(not to scale)

Open Question: How does a Black Hole's "sphere of influence" affect the heliosphere?

Can you hear me?

(not to scale)

Common Fundamental Processes

- Turbulence
- Wave-Particle interactions
- Kinetic Instabilities
- Evolution of Particle Velocity Distribution Functions (VDFs)
- Dust
- Magnetic Reconnection
- Shocks
- Much more!

Parker Solar Probe is supporting an ongoing investigation...

1. *Who* is involved in the story of macro-scale to micro-scale cosmic energy flow?
2. *What* is the nature of the mechanisms mediating cross-scale energy transfer?
3. *Why* do kinetic-scale features show signatures of macroscale processes?
4. *When* does cross-scale energy transfer occur?
5. *Where* in the heliosphere can we witness it?
6. *How* does cosmic energy flow heat plasmas?

*Top-level PSP Science
Question (Fox, 2016)*

The story of a proton beam

Departures from local thermodynamic equilibrium in particle velocity distribution functions (VDFs) can provide free energy for wave generation

Non-Maxwellian features, such as beams, have been observed by SPAN-I, a subset of the particle instrument suite, SWEAP

→ 3D ion distributions with mass discrimination

Simultaneous electromagnetic field data from FIELDS shows hints of energy transfer via wave-particle interactions

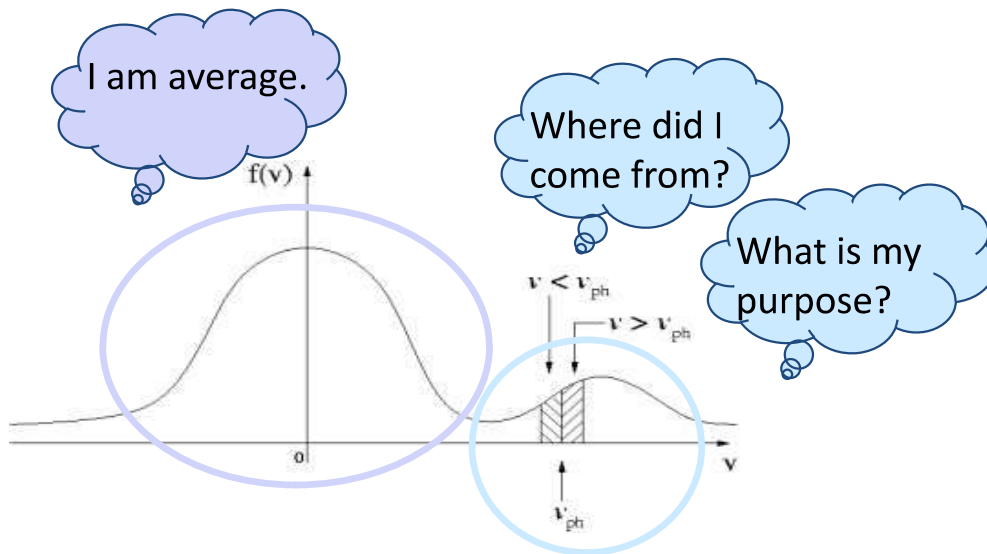

Fig. 2. SPAN-I: (a) Top-hat design (b) Highlighted on PSP within green circle (c) Close-up taken in lab (at SSL)

[Livi et al, 2021]

