OFFICE Calibrate eq - path (ok)
0710 - onsite - Bill already onsite ; 0720 - RENEGADE ONSITE
0720 - Called duty office - OK to dig
Finish DPT 093 & DPT094
DPT095 = location F on map DPT096 = location O on map
0815 - SANTA CRUZ ON SITE - began clearing
0820 - spoke w/ Mike about clearing → concerned about shallow TCE @ DPT092
0930 - spoke w/ Mike Fraser → subcontracting Zebra to pressure grout on Friday - 3 man crew w/ Rig & pressure grouter
1235 - off site to lunch (Bill, Rebecca, Matt, Maya &
1310 - back onsite
1600 - left site

Plans/Future Activities

Completed DPT093, DPT095, DPT094, DPT096 (IR samples to Dale)

MARK MAHONEY

Work Performed

Well Installation: Sampling Soil:
Soil Borings: Sampling SW/Sediment:
DPT: X Soil Sampling Sampling Monitor Wells:
Well Inventory: Sampling Hazardous Waste:
Other: Sampling Drums:

Observations/Issues of Concern

0600 - @ office calibrate eq, email data partner
0710 - onsite - SANTA CRUZ ONSITE ; BELL ONSITE
0720 - RENEGADE ONSITE
0730 - called duty office ON to dig
DPT098 - @ location M on map - Mayra starting there
traveling DPT097
0930 - ALF onsite
1030 - ALF offsite generator problems - will run samples tonight
1145 - ALF back onsite
1300 - Groundwater protection rig down - hydraulic line rubbing on side of mast - will replace line
Zeba will perform sampling tomorrow for provided → need to get crew to grout still
phase II 1700 → left site

Plans/Future Activities

GROUNDWATER PROTECTION PICKED UP 3 SPILL PALLETS FOR US THIS MORNING
put air stripper systems in storage area
completed DPT097, DPT098, DPT100 - (14 samples to Date)

GeoSyntec Consultants **DAILY FIELD REPORT** Page 1 of 2

Project: LCOA
Project No.: FO0552
Contractors: RENEGADE – Matt Harry, Mark Medley ALF – Pete Schamp
Zebra – Walter Moon, Josh Dumas
Date: 7/12/05
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT: GW sampling
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0600 – @ office calibrate equipment, pack cars
0700 – onsite – 0710 called dusty office – on to dig
0715 – called Utility locators – Pete – will be onsite to approx cleared areas ~ 1000
0710 – Renegade onsite
~0900 – Spoke w/ Kim from Hertz – will pick up generator on Tuesday
~0910 – Zebra onsite – precision working @ wrong building station – miscommunication (rig 7720)
0920 – called Glover oil – Dan out of office today – call back Mon morning
Myra showed DPT101 – location B on map
Finishing DPT097
0930 – PR&D onsite – reducing soil in drums to 67% + emptying carbon vessel
1010 – sent PR&D to Williams Corner to pick up 3 water drums from EPS

Plans/Future Activities

1010 – ALF onsite ; 1215 – ALF offsite – 1400 ALF onsite
1215 – left site for lunch – 1300 returned to site
1300 – Pete & Shawn onsite to utility locate newly cleared area – everything clear
~1400 – PR&D offsite – ~1500 PR&D back onsite
~1645 – PR&D offsite – will return Monday to finish carbon vessel

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

1645 - Phase II - 1720 phase II complete
1900 - PRMD did not clean up site - left open drums & drums off of spill pallets - also cigarette butts & trash - left message w/ him
~2000 - left site

Plans/Future Activities

- reissue badges for Precision - Devon, T.J. & Chris (expire 7/20)
- need to prepare work drums & label
- Completed DPT07, DPT 102, DPT 103 & DPT 101 (20 samples to Date)

Signature/Date 7/15/05

GeoSyntec Consultants **DAILY FIELD REPORT** Page 1 of 1

Project: LCP4 Date: 7/22/08
Project No.: FØ552 Task No.:
Contractors: EDS - Chris Phelps, Keith Olsen ALF - Dale Schamp
Rewigade - ~~George~~ Jorge Dasgue, Louis Salgado

Work Performed

Well Installation:
Soil Borings:
DPT: X GW sampling
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0600 - @ office - calibrate equipment, email data, pull cores
0700 - onsite - called duty office - OK to dig
0730 - EDS & Rewigade onsite
1130 - EDS & Nayra offsite for lunch; 1205 - EDS & Nayra back onsite
1205 - Rebecca & Rewigade offsite for lunch - 1225 - Rebecca & Rewigade onsite
1240 - ~~Heft~~ picked up generator
1320 - Phase II → over 1420
Nayra & EDS in ~~hot~~ spot one (DPT108 & DPT110)
1730 - EDS offsite
1745 - Rewigade & Rebecca offsite

Plans/Future Activities

DPT104 completed (rock sample @ 69') ; DPT107 completed (64', 69', ~~75'~~ 73', 80')
DPT108 completed ; DPT109 completed & DPT110 completed
21 samples to Date

* post sampling out of tubing

GeoSyntec Consultants **DAILY FIELD REPORT** Page 1 of 1

Project: LCQ4 Date: 7/20/05
Project No.: FQ0550 Task No.:
Contractors: EDS - Chris Phelps, Keith Olsen ALF - Dale Schamp
Renegade - Louis Salgado, Jorge Borjas

Work Performed

Well Installation: Sampling Soil:
Soil Borings: Sampling SW/Sediment:
DPT: X GW Sampling Sampling Monitor Wells:
Well Inventory: Sampling Hazardous Waste:
Other: Sampling Drums:

Observations/Issues of Concern

0600 - @ office calibrate equipment - email data - pack cars
0710 - onsite - called duty office - ok to dig
0720 - Renegade & EDS onsite
Hazes @ DPT 111 colocated w/ MP004
Reb - DPT 112 - east side of slab btwn PA120 & PA090
- closer to 90 due to large tree
0900 - ALF onsite
1115 - EDS & Hazes to lunch → back 1150
1190 - Renegade & Reb to lunch → return 1230
1230 - Called Glover oil again & left message w/ Dan about AST
1330 - Dan called & will pick up AST on Thurs or Fri
1345 - Dan onsite to EDS locations - offsite ~1445
1700 - Louis diabetic → sugar too high & light headed
1720 - offsite - phase II

Plans/Future Activities

Completed DPT 111, 112, 113, 114 - 27 samples to Dale
Started DPT 116, 115

Signature/Date 7/20/05

Project: LC24 Date: 7/24/08
Project No.: F00552 Task No.:
Contractors: EDS - Chas Phelps + Heath Oliver ALE - Dale Schamp
Renegade - Jamie Delgado, Jorge Barajas

Work Performed

Well Installation:
Soil Borings:
DPT: GW sampling
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0600 - @ office calibrate eq, email data + pack cars
0700 - on site; called duty office - OK to dig
0725 - EDS on site 0730 - Renegade on site
- Rayra completing DPT 116 - Reb completing DPT 115
- Reb sampling DPT 117 - 12 weeds
- Rayra sampling DPT 118 & DPT 119 1st hot spot 1
~1145 Rayra + EDS → lunch → 1250 back on site
- 1220 Renegade & Reb offsite lunch → 1240 back on site
- 1800 EDS offsite
1820 - Rayra offsite
- 1845 - Rebecca offsite / Renegade

Plans/Future Activities

Completed DPT 116 (62-66) (67-71) (71-75) (76-80) ✓
Completed DPT 115 (71-75, 76-80); DPT 117 - (12 weeds) ✓5
Completed DPT 118 (hot spot 1) ✓; DPT 119 (hot spot 1) ✓5
Collected Sample DPT 75 (67-71) ✓; DPT 120 - no soft sample ✓4
b/c surrounded by locations w/ clean soft samples.

Geosyntec consultants

DAILY FIELD REPORT

Page 1 of 1

Project: F00552
Project No.: LC34
Contractors: EDS + Keith Olson + Glen (JR) Pennington

Date: 8/15/08
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT: X
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0645 Meet Rebecca at office. Calibrate and load equipment.
0715 Get call from EDS that one of the drillers did not show up for work. They are getting a replacement but will be late.
0830 Arrive at site. meet Sean for utility locate. Call duty office and get OK to dig. Mark sample locations.
0930 Keith and JR (EDS) arrive at site.
1000 Hand auger and drill DPT127. Sampled at 18ft + 25ft. Grout hole and decon equipment.
1100 Start DPT128. Sampled at 18ft + 25ft. Grout hole + decon.
1200 Lunch Break
1230 mark the rest of the locations. Keith + JR help put the Poly Tanks inside fenced storage area.
1300 Work stopped due to phase II lightening warning.
1400 ~~Start~~ DPT129, DPT130, DPT131 and DPT132 Sampled at 18ft + 25ft. Grout holes, dispose of IDW
1816 leave site for the day.

Plans/Future Activities

Drum Bar Code 168952 Spill Pallet 146005
All pallets are strapped down.

DAILY FIELD REPORT

Project: LC34
Project No.: FO0552
Contractors: EDS - Chris Phelps & Keith Olson

Date: 8/18/08
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT: X
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0615 Arrive at office. Call duty office for HURICON dig STATUS. Currently in HURICON IV, OK to dig, expected to go to HURICON III sometime today. Calibrate and load equipment.

0715 Meet drillers at site. They have the cement cover but no power source. Start DPT133, hand auger to 5', sample at 18', 25', 64' and 69'.

1000 David arrives with generator. Move to concrete location and drill hole.

1025 David leaves site. Return to DPT133. Sample at 73' and 78'.

1130 Lunch break

1200 Grout DPT133. Sample DPT134 at 18' and 23'. While preparing to sample at 64' discovered ~~a~~ screen failure. Pulled rods, put on a new screen and sampled at 64'. Sampled at 69' and 73'. Could not recover any water to sample at 78'. Grout hole.

Plans/Future Activities

DAILY FIELD REPORT

Project: LC34
Project No.: F08552
Contractors: EDS - Chris Phelps and Keith Olson
Date: 8/18/08
Task No.:

Work Performed

Well Installation:		Sampling Soil:	
Soil Borings:		Sampling SW/Sediment:	
DPT:	X	Sampling Monitor Wells:	
Well Inventory:		Sampling Hazardous Waste:	
Other:		Sampling Drums:	

Observations/Issues of Concern

1630 Sample DPT135 at 23' and 43'. Grout hole.
1730 Sample DPT136 at 18' and 25'. Grout hole.
1830 Check site to make sure all items are secure (i.e. spill pallets straped, etc.). Leave site.

Plans/Future Activities

Work for Tue. 8/19/08 cancelled due to anticipated HURICON III conditions.

Observations/Issues of Concern

0550 Angel arrived at the office to calibrate, get ice etc.
0645 Angel arrived on site EDS was already onsite
9:30 Dale Mobile Lab arrive ALF — Grouted DPT 138 & started drilling DPT 139 (18,25,73,78)
9:50 Start pulling out rods & grouting DPT 139
1050 Grouting DPT 139 complete go to rinse rods
1110 Start DPT 140 hand augar & drill + sample (18,25,64,69,73,
1330 break for lunch
1400 resume drilling
1600 move to DPT 141 however DPT 140 has not been grouted yet think the pressure grouter tomorrow might be faster?
1640 Phase II
1720 EDS & Angel leave site

Plans/Future Activities

Bring drum sticker to label drum EDS brought drum place on Spill pallet 153524 (bar code) the pallet now has four drums
Grout DPT 140 + top off 137, 138 + 139

Observations/Issues of Concern

0600 Angel @ office to calibrate & load up
0645 Angel on site EDS already here
1020 Mobile Lab ALF, Dale showed up
1030 start DPT 142
1500 finish DPT 142 & start pressure grouting DPT 137
1630 finish grouting DPT 137 (had waited to grout others thinking pressure grouting would be faster but it was not)
1630 start grouting DPT 142
1730 start DPT 143 (71-75)
1845 drilled DPT 143 75-80 but could not insert inner rods pulled out to drill out rods and drill battery died & they refused to finish drilling the last sample, so clean up & grout
2005 EDS & Angel leave site (1900 mobile lab left)
drum # 163525 purge water DPT 137, 138, 139, 140, 141, 142 (4 drums on the pallet)
One drum on pallet 15352 (still room in drum but not on pallet)

1240 back for lunch 1300 back to work

PID trouble
fresh air calibrate, then in same location → fresh air
would jump & range from 0.0 ppm to 2.3 ppm
with breeze far away from drilling.
Tried multiple fresh air calibrations & the meter
continued to fluctuate wildly.

DPT SAMPLING
OCTOBER 2008

FIELD FORMS

GeoSyntec Consultants **DAILY FIELD REPORT** Page 1 of 1

Project: LC34
Project No.: FO 0552
Contractors: EDS
Date: 10/17/08
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT: DPT0144, DPT0145
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

630 at office - calibrate and load, turn around to get sample vials
700 leave office + call duty station since ALF will not be onsite until later
730 onsite, EDS already there
0805 purge DPT0144 - 16 to 20 sampled at 0815
0825 purge DPT 0144 - 23 to 27 sampled at 0830
0850 purge DPT 0144 62 to 66 sampled at 0855
0900 ALF showed up on site
0920 purge DPT0144 67 to 71 sampled at 0926
0950 purge DPT 0144 71 to 75 sampled at 0956
1000 EDS to decon - pressure wash screens (they have 4 plus an extra so 5 screen and setup drum + spill platette decon over at other spill palet done at 103
1046 purge DPT0144 75 to 80 sampled at 1052
1105 drilling to 80 to grout through inner rods,
1135 break for lunch 12:15 back from lunch then decon the 1 screen + setup on 145
1242 purge DPT0145 16 to 20 sampled 1247
1305 purge DPT0145 23 to 27 sampled @ 1305

Plans/Future Activities

cont.
1325 purge DPT0145 62 to 66 sampled @ 1332
1355 purge DPT0145 67 to 71 sampled @ 1400
1440 purge DPT0145 71 to 75 sampled @ 1445
1512 purge DPT0145 75 to 80 sampled @ 1518
1600 Mobile lab offsite
1630 EDS offsite
1700 label drum + palet and leave site

10/17/08
Signature/Date

container ID 1660082 drum
container ID 1660081 spill pallet (only 1 drum)

Project: LC-34 Date: 10-20-08
Project No.: FO 0552 Task No.:
Contractors: EDS, ALF

Work Performed

Well Installation:
Soil Borings:
DPT: DPT 146, DPT 147, finish Sinterals at DPT 143,
Well Inventory:
Other: DPT 148, DPT 149

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

700 @ office to load and calibrate & call Duty Station - ok today
745 onsite
800 EDS onsite
0830 start purging DPT 146 8 to 12, sampled at 0837
0846 start purging DPT 146 16 to 20, sampled at 0853
0905 start purging DPT 146 23 to 27, sampled at 0910
0915 stop to decon screens
0947 start purging DPT 146 41 to 45, sampled at 0952
1000 drill down to grout through rods to 10:30
1035 Start purging DPT 147 8 to 12, sampled at 1040
1049 start purging DPT 147 16 to 20 sampled at 1055
1107 start purging DPT 147 23 to 27 sampled at 1112
1128 start purging DPT 147 41 to 45 sampled at 1135
1145 go to lunch, back about 1230 & start grouting rods already in
1315 start purging DPT 143 16 to 20 sampled at 1320
1332 start purging DPT 143 23 to 27 sampled at 1337

