FY22 Highlights

Standards & Policy and Guideline Development

Development of a NASA Engineering and Safety Center (NESC) Technical Assessment Report

- Title: ***Recommendations on Use of Commercial-Off-The-Shelf (COTS) Electrical, Electronic, and Electromechanical (EEE) Parts for NASA Missions***
- Phase II of Assessment includes more government agencies (FAA, NAVSEA, MDA, etc.) and manufacturers to discuss COTS manufacturing
 - Objectives are to define term *Industry Leading Parts Manufacturers*, understand methods that manufacturers use to measure quality, assurance, and reliability, and to develop flows for part verification based on mission classification.
 - Phase II Report: <https://ntrs.nasa.gov/citations/20220018183>

NASA Current Practice/Approach

- **Definitions**

- **COTS Part:** A part for which the manufacturer solely establishes and controls specifications for configuration, performance, quality, and reliability. This includes design, materials, processes, assembly, and testing with no Government-imposed requirements (i.e., no Government oversight).
- **NASA-screened COTS part:** A COTS part that, after procurement, is screened, and in many cases qualified, per NASA Agency, Center, or Program parts requirements documents, such as EEE-INST-002 or equivalent documents, by NASA, NASA contractors, a third-party, or the part manufacturer.

- **Process for Standard vs non-standard parts**

- Primarily specific classes of MIL-SPEC parts, are considered "standard". Standard parts typically are used without further testing ("use-as-is").
- All other parts, including COTS parts, are nonstandard. Nonstandard parts are subjected to initial screening and subsequent lot acceptance testing of representative samples from each procured lot per MIL-SPEC or similar requirements. Parts that pass these screens are then considered NASA-screened COTS parts.

