DELTA: An Open-Source Framework to Simplify Deep Learning with Satellite Imagery

Michael von Pohle, Brian Coltin, Scott McMichael, Michael Furlong

LaRC Data Science Expo – 07/15/2021

https://github.com/nasa/delta

DELTA Helps Address Two Big Problems

- Labor and time intensive preprocessing, postprocessing, and boilerplate code to turn satellite imagery into an MLready dataset
- Difficulty in applying trained models to satellite imagery.
 Especially in the earth science community among those with limited ML experience

https://www.forbes.com/sites/gilpress/2016/03/23/data-preparation-most-time-consuming-least-enjoyable-data-science-task-survey-says/?sh=4a745d706f63

A Few Notes on Satellite Imagery

- Single images are often 1GB+ 10k x 10x pixels or more
- A dataset of imagery can easily be several hundred GBs in size
- Often hyperspectral more than RGB
- Can include metadata layers alongside data layers
- May not be rectangular

DELTA Features

- Works with any geospatial imagery/data that GDAL supports
- Has support for unpacking and preprocessing a growing list of common raw satellite imagery sources (Worldview, Sentinel, Landsat)
- Has a collection of common image preprocessing functions
- Performs tiling of imagery, training/inference, and restitching of predictions with adjustable overlap
- Works with h5 and SavedModel model formats
- Uses human readable YAML config files

- Has single node multi-GPU support
- MLFlow/TensorBoard integration
- Modular and extensible for adding custom image formats/layers/losses/metrics/callbacks /augmentations/preprocessing functionality
- Can import ImageryDataset class for use in your own framework to leverage DELTA's imagery handling anywhere you used Tensorflow Dataset

Example: Mapping clouds with Landsat-8 images

- Using USGS SPARCS dataset Landsat 8
- Demonstrate:
 - Ease of ingesting imagery and labels for ML setup
 - Ease of applying trained models to imagery
 - Ease and customizability for training and inference both for ML scientists and less experienced domain scientists
- Jupyterlab demo

Example: Flood mapping with Worldview imagery – IRONFIST project

- Using multiple satellite imagery sources: Worldview, Sentinel, possibly others
- Trying to segment flooded areas in satellite imagery
 - Rapid disaster response
 - Create downstream labeled earth science data products
- IRONFIST project participants:
 - NASA: Brian Coltin, Scott McMichael, Michael von Pohle
 - USGS: John Jones, Jack Eggleston, Rachel Sleeter, Ryan Longhenry, Dean Mierau, Brenda Ellis, Apoorva Shastry
 - NGA/NCSA: Kevin Dobbs, Jim Phillips
 - U of A: Zhe Jiang, Arpan Man Sainju
 - U. Syracuse: Liz Carter