Plans/Future Activities

1356 start purging DPT 143 62 to 66, sampled at 1402
1423 start purging DPT 143 67 to 71, sampled at 1428
1453 start purging DPT 143 76 to 80 sampled at 1500
1500 pull up & push down to 80 to grout then pressure wash & dump trash
1600 finally started DPT 148 start purging 1600 for 16 to 20 sampled at 1625
1632 Start purging DPT 148 23 to 27, ~~sampled at 1637~~
grout DPT 148 finished at ~~1650~~ 1650 2M
1711 start purging DPT 149 16 to 20, sampled at 1714
1725 start purging DPT 149 23 to 27, sampled at 1730 go decon screens
1801 Start Purging DPT 149 62 to 66 Sampled at 1805
1810 EDS and ALF offsite

Signature/Date

drum 80% full will use second drum from EDS tomorrow. 185 offsite

Observations/Issues of Concern

0620 Angel at office to calibrate Hand. Horiba error 5, use YSI, Lamotte 2020e low battery. YSI low battery on site
0715 Angel onsite, EDS already onsite, new drum 166083
0808 start purging DPT 149 67 to 71, sampled at 815 (location "F")
0842 start purging DPT 149 71 to 75, sampled at 847
0915 start purging DPT 149 75 to 80, sampled at 921; 930 ALF onsite
0935 drill back down to 80 to grout through rods & decon 1005
1023 start purging DPT 150 16 to 20, sampled at 1028 (location "G")
1025 Dave onsite to pick up pump & bring batteries, off site 1040
1038 start purging DPT 150 23-27, sampled at 1045 (still need to grout)
1109 start purging DPT 151 16-20, sampled at 1115 (location "H")
1125 start purging DPT 151 23-27, sampled at 1130
1145 decon, 12-1230 lunch
1240 start purging DPT 152 16-20, sampled at 1245 (location "I")
1258 start purging DPT 152 23-27, sampled at 1305 Dave onsite for 5 mins
1344 start purging DPT 153 16-20, sampled at 1350 (location "Q")

Plans/Future Activities

1400 start purging DPT 153 23-27, sampled at 1405
1448 start purging DPT 154 16-20, sampled at 1453
1505 start purging DPT 154 23-27, sampled at 1510
1545 start purging DPT 155 16-20, sampled at 1551
1601 start purging DPT 155 23-27, sampled at 1607
1615 to 1650 fill tank with water and decon
1710 start purging DPT 156 16-20, sampled at 1716
1728 start purging DPT 156 23-27, sampled at 1734
1750 ALF offsite
Grout & dump water EDS offsite at 1800, Angel offsite 1810

Contractors: EDS + ALF
Date: 10-22-08
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT: 157, 158, 159
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

Angel at office @ 630 to calibrate and load, leave at 710, onsite 730, EDS onsite
740 begin grouting location "G" DPT150 from yesterday, the start location "L" need to grout "H"
810 start purging DPT 157 16 to 20, sampled at 815
826 start purging DPT 157 23 to 27, sampled at 831 grout DPT 157
917 start purging DPT 158 16 to 20, sampled at 923, ~~grout~~ dM
934 start purging DPT 158 23 to 27, sampled at 940, grout DPT 158
1020 start purging DPT 159 16 to 20, sampled at 1026
1036 start purging DPT 159 23 to 27, sampled at 1042, grout DPT 159
1135 Setup to grout Location "H", DPT 151 from yesterday & decon
1145 lunch, return 1220 Setup on Location "K"
1242 start purging DPT 160 Location "K", sampled 16-20 at 1248
1259 started purging DPT 160 23-27, sampled 1305, grout 160
1338 started purging DPT 161 16 to 20, sampled at 1345
1357 started purging DPT 161 23 to 27, sampled at 1402 grout 161, decon, tour bus mov
1453 started purging DPT 162 16 to 20, sampled at 1457
1511 started purging DPT 162 23 to 27 sampled at 1516, grout DPT 162

Plans/Future Activities

1553 Started pursing DPT 163 16 to 20, sampled at 1559
1609 Started purging DPT 163 23 to 27, sampled at 1615, grout, decon, Neucrum dump tras
1705 Setup on DPT 164 1718 started purging 16 to 20, sampled at 1723
1733 Started purging DPT 164 23 to 27, sampled at 1740, grout DPT 16
1745 ALF offsite, setup on Location R for morning, met at 7:00
1805 EDS and Angel offsite

GeoSyntec Consultants **DAILY FIELD REPORT** Page 1 of 1

Project: LC34
Project No.: FO0552
Contractors: EDS, ALF
Date: 10/23/08
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT: 165, 166, 110, 135, 167, 168, 169, 170, 171
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

Angel at office at 6:00 to calibrate & load
700 onsite, EDS already onsite 0722 start purging DPT 165 ("R") 16 to 20, sampled at 7:28
738 start purging DPT 165 23 to 27, sampled at 745, grout & decon
805 start purging DPT 166 16 to 20, sampled at 831 (location "S")
842 start purging DPT 166 23 to 27 sampled at 848 Jim onsite, grout, Jim offsite
928 start purging DPT 110 16 to 20, sampled at 935, ALF on Site at ~ 930
1002 start purging DPT 135 16 to 20, sampled at 1008, grout & decon, cut path in woods
1058 start purging DPT 167 16 to 20, sampled at 1103
1114 Start purging DPT 167 23 to 27, sampled at 1121, pull up & pack for lunch
1135 break for lunch 1204 back onsite grout DPT 167
1240 start purging DPT 168 16 to 20, sampled 1245
1258 start purging DPT 168 23 to 27 sampled at 1303, grout & decon
1351 start purging DPT 169 16 to 20, sampled at 1356
1407 start purging DPT 169 23 to 27, sampled at 1412, grout
1419 start purging DPT 170 16 to 20, sampled at 1452
1503 Start purging DPT 170 23 to 27, sampled at 1509, grout, decon fill H2O tank

Plans/Future Activities

1603 start purging DPT 171 16 to 20, sampled at 1608
1620 start purging DPT 171 23 to 27, sampled at 1626, grout
ALF offsite at 1645, dump trash load up, strap pallet
1715 EDS and Angel offsite

DPT SAMPLING
DECEMBER 2008

FIELD FORMS

Geosyntec consultants

DAILY FIELD REPORT

Project: LC34
Project No.: 600552
Date: 12/17/08
Task No.:
Contractors: EDS - Chris Phelps & Keith Olson; ALF - Dale Schamp
Santa Cruz - Stephen Sands & Kenneth Willis

Work Performed

Well Installation:		Sampling Soil:	
Soil Borings:		Sampling SW/Sediment:	
DPT:	X	Sampling Monitor Wells:	
Well Inventory:		Sampling Hazardous Waste:	
Other:	Clearing Paths	Sampling Drums:	

Observations/Issues of Concern

0630 - Arrive at office, calibrate and load equipment, travel to site.
0730 - meet EDS on site. Call CCAFS Duty office - OK to dig.
Hand auger DPT172 (Location W) to 5' and sample at 8', 18' and 25'.
0820 ALF on site
0915 Santa Cruz on site. Clear East side paths.
0930 Hand auger DPT173 (Location P) to 5' and sample at 8', 18' and 25'.
1030 Hand auger DPT092 to 5' and sample at 8'.
Santa Cruz moves to West side Paths.
1045 Hand auger DPT174 (Location O) to 5' and sample at 8' and 18'.
1130 EDS lunch break.
1200 Sample DPT174 at 25'.
1230 Hand auger DPT175 (Location Q) to 5' and sample at 8', 18' and 25'.
1345 Hand auger DPT176 (Location R) to 5' and Sample at 8', 18' and 25'.
1500 Hand auger DPT177 (Location S) to 5' and sample at 8', 18' and 25'.
1600 Hand auger DPT178 (Location V) to 5' and sample at 8'.

Plans/Future Activities

Project: LC34
Project No.: FORSS2
Contractors: Same as p.1

Date: 12/11/08
Task No.:

Work Performed

Well Installation:		Sampling Soil:	
Soil Borings:		Sampling SW/Sediment:	
DPT:	X	Sampling Monitor Wells:	
Well Inventory:		Sampling Hazardous Waste:	
Other:	X	Sampling Drums:	

Observations/Issues of Concern

1630 EDS leaves site for the day.
1645 ALF leaves site for the day.
1700 Santa Cruz completes work and leaves site.
1715 Travel back to office.

Plans/Future Activities

IDW disposed of in Drum # 170375 on spill pallet 166081.

DAILY FIELD REPORT

Page 1 of 1

Project: LC34
Project No.: F00552
Contractors: EDS - Chris Phelps + Keith Olson

Date: 12/2/08
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT: X
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0700 Arrive at office - Calibrate + load equipment.
0800 meet EDS at site. Call CCAFS Duty office to verify there are no dig restrictions - OK to dig. Sample DPT178 at 18' and 25'.
0845 Move to DPT179 (location U) and Sample at 8', 18' and 25'.
0900 Mobile lab on site. Setup at DPT180 (location T) and sample at 8', 18' and 25'.
1045 Setup at DPT181 (location X) and sample at 8' and 18'.
1130 Lunch Break. EDS will pick up spill pallet at POL.
1200 Sample DPT181 at 25'.
1300 Move to DPT182 and sample at 8', 18' and 25'.
1415 Setup at DPT183 and Sample at 8', 18' and 25'
1530 Move to DPT184 and Sample at 8', 18' and 25'.
1700 Leave site for the day.

Plans/Future Activities

Drum #
170376 Soil Drum (charcoal) Pallet # 168846 (TetraTech Pallet)
170375 Purge/Decon Water Pallet # 166081
All DPT locations hand augered to 5'.

DAILY FIELD REPORT

Project: LC34
Project No.: FOA552
Date: 12/3/08
Task No.:
Contractors: EDS - Chris Phelps & Keith Olson; ALF - Dale Schamp

Work Performed

Well Installation:
Soil Borings:
DPT: X
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0700 Arrive at office, calibrate & load equipment, travel to site.
0800 meet EDS on site, Call CCAFS Duty office - OK to dig.
Hand auger DPT185 (location C) to 5' and sample at 18' and 25'
0845 ALF on site
0900 Hand auger DPT186 (location D) to 5' and sample at 18' and 25'
0940 Hand auger DPT187 (location A) to 5' and sample at 18' and 25'
1020 Hand auger DPT188 (location B) to 5' and sample at 18' and 25'.
1100 Hand auger DPT189 (location H) to 5'.
1115 Lunch break.
1145 Sample DPT189 at 18' and 25'
1230 Hand auger DPT190 (location F) to 5' and sample at 18' and 25'
1310 Hand auger DPT191 (location G) to 5' and sample at 18' and 25'
1400 Hand auger DPT192 (location I) to 5' and sample at 18' and 25'
1445 Hand auger DPT193 (location N) to 5' and sample at 18' and 25'
1515 Hand auger DPT152 to 5' and sample at 10'

DAILY FIELD REPORT

Page of

Project: F00552-LC34
Project No.: F00552
Contractors: EDS, ALF

Date: 12-4-08
Task No.:

Work Performed

Well Installation:
Soil Borings: (16-20) (16-20) (16-20)
DPT: 195, 196, 197, 126, 113, 119
~~Well Inventory~~: 198,
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

Angel at office to calibrate 0700, pick up badge & head to site
0810 Angel onsite, EDS already setup
0830 ALF onsite
1100 Jim onsite, marked locations - offsite at 1130
1145 break for lunch
1215 back from lunch more DPT
1650 ALF offsite
1700 EDS & Angel offsite

Started drum 166085 on pallet 166086

DAILY FIELD REPORT

Page of

Project: FO 0552 LG34
Project No.:
Contractors: EDS, ALF

Date: 12-5-08
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT: 203, 204, 205
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0700 Angel @ office to calibrate & load
0750 Angel onsite, EDS already there
0830 Dale (ALF) onsite
1135 break for lunch
1230 back from lunch
1500 Melissa onsite
1530 ALF left w/ talking to anyone
1630 EDS and Angel offsite

drum 166085 at 80% on pallet 166086
drum 166087 at 20% on pallet 166086

DPT SAMPLING
JANUARY 2009

FIELD FORMS

Geosyntec consultants

DAILY FIELD REPORT

Project: LC34 Date: 1/23/09
Project No.: F0055 2 Task No.:
Contractors: Santa Cruz Construction ; Jake Benton

Work Performed

Well Installation:
Soil Borings:
DPT:
Well Inventory:
Other: Land Clearing

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0645 Receive call from Santa Cruz that Jake's badge is not ready. Call Rebecca to work problem.
0800 Arrive at site. Stake DPT locations.
0900 Sean O'Brien conducts utility locate.
1000 Santa Cruz arrives on site. Clear Paths on northwest and southeast sides of the site.
1500 Finished clearing. Load equipment. Finish marking locations.
1545 Leave site for the day.

Plans/Future Activities

DAILY FIELD REPORT

Project: LC34 Date: 1/26/09
Project No.: F00552 Task No.:
Contractors: EDS - Chris Phelps + Keith Olson; ALF - Dale Schamp

Work Performed

Well Installation:		Sampling Soil:	
Soil Borings:		Sampling SW/Sediment:	
DPT:	X	Sampling Monitor Wells:	
Well Inventory:		Sampling Hazardous Waste:	
Other:		Sampling Drums:	

Observations/Issues of Concern

0630 Arrive at office. Calibrate and load equipment.
0730 meet EDS at site. Call CCAFS duty office - OK to dig. Conduct tailgate meeting.
0800 Hand auger DPT209 (Location A) to 5'. Sample at 6'-10', 16'-20' and 23'-27'.
0855 Hand auger DPT210 (Location B) to 5'. Sample at 6'-10', 16'-20' and 23'-27'. Grout DPT209 + DPT210.
0950 Hand auger DPT211 (Location C) to 5'.
1000 ALF on site. Sample DPT211 at 6'-10', 16'-20' and 23'-27'. Grout hole.
1050 Hand auger DPT212 (Location D) to 5'. Sample at 6'-10'.
1125 Lunch break.
1205 Sample DPT212 at 16'-20', ~~and~~ 23'-27', and 38'-42'. Trimmy grout hole.
1315 Hand auger DPT213 (Location E) to 5'. Sample at 6'-10', 16'-20', 23'-27' and 38'-42'. Trimmy Grout hole.

Plans/Future Activities

DAILY FIELD REPORT

Project: F00552 LC34 Date: 1/27/09
Project No.: F00552 Task No.:
Contractors: EDS-Chris Phelps & Keith Olson; AEF- Dale Schamp

Work Performed

Well Installation:		Sampling Soil:	
Soil Borings:		Sampling SW/Sediment:	
DPT:	X	Sampling Monitor Wells:	
Well Inventory:		Sampling Hazardous Waste:	
Other:		Sampling Drums:	

Observations/Issues of Concern

0630 Arrive at office. Calibrate and load equipment.
0730 Meet EDS at site. Call CCAFS Duty office - OK to dig. Stake step out locations.
0750 Hand auger DPT216 (Location J) to 5'. Sample at 6'-10', 16'-20' and 23'-27'. Grout hole.
0845 Hand auger DPT217 (Location H) to 5'. Sample at 6'-10', 16'-20' and 23'-27'.
0930 AEF on site. Grout hole.
0950 Hand auger DPT218 (Location I) to 5'. Sample at 6'-10', 16'-20' and 23'-27'. Grout hole.
1040 Hand auger DPT219 (Location K) to 5'. Sample at 6'-10' and 16'-20'.
1115 Lunch break
1145 Sample DPT219 at 23'-27'. Grout hole.
1200 Sean conducts utility locate for step out locations.
1245 Hand auger DPT220 (Stepout ~50' NW of DPT210) to 5'. Sample at 6'-10', 16'-20' and 23'-27'. Grout hole.