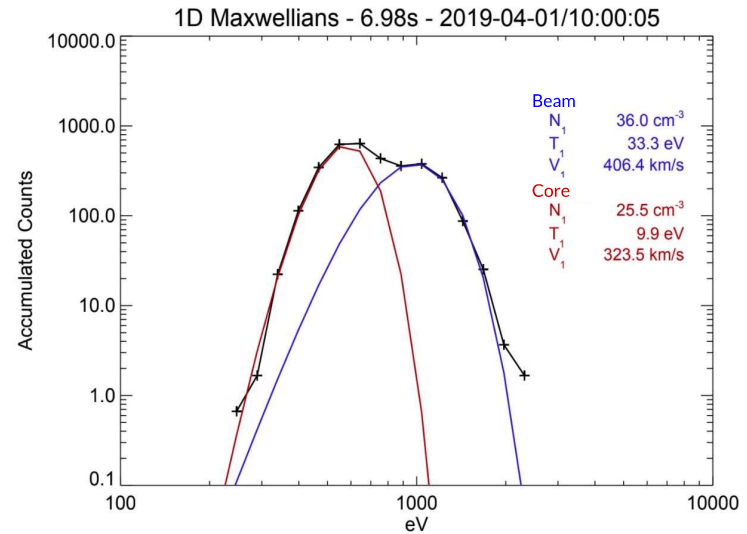

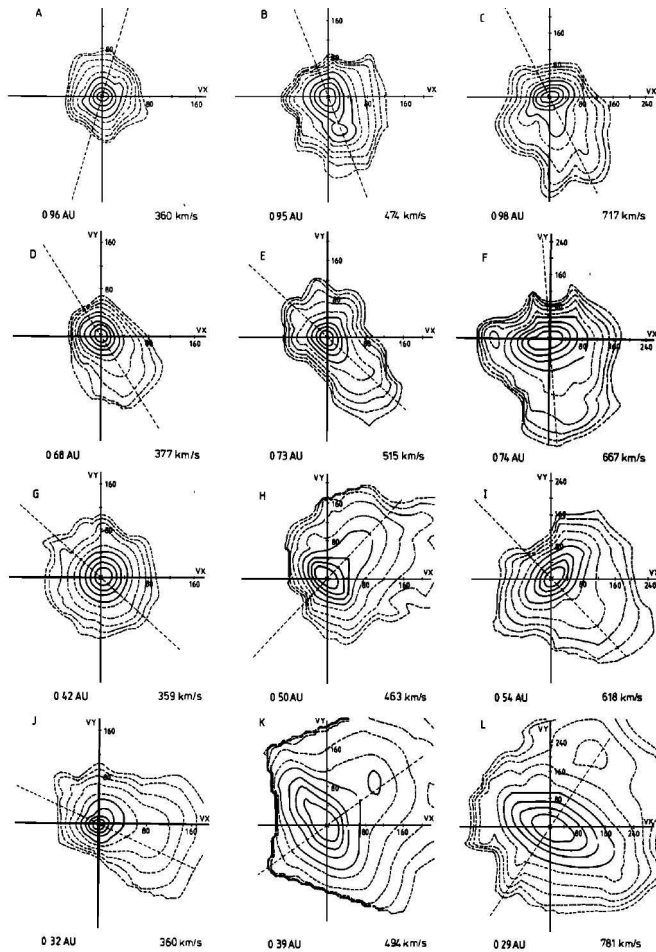

Example non-Maxwellian feature, a bump-on-tail instability that could lead to wave growth. Particles moving slightly slower (faster) than the wave phase velocity can participate in resonant interaction, leading to energy transfer from the particles to the wave.

Turbulence in the Near-Earth Solar Wind

Ultimate goal:
To understand the **dynamics** and **energetics** of the entire cascade, from **large scale** turbulent motions to **plasma heat**

But what about electron beam (strahl)?

