

Regional Modeling and Simulation for Vertiport Location Assessment

Dr. Kapil Sheth
NASA Ames Research Center

Presentation to Hillsborough County Affiliates
July 22, 2021

Motivation

Where can a vertiport be placed near Downtown Los Angeles?

Motivation

Can we assess the suitability of a vertiport near Los Angeles City Hall?

Advanced/Regional/Urban Air Mobility

- Research objectives - safety and convenience, viability, infrastructure, scalability, traffic management, and public acceptance
- Benefits - mobility, commutes and deliveries, and decreased emissions and noise, and perhaps congestion
- NASA Activities
 - ATM-X and AAM Project, AMIO*
 - ConOps, Technical Challenges, Reference Implementations, Interoperability
 - Series of simulations for UAM airspace management, high-tempo information exchange, connecting partners, and preparation for flight tests

*ATM=Air Traffic Management, AAM=Advanced Air Mobility, AMIO=AAM Mission Integration Office₄

Why NASA?

- Need: Desire for an unbiased entity to help state and local entities with modeling and simulation
- Approach: NASA works with communities to help assess vertiport locations and transfer technology
- Benefit: Common attributes access and understanding across communities
- Competition: From industry and academia, with limited data access and more resources

Regional Modeling Tool

Vertiport Suitability

- Region/city parameters
- Zoning, environmental impact, intermodal systems, etc.
- Importance of factors (rewards and penalties)
- Algorithmic aggregation and thresholding
- Location suggestions and vertiport selection
- Open architecture

Zoning Attribute

Environmental Impact

Intermodal Systems

Grid (7x7 miles), each cell (~55 meters or ~185 ft)

Intermodal Systems

Composite Suitability

Los Angeles, CA

Composite Suitability

Columbus, Ohio

Case Study

Seven locations sent to City of Columbus Planning Department.
All considered acceptable. “Pleasantly surprised!”

Regional Modeling Tool (RMT)

Demo

Regional Simulation Tool

Vertiport Assessment and Mobility Operations System (VAMOS!)

Flight of UAM Vehicles

- Selected vertiport locations
- Intent to assess feasibility of flight
- Route structure between locations
- Simulation of vehicle flight (models, winds, etc.)
- Impact on environment (noise)
- Assess frequency and density across any part of the US
- Reiterate with modeling tool, as necessary!

Flights between Vertiports in Los Angeles

Modeling with WorldWind; Simulation can connect to TestBed

Flights between Vertiports in Florida

Vertiports placed in Tampa, Orlando, and Fort Myers, FL

Flights between Vertiports in Ohio

Direct routes

Along freeway corridors

VAMOS!

Demo

Surfaces

Ongoing work...

- CONUS-based experience
 - Go anywhere within the US
 - On-Demand data availability
- Temporal data handling
 - Specific data sets: road congestion, demand, etc.
 - Display and compute capability
- Iterative intelligence
 - Integration of modeling and simulation tools
 - User in the loop
- Patent pending...

Questions?

(Kapil.Sheth@nasa.gov)

Current Interest

- Three types of entities
 - Regional, FAA
 - Vertiport developers
 - Vehicle manufacturers
- Researchers
 - Noise modeling
 - Surface mobility data
 - Ground congestion information
 - Vehicle flight route structure

Composite Suitability Threshold

It is undesirable to place a vertiport between N. Spring St. and N. Broadway, downtown LA

Solution

It is not a good location for a vertiport

Ongoing work...

- Partnership with Tampa Bay Area-Florida
 - Adaptations for Tampa, Temple Terrace, and Plant City
 - Possibly collaborate with St. Petersburg, Orlando as well
- New adaptations for
 - Cincinnati, Cleveland, Dayton, Canton-Akron, and Toledo
 - Exploring infrastructure for entire State of Ohio
- Detailed analysis of two potential locations for City of Los Angeles
- Implementing flight corridors (e.g., path along freeways) and noise footprints

Train Station Criterion (A_i)

Importance of attribute as a function of distance
(or as a function of time)

Composite Suitability

Suitability function, S:

$$S = \sum (W_i * A_i) / \sum W_i$$

$$\begin{aligned} S = & (\quad 4 * \text{Noise} \\ & + 5 * \text{Zoning} \\ & + 5 * \text{Power Grid} \\ & + 3 * \text{Ground Congestion} \\ & + 3 * \text{Train Stations} \\ & + 4 * \text{Hospitals} \\ & + 5 * \text{Fire Stations} \\ & + 1 * \text{Sports Venues}) \\ & / 30 \end{aligned}$$