DAILY FIELD REPORT

Project: LC34
Project No.: FOØ552
Contractors: same as p.1

Date: 1/27/09
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT: X
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

1325 Hand auger DPT221 (stepout ~50' NE of DPT210 towards IW0053I+D) to 5'. Sample at 6'-10', 16'-20', and 23'-27'. Grout hole.
1430 Hand auger DPT222 (stepout ~60' SW of DPT214) to 5'. Sample at 6'-10', 16'-20' and 23'-27'. Grout hole.
1530 Clear path to DPT223 (~50' SW of DPT215). Hand auger to 5' and sample at 6'-10', 16'-20' and 23'-27'. Grout hole.
1645 Leave site for the day.

DAILY FIELD REPORT

Project: LC34 Date: 1/28/09
Project No.: FOB552 Task No.:
Contractors: EDS-Chris Phelps & Keith Olson; ALF-Dale Schamp

Work Performed

Well Installation:
Soil Borings:
DPT: X
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0645 Arrive at office. Calibrate and load equipment. Call CCAFS duty office to verify OK to dig.
0745 Meet EDS at site. Hand auger DPT224 (Location W) to 5'. Sample at 6'-10', 16'-20' and 23'-27'. Grout hole.
0900 Hand auger DPT225 (Location X) to 5'. ALF on site. Sample DPT225 at 6'-10', 16'-20' and 23'-27'. Grout hole.
1000 Hand auger DPT~~226~~ (Location R) to 5'. Sample at 6'-10', 16'-20' and 23'-27'. Grout hole.
1100 Hand auger DPT227 (approx. 20' NW of SW most path) to 5'.
1115 Lunch break.
1215 Sample DPT227 at 6'-10', 16'-20' and 23'-27'. Grout hole.
1300 Hand auger DPT228 (~~5~~ 45' N of DPT209) to 5'. Sample at 6'-10', 16'-20' and 23'-27'. Grout hole.
1340 Hand auger DPT229 (~~L~~ocation N) to 5'. Sample at 6'-10', 16'-20' and 23'-27'. Grout hole.

Project: LC34 Date: 1-29-09
Project No.: FO055 2 Task No.:
Contractors: EDS & ALF

Work Performed

Well Installation:
Soil Borings:
DPT: DPT232 through DPT239
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0650 Angel to office to Calibrate & load car
0745 Angel onsite, EDS already onsite
0755 Start DPT 232 hand auger, 8 ft, 18 ft and 25 ft sample & grout
0850 Start DPT 233 hand auger, had to move ~1 ft NW b/c of refusal in 2 locations
0915 Stop after 6-16 to decon (4 screens)
0925 finish DPT 233 16 to 26 and 23 to 27 and grout
0955 Start DPT 234 6 to 16 ft, 16 to 26 ft decon then 23 to 27 ft and grout
1050 Start DPT 235 sample 6-16
1105 Break for lunch, back at 1140, sample 16 to 26 and 23 to 27 and grout
1230 Start DPT 236, Dale (ALF) back from lunch, change Horiba battery, Calibration problems - probably Auto Cal Solution - discuss w/ Rebecca & Jan
1320 Start DPT 237 6 to 10 decon, sample 6 to 10 decon, sample 16 to 26 and 23 to 27 ft
1450 start DPT 238 sample 6-10 ft decon, sample 16 to 26 ft and 23 to 27 ft, Hard RAIN
1545 Start DPT 239 sample 6-10 ft and 16 to 26 ft & 23 to 27 ft
1640 EDS offsite
1645 Angel offsite, ALF packing up to leave

DAILY FIELD REPORT

Page of

Project: LC34
Project No.: FO0552
Contractors: EDS, ALF

Date: 1-30-09
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT: DPT240 through DPT245
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0655 Angel at office to calibrate and load
0740 Angel onsite, EDS already onsite, cold rain, DPT240, 241, 242
1000 ALF onsite
1130 break for lunch, back at 1200, DPT 243 ~~and 244~~ etc
1330 coredrill location Y + Z, finish Y at 1400, finish Z at 1430 DPT 244 and 245
1600 Jan onsite
1630 ALF offsite
1705 EDS offsite
1725 Angel + Jan offsite

DPT SAMPLING
MARCH 2009

FIELD FORMS

Geosyntec consultants

DAILY FIELD REPORT

Page 1 of 1

Project: LC34
Project No.: F0855Z
Contractors: EDS - Chris Phelps & Keith Olson; ALF - Dale Schamp

Date:
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT: X
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

1000 Meet EDS on site. Hand auger DPT0188 to 5' and sample at 12'-16', 25'-29', 30'-34', 41'-45' and 56'-60'. Grout hole.
1130 Lunch break.
1200 Hand auger DPT0246 to 5' and sample at 12'-16', 25'-29', 30'-34', 41'-45', and 56'-60'. Grout hole.
1330 Hand auger DPT0247 to 5' and sample at 12'-16', 25'-29', 30'-34', 41'-45' and 56'-60'. Grout hole. Dispose of IDW.
1600 Leave site for the day.

Observations/Issues of Concern

0700 - at office - load car, prepare paperwork
0845 - onsite - call dwty office - Tetra Tech Dig Permit # 20049684 - ok to dig

Calibrate PID - Mini RAE Lite (PGM 7300)
Calibration gas Isobutylene 100 ppm lot # LTD308-MM-CM exp April 2011

	I	F
Zero =	1.3 ppm	0.0 ppm
100 ppm =	100.1 ppm	100.1 ppm

0920 - GPT onsite
* Disposal of Soil from soil boring in roll off (Tetratech)
* Phase II ~ 3:30 pm → drillers did not have sand had to go to Home Depot to get (for seal) (3-4:15 pm)

1200 offsite for lunch 1315 back onsite

0650 left site

Plans/Future Activities

- starting w/ SB1000

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Comments:

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

	2.5										
	3										

Note: When purging well with pump or intake tubing within the well screen, purge minimum of 1 equipment volume prior to first field parameter measurements. Take additional field parameter measurements no sooner than 2 to 3 minutes apart, must purge minimum of 3 equipment volume + stabilized field parameters for sampling.

Note: When purging a well with well screen fully submerged and pump or intake tubing is placed in water column above the screened zone, purge minimum of one well volume prior to collecting first field parameter measurements. Take additional field parameter measurements every ¼ well volume until purging requirements are satisfied.

Note: Three (3) consecutive readings within specified limits are to be obtained for sampling. Temperature: ± 0.2 °C; pH: ±0.2 standard units; Specific Conductance: ± 5.0% of reading; DO is no greater than 20% saturation at field measured temperature; and Turbidity ≤ 20 NTUs

If DO or Turbidity measurements cannot meet the above requirements within 5 well volumes; Temp, pH, Conductivity ranges remain unchanged, however, DO and turbidity must meet the following: DO ± 0.2 mg/L or 10%, whichever is greater; and Turbidity ± 5 NTUs or 10%, whichever is greater

For high turbidity and DO, check flow through cell for air bubbles, which may be causing erroneous readings. Turbidity should be verified visually and with a separate Turbidity meter (if available). All attempts should be made to get the parameters within the specified limits. Check water quality meter calibration before using again.

LC34-IW0076-075.0-

Sample ID: 200908 Time Collected: 1140 Comments: VOCs

EV= [pump vol (gal) + ((0.041)(tubing diameter x tubing diameter (in in.) x tubing length (in ft)))+flow thru vol (in gal))] = EV in gal

~~0.25~~ 0.25 0.25 85 0.5 = 0.7178 × 3 = 2.15 gallons

Project: FD0552.5
Project No.: LC34
Contractors: N/A

Date: 8/21/09
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT:
Well Inventory:
Other: Slug Testing: PA-22 (55-60) PA-20 (55-60), PA21 (55-60) IW-02DI (50-55)

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

- 1 steel 55 gal drum 33% full
- 3 blue plastic drums ethyl lactate
- Various wooden palletts
- 1 empty spill pallett labeled and strapped
- White plastic tarp

IW-02DI - 7.92 from top of slug apparatus 2" metal well
5.41 BTOC

PA-20 = 5.15 BTOC 2" metal well
PA-21 = 5.13 BTOC 2" metal well ~12' West of sidewalk
~9' West of line of wells

PA-22 = 5.83 BTOC 2" metal well. unable to get as much pressure built up.

1800 Back at office, unpack truck.

Plans/Future Activities

Also strapped 1 pallet at Wilson corner & removed debris
Strapped 2 pallets at CH2S

DAILY FIELD REPORT

Page 1 of 1

Project: LC34-DPT
Project No.: FO0552B
Contractors: EDS ALF

Date: 10/2/09
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT:
Well Inventory:
Other: DPT GW Sampling

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0730 Arrive Site, drillers are onsite. Conduct tailgate Safety meeting. Contact duty office & speak to Barbara about ~~DPT~~ drilling activities - okay to drill. Using dig permit # 1504 9684.
~~0800~~ 0830 Sean, utility locator, is back onsite to clear remaining DPT locations
900 All DPT locations are clear, Sean departs site
Calibrate PID meter:
100 ppm Isobutylene Cal Gas
Lot # LPD 308-mw-cm
Expires 04/~~2007~~ 2011
Readings = 100.1 Okay.
1930 All personnel depart site.

Comments:

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

DAILY FIELD REPORT

Page 1 of 1

Project: LC34
Project No.: F00552
Contractors: EDS (Davey & JR), ALF (Dale)

Date: 10/6/09
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT: (S) DPT0266 (36-40), (55-59)
Well Inventory:
Other: DPT0267 (T) (6-10)(16-20)(23-27)(36-40)
DPT0268 (U), DPT0269 (V), DPT0270 (W) (same intervals as DPT0267)

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0630 Arrive at office, Calibrate instrument.
0655 Leave office, buy batteries for PID meter, travel to site.
0730 Arrive onsite. EDS arrives at 0740. Call Duty Office, Set up on DPT0266, continue drilling; pressure grout, (Tilcher) decon, set up on DPT0267 (T).
1002 Sid Meyers from Health & Safety arrived to make a quick safety check (Everything is OK). Pressure grout DPT0267, decon, set up on DPT0268 (U), pressure grout, decon, ~~break~~
1300 Lunch
1330 Set up on DPT0269, pressure grout, decon, setup on DPT0270 (W), pressure grout, after refilling driller's water tank, top off DPT0266-DPT0268, clean grouter, decon
1800 Leave site, return to office, decon.
1830 Leave office.

Observations/Issues of Concern

0630 Arrive at office, calibrate instrument (Barbara)
0730 Arrive at site, EDS arrives at 0735, call Duty Office. Set up on DPT0271(X), core DPT0271 and DPT0272 (while hand augering DPT0271), drillers' Geopump is mal-functioning, call Dave to have Geopump from office brought to site (No one in the field had a spare). Pressure grout, decon. Setup on DPT0272(Y), pressure grout
1310 Lunch
1335 Decon, setup on DPT0273(Z), pressure grout, decon, set up on DPT0274(AA), Tremi grout, top off previous DPTs, rinse out grouter, decon, set up on DPT0275, do at 6 depths, ~~decon~~, dump water, leave site at 6:25, return to office, decon, unpack.
1900 Leave office.

DAILY FIELD REPORT

Page 1 of 1

Project: LC-34 And MLP/WAB
Project No.: FOOS52 & FLOS9B
Contractors: FEDS

Date: 10/8/09
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT: ✓
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0730 DMS arrives site, Await drillers Arrival. Call CCAS duty office, Speak w/ TUCKER - okay to drill.
0745 Drillers arrive site & set up. Calibrate PID meter - Reading = 100 ppm Using 100 ppm Isobutylene Cal.gas.
DMS Conducts Tailgate safety meeting. Begin DPT AC GW Sampling.
Soil boring SB1001 Sampled @ 12:00 40'-45'. Recovery from 41.5' - 45' only. TAN, Silty, medium to coarse silty SAND
1210 - DPT & Soil Sampling Complete; Drillers Top-off all DPT location w/ Grout.
1320 Depart site, Travel to MLP/WAB to collect DPT GW Samples.

Specific Conductance Probe Cleaned? Yes No Disolved Oxygen membrane Changed? Yes No

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

Observations/Issues of Concern

0645 Arrive @ Tetroville office. Calibrate YSI + pack equipment
0745 EDS arrives @ Badging Station (15 min late)
0800 Arrive @ LC34 + begin unpacking trailer + equipment
0818 Call CCAFB Duty Officer + conduct tailgate safety meeting
0900 Start DPT 278. Hand Auger to 5'
0950 DPT 278 finished. EDS must decon after 3 screens. Move to DPT 279 after.
1010 DPT 279 started. Hand auger to 5'
1055 DPT 279 finished. Decon + move to DPT 280
1110 DPT 280 started. Hand auger to 5'
1155 DPT 280 finished. Decon + lunch
1300 Pump Down Purge water. Move to DPT 281
1305 DPT 281 started. Move the location 12' west to avoid buried concrete slab. Hand auger to 5'
1350 DPT 281 finished. Decon + move to DPT 282
1410 DPT 282 started. Hand auger to 5'
1455 DPT 282 Finished. Decon and move to DPT 283
1520 DPT 283 Started. Hand Auger to 5'

Plans/Future Activities

1610 DPT 283 finished. Decon + move to DPT 284
1625 Dpt 284 started. Hand auger to 5'.
1715 DPT 284 finished. Decon + move to DPT 285 for tomorrow.
1745 EDS finished for the day. I got to drop off the samples for the on site mobile lab
1800 Samples dropped off.
1820 Return to Pitzquillo office for YSI CCV
1845 End of the day

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Comments:

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

DAILY FIELD REPORT

Project: LC34
Project No.: FO0055DB
Contractors: EDS

Date: 3/11/10
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT:
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0630 Arrive @ Titusville office to calibrate YSI & pack truck
0730 Arrive @ LC34. Call duty officer & find today is a critical day for Rx Caps.
0800 So as not to waste a day of drilling & Lab time, we decide move to CM49 when another DPT drilling event is occuring.
0900 EDS is picked up, loaded & leave LC34 for CM49

Plans/Future Activities

DPT Next week after Engin test & thunderstorms

DAILY FIELD REPORT

Project: LC34
Project No.: FO 0552 B
Contractors: EDS, Dailey & JR

Date: 3-15-2010
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT: DPT 285, mw-6 DPT 292
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0640 Angel at Titusville office to calibrate equipment & pack
0730 Arrive onsite, EDS onsite
0740 Call NASA security and Rebecca, Rebecca had to call duty station, talk to Donna and got ok to dig, Angel has no reception
0745 conduct tailgate safety meeting
0800 setup on location "1t" DPT00285, hand auger to 5 ft and collect samples 6-10, 16-20 and 23-27
0845 finish DPT00285, grout hole and decon screens (EDS has only 3 screens today)
0900 KB labs called to give mobile lab contacts phone numbers Thom 352-538-5099 and Greg 407-684-2702, setup on DPT0286 hand auger to 5 ft and collect samples
0945 finish DPT00286, decon screens and grout hole
1000 setup on DPT00287, hand auger to 5ft, Jan onsite to give Angel map
1050 finish DPT00287, decon rods and grout hole
1100 setup on DPT00288, hand auger to 5ft and collect samples
1145 finish DPT00288, decon screens and grout hole