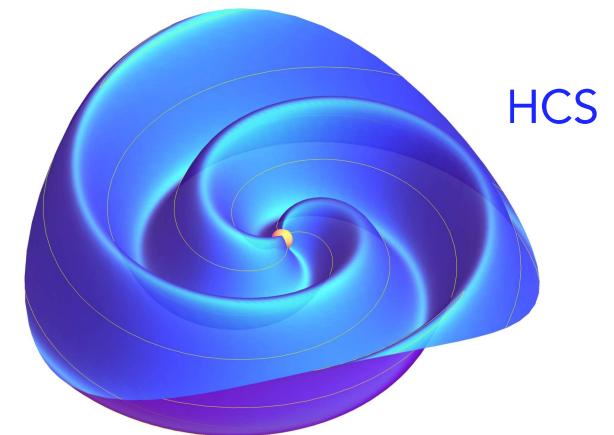

Electron VDF components. Credit: M. Pulupa

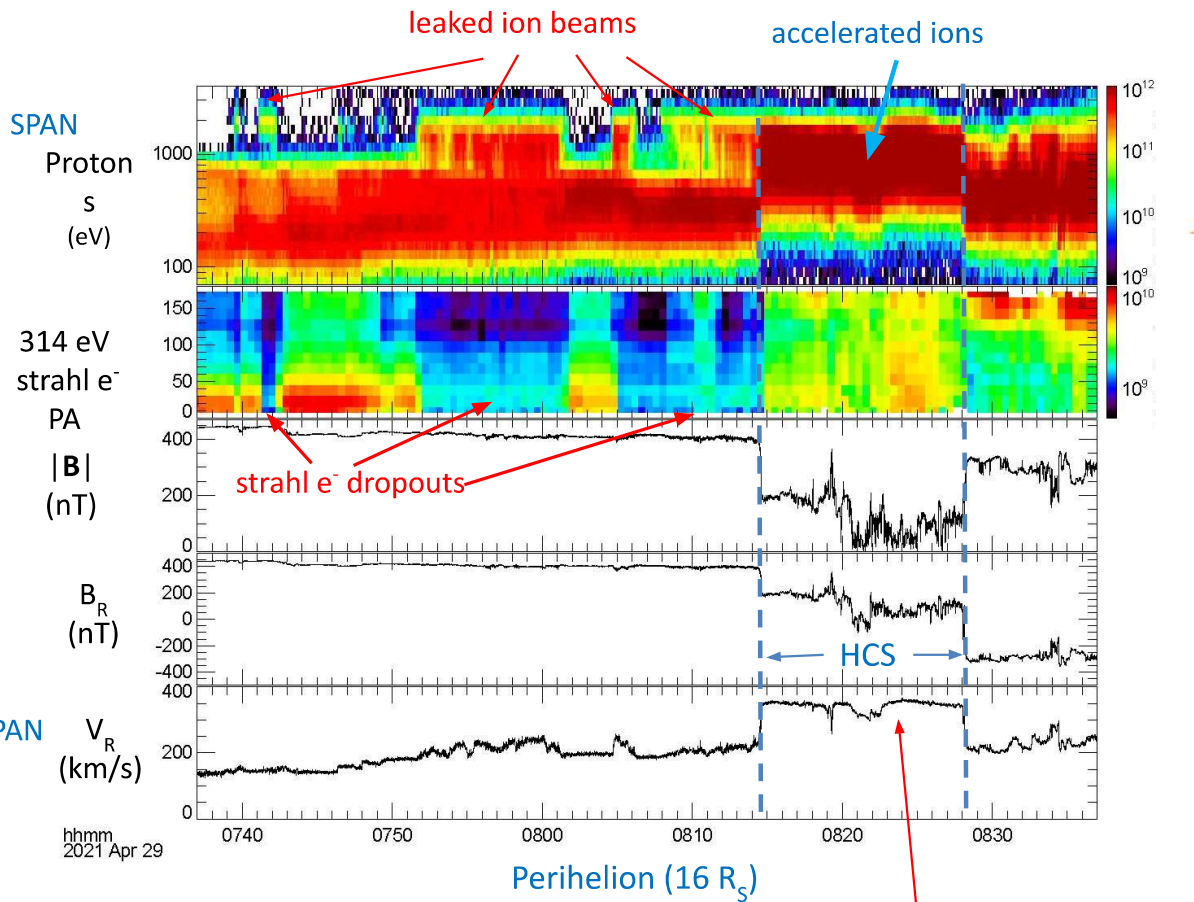

Behaviour of electron strahl indicates magnetic connection to Sun

The electron VDF participates in electron-scale wave-particle instabilities

The electron VDF is known to depend on location from Heliospheric Current Sheet (HCS)

