Forebody

- Two aerothermal sensors collocated on backshell.

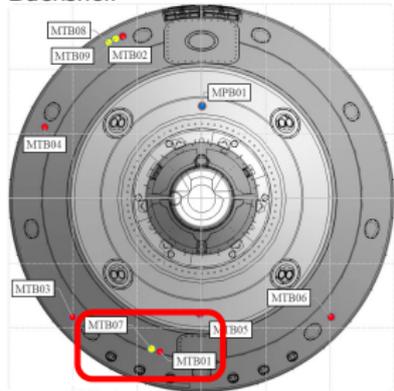

MTB01

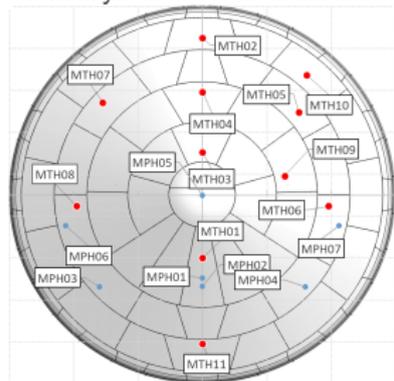

MTB07

Backshell

- MTB01: SLA-561V sensor plug – in depth thermocouple measurements.
- MTB07: Heat flux gauge – direct measurement of total heat flux.

- SLA-561V sensor plug
 - Surface temperature and heating derived from inverse analysis based on material response models.
 - Derived measurements are subject to modeling errors.

Goal

Develop a framework for processing all three measurement sources simultaneously, considering the various sources of measurement errors.

- SLA-561V sensor plug
 - Surface temperature and heating derived from inverse analysis based on material response models.
 - Derived measurements are subject to modeling errors.
- Heat flux gauge
 - Copper housing acts as a heat sink.
 - Cold wall heat flux measurement.

Goal

Develop a framework for processing all three measurement sources simultaneously, considering the various sources of measurement errors.

- SLA-561V sensor plug
 - Surface temperature and heating derived from inverse analysis based on material response models.
 - Derived measurements are subject to modeling errors.
- Heat flux gauge
 - Copper housing acts as a heat sink.
 - Cold wall heat flux measurement.
- Radiometer
 - Measurement is subject to attenuation due to ablation products depositing on the sapphire window.

Goal

Develop a framework for processing all three measurement sources simultaneously, considering the various sources of measurement errors.

*Kalman Filtering*¹ is a statistical algorithm for state estimation using measurements through time.

- Also known as *linear quadratic estimation*.
- Produces estimates of unknown states which can be more accurate than single measurements.
- Useful when many noisy measurements are present and the best estimation of some states are desired.

For a nonlinear system the *extended* Kalman filter is required, where $A = \frac{\partial f(x)}{\partial x}$ and $H = \frac{\partial h(x)}{\partial x}$.

Filter model:

$$\dot{\mathbf{x}} = \mathbf{f}(\mathbf{x}, t) + \mathbf{B}u$$

Filter model:

$$\dot{\mathbf{x}} = \mathbf{f}(\mathbf{x}, t) + \mathbf{B}\mathbf{u}$$

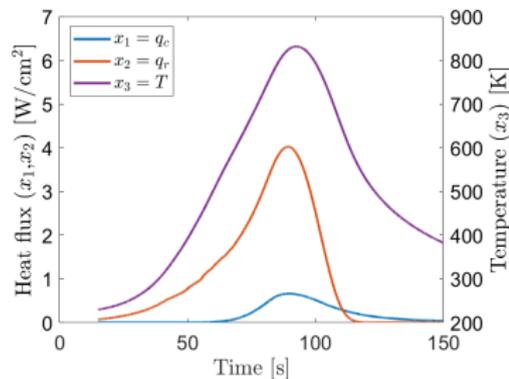

Convective/radiative heating correlations:

$$q_c = A_c \rho^{B_c} V^{C_c}$$

$$q_r = A_r (\rho_{CO})^{B_r} (\rho_{CO_2})^{C_r} T^{D_r}$$

Surface temperature based on energy balance without blowing or ablation:

$$\dot{T} = c_1 (q_c + c_2 q_r) - c_1 c_3 \kappa (T^4 - c_4^4)$$

Filter model:

$$\dot{\mathbf{x}} = \mathbf{f}(\mathbf{x}, t) + \mathbf{B}\mathbf{u}$$

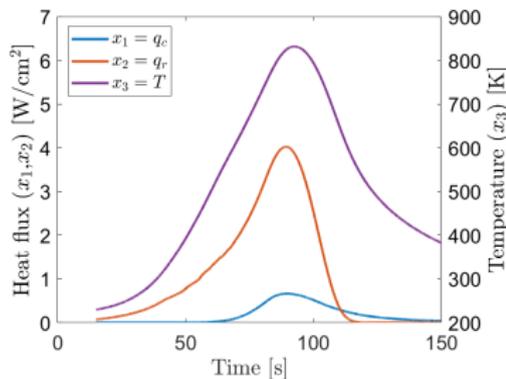

Convective/radiative heating correlations:

$$q_c = A_c \rho^{B_c} V^{C_c}$$

$$q_r = A_r (\rho_{CO})^{B_r} (\rho_{CO_2})^{C_r} T^{D_r}$$

Surface temperature based on energy balance without blowing or ablation:

$$\dot{T} = c_1 (q_c + c_2 q_r) - c_1 c_3 \kappa (T^4 - c_4^4)$$

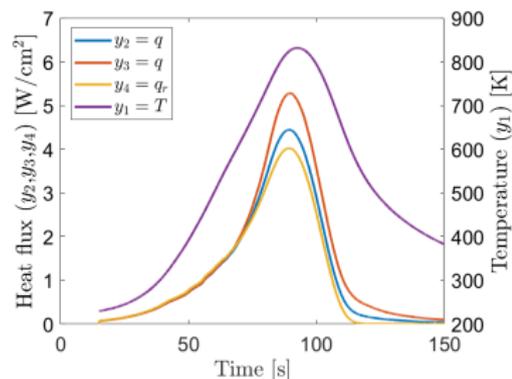

Process model:

- x_1 : Convective heat rate
- x_2 : Radiative heat rate
- x_3 : Surface temperature
- $x_4 - x_7$: Multiplicative error states

$$\mathbf{x} = \begin{bmatrix} q_c \\ q_r \\ T \\ x_4 \\ x_5 \\ x_6 \\ x_7 \end{bmatrix}, \quad \mathbf{u} = \begin{bmatrix} \dot{q}_c \\ \dot{q}_r \end{bmatrix}, \quad \mathbf{f} = \begin{bmatrix} 0 \\ 0 \\ \dot{T} \\ 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}, \quad \mathbf{B} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \end{bmatrix}$$

Measurements:

2 Methods

3 Results

4 Conclusions

Conclusions:

- Developed a Kalman filter framework which blends aerothermal measurement data of different types of sensors.
- Filtering approach applied to a location with three colocated sensors and another with two colocated sensors.
- Overall results show higher peak heating than predicted by previous correlations.
- Filter predicted an estimate of radiometer blockage due to ablation products comparable to previous predictions.

Conclusions:

- Developed a Kalman filter framework which blends aerothermal measurement data of different types of sensors.
- Filtering approach applied to a location with three colocated sensors and another with two colocated sensors.
- Overall results show higher peak heating than predicted by previous correlations.
- Filter predicted an estimate of radiometer blockage due to ablation products comparable to previous predictions.

Future work:

- Further investigate cold wall correction factor.
- Develop future applications of this approach for aerothermal problems.