DAILY FIELD REPORT

Project: LC 34
Project No.: FO0552B
Contractors: EDS (Davey + JR)

Date: 3/15/10
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT: DPT 0285 – DPT 292
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

1200 break for lunch back at 1230 set up on DPT 0289
1325 finish DPT 289, grout hole and decon screens
1340 setup on DPT ~~289~~ 290, hand auger to 5ft
1420 decon screens, grout hole because DPT 290 is finished
1430 setup on DPT 291, hand auger to 5ft
1520 finish DPT 291, grout hole and decon screens
1530 setup on DPT 292, hand auger to 5ft
1615 finish DPT 292, grout hole and decon screens
Filled Drum # 178569 to 80% purge water and decon water
New drum # 157341 about 20% full purge water and decon water
Both drums are on pallet # 178568
1630 Talk to Thomas at KB labs to get combo to drop off samples coc 73 and leave for CMTS to grout 3 holes from last week, they have cones marking them
1715 finish grouting holes at CMTS, EDS leaves for the day
Angel goes to meet mobile lab to drop off samples, lockout inside

Plans/Future Activities

1725 Angel leaves WMSA for office to unload and check equipment calibration

DAILY FIELD REPORT

Page 1 of 1

Project: FO 0552
Project No.: LC 34
Contractors: EDS (Davey & JR)

Date: 3-16-2010
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT: DPT 293 through DPT 307
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0695 Angel at office to calibrate equipment and pack
0705 leave office for LC 34, call NASA Duty office, OK to dep
0730 Angel onsite, 0740 EDS (Davey & JR) onsite
0745 Tailgate safety meeting, slips, trips and falls, Level D modified, wildlife
0800 Setup on DPT 0293 hand auger 5ft
0850 finish DPT 0293, grout hole & decon screens
0910 setup on DPT 0294, hand auger 5ft
0953 finish DPT 0294, grout hole and decon screens
1010 setup on DPT 0295, hand auger 5ft
1100 finish DPT 0295, grout hole & decon screens
1110 setup on DPT 0296
~~1100~~ 1200 finish DPT 0296, grout hole and decon screens
1220 break for lunch back at 1250 move to next row setup on DPT 297, hand auger 5ft
1310 Jon onsite to GPS locations offsite ~1430
1355 finish DPT 297, grout hole and decon screens
1405 setup on DPT 298, hand auger to 5ft

Plans/Future Activities

1450 finish DPT 298, grout hole and decon screens
1500 setup on DPT 299, hand auger to 5ft, did all 3 intervals
1545 finish DPT 299, grout hole and decon screens
1600 setup on DPT 300, hand auger 5ft finish @ 1620, grout hole, JR decon screens while drills next hole
1625 setup on DPT 301 hand auger 5ft finish @ 1650, grout, JR decons in between
1700 setup on DPT 302 hand auger 5ft finish @ 1730, grout
load up truck, leaving trailer and probe on site
1820 EDS offsite Angel to take samples to mobile lab
Spent 20 mins filling their water tank & didn't pack all equipment

Signature/Date 3/16/2010

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings: always start with pH 7, add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

DAILY FIELD REPORT

Page 1 of 1

Project: LC34 Date: 7/6/10
Project No.: F0052 Task No.: 5.2
Contractors: EDS - Glen Pennington + Giovanni Barrera; KD Labs - Glenn Jackson

Work Performed

Well Installation: ____ Sampling Soil: ____
Soil Borings: ____ Sampling SW/Sediment: ____
DPT: X Sampling Monitor Wells: ____
Well Inventory: ____ Sampling Hazardous Waste: ____
Other: ____ Sampling Drums: ____

Observations/Issues of Concern

0630 Pick up water + ice, meet Lindsay at office, Calibrate and load equipment,
0730 meet EDS + KD Labs at badging station, Drop drums at MLPVAB and Travel To site,
0830 call duty office and check in, Conduct Tailgate meeting, Sample DPT0303, Start sampling DPT0304 (Location B on map), (Location A on map)
1230 Lunch
1300 Finish sampling DPT0304, Sample DPT0305 (Location C on map and DPT0306 (Location D on map) to 27' ft,
1845 Travel to MLPVAB site To pick up empty drums,
1900 Leave site,

Plans/Future Activities

Sample Depths - 6-10', 11-15', 16-20', 23-27' + 36-40',
DPT locations were surface grouted,
IDW Drum # 183399
Spill Pallet # 170362

1. See Table FS 2200-2 on the back of this form

Comments:

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

DAILY FIELD REPORT

Page 1 of 1

Project: LC34
Project No.: FOOSS2B
Date: 7/7/10
Task No.: 5.2
Contractors: EDS - Glen Pennington + Giovanni Barrera; KB Labs - Glen Jackson

Work Performed

Well Installation:		Sampling Soil:	
Soil Borings:		Sampling SW/Sediment:	
DPT:	X	Sampling Monitor Wells:	
Well Inventory:		Sampling Hazardous Waste:	
Other:		Sampling Drums:	

Observations/Issues of Concern

0600 Arrive at office. Calibrate + load equipment. Travel to site.
0700 Meet EDS + KB labs on site. Call Duty office. Collect 40' sample from DPT0306. Sample DPT0307, DPT0308, DPT0309, and DPT0310. Surface grout locations.
1700 Leave site.

Plans/Future Activities

Sample depths: 6-10', 11-15', 16-20', 23-27' + 36-40'

1. See Table FS 2200-2 on the back of this form

Comments:

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

1. See Table FS 2200-2 on the back of this form

Comments:

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

DAILY FIELD REPORT

Page 1 of 1

Project: LC34 Date: 7/15/10
Project No.: FO0552B Task No.: 1.4.0
Contractors: EDS (J.R. + Geo), KB Labs (Glenn Jackson)

Work Performed

Well Installation: _____
Soil Borings: _____
DPT: 180, 174, 234, 229, 179, 218, 080, 254
Well Inventory: _____
Other: _____

Sampling Soil: _____
Sampling SW/Sediment: _____
Sampling Monitor Wells: _____
Sampling Hazardous Waste: _____
Sampling Drums: _____

Observations/Issues of Concern

0690 Arrive @ Tidewalk office. Calibrate YSI & pack vehicle.
0700 Leave office
0730 Meet drillers on site. Drillers begin prepping equipment for drilling.
0745 Tailgate H&S meeting w/ drillers. Call Onge security.
0800 Begin DPT 180
0830 Finish DPT 180. Move to DPT 174
0920 Finish DPT 174. Decon of screens necessary
0950 Begin DPT 234. Grout previous DPT holes while samples being drawn
1015 Finish DPT 234 Move to DPT 229
1100 Finish DPT 229 Decon & move to DPT 179.
1200 Finish DPT 179. Lunch & move to DPT 218
1310 Finish DPT 218. Move to DPT 080 & Decon screens
1330 Phase II Lightning alert called over Cape.
1630 Phase II over. Begin DPT 080
1700 DPT 080 finished. Move to DPT 254
1745 DPT 254 finished. Drillers grout holes & head off site.

Plans/Future Activities

1815 Return to office. End of the day

Continue DPT Sampling

Signature/Date

Comments:

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7, add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

DAILY FIELD REPORT

Page 1 of

Project: LC34
Project No.: FOOSSJB
Date: 7/13/10
Task No.: 1240
Contractors: EDS (J.R. + Geo) KB Labs (Glen Jackson)

Work Performed

Well Installation:
Soil Borings:
DPT: 239, 72, 73, 88, 280, 217, 279, 222, 251, 98
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0530 Arrive @ Titusville office. Collect YSI & pick up vehicle
0630 Arrive on site. Meet w/ drillers & finish paperwork
0700 EDS arrives on site. Conduct tailgate H&S meeting. Call Cape security to advise them of our drilling activities.
0715 Drillers decon screens from rear to DPT 239
0750 Finish DPT 239. Move to DPT 072
0830 Finish DPT 072. Drillers must decon & perform rod maintenance
0905 Begin DPT 073
0940 Finish DPT 073. Move to & start DPT 088
1030 Finish DPT 088. Decon & move to DPT 280
1045 Begin DPT 280
1130 Finish DPT 280. Begin DPT 217
1200 Finish DPT 217. Decon & lunch. Move to DPT 279
1235 Begin DPT 279
1315 Finish DPT 279. Phase II Lightning alert over Cape Canaveral
1430 Phase II over. Move to DPT 222 & hand auger to 5'

Plans/Future Activities

1510 Finish DPT 222. Move to DPT 251 while Drey decons. Hand auger to 5'
1600 Finish DPT 251. " DPT 98 " "
1700 Finish DPT 98. Decon & pump IDW.
1730 EDS leave site.
1800 Return to office. Unload vehicle & end the day

7/13/10
Signature/Date

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7, add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

Sampling Drums:

Observations/Issues of Concern

0600 Arrive @ Fitzsville office. Calibrate YSI & pick up vehicle. Head to Site.
0700 Arrive on site. Meet drillers. Giovanni No longer w/ EDS Davey will replace him
0715 Conduct H&S tailgate meeting. Call Cape security to alert them of our drilling.
0730 Start DPT 120
0730 Davey & EDS arrives on site. Safety meeting conducted w/ him before returning to work
0750 Finish DPT 120. Move to DPT 87 & start by hand augering to 5'
0830 Finish DPT 87. Davey decons while JR moves to DPT 203 accross site.
0850 Start DPT 203.
0935 Finish DPT 203. Davey decons 3 screens while JR moves to & hand augers DPT 200
1030 Finish DPT 200. " DPT 191
1130 Finish DPT 191. " DPT 276
1225 Finish DPT 276. " DPT 190. Take Lunch
1305 Start DPT 190.
1350 Finish DPT 190. Davey decons 3 screens while JR moves to & begins DPT 189
1440 Finish DPT 189. " DPT 202
1530 Finish DPT 202. Davey decons screens while JR sets up on DPT 153.

Plans/Future Activities

1545 Drillers Drum all IDW. Train Davey to grout all DPT locations completed today & JR performs maintenance on the drilling rods
1630 EDS leaves site. 25 samples taken today.
1700 Return to ~~site~~ Fitzsville office. Unload vehicle & end day

1. See Table FS 2200-2 on the back of this form

Comments:

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings: always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

DAILY FIELD REPORT

Page / of

Project: C34
Project No.: FO0552B
Contractors: EDS (JR + Dave) KB Labs (Glenn Jackson)
Date: 7/15/10
Task No.: 1240

Work Performed

Well Installation:
Soil Borings:
DPT: 153, 199, 198, 205, 224, 225, 149, 143
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0600 Arrive @ Titusville office. Calibrate YSI & pack vehicle. Leave for site
0700 Arrive on site. Meet EDS drillers.
0715 Tailgate safety meeting
0730 Begin DPT 153. Mound dug out to 5' yesterday afternoon
0800 Finish DPT 153. Move to DPT 199 & hand auger to 5' while Parker decons screens
0900 Finish DPT 199. " DPT 198 "
1000 Finish DPT 198. " DPT 205 "
1100 Finish DPT 205. " DPT 224 "
1150 Finish DPT 224. Lunch ~~Phot~~ NS and decon. Move to DPT 225
1235 Begin DPT 225.
1335 Finish DPT 225. Move to DPT 149 & hand auger to 5' while screens are decon'ed
1435 Finish DPT 149. " DPT 143 " "
1530 Finish DPT 143. Dump IDW. Grout DPT holes & perform rod maintenance.
1600 Transfer contents of drums 178569 & 157341 from recond. lined drums to new drums. Old drums to be taken by EDS. Some pallet ID exc'd
1630 Drillers leave site to pick up one additional drum for use tomorrow

Plans/Future Activities

GPS DPT locations completed this week so far
1730 Finish GPS. Leave site
1800 Return to Titusville office. Unload vehicle & end the day.

6/15/10
Signature/Date

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7, add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

DAILY FIELD REPORT

Page 1 of

Project: LC34 Date: 7/16/10
Project No.: FO0552B Task No.: 12+0
Contractors: EDS (JR & Davey), KB Labs (Glenn Jackson)

Work Performed

Well Installation:
Soil Borings:
DPT: 144, 154, 196, 155, 158, 148, 131, 201
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0600 Arrive @ Titusville office. Calibrate YSI & pack vehicle. Head to site
0700 Arrive on site. Drillers Decon screens. JR moving to DPT 144
0715 Tailgate H&S meeting. Begin DPT 144 attn. Davey decons screens from yesterday
0805 Finish DPT 144. Davey decons screens while JR moves to DPT 154 & Hand augers to 5'
0900 Finish DPT 154. " DPT 196 "
0955 Finish DPT 196. " DPT 155 "
1045 Finish DPT 155. " DPT 158 "
1135 Finish DPT 158. Lunch. Davey decons screens while JR breaks through asphalt @ DPT 148. Hand Auger to 5' after through asphalt.
1230 Begin DPT 148
1325 Finish DPT 148. Decon screens & move to DPT 131. Hand auger to 5'
1415 Finish DPT 131. " DPT 201 "
1505 Finish DPT 201. Decon screens & dump IDW.
1530 Mobile Lab Leaves site. EDS continues demob preparation. Screen decon pulet emptied into Drum
1605 EDS leaves site

Plans/Future Activities

1640 Return to Titusville office. Unpack vehicle & complete field forms
1800 End of the day

7/16/10
Signature/Date

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Comments:

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7, add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

DPT SAMPLING
DECEMBER 2010

FIELD FORMS

Geosyntec consultants

DAILY FIELD REPORT

Page 1 of 1

Project: ~~LC40~~ LC34
Project No.: F00550
Date: 12/13/10
Task No.:
Contractors: EOS- Glen Pennington & Michael Scripe KB Labs- Glenn Jackson
SpecPro- Shane Russell

Work Performed

Well Installation:
Soil Borings:
DPT: X
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0630 Arrive at office. Calibrate & load equipment. call CCAFS Duty office - get OK to dig.
0730 meet KB Labs and EOS at badging station.
0800 meet SpecPro onsite. Call Security. Conduct Tailgate meeting. Discuss trail clearing with SpecPro.
0900 Set up on DPT0312 (Location A on map). Attempted to sample at 6-10 ft bgs but had not hit groundwater yet due to pad elevation. Sampled at 11-15', 16-20', 23-27', 36-40', 41-45' & 46-50'.
1145 Set up on DPT0313. Sample at 6-10', 11-15', 16-20', 23-27', 36-40' and 41-45'. (Location B on map).
1445 Set up on DPT0314. Sample at 6-10', 11-15', 16-20', 23-27', 36-40' & 41-45'. (Location E on map)
1700 Left site.

Plans/Future Activities

Hand auger all locations to 5'.
IDW is being drummed and will be disposed of in remediation system.