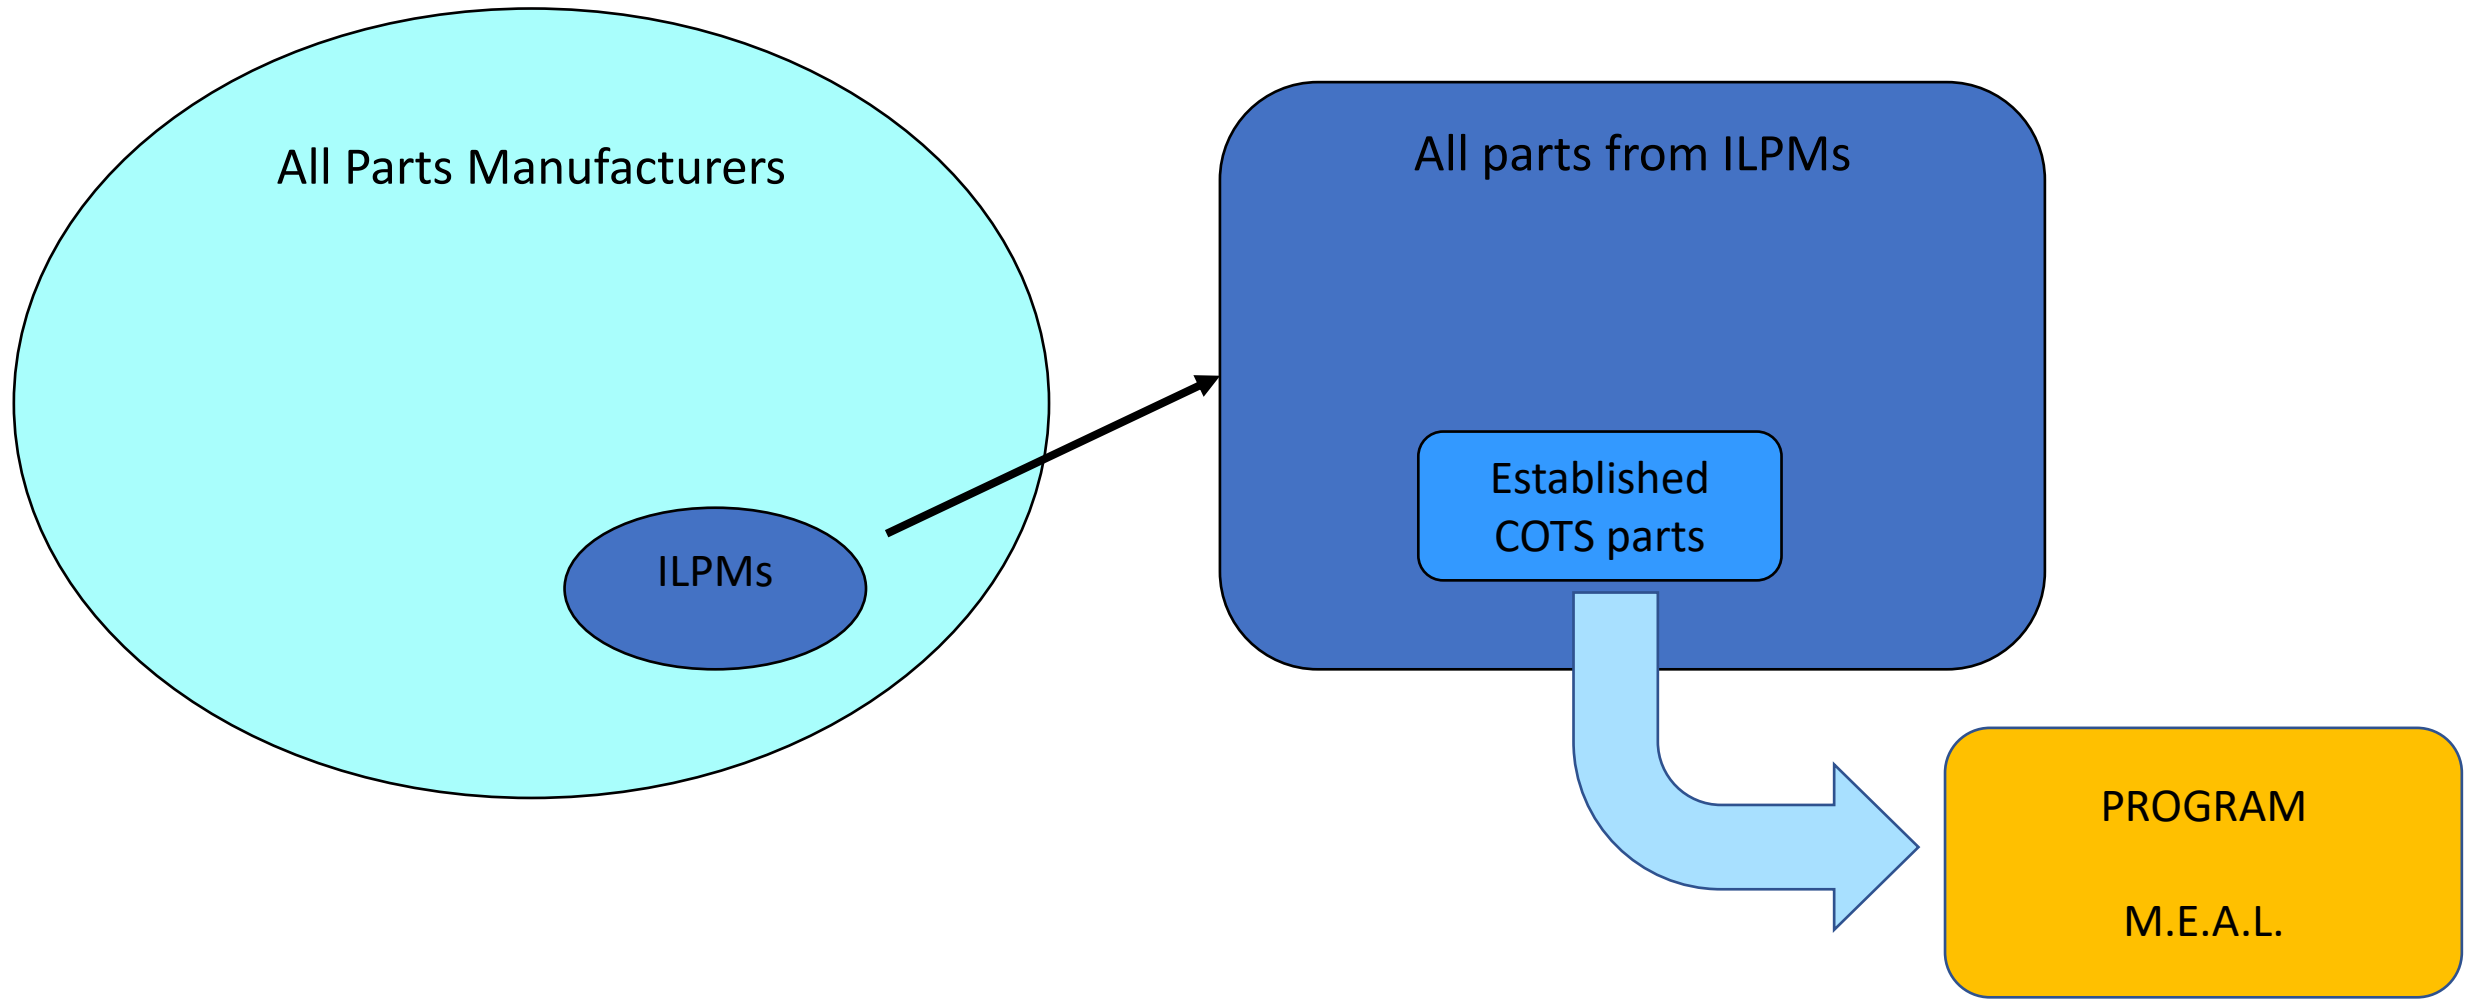

New Terminology Defined

- Phase I defined an *Industry Leading Parts Manufacturer (ILPM)*
 - A parts manufacturer with high volume automated production facilities and which can provide documented proof of the technology, process, and product qualification, and its implementation of the best practices for “zero defects” for parts quality, reliability and workmanship.
 - Take advantage of what commercial industry does the best - high volume automated production and best practices for “zero defects.”
- Phase II
 - Define additional terminology “Established COTS parts.”
 - Provide characteristics and criteria of an ILPM and part-level verification criteria for NASA missions.
 - Phase II recommendation is to select Established COTS parts category from ILPMs; updated from Phase I recommendation of “select parts from ILPMs”.