PSP Encounter 08 HCS at 16 R_s : Reconnection producing high-energy proton beams observed around the HCS

Evidence for proton beams originating from the HCS exhaust:

- Same upper energy

- Energy dispersion

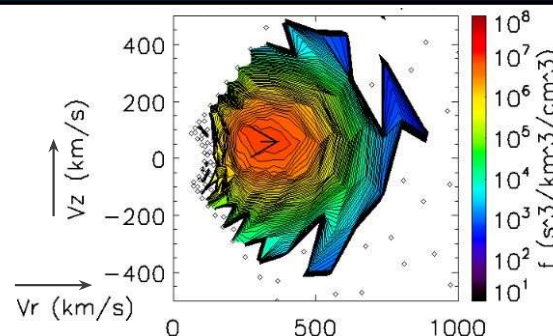

- Strahl electron dropouts implying disconnection from Sun

Electrostatic wave activity

The proton beam provides macro-scale context

If proton beam intensity is connected to HCS, and electron strahl is connected to corona, then the proton beam is providing context for coronal field line connections

Closer to the Sun, we expected stronger acceleration of particles
→ more available energy for cosmic information flow

Not expected: Close to the HCS we have more energy scattering and leakage
→ could be a significant energy driving region

Ion heat flux (both protons and alphas) may play a more significant role in energy transfer within the HCS and associated rxn

Which instabilities (fluid and kinetic scale) are responsible for what and why?
Tearing mode? 2-fluid? Ion Acoustic? Ion Cyclotron?

Mysteries and opportunities await us in the HCS

The HCS is more dynamic than previously thought
... *simple picture needs to be revisited!*

Can we infer the inherent 3D nature and non-steady state dynamics of the HCS?

HCS dynamics appear similar to the *magnetotail* (and *heliotail?*). PSP data provides ample opportunities to assess the universality of magnetic reconnection, shocks, instabilities, across the *ocean of plasma regimes*...

Toward a new coordinate system for optimally extracting (a)symmetries leading to multi-scale, explosive energetic phenomena: The Mobius Transformation

Seemingly uncorrelated data :(

Re-organization of data shows pattern :)

Möb: E8 'sine waves' with 'line-like' transform

1. $f_0 = \text{mov}(B_R - iB_N)$

2. $f_0 = \text{mov}(B_R) - \text{mov}(iB_N)$

3. $f_6 = (f_0 + |B|)/(f_0 - |B|)$

||

||

E8 transformation

*The Mobius Transformation Applied to PSP Heliospheric Current Sheet Crossings Reveals **Singularity** at Multiple Scales:*

Diagnostic for Generalized Discontinuities in any Heliospheric Regime Associated With Magnetic Reconnection, Magnetic Field Topological Change, Plasma Instability, Nonlinear Dynamics, Shocks, Resonant Wave-particle Interactions, etc ..

/(Input*c+d)

Where does the cosmic energy flow?

We are on our way toward connecting micro to macro scale physics in the inner heliosphere!

How do those asymmetries contribute to energy transfer and plasma heating?

What is the origin of the VDF asymmetries?

VDFs may show energy flow signatures via: wave-particle interactions, solar stream sources, HCS proximity, reconnection (topological changes)...

$$\begin{aligned} x &= B_{\text{radial}} \\ y &= B_{\text{tangential}} + B_{\text{normal}} \\ z &= x + iy \end{aligned}$$

Step 1 3a \Rightarrow a3

Step 3
b3 \Rightarrow b3

$$w = (z+|B|)/(z-|B|)$$

Step 2 a3 \Rightarrow b3

29-Apr-2021 E8 PSP B-field 4s=10³ pt avg

The future of heliophysics is trans-disciplinary

Astro ?

Trans-Disciplinary - Higher Level Synthesis

Inter-Disciplinary - Interactive

Multi-Disciplinary - Additive

Disciplinary - Silos

Think big!
Thanks :)