Janet Barlow 12/13/10

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

DAILY FIELD REPORT

Page 1 of 1

Project: LC34
Project No.: F00552
Date: 12/14/10
Task No.:
Contractors: EDS - Glen Pennington & Michael Scripes; KB Labs - Glenn Jackson
SpecPro - Shane Russell

Work Performed

Well Installation:
Soil Borings:
DPT: X
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0630 Arrive at office. Calibrate & load equipment, Call CCAFS Duty office - OK to dig.
0730 meet EDS, KB labs and SpecPro on site. Call CCAFS security, Talk to Shane about clearing paths. Conduct Tailgate meeting.
0800 Set up on DPT0315.(F) Geoprobe will not start - dead batteries. Cannot get vehicle close to jump start it. Change out batteries from vehicles until it starts.
0930 Sample at 6-10', 11-15', 16-20', 23-27', 36-40' and 41-45'
1215 Sample DPT0316 (Location H on map) at 6-10', 11-15', 16-20', 23-27', 36-40' and 41-45'
1415 Sample DPT0317 (Location G on map) at 6-10', 11-15', 16-20', 23-27', 36-40' and 41-45'
1600 Sample DPT0318 (Location D on map) at 6-10' and 11-15'
1700 Leave site.

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Comments:

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

CCV - Continuing Calibration Verification

Comments: _____

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

DAILY FIELD REPORT

Page 1 of 1

Project: LC34
Project No.: FO0550
Date: 12/16/10
Task No.:
Contractors: EDS - Glen Pennington + Michael Scripe; KB Labs - Glenn Jackson
~~Spectro - Shane Russell~~ IRD

Work Performed

Well Installation:
Soil Borings:
DPT: X
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0630 Travel to site.
0700 Meet EDS + KB Labs on site. Call CCAFS Duty office (OK to dig) and security. Conduct tailgate meeting.
0830 Sample DPT0321 (location C on map) at 6-10', 11-15', 16-20', 23-27', 36-40' and 41-45'.
1100 Sample DPT0147 at 56-60'.
1140 Sample DPT0146 at 56-60'.
1215 Lunch break.
1245 Sample DPT0135 at 56-60'.
1330 Sample DPT0126 at 56-60'.
1400 Sample DPT0111 at 56-60'.
1445 Sample DPT0322 (location A on map) at 6-10', 11-15', 16-20', 23-27' and 36-40'.
1615 Sample DPT0323 (location B on map) at 6-10', 11-15', 16-20', 23-27' + 36-40'.
1745 Leave site.

DAILY FIELD REPORT

Page 1 of 1

Project: LC34
Project No.: F08052
Contractors: EDS - Glen Pennington + Michael Scripe; KB Labs - Glenn Jackson

Date: 12/17/10
Task No.:

Work Performed

Well Installation:
Soil Borings:
DPT: X
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0630 Travel to site.
0700 meet EDS + KB Labs on site. Call CCAFS Duty office (OK to dig) + Security. Conduct tailgate meeting. EDS Surface grouts locations DPT0312-321.
0815 Sample DPT0324 (location C on map) at ~~16-20'~~ 6-10', 11-15', 16-20', 23-27' and 36-40'
0945 Sample DPT0325 (Location E on map) at ~~16-20'~~ 6-10', 11-15', 16-20', 23-27' and 36-40'.
1100 Sample DPT0326 (location F on map) at 6-10', 11-15', 16-20', 23-27', ~~36-40'~~.
1200 Lunch break. Pick up batteries for YSI.
1300 Sample DPT0326 at 36-40'.
1330 Sample DPT0327 at 6-10', 11-15' 16-20', 23-27' + 36-40'.
1510 Surface grout locations DPT0325-327.
1530 Sample DPT0154 at 56-60'.
1600 Surface grout locations DPT0111, 126, 135, 146, 147 + 154.
1715 Leave site.

Plans/Future Activities

183391 80%
183400 80% > IDW stored in drums until system is running. TerraTech will dispose of IDW in system at that point.

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Comments:

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Comments:

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

Project: LC54
Project No.: FO0552B
Contractors: EDS - JR Pennington and Shaun Crise
KB Labs - Tuan Lau

Date: 9-14-11
Task No.: 12*0

Work Performed

Well Installation:
Soil Borings:
DPT: 0335, 0336, 0337, 0338
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0645 Met Emily at office. Calibrated YSI & Turbidity Meter
0730 Arrive at Badging Station; Received Badge - Tuan had issues receiving badge
0754 Called CCAFS Duty Office; Go ahead with drilling
0845 Safety Mtg; Discussed COCs, Med Facility, Scope of Work, PPE
0945 Started w/ location A Main Area DPT0332
1121 Finished DPT 0335, moving to DPT 0336. Using the remaining clean rods for first two samples of DPT0336.
1153 - 1250 Lunch
1250 - 1330 Drillers decon'd all samplers and rods.
1424 Finished Sampling DPT0336, Located and begin sampling DPT0337
1551 Finished sampling DPT0337 DPT0334
1750 Finished sampling DPT0338. Grouted DPT0332 - 0335
1803 Sampled IDW 183866
1810 Filled out Appendix B
checkout with Jill and Rebecca
Leave site

Project: ~~ES~~ LC34
Project No.: ~~LC34~~ FO0952B
Contractors: KB Labs - TuanLuu
ED S - JR Penington & Shaun Cripe

Date: 9-15
Task No.: 12*0

Work Performed

Well Installation:
Soil Borings:
DPT: 0339, 0250, 0340, 0177, 0097,
~~Well Inventory~~: 0122, 0069, 0242, 0344
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

Observations/Issues of Concern

0600 Arrive at Geosyntec; Calibrate YSI. Send back YSI from yesterday and Turbidity meter.
0720 Called Duty office; OK to dig
0725 Tailgate Safety Meeting; DPT sampling, COCs, PPE, Hand auger, ~~ML~~
0919 Finished DPT ~~0336~~ 0339
0925 Decon all five Sampling screen and sheaths.
1008 Begin drilling at DPT 0250 - ~~Ka~~ TuanLuu arrives on-site
1036 Begin drilling at (F) DPT ~~0337~~ 0340
1130 Finished drilling at DPT ~~0337~~ 0340; decon 1 screen
1149 Begin drilling at DPT 0177
1154 Finish drilling DPT 0177; Decon screens (5)
1206 Break for lunch, 1305 Back from lunch
1315 Begin DPT 0097.
1342 Begin DPT ~~00~~0122 - Decon 2 screens
1415 Begin DPT 0069
1505 Begin drilling DPT 0242

Comments: ———

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

Personnel :	Scott McGuire	(SM)	TT	FOM
	Jonathan Syrek.	(JS)	KB	Lab
	Glen Pennington	(GP)	EDS	Driller
	Mitch Pennington	(MP)	EDS	Helper

Weather : 70° Cloudy
Objective : HPT's to 80'. x 6.
PPE : Level D

0710 SM at badging office to meet KB.
0715 KB arrived.
0725 KB Setting up.
0745 SM, J at LC34 EDS on site.
2 man crew. see above.
@800 H+S meeting completed. Level D PPE.
Topics: Slips Trips, Falls. Weather.
0830 KB set up. HPT 06. Equip Insp completed. (OK).
0840 SM called DUTY office. clear to dig.
0845 Hand augered to 4' to clear utilities.
0850 Begin pushing HPT 0-80'
0950 Arrive at 79.4' bls. Could not get to 80' due to the lack of rods on KB's HPT string.
1000 SM called C. Hook to let him know. He
1005 said 79.4 is fine.
Begin pulling rods.
1040 All rods out of the ground. (JS) checking HPT probe to make sure it's operational before we move to the next ~~#~~ location.
1100 Set up at RW4 for HPT 4. 0-80'.
1105 Hand augered to 4' to clear utilities.
1110 Begin HPT.
1205 Arrive @ 80.5'. Taking 30 min lunch.
1235 End Lunch. Pulling rods.
1240 Mike, Anne on site.
1300 All rods pulled.
1320 Mike and Anne leaving site. KB informed me the Ec on the probe stopped working Halfway down the hole.
1330 Per C. Hook we will redo the boring.
1400 KB took the HPT apart and checked it. He thinks it may have been a loose connection on the ec cord.

SM

1/8/13 LC34 HPT's

Cont	HPT Put back together after an operational check. Boring moved 2' then hand augered to 4' to clear utilities.
1415	Begin HPT06.
1500	Arrived at 80' bls.
1505	Pulling rods.
1540	HPT rods out. Pushing DPT rods to 80' to pressure grout.
1555	starting to pressure grout.
1645	Pressure grouting completed. Starting HPT01.
1720	Pressure grouting 1st Loc HPT01
1730	Pressure grouting completed.
1745	steam decon completed.
1800	SM, crew leaving LC34.

1/9/13

LC34 HPT's

Personnel :	Scott McGuire	(SM)	TT	FOM
	Jonathan Syrek	(JS)	KB	Chemist
	Glen Pennington	(GP)	EDS	Driller
	Mitch Pennington	(MP)	EDS	Helper

Weather : 71° Cloudy
PPE Level : D
Objective : Continue HPT's.

0645 SM at LC34.
0700 KB, EDS on site.
0715 H+S meeting completed. Level D PPE.
Topics : Slips Trips, Falls. Weather. Insects.
0720 KB generator will not start. Flooded..
will let set for a bit and try to restart.
0830 No luck with KB's Generator. We will use
the drillers generator. SM called duty office. Clear.
0845 Set up on RW05 = HPT05. Back on KB's generator.
Previously hand augered to 4' to clear utilities.
0855 Begin HPT
0955 Arrive at 80'. HPT test good.
1000 Pulling rods.
1040 Rods pulled.
1045 Begin pressure grouting. Must drive rods
back down to 80' for pressure grouting.
1130 Pressure grouting completed.
1145 Steam decon completed.
1200 Set up on RW01 = HPT06.
Previously cored and hand augered to 4'
to clear utilities.
1210 Begin HPT06.
1300 Arrive at 80'. HPT test good.
1310 Pulling rods.
1340 Rods pulled.
1350 Pushing to 80' to pressure grout.
1440 Pressure grouting completed.
1500 HPT06 area cleaned up.
1525 Steam decon completed.
1540 Set up on RW03 = HPT03.
Will not have enough time to complete
HPT and pressure grout. HPT03, 02 will be done tomorrow
1600 EDS leaving site. SM waiting to meet MJ.

L. McG

1/10/13

LC34 HPT's

Personnel : Scott McGuire (SM) Tt FOM
Tuan Luu (TU) KB Chemist
Glen Pennington (GP) EDS Driller
Mitch Pennington (MP) EDS Helper

Weather : 71°
PPE Level : D
Objective : Complete HPT's

0645 SM on site.
0700 KB, EDS on site.
0715 H+S meeting completed. Level D PPE.
Topics : Slips Trips, Falls. Weather. Heat stress.
Vehicle safety.
0720 SM called CCAFS duty office. We are clear to dig.
Previously set up on RW03 = HPT03. 80'.
Previously hand augered to 4' to clear utilities.
0740 Begin HPT03.
0830 Arrive at 80'.
0840 Pulling HPT rods.
0900 Rods pulled.
0905 Preparing to pressure grout.
0910 Pushing back down to 80' to grout.
0930 Pressure grouting completed
0945 steam decon completed.
1000 Set up on RW02 = HPT02. 80'
Previously hand augered to 4' to clear utilities.
1005 Begin HPT02.
1050 Arrive at 80'.
1055 Pulling HPT rods.
1120 Rods pulled.
1130 Pushing to pressure grout.
1230 Pressure grouting completed.
1245 Preparing to clean up and demob.
1315 EDS leaving site.
1330 SM leaving site. Dig permit left at LC34.

LC34-DPT0285	HS5	02/05/15	0825	13'	Gray	None	

SAMPLE COLLECTION INFORMATION

Analysis	Preservative	Container Requirements	Collected
VOCs (8260B)	None	Two 40 mL vials collected for analayis by ALF	X

OBSERVATIONS / NOTES

Hand Auger five feet to clear utilities
Borehole grouted through boring rods
Rig, Rods, and associated tooling decon'd with pressurized steam

Circle if Applicable:

MS/MSD	Duplicate ID No.:

Tetra Tech NUS, Inc.

PERSONNEL:	ALEX MURPHY	TE	ENGINEER	A.M.
	BRIAN NAZWORTH	GPI	DRILLER	B.N.
	JONATHAN HUMR	GPI	HELPER	J.H.

1150: A.M. ARRIVES AT LC34. GIVES NEWAGE samples from CCF

1200: GPI ARRIVES ONSITE AFTER HAVING TAILGATE LUNCH AND GONE THROUGH CAPE CANAVERAL INSPECTION.

1330: CONDUCT ONSITE H&S MEETING. Go through full site HASP

1400: GPI BEGINS BUILDING STEAM DECON PAD AND DECONNING RODS.

1440: MOBILIZING TO POINT 47.

1450: SET UP ON POINT 47. COMMENCE DRILLING TO 10' BLS. HA' to 5'.

1500: REACHED 10'. PURGE INITIATED.

1510: Sample Collected. LC34-DPT0431-008.0-20160125. Approx 1 gallon purged ↑ CLEAR. NO ODOR No Silt.

1515: Commence drilling to 15' BLS.

1520: Reached 15' BLS. Purge Initiated.

1530: Pb Sample Collected. LC34-DPT0431-013.0-20160125. Approx 1 gallon purged. ↑ CLEAR. NO ODOR No Silt.

1535: Commence drilling to 20' BLS.

1540: Reached 20' BLS. Purge Initiated.

1550: SAMPLE COLLECTED. LC34-DPT0431-018.0-20160125. Approx 1 gallon purged. ↑ slightly Silty. NO ODOR LT Gray

1555: Commenced drilling to 27' BLS.

1605: Reached 27' BLS. Purge Initiated

1615: Sample Collected. LC34-DPT0431-025.0-20160125. Approx 1 GALLON PURGED. ↑ slightly silty. NO ODOR LT Gray

1620: Commence drilling to 34' BLS.

1630: Reached 34' BLS. Purge Initiated.

1640: SAMPLE COLLECTED. LC34-DPT0431-032.0-20160125. Approx 1 GALLON Purged. ↑ SLIGHTLY SILTY. NO ODOR. LT Gray.

1645: Commence drilling to 40' BLS.

1650: Reached 40' BLS. Purge Initiated.

1700: SAMPLE COLLECTED. LC34-DPT0431-038.0-20160125. Approx 1 gallon purged. ↑ VERY SILTY. NO ODOR Gray.

1705: GROUTING THROUGH RODS TO SURFACE.

1715: NEFF KUBOTA GETS FLAT TIRE WHILE RUNNING RODS & TOOLING TO DECON AREA.

1720: A.M. A.M. CALLS NEFF. WILL NEED TO REPAIR IN THE MORNING.

1730: A.M. & GPI OFFSITE.

1522 : Commence drilling to 40' BLS.

1530 : Reached 40' BLS. Purge Initiated.

1540 : Sample Collected. LC34-DPT0449-038.0-20160201

Light Grey. Little Silt. Organic Odor. Approx 1 Gallon Purged.

1542 : Commence Grouting through rods to surface.

1550 : Rods and tooling decanned with steam while B.N. mobilizes to point 37.

1555 : Set up on Point 37. HA to 5' BLS to clear utilities.

1600 : Commence drilling to 10' BLS.

1605 : Reach 10' BLS. Purge Initiated.