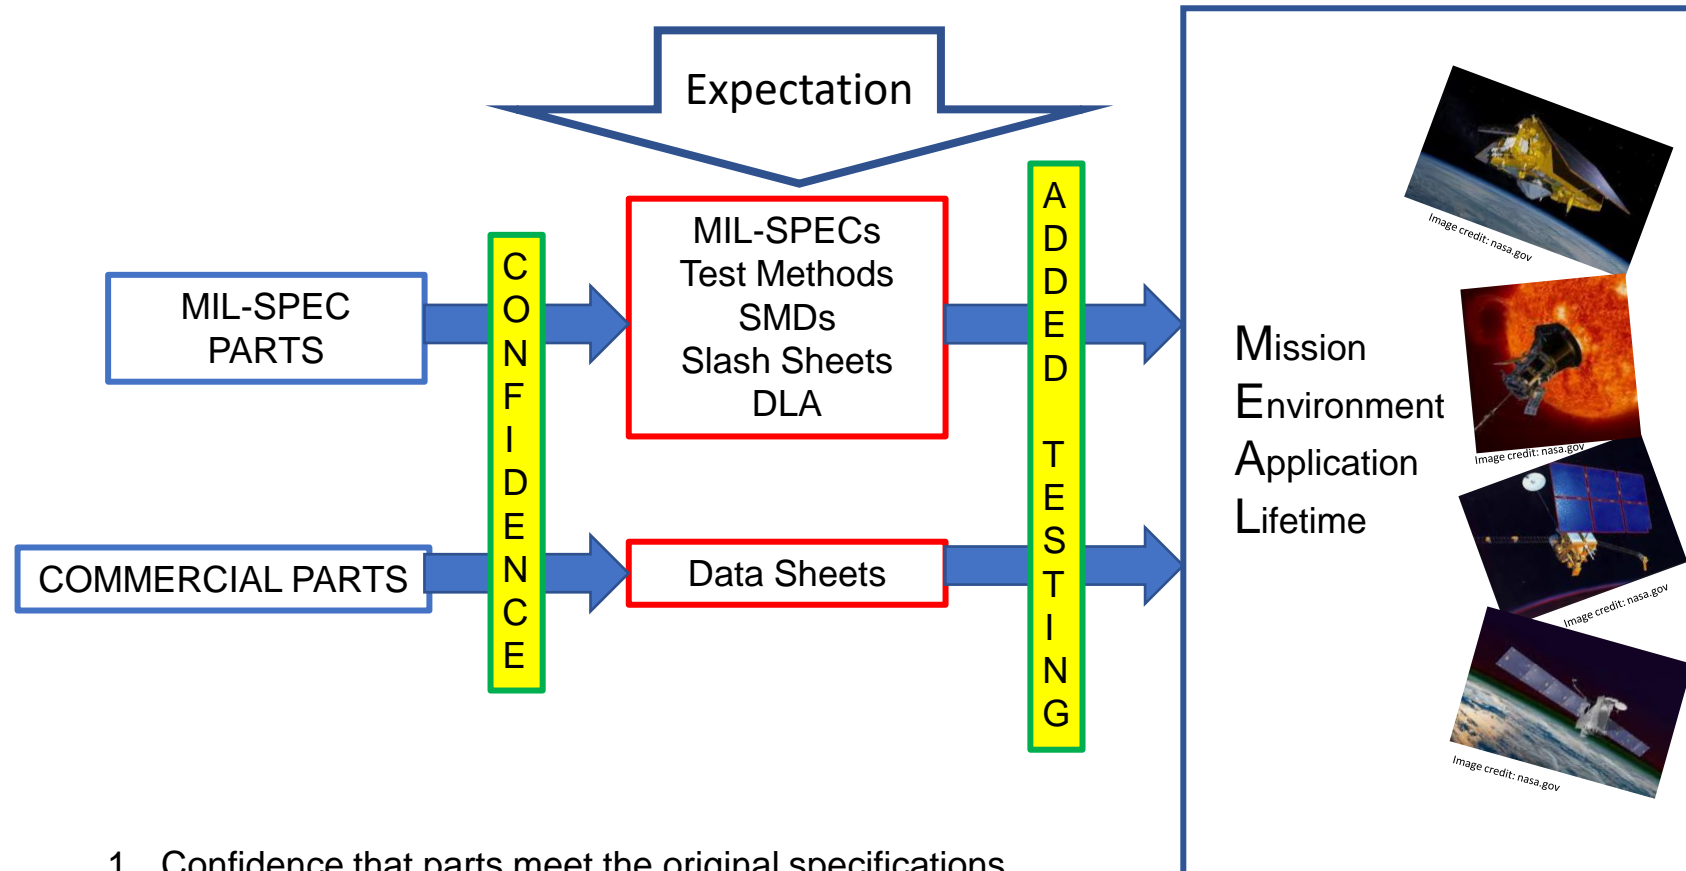

Big Picture

Concerns for Picking Parts

1. Confidence that parts meet the original specifications.
2. Analysis to ensure mission requirements are being met, especially if requirements are above data sheet/SMD limits.
3. Added testing should be done with extreme caution

Criteria for an ILPM

1. An ILPM may have various COTS part categories and must have at least one Established COTS Part category.
2. An ILPM is willing to share parts quality and reliability data with NASA, including estimated production DPPM (defective parts per million), field failure DPPM and/or part failure rates (FITs), and how those statistics are derived.
3. An ILPM is willing to provide NASA documents substantiating parts quality and reliability.
4. An ILPM is willing to allow NASA to visit on-site and/or to work with NASA or prime contractors to maintain a strong customer-manufacturer relationship.

New Terminology Defined - Established COTS Part

1. Produced using processes that have been stable for at least **one year** so there are enough data to verify the part's reliability;
2. Produced in **high volume**. High volume is defined as a series of parts sharing the same datasheet having a combined sales volume over **one million parts** during the part's lifetime;
3. **100% electrically tested** per datasheet specifications at typical operating conditions in production prior to shipping to customers. Additionally, the manufacturer must have completed multi-lot characterization over the entire set of operating conditions cited in the part's datasheet, prior to mass production release. Thus, production test limits are set for typical test conditions sufficient to guarantee that the parts will meet all parameters' performance specifications on the datasheet;
4. Produced on **fully automated production lines** utilizing statistical process control (SPC), and undergoes in-process testing, including wafer probing for microcircuits and semiconductors, and other means appropriate for other products (e.g., passive parts). These controls and tests are intended to maintain process tolerances and eliminate defective parts at various stages of production
5. Demonstrated **consistent yield** trend appropriate for high volume commercial technologies at that technology node.

Flow for Using COTS Parts for All Mission Risk Classifications

Notional Flow for using COTS Parts for all Mission Risk Classifications

COTS parts for all mission Classifications (Sec. 7.2): *Project Managers* evaluate and decide EEE part options based on the project risk classification using a holistic approach, per recommendations:

- Class A/B + Human rated:** "MIL parts-based design" approach, i.e., most of parts are MIL parts. Only select COTS parts when MIL parts cannot meet requirements or are not available
- Class C:** "MIL-SPEC parts-based design" approach or "system of COTS" approach or a combined approach
- Class D/Sub-D:** "system of COTS" approach, i.e., most should be Established COTS parts from ILPMs

Architecture & Design Approaches (Sec. 7.2.2, 7.2.3): *Avionics Engineers, Circuit Designers & Radiation Engineers*

COTS Parts Selection (Sec. 7.2.2, 7.2.3, 7.2.9): *Circuit Designers, Parts Engineers & Radiation Engineers* proactively collaborate early & often in selecting parts:

COTS Parts Procurement (Sec. 7.2.2): *Parts Engineers & Procurement Specialists* procure parts from OCMs or authorized distributors:

Radiation Hardness Assurance (Sec. 7.2.9): *Radiation Engineers & Circuit Designers* perform RHA as needed

Parts-Level Verification (Sec. 7.2.4-7.2.6): *Parts Engineers* verify Parts at part-level

Part-level verification may result in recommending using a NASA-Screened COTS part, if the part cannot be verified as an Established COTS part from an ILPM.

Board- and box-level verification (Sec. 7.2.4-7.2.6): *Circuit Designers* and/or *Avionics Engineers* perform board- and box-level verifications

Ready for higher-level integration and testing (I&T)

Parts-Level Verification (details in 7.2.4-7.2.6): *Parts Engineers* to verify COTS Parts at parts-level

Class A/B + Human-rated Missions (details in 7.2.6)

Class C (details in 7.2.5)

Class D/Sub-D (details in 7.2.4)

For COTS parts, verify the following:

- Part manufacturer is an ILPM (details in 7.1.3, 7.2.4-7.2.6).
- Part is an Established COTS part from the ILPMs (details in 7.1.3, 7.2.4-7.2.6).
- Add or modify additional testing to address MEAL, if necessary (details in 7.2.4-7.2.6).

Additional part-level verification (details in 7.2.6):

- If EEE-INST-002 required tests are not performed by the ILPM, use one of the following methods:
 - Use NASA-Screened COTS approach, **OR**
 - Determine which ILPM practices may relate to EEE-INST-002 required tests.
- Perform DPA/CA (details in 7.2.7) on sampled parts from each procured lot for each part type.

Board- and box-level verification (details in 7.2.5-7.2.6): *Circuit Designers* and/or *Avionics Leads* perform board- and box-level verification.

NASA current practices for board- and box-level verification.

Additional part-level verification (details in 7.2.5):

- If using "MIL-SPEC parts-based design" approach, follow Class A/B mission verification process.
- If using "system of COTS" approach, follow Class D/Sub-D mission verification process **PLUS** DPA/CA
- Mission verification tailored for a combined approach.

NASA current practices for board- and box-level verification.

Board- and box-level verification (details in 7.2.4): *Circuit Designers* and/or *Avionics Leads* to perform board- and box-level verification.

Build multiple boards and boxes and perform a large amount of board- and box-level testing early-on in the design cycle to verify parts, design, hardware and interfaces.

Radiation Concerns

- Parts levels in EEE-INST-002 and equivalent documents do not indicate the level of radiation tolerance, and thus the selection of parts level 1, 2, or 3 does not imply or provide any type of radiation hardness or mitigation of radiation effects.
- MIL-SPEC parts may or may not include a radiation hardness designator signifying TID performance but may be sensitive to SEE.
- Lot-to-lot variation of radiation sensitivity may be larger for non-radiation-hardness-assured (non-RHA) parts than for RHA parts, since space radiation tolerance is typically not designed and optimized for parts without radiation addressed in their datasheets.
- RHA mitigations must include system-level techniques and solely depend on part-level robustness.

Credit: NASA/GSFC

Conclusion

Properly selected COTS parts in appropriate applications can offer performance and supply availability **advantages compared to MIL-SPEC parts**. Their utility and demonstrated reliability results from large volumes and automated production and testing processes. However, careful review and a thorough **understanding of their specifications (i.e., datasheet limitations)** is needed, and verifying that manufacturer specifications and reliability **meet space hardware application needs** is necessary.

This report proposes

- MIL-SPEC screening and non-radiation-related lot acceptance testing be reduced or eliminated in cases where evidence of sufficient quality and reliability exists for COTS parts.
- The extent of NASA's insight into COTS manufacturers and the amount and nature of the needed evidence will differ by mission and will likely be driven by a mission's resources and associated risk posture.

Standards & Policy and Guideline Development

- Title: *Avionics Radiation Hardness Assurance (RHA) Best Practices*
- <https://ntrs.nasa.gov/>
- Covers total ionizing dose, total non-ionizing dose, and single-event effects
- Title: *NASA Technical Standard for RHA ****In Progress*****
- ToC: 1. Scope 4. RHA Fundamentals 5. RHA Process Req's
6. RHA Process Taxonomy 7. Rad Threats & Hardness Assurance
Appendix (Example RCP's)

Risk tolerance posture	Highest	High	Medium-High	Medium-Low	Low
Anticipated scope of SEE testing	None	CCA-level high energy proton testing	Combination of CCA- and part-level, high-energy proton and heavy ion testing ¹	Piece-part heavy ion characterization test data should be available. Additional testing as needed for NDSEE characterization, low-LET-threshold parts proton susceptibility, and CCA-level for complex system interactions (e.g., SW and HW) validation.	

- Includes deliverables throughout Project Development Lifecycle
- Scheduled to be complete in FY23

FY23 Plans

COTS UTILIZATION STEPS

- Relationship with COTS manufacturers
 - Industry Leading Parts Manufacturers (ILPM)s
 - Data sheets
 - Process control data
 - Qualification & Screening
 - Sampling
 - Process for implementing changes
- Parts Evaluation & Analysis Capability
 - Initial motivation for NEPP Program's predecessor in the 70s
 - Failure rate determination
 - Failure mechanisms/Physics of Failure/Acceleration Factors
 - Environmental testing geared towards NASA missions (MEAL)
 - Not re-inventing the wheel
 - Attempt at "Standardization" for generic mission profiles