1615 : Sample Collected. LC34-DPT0450-008.0-20160201

Grey. Slightly Silty. No Odor. Approx 1 Gallon Purged.

1617 : Commence drilling to 15' BLS.

1625 : Reach 15' BLS. Purge Initiated.

1635 : Sample Collected. LC34-DPT0450-013.0-20160201

Slightly Silty. Grey. Organic Odor. Approx 1 Gallon Purged.

1637 : Commence drilling to 20' BLS.

1645 : Reach 20' BLS. Purge Initiated.

1655 : Sample Collected. LC34-DPT0450-018.0-20160201

Silty. Grey. No Odor. Approx 1 Gallon Purged.

1657 : Commence drilling to 27' BLS.

1705 : Reached 27' BLS. Purge Initiated.

1715 : Sample Collected. LC34-DPT0450-025.0-20160201

Silty. Grey. No Odor. Approx 1 gallon purged.

1717 : Commence drilling to 34' BLS.

1725 : Reach 34' BLS. Purge Initiated.

1735 : Sample Collected. LC34-DPT0450-032.0-20160201.

Silty. Grey. No Odor. Approx 1 Gallon purged.

1737 : Commence drilling to 40' BLS.

1745 : Reached 40' BLS. Purge initiated.

1755 : Sample Collected. LC34-DPT0450-038.0-20160201.

Grey. Silty. No Odor

1800 : A.M. I GOT ARRIVE OFFSITE.

2-1-2016

2/2/2016 LC34 DPT GW Sampling 112g06039

Personnel: Alex Murphy TG Engineer A.M.
Brian Nazworth GPI Driller B.N.
Jonathan Hume GPI Helper J.H.

Objective: DPT GW Sampling

0730: A.M. & GPI arrive onsite. Conduct morning H&S meeting. Topics discussed: Proper Lifting Techniques, Driving on Base, Sun Protection
0735: Begin grouting DPT0450 through rods to surface.
0745: Rods & tooling decon'ed with steam while B.N. mobilizes to Point 38.
0750: Set up on Point 38. HA to 5' bls to clear utilities.
0755: Commence drilling to 10' bls.
0800: Reach 10' bls. Purge initiated.
0810: Sample Collected. LC34-DPT0451-008.0-20160202
Grey. Silty. No Odor. Approx 1 Gallon Purged.
0812: Commence drilling to 15' bls.
0820: Reach 15' bls. Purge Initiated
0830: Sample Collected. LC34-DPT0451-013.0-20160202
Grey. Slightly silty. No Odor. Approx 1 Gallon Purged
0832: Commence drilling to 20' bls.
0840: Reach 20' bls. Purge Initiated.
0850: Sample Collected. LC34-DPT0451-018.0-20160202
Grey. Silty. No Odor. Approx 1 Gallon Purged
0852: Commence Drilling to 27' bls.
0900: Reached 27' bls. Purge Initiated
0910: Sample Collected. LC34-DPT0451-025.0-20160202
Silty. Grey. No Odor. Approx 1 gallon purged.
0912: Commence drilling to 34' bls.
0920: Reach 34' bls. Purge initiated.
0930: Sample Collected. LC34-DPT0451-032.0-20160202
Slightly Silty. Slightly Organic. Grey. Approx 1 gallon purged.
0932: Commence drilling to 40' bls
0940: Reach 40' bls. Purge initiated.
0950: Sample Collected. LC34-DPT0451-038.0-20160202
very silty. no odor. Grey. Approx 1 Gallon purged.
0952: Commence grouting through rods to surface.
1000: Rods & tooling decon'ed w/ steam while B.N. mobilizes to point 39.
1005: Set up on point 39. HA to 5' bls to clear utilities.
1010: Drilling to 10' bls.
1015: Reached 10' bls. Purge initiated.
1025: Sample Collected. LC34-DPT0452-008.0-20160202
Grey. Silty. No Odor. Approx 1 gallon purged.

Rite in the Rain
Scale: 1 square =

2/2/2016 LC34 DPT GW Sampling 1129060039

0927: Commence drilling to 15' BLS.
0935: Reach 15' BLS. Purge Initiated.
0945: Sample Collected. LC34-DPT0452-013.0-20160202
0947: Grey. Slightly Silty. No Odor. Approx 1 gallon purged.
0947: Commence drilling to 20' BLS.
1055: Reach 20' BLS. Purge initiated.
1105: Sample Collected. LC34-DPT0452-018.0-20160202
Grey. Silty. No Odor. Approx 1 gallon purged.
1107: Commence Drilling to 27' BLS.
1115: Reach 27' BLS. Purge initiated.
1125: Sample Collected - LC34-DPT0452-025.0-20160202
Grey. Silty. No Odor. Approx 1 gallon purged.
1127: Commence drilling to 34' BLS.
1135: Reach 34' BLS. Purge Initiated.
1145: Sample Collected. LC34-DPT0452-032.0-20160202
LT Grey. Slightly Silty. Organic Odor. Approx 1 gallon purged
1147: Commence drilling to 40' BLS
1155: Reached 40' BLS. Purge initiated.
1205: Sample Collected. LC34-DPT0452-038.0-20160202
Grey. Very Silty. No Odor. Approx 1 gallon purged.
1207: Commence Grouting Through Rods to surface.
1215: Rods and tooling Decontaminated with steam while B.D. mobilizes to Point 40.
1220: Set up on Point 40. HA to 5' BLS and Drilling to 10' commenced.
1225: Reached 10' bls. Purge initiated.
1235: Sample Collected. LC34-DPT0453-008.0-20160202
Grey. Slightly Silty. No Odor. Approx 1 gallon purged.
1237: Commence Drilling to 15' BLS.
1245: Reach 15' BLS. Purge initiated.
1255: Sample Collected. LC34-DPT0453-013.0-20160202
Grey. Silty. No Odor. Approx 1 Gallon Purged.
1257: Commence Drilling to 20' BLS
1305: Reach 20' BLS. Purge Initiated. GPI offsite for lunch
1315: Sample Collected. LC34-DPT0453-018.0-20160202
Grey. Silty. No Odor. Approx 1 Gallon purged.
1325: GPI back onsite from lunch. Commence drilling to 27' BLS.
1330: Reach 27' BLS Purge Initiated.
1340: Sample Collected. LC34-DPT0453-025.0-20120202
LT Grey. No Silt. Organic Odor. Approx 1 gal purged.
1342: Commence Drilling to 34' BLS.

2/2/2016 LC34 DPT GW Sampling 112y06039

1350: Reached 34' BLS. Purge initiated.

1400: Sample Collected. LC34-DPT0453-032.0-20160202

Light Grey. Slightly Silty. Slightly Organic. Approx 1 gallon purged.

1402: Commence drilling to 40' BLS.

1410: Reach 40' BLS. Purge Initiated.

1420: Sample Collected. LC34-DPT0453-038.0-20160202

Dark Grey. Very Silty. No Odor. Approx 1 Gallon Purged.

1422: Commence Grouting through Rods to Surface.

1427: Rods and tooling decon'ed with steam while B.D. mobilizes to point 41.

1430: Set up on Point 41. HA to 5' BLS and commence drilling to 10'

1435: Reached 10'. Purge Initiated.

1445: Sample Collected. LC34-DPT0454-008.0-20160202

Light Grey. Slightly Silty. No Odor. Approx 1 gallon purged.

1447: Commence Drilling to 15' BLS.

1455: Reached 15' BLS. Purge Initiated.

1505: Sample Collected. LC34-DPT0454-013.0-20160202

LT Grey. Slightly Silty. No odor. Approx 1 gal purged

1507: Commence drilling to 20' BLS.

1515: Reach 20' BLS. Purge Initiated.

1525: Sample Collected. LC34-DPT0454-018.0-20160202

Light Grey. Silty. No Odor. Approx 1 gal purged.

1527: Commence drilling to 27' BLS

1535: Reach 27' BLS Purge Initiated.

1545: Sample Collected. LC34-DPT0454-025.0-20160202

Light grey. Slightly Silty. Organic Odor. Approx 1 gallon purged.

1547: Commence drilling to 34' BLS.

1555: Reach 34' BLS. Purge Initiated.

1605: Sample Collected. LC34-DPT0454-032.0-20160202

Light grey. No odor. Approx 1 gallon purged. Slightly silty.

1607: Commence drilling to 40' bls.

1615: Reach 40' bls. Purge initiated.

1625: Sample Collected. LC34-DPT0454-038.0-20160202

Very Silty. Dark Grey. No Odor. Approx 0.5 gallons purged (depth did not produce well)

1627: Commence grouting through rods to surface.

1635: Rods & tooling decanned with steam. GPI begins site preparation for next week (refueling drill rig, refilling rig with water

1700: A.M. & GPI offsite.

2/2/2016

2/8/2016 LC34 DPT GW Sampling 112g06089

PERSONNEL: Alex Murphy TE Engineer A.M
Brian Nazworth / Jonathan Hume GRI Driller / Helper B.N/J.H.

OBJECTIVE: DPT GW Sampling PPE: Level D Weather: 40°F Clear Skies

0730: A.M. ARRIVES ONSITE.

0915: GPI ARRIVES ONSITE. CONDUCT MORNING H2S MEETING. TOPICS DISCUSSED: Proper PPE, Slips trips falls, MAINTAIN HYDRATION.

0920: SET UP ON POINT 42. HA' TO 5' BLS TO CLEAR UTILITIES.

0925: COMMENCE DRILLING TO 10' BLS.

0930: REACH 10' BLS. PURGE INITIATED.

0940: Sample Collected. LC34-DPT0455-008.0-20160208
CLEAR. NO ODOR. NO SILT. Approx 1 GALLON purged.

0942: Commence drilling to 15' BLS.

0947: Reach 15' BLS. Purge initiated.

0955: Sample Collected. LC34-DPT0455-013.0-20160208
Light Grey. Slightly silty. No odor. Approx 1 Gal purged.

0957: Commence drilling to 20' BLS.

005: Reach 20' BLS. PURGE INITIATED.

1015: Sample Collected. LC34-DPT0455-018.0-20160208
GREY. SILTY. No Odor. Approx 1 GALLON PURGED.

1017: Commence drilling to 27' BLS.

1025: Reach 27' BLS. Purge initiated.

1035: Sample Collected. LC34-DPT0455-025.0-20160208
GREY. SILTY. Slightly ORGANIC. Approx 1 Gallon purged.

1037: Commence drilling to 34' BLS.

1045: Reache 34' BLS Purge initiated.

1055: Sample Collected. LC34-DPT0455-032.0-20160208
CLEAR. No Silt. STRONG ORGANIC ODOR. Approx 1 GALLON PURGED.

1057: Commence drilling to 40' BLS.

1105: Reach 40' BLS. Purge initiated.

1115: Sample Collected. LC34-DPT0455-038.0-20160208
GREY. No Odor. SILTY. Approx 1 gallon purged.

1117: Commence grouting through rods to surface.

1125: Rods & tooling deconned w/ steamwhile B.N. mobilizes to point 43.

1130: Setup on point 43, HA to 5' BLS TO clear utilities AND commence drilling to 10' BLS.

1135: Reach 10' BLS Purge initiated.

1145: Sample collected. LC34-DPT0456-008.0-20160208
Light grey. Silty. No Odor. Approx 1 gallon purged.

1147: Commence drilling to 15' BLS.

1155: Reached 15' BLS. Purge initiated.

1510: Reach 10' bls. Purge initiated.
1520: Sample Collected. LC34-DPT0462-008.0-20160209
Light grey. Slightly Silty. No Odor. Approx 1 gallon purged.
1522: Commence drilling to 15' BLS.
1530: Reached 15' BLS. Purge initiated.
1540: Sample Collected. LC34-DPT0462-013.0-20160209
Slightly Silty. Grey. No Odor. Approx 1 gallon purged.
1542: Commence drilling to 20' BLS.
1550: Reach 20' BLS. Purge initiated
1600: Sample Collected. LC34-DPT0462-018.0-20160209
Grey. Slightly Silty. No Odor. Approx 1 gallon purged.
1602: Commence drilling to 27' BLS.
1610: Reach 27' BLS. Purge initiated.
1620: Sample Collected. LC34-DPT0462-025.0-20160209
Grey. Silty. Approx 1 gallon purged. No odor.
1622: Commence drilling to 34' BLS.
1630: Reach 34' BLS purge initiated.
1640: Sample Collected. LC34-DPT0462-032.0-20160209
Grey. Slightly Silty. Organic Odor. Approx 1 gallon purged.
1642: Commence drilling to 40' BLS
1650: Reached 40' BLS. Purge initiated.
1700: Sample Collected. LC34-DPT0462-038.0-20160209
Grey. Slightly Silty. Slight Organic Odor. Approx 1 gallon purged.
1702: Commence grouting through rods
1710: Rods and tooling decanned with steam while B.N. mobilizes to point 08.
1715: B.N. SETS UP on Point 08. HA TO 5' BLS TO CLEAR UTILITIES.
1720: Commence drilling to 10' bls.
1725: Reach 10' bls. Purge initiated.
1735: Sample Collected. LC34-DPT0463-008.0-20160209
Light Grey. Slightly Silty. No Odor. Approx 1 gal purged.

2/9/2016 LC34 DPT GW Sampling 112606039

57: Commence drilling to 15' BLS and Purge Initated.

45: Sample Collected. LC34-DPT0463-013.0-20160209

Lt Grey. Slightly silty. No Odor. Approx 1 Gallon Purged.

17: Commence drilling to 20' BLS and Purge Initated.

~~15~~: 1805 Sample Collected. LC34-DPT0463-018.0-20160209

Grey. No Odor. Slightly Silty. Approx 1 Gallon Purged.

10: A.M. 3 GPI offsite.

2/9/2016

2/10/2016 LC34 DPT GW Sampling 1126 06089

PERSONNEL: Alex Murphy TE Engineer A.M.
Brian Nazworth / Jonathan Humr GRI Driller / Helper B.N. / J.H.

OBJECTIVE: DPT GW Sampling PPE: Level D WEATHER: 40°F+ Clear Skies

0730: A.M. & GPI arrives onsite. Conduct morning HSS meeting. Topics discussed: Cold weather. Proper PPE. Slips trip falls

0735: Commence drilling Point 08 to 27' BLS.

0740: Reach 27' BLS. Purge initiated.

0750: Sample Collected. LC34-DPT0463-025.0-20160210

Grey. Silty. No Odor. Approx 1 Gallon Purged

0752: Commence Drilling to 34' BLS.

0800: Reach 34' BLS. Purge Initiated.

0810: Sample Collected LC34-DPT0463-032.0-20160210

LT Grey. No Silt. Slightly Organic. Approx 1 Gallon Purged.

0812: Commence Drilling to 40' BLS

0820: Reach 40' BLS. Purge Initiated

0830: Sample Collected. LC34-DPT0463-038.0-20160210

LT Grey. No Silt. Slightly Organic Approx 1 Gallon Purged.

0832: Commence Grouting through rods to surface.

0840: B.N. mobilizes to Point 10 while J.H. decons rods & tubing.

0845: Set up on Point 10. HA to 5' BLS & commence drilling to 10' BLS.

0850: Reach 10' BLS. Purge Initiated.

0900: Sample Collected. LC34-DPT0463-008.0-20160210

LT Grey. No Silt. No Odor. Approx 1 Gallon Purged

0902: Commence drilling to 15' BLS.

0910: Reach 15' BLS. Purge Initiated

0920: Sample Collected LC34-DPT0464-013.0-20160210

LT Grey. No Silt. No Odor. Approx 1 Gallon Purged

0922: Commence drilling to 20' BLS.

0930: Reach 20' BLS. Purge Initiated.

0940: Sample Collected. LC34-DPT0464-018.0-20160210

Grey. Slightly Silty. No Odor Approx 1 Gallon Purged.

0942: Commence drilling to 27' BLS.

0950: Reach 27' BLS. Purge Initiated.

1000: Sample Collected. LC34-DPT0464-025.0-20160210

Grey. Slightly Silty. Slight Organic Odor. Approx 1 gallon purged.

1002: Commence drilling to 34' BLS.

1010: Reach 34' BLS. Purge Initiated.

1020: Sample Collected LC34-DPT0464-032.0-20160210

Grey. Slightly Silty. Slight Organic Odor. Approx 1 Gallon Purged.

1022: Commence drilling to 40' BLS.

2/10/2016 LC34 DPT GW Sampling 112g06039

:50 : Reached 40' bls. Purge Initiated.

:40 : Sample Collected. LC34-DPT0464-038.0-20160210

Grey. Very silty. No Odor. Approx 1 gallon Purged.

:42 : Commence Grouting Through rods

:50 : B.N. mobilizes to Point 04, while J.H. decons rods and tooling.

:55 : Set up on Point 04. HA to 5' bls and drilling to 10'.

:00 : Reach 10' bls. Purge Initiated.

:0 : Sample Collected. LC34-DPT0465-008.0-20160210

Grey. Slightly Silty. No Odor. Approx 1 gallon Purged.

:12 : Commence Drilling to 15' bls.

:20 : Reach 15' bls. Purge Initiated.

:30 : Sample Collected. LC34-DPT0465-013.0-20160210

Grey. Slightly Silty. No Odor. Approx 1 gallon purged.

:12 : Commence Drilling to 20' bls.

:10 : Reach 20' bls. Purge Initiated.

:50 : Sample Collected. LC34-DPT0465-018.0-20160210

Grey. Slightly Silty. No Odor. Approx 1 gallon purged.

:52 : Commence Drilling to 27' bls.

:00 : Reach 27' bls. Purge Initiated.

:10 : Sample Collected. LC34-DPT0465-025.0-20160210

Grey. Slightly Silty. No Odor. Approx 1 gallon purged.

:12 : Commence Drilling to 34' bls.

:20 : Reach 34' bls. Purge Initiated.

:30 : Sample Collected. LC34-DPT0465-032.0-20160210

Grey. Slightly Silty. Slightly Organic Approx 1 gallon purged.

:32 : Commence Drilling to 40' bls.

:40 : Reach 40' bls. Purge Initiated. GEI offsite for lunch.

:50 : Sample Collected. LC34-DPT0465-038.0-20160210

Grey. Slightly Silty. No Odor. Approx 1 gallon purged.

:10 : GEI back onsite. Commence Grouting through rods to surface

:20 : B.N. mobilizes to Point 06 while J.H. Decons rods & tooling

:25 : BN. sets up on Point 06. HA to 5' bls to clear utilities

:30 : Commence Drilling to 10' bls.

:35 : Reach 10' bls. Purge Initiated.

:45 : Sample Collected. LC34-DPT0466-008.0-20160210

Light Grey. Slightly Silty. No Odor Approx 1 gallon purged

:47 : Commence Drilling to 15' bls.

:52 : Reach 15' bls. Purge Initiated.

:00 : Sample Collected. LC34-DPT0466-013.0-20160210

Grey. Slightly Silty. No Odor. Approx 1 gallon purged

ale: 1 square = _____

2/10/2016 LC34 DPT GW Sampling 1120606039

1402: Commence drilling to 20' BLS.

1407: Reach 20' BLS. Purge initiated.

1415: Sample collected. LC34-DPT0466-018.0-20160210

Grey Slightly Silty. No Odor. Approx 1 gallon purged.

1417: Commence drilling to 27' BLS.

1425: Reach 27' BLS. Purge Initiated.

1435: Sample Collected. LC34-DPT0466-025.0-20160210

Grey. Slightly Silty. No Odor. Approx 1 gallon purged

1437: Commence drilling to 34' BLS.

1445: Reach 34' BLS. Purge Initiated.

1455: Sample Collected. LC34-DPT0466-032.0-20160210

Light Grey. Slightly Silty. Organic Odor. Approx 1 gallon purged.

1457: Commence drilling to 40' BLS.

1505: Reach 40' BLS. Purge Initiated.

1515: Sample Collected. LC34-DPT0466-038.0-20160210

Light Grey. Slightly Silty. Slight Organic Odor. Approx 1 Gallon Purged.

1517: Commence Grouting through rods to surface.

1525: B.N. mobilizes to Point 01 while J.H. decons rods & tooling.

1530: Set up on Point 01, HA to 5' BLS and drilling to 10' BLS

1535: Reach 10' BLS. Purge Initiated.

1545: Sample Collected. LC34-DPT0467-008.0-20160210

Grey. Slightly Silty. No Odor. Approx 1 gallon purged.

1547: Commence drilling to 15' BLS.

1552: Reach 15' BLS. Purge Initiated.

1600: Sample Collected. LC34-DPT0467-013.0-20160210

Clear. No Silt. No Odor. Approx 1 gallon purged.

1602: Commence drilling to 20' BLS.

1610: Reach 20' BLS. Purge Initiated.

1620: Sample Collected. LC34-DPT0467-018.0-20160210

Light Grey. Very little silt. No Odor. Approx 1 gallon purged.

1622: Commence drilling to 27' BLS.

1630: Reach 27' BLS. Purge Initiated.

1640: Sample Collected. LC34-DPT0467-025.0-20160210

Light Grey. Slightly Silty. Slight Organic Odor. Approx 1 gallon purged

1642: Commence drilling to 34' BLS.

1650: Reached 34' BLS. Purge Initiated.

1700: Sample Collected. LC34-DPT0467-032.0-20160210

Grey. Slightly Silty. No Odor. Approx 1 gallon purged.

1702: Commence drilling to 40' BLS.

1710: Reach 40' BLS. Purge Initiated.

2/10/2016 LC 34 DPT GW Sampling 112g06039

1720: Sample Collected. LC34-DPT0467-038.0-20160210
@ Light Gray. Little Silt. Slight Organic Odor. Approx 1 gallon purged.

1730: GPI 2 A.M. offsite.

2/12/2016 LC34 DPT GW SAMPLING 112G06039

PERSONNEL:	ALEX MURPHY	TE	ENGINEER	A.M.
	BRIAN NAZWORTH	GPI	DRILLER	B.N.
	JONATHAN HUNR	GPI	HELPER	J.H.

OBJECTIVE: DPT GW SAMPLING PPE: LEVEL D WEATHER: 40°F+ CLEAR SKIES

0730: A.M. & GPI ARRIVE ONSITE. CONDUCT MORNING H&S MEETING. TOPICS DISCUSSED: PROPER PPE. SLIPS TRIPS FALLS. MAINTAIN HYDRATION

0735: GPI BEGINS GROUTING LOCATION 29 THROUGH RODS TO SURFACE.

0745: RODS AND TOOLING DECONNED WITH STEAM BY J.H. WHILE B.N. MOBILIZES TO POINT 30.

0750: SET UP ON POINT 30. (LOCATION 30-20'N OF OFFSET). HA TO 5' BLS TO CLEAR UTILITIES.

0755: COMMENCE DRILLING TO 10' BLS & PURGE INITIATED.

0810: SAMPLE COLLECTED. LC34-DPT0473-008.0-20160212. LT GREY. LITTLE SILT. NO ODOR. APPROX 1 GALLON PURGED. DRILLING TO 15' BLS THEN PURGE INITIATED.

0825: SAMPLE COLLECTED. LC34-DPT0473-013.0-20160212. LT GREY. NO SIH. NO ODOR. APPROX 1 GALLON PURGED. DRILLING TO 20' BLS THEN PURGE INITIATED.

0840: SAMPLE COLLECTED. LC34-DPT0473-018.0-20160212. LT GREY. NO SIH. NO ODOR. APPROX 1 GALLON PURGED. DRILLING TO 27' BLS THEN PURGE INITIATED.

0855: SAMPLE COLLECTED. LC34-DPT0473-025.0-20160212. GREY. SLIGHTLY SILTY. SLIGHT ORG ODOR. APPROX 1 GALLON PURGED. DRILLING TO 34' BLS THEN PURGE INITIATED.

0910: SAMPLE COLLECTED. LC34-DPT0473-032.0-20160212. GREY. SILTY. NO ODOR. APPROX 1 GALLON PURGED. DRILLING TO 40' BLS THEN PURGE INITIATED.

0925: SAMPLE COLLECTED. LC34-DPT0473-038.0-20160212. GREY. SILTY. NO ODOR. APPROX 1 GALLON PURGED. COMMENCE GROUTING THROUGH RODS TO SURFACE.

0935: RODS AND TOOLING DECONNED W/ STEAM BY J.H. WHILE B.N. MOBILIZES TO POINT 31.

0940: SET UPON POINT 31. HA TO 5' BLS THEN DRILLING TO 10' BLS. (POINT 31-20'N of offset)

0950: PURGE INITIATED

1000: SAMPLE COLLECTED. LC34-DPT0474-008.0-20160212. LT GREY. NO ODOR. NO SIH. APPROX 1 GALLON PURGED. DRILLING TO 15' BLS THEN PURGING

1015: SAMPLE COLLECTED. LC34-DPT0474-013.0-20160212. LT GREY. NO ODOR. NO SIH. APPROX 1 GALLON PURGED. DRILLING TO 20' BLS THEN PURGING

1030: SAMPLE COLLECTED. LC34-DPT0474-018.0-20160212. LT GREY. NO ODOR. NO SILT. APPROX 1 GALLON PURGED. DRILLING TO 27' BLS THEN PURGING

1045: SAMPLE COLLECTED. LC34-DPT0474-025.0-20160212. GREY. SLIGHT SIH. SLIGHT ORG ODOR. APPROX 1 GALLON PURGED. DRILLING TO 34' BLS THEN PURGING

1100: SAMPLE COLLECTED. LC34-DPT0474-032.0-20160212. GREY. SILTY. NO ODOR. APPROX 1 GALLON PURGED. DRILLING TO 40' BLS THEN PURGING

1115: SAMPLE COLLECTED. LC34-DPT0474-038.0-20160212. GREY. SILTY. NO ODOR. APPROX 1 GALLON PURGED. COMMENCE GROUTING THROUGH RODS TO SURFACE

1125: COMMENCE DECONNING RODS & TOOLING BY STEAM BY J.H. B.N MOBILIZES TO POINT 25.

1130: SET UP ON POINT 20. HA TO 5' BLS TO CLEAR

1135: COMMENCE DRILLING TO 10' BLS AND PURGE INITIATED.

2/12/2016 LC34 DPT GW Sampling 1126060039

1150: Sample Collected. LC34-DPT0475-008.0-20160212. Grey. Little Silt. No Odor
Approx 1 gallon Purged. Commence drilling to 15' BLS and purge initiated.

1205: Sample Collected. LC34-DPT0475-013.0-20160212. Grey. Little Silt. No Odor.
Approx 1 gallon Purged. Commence Drilling to 20' BLS.

1220: Sample Collected. LC34-DPT0475-018.0-20160212. Grey. Little Silt. No Odor.
Approx 1 gallon Purged. GPI offsite for lunch.

1300: GPI back onsite. Commence drilling to 27' BLS and initiating Purge.

1315: Sample Collected. LC34-DPT0475-025.0-20160212. Grey. Little Silt. Organic Odor.
Approx 1 gallon Purge. Commence drilling to 34' BLS & Purge initiated.

1330: Sample Collected. LC34-DPT0475-032.0-20160212. Grey. Little Silt. No Odor.
Approx 1 gallon Purged. Commence Drilling to 40' BLS and Purging.

1345: Sample Collected LC34-DPT0475-038.0-20160212. Grey. Silty. No Odor.
Approx 1 gallon Purge. Commence grouting through rods.

1355: Rods and tooling decon'ed with steam by J.H. while B.D. mobilizes to Point 13.

1400: Set up on Point 13. HA to 5' BLS to clear utilities & drilling to 10' BLS.

1420: Sample Collected. LC34-DPT0476-008.0-20160212. Clear. No Silt. No Odor.
Approx 1 gallon Purged. Commence drilling to 15' BLS and purge initiated.

1435: Sample Collected. LC34-DPT0476-013.0-20160212. Grey. Slight Silt. No Odor
Approx 1 gallon Purged. Commence Drilling to 20' BLS and Purge Initiated.

1450: Sample Collected. LC34-DPT0476-018.0-20160212. Clear. No Silt. No Odor.
Approx 1 gallon Purged. Commence Drilling to 27' BLS & Purge initiated.

1510: Sample Collected. LC34-DPT0476-025.0-20160212. Slight Org. Little Silt. Lightbrown
Approx 1 Gallon Purged. Commence Drilling to 34' BLS & Purge initiated.

1530: Sample Collected. LC34-DPT0476-032.0-20160212. Grey. Slightly Silty. No Odor
Commence Drilling to 40' BLS and Purge Initiated.

1550: Sample Collected. LC34-DPT0476-038.0-20160212. Grey. Silty. No Odor.
Approx 1 Gallon purged. Commence grouting through rods to surface.

1605: GPI begins end of day site cleanup, including:
Unloading Trailer of supplies that will stay onsite and hooking up trailer to box truck; decanning rods & tooling with steam, Pumping water from decon pad into drums.

1630: A.M. & GPI offsite.

	Jonathan Hume	GPI	HELPER	J.H.

OBJECTIVE: DPT GW Sampling PPE: Level D Weather: 60°F+ Partly Cloudy

0730: A.M. ARRIVES ONSITE. RECEIVES CALL FROM GPI that they will be onsite @ 9a.

0935: GPI ARRIVES ONSITE. CONDUCT MORNING H2S Meeting. Topics discussed: Proper PPE, Road Safety, slips trips falls

0945: SET UP ON POINT 11. This point has been RELOCATED 15' EAST TO AVOID Gopher tortoise hole. (RELOCATED FROM SURVEYED STAKE). HA TO 5' BLS TO CLEAR UTILITIES.

0950: COMMENCE DRILLING TO 10' BLS AND PURGE INITIATED.

1005: SAMPLE COLLECTED. LC34-DPT0477-008.0-20160215. Grey. Slight Silt. No Odor. Approx 1 gallon purged. Commence Drilling to 15' BLS & Purge initiated.

1020: SAMPLE COLLECTED. LC34-DPT0477-013.0-20160215. Grey. Slight Silt. No Odor Approx 1 gallon purged. Commence Drilling to 20' BLS & Purge initiated.

1035: SAMPLE COLLECTED. LC34-DPT0477-018.0-20160215. Grey. Slight Silt. No Odor Approx 1 gallon purged. Commence Drilling to 27' BLS & Purge initiated.

1050: Sample Collected. LC34-DPT0477-025.0-20160215. Grey. Slight Silt. Slight Org. Approx 1 gallon purged. Commence drilling to 34' BLS & purge initiated.

1105: Sample Collected. LC34-DPT0477-032.0-20160215. Lt Grey. Slight Silt. No Odor. Approx 1 gallon purged. Commence drilling to 40' BLS & purge initiated.

1120: Sample Collected. LC34-DPT0477-038.0-20160215. Grey. Slight Silt. No Odor. Approx 1 GALLON PURGED. COMMENCE GROUTING THROUGH RODS TO SURFACE.

1130: RODS & TOOLING DECONNED w/ STEAM BY J.H. while B.N MOBILIZES TO Point 15.

1135: SET UP ON point 15. HA TO 5' BLS AND drilling to 10' BLS.

1150: Sample Collected. LC34-DPT0478-008.0-20160215. Lt Grey. No Silt. No Odor. Approx 1 gallon purged. Commence drilling to 15' BLS & purge initiated.

1205: Sample Collected. LC34-DPT0478-013.0-20160215. Lt Grey. No Silt. No Odor. Approx 1 GALLON Purged. Commence Drilling to 20' BLS & purge initiated.

1220: Sample Collected. LC34-DPT0478-018.0-20160215. Lt Grey. Slight Silt. No Odor Approx 1 Gallon Purged. Commence drilling to 27' BLS & Purge initiated.

1235: Sample Collected. LC34-DPT0478-025.0-20160215. Grey. Slightly Silty. No Odor Approx 1 gallon purged. Commence drilling to 34' BLS & purged initiated.

1250: Sample Collected. LC34-DPT0478-032.0-20160215. Grey. Slight Silty. No Odor Approx 1 gallon purged. Commence drilling to 40' BLS & purge initiated.

1305: Sample Collected. LC34-DPT0478-038.0-20160215. Grey. Silty. No Odor Approx 1 GALLON PURGED. GPI OFFSITE FOR LUNCH.

1410: GPI back onsite from lunch. MOBILIZING TO POINT 07.

1420: Setup on point 07. HA to 5' BLS to clear utilities

1425: Commence drilling to 11' BLS. AND purge initiated.

2/15/2016 0479 LC34 DPT GW Sampling 42906039

1440: Sample Collected. LC34-DPT0479-008.0-20160215. Grey. Silty. No Odor
Approx 1 gallon Purged. Commence drilling to 15' BLS and Purged Initiated.
1455: Sample Collected. LC34-DPT0479-013.0-20160215. Grey. Silty. No Odor.
Approx 1 Gallon Purged. Commence drilling to 20' BLS and Purge Initiated.
1510: Sample Collected. LC34-DPT0479-018.0-20160215. Grey. Silty. No Odor.
Approx 1 Gallon Purged. Commence drilling to 27' BLS & Purge Initiated.
1525: Sample Collected. LC34-DPT0479-025.0-20160215. Lt Grey. No Silt. No Odor
Approx 1 Gallon Purged Commence drilling to 34' BLS & Purge initiated.
1540: Sample Collected. LC34-DPT0479-032.0-20160215. Lt Grey. Little Silt. Org. Odor.
Approx 1 Gallon purged Commence drilling to 40' BLS & Purging
1555: Sample Collected. LC34-DPT0479-038.0-20160215. Lt Grey. No Silt. Org Odor.
Approx 1 gallon purged. ~~Commence drilling~~ to Grouting through rods to surface.
1605: Rods & tooling decanned w/ steam while B.D. mobilizes to point 12.
1610: Set up on point 12. HA to 5' BLS to clear utilities and drilling to 10' BLS.
1625: Sample Collected. LC34-DPT0480-008.0-20160215. Grey. No Silt. No Odor.
Approx 1 gallon purged. Commence Drilling to 15' BLS and Purge initiated).
1640: ~~Beach~~ 1st Sample Collected. LC34-DPT0480-013.0-20160215. Grey. No Silt. No Odor.
Approx 1 gallon purged. Commence Drilling to 20' BLS and Purge Initiated.
1655: Sample Collected. LC34-DPT0480-018.0-20160215. Grey. ~~No~~ Silty. No Odor
Approx 1 gallon purged. Commence Drilling to 27' BLS and Purge Initiated.
1710: Sample Collected. LC34-DPT0480-025.0-20160215. Grey. Slight Silt. No Odor
Approx 1 gallon purged. Commence Drilling to 34' BLS and purge initiated.
1725: Sample Collected. LC34-DPT0480-032.0-20160215. Grey. Slight Silt. No Odor
Approx 1 gallon purged.
1730: A.M. 3 GDI offsite.

2/15/2016

2/16/2016 LC 34 DPT GW Sampling 1127060039

Personnel: Alex Murphy TB Engineer A.M.
Brian Nazworth GPI Driller B.N.
Jonathan Hume GPI Helper J.H.

OBJECTIVE: DPT GW Sampling PPE: Level D Weather: 60°F Cloudy/Rainy

0730: A.M. & GPI arrive onsite. Conduct morning HSS meeting; Topics discussed: Proper PPE, Wet surfaces, Wildlife.

0735: Set back up on Point 12. Commence drilling to 40' BLS & Purge initiated.

0750: Sample Collected LC34-DPT0480-038.0-20160216. Grey. Slightly Silty. No Odor. Approx 1 gallon purged. Commence grouting through rods to surface.

0800: Rods and tooling decon'ed w/ steam by J.H. B.N. mobilizes to Point 5.

0810: Set up on point 05. HA to 5' BLS and commence drilling to 10' & purge initiated.

0825: Sample Collected. LC34-DPT0481-008.0-20160216. Grey. Silty. No Odor. Approx 1 gallon purged. Commence drilling to 15' BLS & Purge Initiated.

0840: Sample Collected. LC34-DPT0481-013.0-20160216 Grey. Silty. No Odor. Approx 1 gallon purged. Commence drilling to 20' BLS & Purge Initiated.

0855: Sample Collected. LC34-DPT0481-018.0-20160216. Grey. Silty (slightly). No Odor. Approx 1 gallon purged. Commence drilling to 27' BLS & Purge Initiated.

0910: Sample Collected. LC34-DPT0481-025.0-20160216. Lght Grey. Slightly Silty. No Odor. Approx 1 gallon purged. Commence drilling to 34' BLS. & Purge Initiated.

0925: Sample Collected LC34-DPT0481-032.0-20160216. Lght Grey. Slightly Silty. No Odor. Approx 1 gallon purged. Commence drilling to 40' BLS and purge initiated.

0940: Sample Collected LC34-DPT0481-038.0-20160216. Grey. Silty. No Odor. Approx 1 Gallon Purged. Commence ~~drilling~~ to grouting through rods to surface.

0950: Rods & Tooling decon'ed w/ steam by J.H. while B.N mobilizes to Point 14.

1000: Set up on Point 14. HA to 5' BLS, Drilling to 10' BLS and purge initiated.

1015: Sample Collected. LC34-DPT0482-008.0-20160216. Grey. Slightly Silty. No Odor. Approx 1 Gallon Purged. Commence drilling to 15' BLS and Purge Initiated

1030: Sample Collected. LC34-DPT0482-013.0-20160216. Grey. Slightly Silty. No Odor. Approx 1 Gallon Purged. Commence drilling to 20' BLS & Purge Initiated.

1045: Sample Collected. LC34-DPT0482-018.0-20160216. Clear. No Silt. No Odor. Approx 1 gallon purged. Commence drilling to 27' BLS & Purge initiated.

1100: Sample Collected. LC34-DPT0482-025.0-20160216. CS on site; AM offsite

1115 Sample Collected LC34-DPT0482-032.0-20160216 8260B

1130 Sample Collected LC34-DPT0482-038.0-20160216 8260B

1145 DPT0482 Grouted 40' to surface through rods; PH decanning

1200 Set up on DPT0483 (Location 33; 25' W o/s); hand auger 5'

1205 Drilling Commenced

1215 Sample collected LC34-DPT0483-008.0-20160216 Gray; No Odor

1225 Sample Collected LC34-DPT0483-013.0-20160216 Gray; no odor

1240 Sample Collected LC34-DPT0483-018.0-20160216 Gray; No Odor

	Chuck Sorden	TT	GEOLOGIST	C.S.
	Jeff Zeigler	GPI	DRILLER	J.Z.
	Josh Maynard	GPI	HELPER	J.M.

WEATHER: CLEAR SKIES 80°F+

PPE: LEVEL D

H3S TOPICS: PROPER PPE, ACTIVITY AROUND POTENTIALLY CONTAMINATED WATER, BREATHING ZONE MONITORING.

OBJECTIVE. DPT GW SAMPLING

0680: A.M. EN ROUTE TO LC34. PICKING UP ICE EN ROUTE.

0645: A.M. ARRIVES ONSITE. LOADING UP EQUIP & CALIBRATING PID

0650: A.M. CALLED DUTY OFFICE. GOOD TO DIG TODAY.

0700: GPI ARRIVES ONSITE. CONDUCT MORNING H2S MEETING. TYVEK SUITS HAVE BEEN ADDED TO PPE REQUIREMENTS FROM DRILLERS.

0720: COMMENCE TRIPPING OUT RODS THEN DRILLING TO 90' BLS.

0750: SAMPLE COLLECTED. LC34-DPT0657-088.0-20181018. SLIGHT SILT. TLE ODOR GREY. 4000+ ppm COMING OUT OF RODS. BREATHING ZONE 0.0ppm. DALE OUSight.

0820: SAMPLE COLLECTED. LC34-DPT0657-093.0-20181018 SILTY. SLIGHT TLE ODOR. GREY.

0850: SAMPLE COLLECTED. LC34-DPT0657-098.0-20181018. Silty. Sight TLE odor. GREY.

0900: DPT0657 PRESSURE GROUTED FROM 100' TO SURFACE THROUGH RODS. PERIODICALLY CHECKING BREATHING ZONE

0920: LOST THE DRILLING BIT TIP DOWN THE HOLE. ATTEMPTING TO RETRIEVE.

0945: GROUTING COMPLETE. BEGINNING STEAM & ALCONOX DECON

1020: FIRST ROUND OF DECON COMPLETE. STILL GETTING PID READINGS OF 2-10ppm ON EACH SAMPLER. ONE SAMPLE WAS 450ppm. DECONNING AGAIN.

1050: SETTING UP ON LOCATION 35 :0 BGS. Punching through asphalt & HA TO 5' BLS to CLEAR UTILITIES.

1100: C.S. ARRIVES ONSITE. A.M. OFFSITE; Drilling DPT0658

SAMPLE COLLECTION INFORMATION

Analysis	Preservative	Container Requirements	Collected
SW-846 8260B VOCs	None	Two (2) - 40 mL vials delivered to Mobile Lab	X

OBSERVATIONS / NOTES

All intervals purged a minimum of five (5) screen volumes (1.5 L) prior to sample collection.
Hand auger five feet to clear utilities
Borehole abandoned via pressure grouting through boring rods
Rig, Rods, and associated tooling decon'd with pressurized steam

OBSERVATIONS / NOTES

All intervals purged a minimum of five (5) screen volumes (1.5 L) prior to sample collection.
Hand auger five feet to clear utilities
Borehole abandoned via pressure grouting through boring rods
Rig, Rods, and associated tooling decon'd with pressurized steam

Circle if Applicable:

SAMPLE COLLECTION INFORMATION

Analysis	Preservative	Container Requirements	Collected
SW-846 8260B VOCs	None	Two (2) - 40 mL vials delivered to Mobile Lab	X

OBSERVATIONS / NOTES

All intervals purged a minimum of five (5) screen volumes (1.5 L) prior to sample collection.
Hand auger five feet to clear utilities
Borehole abandoned via pressure grouting through boring rods
Rig, Rods, and associated tooling decon'd with pressurized steam

SAMPLE COLLECTION INFORMATION

Analysis	Preservative	Container Requirements	Collected
SW-846 8260B VOCs	None	Two (2) - 40 mL vials delivered to Mobile Lab	X

OBSERVATIONS / NOTES

All intervals purged a minimum of five (5) screen volumes (1.5 L) prior to sample collection.
Hand auger five feet to clear utilities
Borehole abandoned via pressure grouting through boring rods
Rig, Rods, and associated tooling decon'd with pressurized steam

SAMPLE COLLECTION INFORMATION

Analysis	Preservative	Container Requirements	Collected
SW-846 8260B VOCs	None	Two (2) - 40 mL vials delivered to Mobile Lab	X

OBSERVATIONS / NOTES

All intervals purged a minimum of five (5) screen volumes (1.5 L) prior to sample collection.
Hand auger five feet to clear utilities
Borehole abandoned via pressure grouting through boring rods
Rig, Rods, and associated tooling decon'd with pressurized steam

Circle if Applicable:

SAMPLE COLLECTION INFORMATION

Analysis	Preservative	Container Requirements	Collected
SW-846 8260B VOCs	None	Two (2) - 40 mL vials delivered to Mobile Lab	X

OBSERVATIONS / NOTES

All intervals purged a minimum of five (5) screen volumes (1.5 L) prior to sample collection.
Hand auger five feet to clear utilities
Borehole abandoned via pressure grouting through boring rods
Rig, Rods, and associated tooling decon'd with pressurized steam

Circle if Applicable:

SAMPLE COLLECTION INFORMATION

Analysis	Preservative	Container Requirements	Collected
SW-846 8260B VOCs	None	Two (2) - 40 mL vials delivered to Mobile Lab	X

OBSERVATIONS / NOTES

All intervals purged a minimum of five (5) screen volumes (1.5 L) prior to sample collection.
Hand auger five feet to clear utilities
Borehole abandoned via pressure grouting through boring rods
Rig, Rods, and associated tooling decon'd with pressurized steam

SAMPLE COLLECTION INFORMATION

Analysis	Preservative	Container Requirements	Collected
SW-846 8260B VOCs	None	Two (2) - 40 mL vials delivered to Mobile Lab	X

OBSERVATIONS / NOTES

All intervals purged a minimum of five (5) screen volumes (1.5 L) prior to sample collection.
Hand auger five feet to clear utilities
Borehole abandoned via pressure grouting through boring rods
Rig, Rods, and associated tooling decon'd with pressurized steam

SAMPLE COLLECTION INFORMATION

Analysis	Preservative	Container Requirements	Collected
SW-846 8260B VOCs	None	Two (2) - 40 mL vials delivered to Mobile Lab	X

OBSERVATIONS / NOTES

All intervals purged a minimum of five (5) screen volumes (1.5 L) prior to sample collection.
Hand auger five feet to clear utilities
Borehole abandoned via pressure grouting through boring rods
Rig, Rods, and associated tooling decon'd with pressurized steam

Circle if Applicable:

SW-846 8260B VOCs	None	Two (2) - 40 mL vials delivered to Mobile Lab	X

OBSERVATIONS / NOTES

All intervals purged a minimum of five (5) screen volumes (1.5 L) prior to sample collection.
Hand auger five feet to clear utilities
Borehole abandoned via pressure grouting through boring rods
Rig, Rods, and associated tooling decon'd with pressurized steam

Circle if Applicable:

SAMPLE COLLECTION INFORMATION

Analysis	Preservative	Container Requirements	Collected
SW-846 8260B VOCs	None	Two (2) - 40 mL vials delivered to Mobile Lab	X

OBSERVATIONS / NOTES

All intervals purged a minimum of five (5) screen volumes (1.5 L) prior to sample collection.
Hand auger five feet to clear utilities
Borehole abandoned via pressure grouting through boring rods
Rig, Rods, and associated tooling decon'd with pressurized steam

Circle if Applicable:
