EXECUTIVE SUMMARY

This Year 3 Annual Performance Monitoring Report (PMR) presents the operations, maintenance, and monitoring activities for the Hydraulic Containment System (HCS) Interim Measure (IM) at the Components Refurbishment and Chemical Analysis (CRCA) facility located at John F. Kennedy Space Center (KSC), Florida. The primary objective of the HCS is to attain hydraulic control of the dissolved-phase chlorinated volatile organic compound (CVOC) plume, with the secondary objective to reduce concentrations of CVOCs in the high-concentration plume to support transition to monitored natural attenuation (MNA). CRCA has been designated Solid Waste Management Unit 041 under the KSC Resource Conservation and Recovery Act Corrective Action Program.

The timeframe for activities documented in this Year 3 PMR extends from September 2021 through October 2022. Baseline sampling activities were completed in June 2019, and full-scale startup of the HCS IM was completed in July-August 2019. The operational runtime of the HCS for the Year 3 reporting period was approximately 91%, with the majority of downtime attributed to system maintenance and repair. This is generally consistent with Year 1 and Year 2 runtimes of 85% and 92%, respectively. To help reduce downtime, an anti-scaling amendment, Redux 390, has been used to reduce scaling and help maintain system design parameters. Over nine million gallons of groundwater were treated during Year 3 of HCS operations, and concentrations of the site's contaminants of concern (trans-1,2-dichloroethene and vinyl chloride) have been reduced by over 97%.

This PMR describes the activities that were performed during Year 3 to operate and monitor the HCS IM, which includes three extraction wells, seven injection wells, and conveyance piping to a modular structure containing the control panel and an air stripper. Influent and effluent sampling results from the air stripper show that the system is operating as designed and is reducing concentrations of contaminants of concern to below detection limits. In addition to HCS operation, this PMR also discusses performance monitoring that has been implemented to assess progress of the HCS IM and overall plume conditions through scheduled groundwater (quarterly and semi-annual) and sub-slab soil gas (quarterly) sampling and analysis. Two ambient air samples were also collected on a quarterly basis in the vicinity of the modular structure and the

paved driveway east of the Solvent Reclamation Area during routine operation and maintenance (O&M) activities to ensure safe breathing zone air quality for on-site personnel. All sub-slab soil gas and ambient air sampling conducted during the Year 3 operational period showed results below applicable regulatory air screening limits.

Predictions made during the Year 2 groundwater model updates were in close correlation to post Year 3 plume conditions. Therefore, it can be assumed that the projected path remains valid for transition to MNA in one to two years of continuous HCS operation.

The contents of this Year 3 PMR were presented during the February 2023 KSC Remediation Team meeting, where Team consensus was reached on several items including continued O&M of the HCS, and continued monitoring of groundwater, ambient air, and sub-slab soil gas. Replacement of MW0019 and VMP04 was also recommended, as well as additional direct-push technology sampling to further delineate the downgradient plume and confirm overall site-wide low-concentration plume boundaries. Sampling for per- and polyfluoroalkyl substances at CRCA is ongoing and will be submitted under separate cover.

SECTION I
INTRODUCTION

This Performance Monitoring Report (PMR) presents the Year 3 operations, maintenance, and monitoring (OM&M) activities for the Hydraulic Containment System (HCS) Interim Measure (IM) at the Components Refurbishment and Chemical Analysis (CRCA) facility located at John F. Kennedy Space Center (KSC), Florida (Figure 1-1). The CRCA facility has been designated Solid Waste Management Unit (SWMU) 041 under KSC's Resource Conservation and Recovery Act (RCRA) Corrective Action Program. This PMR was prepared by Tetra Tech, Inc. for the National Aeronautics and Space Administration (NASA) under Indefinite Delivery Indefinite Quantity (IDIQ) Contract 80KSC019D0011-80KSC019F0066.

The Year 3 operational timeframe for HCS IM activities documented in this PMR extends from September 2021 through October 2022. The following activities were completed during this timeframe:

- Full-scale operation and maintenance (O&M) of the HCS IM from September 2021 to October 2022;
- Quarterly and semi-annual performance monitoring (October 2021, January 2022, April 2022, July 2022, and October 2022); and,
- Sub-slab soil gas sampling and ambient air sampling (conducted quarterly).

Note, a direct push technology (DPT) sampling event was conducted in March 2022 to delineate and confirm overall plume boundaries; however, this sampling event is not documented in this report as additional DPT sampling is being completed. All DPT data will be presented in one report once sampling is complete.

The HCS IM has been operational since August 2019. The system includes three extraction wells (EWs) and seven injection wells (IWs) with associated treatment trailer with air stripper. The primary objective is to obtain and maintain hydraulic control of the dissolved-phase chlorinated volatile organic compound (CVOC) plume, and the secondary objective is to reduce

concentrations of CVOCs to support transition to monitored natural attenuation (MNA). Additional details on HCS implementation are presented in the following sections.

1.1 SITE LOCATION

The CRCA facility is located east of Contractors Road, approximately 1,500 feet south of the intersection of Contractors Road and Saturn Causeway, in Section 18, Township 22 South, and Range 37 East at KSC, Florida (Figure 1-1). The Vehicle Assembly Building is approximately 0.75 miles north of CRCA and the Shuttle Landing Facility (now known as the Launch and Landing Facility) is about 2.3 miles to the northwest. Launch Complex 39A/B is situated approximately 3.5 miles northeast of CRCA, while the KSC Industrial Area is approximately 3.5 miles to the south. KSC is located on Merritt Island, part of a barrier island complex bordered to the east by the Banana River and to the west by the Indian River. Cape Canaveral Space Force Station comprises the eastern boundary of this barrier island complex known collectively as the Indian River Lagoon; a brackish estuarine environment connected to the Atlantic Ocean by natural tributaries and dredged navigational waterways.

1.2 SITE DESCRIPTION AND LAYOUT

The CRCA buildings and structures were constructed in 1998 in support of the NASA space program. The property is an approximately three-acre rectangular parcel, primarily paved, and houses numerous support structures and buildings. Operations performed at CRCA include the cleaning and refurbishment of mechanical and operation parts in the main building (Building K6-1696), the storage of hydrogen gas cylinders (Building K6-1697A), decontamination of parts contaminated with fuel or oxidizers (Building K6-1747), solvent reclamation (Building K6-1696B), a satellite accumulation area for hazardous waste (Building K6-1748A), and storage of miscellaneous goods, pallets, and spent chemical totes (Building K6-1748D). The solvent used for cleaning at CRCA is Vertrel™ MCA, a mixture of trans-1,2-dichloroethene (tDCE) and 2H,3H-decafluoropentane (DFP), and is stored in Building K6-1696A. Figure 1-2 presents the CRCA site layout.

Detailed descriptions of the site background, area setting, site history, RCRA Facility Investigation (RFI) findings, and other pre-IM data are presented in the March 2015 CRCA RFI

Progress Report (NASA, 2015) and the November 2018 CRCA RFI Progress Report, Revision 1 (NASA, 2018d). The November 2018 Progress Report also includes site information dating from the initial SWMU Assessment (SA) in October 2004.

To further describe site conditions, the following sections present a general description of the soil stratigraphy, surface water features, and groundwater flow at CRCA.

1.2.1 Soil Stratigraphy. Soil boring data collected during subsurface investigations from June 2006 to March 2019 at 21 locations, to a maximum depth of 80 feet below land surface (bls), were studied to classify the varying stratigraphic layers found beneath the study area. This information was used to differentiate and collate soil layers for a better understanding of site stratigraphy and hydrogeologic trends at CRCA.

At CRCA, clayey and silty sands were encountered near the surface in the vicinity of the main building (Building K6-1696) to a depth of approximately five feet bls. Below this depth, the site stratigraphy consists of fine to very fine sand with trace of silt grading into medium to very fine sand and the introduction of shell fragments at about 10 feet bls. Fine to very fine sand with varying amounts of shell fragments and silt are found to about 25 feet bls. Shell fragments exist in greater abundance to about 60 feet bls, interspersed with layers predominated by fine to very fine and coarse to very fine sands. Generally, the occurrence of shell fragments increases to the west of the study area. The soils become more clayey at approximately 60 feet bls, where fine to very fine sand with trace to some shell, clay and trace to little shell were found. A homogeneous clay with trace to some silt, very fine sand, and shell was consistently encountered from approximately 70 to 80 feet bls, the vertical extent of soil borings conducted at CRCA. A more detailed discussion of the site stratigraphy is presented in the CRCA Year 2 Groundwater Flow and Solute Transport Model Construction, and Calibration Report (groundwater modeling report) presented as Appendix A of the Year 2 Annual PMR (NASA, 2022). For reference, the geologic cross-sections from the modeling report are included in this report as Figures 1-4, 1-5, and 1-6.

1.2.2 Surface Water Features. The CRCA study area is a relatively flat (less than 10 feet of total relief) predominantly paved area with a relatively shallow water table. Surface elevations decrease to the west of the CRCA facility toward a densely wooded area. Drainage swales are

located on both the eastern and western sides of Contractors Road, west of CRCA. There are no surface water bodies on or immediately adjacent to CRCA. The swales and wooded area west of Contractors Road periodically have ephemeral standing water during the wet season.

The Turning Basin, which connects to the Banana River and ultimately Port Canaveral by an approximately 300-foot-wide dredged canal system, is located approximately 0.75 miles to the northeast of CRCA. This roughly circular water body, constructed to transport large space-related parts such as rocket boosters, is south of a meandering water body which runs roughly east-west and is situated approximately 1.0-mile northwest of the study area. Regionally, the Indian River is located approximately four miles west of CRCA and the Banana River is approximately five miles to the east. Refer to Figure 1-3 for an aerial map showing surface water features in the vicinity of the study area.

1.2.3 Groundwater Flow. June 2019 baseline groundwater flow conditions (prior to HCS startup) at shallow depths were generally from east to west, with a depressional area of radial flow observed west of the Solvent Reclamation Area at MW0003, probably due to surface stormwater drainage features. Slight mounding to the southwest beneath the building was observed converging toward MW0008 and resolving in western and northwestern flow with a more relaxed gradient toward Contractors Road. At intermediate depths, flow occurred to the northwest from the Solvent Reclamation Area and to the northeast from Contractors Road, converging toward the northern parking area. Baseline flow within the deep intervals was predominately to the northwest, with a more westerly bend toward Contractors Road and across the railroad tracks (NASA, 2021a).

Since start-up of the HCS, fluctuations in the water table at CRCA range from about 0.5 feet to 3.5 feet above mean sea level (msl). The hydraulic gradient generally slopes to the west at shallow, intermediate, and deep intervals within the surficial aquifer, typically mimicking site topography. Fluctuations in flow direction are primarily observed in the vicinity of the main building at shallow depths, becoming more radial as extraction well pumping continues. General flow remains to the west, likely discharging to surface water features such as drainage ditches, wetlands, and ultimately the Indian River. At intermediate depths, the hydraulic gradient has become more uniform following commencement of HCS operations, with a predominately

westward flow pattern. Like the shallower depths, deep groundwater flow is generally to the west, but is influenced by HCS pumping and injection schedules resulting in steeper hydraulic gradients and radial flow. A more detailed discussion of the potentiometric surface at shallow, intermediate, and deep intervals within the surficial aquifer at CRCA during HCS operation is presented in Section IV of this report.

1.3 CONTAMINANTS OF CONCERN

Historically, the contaminants of concern (COCs) in groundwater at CRCA were identified as cis-1,2-dichloroethene (cDCE), tDCE, and vinyl chloride (VC). At the time of the HCS implementation in May 2019, VC and tDCE were observed with the highest concentrations in groundwater. cDCE has not been observed above the State of Florida Groundwater Cleanup Target Level (GCTL) since 2014. VC was observed with concentrations exceeding the 100 micrograms per liter (µg/L) Florida Department of Environmental Protection (FDEP) National Attenuation Default Concentration (NADC), and tDCE was observed with concentrations exceeding the 100 µg/L State of Florida GCTL. These CVOCs were detected in groundwater in the vicinity of the CRCA Solvent Reclamation Area. The study area is defined based on contaminant concentrations and presented in the March 2018 Site Characterization advance data package (ADP) (NASA, 2018a):

- Hot Spot (HS) 1 – defined as the area where CVOC concentrations exceed 10 times FDEP NADC;
- High Concentration Plume (HCP) – defined by CVOC concentrations exceeding the FDEP NADC; and
- Low Concentration Plume (LCP) – defined by CVOC concentrations exceeding the State of Florida GCTL.

HS1 is defined in the March 2018 Site Characterization ADP as a 0.8-acre area with a maximum contaminant depth of 57 feet bls. The HCP is described as an area encompassing 2.07-acres, with a maximum depth of 57 feet bls, and the LCP is defined as a 6.54-acre area, with a maximum depth of 62 feet bls. The vertical extent of HS1, HCP, and LCP are marked by the clayey layer

found consistently across the site at these depths. The majority of contaminant mass resides within the fine sand to shelly zone, 40 to 52 feet bls. Extraction well screen interval placement was selected to target this groundwater contaminant mass. Deeper samples were not pursued to avoid creating a preferential pathway for further vertical migration. The footprints of the CRCA HS1, HCP, and LCP as identified in the 2018 Site Characterization are presented on Figure 1-7.

1.4 REMEDIAL APPROACH

This hydraulic containment IM consists of extracting groundwater through deep zone EWs (screened from 43 to 63 feet bls), treating recovered groundwater via an air stripper, and discharging groundwater back into the subsurface via deep zone IWs (screened from 41 to 61 feet bls). Figure 1-7 presents the layout of the resulting HCS installation with an overlay of the groundwater plume, as identified in the 2018 Site Characterization ADP (NASA, 2018a).

The HCS was primarily implemented to mitigate the migration of groundwater CVOCs by positioning EWs downgradient of HS1 and the HCP. Extracted groundwater is then treated through a treatment system consisting primarily of an air stripper that aerates the groundwater, volatilizing the CVOCs, and as a secondary benefit, promote aerobic degradation of the HS and HCP via recirculation of the aerobic water. The treated groundwater is injected upgradient and side-gradient of the HS and HCP via a network of deep zone IWs.

The treatment timeframe to reduce VC concentrations appropriate for transition to MNA was initially estimated to be 35 years based on preliminary pumping calculations, as stated in the April 2019 CRCA HS1 Implementation Work Plan (IWP) (NASA, 2019b). However, aquifer testing, lithologic and geochemical data collection within the target treatment zone, and the Year 1 performance evaluations of the HCS were used to re-evaluate treatment of the HS and HCP. These data were processed and analyzed via 3-dimensional groundwater modeling, predicting a transition to MNA after 12 years (NASA, 2020b). This treatment timeframe was re-visited following Year 2 of HCS operation and presented in the groundwater modeling section of the Year 2 Annual PMR. Both non-pumping and pumping scenarios were evaluated, with continued HCS operation projected to reach GCTLs in 11 years (NASA, 2022).

To determine whether DFP needed to be addressed by active remediation, in August 2018 groundwater samples collected from eight monitoring wells were analyzed for DFP. The monitoring wells sampled were selected by targeting different lithologic layers and depths relative to the existing groundwater plume and proximity to different operational rooms within and adjacent to Building K6-1696. The maximum DFP concentration was 23.2 µg/L, below the GCTL of 1,800 µg/L derived by the University of Florida on behalf of the FDEP (NASA, 2019c). In February 2019, the vapor samples collected from four sub-slab locations were also analyzed for DFP. Results detected DFP in two of these sub-slab samples at concentrations below the calculated commercial vapor intrusion screen level (VISL). Based on these findings, DFP was not carried forward as a standard analyte for the IM project (NASA, 2019c).

During the Year 2 Annual PMR reporting period, groundwater samples collected from the performance monitoring wells were analyzed for *Dehalococcoides* (*Dhc*), VC reductase, and methane, ethane, and ethene (MEE). These results suggested that passive detoxification was possible in the present environment, but to a minimal extent. Further, since significant CVOC reduction was observed after two years of HCS operation, it was determined that the option to implement additional HCS treatment amendments was not necessary for Year 3 (NASA, 2022).

1.5 SITE CHARACTERIZATION AND REMEDIAL ACTIVITIES

This section summarizes previous investigations and remedial activities conducted at CRCA leading up to current COC identification (tDCE and VC), remedial approach discussions, HCS design, and system OM&M. KSC Remediation Team (KSCRT) meeting highlights are presented to chronicle the progression of site characterization and remedial activities. KSCRT Meeting Minutes are included in Appendix A. A detailed report of the remedial activities, prior to HCS implementation, at CRCA is provided in the RFI Progress Report (NASA, 2018d).

1.5.1 HS1 Site Characterization ADP. The Site Characterization ADP for CRCA HS1 was presented at the March 2018 KSCRT Meeting. This ADP summarized field investigations that began with the initial SA in June 2004 and discussed the results of HS, HCP, and LCP delineation via DPT data collected from September 2016 through February 2018. Based on these data, the HS was defined as the area of the groundwater plume with COC concentrations greater

than 10 times FDEP NADCs. The HCP and LCP were also characterized, which are defined as areas of groundwater with concentrations of COCs greater than FDEP NADCs and State of Florida GCTLs, respectively. Groundwater samples and lithologic cores collected and analyzed during the DPT studies, along with monitoring well sampling results, were presented as part of the Site Characterization. A total of 512 DPT groundwater samples and eight monitoring well samples were collected between September 2016 and February 2018. Team consensus was reached for the delineation of CRCA HS1 and the HCP and LCP (Meeting Minute 1803-M05, Decision 1803-D23).

The Site Characterization for CRCA HS1 also proposed the screening of technologies for the HS and HCP. Team consensus was reached for the following technologies to be evaluated in the Remedial Alternatives Evaluation (RAE) (Meeting Minutes 1803-M05, Decision 1803-D24):

- Air sparging (AS) curtain for the HCP, including soil vapor extraction (SVE) to mitigate potential vapor issues, and in-situ chemical oxidation (ISCO) for the HS;
- AS for the HCP, including SVE to mitigate potential vapor issues, and biostimulation for the HS;
- Hydraulic control for the HCP, including air stripping, and ISCO for the HS; and,
- Hydraulic control for the HCP, including air stripping, and biostimulation for the HS.

1.5.2 HS1 Remedial Alternatives Evaluation ADP. The CRCA HS1 RAE was presented at the May 2018 KSCRT Meeting (NASA, 2018b). The medium of concern, COCs, and cleanup criteria were included in the RAE. The IM objectives identified in the RAE included reducing concentrations within the HS and HCP via an IM to support transition to MNA, mitigating plume migration, and minimizing risk to workers in Building K6-1696 by preventing vapor intrusion. Team consensus was reached to proceed to an Interim Measure Work Plan (IMWP) for HS1 via hydraulic containment. Consensus included the need for additional data collection via aquifer tests, total organic carbon (TOC) analysis, and further lithologic characterization in the target treatment zone (Meeting Minute 1805-M08, Decision 1805-D22). The additional data collected was to be used to evaluate the potential application of additional amendments to enhance

treatment of the HS.

1.5.3 HS1 IMWP. The CRCA HS1 IMWP was presented at the June 2018 KSCRT Meeting, providing details of the proposed hydraulic containment IM. An overview of the design of the HCS and supporting construction details and calculations were included in the IMWP. Additionally, the IM objective was modified from the RAE to the following:

- Primary IM objective: obtain hydraulic control of the dissolved phase CVOC plume;
- Secondary objective: reduce concentrations of CVOCs in HS1 and the HCP via an IM to support transition to MNA; and
- Deferred: the portion of the objective involving the need to minimize risk to workers in Building K6-1696 by preventing vapor intrusion and will be evaluated based on Air Sampling Plan results (addressed in Section IV of this PMR).

Team consensus was reached for the design of the HCS (Meeting Minute 1806-M02, Decision 1806-D02). An IMWP (NASA, 2018c), including supplemental information, was approved by FDEP on October 30, 2018.

1.5.4 HS1 IWP. The CRCA HS1 IWP (NASA, 2019b) was prepared based on the IMWP, which outlined the design and implementation of an HCS. To support the IWP, air sampling activities were presented at the April 2019 KSCRT Meeting to determine if the IM objective may need to be modified to include minimizing risk to workers in Building K6-1696 by preventing vapor intrusion. This meeting presented information summarizing the Phase I (January 2018) and Phase II (August 2018) air monitoring events. Based on the Phase II sub-slab soil gas sampling results, it was determined that ambient air sampling was not necessary as the CVOC groundwater plume beneath Building K6-1696 is not presenting a vapor intrusion risk to the workers present. This meeting discussed that the IWP for the HCS IM was in development, including a provision to include the sub-slab sampling at VMP01 through VMP04 as part of the quarterly monitoring plan. Team consensus was reached that the air monitoring evaluation was complete and further ambient air samples within Building K6-1696 were not needed at that time (Meeting Minute 1904-M16, Decision 1904-D40). As a result, an Air Monitoring Report was

prepared for the FDEP documenting these Phase I and Phase II studies and outlining the quarterly soil gas sampling planned as part of the performance monitoring program (NASA, 2019d). This plan was approved by the FDEP in April 2020.

1.5.5 HS1 IM. The CRCA HS1 IM was presented at the June 2019 KSCRT Meeting. This meeting discussed IM field activities including the installation of 12 monitoring wells (MW0021 to MW0032), installation of three EWs (EW0001 to EW0003), seven IWs (IW0001 to IW0007), and associated infrastructure including treatment system, hydraulic profiling tool (HPT) data collection, slug testing, a step pump test at EW0002, constant rate tests, and IW testing. Based on injection test results, anticipated capacities for IW0001, IW0002, and IW0007 were discussed. The HCS was deemed complete and system commissioning, startup, and baseline sampling were proposed (Meeting Minute 1906-M09). Construction of the HCS was documented in an IM Implementation Report (NASA, 2019c).

1.5.6 HS1 PMR Mid-Year Update ADP. The HS1 PMR Mid-Year Update was presented at the June 2020 KSCRT Meeting, which summarized the groundwater IM, HCS startup, and O&M activities (NASA, 2020a). This meeting documented initial startup activities completed July 22 to 26, 2019, including an overview of the HCS testing, IW flow rates, and HCS maintenance. Troubleshooting activities involving scaling issues with the system effluent bag filters, and anti-scaling measures including biological activity reaction test (BART) and Redux 390 injection pilot tests were presented. Since tDCE was not detected at concentrations above its GCTL from June 2019 to April 2020, VC became the targeted analyte for groundwater plume remediation. Baseline sampling results for groundwater, soil-gas, and ambient air were also presented and discussed. The KSCRT agreed that the path forward for the HCS was to continue operation and evaluation to maintain hydraulic control of the groundwater plume and further reduce VC concentrations; continue the quarterly sampling of four monitoring wells and the semi-annual sampling of 16 monitoring wells; and to prepare and submit a groundwater model in conjunction with the Year 1 PMR (Meeting Minute 2006-M02).

1.5.7 HS1 Annual PMR ADP. The Year 1 Annual PMR was presented at the October 2020 KSCRT Meeting, and included activities completed from June 2019 through August 2020. The purpose of this briefing was to present the progress of the HCS after one year of operation. The

following topics were discussed: baseline sampling results; one year of performance monitoring results (including groundwater, sub-slab soil gas, and ambient air); an overview of HCS O&M; HCS performance milestones; and the groundwater model. During this meeting, the path forward for performance monitoring was discussed, with monitoring well sampling locations and sampling frequency adjusted accordingly. This included removing eight monitoring wells (MW0003 and MW0020 through MW0026) from the performance sampling program, changing two wells from semi-annual to quarterly sampling (MW0027 and MW0029), and transitioning one well (MW0028) to semi-annual sampling. In addition, sulfate, sulfide, nitrate, nitrite, carbon dioxide, iron, dissolved iron, and RCRA metals analyses were discontinued from groundwater sampling events (Meeting Minute 2010-M02, Decisions 2010-D02 to D04). The contents of this ADP were included in the Year 1 PMR (NASA, 2021a).

1.5.8 HS1 Year 2 Annual PMR ADP. The Year 2 Annual PMR was presented at the November 2021 KSCRT Meeting, and included activities completed from September 2020 through August 2021. The purpose of this meeting was to present the progress of the HCS after two years of operation. The following topics were discussed: one year of performance monitoring results (including groundwater, sub-slab soil gas, and ambient air); an overview of HCS O&M; HCS performance milestones; and the results of the groundwater model after two years of HCS operation. During this meeting, the path forward for performance monitoring was discussed, with monitoring well sampling locations and sampling frequency modified in anticipation of Year 3 HCS operation. Consensus was reached to continue operation of the HCS, remove five monitoring wells from the sampling plan due to non-detect results (MW0012, MW0015, MW0028, MW0029, and MW0030), continue performance monitoring at four wells on a quarterly basis and an additional three wells on a semi-annual basis, and to continue ambient air and vapor monitoring during Year 3 with the addition of a background ambient air sample to assist in distinguishing potential contributions from routine facility operations (Meeting Minute 2111-M04, Decisions 2111-D12 through D14. The contents of this ADP were included in the Year 2 Annual PMR (NASA, 2022). Previous *Dhc* and VC reductase data and the updated groundwater model determined that no additional amendments were needed to supplement HCS performance at that time.

1.5.9 HS1 Year 3 Annual PMR ADP. The Year 3 Annual PMR ADP was presented at the February 2023 KSCRT Meeting, and included activities completed from September 2021 to October 2022. The purpose of this meeting was to present progress of the HCS after three years of operation. The following topics were discussed: five quarters of performance monitoring results; an overview of HCS O&M; HCS performance milestones; and ambient air and sub-slab soil gas sampling results. During this meeting, the path forward for performance monitoring was discussed, with monitoring well sampling locations and sampling frequency modified in anticipation of Year 4 HCS operation. The contents of the Year 3 Annual PMR ADP are included in this report.

1.6 INTERIM MEASURES OBJECTIVE

The primary IM objective for CRCA HS1 is to obtain and maintain hydraulic control of the dissolved-phase CVOC plume. The secondary objective is to reduce concentrations of CVOCs in HS1 and the HCP (defined as VC greater than 100 µg/L) to support transition to MNA. The objectives were developed to provide a flexible treatment train approach where certain metrics such as remedial performance, plume dynamics, and natural attenuation characteristics can be evaluated to determine whether the remediation objectives have been met and ultimately reach an endpoint to the IM. Based on the treatment performance of the HS1 IM, HCS operations may be modified, as appropriate, to achieve IM objectives.

1.7 REPORT ORGANIZATION

The remainder of the PMR is organized as follows:

Section II: Hydraulic Containment System Process Description – presents a general summary of the components of the treatment train of the HCS.

Section III: System Operation, Maintenance, and Monitoring – details the O&M plan, which was implemented for system operation, discusses maintenance activities conducted, and evaluates the overall HCS performance.

Section IV: Performance Monitoring Results and Discussion – presents the strategy for and summarizes the results of groundwater sampling, groundwater level surveys, field measurements, sub-slab vapor monitoring analysis, and ambient air monitoring.

Section V: Conclusions and Recommendations – summarizes the findings of this PMR and discusses further options based on this information.

Section VI: References – provides a list of references cited in this report.

SECTION II
HYDRAULIC CONTAINMENT SYSTEM PROCESS DESCRIPTION

The HCS was installed during a series of events between November 2018 and May 2019, in accordance with the October 2018 HS1 IMWP (NASA, 2018c) and the April 2019 HS1 IWP (NASA, 2019b). Components of the HCS include three EWs, seven IWs, a network of conveyance piping, and a treatment trailer. Additionally, 12 monitoring wells (MW0021 through MW0032), as detailed in the IMWP, were installed during HCS implementation and sampled at the prescribed frequency during Year 1 (NASA, 2020b), Year 2 (NASA, 2021a), and Year 3 (presented in Sections IV and V of this report) to monitor performance of the HCS. As discussed in Section IV of this report, three of these wells were part of the Year 3 performance monitoring plan (MW0027, MW0031, and MW0032). HCS installation activities were documented in the IM Implementation Report (NASA, 2019c).

Three EWs (EW0001, EW0002, EW0003) were installed to depths of 63-feet bls in strategic locations downgradient from HS1 with overlapping radii of influence (see Figure 1-7). Groundwater is extracted from the three deep zone EWs using dedicated 230-volt (V), two-horsepower (hp), single-phase, electric Grundfos 10E5 submersible pumps with a pump range of zero to 15 gallons per minute (gpm). EWs draw contaminated groundwater with a design flow rate of 7.0 gpm. Extracted water is conveyed through dedicated one-inch high-density polyethylene (HDPE) piping installed approximately 24-inches bls. Flowrates of extracted fluids from individual EWs are individually totalized. Two 25-micron bag filters, plumbed in parallel arrangement, remove sediment from the water prior to entry into a 500-gallon polyurethane equalization tank (EQ tank). A three-hp, 460-V pump transfers groundwater from the EQ tank into a QED Environmental System (QED™) E-Z Tray Model 4.4 SS air stripper with a three-phase, 460-V three-hp blower. The treated water from the air stripper sump is pumped by a three-hp 460-V transfer pump through two 50-micron bag filters plumbed in parallel.

Treated water is conveyed away from the HCS to dedicated one-inch HDPE piping installed 24-inches bls to the IWs. Seven IWs (IW0001 through IW0007) were installed at strategic locations upgradient of HS1 to encourage contaminated water to migrate towards the EWs. The IWs were designed to accept treated groundwater at a flowrate of 3.0 gpm.

SECTION III
SYSTEM OPERATION, MAINTENANCE, AND MONITORING

This section identifies the activities conducted and results obtained during full-scale Year 3 HCS OM&M activities at CRCA from September 2021 to October 2022.

3.1 SITE VISITS

From September 2021 to October 2022, system O&M was conducted at least monthly by a field technician, per the 2019 CRCA HS1 IWP (NASA, 2019b) and following guidance from the Site-Specific Health and Safety Plan (SSHASP; NASA, 2021b). During each O&M visit, the system was checked for abnormal conditions (noises, leaks, temperature, and vibration). The HCS was inspected for leaks at each connection to the conveyance lines and in the bag filters, EQ tank, and air stripper. The HCS was also checked for excessive vibration, noise or temperature at each pump, the conveyance lines, the air stripper, and the bag filters. Lubrication was inspected as applicable; differential pressures and flow rates across bag filter units and process equipment were assessed; system operation data was recorded and compared to the previous month's data; and filter bags, tanks, and strippers were inspected for solids build-up and the air stripper trays were cleaned with a pressure washer.

The system was shut down (partially or completely) for a total of 36.8 days from September 1, 2021, through October 31, 2022. The shutdowns were associated with groundwater sampling events, maintenance events, and a facility shut down due to Hurricane Ian. Minimal downtime was needed for performance monitoring sampling conducted in October 2021, January 2022, April 2022, July 2022, and October 2022. The most downtime was due to maintenance and replacement of equipment, which is summarized in Section 3.4.

3.2 REMOTE MONITORING

The system was evaluated in person via monthly site visits (Section 3.1) and remotely by reviewing telemetry daily reports. Flowrates in each EW were monitored and average flowrates ranged from 6.82 to 7.14 gpm during operation, slightly less than or generally consistent with the design criteria of 7.00 gpm per extraction well pump. Flowrates in each IW were also monitored.

Average flowrates ranged from 4.29 to 12.00 gpm per IW during operation, exceeding the minimum design criteria of 3.00 gpm for IW pumps as presented in the IMWP. As water is extracted from the EWs, it accumulates in the EQ tank and then is pumped via a transfer pump through the treatment system into the IWs. The IWs have shown to be able to take on enough water to not allow the treatment system to back up. Additionally, the area around the IWs is consistently monitored for groundwater mounding to ensure that increased flowrates do not cause over-saturation.

3.3 OPERATIONAL SUMMARY

O&M activities conducted for the HCS during the Year 3 operating period included routine data collection (operational and analytical) and maintenance of system components. Full-scale O&M of the system was initiated on August 16, 2019. The prove-out O&M phase initially involved weekly sampling and daily system monitoring. System sampling frequency transitioned to monthly after September 2019, and this frequency has been maintained throughout the three-year operational period.

In summary, the cumulative runtime for the HCS was approximately 91% from September 10, 2021, to October 24, 2022. Based on totalizers from EW001, EW0002, and EW0003, a total of 10,252,436 gallons of groundwater were treated during this timeframe. Analytical data from system influent and effluent show the system is effectively treating extracted groundwater.

Operational data (flowrates, pressures, recovery volumes) for the reporting period is included in Table 3-1. Laboratory analytical results for system influent and effluent samples are summarized in Table 3-2 (further discussed in Section 3.6). Table 3-3 presents runtime data for Year 3 operation of the HCS. Table 3-4 presents significant maintenance events, operational issues, and corrective actions associated with operations (further discussed in Section 3.4). Laboratory analytical reports are included in Appendix B. The O&M field notes are included in Appendix C.

Additional details about O&M activities are included in subsequent sections.

3.4 MAINTENANCE ACTIVITIES

Routine maintenance and inspection activities were conducted while the system was operating in a manner that minimized emergencies or unscheduled shutdowns. O&M was performed in accordance with the 2019 CRCA IWP (NASA, 2019b).

3.4.1 System General Maintenance Activities. In general, routine O&M consists of observing and adjusting process conditions and checking the system for abnormal conditions (e.g., noise, leaks, temperature, and vibration). During each site visit, the following routine activities were performed:

- Inspection of the HCS for leakage and excessive vibration noise, or temperature;
- Inspection of lubrication, as applicable;
- Assessment of differential pressure and flow rates across bag filter units and process equipment;
- Recording of system operation data and comparing data to design conditions and previous operating data;
- Observing and noting solids build-up in filter bags, the EQ tank, and the air stripper; and
- Cleaning of air stripper trays, replacement of bag filters (if necessary), and replacement of pump seals (if necessary).

All equipment was depressurized and drained prior to conducting maintenance activities.

3.4.2 System Repairs and Modifications. System repairs and modifications implemented during Year 3 HCS operation include:

- **Blower Motor Malfunction –** On September 13, 2021, the air stripper blower motor failed. This failure was attributed to improper procedures causing the air stripper water level to overfill, resulting in a strain on the motor, blower motor overload, and failure. A

new blower motor was ordered and installed, and the system was restarted on October 1, 2021.

- **Breaker Tripped –** On October 19, 2021, the EQ tank's breaker was tripped during flowmeter cleaning. The system was restarted on October 20, 2021, after cleaning was complete.

- **High EQ Tank –** On March 9, 2022, a high EQ tank reading caused the system to shut-down. The system was restarted on March 14, 2022, after scheduled maintenance was complete.

3.5 EVALUATION OF MAJOR TREATMENT COMPONENTS

The evaluations discussed in this section were completed to confirm achievement of the IM objective, proper functioning of system process components, and verification of treatment system performance. The following provides an overview of the current operational status of major system process components:

Extraction Wells – EWs are performing at the intended groundwater extraction rates.

Groundwater Extraction Pumps – The Grundfos RediFlo 10E5 submersible pumps have operated effectively since initial startup. No evidence of sediment, mineral, or biological pump head fouling has been observed.

Bag Filters – There are two influent bag filters upstream of the EQ tank and two bag filters downstream of the air stripper. The influent bag filters are replaced approximately monthly, and the bag filters downstream of the air stripper are replaced approximately monthly now that the scaling reduction amendment, Redux 390, has been applied to the system (bag filters were replaced weekly or bi-weekly prior to amendment).

Equalization Tank – The double-walled, 500-gallon, EQ tank has operated reliably since initial startup with the exception of the original level-sensor installation, and the overflow event, as documented in the Year 1 Annual PMR (NASA, 2021a), as well as the breaker that was tripped as stated in Section 3.4.2. Subsequently, the pump controls within the tank have operated without

issue. Typical maintenance of the EQ tank includes cleaning and replacement of floats and the totalizer. Future removal of settled solids from the tank may be required if sediments accumulate to a level that interferes with process operations.

Air Stripper – The QED™ air stripper has operated as designed since installation. Factors influencing treatment efficiency, such as biofouling, is being controlled to the maximum extent possible to maintain removal efficiencies. The trays are cleaned monthly to remove solids. Air stripper blower motor replacement was necessary as a result of improper water level maintenance.

Transfer Pumps – The transfer pumps from the EQ tank and air stripper are in acceptable condition and can be operated without modification. On-going maintenance activities will include replacement of pump and stator seals, as required, for normal operations.

Injection Wells – IWs have functioned adequately during the period of performance. Discharges to the IWs are adjusted to maintain a flowrate of 2 to 3 gpm per well. However, based on site conditions, higher flowrates have been achieved since system startup. Groundwater mounding is consistently monitored around IWs to ensure increased flowrates do not cause over-saturation. Slight increases in injection pressures were recorded from the 2019 startup through the first year of HCS operation and continued to increase during the second year. During Year 3, injection pressures were maintained at a constant rate at pressures generally lower than the previous year. No further adjustments are anticipated at this time.

3.6 PROCESS SYSTEM SAMPLING RESULTS

Combined influent and effluent samples of extracted groundwater were collected prior to and after being treated by the air stripper to analyze system efficacy. During Year 3 of HCS operation, influent and effluent samples were collected on a monthly basis, with the exception of September 2021 as the system was off for blower maintenance and January 2022 due to an apparent oversight.

All samples were analyzed for volatile organic compounds (VOCs) by U.S. Environmental Protection Agency (EPA) Method 8260D during each sampling event by Environmental

Conservation Laboratories, Inc. in Orlando, Florida (ENCO) or Pace Analytical Services, LLC in West Columbia, South Carolina (Pace). Samples collected in April through October 2022 were also analyzed for per-and polyfluoroalkyl substances (PFAS) by Liquid Chromatography Tandem Mass Spectrometry (LC/MS/MS) Compliant with Table B-15 of the U.S. Department of Defense (DoD) Quality Systems Manual (QSM) version 5.3. This PFAS data is being evaluated as part of an independent PFAS Site Assessment Report, which will be submitted under separate cover.

The following summarizes VOC results from the influent and effluent samples collected during the Year 3 operating period:

- Influent and effluent tDCE concentrations were all non-detect.

- VC concentrations going into the HCS system during Year 3 of operation ranged from non-detect (April and June 2022) to 11 µg/L (October 2021). Effluent concentrations remained below the 1 µg/L GCTL except for April 2022 and June 2022, with concentrations of 2.6 µg/L and 2.9 µg/L, respectively. Once these concentrations were received from the lab, the NASA Remediation Project Manager (RPM) was notified. After consultation with the RPM and the field sampler, it was concluded that sample identifications were likely accidentally switched during those field events. Therefore, it can be reasonably asserted that the April and June 2022 VC results of 2.6 µg/L and 2.9 µg/L apply to the influent concentrations and the non-detect values apply to the effluent concentrations.

- During the November 2021 event, several other VOCs were detected in the influent sample above the method detection limit (MDL), including o-xylene (16 µg/L), acetone (25 µg/L), methyl acetate (5.5 µg/L), and chloromethane (48 µg/L). Of these compounds, only acetone (15 µg/L) and chloromethane (26 µg/L) were detected in the effluent, in addition to bromomethane (1.3 µg/L; non-detect in influent sample). Because acetone and the halomethanes can be common laboratory cleaning agents, these detections may be attributed to a false-positive occurring during sample analysis and are therefore not likely site-related. None of these compounds were detected in subsequent sampling events, with

the exception of chloromethane in the June 2022 event (0.59 µg/L influent; non-detect effluent) and September 2022 event (0.86 µg/L influent; 1.8 µg/L effluent).

Overall, influent concentrations have continued to decrease during the third year of HCS operation. Since system startup, the combined influent concentration of VC has decreased from 130 µg/L in July 2019 to 2.0 µg/L in October 2022. The VC concentrations initially increased after startup, with the highest result of 260 µg/L in August 2019, but this was not unexpected as the system is designed to hydraulically draw in more contamination based on placement of EWs and IWs. All tDCE influent concentrations have been below GCTLs or non-detect since baseline. All effluent concentrations of tDCE and VC were non-detect during Year 3 of HCS operation, with the understanding of labels inadvertently switched during the April and June 2022 sampling events, as discussed above.

Influent and effluent data for the site's COCs (tDCE and VC) from baseline through the third year of HCS operation are presented in Table 3-2.

08/22/22	27,541,435	21.19	1	1	25	25
09/19/22	28,396,327	21.20	1	1	25	25
10/24/22	29,462,827	21.16	1	1	25	25

Notes:

(1) Based on totalizers from EW0001, EW0002 and EW0003

PID = Photoionization Detector

gpm = gallons per minute

psi = pounds per square inch

gal = gallon

in wc = inches of water column

ppmv = parts per million by volume

The differences in recorded flow between the influent, equalization tanks, air stripper meters, and the calculated readings from other meters may be attributed to water quality sensitivity, meters failing, pausing, and plugging up from time to time between maintenance events. During maintenance, these issues are assessed to see if cleaning or replacement is needed.

Table 3-2. trans-1,2-Dichloroethene and Vinyl Chloride Influent and Effluent Analytical Results (continued)

Notes:
Concentrations in µg/L
tDCE = trans-1,2-dichloroethene
VC = vinyl chloride
I = Value was reported above the laboratory method detection limit, but below the practical quantitation limit
U= Value was reported as below the method detection limit, therefore the detection limit is shown
Shading indicates State of Florida Groundwater Cleanup Target Level (GCTL) exceedance, tDCE = 100 µg/L, VC = 1 µg/L
Bolding indicates a concentration is greater than the method detection limit
No influent/effluent samples were collected in September 2021 due to system shutdown for blower repair
No influent/effluent sampling records located for January 2022, assumed technical oversight
* indicates that the influent and effluent samples were likely switched

Table 3-3. CRCA Year 3 Hydraulic Containment System Runtime

Month	Hours in the Month	Hours System Down	Days in the Month	Days System Down	Operational Run Time	Primary Downtime Contributing Factor
Sep-21	720	332	30	13.8	54%	Blower motor shorted after restart; replacement ordered. Monthly Operation and Maintenance event and air strippers cleaned.
Oct-21	744	96	31	4.0	87%	Blower motor replaced. Monthly Operation and Maintenance event and air strippers cleaned; Breaker tripped by technician during flowmeter cleaning.
Nov-21	720	12	30	0.5	98%	Monthly Operation and Maintenance event and air strippers cleaned.
Dec-21	744	12	31	0.5	98%	Monthly Operation and Maintenance event and air strippers cleaned.
Jan-22	744	12	31	0.5	98%	Monthly Operation and Maintenance event and air strippers cleaned.
Feb-22	672	12	28	0.5	98%	Monthly Operation and Maintenance event and air strippers cleaned.
Mar-22	744	144	31	6.0	81%	System down due to EQ high level and underwent maintenance; Monthly Operation and Maintenance event and air strippers cleaned.
Apr-22	720	24	30	1.0	97%	Monthly Operation and Maintenance event and air strippers cleaned.
May-22	744	24	31	1.0	97%	Monthly Operation and Maintenance event and air strippers cleaned.
Jun-22	720	24	30	1.0	97%	Monthly Operation and Maintenance event and air strippers cleaned.
Jul-22	744	24	31	1.0	97%	Monthly Operation and Maintenance event and air strippers cleaned.
Aug-22	744	24	31	1.0	97%	Monthly Operation and Maintenance event and air strippers cleaned.
Sep-22	720	120	30	5.0	83%	Monthly Operation and Maintenance event and air strippers cleaned; Powered down for Hurricane Ian.
Oct-22	744	24	31	1.0	97%	Monthly Operation and Maintenance event and air strippers cleaned.
Total	10,224	884	426	36.8	91%	

Notes:

Table 3-4. CRCA Year 3 Hydraulic Containment System Maintenance Events

System Component	Issue	Issue Date	Resolution	Resolution Date
Blower Motor	Failed after restart	9/13/2021	Ordered new blower motor and replaced.	10/1/2021
Breaker	Tripped during flowmeter cleaning	10/19/2021	Restarted after scheduled cleaning.	10/20/2021
High EQ tank	System tripped	3/9/2022	Restarted after scheduled maintenance.	3/14/2022
System Component	Hurricane Ian	9/26/2022	Powered down for Hurricane Ian; continued as normal after shut down.	9/30/2022

Notes:

EQ = Equalization

SECTION IV
PERFORMANCE MONITORING RESULTS AND DISCUSSION

This section includes sampling activities and results from the Year 3 HCS operating period, conducted between September 2021 to October 2022. Samples were collected from groundwater, sub-slab soil gas, and ambient air.

As noted in Section I, the DPT groundwater sampling event conducted in March 2022 is not documented in this report; this event will be documented with additional DPT groundwater data being collected to delineate and confirm overall plume boundaries.

4.1 GROUNDWATER SAMPLING

Groundwater monitoring was implemented at CRCA to ensure that hydraulic containment of the groundwater plume is maintained during HCS operation. The monitoring program also evaluates the overall extent of the plume and how it changes over time. Reduction in CVOC concentrations is monitored to support transition to MNA once IM objectives are achieved. Figure 4-1 illustrates the Year 3 sampling plan, as well as monitoring well, IW, and EW locations.

The Year 3 sampling plan was consistent with the Year 2 sampling plan, with the exception of removing monitoring wells MW0012, MW0015, MW0028, MW0029, and MW0030 from the Year 3 plan based on recommendations presented in the Year 2 Annual PMR (due to non-detect results) (NASA, 2022).

Five separate sampling events were conducted during the Year 3 reporting period. A total of 26 groundwater samples were collected during these events with four monitoring wells sampled on a quarterly basis and an additional three sampled on a semi-annual basis, as summarized in the table below.

Year 3 Groundwater Monitoring Events

Date of Groundwater Sampling	Number of Monitoring Wells Sampled
October 7, 2021	4
January 14, 2022	7
April 18, 2022	4
July 21, 2022	7
October 26-28, 2022	4

Quarterly: MW0018, MW0019, MW0031, and MW0032
Semi-annual: MW0002, MW0013, and MW0027

Quarterly performance monitoring wells (MW0018, MW0019, MW0031, and MW0032) were sampled and analyzed by a fixed-base laboratory (ENCO for the October 2021 and January 2022 sampling events and Pace for the April, July, and October 2022 sampling events) for VOCs via EPA Method 8260D (all events) and/or MEE via RSK-175 (all events, except October 2022). Additionally, select wells (MW0018, MW0019, and MW0031) were analyzed for *Dhc* and VC reductase bacterial analyte group during the October 2021, January 2022, and July 2022 sampling events by Microbial Insights, Inc. in Knoxville, Tennessee. Note, during the October 2022 sampling event, samples were also collected for PFAS analysis from several wells on-site. This PFAS data is being evaluated as part of an independent PFAS Site Assessment Report, which will be submitted under separate cover.

Semi-annual monitoring wells (MW0002, MW0013, and MW0027) were sampled and analyzed by a fixed-base laboratory (ENCO or Pace) for VOCs only via EPA Method 8260D.

Table 4-1 outlines the Year 3 groundwater monitoring plan. Groundwater results are discussed in Section 4.6 of this report.

Groundwater sampling and analyses were performed in accordance with the KSC Sampling and Analysis Plan for the RCRA Program (NASA, 2017), KSC Decision Process Document (NASA, 2019a), and FDEP Standard Operating Procedure (SOP) FS 2200 (FDEP, 2017). Field forms and the associated notes for each sampling event are provided in Appendix D. Purge water collected during the groundwater sampling activities was treated as investigation derived waste (IDW),

managed in accordance with the KSC IDW Management Plan (NASA, 2006), then put back into the treatment system for processing. Miscellaneous trash and personal protective equipment generated during sampling activities were disposed of in an appropriate container.

4.2 SUB-SLAB SOIL GAS SAMPLING

As part of performance monitoring, sub-slab soil gas samples were collected from four pre-installed vapor monitoring pins (VMPs) located beneath, or near, the foundation of the main building (Building K6-1696), as shown on Figure 4-2. The purpose of sub-slab soil gas sample collection is to evaluate the potential for VOC vapors to migrate into the occupied building due to operation of the HCS.

Baseline samples were collected in February 2019 in accordance with the CRCA IWP (NASA, 2019b), with samples collected on a routine basis since HCS operation was initiated. The sampling dates for the Year 3 reporting period were October 21, 2021; January 14, 2022; April 25, 2022; July 22, 2022; and, October 27, 2022, at locations VMP01, VMP02, VMP03, and VMP04. SUMMA® canisters, with 1-hour time-weighted average (TWA) regulators, were used to capture the samples for transport to ENCO in Orlando, Florida for the October 2021 and January 2022 sampling events, and Pace in West Columbia, South Carolina for the April, July, and October 2022 sampling events. These soil gas samples were analyzed for VOCs via EPA Method TO-15. Refer to Appendix B for the complete laboratory reports. The sub-slab soil gas results are discussed in Section 4.8 of this report.

4.3 AMBIENT AIR SAMPLING

Ambient air samples were collected at two designated sample locations: (1) In the vicinity of the HCS treatment trailer to evaluate the potential for VOC vapors to impact field engineers and technicians during maintenance activities due to HCS operations (AMB01), and (2) In the parking lot behind the CRCA main facility (AMB02), as recommended in the Year 2 Annual PMR, to assist in distinguishing potential contributions from routine facility operations. The sample locations are shown on Figure 4-2. The air samples were passively collected using SUMMA® canisters over an 8-hour period to determine if contaminants are present in the ambient air surrounding the treatment system or near CRCA facility operations. These samples

were collected in concert with the sub-slab air sampling events on October 21, 2021; January 14, 2022; April 25, 2022; July 22, 2022; and October 27, 2022. During the October 2022 sampling event, a SUMMA® canister valve malfunction occurred at one of the locations, necessitating re-sampling on November 1, 2022. The ambient air samples were analyzed for VOCs via EPA Method TO-15 at a fixed-based laboratory (ENCO or Pace). These results are further discussed in Section 4.9 of this report.

4.4 WATER LEVELS

Water levels were measured at 35 permanent monitoring wells as a baseline in June 2019, and then quarterly after HCS start-up in conjunction with groundwater performance monitoring activities. Synoptic measurements collected from monitoring wells were converted to groundwater elevations (see Table 4-2), organized into shallow (5 to 15 feet bls), intermediate (25 to 40 feet bls), and deep (53 to 63 feet bls) zones based on the screened intervals of the wells, and interpreted onto groundwater contour maps.

During the five quarterly sampling events within the Year 3 reporting period, the same 35 permanent monitoring wells from baseline were measured. The quarterly water level events were conducted in October 2021, January 2022, April 2022, July 2022, and October 2022 to continually monitor groundwater level fluctuations. The resulting potentiometric surface maps, presented as Figures 4-3 through 4-17, were used to illustrate the behavior of groundwater flow specific to each zone and measurement event and how flow may be affected by HCS operations.

In general, the slope of the water table continues to vary with depth within the surficial aquifer, well location, and time lapsed relative to system operation. The observations made during the Year 3 synoptic events are presented below. Hydrogeologic conditions observed at the site during baseline and the first two years of HCS operation are presented and discussed in the groundwater modeling report section of the Year 2 Annual PMR (NASA, 2022).

4.4.1 Potentiometric Surface of Shallow Zone. During the first quarter of Year 3 HCS operation (October 2021, Figure 4-3), groundwater flow within the shallow zone of the surficial aquifer system occurred to the south in the vicinity of the Solvent Reclamation Area (within the “Chemical Process Area” on figures), becoming more southwestern toward Contractors Road.

Slight mounding was noted in the vicinity of MW0009 with radial flow to the southeast and southwest. In January 2022, groundwater flow exhibited similar trends to the previous quarter with the highest groundwater elevation noted at MW0011, located in the vicinity of the injection wells flowing radially to the southeast toward the Solvent Reclamation Area, to the south, and southwest toward Contractors Road (Figure 4-4). In April 2022, mounding continued toward the center of the site in the vicinity of MW0009 and MW0011, with a general radial flow maintained to the southwest, becoming more westward toward Contractors Road (Figure 4-5). In July 2022, the area of MW0009 became depressional, with radial flow indicated (Figure 4-6). This depressional area is most likely due to increased hydraulic gradients and altered flow patterns by surrounding injection wells. From the center of the site, flow continued to the west toward the three EWs and Contractors Road. During October 2022, the area of MW0009 was no longer depressional, resuming to subtle mounding with flow to the south and east toward a gently sloping depressional area at MW0005 (Figure 4-7).

The lower areas noted within the shallow zone are most likely due to the increased hydraulic gradient and higher groundwater elevations induced by IWs (IW0003, IW0007, and IW0005) in the Solvent Reclamation Area. The higher groundwater elevations consistently found to the north in the area of the injection wells, appear to flow radially toward the southeast, south, and southwest. Stormwater drainage features would be expected to further affect these shallow drainage conditions, as observed during baseline conditions (June 2019).

4.4.2 Potentiometric Surface of the Intermediate Zone. During Year 3 of HCS operation, intermediate groundwater flow in October 2021 generally flowed to the northwest from the southeast corner of the building, with a decreased gradient and general westward flow west of the HCS, toward Contractors Road (Figure 4-8). An isolated depressional area is noted at MW0002, near the center of the Solvent Reclamation Area. In January 2022, flow occurred more to the west and southwest with more uniform contours and a decreased hydraulic gradient. MW0002 no longer marked a depressional area, becoming the area of highest groundwater elevation during this measuring event (Figure 4-9). In April 2022, uniform flow was noted to the west, then northwest toward MW0029 (Figure 4-10). Intermediate flow became more uniform in July 2022, with flow generally occurring to the west and northwest, and gradients decreasing

(Figure 4-11). In October 2022, flow continued to the west, with a southern and northwestern flow component emanating from slight mounding at MW0002, located within the Solvent Reclamation Area. Groundwater contours became more uniform and resolved to a predominately westerly flow west of the main building, toward Contractors Road (Figure 4-12).

4.4.3 Potentiometric Surface of the Deep Zone. During the third year of HCS operation, the October 2021 deep potentiometric surface showed a flow that is generally westward, with a slight southwestern and southeastern convergence toward MW0030 (Figure 4-13). The January 2022 potentiometric surface map shows the flow consistent with the pattern three months prior, occurring uniformly to the west, with slight convergence toward MW0030 (Figure 4-14). The April 2022 data demonstrates a flow within the deep intervals continuing to the west, northwest, and southwest (Figure 4-15). In July 2022, groundwater contours indicated a uniform flow pattern to the west and northwest from the Solvent Reclamation Area toward Contractors Road (Figure 4-16). In October 2022, groundwater flow patterns changed significantly with flow from the north (MW0020) to the southeast and southwest near IWs, IW0001 and IW0002. A depressional area with radial flow was observed to develop toward MW0019, located east of EWs, EW0001, EW0002, and EW0003, along with a higher elevation and converging flow to the northeast and southwest from MW0031 (Figure 4-17).

4.5 FIELD MEASUREMENTS

Temperature, pH, specific conductance, dissolved oxygen, turbidity, and oxidation reduction potential (ORP) were measured and recorded in the field during monitoring well sampling activities. These field measurements from the Year 3 groundwater sampling events are summarized in Table 4-3. Sample log sheets prepared in the field are included in Appendix D.

Field measurements were collected to ensure that groundwater conditions were fully stabilized in accordance with FDEP's SOP for groundwater sampling (FS 2200) before groundwater sample collection, ensuring samples are representative of surficial aquifer conditions (FDEP, 2017). The water pumped from each well was collected and managed as IDW and put into the HCS for processing.

The following presents a summary of field measurements taken prior to each of the quarterly and semi-annual sampling events conducted during Year 3 of HCS operation at CRCA. During the October 2021 groundwater sampling event (Quarter 1), groundwater temperatures in the four wells sampled ranged from 22.80 to 28.30°C, with an average of 25.58°C. Readings of pH ranged from 6.86 to 7.04, with an average of 6.95. Specific conductance ranged from 718.0 to 2,914.0 microSiemens per centimeter (µS/cm), with an average of 1,426.5 µS/cm. Dissolved oxygen values varied from 0.02 to 0.15 milligrams per liter (mg/L), with an average of 0.09 mg/L. Turbidity readings ranged from 0.67 to 13.20 nephelometric units (NTU), with an average value of 5.66 NTU. ORP readings ranged from -98.5 to -84.6 millivolts (mV), with an average reading of -89.7 mV.

The second quarter (Quarter 2) and first semi-annual round of groundwater sampling in January 2022 exhibited groundwater temperatures in the seven wells sampled ranging from 22.0 to 25.10°C, with an average of 23.45°C. Readings of pH ranged from 6.34 to 7.96, with an average of 7.23. Specific conductance ranged from 259.0 to 1509.8 µS/cm, with an average of 900.42 µS/cm. Dissolved oxygen values varied from 0.04 to 0.15 mg/L, with an average of 0.09 mg/L. Turbidity readings ranged from 0.78 to 28.20 NTUs, with an average value of 7.93 NTUs. MW0032 had a high level of turbidity, exceeding the stabilization limit of less than 20 NTUs. Per the FDEP SOP (FDEP, 2017), five volumes of the screened interval were purged to achieve stable conditions. All other parameters were stable and sampled per FDEP SOP, and therefore purging was discontinued. ORP values ranged from -171.3 to 28.5 mV, with an average reading of -58.13 mV.

During the third quarterly sampling event (Quarter 3) in April 2022, groundwater temperatures at the four wells sampled ranged from 22.92 to 27.09°C, with an average of 25.01°C. Readings of pH ranged from 6.61 to 6.79, with an average of 6.70. Specific conductance ranged from 1,089.2 to 2,137.0 µS/cm, with an average of 1,461.2 µS/cm. Dissolved oxygen values varied from 0.04 to 0.13 mg/L, with an average of 0.08 mg/L. Turbidity readings ranged from 0.77 to 26.31 NTU, with an average value of 9.75 NTU. Like the previous event, MW0032 had a high level of turbidity, exceeding the stabilization limit of less than 20 NTUs. Per the FDEP SOP (FDEP, 2017), five volumes of the screened interval were purged, all to achieve stable conditions. All

other parameters were stable and sampled per FDEP SOP, and therefore purging was discontinued. ORP values ranged from 19.6 to 58.2 mV, with an average reading of 37.6 mV.

For the fourth quarter (Quarter 4) and second semi-annual sampling event in July 2022, groundwater temperatures in the seven wells sampled ranged from 22.91 to 29.92°C, with an average of 26.79°C. Readings of pH ranged from 6.08 to 6.95, with an average of 6.61. Specific conductance ranged from 316.5 to 1,953.9 µS/cm, with an average of 1,142.24 µS/cm. Dissolved oxygen values varied from 0.04 to 0.14 mg/L, with an average of 0.09 mg/L. Turbidity readings ranged from 0.88 to 17.51 NTU, with an average value of 10.10 NTU and ORP values ranged from -84.7 to -17.5 mV, with an average reading of -43.29 mV.

For the fifth quarter event (Quarter 5) in October 2022, groundwater temperatures in the four wells sampled ranged from 23.10 to 27.20°C, with an average of 25.18°C. Readings of pH ranged from 6.80 to 7.19, with an average of 7.05. Specific conductance ranged from 788.0 to 1,168.0 µS/cm, with an average of 960.75 µS/cm. Dissolved oxygen values varied from 0.01 to 0.24 mg/L, with an average of 0.10 mg/L. Turbidity readings ranged from 1.34 to 63.7 NTU, with an average value of 20.03 NTU. MW0019 had a high level of turbidity, exceeding the stabilization limit of less than 20 NTUs. Per the FDEP SOP (FDEP 2017), five volumes of the screened interval were purged, all to achieve stable conditions. All other parameters were stable and sampled per FDEP SOP, and therefore purging was discontinued. ORP values ranged from -159.0 to -79.2 mV, with an average reading of -15.63 mV.

4.6 GROUNDWATER ANALYTICAL RESULTS

Quarterly and semi-annual performance monitoring groundwater samples were collected and analyzed in accordance with the prescribed schedule and analyte list (Table 4-1). A summary of results for baseline and all performance monitoring events to date for the site's COCs (tDCE and VC) are presented in Table 4-4. The Year 3 field measurements recorded prior to the collection of each groundwater sample are presented on Table 4-3 and discussed in the previous section. Results for miscellaneous parameters including *Dhc*, VC reductase, and MEE are presented in Table 4-5. Laboratory analytical reports are provided in Appendix B. The groundwater sampling log sheets and chain-of-custody forms are provided in Appendix D. The VOC data is shown on

Figures 4-18 and 4-19 for the intermediate and deep zones, respectively. Figure 4-20 illustrates the combined intermediate and deep plumes, and includes sampling data from other monitoring wells previously sampled as part of the performance monitoring program.

The following summarizes VOC findings from each sampling event completed during the Year 3 reporting period. *Dhc*, VC reductase, and MEE results are also presented below. Evaluation of overall plume conditions and HCS performance is provided under Section 4.7.

4.6.1 October 2021 (Year 3, Quarter 1). On October 7, 2021, the initial round of quarterly sampling for the Year 3 HCS operation reporting period was conducted. During this sampling event, four monitoring wells were sampled (MW0018, MW0019, MW0031 and MW0032) and analyzed for VOCs. All four wells have a screened interval from 53-63 feet bls. There were detections of VC in all four samples, with results ranging from 0.78 to 42 µg/L, exceeding the GCTL of 1 µg/L at three locations (MW0018, MW0031, and MW0032). All wells were non-detect for tDCE.

Year 3 results showed oscillating VC concentrations since the baseline event, with GCTL exceedance at MW0018 (42 µg/L) and a slight detection of 0.78 µg/L at MW0019, both in the vicinity of the main building and the EW and IW system. Groundwater samples collected from monitoring well, MW0031, indicate a steady decline of VC concentrations from 680 µg/L (baseline) to 13 µg/L (October 2021). To the west of the railroad tracks, MW0032 showed an increase of VC levels from non-detect during baseline, 17 µg/L in October 2020, and reducing to 8.7 µg/L in October 2021. This trend indicates that downgradient LCP plume migration is occurring beyond the capture zone of the HCS within the 53-63 feet bls zone.

In addition to VOC analysis, three of the wells (MW0018, MW0019, and MW0031) were also analyzed for MEE and microbial analyses in October 2021. For MEE, methane was the only compound detected with concentrations ranging from 425 to 1,140 µg/L. For microbial, *Dhc* was the only detection with concentrations of 130 Cells per milliliter (Cells/mL) (MW0018), 108 Cells/mL (MW0019), and 258 Cells/mL (MW0031).

4.6.2 January 2022 (Year 3, Quarter 2). The second round of quarterly sampling for the Year 3 HCS operation reporting period, as well as the initial semi-annual round of sampling, was

conducted on January 14, 2022. During this sampling event, four quarterly samples were collected from the deep wells (MW0018, MW0019, MW0031 and MW0032) and analyzed for VOCs. The three semi-annual wells (MW0002, MW0013, and MW0027) were also sampled for VOCs. Results showed one sample with a low-level detection of tDCE (1.1 µg/L at MW0002) with the other six samples non-detect for tDCE. VC was detected at five of the seven wells, ranging from 1.1 µg/L at intermediate well MW0013 to 34 µg/L at deep well MW0018. The other two deep wells with detections (MW0031 and MW0032) showed concentrations of 7.8 µg/L and 14 µg/L, and the intermediate well, MW0002, detected VC at 6.6 µg/L. VC was non-detect in wells MW0019 and MW0027.

Within the area of hydraulic control, results indicate a continued low-level VC detection at MW0013 (1.1 µg/L), slightly lower than the 1.4 µg/L detected in July 2021, but has increased since HCS operation (non-detect at baseline). The highest VC concentration within the intermediate zone was found at MW0002, located east of the main building and within the Solvent Reclamation Area, with a concentration of 6.6 µg/L, above the GCTL; however, showing a reduction from the baseline detection of 28 µg/L. MW0027, located downgradient from the main building, showed a VC concentration of 7 µg/L within the intermediate zone in January 2021 (previous reporting period), warranting further observation as this was the first occurrence of a positive VC detection at this location. During this Year 3, January 2022 sampling event, VC was non-detect at MW0027. Three of the four deep wells revealed positive concentrations of VC, while groundwater collected from MW0019 showed a non-detect level. This non-detect value at MW0019 dramatically decreased since baseline sampling from 250 µg/L to 0.78 µg/L during October 2021 sampling, and now non-detect in January 2022.

Deep wells MW0018 and MW0031 (located within the hydraulic control area), and MW0032 (located downgradient of the hydraulic control area) showed VC detections of 34 µg/L, 7.8 µg/L, and 14 µg/L, respectively, all exceeding the GCTL. Although remaining above the GCTL, MW0018 concentrations have decreased from 140 µg/L during baseline sampling, showing a constant decrease with subsequent sampling events. Similarly, deep well MW0031 (7.8 µg/L) represents the lowest detected VC concentration since baseline sampling (680 µg/L). Groundwater data from downgradient location, MW0032, have exhibited a fluctuation of VC

concentrations since baseline sampling (non-detect), with a slight increase from the Year 3, Quarter 1 sampling (October 2021) of 8.7 µg/L to this sampling event (14 µg/L). This is currently the most downgradient monitoring well; however, as noted previously, a DPT sampling event is being conducted to evaluate the extent of the LCP.

In addition to VOC analysis, three of the deep performance wells (MW0018, MW0019, and MW0031) were sampled for MEE and microbial analyses. The results of these analyses are presented on Table 4-5. Three of the four dissolved gases (ethane, ethene, and propane) from the MEE analyses suite were undetected at all locations sampled. Conversely, methane was found at all three wells (1,150 µg/L at MW0018, 346 µg/L at MW0019, and 657 µg/L at MW0031). MEE and microbial analyses findings in January 2022 are generally consistent with October 2021 results.

4.6.3 April 2022 (Year 3, Quarter 3). The third round of quarterly sampling for the Year 3 HCS operation reporting period occurred on April 18, 2022. Four samples were collected from the deep wells (MW0018, MW0019, MW0031, and MW0032) and analyzed for VOCs. All wells were non-detect for tDCE. VC levels ranged from 0.52 µg/L to 33 µg/L within the deep zone during this sampling event.

Results at MW0018 continue to show a slight VC reduction from 34 µg/L in January 2022 to 33 µg/L during this April 2022 sampling event. Beneath the main building at MW0019, VC levels were detected at 0.52 µg/L. The VC concentrations at MW0031, west of the main building slightly increased to 12 µg/L from 7.8 µg/L in the previous sampling event, but overall, still a reduction from baseline sampling of 680 µg/L. MW0032 showed a slight reduction in VC of 12 µg/L, as compared to the Year 3, Quarter 2 concentration of 14 µg/L at this downgradient location.

During the April 2022 sampling event, groundwater samples were analyzed at three deep performance wells (MW0018, MW0019, and MW0031) for MEE, as summarized in Table 4-5. Microbial parameters were not analyzed during this sampling event. Similar to the October 2021 and January 2022 MEE results, only methane was detected, with concentrations of 800 µg/L, 260 µg/L, and 420 µg/L at MW0018, MW0019, and MW0031, respectively.

4.6.4 July 2022 (Year 3, Quarter 4). The fourth quarterly and second semi-annual sampling event for the Year 3 HCS operation reporting period was conducted on July 21, 2022. Four quarterly samples were collected from the deep wells (MW0018, MW0019, MW0031, and MW0032) and analyzed for VOCs. The three semi-annual wells (MW0002, MW0013, and MW0027) were also sampled for VOCs. tDCE was non-detect in all samples. VC was detected at 2.0 µg/L at two intermediate wells (MW0002 and MW0013); however, the third intermediate well (MW0027) showed no detection. VC concentrations within the deep zone ranged from 1.7 µg/L (MW0019) to 31 µg/L (MW0018).

MW0002, with a VC detection above GCTL at 2.0 µg/L, showed a reduction from Year 3, Quarter 2 sampling of 6.6 µg/L, and a reduction from baseline sampling of 28 µg/L. A VC concentration of 31 µg/L was detected at MW0018, but this location has shown a continuous reduction since its baseline concentration of 140 µg/L. MW0019 showed a VC detection of 1.7 µg/L, slightly above the GCTL, oscillating since July 2020, but has shown an overall reduction from its baseline VC result of 250 µg/L. VC levels have continued to decrease in MW0031, with a reading of 12 µg/L in April 2022, and 4.6 µg/L during the July 2022 sampling event. West of the railroad tracks at deep well, MW0032, VC levels increased slightly from 12 µg/L in April 2022 to 14 µg/L three months later, indicating an oscillating trend at this location since baseline and further substantiating LCP migration to the west.

In July 2022, three of the four quarterly monitoring wells (MW0018, MW0019, and MW0031) were also sampled for MEE and microbial analyses. As shown on Table 4-5, MEE results continued to show methane as the only detected dissolved gas (580 µg/L at MW0018, 520 µg/L at MW0019, and 390 µg/L at MW0031), with concentrations continuing to decrease at MW0018 and MW0031 since October 2021, but slightly increasing at MW0019. Of note, methane results from all three wells in July 2022 were flagged with laboratory qualifier “B”, meaning this compound was also detected in the method blank (laboratory control sample) at a concentration above the MDL but below half the practical quantitation limit (PQL). This indicates methane results could be influenced by potential laboratory contamination or interferences in the analytical system; therefore, results may not be fully associated with the site-specific samples. The only detected microbial was *Dhc* at 18.2 Cells/mL (MW0018), 21.1 Cells/mL (MW0019),

and 9.8 Cells/ml (MW0031). After July 2022, NASA decided to forgo any further MEE or microbial sampling through the remainder of active remediation (see Section 4.7 for further discussion).

4.6.5 October 2022 (Year 3, Quarter 5). The fifth round of quarterly sampling for the Year 3 HCS operation reporting period occurred from October 26 to 28, 2022. Four quarterly samples were collected from the deep wells (MW0018, MW0019, MW0031, and MW0032) and analyzed for VOCs. tDCE was non-detect in all samples. VC was detected at all four wells, ranging from 0.46 µg/L at MW0019 to 26 µg/L at MW0018. At MW0018, VC levels decreased slightly from 31 µg/L in July 2022 to 26 µg/L in October 2022. Note, the VC result at MW0018 had a lab qualifier, M-03, which indicates the laboratory manually selected the peak for analysis due to chromatographic interference and was re-checked via extra samples after holding time. The subsequent analysis showed a level of VC similar to the other, with a concentration of 23 µg/L. This result was given lab qualifier, H, which shows that since an extra sample was analyzed, this sample did not meet the referenced method's holding time.

At MW0031, located approximately 20 feet west of the main CRCA building, VC levels increased slightly from 4.6 µg/L detected three months prior to 5.3 µg/L. At MW0032, the westernmost well, VC concentrations decreased from 14 µg/L in July 2022 to 9.2 µg/L three months later, continuing to represent the downgradient flank of the LCP, connecting with MW0031 to the east and showing separation from MW0018 isolated farther east within the Solvent Reclamation Area.

4.7 HCS PERFORMANCE AND PLUME CONDITIONS EVALUATION

This section evaluates the results of the October 2021 through October 2022 performance monitoring events conducted during Year 3 of HCS operation at CRCA. The intermediate and deep groundwater CVOC plume reshaping within the surficial aquifer at CRCA over time will be discussed, starting with the implementation of the June 2019 baseline sampling, and culminating into the fifth quarter of performance monitoring sampling conducted during the Year 3 HCS operation period, as presented on Table 4-4. Other parameters sampled (MEE and microbial analyses) are also discussed in this section.

VOCs: From baseline to Year 3 performance monitoring, tDCE was detected at one location within the intermediate plume and at three locations within the deep portions of the CVOC plume. All tDCE detections were at concentrations between the MDL and PQL, significantly below its GCTL of 100 µg/L. VC was detected above regulatory limits within both the intermediate and deep zones of the surficial aquifer at CRCA. These results are illustrated on maps depicting the horizontal extent of the VC intermediate plume at 25-40 feet bls (Figure 4-18) and the VC deep plume at 53-63 feet bls (Figure 4-19). The following presents a discussion of these CVOC detections and trends at the intermediate and deep levels from baseline (June 2019) to the Year 3 HCS operation reporting period through October 2022.

Within the intermediate depths at CRCA, tDCE was detected at one location, MW0002, located within the Solvent Reclamation Area, east of the primary building. This parameter was found during the July 2021 (Year 2) performance monitoring event at 0.73 µg/L and during the January 2022 sampling event (Year 3) at 1.1 µg/L. These values, between MDL and PQL, are significantly below the GCTL for tDCE but serve as data points providing information on plume tracking and site characterization. Like the Year 2 HCS operations performance monitoring well data, the intermediate VC plume at the conclusion of Year 3 HCS operations is of LCP levels, with concentrations in exceedance of the GCTL, but significantly below the NADC. After Year 3, the intermediate VC plume continues to become more elongated, with slight GCTL exceedances remaining at MW0002 (30-35 feet bls) located in the Solvent Reclamation Area east of the main building, and MW0013 toward the center of the CRCA primary building, both of which are located in the HCS captures zone. Specifically, at MW0002, a VC concentration of 6.6 µg/L was detected in January 2022, decreasing to 2.0 µg/L in July 2022. This well had the highest VC level detected (28 µg/L) within the intermediate zone during the baseline sampling event in June 2019. Over time, VC has steadily declined in this well to 1.8 µg/L in July 2020, then increased slightly in January 2021 (3.1 µg/L) and oscillating but remaining below 10 µg/L through July 2022. At MW0013, VC concentrations were 1.1 µg/L in January 2022, but increased to 2.0 µg/L in July 2022, slightly above the GCTL for this compound.

The fluctuations in VC concentrations within the intermediate zone further support the idea that EW and IW operations influence plume behavior by altering groundwater flow patterns.

Depressional areas within the surficial aquifer system of CRCA are created by EWs and conversely, IWs induce mounding with re-introduction of treated groundwater. At the end of the third year of HCS operation, the intermediate LCP continues to extend beneath the building, from MW0013 near the center of the primary building and MW0012. At MW0012 (25-30 feet bls), located between the primary building and the Solvent Reclamation Area, a steady decrease of VC concentrations was observed from 2.6 µg/L during baseline to non-detect in January 2021, and remaining non-detect during the July 2021 sampling event of Year 2 (NASA, 2022). MW0012 was not included in the Year 3 sampling plan based on these non-detect results, but provides good spatial data to evaluate plume conditions (see Figure 4-20). Trend analysis graphs for VC in the intermediate wells sampled during Year 3 are shown on Figure 4-21.

The resulting northwest to southeast orientation of the intermediate VC plume is defined by the slight GCTL exceedance to the northwest at MW0013 and to the southeast at MW0002. The elongated nature and low GCTL exceedances of the present intermediate VC plume are in general agreement with the simulated plume predicted under pumping conditions after three years of HCS operation; however, one difference noted is that actual Year 3 plume conditions do not indicate a continued presence of VC west of the CRCA facility. Figure 4-22 shows a comparison of groundwater model predictions (Years 1, 3, and 5), previously presented in the Year 1 Annual PMR (NASA, 2021a), to the actual Year 3 intermediate plume. Of note, the original groundwater model was re-calibrated as part of the Year 2 Annual PMR (NASA, 2022); however, results were similar and therefore the original model was used for comparison purposes.

Within the deep zone of the CRCA surficial aquifer, for the sampling events completed during the Year 3 reporting period (October 2021 to October 2022), no tDCE concentrations were detected in the groundwater. Slight detections of tDCE were identified during baseline within the deep plume (1.91 µg/L at MW0019, 0.97 µg/L at MW0030, and 4.41 µg/L at MW0031), but did not persist during subsequent sampling events.

Since baseline conditions, the deep VC plume has generally decreased in concentration in the vicinity of the Solvent Reclamation Area and the primary building, but increased near MW0032, located in the low-lying area west of Contractors Road and beyond the railroad tracks. Further,

based on the most recent sampling results, the LCP plume appears to separate into an isolated eastern component encompassing MW0018 and an elongated western component stretching from MW0031 to the east, to MW0032 to the west, as shown on Figure 4-19.

At the eastern LCP in the vicinity of MW0018, VC levels went from 140 µg/L during baseline and generally decreased through October 2022 with some oscillation to 23 µg/L. The separation occurred due to the decrease of VC concentrations to below the GCTL at MW0019 (0.46 µg/L) during the October 2022 sampling event. Here, concentrations were 250 µg/L during the June 2019 baseline sampling event, reducing to below the NADC in January 2020 (34 µg/L) and continuing to decrease to below the GCTL in October 2021 (Year 3, Quarter 1) to non-detect in January 2022 (Year 3, Quarter 2), then hovering above the GCTL in July 2022 (at 1.7 µg/L), before finally decreasing to 0.46 µg/L in October 2022.

The upgradient extent of the western LCP starts at MW0031, west of the primary building, persists toward the three EWs, across Contractors Road, and continues past the railroad tracks to MW0032. MW0031 showed VC concentrations exceeding the NADC during baseline and October 2019 events (680 µg/L and 310 µg/L, respectively). These VC concentrations decreased to below the NADC in January 2020 (87 µg/L), then steadily decline to 5.3 µg/L in October 2022, during the fifth quarter of performance monitoring of the Year 3 HCS operation reporting period. Here, the deep plume extends approximately 200 feet westward to MW0032, where VC concentrations have increased from non-detect during baseline, to 17 µg/L in October 2020 (Year 1 of HCS operation), and then remaining above the GCTL after one non-detect event in January 2021. The increase in VC concentrations at this downgradient location may be attributed to the general westward groundwater flow direction from the CRCA property and the location of MW0032 outside the radii of influence of the three EWs to the east. Trend analysis graphs for VC in the deep wells sampled during Year 3 are shown on Figure 4-21.

The resulting shape and separation of the deep VC plume resembles the three-year projection of the groundwater model under pumping conditions, as depicted in the modeling report included in the Year 1 Annual PMR (NASA, 2021a); however, some differences were noted. For example, the model predicted VC exceedances in the area of MW0019; however, this well was less than GCTLs during four of the five Year 3 quarterly sampling events. Figure 4-23 shows a

comparison of groundwater model predictions (Years 1, 3, and 5), previously presented in the Year 1 Annual PMR (NASA, 2021a), to the actual Year 3 deep plume. Of note, the original groundwater model was re-calibrated as part of the Year 2 Annual PMR (NASA, 2022); however, results were generally similar and therefore the original model was used for comparison purposes.

From the June 2019 baseline sampling event to October 2022, the plume has continued to decrease in size and in concentration. Overall, the plume centerline concentrations of tDCE have decreased to non-detect concentrations (going from 4.4 µg/L at MW0031 in June 2019 to non-detect in all Year 3 sampling events) and the plume centerline concentrations of VC has decreased by 97% (with the geomean going from 153 µg/L in June 2019 to 3.99 µg/L in October 2022). The VC mass reductions are summarized in Table 4-6. VC concentration trend analysis graphs are shown on Figure 4-21.

Other Parameters: Dissolved gases were analyzed to evaluate whether conditions are favorable for reductive dechlorination. As shown on Table 4-5, from October 2021 to July 2022, methane concentrations gradually decreased at the deep wells sampled for MEE parameters (MW0018, MW0019, and MW0031). The highest concentration occurred at MW0018, with a peak methane concentration of 1,150 µg/L in January 2022. Concentrations steadily decreased in this well to 580 µg/L in July 2022. No ethane, ethene, or propane were detected during the Year 3 sampling events. The presence of methane in the Year 3 groundwater samples is indicative of anaerobic conditions, which can be favorable for reductive dechlorination; however, the absence of ethene and ethane does not indicate reductive dechlorination is occurring with the low-level VC concentrations remaining in these wells.

Microbial parameters were analyzed to identify if organisms are present that have the ability to complete the reductive dechlorination process. Groundwater samples collected for microbial analysis within the deep zone showed positive *Dhc* concentrations, with the highest found at MW0031 (258 Cells/mL) in October 2021, which subsequently decreased to 9.8 Cells/mL in July 2022. The remaining microbial parameters were undetected at the three deep well locations, screened from 53 to 63 feet bls.

Positive *Dhc* detections can indicate that reductive dechlorination is occurring, facilitating the reduction of hydrogen and chlorine atoms from compounds such as VC, ultimately reducing to inert ethene. However, with *Dhc* levels significantly below 100,000 Cells/mL, coupled with the absence of VC reductase genes, the potential for natural reductive dechlorination within the deep subsurface of CRCA is expected to be minimal. Further, the absence of ethene within the 53-63 feet bls interval may indicate that complete reductive dechlorination is not appreciable at these depths. This accounts for why the MEE and microbial analytes have been removed from the Year 4 performance monitoring plan.

4.8 SUB-SLAB VAPOR MONITORING ANALYTICAL RESULTS

During Year 3 of HCS operations, the four sub-slab vapor monitoring locations were sampled in October 2021, January 2022, April 2022, July 2022, and October 2022. Low levels of tDCE were encountered at all VMP locations during various sampling events, with the highest detection of 18 micrograms per cubic meter ($\mu g/m^3$) occurring in October 2021 at VMP03. At the remaining three locations, tDCE levels detected in October 2021 include 6.0 $\mu g/m^3$ at VMP01, 11 $\mu g/m^3$ at VMP02, and 14 $\mu g/m^3$ at VMP04. In January 2022, the only tDCE detection was 3.3 $\mu g/m^3$ at VMP02. In April 2022, tDCE was detected at all locations except VMP01, with concentrations ranging from 3.37 to 4.16 $\mu g/m^3$. The July 2022 sampling event resulted in four positive tDCE concentrations, ranging from 0.951 to 7.09 $\mu g/m^3$. The October 2022 sampling event resulted in tDCE detections at all four sampling locations, ranging from 1.07 to 7.25 $\mu g/m^3$. VC was not detected at any of the four sub-slab vapor monitoring locations during Year 3.

Analytical results were compared to EPA VISLs for Year 3 HCS operation sub-slab soil gas sampling events. VC, the primary COC in the groundwater plume beneath Building K6-1696, was detected at a concentration of 0.24 $\mu g/m^3$ at one of the sub-slab monitoring locations (VMP03) during the initial year of HCS operation (October 19, 2019) and has not been detected since. CVOC analytical results from sub-slab soil gas sampling are presented in Table 4-7 and summarized on Figure 4-24 (tDCE and VC).

4.9 AIR MONITORING ANALYTICAL RESULTS

During Year 3 quarterly performance monitoring events, air quality samples were taken approximately 50 feet from the outlet of the HCS trailer containing the air stripper and within the paved driveway east of the Solvent Reclamation Area, as shown on Figure 4-24. Air samples were collected over an 8-hour period and analyzed for VOCs via EPA Method TO-15.

Air sample results were compared to Occupational Safety and Health Administration (OSHA) Permissible Exposure Limits (PELs). During the third year of HCS operation performance sampling, all ambient air results were significantly below OSHA PELs for the respective parameters tested. For full analytical results of ambient air samples, refer to Table 4-8, and to Figure 4-24 for a summary of the ambient tDCE and VC results presented in concert with the sub-slab soil results.

Table 4-1. Year Three Monitoring Plan

Monitoring Well	Screen Interval	Monitoring Function	October 2021	January 2022	April 2022	July 2022	October 2022
(CRCA-)	(ft bls)		Sample for VOCs via EPA Method 8260D

Notes:

All elevations are in feet above mean sea level (North America Vertical Datum of 1988)

ft bls = feet below land surface

TOC = Top of casing (elevation)

DTW = Depth to water in feet below TOC

NM = Not measured

Monitoring wells MW0005, MW0005A, MW0005B, and MW0005C are aligned along a shared transect running north to south. Representative wells from this group are typically selected for contouring purposes.

The following wells were not measured in October 2022:

MW0005A, MW0005B, MW0005C since data was found to be inconsistent with surrounding area (measurements deferred to MW0005)

MW0032 not measured due to inaccessibility

Notes:

Field measurements displayed are final stabilized measurements collected before sampling.

SC = Specific conductance in microSiemens per centimeter (µS/cm).

DO = Dissolved oxygen in milligrams per liter (mg/L).

ORP = Oxidation/reduction potential in millivolts (mV).

NM = Not measured.

S.U. = Standard Units.

°C = Degree Celsius.

Values have been rounded from the source material field notes as follows: pH, temperature, turbidity and dissolved oxygen are shown to 2 decimals places, while conductivity and ORP is shown to one decimal place.

Notes:

tDCE = trans-1,2-dichloroethene.

J = Estimated value.

VC = vinyl chloride.

U = Value was reported as below the method detection limit, therefore the detection limit is shown.

H = Out of holding time; extra vials with analytical method 8260D were prepared and sent to the lab with initial vials.

I = Value is between method detection limit and practical quantitation limit.

Bolding indicates a concentration is greater than the method detection limit.

Shading indicates State of Florida Groundwater Cleanup Target Level (GCTL) exceedance, tDCE = 100 µg/L, VC = 1 µg/L.

M-03 = Incorrect auto integration.

Notes:

U = Value was reported as below the method detection limit

B= Detected in the method blank.

I =Value is between method detection limit and practical quantitation limit.

< = The target gene was not detected at the limit of quantitation

Bolding indicates a concentration is greater than the method detection limit

* Not a contaminant of concern at CRCA, but part of the Microbial Insights laboratory analytical suite

"--"= Analysis was not collected.

Notes:
VC = vinyl chloride.
lbs = pounds.
µg/L = micrograms per liter.
U= Value was reported as below the method detection limit, therefore the detection limit is shown.
J= Estimated value.
I = Value is between method detection limit and practical quantitation limit.
Shading indicates the State of Florida Groundwater Cleanup Target Level (GCTL) exceedance, VC = 1 µg/L.
* = rounded to the nearest hundredth of a pound
Bolding indicates a concentration is greater than the method detection limit.
+ = VC value of 26 ug/L at MW0018 from initial lab run in October 2022, and used as conservative measure for mass reduction.
- = No data from this sampling event.

Table 4-7. Sub-Slab Soil Gas Analytical Results (Continued)

Notes:

1 - Analyte list presented is based on initial sub-slab soil gas sampling events. Additional analytes and results from subsequent sampling events can be found in supporting laboratory reports.

USEPA VISL = United States Environmental Protection Agency Vapor Intrusion Screening Level, May 2018 Region Screening Levels, 10^{-6} carcinogen risk, commercial

µg/m³ = micrograms per cubic meter.

Bolded concentrations indicate exceedance in laboratory method detection limit.

I = Analyte detected at a value greater than the laboratory method detection limit, but less than the practical quantitation limit.

J= Estimated value.

U = Analyte not detected at associated detection limit.

B = Same analyte found in the associated blank.

NA = Not analyzed.

NC = No screening criteria has been established or was calculated.

Notes:

1 - Analyte list presented is based on initial ambient air sampling events. Additional analytes and results from subsequent sampling events can be found in supporting laboratory reports.

Values are presented as 8-hour time weighted average.

Concentrations in micrograms per cubic meter.

U = Value was reported as below the method detection limit, therefore the detection limit is shown.

I = Value is between method detection limit and practical quantitation limit.

Shaded analytes indicated constitutes detected in the groundwater during monitoring sampling.

Bolded concentrations indicate exceedance in laboratory method detection limit.

NR= Not recorded.

PEL = Permissible exposure limit.

TLV = Threshold limit value.

V = analyte was detected in both the sample and the associated method blank.

B = Same analyte found in the associated blank.

J = Estimated result between the LOQ and the detection limit.

* = October 2022 had sampling done at AMB02; however, pressure was lost after four hours due to a valve malfunction, therefore, AMB02 was resampled but referenced as AMB03 in lab data (Analytical Package L1553021).

SECTION V
CONCLUSIONS AND RECOMMENDATIONS

5.1 CONCLUSIONS

After three years of operation, the HCS is performing as designed to hydraulically control the CVOC plume and reduce concentrations of CVOCs to support transition to MNA. Current plume conditions suggest that the predicted course, based on Year 2 groundwater modeling predictions of transition to MNA in one to two years with continuous HCS operation, remains valid. The HCS has treated over 27 million gallons of groundwater since startup and has reduced concentrations of tDCE to below the MDL sitewide and reduced concentrations of VC by over 97%.

Ambient air sampling results for the treatment trailer area and within the paved driveway east of the Solvent Reclamation Area continue to be significantly below OSHA PELs and demonstrate breathing air safety for on-site personnel. In addition, sub-slab sampling results after three years of HCS operation do not show any exceedances of commercial EPA VISLs and indicate no effect from HCS operation in the CRCA building workspace.

Performance of the HCS has been operating as designed with only brief interruptions due to routine maintenance, Hurricane Ian, and repairs. The most noteworthy system repair during Year 3 HCS operation involved replacement of the blower motor for the air stripper. The operational runtime of the HCS from September 2021 to October 2022 (Year 3) was approximately 91%.

Overall plume conditions indicate some increasing VC concentrations in the most downgradient monitoring well (MW0032) from the HCS. This may be attributed to the general westward groundwater flow direction from the CRCA property and the location of MW0032, which is outside the radii of influence of the three EWs to the east. DPT sampling is on-going to further delineate the downgradient plume and confirm overall site-wide LCP boundaries.

5.2 RECOMMENDATIONS

The HCS performance detailed in this report and the PMR ADP were presented to the KSCRT in February 2023 (Meeting Minute 2302-M08, Decisions 2302-D13 through -D15). Team consensus was reached on several items including continued operation and evaluation of the HCS to maintain hydraulic control of the groundwater plume and further reduce VC concentrations, continued ambient air and vapor monitoring sampling, and continued performance monitoring with the following changes:

- Discontinue MW0027 from the sampling schedule due to non-detect results.
- Remove MEE and microbials from the analyte list for Year 4. Performance monitoring of four wells (quarterly) and two wells (semi-annually) will continue for VOCs only.

The proposed Year 4 Sampling Plan (2023-2024) is presented in Table 5-1 and on Figure 5-1. This includes replacement of monitoring well MW0019 and accompanying sub-slab sampling point VMP04, which is recommended to be installed during construction of the "non-clean room" area, as shown on the Relocation Schematic (Figure 5-2). The new location will be in a lab storage room located east of the current location. The relocation of MW0019 and VMP04 was discussed with the FDEP, and subsequent approval was received via email in October 2022. The purpose for relocation is that the room where MW0019 and VMP04 are currently located, will undergo construction from a storage room to a "clean room". The existing locations of MW0019 and VMP04 are recommended for proper abandonment as part of the relocation process.

Additionally, plans continue with ongoing DPT sampling to further delineate the downgradient plume edge and confirm overall site-wide LCP boundaries. Findings from the DPT groundwater investigation will be presented to the KSCRT along with recommendations for installation of new monitoring wells, as warranted.

In addition, select existing monitoring wells and DPT samples will be analyzed for PFAS to follow-up on the detection from a sample collected by others in 2021 as part of the on-going Center-wide PFAS sampling effort. Once available, these results, consisting of two separate

monitoring well events and two DPT sampling events will be presented to the KSCRT in a separate PFAS Site assessment ADP and a Site Assessment Report.

Table 5-1. Proposed Sampling Plan for Year Four (2023).

Monitoring Well	Screen Interval (ft bls)	Jan-23	Apr-23	Jul-23	Oct-23	Rationale
		Sample for VOCs via EPA Method 8260D				
MW0002	[30-35]	X	-	X	-	VC concentration above GCTL in January 2022 and July 2022. Continue semiannual performance monitoring. Within LCP.
MW0013	[25-30]	X	-	X	-	VC concentration at GCTL in January 2022 and above GCTL in July 2022. Continue semiannual performance monitoring sampling as is.
MW0018	[53-63]	X	X	X	X	VC concentration above GCTL in all Year 3 sampled quarters. Continue quarterly performance monitoring as is.
MW0019	[53-63]	X	X	X	X	VC concentration at GCTL in July 2022, and below GCTL at other Year 3 sampled quarters. Continue quarterly performance monitoring as is.
MW0031	[53-63]	X	X	X	X	VC concentration above GCTL in all sampled quarters. Continue quarterly performance monitoring as is.
MW0032	[53-63]	X	X	X	X	VC concentration above GCTL in all sampled quarters. Continue quarterly performance monitoring as is.

Component Refurbishment and Chemical Analysis (CRCA) Facility (SWMU# 041) Performance Monitoring , February 2023

Objective: This advance data package (ADP) provides a summary of Year 3 of the hydraulic containment and treatment system operation and maintenance, performance groundwater sampling, sub-slab vapor monitoring, air monitoring results, and test consensus statements on a path forward.

Discussion: Over 27 million gallons of groundwater have been successfully treated at CRCA from startup in July 2019 through October 2022. Hydraulic capture is performing as designed and mitigating downgradient migration of vinyl chloride (VC).

During Year 3, influent and effluent samples were collected monthly for volatile organic compound (VOC) analysis. Groundwater VOC samples were collected from four monitoring wells quarterly and three additional wells semi-annually. Water levels were measured in all site monitoring wells quarterly. Sub-slab vapor samples from four vapor pins installed beneath the CRCA foundation were sampled quarterly for VOC analysis. Ambient air monitoring was conducted

using a direct reading instrument outside the water treatment building and at a background location.

Though VC concentrations remain above the Florida Groundwater Cleanup Target Level (GCTL) of 1 µg/L in select areas, they are decreasing over time in the monitoring wells. VC concentrations show a 97% reduction in the hydraulic containment system (HCS) system influent from startup through July 2022. Trans-1,2-dichloroethene (tDCE) is a major component of Vertrel™ MCA, the product which was released. Its concentrations remained undetected at all wells during the Year 3 HCS operational period, except one detection of 1.1 J µg/L in January 2022 in MW0002. The system is operating as designed with only brief interruptions due to routine maintenance and minor repairs. A runtime of 90% was achieved for Year 3. Ambient air sampling results for the treatment trailer area continue to be significantly below OSHA permissible exposure limit (PEL) levels. Similarly, sub-slab sampling results continue to show levels below commercial the Environmental Protection Agency (EPA) vapor intrusion screening levels (VISLs), with no impact to workers expected inside Building K6-1696.

Monitoring well MW0019 is under the building. Due to a remodeling project, that well will be abandoned and a replacement installed nearby, still beneath the building. The Department of Environmental Protection reviewed and approved of the proposed new location.

The Team reached consensus to continue operation and evaluation of the HCS to maintain hydraulic control of the groundwater plume and to further reduce VC concentrations **(2302-D13).**

The Team reached consensus to continue performance monitoring at the designated locations as outlined on Slide 42 (CRCA-MW0002, MW0013, MW0018, MW0019, MW0031 and MW0032). Monitoring well MW0027 will be removed from the sampling schedule as this well showed no detections during the Year 3 reporting period **(2302-D14).**

The Team reached consensus to continue ambient air and vapor monitoring sampling **(2302-D15).**

Results: Decision Items 2302-D13, D14, D15

Components Refm·bishment ancl Chemical Analysis Facilitv (SWMU #041) Yea!' 2 Pel'formance Monitol'ing, Novembel' 2021

Goal: The pmpose of the ADP is to smnmarize the Components Refurbishment and Chemical Analysis (CRCA) Year 2 Hydraulic Containment System (HCS) for Hot Spot 1 (HSl) Annual Pe1fonnance Monitoring Report (PMR).

Discussion: The advance data package (ADP) presented during the November 2021 Kennedy Space Center Remediation Team (KSCRT) meeting sununarized the investigation and site histo1y of CRCA: the HCS system operation pe1formance from September 2020 through August 2021 (Year 2 of system operation): Year 2 groundwater. sub-slab vapor. and ambient air analytical results: and updated grnundwater model based on Year 2 data collection.

The medium of concem at CRCA is groundwater. The contaminants of concem are vinyl chloride (VC) and trans-1.2-dichloroethene (tDCE). The primaiy Interim Measure (IM) objective is to attain hydraulic control of a dissolved-phase chlorinated volatile organic carbon (CVOC) plume. The seconda1y IM objective is to reduce concentrations of CVOCs in HS 1 and the high concentration plume (HCP) to support transition to monitored natural attenuation (MNA).

Cleaning operations at the site went from using trichloroethene to Freon 113 to Vertrel MCA. Vertrel MCA consists oftrans-1.2-dichloroethene and decafluoropentane. It was that product which was released. As of July 2021. VC (a breakdown product of trans-1.2-dichloroethene) was the only contaminant remaining above its groundwater cleanup target level (GCTL). Concentrations show a decreasing trend since start-up of the hydraulic containment and treatment system. The groundwater model update forecasts attainment of GCTLs in approximately 11 years under cun-ent pumping conditions. vVithout the hydraulic contaimnent system. contaminant migration to the west (downgradient) would resume.

Referencing Slide 12. FDEP pointed ont that the volume of water extracted and the volume of water injected for the year do not balance (volume injected is greater than vohune extracted) and inquired why. Tetra Tech replied that they have looked at that difference. and cannot fully explain it. The engineers speculate that it has to do with aerated water leaving the treatment system not registering coffectly in the flow meters.

FDEP initiated a discussion about contaminant migration. The down gradient well. MW0032, was positioned just beyond the leading edge of the VC plume based on direct push technology (DPT) groundwater sampling completed in 2018 in the wooded area between the railroad tracks and State Road 3/Kennedy Parkway. No contaminants were detected in the initial sample. but VC has been above its GCTL in most samples since 2020. FDEP inquired where the westem limit of groundwater capture was. Tetra Tech explained that the design radius of influence (ROI) was 75 feet. The pump test (step test with greater load on aquifer 2.5 times the design rate) and a constant rate test (24 hours) conducted before full system construction showed influence in a monitoring well located about 400 ft from the wells; a greater influence than the design was based on. The extraction wells are intended to effectively capture the plume under the building. Tetra Tech estimates the approximate actual capture is in the neighborhood of75 feet.

FDEP inquired what portion of the plume to the west is hydraulically cut off from the source area while pumping? Tetra Tech responded that no significant amomlt ofVC is expected to migrate to the westem area. NASA added that there was dissolved contamination ah·eady beyond the influence of the extraction wells at the time the containment system was installed. A DPT investigation is planned for late this year or early next to evaluate plume migration. Results will be briefed to the Team and new monitoring well locations proposed. Tetra Tech noted that the area between the railroad tracks and State Road *3* often has standing water, and there will therefore be some constraints to sampling. FDEP conctmed with this path forward.

NASA related that CRCA MW0003 had been sampled for per- and polyfluorinated substances (PFAS) as part of the Center-wide PFAS Confinnato1y Sampling. The perfluorooctanoic acid result was 204 palis per trillion (ppt). FDEP asked if the source of PFAS was known and if it was near that well. and what if the timing for further PFAS investigation.

NASA replied that initial PFAS sampling is planned to take place this fiscal year. PFAS precursor chemicals were identified in the CRC chemical invento1y, but a specific source has not been identified. FDEP inquired if operation of the HCS at this site would exacerbate the PFAS distribution. to which NASA responded that this system is. at a minimum, recirculating what is there. FDEP inquired if there was any purge or decontamination wastewater generated here from sampling operations? NASA responded that liquid investigative derived waste is routed tlu·ough the site's water treatment system.

The Team reached consensus to continue operation and evaluation of the hydraulic containment system to maintain hydraulic control of the chlorinated volatile organic compound grotmdwater plume and to further reduce vinyl chloride concentrations **(2111-D12).**

The Team reached consensus to continue perfonuance monitoring at designated locations outlined on slide 5l of the ADP, with the removal of monitoring wells MW0012, MW00l 5. MW0028, MW0029. and MW0030 from the sampling schedule. These wells showed no detections during the Year 2 reporting period. Wells MW0018. MW0019. MW0031 and MW0032 will be sampled quarterly and wells MW0002. MW0013 and MW0027 will be sampled semiannually **(2111-Dl3).**

The Team reached consensus to continue ambient air and vapor monitoring sampling. with the addition of a background ambient air sample to assist in distinguishing potential contributions from routine facility operations **(2111-D14).**

Components Refurbishment and Chemical Analysis (CRCA) Solid Waste Management Unit (SWMU) #041, Year 1 Operations Maintenance and Monitoring, October 2020

Discussion

Installation, startup, and commissioning of the HCS was previously presented in the June 2020 CRCA HCS Mid-Year Performance Monitoring ADP. CRCA is located east of Contractors Road, approximately 1 mile north of Schwartz Road. The site consists of Building K6-1696 and the surrounding support building and structures, including the Chemical Processing Area (CPA).

The groundwater contaminant plume at CRCA consists of a 6.54-acre Low Concentration Plume (LCP) where CVOC concentrations exceed Florida Department of Environmental Protection (FDEP) Groundwater Cleanup Target Levels (GCTLs). Within the LCP is a 2.07-acre High Concentration Plume (HCP) where CVOC concentrations exceed FDEP Natural Attenuation Default Concentrations (NADCs), and within the HCP is a 0.8-acre Hot Spot (HS) where CVOC concentrations exceed 10 times (10X) NADCs. Approximately 88-percent of the CVOC plume mass is vinyl chloride (VC) based on pre-IM sampling. The primary IM objective is to attain hydraulic control of the dissolved-phase CVOC plume, and the secondary objective is to reduce concentrations of CVOCs via an IM to support transition to monitored natural attenuation (MNA).

Startup and prove-out activities were conducted from July 22 through August 16, 2019 and included a pre-commissioning check, functional performance tests, and system balancing of the extraction wells (EWs) and injection wells (IWs). The target design flow rate of each EW is 7 gallons per minute (gpm) and of each IW is 3 gpm.

Full-scale operation subsequently began after system balancing and continued through August 2020 (end of the reported operational period) and consisted of monthly air stripper cleaning, influent/effluent sampling for VOCs, and routine maintenance. The HCS performance flow rates and total gallons processed from August 2019 through August 2020, are listed on slide 10 of the ADP.

During this operational period, quarterly performance groundwater sampling was conducted in June 2019 (baseline sampling), October 2019, January 2020, April 2020, and July 2020. Additionally, sub-slab vapor monitoring and ambient air sampling were collected in October 2019, January 2020, April 2020, and July 2020 to determine if the HCS has potentially impacted indoor air for the workers present at the CRCA facility. No CVOC analytes were detected at concentrations exceeding their respective Commercial Vapor Intrusion Screening Levels (VISLs) in the sub-slab vapor samples, and all ambient air sample results were below the OSHA Personal Exposure Limit (PEL) for each constituent analyzed. No adjustments to the HCS system are currently needed based on these results.

Results of the groundwater performance monitoring were provided on slide 28. Data evaluation over the Year 1 operational period shows that all VOCs are less than NADCs with the exception of monitoring well (MW) MW0018 (110 g/L for VC). tDCE has been less than GCTL since before the

baseline groundwater sampling event in June 2019. VC is generally decreasing in all wells during the operation period with only slight rebound in 6 monitoring wells during the July 2020 sampling event (MW0012, MW0013, MW0018, MW0019, MW0028, and MW0031). Monitoring wells MW0003, MW0020 through MW0027, and MW0029 have shown no observed VC concentrations above laboratory method detection limits since baseline sampling. These wells are proposed to be removed from the performance sampling program.

Additionally, groundwater modeling was conducted based upon data collected during Year 1 operations to simulate site-specific surficial aquifer conditions, assess groundwater flow in 3-dimensions, and predict future groundwater remediation response to optimize and streamline long-term operations. Data inputs to the groundwater model consisted of twenty-one boring logs, seven synoptic groundwater level events, 3 to 5 slug tests at all well locations (except MW0013), pumping tests at EW0002, infiltration tests at three IWs, sieve analysis, HPT logging, and chemical analysis from baseline and quarterly groundwater sampling events.

Conclusions based on the groundwater modeling results forecast that, with continued system operation, VC reaches GCTL in approximately 4 to 5 years for all areas except for MW0018. Increasing the injection rate at IW0005 to increase flushing at MW0018 is recommended to expedite groundwater cleanup.

Over eight million gallons have successfully been treated through the HCS system during this operation period. VC concentrations in the groundwater remain above the GCTL of 1 g/L but are decreasing over time, with an 86% reduction in VC since startup.

The path forward for HCS is continued operation and evaluation to maintain hydraulic control of the groundwater plume and to further reduce VC concentrations, continue quarterly sampling of 3 monitoring wells and semiannual sampling of 7 monitoring wells, and to update the Groundwater Model and Transport Evaluation during Year 2 operation reporting.

FDEP inquired if any of the green or yellow shaded wells on Slide 11 are also sampled annually. Tetra Tech stated none of the wells are currently in an annual sampling event.

FDEP noted that there is only one point of compliance well, MW0018. How confident is the Team that there are no other concentrations within that area that are not monitored? Should there be an additional well in a downgradient location? Tetra Tech pointed out data on slide 32 for mid-plume monitoring wells that show decreasing VC results, indicating that the aquifer conditions promote VOC reduction. During each LTM event, data always supported the conclusion that this was a solid reducing environment, resulting in high confidence that the VC on the downgradient side will attenuate. If we need to consider further delineation in the wooded area, this is something that can be discussed; it is projected that the Team will continue to see concentration decreases in this area.

NASA stated their belief is that this VC plume had already passed the point of the extraction wells before the HCS was installed. Based on observations and water level measurements, NASAs suspicion is that the VC plume has not migrated into this area since HCS startup by was already in that area but acknowledged the VC concentration does merit close watching.

FDEP inquired if the June 2019 sample was the first because MW0032 had just been installed. Tetra Tech replied yes and brought up slide 6 to show the locations of 2016-2018 direct push technology (DPT) samples taken from the water table to about 55ft at every depth interval. Most performance monitoring wells were installed after that sampling event. FDEP asked if the system has been operating for one year? If so, would it make sense to keep in the quarterly sampling event to have more data? The HCS had been running for 1 year in August 2020. NASA stated that this well (MW0032) is in the semi-annual sampling event, but they can add it to the quarterly event if preferred. FDEP stated that they would want to know as early as possible if you are not seeing contaminant decreases in that well; quarterly sampling could bring it to our attention sooner. NASA took an action item to transition MW0032 to quarterly monitoring.

FDEP noted that, in terms of depth, it looks like the Team only evaluated to 63 below land surface (bls); and inquired if there is additional data where the Team has sampled deeper than that with DPT? Tetra Tech stated there are physical limitations with a tight confining layer at approximately 55-63 bls at the site. The Team did not want to punch through that confining layer and create preferential pathways for contaminant migration. This is a tough formation to drill through, with additional physical limitations such as wetlands, woods, train tracks, etc. It was determined the concentrations essentially stop around that confining layer. NASA added that this same confining layer is p 1,2-trans-DCE and decafluoropentane) is the COC for this site. NASA worked with FDEP to come up with a risk-based cleanup target level for decafluoropentane with assistance from University of Florida.

VC is lower in density than water in product form. FDEP was interested to know if this was a sinking plume based on the plumes cross-section. DCE is slightly denser than water. Tetra Tech pulled up a past presentation (March 2018 CRCA Step 1 presentation) to show how the plume is migrating away from the chemical processing area and how the plume looked to have been just in the shallow zone at the time of the evaluation. Over the course of the DPT sampling events, the plume started migrating and VC concentrations start increasing and expanding west as you get deeper. The deepest zone is under the occupied building. The geology and plume were shown on slide 31 of the March 2018 presentation.

NASA added that they identified the plume when it was in the shallow zone and over time the plume has migrated deeper. However, the retarding unit has made it spread out laterally at this point. For some history on how we came to use Vertrel, NASA stated in the beginning of the space program that TCE was historically used as a precision cleaner for flight hardware. NASA then migrated to using Freon 113, and eventually

Vertrel MCA because it was supposedly more environmentally friendly (greener chemical).

FDEP inquired why the Team opted out of having a point of compliance well in the deeper 30 ft zone at this site? Why is there not a sister well in the MW0032 location? FDEP pointed out on slide 23 of the 2020 ADP that there exists a distinct plume west of the railroad tracks, but no point of compliance well in that area. Why is that? Tetra Tech looked up the past information for DPT 232 (which is the single downgradient point with a 30-40 ft. interval exceedance) to check and see what the results were. The concentrations at DPT 232 was 12 ug/L at the 30-40 ft interval, 4 ug/L below that, and at the 62ft interval there was non-detect. FDEP inquired what the concentration was in the area of MW0032. Tetra Tech stated that MW0032 is located between DPT232 and DPT233. DPT 233 results were non-detect at the 30-40 ft interval, 10 g/L at the 40-50 ft interval. FDEP pointed out that a well currently exists in the 53-63 ft interval and asked why a shallower well was not also installed in this location. Tetra Tech stated that the logic for a monitoring well was not to monitor degradation of the plume in that area, but to monitor the potential migration from the treatment zone after the HCS was installed. MW0032 is screened to capture the interval that the HCS targets.

FDEP noted there are not high concentrations in this area but wants to make sure we are monitoring the downgradient leading edge of the plume. The plume is supposedly captured now with VC concentrations at MW0032 increasing since HCS start-up. NASA acknowledged that a portion of the plume had already moved through and downgradient of the capture zone prior to HCS start-up, and that low-level VC has increased in the downgradient well over the two most recent sampling events. NASA will transition MW0032 to a quarterly sampling basis in order to watch the trends there more carefully. FDEP agreed with this. NASA inquired if FDEP would like a basket item reported after the next two quarters of sampling events to provide trends of this monitoring? FDEP stated they would. NASA took the action to present a basket item after the next two rounds of quarterly groundwater data, which will take place in October 2020 and January 2021.

FDEP pointed out the recent increase in concentrations at MW0018. To increase flushing in the vicinity of MW0018, Tetra Tech proposes to increase the injection rate at nearby injection well IW0005. The increased injection rate will be achieved by reducing injection rates at other wells. FDEP asked what the increasing VC concentrations at MW0018 are attributed to? Tetra Tech responded with an explanation from one of their professional geologists: MW0018 is one of the quarterly upgradient centerline wells and, based on the data, the geologist believes it is likely the plume collapsing and moving in toward the centerline that is being created by the extraction and injection wells. That would explain increased concentrations. Tetra Tech noted that the wells are taking in more water than designed. This will make it possible to balance out IW0005 by lowering flow rates in other injection well (say to 3.5-4gpm). The adjustment will increase the flushing at this well, which will be more of a focused approach than the current extraction/injection regime.

A groundwater model was developed for CRCA using MODFLOW and MT3D, and details were presented to the Team. Under current pumping conditions, VC is predicted to reach its GCTL in 4-5 years in all locations except the vicinity of MW0018, which is forecast to attain GCTL in 12 years. If groundwater extraction and treatment stopped now, rebound would occur and VC is forecast to take 10 years to reach GCTL.

FDEP observed that the concentrations at MW0018 didnt go up that much from April 2020 to June 2020. Do we have a downgradient MW to monitor? Tetra Tech responded that MW0019, MW0028, and now MW0032 are positioned along a flow path downgradient of MW0018 and will be sampled quarterly to monitor contaminant trends. FDEP had no objection to the path forward. FDEP has the March 2020 IGM report for review, and inquired if they will be receiving another report after that? NASA confirmed a CAMP date of December 2020 for the next report, and explained that the intent of briefing the Team before submitting plans and reports is so that any questions that arise through Team members review of the ADP and its presentation can be addressed and incorporated prior to submitting the report or plan.

FDEP inquired if the wells proposed for elimination are in the shallow zone? Tetra Tech stated they are in the shallow zone and intermediate zone. These wells were installed based on location of the plume prior to HCS start-up. Tetra Tech is proposing to eliminate the MWs since we feel we have good understanding of the current plume. From initial baseline sampling to current, we have had no contaminant detections in these locations that we are proposing to eliminate. For performance sampling only, we are looking to eliminate these from the sampling program. FDEP asked if Tetra Tech could show where the wells are in the context of the plume. Tetra Tech pulled up slides 31 and 32 in the current ADP to provide a detailed explanation with the depths of the wells. FDEP stated that it doesnt look like there exists a shallow plume anymore. Tetra Tech concurred with that. FDEP stated that groundwater was flowing from the east to the west, and inquired if there was a southern component? Tetra Tech confirmed that the flow was from the east to the west and there is not a southern component. FDEP inquired if the Team is comfortable eliminating these wells. Tetra Tech stated that if FDEP recommends that MW0027 and MW0029 be retained in the intermediate zone, they will be. FDEP confirmed they would like MW0027 and MW0029 retained. NASA added that we will have changing plume morphology at this site over time due to groundwater recovery and treatment, and to keep that in mind. We need to consider what wells to retain or eliminate over time as a result of the changes in plume morphology. DPT is now used for performance monitoring at site LC34 as a result of similar conditions.

FDEP observed that the data used to populate the groundwater model will not have a large temporal difference if the model is updated after the second year of operation. Tetra Tech did not disagree but noted that updating the model is fairly simple now that the model has been developed and validated.

Geochemical indicators ha

Goal

The objective is to summarize the groundwater interim measures (IM) hydraulic containment system (HCS) Year 1 operation and maintenance

(O&M) for the treatment of chlorinated volatile organic compounds (CVOCs) at the Components Refurbishment and Chemical Analysis Facility (CRCA).

Decision Id	Decision
D2	The Team reached consensus to increase the groundwater reinjection rate at IW0005 to increase flushing in the vicinity of MW0018.
D3	The Team reached consensus to continue performance monitoring with the following changes: remove monitoring wells MW0003, and MW0020 through MW0026 from the performance sampling program, MW0027 and MW0029 will be sampled semi-annually, and MW0032 will transition to quarterly sampling; eliminate sulfate, sulfide, nitrate, nitrite, carbon dioxide, iron, dissolved iron, and RCRA metals analyses from groundwater sampling events (continue analysis of VOCs, MEE, DHC, and VC reductase in quarterly performance monitoring wells); transition MW0028 to semiannual sampling.
D4	The Team reached consensus to update the groundwater model and transport evaluation after completion of the Year 2 operational period.

Topic		
KSC Headquarters Building Area (KHQA) (SWMU #104) Perimeter Soil IM Completion, October 2020		
Discussion		
A soil investigation was conducted from February 2020 to April 2020 to delineate PCB contamination suspected from deteriorating painted columns on the exterior of the former Headquarters Building. No areas with PCBs equal to or greater than 50 mg/kg were discovered during this investigation. The IM Work Plan (IMWP), approved by the Florida Department of Environmental Protection (FDEP) in June 2020, was developed using the KSC PCB Generic Work Plan. The IMWP addressed the soil contaminated by paint residue only. Two electrical equipment substations locations with PCB contamination as a result of dielectric fluid releases are being addressed separately (Location of Concern [LOC] 2D and LOC 2E).

Component Refurbishment and Chemical Analysis Facility Solid Waste Management Unit (SWMU) #41 Pump and Treat Operations, Maintenance, and Monitoring, June 2020

Discussion

concentrations exceed FDEP Groundwater Cleanup Target Levels (GCTLs). Within the LCP is a 2.07 acre High Concentration Plume (HCP) where CVOC concentrations exceed FDEP Natural Attenuation Default Concentrations (NADCs). Within the HCP is a 0.8 acre Hot Spot (HS) where CVOC concentrations exceed 10 times (10X) NADCs. Approximately 88 percent of the CVOC plume mass is vinyl chloride (VC). The primary IM objective is to attain hydraulic control of the dissolved-phase CVOC plume and the secondary objective is to reduce concentrations of CVOCs via an IM to support transition to monitored natural attenuation (MNA).

Initial startup activities were conducted from July 22-26, 2019 and included a pre-commissioning check and functional performance tests. During functional performance tests extraction well (EW), equalization (EQ) tank, and air stripper pumps were each set to approximately one half of their respective design flow rates, and steadily increased until they reached two to three times their design flow rate in order to stress-test the system. Additionally, air stripper influent and effluent samples for VOC analysis were collected in 8-hour intervals during Day 1, and then daily for the remainder of Week 1.

System prove-out was conducted during weeks two through four (July 29 August 16, 2019), which included system balancing of EWs and injection wells (IWs). The target design flow rate of each EW is 7 gallons per minute (gpm) and of each IW is 3 gpm. Based on system prove-out, each EW was able to achieve and maintain the design flow rate of 7 gpm and each IW was able to achieve the following flow rates: IW0001 achieved 8.2 gpm, IW0002 achieved 8.5 gpm, IW0003 achieved 8.1 gpm, IW0004 achieved 0.1 gpm, IW0005 achieved 7.6 gpm, IW0006 achieved 4.0 gpm, and IW0007 achieved 10.9 gpm.

O&M continued through May 2020 and consisted of monthly air stripper cleaning, influent/effluent sampling for VOCs, and routine maintenance. During this operational period, quarterly performance groundwater sampling was conducted in June 2019 (baseline sampling), October 2019, January 2020, and April 2020. Additionally, sub-slab vapor monitoring and ambient air sampling was collected in October 2019, January 2020, and April 2020 to determine if the HCS has impacted the workers present at the CRCA facility. No CVOC analytes were detected at concentrations exceeding their respective commercial Vapor Intrusion Screening Levels (VISLs) in the sub-slab vapor samples, and all ambient air sample results were below the OSHA Personal Exposure Limit (PEL) for each constituent analyzed. No adjustments to the HCS system are currently needed based on these results.

Additionally during this operational period, maintenance to the system was conducted including the following: cleaning out the flow totalizers which increased the flow in IW0004 from 0.1 gpm to 3.6 gpm; conducting biological activity reaction tests (BART) and Redux 390 inject pilot test

to reduce scaling on the effluent bag filters; and level sensor replacement on the EQ tank float stem.

In summary, over six million gallons have successfully been treated through the HCS system during this operation period. VC concentrations in the groundwater remain above the GCTL of 1 ug/L, but are decreasing over time with a 90% reduction in VC since startup in May 2020. tDCE concentrations have been non-detect during the last two quarterly sampling events. The system is operating as designed with only brief interruptions due to routine maintenance. Daily introduction of Redux 390 amendment has significantly reduced system scaling and helped to maintain system design parameters. The increase of reductive dechlorination indicators suggest a favorable environment for detoxification of these contaminants. Ambient air sampling results for the treatment trailer area are significantly below OSHA PEL levels and sub-slab sampling results show the levels below commercial Environmental Protection Agency (EPA) VISLs.

The path forward for HCS is continued operation and evaluation to maintain hydraulic control of the groundwater plume and to further reduce VC concentrations, continued quarterly sampling of 4 monitoring wells and semiannual sampling of 16 monitoring wells (next event in July 2020), and preparation and submittal of the Groundwater Model in conjunction with the Year 1 Performance Monitoring (PM) Report.

Goal

The purpose is to summarize the groundwater interim measures (IM) hydraulic containment system (HCS) startup and operation and maintenance (O&M) for the treatment of chlorinated volatile organic compounds (CVOCs) at the Components Refurbishment and Chemical Analysis Facility (CRCA).

M3	Willson, Deborah	KSC HEADQUARTERS BUILDING AREA (SWMU 104)

Topic

KSC Headquarters Building (SWMU) #104, Perimeter Polychlorinated Biphenyl (PCB) Excavation / Interim Measure Work Plan

Discussion

A soil investigation was conducted from February to April 2020 to delineate PCB contamination suspected from deteriorating painted columns on the exterior of the former Headquarters Building. The proposed excavation areas will remove all soil with PCBs exceeding 0.5 mg/kg. No areas with PCBs greater than 50 mg/kg were discovered during this investigation. The proposed IM includes 25 areas around the perimeter of the former Headquarters Building to depths ranging from 0.5 to 4 feet (ft) below land surface. The IMWP was developed using the PCB Generic Work Plan.

The path forward for this site is to conduct the proposed IM prior to demolition of the former Headquarters Building. Following demolition of the building, the previously scoped and funded soil remediation for location of concern (LOC) 2D and LOC 2E will be conducted.

Due to the condensed timeline the Team is working with in this situation, NASA will send this report out ahead of FDEPs written approval. FDEP stated they will make it a priority to review this plan once it is received.

FDEP inquired on the disposition of the root bulbs from trees and vegetation being removed as a result of excavation activities. Tetra Tech responded that trees and vegetation will be cut down to grade level. The root bulbs will be removed with the excavator and disposed of in the KSC landfill along with the contaminated soils. NASAs Alex Garcia confirmed that this waste can be disposed of at the KSC landfill. FDEP agreed with this response and requested that the root bulb details be added to the IMWP.

The Draft IMWP was then reviewed by the Team, and NASA suggested the disposition of the root bulbs from the excavation be addressed in the waste handling and disposal section of the document.

Goal

The purpose is to present an Interim Measure Work Plan (IMWP) for polychlorinated biphenyl (PCB)-contaminated soil at the KSC Headquarters Building Area (KHQA).

Decision Id	Decision
D2	The Team reached consensus on the delineation of PCBs in soil to the residential soil cleanup target levels (R-SCTL) (0.5 mg/kg) at the KHQA site.
D3	The Team reached consensus on the boundaries of the 25 excavation areas proposed for the IM at KHQA.

Topic:

Component Refurbishment and Chemical Analysis (SWMU 041)

Discussion:

Based on results of the 2016 DPT investigation, the plume is migrating west of Building K6-1696, tDCE present in 30-55 ft BLS zone is greater than GCTL, VC present west of Building K6-1696 is greater than 10 times NADC. Methane results greater than 1 milligram per liter (mg/L), and presence of ethene suggesting reducing conditions. Groundwater flow is generally to the south-southeast in the 0 to 20 feet BLS zone, and northwest in the 20 to 60-foot zones. However, the current monitoring well network may not be adequate to properly determine the groundwater flow direction

tDCE and VC are COCs in groundwater. TCE and cDCE have no results exceeding the GCTL.

Team consensus reached on that the horizontal and vertical extents are adequately delineated (Hot Spot, HCP, and LCP for entire site are defined).

Proposed Treatment Areas for evaluation:
Hot Spot – VC greater than 1,000 µg/L; Total mass of 35.36 lbs
HCP – VC greater than 100 µg/L, total mass of 12.58 lbs.

Site Conditions and Considerations:
Building K6-1696 covers approximately 90% of the HS and 50% of the HCP plumes. Paved asphalt over majority of CRCA facility.
Electric power available. Numerous utilities within the Chemical Processing Area (CPA).
Area west of plumes is densely vegetated, with areas of seasonal standing water when the water table is elevated.
Average Site Elevations – approximately 7 feet above mean sea level (msl) NAVD88.
Relatively flat terrain.
Drainage swales located on both the east and west sides of Contractor Road.
Groundwater depth varies between 3 and 5 feet below land surface.
Groundwater flow is generally to the south-southeast in the 0 to 20 feet BLS zone, and northwest in the 20 to 60-foot zones. However, the current monitoring well network may not be adequate enough to properly determine the groundwater flow direction.

Data Gaps:
VC and tDCE not delineated per KSCRT EE Process within Building K6-1696, CPA, and wooded area due to limited access.
Vertical delineation of VC to GCTL not complete below 64 feet BLS, as a confining clay layer was identified and do not want to create a possible preferential pathway for further vertical migration.
Potentially inadequate monitoring well network to determine groundwater flow.
Fraction of organic carbon (foc) is a data gap. A few samples may be needed and should be collected prior to any implementation.

Is there a vertical contaminant gradient? Is there a water leak that may be pushing contamination down?

Team consensus reached on the retainment of the following technologies for evaluation:
Alternative 1. Barrier: Air Sparging Curtain of HCP (including Soil Vapor Extraction [SVE] to mitigate potential vapor issues), Source Treatment: In-Situ Chemical Oxidation of Hot Spot.
Alternative 2. Barrier: Air Sparging Curtain for HCP (including SVE to mitigate potential vapor issues), Source Treatment: Biostimulation of Hot Spot.
Alternative 3. Barrier: Hydraulic Control for HCP (including Air Stripping/Carbon Absorption), Source Treatment: In-situ Chemical Oxidation of Hot Spot.
Alternative 4. Barrier: Hydraulic Control of HCP (including Air Stripping/Carbon Absorption), Source Treatment: Biostimulation of Hot Spot.

If hydraulic control is done, consider adding electron donor to reinjected water.

Goal:

Present Site Characterization and obtain Team consensus on path forward.

Decision:23	Team consensus reached on that the horizontal and vertical extents are adequately delineated (Hot Spot, HCP, and LCP for entire site are defined).

Decision:24	Team consensus reached on the retainment of the following technologies for evaluation: Alternative 1. Barrier: Air Sparging Curtain of HCP (including Soil Vapor Extraction [SVE] to mitigate potential vapor issues), Source Treatment: In-Situ Chemical Oxidation of Hot Spot. Alternative 2. Barrier: Air Sparging Curtain for HCP (including SVE to mitigate potential vapor issues), Source Treatment: Biostimulation of Hot Spot. Alternative 3. Barrier: Hydraulic Control for HCP (including Air Stripping/Carbon Absorption), Source Treatment: In-situ Chemical Oxidation of Hot Spot. Alternative 4. Barrier: Hydraulic Control of HCP (including Air Stripping/Carbon Absorption), Source Treatment: Biostimulation of Hot Spot.

Meeting Start Date:	Meeting ID:	Minute ID:	Presenter:	PRL / SWMU:
03/22/2018	196	6	Murphy, Alex	COMPONENTS REFURBISHMENT AND CHEMICAL ANALYSIS (SWMU 041)

Topic:

Component Refurbishment and Chemical Analysis (SWMU 041)

Discussion:

Operations began in 1998 with cleaning of spacecraft components using several organic and inorganic chemicals. The primary solvent of concern is Vertrel MCA which is a mixture of tDCE (35-41%) and decafluoropentane (59-65%). This was historical stored and used in the Chemical Processing Area (CPA). Bulk storage tanks of Vertrel were removed from CPA, and Vertrel is now stored in Building K6-1696A. tDCE and VC are the primary contaminants of concern at the site. Decafluoropentane has not been sampled in groundwater since 2006 (detected in groundwater sample DPT0103 in the 55 feet BLS zone at a concentration of 28.1 µg/L, less than the FDEP GCTL of 49 µg/L).

Based on VOC groundwater concentrations beneath Building K6-1696, an air monitoring plan will be developed to determine if vapor intrusion is occurring within the occupied Building K6-1696 with plume in its current state (absent of any IM implementation). Phase I will be an evaluation of the facility operations. Phase II will consist of groundwater sampling at select monitoring wells and soil gas sampling at select locations within Building K6-1696. Phase III is indoor ambient air sampling.

Phase I was completed in January 2018. There were no potential indoor vapor intrusion pathways found. The only VOC usage within Building K6-1696 is within the Extraction Laboratory at the northwest corner of the facility. Review of chemical inventory list found no chemicals in Building K6-1696 containing tDCE, VC, or decafluoropentane. Site reconnaissance of Building K6-1696A (location of stored Vertrel MCA) found this building to only be occupied for a maximum of 4 hours per day and is not a closed structure. Soil vapor extraction (SVE) system was abandoned approximately 5 years ago. The piping was pulled, and the vertical extraction wells are still on site.

Will evaluate Vapor Pins for use at this site. It was recommended to sample for oxygen to give insight into VC degradation in the vadose zone. Recommendation was made to check EPA Vapor Intrusion Screening Level (VISL) before you send to the lab to ensure that the laboratory detection limits are below the VISLs.

If indoor air sampling completed, need an outdoor sample with no operations in progress. Also make sure the Method TO15 is validated for decafluoropentane.

Team consensus reached to collect groundwater samples for VOCs (modified to include decafluoropentane) at the following monitoring well locations: MW0006, MW0008, MW0009, MW00011, MW0012, MW0013, MW0018, and MW0019.

Team consensus reached to collect soil gas sampling: one within the Calibration Warehouse (adjacent to MW0019), two within the Field Cleaning Room (one adjacent to MW0008 and one adjacent to MW0009), and one inside Building K6-1696 (adjacent to MW0011 and MW0012). Samples will be collected and be analyzed for VOCs via USEPA Method TO15 and be expanded to include decafluoropentane. Sampling locations will be confirmed based on review of the groundwater analysis. Soil gas sampling will be conducted when the doors to the facility are closed and preferably without the operation of the HVAC system.

An additional round of soil gas sampling may be warranted based on evaluation of the analytical results. Come back to Team with Phase II results before moving to Phase III.

Goal:

Present an air monitoring plan and obtain Team consensus on proposed plan.

Decision:25	Team consensus reached to collect groundwater samples for VOCs (modified to include decafluoropentane) at the following monitoring well locations: MW0006, MW0008, MW0009, MW00011, MW0012, MW0013, MW0018, and MW0019.

Decision:26	Team consensus reached to collect soil gas sampling: one within the Calibration Warehouse (adjacent to MW0019), two within the Field Cleaning Room (one adjacent to MW0008 and one adjacent to MW0009), and one inside Building K6-1696 (adjacent to MW0011 and MW0012). Samples will be collected and be analyzed for VOCs via USEPA Method TO15 and be expanded to include decafluoropentane. Sampling locations will be confirmed based on review of the groundwater analysis. Soil gas sampling will be conducted when the doors to the facility are closed and preferably without the operation of the HVAC system.

Meeting Start Date:	Meeting ID:	Minute ID:	Presenter:	PRL / SWMU:
05/10/2018	197	8	Murphy, Alex	COMPONENTS REFURBISHMENT AND CHEMICAL ANALYSIS (SWMU 041)

Topic:

Component Refurbishment and Chemical Analysis (CRCA) Facility

Discussion:

IM objectives:
Primary Objective – Phase 1
• Mitigate plume migration
• Minimize risk to workers present within building K6-4696 by preventing vapor intrusion.
Secondary Objective – Phase 2
• Reduce concentrations within the VC hot spot and high concentration via an interim measure to support transition to monitored natural attenuation (MNA).

Data Gaps
Aquifer characteristics (hydraulic conductivity, groundwater velocity, hydraulic gradient) are not well define at the target treatment depth
Total Organic Carbon at target treatment depth
Proposed Year 1 Data Collection
Prior to implementation of Phase II:
• Aquifer tests will be conducted to better define the target treatment zone
• Total organic carbon (TOC) analysis and further lithologic characterization will be conducted in the target treatment zone
Results of the Year 1 data collection will be evaluated to adjust Phase II
The proposed Year 1 data collection will be outlined in the Interim Measure Work Plan

Alternative G1 – Phase I air sparge down gradient of high concentration plume and soil vapor extraction (SVE) in vadose zone. Phase II in situ chemical oxidation (ISCO) in Hot Spot. Estimated treatment time to less than NADCs is approximately 5 years and time to less than GCTLs via MNA is approximately 75 years. Estimated lifecycle cost is $3.97 million.

Advantages:
Effective technology at well-defined sites.
KSC level of air sparge experience
Large Hot Spot reduction from ISCO
Existing air sparge system onsite can reduce costs.

Disadvantages:
Energy intensive
Preferential pathways possible
Buffering capacity impacted
Potential vapor intrusion generator for occupied building K6-4696
High ISCO capital costs.

Alternative G2 – Phase I air sparge down gradient of high concentration plume and soil vapor extraction (SVE) in vadose zone design will be the same as Alternative G1. Phase II bioremediation injections in Hot Spot. Estimated treatment time to less than NADCs is approximately 5 years and time to less than GCTLs via MNA is approximately 75 years. Estimated lifecycle cost is $2.817 million.

Advantages:
Same as Alternative G1, but large Hot Spot reduction and continuing reduction during substrate recirculation.

Disadvantages:
Same as Alternative G1, but lower capital costs of bio compared to ISCO.

Alternative G3 – Phase I hydraulic control down gradient of high concentration plume. Phase II ISCO in Hot Spot; direct injection of ChemOx reagents into Hot Spot Plume will be the same as Alternative G1. Estimated treatment time to less than NADCs is approximately 5 years and time to less than GCTLs via MNA is approximately 75 years. Estimated

lifecycle cost is $4.02 million.

Advantages:
Effective technology for site COCs
Large Hot Spot reduction

Disadvantages:
Required adequate geochemical conditions to be successful
High ISCO capital costs

Alternative G4 – Phase I hydraulic control down gradient of high concentration plume; design will be the same as Alternative G3. Phase II bioremediation injections in Hot Spot; design will be the same as Alternative G2. Estimated treatment time to less than NADCs is approximately 5 years and time to less than GCTLs via MNA is approximately 75 years. Estimated lifecycle cost is $2.864 million.

Advantages:
Effective technology for site COCs
Large Hot Spot reduction and continuing reduction during substrate recirculation

Disadvantages:
Same as Alternative G3, but lower capital costs for injections

Team consensus reached on Alternative G4 Phase 1, Year 1 consisting of hydraulic containments with additional data collection (aquifer tests to better define the target treatment zone, TOC analysis, and further lithologic characterization in the target treatment zone).

Following Phase I, re-evaluate and adjust Phase II.

Consider not using double wall piping since within the footprint of the plume. Look at what was done at LC34 and do not pursue the double wall piping.

Consider reinject with a tracer that could be picked up at a recovery well at the end of the first year this will demonstrate the water movement from one side to the other.

Consider Hydraulic Profiling Tool (HPT) data evaluation prior to installing injection wells.

Goal:

Present remedial alternative evaluation and obtain team consensus on path forward.

Decision:22	Team consensus reached on Alternative G4 Phase 1, Year 1 consisting of hydraulic containments with additional data collection (aquifer tests to better define the target treatment zone, TOC analysis, and further lithologic characterization in the target treatment zone).

Meeting Start Date:	Meeting ID:	Minute ID:	Presenter:	PRL / SWMU:
06/28/2018	200	2	Murphy, Alex	COMPONENTS REFURBISHMENT AND CHEMICAL ANALYSIS (SWMU 041)

Topic:

Components Refurbishment and Chemical Analysis (CRCA) Facility (SWMU 041)

Discussion:

Based on the Step 1B evaluation, the High Concentration Plume (HCP) and the Hot Spot will be the area of focus for the IMWP. Approximately 88% of the volatile organic compound (VOC) plume mass is within the HCP and Hot Spot. 100% of the trans-1,2-dichloroethene (tDCE) mass is from 50 to 60 50 feet (ft) below land surface (BLS). 47% of the vinyl chloride (VC) plume is from 40 to 50 ft BLS and 45% is from 50 to 60 ft BLS. The site characterization identified groundwater as the medium of concern.

The primary IM objective is to attain hydraulic control of the dissolved-phase chlorinated VOC (CVOC) plume with the caveat that prevention of vapor intrusion will be re-evaluated upon baseline air sampling or in the Year 1 performance monitoring evaluation. The secondary IM objective is to reduce concentrations of CVOCs in Hot Spot 1 and HCP via an IM to support transition to monitored natural attenuation (MNA).
Consensus was reached to retain pump and treat downgradient of the HCP, conduct aquifer testing and lithologic evaluations in target treatment zone during Year 1 pump and treat operation and evaluate path forward for treatment of Hot Spot 1 at the end of Year 1 (meeting minute 1805-M08, decision 1805-D22).

Site Conditions and Considerations:
• Average site elevations are approximately 7 feet above mean sea level (msl) relative to NAVD88.

• Relatively flat terrain.
• Drainage swales located on both the eastern and western sides of Contractors Road, and low-lying wooded area with approximately 2 feet of standing water approximately 250 west of building K6-1696.
• Groundwater elevations vary between 3 and 5 ft BLS.
• Groundwater flow is generally to the south-southeast in the 0- to 20 ft BLS zone, and northwest in the 20- to 60 ft BLS zones. However, the current monitoring well network may not be adequate to properly determine groundwater flow direction.
• Electric power available (VFI 713).
• Majority of groundwater contaminant mass is beneath building K6-1696. Access within building K6-1696 is limited. Additionally, there are numerous utilities throughout the Chemical Processing Area (CPA) just east of building K6-1696

Per team consensus at the May 2018 KSCRT Meeting, Alternative G4 has been modified as follows:
The pump and treat system will be installed as proposed in Alternative G4.
During the first year of operation, aquifer testing and lithologic, geochemical, and constituents of concern data collection will be conducted to evaluate the performance of the pump and treat system and the hydraulic state of the target treatment zone (43 to 63 ft BLS).
After approximately 1 year of operation, a performance evaluation will be conducted, and a path forward will be proposed to treat the HS located beneath the building.

Proposed Year 1 Aquifer Testing:
Install 11 monitoring wells at 7 locations:
• 1 Shallow well (5 to 15 ft BLS) will target the upper sand unit
• 4 Intermediate wells (30 to 40 ft BLS) will target the fine to very fine sand unit.
• 6 Deep wells (53 to 63 ft BLS across the site) will target the shell zone above the very fine sand layer.
• Hydraulic Profiling Tool (HPT) data collection will be conducted during the 6 deep monitoring well installations from surface to 63 feet BLS to produce a detailed log of relative formation permeability and estimate hydraulic conductivity.
Slug testing will be performed at newly installed monitoring wells and select existing monitoring wells:
• Using a solid slug rod capable of displacing approximately 3 feet of water (instantaneous head change)
• Data collected with a Solinst Levelogger or Van Essen Micro-Diver
• If slug testing does not generate a suitable head difference, then falling head tests will be conducted on the newly installed and existing monitoring wells
Monitoring well installation and aquifer tests on monitoring wells will be conducted prior to installation of the pump and treat system.
Installation of pump and treat system:
• Extraction well EW0002 and injection well IW0007 will be installed initially.
• A step-drawdown pumping test (step test) will be conducted at the central extraction well (EW0002) to observe the pumping performance under variable extraction conditions.
? Pumping rate in the extraction well will begin at 0.5 times the design flow rate and increase approximately every 30 minutes up to 1.25 times the design flow rate.
? Step test results will be used to evaluate transmissivity, well efficiency, and capture zone.
• A 24- or 48-hour constant-rate test will be performed at EW0002, with the test rate at the assumed extraction rate of 7 gallons per minute (gpm)
? Monitoring well water levels will be monitored with Solinst Leveloggers or Van Essen Micro-Divers.
? Transmissivity and storage will be estimated using AQTESOLV.
? Capture zone analysis will be performed to ensure adequate capture at targeted rate.
• A pressure transducer will be installed on injection well IW0007 to monitor water level changes before, during, and after the injection test.
• After completion of the extraction well EW0002 and injection well IW0007 tests, the remainder of the pump and treat system will be installed, modifying (if necessary) based on the test results.
• MODFLOW modeling estimating pump and injection system performance will be presented in the Year 1 Performance Monitoring Report, or when site-specific data supports its use.
• RT3D transport modeling will be conducted no sooner than after Year 1, or after site-specific data supports its use.

Pump and Treat Design Summary:
Extraction Wells
• Three installed to depths of 63 ft BLS (targeting shell zone)
• Construction: 6-inch diameter PVC riser with 20-foot 0.010-inch slotted screen set in 10-inch casings
• 75-foot capture zone spacing downgradient of HCP
• Flow rate of approximately 5 to 7 gpm per well
• Prior to installation of extraction wells, collect 1 soil sample from each extraction well location targeting the shell layer (approximately 43 to 63 ft BLS) to be analyzed at a fixed-based laboratory for:
? Total Organic Carbon
? Soil Grain Size to confirm filter pack size and screen slot size
Injection Wells
• Seven installed to depths of 61 ft BLS (targeting shell zone)
• 6 of 7 installed at angles to reach injection edge of HCP
• Construction: 6-inch diameter schedule 40 PVC with 20-foot 0.020 slotted screen set in 10-inch casings
From air stripper, extracted groundwater will be re-distributed to injection wells located on the northern, southern, and eastern sides of Building K6-1696 (upgradient of the HCP).
Emissions less than KSC Title V Operating Air Permit (based on mass present).
Injection and extraction well information (coordinates, depth, etc.) provided in IMWP Table 1.
Performance monitoring plan provided in IMWP Table 2.

O&M Frequency: Daily for the first week, weekly for the first month, bi-weekly thereafter.
Estimate treatment time to reach Natural Attenuation Default Concentrations (NADC):
• Based on preliminary pumping calculations of pump and treat system without the introduction of amendments: approximately 35 years of pump and treat operation.
• After Year 1 of pump and treat operation and treatment zone data collection, the estimated treatment time to reach NADCs and Year 2 (and onward) path forward will be re-evaluated.

Proposed Performance Monitoring:
• Baseline Sampling:
? 19 monitoring wells for VOCs
? 4 monitoring wells for select geochemical parameters (methane, ethane, and ethene (MEE), sulfate, sulfide, nitrate/nitrite, alkalinity, carbon dioxide, iron, dissolved iron, Resource Conservation and Recovery Act (RCRA) metals, total organic carbon, Dehalococcoides, and VC reductase).
• Year 1 Quarterly Monitoring of 4 monitoring wells for VOCs and select geochemical parameters (listed in Baseline Sampling).
• Year 1 Semi-Annual Sampling of 19 monitoring wells for VOCs.
• Water levels collected at all monitoring wells and injection and extraction wells during each quarterly O&M.
• Field parameter data collected from all monitoring wells sampled.

Total capital costs are approximately $895,000.
Total Year 1 Operation Costs approximately $103,000.

A flow chart exit strategy was provided in the advance data package presented at the Team meeting.

Team consensus reached on Hot Spot 1 Interim Measures Work Plan.

Tetra Tech expects one to two months for installation and pump test.
NASA indicated to FDEP that this site a NASA top priority project right now.

Goal:	
Obtain team consensus on Interim Measures Work Plan (IMWP).	
Decision:2	Team consensus reached on Hot Spot 1 Interim Measures Work Plan.

Meeting Minutes Summary Report

Meeting Start Date:	Meeting ID:	Minute ID:	Presenter:	PRL / SWMU:
04/10/2019	204	16	Murphy, Alex	COMPONENTS REFURBISHMENT AND CHEMICAL ANALYSIS (SWMU 041)

Topic:

Component Refurbishment and Chemical Analysis (CRCA) Facility (SWMU 041)

Discussion:

Operations began in 1998 with cleaning of spacecraft components using several organic and inorganic chemicals. The primary solvent of concern is Vertrel MCA. Vertrel MCA is a mixture of trans-1,2-dichoroethene (tDCE, 35 to 41 percent) and decafluoropentane (DFP, 59 to 65 percent). Historically, it was stored and used in the Chemical Processing Area. Bulk storage tanks of Vertrel were removed from the Chemical Processing Area and it is now stored in Building K6-1696A. tDCE and vinyl chloride (VC) are the primary contaminants of concern at CRCA. DFP had not been sampled in groundwater since 2006, when it was detected in groundwater sample DPT0103 in the 55 feet below land surface zone at a concentration of 28.1 micrograms per liter (µg/L), less than the Florida Department of Environmental Protection (FDEP) Groundwater Cleanup Target Level (GCTL) of 1,800 µg/L that was derived from the 2006 University of Florida Clean-Up Criteria for DFP development.

The objective of air monitoring was based on volatile organic compounds (VOC) groundwater concentrations beneath Building K6-1696. The air monitoring plan was developed to determine if vapor intrusion is occurring within the occupied Building K6-1696.

Phase I: Evaluation of facility operations
Analysis of hazardous materials and interviews with CRCA Engineering Supervisor on facility operations to determine VOC usage locations within Building K6-1696.
Review of up-to-date chemical inventory list.
Evaluation of underground trenching and utility system in the CPA to determine if there are potential indoor pathways for vapor intrusion.

Phase I completed (January 2018) to determine Phase II and III approach. No potential indoor vapor intrusion pathways found. Only VOC usage within Building K6-1696 is within the Extraction Laboratory at the northwest corner of the facility. Review of chemical inventory list found no chemicals stored in Building K6-1696 containing tDCE, VC, or DFP. Site reconnaissance of Building K6-1696A (location of stored Vertrel MCA) found this building to only be occupied for a maximum of 4 hours per day and it is not a closed structure.

Phase II:
Groundwater sampled at 8 locations in August 2018 and analyzed for VOCs via Method 8260B and modified to include DFP. VC and DFP observed in groundwater samples. Benzene and toluene were observed below GCTLs and unassociated with source of spill.
Four vapor pins installed for sub-slab soil gas sampling. Samples were analyzed for VOCs via USEPA Method TO-15, modified to include DFP. Unable turn off the HVAC system during sub-slab sampling due to sensitive equipment calibrations within Building K6-1696. Sub-slab soil gas samples observed no detections of VC or tDCE. DFP detections were observed to be less than the calculated soil gas commercial screening level. There was an exceedance of the United States Environmental Protection Agency Residential Vapor Intrusion Screening Levels Sub-Slab for chloroform, assumed to be attributed to potable drinking water and/or sewer lines in the vicinity of VMP0004.

Based on Phase II results, ambient air sampling is not necessary at this time as the CVOC groundwater plume beneath Building K6-1696 is not presenting a vapor intrusion risk to the workers present.

An Implementation Work Plan for a Pump and Treat Interim Measure at CRCA to contain and remediate the CVOC plume beneath Building K6-1696 is in development. Within that work plan, VMP01 through VMP04 are proposed to be used for quarterly performance monitoring sub-slab sampling to ensure that Interim Measures do not generate sub-slab vapor. If contaminant concentrations are detected exceeding the appropriate RVISLs, then the system will be shut down until the problem is identified and corrective action is taken.

Team consensus reached that air monitoring evaluation is complete, ambient air samples within Building K6-1696 do not need to be collected at this time, Air Monitoring Report can be submitted to the FDEP documenting the results of Phase I and Phase II, and quarterly sampling of vapor monitoring pins will be part of performance monitoring program.

Provide memo with data to NASA Industrial Hygienist.

Goal:

Present air monitoring results.

Decision:40	Team consensus reached that air monitoring evaluation is complete, ambient air samples within Building K6-1696 do not need to be collected at this time, Air Monitoring Report can be submitted to the FDEP documenting the results of Phase I and Phase II, and quarterly sampling of vapor monitoring pins will be part of performance monitoring program.

Meeting Minutes Summary Report

Meeting Start Date:	Meeting ID:	Minute ID:	Presenter:	PRL / SWMU:
06/06/2019	205	9	Neumann, Chris	COMPONENTS REFURBISHMENT AND CHEMICAL ANALYSIS (SWMU 041)
Topic:				
Components Refurbishment and Chemical Analysis (CRCA) Facility Solid Waste Management Unit (SWMU) #041 Hot Spot 1 Interim Measure (IM) hydraulic containment system (pump test and construction activiti				
Discussion:				

An extensive site history was presented.

The primary objective of Interim Measures (IM) is to attain hydraulic control of dissolved phase chlorinated volatile organic compounds (CVOC) plume. The secondary objective is to reduce concentrations of CVOC s in Hot Spot 1 and the High Concentration Plume via an IM to support transition to Monitored Natural Attenuation (MNA).

Hot Spot 1 Treatment Zone:
• Encompasses approximately 9.41 acres
? Low Concentration Plume area greater than Groundwater Cleanup Target Levels (GCTL) – 6.54 acres
? High Concentration Plume (HCP) area greater than Natural Attenuation Default Concentrations (NADC) – 2.07 acres
? Hot Spot area greater than ten times NADC – 0.8 acres
• Hot Spot 1 has a total VOC plume mass of 54.25 pounds.
• Approximately 88 percent of VOC plume mass is in Hot Spot and High Concentration Plume and approximately 99 percent of VOC plume mass is vinyl chloride.

Deviations from IM Work Plan:
Biggest change is location of power source. Existing electrical connection RLP1 was selected to provide power to the treatment system instead of VFI 713.
Injection wells were relocated, angles adjusted, and trenching re-routed based on site walk with dig police and facility manager.
Due to relocation, injection well IW0006 screen length was increased from 20 to 30 feet to allow more contact with the High Concentration Plume while maintaining the target treatment depth interval.
Some wells and piping moved to avoid GN2 lines.

Twelve monitoring wells were installed via DPT methods and constructed as outline in the Implementation Work Plan (1 shallow well screened 5 to 15 ft BLS, 4 intermediate wells screened 30 to 40 ft BLS, and 7 deep wells installed 53 to 63 ft BLS).

Hydraulic Profiling Tool (HPT) was conducted at deep monitoring well locations (from the water table to 63 ft BLS) to evaluate hydraulic behavior. Relatively low injection pressure indicates a relatively large grain size and an ability to easily transmit water. High hydraulic conductivity estimates ease with which water can move through pore spaces. The results were relatively uniform for all deep wells where HPT was conducted.

Following the installation of MW0021 through MW0032, slug testing was performed at 31 wells. Rapid recovery in falling and rising head tests were observed (full recovery within 30 seconds at most wells). Oscillary responses were common in many well locations (preliminary analysis confirm hydraulic conductivities (K) range from 50 to 100 plus feet per day).

Step pump test conducted on EW0002. Pumped well for 45 to 60 minutes at 5 different rates. There was rapid drawdown and recovery. Stabilization generally occurred within 15 to 20 minutes. Drawdown ranged from less than 1 ft at 3.5 gallons per minute (gpm) to 3.3 ft at 14 gpm.

Constant Rate Test Results
Data collected every 10 seconds with data transducer using water level probe. Monitored approximately 30 wells across the site in the shallow, intermediate, and deep zones at regular intervals for duration of test. Influence of pumping was observed across the site in all zones. Largest influences observed in the deep zone. Monitoring wells within 150 ft of well being pumped reached stabilization before ending test.

Injection Test
Prior to injection tests, extracted groundwater was stored in a 20,000-gallon frac tank, treated with a mobile air stripper, and “proved-out” with fixed-base laboratory analysis.
Performed injection testing at 3 injection wells that represent the range in lithologies encountered at the site for all injection wells. Generally, 3 to 5 injection rates were used at each location and ran for 4 or more hours in duration. Several long-term tests were run that were greater than 12 hours. Based on injection test results, anticipated capacities for IW0007 is 0.5 to 1.0 gpm, IW0001 up to 30 gpm, and IW002 up to 15 gpm.

Lessons Learned: A smaller sized sonic drilling rig was required to access certain areas. The smaller rig required more water than typical to advance to depth at the angles required. This generated more investigative derived water/soil spoils than anticipated.

Pump and treat system installed to completion. System commissioning, startup, and baseline sampling will be conducted in Summer 2019.

Goal:

Present Hot Spot 1 Interim Measure (IM) hydraulic containment system (pump test and construction activities).

Meeting Minutes Summary Report

Meeting Start Date:	Meeting ID:	Minute ID:	Presenter:	PRL / SWMU:
06/18/2020	210	2	Murphy, Alex	COMPONENTS REFURBISHMENT AND CHEMICAL ANALYSIS (SWMU 041)

Topic:

Component Refurbishment and Chemical Analysis Facility Solid Waste Management Unit (SWMU) #41 Pump and Treat Operations, Maintenance, and Monitoring, June 2020

Discussion:

concentrations exceed FDEP Groundwater Cleanup Target Levels (GCTLs). Within the LCP is a 2.07 acre High Concentration Plume (HCP) where CVOC concentrations exceed FDEP Natural Attenuation Default Concentrations (NADCs). Within the HCP is a 0.8 acre Hot Spot (HS) where CVOC concentrations exceed 10 times (10X) NADCs. Approximately 88 percent of the CVOC plume mass is vinyl chloride (VC). The primary IM objective is to attain hydraulic control of the dissolved-phase CVOC plume and the secondary objective is to reduce concentrations of CVOCs via an IM to support transition to monitored natural attenuation (MNA).

Initial startup activities were conducted from July 22-26, 2019 and included a pre-commissioning check and functional performance tests. During functional performance tests extraction well (EW), equalization (EQ) tank, and air stripper pumps were each set to approximately one half of their respective design flow rates, and steadily increased until they reached two to three times their design flow rate in order to stress-test the system. Additionally, air stripper influent and effluent samples for VOC analysis were collected in 8-hour intervals during Day 1, and then daily for the remainder of Week 1.

System prove-out was conducted during weeks two through four (July 29 – August 16, 2019), which included system balancing of EWs and injection wells (IWs). The target design flow rate of each EW is 7 gallons per minute (gpm) and of each IW is 3 gpm. Based on system prove-out, each EW was able to achieve and maintain the design flow rate of 7 gpm and each IW was able to achieve the following flow rates: IW0001 achieved 8.2 gpm, IW0002 achieved 8.5 gpm, IW0003 achieved 8.1 gpm, IW0004 achieved 0.1 gpm, IW0005 achieved 7.6 gpm, IW0006 achieved 4.0 gpm, and IW0007 achieved 10.9 gpm.

O&M continued through May 2020 and consisted of monthly air stripper cleaning, influent/effluent sampling for VOCs, and routine maintenance. During this operational period, quarterly performance groundwater sampling was conducted in June 2019 (baseline sampling), October 2019, January 2020, and April 2020. Additionally, sub-slab vapor monitoring and ambient air sampling was collected in October 2019, January 2020, and April 2020 to determine if the HCS has impacted the workers present at the CRCA facility. No CVOC analytes were detected at concentrations exceeding their respective commercial Vapor Intrusion Screening Levels (VISLs) in the sub-slab vapor samples, and all ambient air sample results were below the OSHA Personal Exposure Limit (PEL) for each constituent analyzed. No adjustments to the HCS system are currently needed based on these results.

Additionally during this operational period, maintenance to the system was conducted including the following: cleaning out the flow totalizers which increased the flow in IW0004 from 0.1 gpm to 3.6 gpm; conducting biological activity reaction tests (BART) and Redux 390 inject pilot test to reduce scaling on the effluent bag filters; and level sensor replacement on the EQ tank float stem.

In summary, over six million gallons have successfully been treated through the HCS system during this operation period. VC concentrations in the groundwater remain above the GCTL of 1 ug/L, but are decreasing over time with a 90% reduction in VC since startup in May 2020. tDCE concentrations have been non-detect during the last two quarterly sampling events. The system is operating as designed with only brief interruptions due to routine maintenance. Daily introduction of Redux 390 amendment has significantly reduced system scaling and helped to maintain system design parameters. The increase of reductive dechlorination indicators suggest a favorable environment for detoxification of these contaminants. Ambient air sampling results for the treatment trailer area are significantly below OSHA PEL levels and sub-slab sampling results show the levels below commercial Environmental Protection Agency (EPA) VISLs.

The path forward for HCS is continued operation and evaluation to maintain hydraulic control of the groundwater plume and to further reduce VC concentrations, continued quarterly sampling of 4 monitoring wells and semiannual sampling of 16 monitoring wells (next event in July 2020), and preparation and submittal of the Groundwater Model in conjunction with the Year 1 Performance Monitoring (PM) Report.

Goal:

The purpose is to summarize the groundwater interim measures (IM) hydraulic containment system (HCS) startup and operation and maintenance (O&M) for the treatment of chlorinated volatile organic compounds (CVOCs) at the Components Refurbishment and Chemical Analysis Facility (CRCA).

Underground Injection Control (UIC) parameters was recommended for a subset of wells, and should be analyzed for the iron, manganese, and sodium. After one year, sampling frequency and locations should be assessed. This means that the Team would need one additional sampling round to meet that year timeframe. AECOM will take an action to update the presentation prior to uploading to RIS for the records.

AECOM's Jennifer Joyal confirmed this presentation was updated prior to uploading to RIS **(Closed Action Item 2008-A04).**

FDEP stated that the Department has been doing a pilot project regarding per- and polyfluoroalkyl substances (PFAS) occurrence beginning with listing out dry cleaner and other state-led cleanup sites. This PFAS tracking spreadsheet has minimal data so far and provides links to the reports associated with the sites. The State is really trying to identify the max concentrations by media type. It is interesting to see what is coming up. AECOM inquired if the state has a list issued for the hazardous waste sites? AECOM did locate the dry-cleaning list. FDEP stated there are links in the spreadsheet to all different facilities to include landfills and electroplaters. There is an updated version of a tracking sheet for site being investigated for PFAS, and FDEP will send out a copy to the Team.

Laura Barrett (FDEP) provided the latest version of the tracking sheet to the Team **(Closed Action Item 2008-A05).**

Result: Decision item 2010-D01

2010-M02 Alex Murphy /Tetra Tech

Components Refurbishment and Chemical Analysis (CRCA) Solid Waste Management Unit (SWMU) #041, Year 1 Operations Maintenance and Monitoring, October 2020

Goal: The objective is to summarize the groundwater interim measures (IM) hydraulic containment system (HCS) Year 1 operation and maintenance (O&M) for the treatment of chlorinated volatile organic compounds (CVOCs) at the Components Refurbishment and Chemical Analysis Facility (CRCA).

Discussion: Installation, startup, and commissioning of the HCS was previously presented in the June 2020 CRCA HCS – Mid-Year Performance Monitoring ADP. CRCA is located east of Contractors Road, approximately 1 mile north of Schwartz Road. The site consists of Building K6-1696 and the surrounding support building and structures, including the Chemical Processing Area (CPA).

The groundwater contaminant plume at CRCA consists of a 6.54-acre Low Concentration Plume (LCP) where CVOC concentrations exceed Florida Department of Environmental Protection (FDEP) Groundwater Cleanup Target Levels (GCTLs). Within the LCP is a 2.07-acre High Concentration Plume (HCP) where CVOC concentrations exceed FDEP Natural Attenuation Default Concentrations (NADCs), and within the HCP is a 0.8-acre Hot Spot (HS) where CVOC concentrations exceed 10 times (10X) NADCs. Approximately 88-percent of the CVOC plume mass is vinyl chloride (VC) based on pre-IM sampling. The primary IM objective is to attain hydraulic control of the dissolved-phase CVOC plume, and the secondary objective is to reduce concentrations of CVOCs via an IM to support transition to monitored natural attenuation (MNA).

Startup and prove-out activities were conducted from July 22 through August 16, 2019 and included a pre-commissioning check, functional performance tests, and system balancing of the extraction wells (EWs) and injection wells (IWs). The target design flow rate of each EW is 7 gallons per minute (gpm) and of each IW is 3 gpm.

Full-scale operation subsequently began after system balancing and continued through August 2020 (end of the reported operational period) and consisted of monthly air stripper cleaning, influent/effluent sampling for VOCs, and routine maintenance. The HCS performance flow rates and total gallons processed from August 2019 through August 2020, are listed on slide 10 of the ADP.

During this operational period, quarterly performance groundwater sampling was conducted in June 2019 (baseline sampling), October 2019, January 2020, April 2020, and July 2020. Additionally, sub-slab vapor monitoring and ambient air sampling were collected in October 2019, January 2020, April 2020, and July 2020 to determine if the HCS has potentially impacted indoor air for the workers present at the CRCA facility. No CVOC analytes were detected at

concentrations exceeding their respective Commercial Vapor Intrusion Screening Levels (VISLs) in the sub-slab vapor samples, and all ambient air sample results were below the OSHA Personal Exposure Limit (PEL) for each constituent analyzed. No adjustments to the HCS system are currently needed based on these results.

Results of the groundwater performance monitoring were provided on slide 28. Data evaluation over the Year 1 operational period shows that all VOCs are less than NADCs with the exception of monitoring well (MW) MW0018 (110 µg/L for VC). tDCE has been less than GCTL since before the baseline groundwater sampling event in June 2019. VC is generally decreasing in all wells during the operation period with only slight rebound in 6 monitoring wells during the July 2020 sampling event (MW0012, MW0013, MW0018, MW0019, MW0028, and MW0031). Monitoring wells MW0003, MW0020 through MW0027, and MW0029 have shown no observed VC concentrations above laboratory method detection limits since baseline sampling. These wells are proposed to be removed from the performance sampling program.

Additionally, groundwater modeling was conducted based upon data collected during Year 1 operations to simulate site-specific surficial aquifer conditions, assess groundwater flow in 3-dimensions, and predict future groundwater remediation response to optimize and streamline long-term operations. Data inputs to the groundwater model consisted of twenty-one boring logs, seven synoptic groundwater level events, 3 to 5 slug tests at all well locations (except MW0013), pumping tests at EW0002, infiltration tests at three IWs, sieve analysis, HPT logging, and chemical analysis from baseline and quarterly groundwater sampling events.

Conclusions based on the groundwater modeling results forecast that, with continued system operation, VC reaches GCTL in approximately 4 to 5 years for all areas except for MW0018. Increasing the injection rate at IW0005 to increase flushing at MW0018 is recommended to expedite groundwater cleanup.

Over eight million gallons have successfully been treated through the HCS system during this operation period. VC concentrations in the groundwater remain above the GCTL of 1 µg/L but are decreasing over time, with an 86% reduction in VC since startup.

The path forward for HCS is continued operation and evaluation to maintain hydraulic control of the groundwater plume and to further reduce VC concentrations, continue quarterly sampling of 3 monitoring wells and semiannual sampling of 7 monitoring wells, and to update the Groundwater Model and Transport Evaluation during Year 2 operation reporting.

FDEP inquired if any of the green or yellow shaded wells on Slide 11 are also sampled annually. Tetra Tech stated none of the wells are currently in an annual sampling event.

FDEP noted that there is only one point of compliance well, MW0018. How confident is the Team that there are no other concentrations within that area that are not monitored? Should there be an additional well in a downgradient location? Tetra Tech pointed out data on slide 32 for mid-plume monitoring wells that show decreasing VC results, indicating that the aquifer conditions promote VOC reduction. During each LTM event, data always supported the conclusion that this was a solid reducing environment, resulting in high confidence that the VC on the downgradient side will attenuate. If we need to consider further delineation in the wooded area, this is something that can be discussed; it is projected that the Team will continue to see concentration decreases in this area.

NASA stated their belief is that this VC plume had already passed the point of the extraction wells before the HCS was installed. Based on observations and water level measurements, NASA's suspicion is that the VC plume has not migrated into this area since HCS startup by was already in that area but acknowledged the VC concentration does merit close watching.

FDEP inquired if the June 2019 sample was the first because MW0032 had just been installed. Tetra Tech replied yes and brought up slide 6 to show the locations of 2016-2018 direct push technology (DPT) samples taken from the water table to about 55ft at every depth interval. Most performance monitoring wells were installed after that sampling event. FDEP asked if the system has been operating for one year? If so, would it make sense to keep in the quarterly sampling event to have more data? The HCS had been running for 1 year in August 2020. NASA stated that this well

(MW0032) is in the semi-annual sampling event, but they can add it to the quarterly event if preferred. FDEP stated that they would want to know as early as possible if you are not seeing contaminant decreases in that well; quarterly sampling could bring it to our attention sooner. NASA took an action item to transition MW0032 to quarterly monitoring **(2010-A01).**

FDEP noted that, in terms of depth, it looks like the Team only evaluated to 63' below land surface (bls); and inquired if there is additional data where the Team has sampled deeper than that with DPT? Tetra Tech stated there are physical limitations with a tight confining layer at approximately 55'-63' bls at the site. The Team did not want to punch through that confining layer and create preferential pathways for contaminant migration. This is a tough formation to drill through, with additional physical limitations such as wetlands, woods, train tracks, etc. It was determined the concentrations essentially stop around that confining layer. NASA added that this same confining layer is present from the VAB area all the way down Contractors Road. Most of the groundwater contamination at sites in this area (with the exception of dense non-aqueous phase liquids [DNAPL] sites) remains above the confining layer.

FDEP inquired if Vertrel was the contaminant that impacted this area? NASA confirmed Vertrel MCA (a product containing 1,2-trans-DCE and decafluoropentane) is the COC for this site. NASA worked with FDEP to come up with a risk-based cleanup target level for decafluoropentane with assistance from University of Florida.

VC is lower in density than water in product form. FDEP was interested to know if this was a sinking plume based on the plume's cross-section. DCE is slightly denser than water. Tetra Tech pulled up a past presentation (March 2018 CRCA Step 1 presentation) to show how the plume is migrating away from the chemical processing area and how the plume looked to have been just in the shallow zone at the time of the evaluation. Over the course of the DPT sampling events, the plume started migrating and VC concentrations start increasing and expanding west as you get deeper. The deepest zone is under the occupied building. The geology and plume were shown on slide 31 of the March 2018 presentation.

NASA added that they identified the plume when it was in the shallow zone and over time the plume has migrated deeper. However, the retarding unit has made it spread out laterally at this point. For some history on how we came to use Vertrel, NASA stated in the beginning of the space program that TCE was historically used as a precision cleaner for flight hardware. NASA then migrated to using Freon 113, and eventually Vertrel MCA because it was supposedly more environmentally friendly (greener chemical).

FDEP inquired why the Team opted out of having a point of compliance well in the deeper 30 ft zone at this site? Why is there not a sister well in the MW0032 location? FDEP pointed out on slide 23 of the 2020 ADP that there exists a distinct plume west of the railroad tracks, but no point of compliance well in that area. Why is that? Tetra Tech looked up the past information for DPT 232 (which is the single downgradient point with a 30-40 ft. interval exceedance) to check and see what the results were. The concentrations at DPT 232 was 12 ug/L at the 30-40 ft interval, 4 ug/L below that, and at the 62ft interval there was non-detect. FDEP inquired what the concentration was in the area of MW0032. Tetra Tech stated that MW0032 is located between DPT232 and DPT233. DPT 233 results were non-detect at the 30-40 ft interval, 10 µg/L at the 40-50 ft interval. FDEP pointed out that a well currently exists in the 53-63 ft interval and asked why a shallower well was not also installed in this location. Tetra Tech stated that the logic for a monitoring well was not to monitor degradation of the plume in that area, but to monitor the potential migration from the treatment zone after the HCS was installed. MW0032 is screened to capture the interval that the HCS targets.

FDEP noted there are not high concentrations in this area but wants to make sure we are monitoring the downgradient leading edge of the plume. The plume is supposedly captured now with VC concentrations at MW0032 increasing since HCS start-up. NASA acknowledged that a portion of the plume had already moved through and downgradient of the capture zone prior to HCS start-up, and that low-level VC has increased in the downgradient well over the two most recent sampling events. NASA will transition MW0032 to a quarterly sampling basis in order to watch the trends there more carefully. FDEP agreed with this. NASA inquired if FDEP would like a basket item reported after the next two quarters

of sampling events to provide trends of this monitoring? FDEP stated they would. NASA took the action to present a basket item after the next two rounds of quarterly groundwater data, which will take place in October 2020 and January 2021 **(2010-A02).**

FDEP pointed out the recent increase in concentrations at MW0018. To increase flushing in the vicinity of MW0018, Tetra Tech proposes to increase the injection rate at nearby injection well IW0005. The increased injection rate will be achieved by reducing injection rates at other wells. FDEP asked what the increasing VC concentrations at MW0018 are attributed to? Tetra Tech responded with an explanation from one of their professional geologists: MW0018 is one of the quarterly upgradient centerline wells and, based on the data, the geologist believes it is likely the plume collapsing and moving in toward the centerline that is being created by the extraction and injection wells. That would explain increased concentrations. Tetra Tech noted that the wells are taking in more water than designed. This will make it possible to balance out IW0005 by lowering flow rates in other injection well (say to 3.5-4gpm). The adjustment will increase the flushing at this well, which will be more of a focused approach than the current extraction/injection regime.

A groundwater model was developed for CRCA using MODFLOW and MT3D, and details were presented to the Team. Under current pumping conditions, VC is predicted to reach its GCTL in 4-5 years in all locations except the vicinity of MW0018, which is forecast to attain GCTL in 12 years. If groundwater extraction and treatment stopped now, rebound would occur and VC is forecast to take 10 years to reach GCTL.

FDEP observed that the concentrations at MW0018 didn't go up that much from April 2020 to June 2020. Do we have a downgradient MW to monitor? Tetra Tech responded that MW0019, MW0028, and now MW0032 are positioned along a flow path downgradient of MW0018 and will be sampled quarterly to monitor contaminant trends. FDEP had no objection to the path forward. FDEP has the March 2020 IGM report for review, and inquired if they will be receiving another report after that? NASA confirmed a CAMP date of December 2020 for the next report, and explained that the intent of briefing the Team before submitting plans and reports is so that any questions that arise through Team members' review of the ADP

and its presentation can be addressed and incorporated prior to submitting the report or plan.

FDEP inquired if the wells proposed for elimination are in the shallow zone? Tetra Tech stated they are in the shallow zone and intermediate zone. These wells were installed based on location of the plume prior to HCS start-up. Tetra Tech is proposing to eliminate the MWs since we feel we have good understanding of the current plume. From initial baseline sampling to current, we have had no contaminant detections in these locations that we are proposing to eliminate. For performance sampling only, we are looking to eliminate these from the sampling program. FDEP asked if Tetra Tech could show where the wells are in the context of the plume. Tetra Tech pulled up slides 31 and 32 in the current ADP to provide a detailed explanation with the depths of the wells. FDEP stated that it doesn't look like there exists a shallow plume anymore. Tetra Tech concurred with that. FDEP stated that groundwater was flowing from the east to the west, and inquired if there was a southern component? Tetra Tech confirmed that the flow was from the east to the west and there is not a southern component. FDEP inquired if the Team is comfortable eliminating these wells. Tetra Tech stated that if FDEP recommends that MW0027 and MW0029 be retained in the intermediate zone, they will be. FDEP confirmed they would like MW0027 and MW0029 retained. NASA added that we will have changing plume morphology at this site over time due to groundwater recovery and treatment, and to keep that in mind. We need to consider what wells to retain or eliminate over time as a result of the changes in plume morphology. DPT is now used for performance monitoring at site LC34 as a result of similar conditions.

FDEP observed that the data used to populate the groundwater model will not have a large temporal difference if the model is updated after the second year of operation. Tetra Tech did not disagree but noted that updating the model is fairly simple now that the model has been developed and validated.

Geochemical indicators have been analyzed and *Dehaloccoides* (Dhc) census (including reductase genes) performed semi-annually to determine if conditions are favorable for biological reduction of chlorinated VOCs and if amendments might be needed. While the

reductase gene count fluctuates, conditions are favorable, and it does not appear necessary to add amendments.

The Team reached consensus to increase the groundwater reinjection rate at IW0005 to increase flushing in the vicinity of MW0018 **(2010-D02).**

The Team reached consensus to continue performance monitoring with the following changes: remove monitoring wells MW0003, and MW0020 through MW0026 from the performance sampling program, MW0027 and MW0029 will be sampled semi-annually, and MW0032 will transition to quarterly sampling; eliminate sulfate, sulfide, nitrate, nitrite, carbon dioxide, iron, dissolved iron, and RCRA metals analyses from groundwater sampling events (continue analysis of VOCs, MEE, DHC, and VC reductase in quarterly performance monitoring wells); transition MW0028 to semiannual sampling **(2010-D03).**

The Team reached consensus to update the groundwater model and transport evaluation after completion of the Year 2 operational period **(2010-D04).**

Result: Decision item 2010-D02 through D04
Action Item 2010-A01, A02

2010-M03 Chris Neumann /Tetra Tech

KSC Headquarters Building Area (KHQA) (SWMU #104)
Perimeter Soil IM Completion, October 2020

Goal: The purpose is to present the activities and results of the soil Interim Measure (IM) for polychlorinated biphenyl (PCB)-contaminated soil at the KSC Headquarters Building Area (KHQA).

Discussion:
A soil investigation was conducted from February 2020 to April 2020 to delineate PCB contamination suspected from deteriorating painted columns on the exterior of the former Headquarters Building. No areas with PCBs equal to or greater than 50 mg/kg were discovered during this investigation. The IM Work Plan (IMWP), approved by the Florida Department of Environmental Protection (FDEP) in June 2020, was developed using the KSC PCB Generic Work Plan. The IMWP addressed the soil contaminated by

Meeting Minutes Summary Report

Meeting Start Date:	Meeting ID:	Minute ID:	Presenter:	PRL / SWMU:
04/10/2019	204	16	Murphy, Alex	COMPONENTS REFURBISHMENT AND CHEMICAL ANALYSIS (SWMU 041)

Topic:

Component Refurbishment and Chemical Analysis (CRCA) Facility (SWMU 041)

Discussion:

Operations began in 1998 with cleaning of spacecraft components using several organic and inorganic chemicals. The primary solvent of concern is Vertrel MCA. Vertrel MCA is a mixture of trans-1,2-dichoroethene (tDCE, 35 to 41 percent) and decafluoropentane (DFP, 59 to 65 percent). Historically, it was stored and used in the Chemical Processing Area. Bulk storage tanks of Vertrel were removed from the Chemical Processing Area and it is now stored in Building K6-1696A. tDCE and vinyl chloride (VC) are the primary contaminants of concern at CRCA. DFP had not been sampled in groundwater since 2006, when it was detected in groundwater sample DPT0103 in the 55 feet below land surface zone at a concentration of 28.1 micrograms per liter (µg/L), less than the Florida Department of Environmental Protection (FDEP) Groundwater Cleanup Target Level (GCTL) of 1,800 µg/L that was derived from the 2006 University of Florida Clean-Up Criteria for DFP development.

The objective of air monitoring was based on volatile organic compounds (VOC) groundwater concentrations beneath Building K6-1696. The air monitoring plan was developed to determine if vapor intrusion is occurring within the occupied Building K6-1696.

Phase I: Evaluation of facility operations
Analysis of hazardous materials and interviews with CRCA Engineering Supervisor on facility operations to determine VOC usage locations within Building K6-1696.
Review of up-to-date chemical inventory list.
Evaluation of underground trenching and utility system in the CPA to determine if there are potential indoor pathways for vapor intrusion.

Phase I completed (January 2018) to determine Phase II and III approach. No potential indoor vapor intrusion pathways found. Only VOC usage within Building K6-1696 is within the Extraction Laboratory at the northwest corner of the facility. Review of chemical inventory list found no chemicals stored in Building K6-1696 containing tDCE, VC, or DFP. Site reconnaissance of Building K6-1696A (location of stored Vertrel MCA) found this building to only be occupied for a maximum of 4 hours per day and it is not a closed structure.

Phase II:
Groundwater sampled at 8 locations in August 2018 and analyzed for VOCs via Method 8260B and modified to include DFP. VC and DFP observed in groundwater samples. Benzene and toluene were observed below GCTLs and unassociated with source of spill.
Four vapor pins installed for sub-slab soil gas sampling. Samples were analyzed for VOCs via USEPA Method TO-15, modified to include DFP. Unable turn off the HVAC system during sub-slab sampling due to sensitive equipment calibrations within Building K6-1696. Sub-slab soil gas samples observed no detections of VC or tDCE. DFP detections were observed to be less than the calculated soil gas commercial screening level. There was an exceedance of the United States Environmental Protection Agency Residential Vapor Intrusion Screening Levels Sub-Slab for chloroform, assumed to be attributed to potable drinking water and/or sewer lines in the vicinity of VMP0004.

Based on Phase II results, ambient air sampling is not necessary at this time as the CVOC groundwater plume beneath Building K6-1696 is not presenting a vapor intrusion risk to the workers present.

An Implementation Work Plan for a Pump and Treat Interim Measure at CRCA to contain and remediate the CVOC plume beneath Building K6-1696 is in development. Within that work plan, VMP01 through VMP04 are proposed to be used for quarterly performance monitoring sub-slab sampling to ensure that Interim Measures do not generate sub-slab vapor. If contaminant concentrations are detected exceeding the appropriate RVISLs, then the system will be shut down until the problem is identified and corrective action is taken.

Team consensus reached that air monitoring evaluation is complete, ambient air samples within Building K6-1696 do not need to be collected at this time, Air Monitoring Report can be submitted to the FDEP documenting the results of Phase I and Phase II, and quarterly sampling of vapor monitoring pins will be part of performance monitoring program.

Provide memo with data to NASA Industrial Hygienist.

Goal:

Present air monitoring results.

Decision:40	Team consensus reached that air monitoring evaluation is complete, ambient air samples within Building K6-1696 do not need to be collected at this time, Air Monitoring Report can be submitted to the FDEP documenting the results of Phase I and Phase II, and quarterly sampling of vapor monitoring pins will be part of performance monitoring program.

Minute Id	Presenter	PRL SWMU
M2	Murphy, Alex	COMPONENTS REFURBISHMENT AND CHEMICAL ANALYSIS (SWMU 041)

Topic

Components Refurbishment and Chemical Analysis (CRCA) Facility (SWMU 041)

Discussion

Based on the Step 1B evaluation, the High Concentration Plume (HCP) and the Hot Spot will be the area of focus for the IMWP. Approximately 88% of the volatile organic compound (VOC) plume mass is within the HCP and Hot Spot. 100% of the trans-1,2-dichloroethene (tDCE) mass is from 50 to 60 50 feet (ft) below land surface (BLS). 47% of the vinyl chloride (VC) plume is from 40 to 50 ft BLS and 45% is from 50 to 60 ft BLS. The site characterization identified groundwater as the medium of concern.

The primary IM objective is to attain hydraulic control of the dissolved-phase chlorinated VOC (CVOC) plume with the caveat that prevention of vapor intrusion will be re-evaluated upon baseline air sampling or in the Year 1 performance monitoring evaluation. The secondary IM objective is to reduce concentrations of CVOCs in Hot Spot 1 and HCP via an IM to support transition to monitored natural attenuation (MNA).
Consensus was reached to retain pump and treat downgradient of the HCP, conduct aquifer testing and lithologic evaluations in target treatment zone during Year 1 pump and treat operation and evaluate path forward for treatment of Hot Spot 1 at the end of Year 1 (meeting minute 1805-M08, decision 1805-D22).

Site Conditions and Considerations:
? Average site elevations are approximately 7 feet above mean sea level (msl) relative to NAVD88.
? Relatively flat terrain.
? Drainage swales located on both the eastern and western sides of Contractors Road, and low-lying wooded area with approximately 2 feet of standing water approximately 250 west of building K6-1696.
? Groundwater elevations vary between 3 and 5 ft BLS.
? Groundwater flow is generally to the south-southeast in the 0- to 20 ft BLS zone, and northwest in the 20- to 60 ft BLS zones. However, the current monitoring well network may not be adequate to properly determine groundwater flow direction.
? Electric power available (VFI 713).
? Majority of groundwater contaminant mass is beneath building K6-1696. Access within building K6-1696 is limited. Additionally, there are numerous utilities throughout the Chemical Processing Area (CPA) just east of building K6-1696

Per team consensus at the May 2018 KSCRT Meeting, Alternative G4 has been modified as follows:
The pump and treat system will be installed as proposed in Alternative G4.
During the first year of operation, aquifer testing and lithologic, geochemical, and constituents of concern data collection will be conducted to evaluate the performance of the pump and treat system and the hydraulic state of the target treatment zone (43 to 63 ft BLS).
After approximately 1 year of operation, a performance evaluation will be conducted, and a path forward will be proposed to treat the HS located

beneath the building.

Proposed Year 1 Aquifer Testing:
Install 11 monitoring wells at 7 locations:
? 1 Shallow well (5 to 15 ft BLS) will target the upper sand unit
? 4 Intermediate wells (30 to 40 ft BLS) will target the fine to very fine sand unit.
? 6 Deep wells (53 to 63 ft BLS across the site) will target the shell zone above the very fine sand layer.
? Hydraulic Profiling Tool (HPT) data collection will be conducted during the 6 deep monitoring well installations from surface to 63 feet BLS to produce a detailed log of relative formation permeability and estimate hydraulic conductivity.
Slug testing will be performed at newly installed monitoring wells and select existing monitoring wells:
? Using a solid slug rod capable of displacing approximately 3 feet of water (instantaneous head change)
? Data collected with a Solinst Levelogger or Van Essen Micro-Diver
? If slug testing does not generate a suitable head difference, then falling head tests will be conducted on the newly installed and existing monitoring wells
Monitoring well installation and aquifer tests on monitoring wells will be conducted prior to installation of the pump and treat system.
Installation of pump and treat system:
? Extraction well EW0002 and injection well IW0007 will be installed initially.
? A step-drawdown pumping test (step test) will be conducted at the central extraction well (EW0002) to observe the pumping performance under variable extraction conditions.
? Pumping rate in the extraction well will begin at 0.5 times the design flow rate and increase approximately every 30 minutes up to 1.25 times the design flow rate.
? Step test results will be used to evaluate transmissivity, well efficiency, and capture zone.
? A 24- or 48-hour constant-rate test will be performed at EW0002, with the test rate at the assumed extraction rate of 7 gallons per minute (gpm)
? Monitoring well water levels will be monitored with Solinst Leveloggers or Van Essen Micro-Divers.
? Transmissivity and storage will be estimated using AQTESOLV.
? Capture zone analysis will be performed to ensure adequate capture at targeted rate.
? A pressure transducer will be installed on injection well IW0007 to monitor water level changes before, during, and after the injection test.
? After completion of the extraction well EW0002 and injection well IW0007 tests, the remainder of the pump and treat system will be installed, modifying (if necessary) based on the test results.
? MODFLOW modeling estimating pump and injection system performance will be presented in the Year 1 Performance Monitoring Report, or when site-specific data supports its use.
? RT3D transport modeling will be conducted no sooner than after Year 1, or after site-specific data supports its use.

Pump and Treat Design Summary:
Extraction Wells
? Three installed to depths of 63 ft BLS (targeting shell zone)
? Construction: 6-inch diameter PVC riser with 20-foot 0.010-inch slotted screen set in 10-inch casings
? 75-foot capture zone spacing downgradient of HCP
? Flow rate of approximately 5 to 7 gpm per well
? Prior to installation of extraction wells, collect 1 soil sample from each extraction well location targeting the shell layer (approximately 43 to 63 ft BLS) to be analyzed at a fixed-based laboratory for:
? Total Organic Carbon
? Soil Grain Size to confirm filter pack size and screen slot size
Injection Wells
? Seven installed to depths of 61 ft BLS (targeting shell zone)
? 6 of 7 installed at angles to reach injection edge of HCP
? Construction: 6-inch diameter schedule 40 PVC with 20-foot 0.020 slotted screen set in 10-inch casings
From air stripper, extracted groundwater will be re-distributed to injection wells located on the northern, southern, and eastern sides of Building K6-1696 (upgradient of the HCP).
Emissions less than KSC Title V Operating Air Permit (based on mass present).
Injection and extraction well information (coordinates, depth, etc.) provided in IMWP Table 1.
Performance monitoring plan provided in IMWP Table 2.
O&M Frequency: Daily for the first week, weekly for the first month, bi-weekly thereafter.
Estimate treatment time to reach Natural Attenuation Default Concentrations (NADC):
? Based on preliminary pumping calculations of pump and treat system without the introduction of amendments: approximately 35 years of pump and treat operation.
? After Year 1 of pump and treat operation and treatment zone data collection, the estimated treatment time to reach NADCs and Year 2 (and onward) path forward will be re-evaluated.

Proposed Performance Monitoring:

? Baseline Sampling:
? 19 monitoring wells for VOCs
? 4 monitoring wells for select geochemical parameters (methane, ethane, and ethene (MEE), sulfate, sulfide, nitrate/nitrite, alkalinity, carbon dioxide, iron, dissolved iron, Resource Conservation and Recovery Act (RCRA) metals, total organic carbon, Dehalococcoides, and VC reductase).
? Year 1 Quarterly Monitoring of 4 monitoring wells for VOCs and select geochemical parameters (listed in Baseline Sampling).
? Year 1 Semi-Annual Sampling of 19 monitoring wells for VOCs.
? Water levels collected at all monitoring wells and injection and extraction wells during each quarterly O&M.
? Field parameter data collected from all monitoring wells sampled.

Total capital costs are approximately $895,000.
Total Year 1 Operation Costs approximately $103,000.

A flow chart exit strategy was provided in the advance data package presented at the Team meeting.

Team consensus reached on Hot Spot 1 Interim Measures Work Plan.

Tetra Tech expects one to two months for installation and pump test.
NASA indicated to FDEP that this site a NASA top priority project right now.

Goal

Obtain team consensus on Interim Measures Work Plan (IMWP).

Decision Id	Decision
D2	Team consensus reached on Hot Spot 1 Interim Measures Work Plan.

End of this Meeting Record

Decision:26	Team consensus reached to collect soil gas sampling: one within the Calibration Warehouse (adjacent to MW0019), two within the Field Cleaning Room (one adjacent to MW0008 and one adjacent to MW0009), and one inside Building K6-1696 (adjacent to MW0011 and MW0012). Samples will be collected and be analyzed for VOCs via USEPA Method TO15 and be expanded to include decafluoropentane. Sampling locations will be confirmed based on review of the groundwater analysis. Soil gas sampling will be conducted when the doors to the facility are closed and preferably without the operation of the HVAC system.

Meeting Start Date:	Meeting ID:	Minute ID:	Presenter:	PRL / SWMU:
05/10/2018	197	8	Murphy, Alex	COMPONENTS REFURBISHMENT AND CHEMICAL ANALYSIS (SWMU 041)

Topic:

Component Refurbishment and Chemical Analysis (CRCA) Facility

Discussion:

IM objectives:
Primary Objective – Phase 1
• Mitigate plume migration
• Minimize risk to workers present within building K6-4696 by preventing vapor intrusion.
Secondary Objective – Phase 2
• Reduce concentrations within the VC hot spot and high concentration via an interim measure to support transition to monitored natural attenuation (MNA).

Data Gaps
Aquifer characteristics (hydraulic conductivity, groundwater velocity, hydraulic gradient) are not well define at the target treatment depth
Total Organic Carbon at target treatment depth
Proposed Year 1 Data Collection
Prior to implementation of Phase II:
• Aquifer tests will be conducted to better define the target treatment zone
• Total organic carbon (TOC) analysis and further lithologic characterization will be conducted in the target treatment zone
Results of the Year 1 data collection will be evaluated to adjust Phase II
The proposed Year 1 data collection will be outlined in the Interim Measure Work Plan

Alternative G1 – Phase I air sparge down gradient of high concentration plume and soil vapor extraction (SVE) in vadose zone. Phase II in situ chemical oxidation (ISCO) in Hot Spot. Estimated treatment time to less than NADCs is approximately 5 years and time to less than GCTLs via MNA is approximately 75 years. Estimated lifecycle cost is $3.97 million.

Advantages:
Effective technology at well-defined sites.
KSC level of air sparge experience
Large Hot Spot reduction from ISCO
Existing air sparge system onsite can reduce costs.

Disadvantages:
Energy intensive
Preferential pathways possible
Buffering capacity impacted
Potential vapor intrusion generator for occupied building K6-4696
High ISCO capital costs.

Alternative G2 – Phase I air sparge down gradient of high concentration plume and soil vapor extraction (SVE) in vadose zone design will be the same as Alternative G1. Phase II bioremediation injections in Hot Spot. Estimated treatment time to less than NADCs is approximately 5 years and time to less than GCTLs via MNA is approximately 75 years. Estimated lifecycle cost is $2.817 million.

Advantages:
Same as Alternative G1, but large Hot Spot reduction and continuing reduction during substrate recirculation.

Disadvantages:
Same as Alternative G1, but lower capital costs of bio compared to ISCO.

Alternative G3 – Phase I hydraulic control down gradient of high concentration plume. Phase II ISCO in Hot Spot; direct injection of ChemOx reagents into Hot Spot Plume will be the same as Alternative G1. Estimated treatment time to less than NADCs is approximately 5 years and time to less than GCTLs via MNA is approximately 75 years. Estimated

lifecycle cost is $4.02 million.

Advantages:
Effective technology for site COCs
Large Hot Spot reduction

Disadvantages:
Required adequate geochemical conditions to be successful
High ISCO capital costs

Alternative G4 – Phase I hydraulic control down gradient of high concentration plume; design will be the same as Alternative G3. Phase II bioremediation injections in Hot Spot; design will be the same as Alternative G2. Estimated treatment time to less than NADCs is approximately 5 years and time to less than GCTLs via MNA is approximately 75 years. Estimated lifecycle cost is $2.864 million.

Advantages:
Effective technology for site COCs
Large Hot Spot reduction and continuing reduction during substrate recirculation

Disadvantages:
Same as Alternative G3, but lower capital costs for injections

Team consensus reached on Alternative G4 Phase 1, Year 1 consisting of hydraulic containments with additional data collection (aquifer tests to better define the target treatment zone, TOC analysis, and further lithologic characterization in the target treatment zone).

Following Phase I, re-evaluate and adjust Phase II.

Consider not using double wall piping since within the footprint of the plume. Look at what was done at LC34 and do not pursue the double wall piping.

Consider reinject with a tracer that could be picked up at a recovery well at the end of the first year this will demonstrate the water movement from one side to the other.

Consider Hydraulic Profiling Tool (HPT) data evaluation prior to installing injection wells.

Goal:

Present remedial alternative evaluation and obtain team consensus on path forward.

Decision:22	Team consensus reached on Alternative G4 Phase 1, Year 1 consisting of hydraulic containments with additional data collection (aquifer tests to better define the target treatment zone, TOC analysis, and further lithologic characterization in the target treatment zone).

Meeting Start Date:	Meeting ID:	Minute ID:	Presenter:	PRL / SWMU:
06/28/2018	200	2	Murphy, Alex	COMPONENTS REFURBISHMENT AND CHEMICAL ANALYSIS (SWMU 041)

Topic:

Components Refurbishment and Chemical Analysis (CRCA) Facility (SWMU 041)

Discussion:

Based on the Step 1B evaluation, the High Concentration Plume (HCP) and the Hot Spot will be the area of focus for the IMWP. Approximately 88% of the volatile organic compound (VOC) plume mass is within the HCP and Hot Spot. 100% of the trans-1,2-dichloroethene (tDCE) mass is from 50 to 60 50 feet (ft) below land surface (BLS). 47% of the vinyl chloride (VC) plume is from 40 to 50 ft BLS and 45% is from 50 to 60 ft BLS. The site characterization identified groundwater as the medium of concern.

The primary IM objective is to attain hydraulic control of the dissolved-phase chlorinated VOC (CVOC) plume with the caveat that prevention of vapor intrusion will be re-evaluated upon baseline air sampling or in the Year 1 performance monitoring evaluation. The secondary IM objective is to reduce concentrations of CVOCs in Hot Spot 1 and HCP via an IM to support transition to monitored natural attenuation (MNA).
Consensus was reached to retain pump and treat downgradient of the HCP, conduct aquifer testing and lithologic evaluations in target treatment zone during Year 1 pump and treat operation and evaluate path forward for treatment of Hot Spot 1 at the end of Year 1 (meeting minute 1805-M08, decision 1805-D22).

Site Conditions and Considerations:
• Average site elevations are approximately 7 feet above mean sea level (msl) relative to NAVD88.

• Relatively flat terrain.
• Drainage swales located on both the eastern and western sides of Contractors Road, and low-lying wooded area with approximately 2 feet of standing water approximately 250 west of building K6-1696.
• Groundwater elevations vary between 3 and 5 ft BLS.
• Groundwater flow is generally to the south-southeast in the 0- to 20 ft BLS zone, and northwest in the 20- to 60 ft BLS zones. However, the current monitoring well network may not be adequate to properly determine groundwater flow direction.
• Electric power available (VFI 713).
• Majority of groundwater contaminant mass is beneath building K6-1696. Access within building K6-1696 is limited. Additionally, there are numerous utilities throughout the Chemical Processing Area (CPA) just east of building K6-1696

Per team consensus at the May 2018 KSCRT Meeting, Alternative G4 has been modified as follows:
The pump and treat system will be installed as proposed in Alternative G4.
During the first year of operation, aquifer testing and lithologic, geochemical, and constituents of concern data collection will be conducted to evaluate the performance of the pump and treat system and the hydraulic state of the target treatment zone (43 to 63 ft BLS).
After approximately 1 year of operation, a performance evaluation will be conducted, and a path forward will be proposed to treat the HS located beneath the building.

Proposed Year 1 Aquifer Testing:
Install 11 monitoring wells at 7 locations:
• 1 Shallow well (5 to 15 ft BLS) will target the upper sand unit
• 4 Intermediate wells (30 to 40 ft BLS) will target the fine to very fine sand unit.
• 6 Deep wells (53 to 63 ft BLS across the site) will target the shell zone above the very fine sand layer.
• Hydraulic Profiling Tool (HPT) data collection will be conducted during the 6 deep monitoring well installations from surface to 63 feet BLS to produce a detailed log of relative formation permeability and estimate hydraulic conductivity.
Slug testing will be performed at newly installed monitoring wells and select existing monitoring wells:
• Using a solid slug rod capable of displacing approximately 3 feet of water (instantaneous head change)
• Data collected with a Solinst Levelogger or Van Essen Micro-Diver
• If slug testing does not generate a suitable head difference, then falling head tests will be conducted on the newly installed and existing monitoring wells
Monitoring well installation and aquifer tests on monitoring wells will be conducted prior to installation of the pump and treat system.
Installation of pump and treat system:
• Extraction well EW0002 and injection well IW0007 will be installed initially.
• A step-drawdown pumping test (step test) will be conducted at the central extraction well (EW0002) to observe the pumping performance under variable extraction conditions.
? Pumping rate in the extraction well will begin at 0.5 times the design flow rate and increase approximately every 30 minutes up to 1.25 times the design flow rate.
? Step test results will be used to evaluate transmissivity, well efficiency, and capture zone.
• A 24- or 48-hour constant-rate test will be performed at EW0002, with the test rate at the assumed extraction rate of 7 gallons per minute (gpm)
? Monitoring well water levels will be monitored with Solinst Leveloggers or Van Essen Micro-Divers.
? Transmissivity and storage will be estimated using AQTESOLV.
? Capture zone analysis will be performed to ensure adequate capture at targeted rate.
• A pressure transducer will be installed on injection well IW0007 to monitor water level changes before, during, and after the injection test.
• After completion of the extraction well EW0002 and injection well IW0007 tests, the remainder of the pump and treat system will be installed, modifying (if necessary) based on the test results.
• MODFLOW modeling estimating pump and injection system performance will be presented in the Year 1 Performance Monitoring Report, or when site-specific data supports its use.
• RT3D transport modeling will be conducted no sooner than after Year 1, or after site-specific data supports its use.

Pump and Treat Design Summary:
Extraction Wells
• Three installed to depths of 63 ft BLS (targeting shell zone)
• Construction: 6-inch diameter PVC riser with 20-foot 0.010-inch slotted screen set in 10-inch casings
• 75-foot capture zone spacing downgradient of HCP
• Flow rate of approximately 5 to 7 gpm per well
• Prior to installation of extraction wells, collect 1 soil sample from each extraction well location targeting the shell layer (approximately 43 to 63 ft BLS) to be analyzed at a fixed-based laboratory for:
? Total Organic Carbon
? Soil Grain Size to confirm filter pack size and screen slot size
Injection Wells
• Seven installed to depths of 61 ft BLS (targeting shell zone)
• 6 of 7 installed at angles to reach injection edge of HCP
• Construction: 6-inch diameter schedule 40 PVC with 20-foot 0.020 slotted screen set in 10-inch casings
From air stripper, extracted groundwater will be re-distributed to injection wells located on the northern, southern, and eastern sides of Building K6-1696 (upgradient of the HCP).
Emissions less than KSC Title V Operating Air Permit (based on mass present).
Injection and extraction well information (coordinates, depth, etc.) provided in IMWP Table 1.
Performance monitoring plan provided in IMWP Table 2.

O&M Frequency: Daily for the first week, weekly for the first month, bi-weekly thereafter.
Estimate treatment time to reach Natural Attenuation Default Concentrations (NADC):
• Based on preliminary pumping calculations of pump and treat system without the introduction of amendments: approximately 35 years of pump and treat operation.
• After Year 1 of pump and treat operation and treatment zone data collection, the estimated treatment time to reach NADCs and Year 2 (and onward) path forward will be re-evaluated.

Proposed Performance Monitoring:
• Baseline Sampling:
? 19 monitoring wells for VOCs
? 4 monitoring wells for select geochemical parameters (methane, ethane, and ethene (MEE), sulfate, sulfide, nitrate/nitrite, alkalinity, carbon dioxide, iron, dissolved iron, Resource Conservation and Recovery Act (RCRA) metals, total organic carbon, Dehalococcoides, and VC reductase).
• Year 1 Quarterly Monitoring of 4 monitoring wells for VOCs and select geochemical parameters (listed in Baseline Sampling).
• Year 1 Semi-Annual Sampling of 19 monitoring wells for VOCs.
• Water levels collected at all monitoring wells and injection and extraction wells during each quarterly O&M.
• Field parameter data collected from all monitoring wells sampled.

Total capital costs are approximately $895,000.
Total Year 1 Operation Costs approximately $103,000.

A flow chart exit strategy was provided in the advance data package presented at the Team meeting.

Team consensus reached on Hot Spot 1 Interim Measures Work Plan.

Tetra Tech expects one to two months for installation and pump test.
NASA indicated to FDEP that this site a NASA top priority project right now.

Goal:	
Obtain team consensus on Interim Measures Work Plan (IMWP).	
Decision:2	Team consensus reached on Hot Spot 1 Interim Measures Work Plan.

Meeting Minutes Summary Report

Meeting Start Date:	Meeting ID:	Minute ID:	Presenter:	PRL / SWMU:
03/22/2018	196	5	Murphy, Alex	COMPONENTS REFURBISHMENT AND CHEMICAL ANALYSIS (SWMU 041)

Topic:

Component Refurbishment and Chemical Analysis (SWMU 041)

Discussion:

Based on results of the 2016 DPT investigation, the plume is migrating west of Building K6-1696, tDCE present in 30-55 ft BLS zone is greater than GCTL, VC present west of Building K6-1696 is greater than 10 times NADC. Methane results greater than 1 milligram per liter (mg/L), and presence of ethene suggesting reducing conditions. Groundwater flow is generally to the south-southeast in the 0 to 20 feet BLS zone, and northwest in the 20 to 60-foot zones. However, the current monitoring well network may not be adequate to properly determine the groundwater flow direction

tDCE and VC are COCs in groundwater. TCE and cDCE have no results exceeding the GCTL.

Team consensus reached on that the horizontal and vertical extents are adequately delineated (Hot Spot, HCP, and LCP for entire site are defined).

Proposed Treatment Areas for evaluation:
Hot Spot – VC greater than 1,000 µg/L; Total mass of 35.36 lbs
HCP – VC greater than 100 µg/L, total mass of 12.58 lbs.

Site Conditions and Considerations:
Building K6-1696 covers approximately 90% of the HS and 50% of the HCP plumes. Paved asphalt over majority of CRCA facility.
Electric power available. Numerous utilities within the Chemical Processing Area (CPA).
Area west of plumes is densely vegetated, with areas of seasonal standing water when the water table is elevated.
Average Site Elevations – approximately 7 feet above mean sea level (msl) NAVD88.
Relatively flat terrain.
Drainage swales located on both the east and west sides of Contractor Road.
Groundwater depth varies between 3 and 5 feet below land surface.
Groundwater flow is generally to the south-southeast in the 0 to 20 feet BLS zone, and northwest in the 20 to 60-foot zones. However, the current monitoring well network may not be adequate enough to properly determine the groundwater flow direction.

Data Gaps:
VC and tDCE not delineated per KSCRT EE Process within Building K6-1696, CPA, and wooded area due to limited access.
Vertical delineation of VC to GCTL not complete below 64 feet BLS, as a confining clay layer was identified and do not want to create a possible preferential pathway for further vertical migration.
Potentially inadequate monitoring well network to determine groundwater flow.
Fraction of organic carbon (foc) is a data gap. A few samples may be needed and should be collected prior to any implementation.

Is there a vertical contaminant gradient? Is there a water leak that may be pushing contamination down?

Team consensus reached on the retainment of the following technologies for evaluation:
Alternative 1. Barrier: Air Sparging Curtain of HCP (including Soil Vapor Extraction [SVE] to mitigate potential vapor issues), Source Treatment: In-Situ Chemical Oxidation of Hot Spot.
Alternative 2. Barrier: Air Sparging Curtain for HCP (including SVE to mitigate potential vapor issues), Source Treatment: Biostimulation of Hot Spot.
Alternative 3. Barrier: Hydraulic Control for HCP (including Air Stripping/Carbon Absorption), Source Treatment: In-situ Chemical Oxidation of Hot Spot.
Alternative 4. Barrier: Hydraulic Control of HCP (including Air Stripping/Carbon Absorption), Source Treatment: Biostimulation of Hot Spot.

If hydraulic control is done, consider adding electron donor to reinjected water.

Goal:

Present Site Characterization and obtain Team consensus on path forward.

Decision:23	Team consensus reached on that the horizontal and vertical extents are adequately delineated (Hot Spot, HCP, and LCP for entire site are defined).

Decision:24	Team consensus reached on the retainment of the following technologies for evaluation: Alternative 1. Barrier: Air Sparging Curtain of HCP (including Soil Vapor Extraction [SVE] to mitigate potential vapor issues), Source Treatment: In-Situ Chemical Oxidation of Hot Spot. Alternative 2. Barrier: Air Sparging Curtain for HCP (including SVE to mitigate potential vapor issues), Source Treatment: Biostimulation of Hot Spot. Alternative 3. Barrier: Hydraulic Control for HCP (including Air Stripping/Carbon Absorption), Source Treatment: In-situ Chemical Oxidation of Hot Spot. Alternative 4. Barrier: Hydraulic Control of HCP (including Air Stripping/Carbon Absorption), Source Treatment: Biostimulation of Hot Spot.

Meeting Start Date:	Meeting ID:	Minute ID:	Presenter:	PRL / SWMU:
03/22/2018	196	6	Murphy, Alex	COMPONENTS REFURBISHMENT AND CHEMICAL ANALYSIS (SWMU 041)

Topic:

Component Refurbishment and Chemical Analysis (SWMU 041)

Discussion:

Operations began in 1998 with cleaning of spacecraft components using several organic and inorganic chemicals. The primary solvent of concern is Vertrel MCA which is a mixture of tDCE (35-41%) and decafluoropentane (59-65%). This was historical stored and used in the Chemical Processing Area (CPA). Bulk storage tanks of Vertrel were removed from CPA, and Vertrel is now stored in Building K6-1696A. tDCE and VC are the primary contaminants of concern at the site. Decafluoropentane has not been sampled in groundwater since 2006 (detected in groundwater sample DPT0103 in the 55 feet BLS zone at a concentration of 28.1 µg/L, less than the FDEP GCTL of 49 µg/L).

Based on VOC groundwater concentrations beneath Building K6-1696, an air monitoring plan will be developed to determine if vapor intrusion is occurring within the occupied Building K6-1696 with plume in its current state (absent of any IM implementation). Phase I will be an evaluation of the facility operations. Phase II will consist of groundwater sampling at select monitoring wells and soil gas sampling at select locations within Building K6-1696. Phase III is indoor ambient air sampling.

Phase I was completed in January 2018. There were no potential indoor vapor intrusion pathways found. The only VOC usage within Building K6-1696 is within the Extraction Laboratory at the northwest corner of the facility. Review of chemical inventory list found no chemicals in Building K6-1696 containing tDCE, VC, or decafluoropentane. Site reconnaissance of Building K6-1696A (location of stored Vertrel MCA) found this building to only be occupied for a maximum of 4 hours per day and is not a closed structure. Soil vapor extraction (SVE) system was abandoned approximately 5 years ago. The piping was pulled, and the vertical extraction wells are still on site.

Will evaluate Vapor Pins for use at this site. It was recommended to sample for oxygen to give insight into VC degradation in the vadose zone. Recommendation was made to check EPA Vapor Intrusion Screening Level (VISL) before you send to the lab to ensure that the laboratory detection limits are below the VISLs.

If indoor air sampling completed, need an outdoor sample with no operations in progress. Also make sure the Method TO15 is validated for decafluoropentane.

Team consensus reached to collect groundwater samples for VOCs (modified to include decafluoropentane) at the following monitoring well locations: MW0006, MW0008, MW0009, MW00011, MW0012, MW0013, MW0018, and MW0019.

Team consensus reached to collect soil gas sampling: one within the Calibration Warehouse (adjacent to MW0019), two within the Field Cleaning Room (one adjacent to MW0008 and one adjacent to MW0009), and one inside Building K6-1696 (adjacent to MW0011 and MW0012). Samples will be collected and be analyzed for VOCs via USEPA Method TO15 and be expanded to include decafluoropentane. Sampling locations will be confirmed based on review of the groundwater analysis. Soil gas sampling will be conducted when the doors to the facility are closed and preferably without the operation of the HVAC system.

An additional round of soil gas sampling may be warranted based on evaluation of the analytical results. Come back to Team with Phase II results before moving to Phase III.

Goal:

Present an air monitoring plan and obtain Team consensus on proposed plan.

Decision:25	Team consensus reached to collect groundwater samples for VOCs (modified to include decafluoropentane) at the following monitoring well locations: MW0006, MW0008, MW0009, MW00011, MW0012, MW0013, MW0018, and MW0019.

RE: Laboratory Results for
Project Number: 112G08970, Project Name/Desc: NASA KSC CRCA Airs
ENCO Workorder(s): AE07721

Dear Alex Murphy,

Enclosed is a copy of your laboratory report for test samples received by our laboratory on Friday, October 22, 2021.

Unless otherwise noted in an attached project narrative, all samples were received in acceptable condition and processed in accordance with the referenced methods/procedures. Results for these procedures apply only to the samples as submitted.

The analytical results contained in this report are in compliance with NELAC standards, except as noted in the project narrative if applicable. This report shall not be reproduced except in full, without the written approval of the Laboratory.

This report contains only those analyses performed by Environmental Conservation Laboratories. Unless otherwise noted, all analyses were performed at ENCO Orlando. Data from outside organizations will be reported under separate cover.

If you have any questions or require further information, please do not hesitate to contact me.

Sincerely,

Kaitlin Dylnicki

Project Manager

Overview

All samples submitted were analyzed by Environmental Conservation Laboratories, Inc. in accordance with the methods referenced in the laboratory report. Any particular difficulties encountered during sample handling and processing will be discussed in the Remarks section below.

Remarks

List of instruments used:

Analytical and Preparation Method	SOP Reference Instrument
TO-15	OVGCMS7

Analysis: TO-15

The calibration curve and the continuing calibration standards are in ppbv. Raw data is reported in pptv. Per request, results may be reported in a unit other than ppbv which is obtained through a conversion factor set up in the laboratories' database.

Manual integrations were performed on samples associated with TO-15. All data & explanations are included in the raw data section of the report.

Methylene chloride is common laboratory contaminant.

Affected Samples: 1J25034-BLK1, CRCA-AMB0001-20211021[AE07721-01], CRCA-AMB0002-20211021[AE07721-02], CRCA-VMP0001-20211021[AE07721-03], CRCA-VMP0002-20211021[AE07721-04], CRCA-VMP0003-20211021[AE07721-05], CRCA-VMP0004-20211021[AE07721-06RE1]
Result for methylene chloride may be biased high due to positive results in the associated method blank.

Affected Samples: CRCA-VMP0004-20211021[AE07721-06]
Sample was analyzed at a dilution due to suspected matrix interference. Initial analysis was over diluted. Sample was reanalyzed at a lower dilution.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy package and in computer-readable data submitted on diskette has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signatures.

Kaitlin Dylnicki
Project Manager

FLAGS/NOTES AND DEFINITIONS

PQL	PQL: Practical Quantitation Limit. The PQL presented is the laboratory MRL.
B	Results are based upon membrane filter colony counts that are outside the method indicated ideal range.
I	The reported value is between the laboratory method detection limit (MDL) and the practical quantitation limit (PQL).
J	Estimated value.
K	Off-scale low; Actual value is known to be less than the value given.
L	Off-scale high; Actual value is known to be greater than value given.
M	Presence of analyte is verified but not quantified; the actual value is less than the MRL but greater than the MDL.
N	Presumptive evidence of presence of material.
O	Sampled, but analysis lost or not performed.
Q	Sample exceeded the accepted holding time.
T	Value reported is less than the laboratory method detection limit. The value is reported for informational purposes only and shall not be used in statistical analysis.
U	Indicates that the compound was analyzed for but not detected.
V	Indicates that the analyte was detected in both the sample and the associated method blank.
Y	The laboratory analysis was from an improperly preserved sample. The data may not be accurate.
Z	Too many colonies were present (TNTC); the numeric value represents the filtration volume.
?	Data are rejected and should not be used. Some or all of the quality control data for the analyte were outside criteria, and the presence or absence of the analyte cannot be determined from the data.
*****	Not reported due to interference.
[CALC]	Calculated analyte - MDL/MRL reported to the highest reporting limit of the component analyses.
J-01	Result may be biased high due to positive results in the associated method blank at a concentration above the MDL and/or greater than one-half the MRL.
O-01	This compound is a common laboratory contaminant.

B	The analyte was detected in the associated method blank.
D	The sample was analyzed at dilution.
J	The reported result is an estimated value.
U	The analyte was analyzed for but not detected to the level shown, adjusted for actual sample preparation data and moisture content, where applicable.
E	The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence (85% or greater confidence) to make a “tentative identification".
Q	One or more quality control criteria failed.

RE: Laboratory Results for
Project Number: 112G08970, Project Name/Desc: NASA KSC CRCA
ENCO Workorder(s): AE07722

Dear Alex Murphy,

Enclosed is a copy of your laboratory report for test samples received by our laboratory on Friday, October 8, 2021.

Unless otherwise noted in an attached project narrative, all samples were received in acceptable condition and processed in accordance with the referenced methods/procedures. Results for these procedures apply only to the samples as submitted.

The analytical results contained in this report are in compliance with NELAC standards, except as noted in the project narrative if applicable. This report shall not be reproduced except in full, without the written approval of the Laboratory.

This report contains only those analyses performed by Environmental Conservation Laboratories. Unless otherwise noted, all analyses were performed at ENCO Orlando. Data from outside organizations will be reported under separate cover.

If you have any questions or require further information, please do not hesitate to contact me.

Sincerely,

Kaitlin Dylnicki

Project Manager

Overview

All samples submitted were analyzed by Environmental Conservation Laboratories, Inc. in accordance with the methods referenced in the laboratory report. Any particular difficulties encountered during sample handling and processing will be discussed in the Remarks section below.

Remarks

List of instruments used:

Analytical and Preparation Method	SOP Reference Instrument
EPA 8260D / 5030B_MS	OVGCMS2
RSK-175	OVGCFID2

Analysis: EPA 8260D

Manual integrations were performed on samples associated with EPA 8260D. All data & explanations are included in the raw data section of the report.

Affected Samples: CRCA-MW0019-058.0-20211007[AE07722-01], 1J12028-MS1, 1J12028-MSD1
Precision between duplicate matrix spikes of the same sample was outside acceptance limits for multiple analytes.

Affected Samples: CRCA-MW0019-058.0-20211007[AE07722-01], 1J12028-MSD1
Matrix spike recovery was outside acceptance limits for carbon disulfide.

Affected Samples: AA68735-CCV1, CRCA-MW0019-058.0-20211007[AE07722-01], CRCA-MW0031-058.0-20211007[AE07722-02], CRCA-MW0032-058.0-20211007[AE07722-03], CRCA-MW0018-058-20211007[AE07722-04]
The associated calibration verification standard for bromomethane, carbon disulfide and tetrachloroethene exhibited high bias. Analyte(s) not detected in the sample.

Affected Samples: 1J12028-BS1, CRCA-MW0019-058.0-20211007[AE07722-01], CRCA-MW0031-058.0-20211007[AE07722-02], CRCA-MW0032-058.0-20211007[AE07722-03], CRCA-MW0018-058-20211007[AE07722-04]
The associated laboratory control sample for carbon disulfide and tetrachloroethene exhibited high bias. Analyte(s) not detected in the sample.

Affected Samples: AA68735-CCV1
Surrogate recovery for toluene-d8 was outside acceptance limits.

Affected Samples: AA68735-CCV1
The continuing calibration verification standard exhibited low bias for multiple analytes; the associated sample had ND (non-detect) results, but sensitivity was verified by analyzing a standard with a concentration equivalent to the reporting limit.

Analysis: RSK-175

Manual integrations were performed on samples associated with RSK-175. All data & explanations are included in the raw data section of the report.

Affected Samples: CCRCA-MW0031-058.0-20211007[AE07722-02]
Initial result for methane was above the calibration range of the instrument. Sample was reanalyzed at a dilution.

Affected Samples: CRCA-MW0018-058-20211007[AE07722-04]
Sample was analyzed at a dilution due to suspected matrix interference.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy package and in computer-readable data submitted on diskette has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signatures.

Kaitlin Dylnicki
Project Manager

FLAGS/NOTES AND DEFINITIONS

PQL	PQL: Practical Quantitation Limit. The PQL presented is the laboratory MRL.
B	Results are based upon membrane filter colony counts that are outside the method indicated ideal range.
I	The reported value is between the laboratory method detection limit (MDL) and the practical quantitation limit (PQL).
J	Estimated value.
K	Off-scale low; Actual value is known to be less than the value given.
L	Off-scale high; Actual value is known to be greater than value given.
M	Presence of analyte is verified but not quantified; the actual value is less than the MRL but greater than the MDL.
N	Presumptive evidence of presence of material.
O	Sampled, but analysis lost or not performed.
Q	Sample exceeded the accepted holding time.
T	Value reported is less than the laboratory method detection limit. The value is reported for informational purposes only and shall not be used in statistical analysis.
U	Indicates that the compound was analyzed for but not detected.
V	Indicates that the analyte was detected in both the sample and the associated method blank.
Y	The laboratory analysis was from an improperly preserved sample. The data may not be accurate.
Z	Too many colonies were present (TNTC); the numeric value represents the filtration volume.
?	Data are rejected and should not be used. Some or all of the quality control data for the analyte were outside criteria, and the presence or absence of the analyte cannot be determined from the data.
*****	Not reported due to interference.
[CALC]	Calculated analyte - MDL/MRL reported to the highest reporting limit of the component analyses.
QL-02	The associated laboratory control sample exhibited high bias; since the result is ND, there is no impact.
QM-11	Precision between duplicate matrix spikes of the same sample was outside acceptance limits.
QM-19	The spike recovery was outside acceptance limits for the MS and/or MSD.
QS-03	Surrogate recovery outside acceptance limits
QV-01	The associated continuing calibration verification standard exhibited high bias; since the result is ND, there is no impact.

B	The analyte was detected in the associated method blank.
D	The sample was analyzed at dilution.
J	The reported result is an estimated value.
U	The analyte was analyzed for but not detected to the level shown, adjusted for actual sample preparation data and moisture content, where applicable.
E	The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence (85% or greater confidence) to make a “tentative identification".
Q	One or more quality control criteria failed.

I Lovelie Metzgar, as the designated Quality Assurance Officer, hereby attest that all electronic deliverables have been thoroughly reviewed and are in agreement with the associated hardcopy data. The enclosed electronic files have been reviewed for accuracy (including significant figures), completeness and format. The laboratory will be responsible for any labor time necessary to correct enclosed electronic deliverables that have been found to be in error. I can be reached at (407) 826-5314 if there are any questions or problems with the enclosed electronic deliverables.

RE: Laboratory Results for
Project Number: 112G08970, Project Name/Desc: NASA KSC CRCA
ENCO Workorder(s): AE08047

Dear Alex Murphy,

Enclosed is a copy of your laboratory report for test samples received by our laboratory on Thursday, October 7, 2021.

Unless otherwise noted in an attached project narrative, all samples were received in acceptable condition and processed in accordance with the referenced methods/procedures. Results for these procedures apply only to the samples as submitted.

The analytical results contained in this report are in compliance with NELAC standards, except as noted in the project narrative if applicable. This report shall not be reproduced except in full, without the written approval of the Laboratory.

This report contains only those analyses performed by Environmental Conservation Laboratories. Unless otherwise noted, all analyses were performed at ENCO Orlando. Data from outside organizations will be reported under separate cover.

If you have any questions or require further information, please do not hesitate to contact me.

Sincerely,

Kaitlin Dylnicki

Project Manager

Overview

All samples submitted were analyzed by Environmental Conservation Laboratories, Inc. in accordance with the methods referenced in the laboratory report. Any particular difficulties encountered during sample handling and processing will be discussed in the Remarks section below.

Remarks

List of instruments used:

Analytical Method / Preparation Method	SOP Reference Instrument
EPA 8260D / EPA 5030B_MS	OVGCMS2

Analysis:

Manual integrations were performed on samples associated with EPA 8260D. All data & explanations are included in the raw data section of the report

Affected Samples: AA68696-CCV1, CRCA-ASEFFLUENT-20211007[AE08047-01], CRCA-ASINFLUENT-20211007[AE08047-02]
The associated calibration verification standard for bromomethane, carbon disulfide and Freon 113 exhibited high bias. Analytes were not detected in the samples.

Affected Samples: 1J11008-BS1, CRCA-ASEFFLUENT-20211007[AE08047-01], CRCA-ASINFLUENT-20211007[AE08047-02]
The associated laboratory control sample for carbon disulfide exhibited high bias. Analyte was not detected in the sample.

Affected Samples: CRCA-ASEFFLUENT-20211007[AE08047-01], 1J11008-MS1, 1J11008-MSD1
Matrix spike recovery was outside acceptance limits for carbon disulfide.

Affected Samples: AA68696-CCV1
The continuing calibration verification standard exhibited low bias for 1,2-dibromo-3-chlorpropane; the associated sample had ND (non-detect) results, but sensitivity was verified by analyzing a standard with a concentration equivalent to the reporting limit.

Affected Samples: AA67203-SCV1
Recovery from bromomethane was outside acceptance limits. Analyte was not detected in the samples.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy package and in computer-readable data submitted on diskette has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signatures.

Kaitlin Dylnicki
Project Manager

FLAGS/NOTES AND DEFINITIONS

PQL	PQL: Practical Quantitation Limit. The PQL presented is the laboratory MRL.
B	Results are based upon membrane filter colony counts that are outside the method indicated ideal range.
I	The reported value is between the laboratory method detection limit (MDL) and the practical quantitation limit (PQL).
J	Estimated value.
K	Off-scale low; Actual value is known to be less than the value given.
L	Off-scale high; Actual value is known to be greater than value given.
M	Presence of analyte is verified but not quantified; the actual value is less than the MRL but greater than the MDL.
N	Presumptive evidence of presence of material.
O	Sampled, but analysis lost or not performed.
Q	Sample exceeded the accepted holding time.
T	Value reported is less than the laboratory method detection limit. The value is reported for informational purposes only and shall not be used in statistical analysis.
U	Indicates that the compound was analyzed for but not detected.
V	Indicates that the analyte was detected in both the sample and the associated method blank.
Y	The laboratory analysis was from an improperly preserved sample. The data may not be accurate.
Z	Too many colonies were present (TNTC); the numeric value represents the filtration volume.
?	Data are rejected and should not be used. Some or all of the quality control data for the analyte were outside criteria, and the presence or absence of the analyte cannot be determined from the data.
*****	Not reported due to interference.
[CALC]	Calculated analyte - MDL/MRL reported to the highest reporting limit of the component analyses.
QL-02	The associated laboratory control sample exhibited high bias; since the result is ND, there is no impact.
QM-07	The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
QM-19	The spike recovery was outside acceptance limits for the MS and/or MSD.
QV-01	The associated continuing calibration verification standard exhibited high bias; since the result is ND, there is no impact.

B	The analyte was detected in the associated method blank.
D	The sample was analyzed at dilution.
J	The reported result is an estimated value.
U	The analyte was analyzed for but not detected to the level shown, adjusted for actual sample preparation data and moisture content, where applicable.
E	The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence (85% or greater confidence) to make a “tentative identification".
Q	One or more quality control criteria failed.

I Lovelie Metzgar, as the designated Quality Assurance Officer, hereby attest that all electronic deliverables have been thoroughly reviewed and are in agreement with the associated hardcopy data. The enclosed electronic files have been reviewed for accuracy (including significant figures), completeness and format. The laboratory will be responsible for any labor time necessary to correct enclosed electronic deliverables that have been found to be in error. I can be reached at (407) 826-5314 if there are any questions or problems with the enclosed electronic deliverables.

RE: Laboratory Results for
Project Number: 112G08970, Project Name/Desc: NASA KSC CRCA
ENCO Workorder(s): AE09032

Dear Alex Murphy,

Enclosed is a copy of your laboratory report for test samples received by our laboratory on Thursday, November 11, 2021.

Unless otherwise noted in an attached project narrative, all samples were received in acceptable condition and processed in accordance with the referenced methods/procedures. Results for these procedures apply only to the samples as submitted.

The analytical results contained in this report are in compliance with NELAC standards, except as noted in the project narrative if applicable. This report shall not be reproduced except in full, without the written approval of the Laboratory.

This report contains only those analyses performed by Environmental Conservation Laboratories. Unless otherwise noted, all analyses were performed at ENCO Orlando. Data from outside organizations will be reported under separate cover.

If you have any questions or require further information, please do not hesitate to contact me.

Sincerely,

Kaitlin Dylnicki

Project Manager

FLAGS/NOTES AND DEFINITIONS

PQL	PQL: Practical Quantitation Limit. The PQL presented is the laboratory MRL.
B	Results are based upon membrane filter colony counts that are outside the method indicated ideal range.
I	The reported value is between the laboratory method detection limit (MDL) and the practical quantitation limit (PQL).
J	Estimated value.
K	Off-scale low; Actual value is known to be less than the value given.
L	Off-scale high; Actual value is known to be greater than value given.
M	Presence of analyte is verified but not quantified; the actual value is less than the MRL but greater than the MDL.
N	Presumptive evidence of presence of material.
O	Sampled, but analysis lost or not performed.
Q	Sample exceeded the accepted holding time.
T	Value reported is less than the laboratory method detection limit. The value is reported for informational purposes only and shall not be used in statistical analysis.
U	Indicates that the compound was analyzed for but not detected.
V	Indicates that the analyte was detected in both the sample and the associated method blank.
Y	The laboratory analysis was from an improperly preserved sample. The data may not be accurate.
Z	Too many colonies were present (TNTC); the numeric value represents the filtration volume.
?	Data are rejected and should not be used. Some or all of the quality control data for the analyte were outside criteria, and the presence or absence of the analyte cannot be determined from the data.
*****	Not reported due to interference.
[CALC]	Calculated analyte - MDL/MRL reported to the highest reporting limit of the component analyses.
J-05	Result may be biased low. Associated calibration verification standard did not meet the minimum control limit.
QL-02	The associated laboratory control sample exhibited high bias; since the result is ND, there is no impact.
QM-07	The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
QM-10	LCS/LCSD were analyzed in place of MS/MSD.
QM-19	The spike recovery was outside acceptance limits for the MS and/or MSD.
QR-02	LCS/LCSD RPD exceeded QC control limits; however, recovery for spike and duplicate was acceptable. Sample results for the QC batch were accepted based on satisfactory recovery and completeness of QC data.
QV-01	The associated continuing calibration verification standard exhibited high bias; since the result is ND, there is no impact.

RE: Laboratory Results for
Project Number: 112G08970, Project Name/Desc: NASA KSC CRCA
ENCO Workorder(s): AE09874

Dear Alex Murphy,

Enclosed is a copy of your laboratory report for test samples received by our laboratory on Tuesday, December 14, 2021.

Unless otherwise noted in an attached project narrative, all samples were received in acceptable condition and processed in accordance with the referenced methods/procedures. Results for these procedures apply only to the samples as submitted.

The analytical results contained in this report are in compliance with NELAC standards, except as noted in the project narrative if applicable. This report shall not be reproduced except in full, without the written approval of the Laboratory.

This report contains only those analyses performed by Environmental Conservation Laboratories. Unless otherwise noted, all analyses were performed at ENCO Orlando. Data from outside organizations will be reported under separate cover.

If you have any questions or require further information, please do not hesitate to contact me.

Sincerely,

Kaitlin Dylnicki

Project Manager

Overview

All samples submitted were analyzed by Environmental Conservation Laboratories, Inc. in accordance with the methods referenced in the laboratory report. Any particular difficulties encountered during sample handling and processing will be discussed in the Remarks section below.

Remarks

List of instruments used:

Analytical and Preparation Method	SOP Reference Instrument
EPA 8260D / 5030B_MS	OVGCMS5

Analysis: EPA 8260D

Manual integrations were performed on samples associated with EPA 8260D. All data & explanations are included in the raw data section of the report.

Affected Samples: AA69776-CCV1, CRCA-ASEFFLUENT-20211214[AE09874-01], CRCA-ASINFLUENT-20211214[AE09874-02]
The associated calibration verification standard for bromomethane exhibited high bias. Analyte(s) not detected in the sample.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy package and in computer-readable data submitted on diskette has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signatures.

Kaitlin Dylnicki
Project Manager

FLAGS/NOTES AND DEFINITIONS

PQL	PQL: Practical Quantitation Limit. The PQL presented is the laboratory MRL.
B	Results are based upon membrane filter colony counts that are outside the method indicated ideal range.
I	The reported value is between the laboratory method detection limit (MDL) and the practical quantitation limit (PQL).
J	Estimated value.
K	Off-scale low; Actual value is known to be less than the value given.
L	Off-scale high; Actual value is known to be greater than value given.
M	Presence of analyte is verified but not quantified; the actual value is less than the MRL but greater than the MDL.
N	Presumptive evidence of presence of material.
O	Sampled, but analysis lost or not performed.
Q	Sample exceeded the accepted holding time.
T	Value reported is less than the laboratory method detection limit. The value is reported for informational purposes only and shall not be used in statistical analysis.
U	Indicates that the compound was analyzed for but not detected.
V	Indicates that the analyte was detected in both the sample and the associated method blank.
Y	The laboratory analysis was from an improperly preserved sample. The data may not be accurate.
Z	Too many colonies were present (TNTC); the numeric value represents the filtration volume.
?	Data are rejected and should not be used. Some or all of the quality control data for the analyte were outside criteria, and the presence or absence of the analyte cannot be determined from the data.
*****	Not reported due to interference.
[CALC]	Calculated analyte - MDL/MRL reported to the highest reporting limit of the component analyses.
QV-01	The associated continuing calibration verification standard exhibited high bias; since the result is ND, there is no impact.

B	The analyte was detected in the associated method blank.
D	The sample was analyzed at dilution.
J	The reported result is an estimated value.
U	The analyte was analyzed for but not detected to the level shown, adjusted for actual sample preparation data and moisture content, where applicable.
E	The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence (85% or greater confidence) to make a “tentative identification".
Q	One or more quality control criteria failed.

I Lovelie Metzgar, as the designated Quality Assurance Officer, hereby attest that all electronic deliverables have been thoroughly reviewed and are in agreement with the associated hardcopy data. The enclosed electronic files have been reviewed for accuracy (including significant figures), completeness and format. The laboratory will be responsible for any labor time necessary to correct enclosed electronic deliverables that have been found to be in error. I can be reached at (407) 826-5314 if there are any questions or problems with the enclosed electronic deliverables.

RE: Laboratory Results for
Project Number: 112G08970, Project Name/Desc: NASA KSC CRCA Airs
ENCO Workorder(s): AF00241

Dear Alex Murphy,

Enclosed is a copy of your laboratory report for test samples received by our laboratory on Friday, January 14, 2022.

Unless otherwise noted in an attached project narrative, all samples were received in acceptable condition and processed in accordance with the referenced methods/procedures. Results for these procedures apply only to the samples as submitted.

The analytical results contained in this report are in compliance with NELAC standards, except as noted in the project narrative if applicable. This report shall not be reproduced except in full, without the written approval of the Laboratory.

This report contains only those analyses performed by Environmental Conservation Laboratories. Unless otherwise noted, all analyses were performed at ENCO Orlando. Data from outside organizations will be reported under separate cover.

If you have any questions or require further information, please do not hesitate to contact me.

Sincerely,

Ryya B Kumm For Kaitlin Dylnicki

Project Manager

Client: Tetra Tech, Inc. (TE016)
Project: NASA KSC CRCA
Client PM: Alex Murphy
Project Number: 112G08970
ENCO Project ID: AF00241
SDG: AF00241-TE016

Overview

All samples submitted were analyzed by Environmental Conservation Laboratories, Inc. in accordance with the methods referenced in the laboratory report. Any particular difficulties encountered during sample handling and processing will be discussed in the Remarks section below.

Remarks

List of instruments used:

Analytical and Preparation Method	SOP Reference Instrument
TO-15	OVGCMS7

Analysis: TO-15

The calibration curve and the continuing calibration standards are in ppbv. Raw data is reported in pptv. Per request, results may be reported in a unit other than ppbv which is obtained through a conversion factor set up in the laboratories' database.

Manual integrations were performed on samples associated with TO-15. All data & explanations are included in the raw data section of the report.

Affected Samples: CRCA-AMB0001-20220114[AF00241-01], CRCA-AMB0002-20220114 [AF00241-02], CRCA-VMP0001-20220114 [AF00241-03], CRCA-VMP0002-20220114 [AF00241-04], CRCA-VMP0003-20220114 [AF00241-05], CRCA-VMP0003-20220114 [AF00241-06]
The continuing calibration verification standard exhibited low bias for carbon tetrachloride; the associated sample had ND (non-detect) results, but sensitivity was verified by analyzing a standard with a concentration equivalent to the reporting limit.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy package and in computer-readable data submitted on diskette has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signatures.

Kaitlin Dylnicki
Project Manager

FLAGS/NOTES AND DEFINITIONS

PQL	PQL: Practical Quantitation Limit. The PQL presented is the laboratory MRL.
B	Results are based upon membrane filter colony counts that are outside the method indicated ideal range.
I	The reported value is between the laboratory method detection limit (MDL) and the practical quantitation limit (PQL).
J	Estimated value.
K	Off-scale low; Actual value is known to be less than the value given.
L	Off-scale high; Actual value is known to be greater than value given.
M	Presence of analyte is verified but not quantified; the actual value is less than the MRL but greater than the MDL.
N	Presumptive evidence of presence of material.
O	Sampled, but analysis lost or not performed.
Q	Sample exceeded the accepted holding time.
T	Value reported is less than the laboratory method detection limit. The value is reported for informational purposes only and shall not be used in statistical analysis.
U	Indicates that the compound was analyzed for but not detected.
V	Indicates that the analyte was detected in both the sample and the associated method blank.
Y	The laboratory analysis was from an improperly preserved sample. The data may not be accurate.
Z	Too many colonies were present (TNTC); the numeric value represents the filtration volume.
?	Data are rejected and should not be used. Some or all of the quality control data for the analyte were outside criteria, and the presence or absence of the analyte cannot be determined from the data.
*****	Not reported due to interference.
[CALC]	Calculated analyte - MDL/MRL reported to the highest reporting limit of the component analyses.
J-05	Result may be biased low. Associated calibration verification standard did not meet the minimum control limit.

B	The analyte was detected in the associated method blank.
D	The sample was analyzed at dilution.
J	The reported result is an estimated value.
U	The analyte was analyzed for but not detected to the level shown, adjusted for actual sample preparation data and moisture content, where applicable.
E	The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence (85% or greater confidence) to make a “tentative identification".
Q	One or more quality control criteria failed.

RE: Laboratory Results for
Project Number: 112G08970, Project Name/Desc: NASA KSC CRCA Airs
ENCO Workorder(s): AF00241

Dear Alex Murphy,

Enclosed is a copy of your laboratory report for test samples received by our laboratory on Friday, January 14, 2022.

Unless otherwise noted in an attached project narrative, all samples were received in acceptable condition and processed in accordance with the referenced methods/procedures. Results for these procedures apply only to the samples as submitted.

The analytical results contained in this report are in compliance with NELAC standards, except as noted in the project narrative if applicable. This report shall not be reproduced except in full, without the written approval of the Laboratory.

This report contains only those analyses performed by Environmental Conservation Laboratories. Unless otherwise noted, all analyses were performed at ENCO Orlando. Data from outside organizations will be reported under separate cover.

If you have any questions or require further information, please do not hesitate to contact me.

Sincerely,

Kaitlin Dylnicki

Project Manager

FLAGS/NOTES AND DEFINITIONS

PQL	PQL: Practical Quantitation Limit. The PQL presented is the laboratory MRL.
B	Results are based upon membrane filter colony counts that are outside the method indicated ideal range.
I	The reported value is between the laboratory method detection limit (MDL) and the practical quantitation limit (PQL).
J	Estimated value.
K	Off-scale low; Actual value is known to be less than the value given.
L	Off-scale high; Actual value is known to be greater than value given.
M	Presence of analyte is verified but not quantified; the actual value is less than the MRL but greater than the MDL.
N	Presumptive evidence of presence of material.
O	Sampled, but analysis lost or not performed.
Q	Sample exceeded the accepted holding time.
T	Value reported is less than the laboratory method detection limit. The value is reported for informational purposes only and shall not be used in statistical analysis.
U	Indicates that the compound was analyzed for but not detected.
V	Indicates that the analyte was detected in both the sample and the associated method blank.
Y	The laboratory analysis was from an improperly preserved sample. The data may not be accurate.
Z	Too many colonies were present (TNTC); the numeric value represents the filtration volume.
?	Data are rejected and should not be used. Some or all of the quality control data for the analyte were outside criteria, and the presence or absence of the analyte cannot be determined from the data.
*****	Not reported due to interference.
[CALC]	Calculated analyte - MDL/MRL reported to the highest reporting limit of the component analyses.
J-05	Result may be biased low. Associated calibration verification standard did not meet the minimum control limit.

I Lovelie Metzgar, as the designated Quality Assurance Officer, hereby attest that all electronic deliverables have been thoroughly reviewed and are in agreement with the associated hardcopy data. The enclosed electronic files have been reviewed for accuracy (including significant figures), completeness and format. The laboratory will be responsible for any labor time necessary to correct enclosed electronic deliverables that have been found to be in error. I can be reached at (407) 826-5314 if there are any questions or problems with the enclosed electronic deliverables.

RE: Laboratory Results for
Project Number: 112G08970, Project Name/Desc: NASA KSC CRCA
ENCO Workorder(s): AF00374

Dear Alex Murphy,

Enclosed is a copy of your laboratory report for test samples received by our laboratory on Friday, January 14, 2022.

Unless otherwise noted in an attached project narrative, all samples were received in acceptable condition and processed in accordance with the referenced methods/procedures. Results for these procedures apply only to the samples as submitted.

The analytical results contained in this report are in compliance with NELAC standards, except as noted in the project narrative if applicable. This report shall not be reproduced except in full, without the written approval of the Laboratory.

This report contains only those analyses performed by Environmental Conservation Laboratories. Unless otherwise noted, all analyses were performed at ENCO Orlando. Data from outside organizations will be reported under separate cover.

If you have any questions or require further information, please do not hesitate to contact me.

Sincerely,

Kaitlin Dylnicki

Project Manager

Overview

All samples submitted were analyzed by Environmental Conservation Laboratories, Inc. in accordance with the methods referenced in the laboratory report. Any particular difficulties encountered during sample handling and processing will be discussed in the Remarks section below.

Remarks

This package includes an amendment to the Level II report dated 01/21/22 for this work order to update the sampling dates to match dates listed on the chain of custody.

List of instruments used:

Analytical and Preparation Method	SOP Reference Instrument
EPA 8260D / 5030B_MS	OVGCMS5
RSK-175	OVGCFID2

Analysis: EPA 8260D

Manual integrations were performed on samples associated with EPA 8260D. All data & explanations are included in the raw data section of the report.

Affected Samples: AA70175-CCV1, CRCA-MW0027-035.0-20220114[AF00374-01], CRCA-MW0002-032.5-20220114 [AF00374-02], CRCA-MW0031-058.0-20220114 [AF00374-03], CRCA-MW0018-058.0-20220114 [AF00374-04], CRCA-MW0013-027.5-20220114 [AF00374-05], CRCA-MW0019-058.0-20220114 [AF00374-06], CRCA-MW0032-058.0-20220114 [AF00374-07]
The associated calibration verification standard for multiple analytes exhibited high bias. Analyte(s) not detected in the sample.

Analysis: RSK-175

Manual integrations were performed on samples associated with RSK-175. All data & explanations are included in the raw data section of the report.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy package and in computer-readable data submitted on diskette has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signatures.

Kaitlin Dylnicki
Project Manager

FLAGS/NOTES AND DEFINITIONS

PQL	PQL: Practical Quantitation Limit. The PQL presented is the laboratory MRL.
B	Results are based upon membrane filter colony counts that are outside the method indicated ideal range.
I	The reported value is between the laboratory method detection limit (MDL) and the practical quantitation limit (PQL).
J	Estimated value.
K	Off-scale low; Actual value is known to be less than the value given.
L	Off-scale high; Actual value is known to be greater than value given.
M	Presence of analyte is verified but not quantified; the actual value is less than the MRL but greater than the MDL.
N	Presumptive evidence of presence of material.
O	Sampled, but analysis lost or not performed.
Q	Sample exceeded the accepted holding time.
T	Value reported is less than the laboratory method detection limit. The value is reported for informational purposes only and shall not be used in statistical analysis.
U	Indicates that the compound was analyzed for but not detected.
V	Indicates that the analyte was detected in both the sample and the associated method blank.
Y	The laboratory analysis was from an improperly preserved sample. The data may not be accurate.
Z	Too many colonies were present (TNTC); the numeric value represents the filtration volume.
?	Data are rejected and should not be used. Some or all of the quality control data for the analyte were outside criteria, and the presence or absence of the analyte cannot be determined from the data.
*****	Not reported due to interference.
[CALC]	Calculated analyte - MDL/MRL reported to the highest reporting limit of the component analyses.
QM-07	The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
QV-01	The associated continuing calibration verification standard exhibited high bias; since the result is ND, there is no impact.

B	The analyte was detected in the associated method blank.
D	The sample was analyzed at dilution.
J	The reported result is an estimated value.
U	The analyte was analyzed for but not detected to the level shown, adjusted for actual sample preparation data and moisture content, where applicable.
E	The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence (85% or greater confidence) to make a “tentative identification".
Q	One or more quality control criteria failed.

I Lovelie Metzgar, as the designated Quality Assurance Officer, hereby attest that all electronic deliverables have been thoroughly reviewed and are in agreement with the associated hardcopy data. The enclosed electronic files have been reviewed for accuracy (including significant figures), completeness and format. The laboratory will be responsible for any labor time necessary to correct enclosed electronic deliverables that have been found to be in error. I can be reached at (407) 826-5314 if there are any questions or problems with the enclosed electronic deliverables.

RE: Laboratory Results for
Project Number: 112G08970, Project Name/Desc: NASA KSC CRCA
ENCO Workorder(s): AF01167

Dear Alex Murphy,

Enclosed is a copy of your laboratory report for test samples received by our laboratory on Monday, February 14, 2022.

Unless otherwise noted in an attached project narrative, all samples were received in acceptable condition and processed in accordance with the referenced methods/procedures. Results for these procedures apply only to the samples as submitted.

The analytical results contained in this report are in compliance with NELAC standards, except as noted in the project narrative if applicable. This report shall not be reproduced except in full, without the written approval of the Laboratory.

This report contains only those analyses performed by Environmental Conservation Laboratories. Unless otherwise noted, all analyses were performed at ENCO Orlando. Data from outside organizations will be reported under separate cover.

If you have any questions or require further information, please do not hesitate to contact me.

Sincerely,

Kaitlin Dylnicki

Project Manager

Enclosure(s)

Client: Tetra Tech, Inc. (TE016)

ENCO Project ID: AF01167
SDG: AF01167-TE016

Overview

All samples submitted were analyzed by Environmental Conservation Laboratories, Inc. in accordance with the methods referenced in the laboratory report. Any particular difficulties encountered during sample handling and processing will be discussed in the Remarks section below.

Remarks

List of instruments used:

Analytical and Preparation Method	SOP Reference Instrument
EPA 8260D / 5030B_MS	OVGCMS5

Analysis: EPA 8260D

Manual integrations were performed on samples associated with EPA 8260D. All data & explanations are included in the raw data section of the report.

Affected Samples: AA70682-CCV1, CRCA-ASEFFLUENT-20220214[AF01167-01], CRCA-ASINFLUENT-20220214[AF01167-02]
The associated calibration verification standard for multiple analytes exhibited high bias. Analyte(s) not detected in the sample.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy package and in computer-readable data submitted on diskette has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signatures.

Kaitlin Dylnicki
Project Manager

FLAGS/NOTES AND DEFINITIONS

PQL	PQL: Practical Quantitation Limit. The PQL presented is the laboratory MRL.
B	Results are based upon membrane filter colony counts that are outside the method indicated ideal range.
I	The reported value is between the laboratory method detection limit (MDL) and the practical quantitation limit (PQL).
J	Estimated value.
K	Off-scale low; Actual value is known to be less than the value given.
L	Off-scale high; Actual value is known to be greater than value given.
M	Presence of analyte is verified but not quantified; the actual value is less than the MRL but greater than the MDL.
N	Presumptive evidence of presence of material.
O	Sampled, but analysis lost or not performed.
Q	Sample exceeded the accepted holding time.
T	Value reported is less than the laboratory method detection limit. The value is reported for informational purposes only and shall not be used in statistical analysis.
U	Indicates that the compound was analyzed for but not detected.
V	Indicates that the analyte was detected in both the sample and the associated method blank.
Y	The laboratory analysis was from an improperly preserved sample. The data may not be accurate.
Z	Too many colonies were present (TNTC); the numeric value represents the filtration volume.
?	Data are rejected and should not be used. Some or all of the quality control data for the analyte were outside criteria, and the presence or absence of the analyte cannot be determined from the data.
*****	Not reported due to interference.
[CALC]	Calculated analyte - MDL/MRL reported to the highest reporting limit of the component analyses.
QV-01	The associated continuing calibration verification standard exhibited high bias; since the result is ND, there is no impact.

B	The analyte was detected in the associated method blank.
D	The sample was analyzed at dilution.
J	The reported result is an estimated value.
U	The analyte was analyzed for but not detected to the level shown, adjusted for actual sample preparation data and moisture content, where applicable.
E	The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence (85% or greater confidence) to make a “tentative identification".
Q	One or more quality control criteria failed.

I Lovelie Metzgar, as the designated Quality Assurance Officer, hereby attest that all electronic deliverables have been thoroughly reviewed and are in agreement with the associated hardcopy data. The enclosed electronic files have been reviewed for accuracy (including significant figures), completeness and format. The laboratory will be responsible for any labor time necessary to correct enclosed electronic deliverables that have been found to be in error. I can be reached at (407) 826-5314 if there are any questions or problems with the enclosed electronic deliverables.

RE: Laboratory Results for
Project Number: 112G08970, Project Name/Desc: NASA KSC CRCA
ENCO Workorder(s): AF02224

Dear Alex Murphy,

Enclosed is a copy of your laboratory report for test samples received by our laboratory on Tuesday, March 22, 2022.

Unless otherwise noted in an attached project narrative, all samples were received in acceptable condition and processed in accordance with the referenced methods/procedures. Results for these procedures apply only to the samples as submitted.

The analytical results contained in this report are in compliance with NELAC standards, except as noted in the project narrative if applicable. This report shall not be reproduced except in full, without the written approval of the Laboratory.

This report contains only those analyses performed by Environmental Conservation Laboratories. Unless otherwise noted, all analyses were performed at ENCO Orlando. Data from outside organizations will be reported under separate cover.

If you have any questions or require further information, please do not hesitate to contact me.

Sincerely,

Kaitlin Dylnicki

Project Manager

Overview

All samples submitted were analyzed by Environmental Conservation Laboratories, Inc. in accordance with the methods referenced in the laboratory report. Any particular difficulties encountered during sample handling and processing will be discussed in the Remarks section below.

Remarks

List of instruments used:

Analytical and Preparation Method	SOP Reference Instrument
EPA 8260D / 5030B_MS	OVGCMS5

Analysis: EPA 8260D

Manual integrations were performed on samples associated with EPA 8260D. All data & explanations are included in the raw data section of the report.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy package and in computer-readable data submitted on diskette has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signatures.

Kaitlin Dylnicki
Project Manager

FLAGS/NOTES AND DEFINITIONS

PQL	PQL: Practical Quantitation Limit. The PQL presented is the laboratory MRL.
B	Results are based upon membrane filter colony counts that are outside the method indicated ideal range.
I	The reported value is between the laboratory method detection limit (MDL) and the practical quantitation limit (PQL).
J	Estimated value.
K	Off-scale low; Actual value is known to be less than the value given.
L	Off-scale high; Actual value is known to be greater than value given.
M	Presence of analyte is verified but not quantified; the actual value is less than the MRL but greater than the MDL.
N	Presumptive evidence of presence of material.
O	Sampled, but analysis lost or not performed.
Q	Sample exceeded the accepted holding time.
T	Value reported is less than the laboratory method detection limit. The value is reported for informational purposes only and shall not be used in statistical analysis.
U	Indicates that the compound was analyzed for but not detected.
V	Indicates that the analyte was detected in both the sample and the associated method blank.
Y	The laboratory analysis was from an improperly preserved sample. The data may not be accurate.
Z	Too many colonies were present (TNTC); the numeric value represents the filtration volume.
?	Data are rejected and should not be used. Some or all of the quality control data for the analyte were outside criteria, and the presence or absence of the analyte cannot be determined from the data.
*****	Not reported due to interference.
[CALC]	Calculated analyte - MDL/MRL reported to the highest reporting limit of the component analyses.
QM-07	The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.

B	The analyte was detected in the associated method blank.
D	The sample was analyzed at dilution.
J	The reported result is an estimated value.
U	The analyte was analyzed for but not detected to the level shown, adjusted for actual sample preparation data and moisture content, where applicable.
E	The concentration indicated for this analyte is an estimated value above the calibration range of the instrument. This value is considered an estimate.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence (85% or greater confidence) to make a “tentative identification".
Q	One or more quality control criteria failed.

I Lovelie Metzgar, as the designated Quality Assurance Officer, hereby attest that all electronic deliverables have been thoroughly reviewed and are in agreement with the associated hardcopy data. The enclosed electronic files have been reviewed for accuracy (including significant figures), completeness and format. The laboratory will be responsible for any labor time necessary to correct enclosed electronic deliverables that have been found to be in error. I can be reached at (407) 826-5314 if there are any questions or problems with the enclosed electronic deliverables.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

DL	Detection Limit.
LOD	Limit of Detection.
LOQ	Limit of Quantitation.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.
U	Below Detectable Limits: Indicates that the analyte was not detected.

Case Narrative
Tetra Tech
Lot Number: XD19036

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.3 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples was in compliance with DOD QSM 5.3 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). For undiluted analysis. For undiluted analysis, the extract is prepared for injection by adding 182 uL of sample extract + 8 uL of reagent water + 10 uL of internal standard solution to a polypropylene autosampler vial. An extra correction factor of 0.91 (182 uL / 200 uL = 0.91) applies. The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1/0.91.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

Pace is a TNI accredited laboratory; however, the following analyses are currently not listed on our TNI scope of accreditation: Drinking Water: VOC (excluding BTEX, MTBE, Naphthalene, & 1,2-dichloroethane) EPA 524.2, E. coli and Total coliforms SM 9223 B-2004, Solid Chemical Material: TOC Walkley-Black, Biological Tissue: All, Non-Potable Water: SGT-HEM EPA 1664B, Silica EPA 200.7, Boron, Calcium, Silicon, Strontium EPA 200.8, Bicarbonate, Carbonate, and Hydroxide Alkalinity SM 2320 B-2011, SM 9221 C E-2006 & SM 9222D-2006, Strontium SW-846 6010D, VOC SM 6200 B-2011, Fecal Coliform Colilert-18.

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

PFAS
Surrogate recovery for the following samples was outside the upper control limit: XD19036-005, XD19036-006. This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

LOQ = Limit of Quantitation
U = Not detected at or above the LOQ
Q = Out of holding time
V = Detected in the method blank
N = Recovery is out of criteria
W = Reported on wet weight basis
E = Quantitation of compound exceeded the calibration range
P = The RPD between two GC columns exceeds 40%
LOD = Limit of Detection
DL = Detection Limit
I = Estimated result < LOQ and ≥ DL
D = Dilution > 1
Q = Surrogate failure
L = LCS/LCSD failure
S = MS/MSD failure

Samples Receipt Checklist (SRC) (ME0018C-15)
Issuing Authority: Pace ENV - WCOL

Revised:9/29/2020
Page 1 of 1

Sample Receipt Checklist (SRC)

Client: Tetra Tech Cooler Inspected by/date: TEC / 04/19/2022 Lot #: XD190036

Means of receipt: ☐ Pace ☐ Client ☐ UPS ☑ FedEx ☐ Other: _____

☐ Yes	☑ No		1. Were custody seals present on the cooler?
☐ Yes	☐ No	☑ NA	2. If custody seals were present, were they intact and unbroken?

pH Strip ID: NA Chlorine Strip ID: NA Tested by: NA

Original temperature upon receipt / Derived (Corrected) temperature upon receipt %Solid Snap-Cup ID: NA

4.9 / 4.9 °C NA / NA °C NA / NA °C NA / NA °C

Method: ☑ Temperature Blank ☐ Against Bottles IR Gun ID: 5 IR Gun Correction Factor: 0 °C

Method of coolant: ☑ Wet Ice ☐ Ice Packs ☐ Dry Ice ☐ None

☐ Yes	☐ No	☑ NA	3. If temperature of any cooler exceeded 6.0°C, was Project Manager Notified? PM was Notified by: phone / email / face-to-face (circle one).
☑ Yes	☐ No	☐ NA	4. Is the commercial courier's packing slip attached to this form?
☑ Yes	☐ No		5. Were proper custody procedures (relinquished/received) followed?
☑ Yes	☐ No		6. Were sample IDs listed on the COC?
☑ Yes	☐ No		7. Were sample IDs listed on all sample containers?
☑ Yes	☐ No		8. Was collection date & time listed on the COC?
☑ Yes	☐ No		9. Was collection date & time listed on all sample containers?
☑ Yes	☐ No		10. Did all container label information (ID, date, time) agree with the COC?
☑ Yes	☐ No		11. Were tests to be performed listed on the COC?
☑ Yes	☐ No		12. Did all samples arrive in the proper containers for each test and/or in good condition (unbroken, lids on, etc.)?
☑ Yes	☐ No		13. Was adequate sample volume available?
☑ Yes	☐ No		14. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
☐ Yes	☑ No		15. Were any samples containers missing/excess (circle one) samples Not listed on COC?
☐ Yes	☑ No	☐ NA	16. For VOA and RSK-175 samples, were bubbles present >"pea-size" (¼"or 6mm in diameter) in any of the VOA vials?
☐ Yes	☐ No	☑ NA	17. Were all DRO/metals/nutrient samples received at a pH of < 2?
☐ Yes	☐ No	☑ NA	18. Were all cyanide samples received at a pH > 12 and sulfide samples received at a pH > 9?
☐ Yes	☐ No	☑ NA	19. Were all applicable NH_3/TKN/cyanide/phenol/625.1/608.3 (< 0.5mg/L) samples free of residual chlorine?
☐ Yes	☐ No	☑ NA	20. Were client remarks/requests (i.e. requested dilutions, MS/MSD designations, etc…) correctly transcribed from the COC into the comment section in LIMS?
☐ Yes	☑ No		21. Was the quote number listed on the container label? If yes, Quote #

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) NA were received incorrectly preserved and were adjusted accordingly in sample receiving with NA mL of circle one: H2SO4, HNO3, HCl, NaOH using SR # NA.
Time of preservation NA. If more than one preservative is needed, please note in the comments below.

Sample(s) NA were received with bubbles >6 mm in diameter.

Samples(s) NA were received with TRC > 0.5 mg/L (If #19 is *no*) and were adjusted accordingly in sample receiving with sodium thiosulfate ($Na_2S_2O_3$) with Shealy ID: NA.

Report of Analysis

Tetra Tech
Foster Plaza 7
661 Anderson Drive
Pittsburgh, PA 15220
Attention: Alex Murphy

Project Name: KSC - CRCA

Project Number: 112G08970

Lot Number:**XE25024**

Date Completed:06/16/2022

06/17/2022 2:55 PM
Approved and released by:
Project Manager II: **Kathy E. Smith**

The electronic signature above is the equivalent of a handwritten signature.

Case Narrative
Tetra Tech
Lot Number: XE25024

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.3 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples was in compliance with DOD QSM 5.3 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). For undiluted analysis. For undiluted analysis, the extract is prepared for injection by adding 182 uL of sample extract + 8 uL of reagent water + 10 uL of internal standard solution to a polypropylene autosampler vial. An extra correction factor of 0.91 (182 uL / 200 uL = 0.91) applies. The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1/0.91.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

Pace is a TNI accredited laboratory; however, the following analyses are currently not listed on our TNI scope of accreditation: Drinking Water: VOC (excluding BTEX, MTBE, Naphthalene, & 1,2-dichloroethane) EPA 524.2, E. coli and Total coliforms SM 9223 B-2004, Solid Chemical Material: TOC Walkley-Black, Biological Tissue: All, Non-Potable Water: SGT-HEM EPA 1664B, Silica EPA 200.7, Boron, Calcium, Silicon, Strontium EPA 200.8, Bicarbonate, Carbonate, and Hydroxide Alkalinity SM 2320 B-2011, SM 9221 C E-2006 & SM 9222D-2006, Strontium SW-846 6010D, VOC SM 6200 B-2011, Fecal Coliform Colilert-18.

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

Surrogate recovery for the following sample(s) was outside the upper control limit: XE25001-001, XE25001-002, XE25001-003, XE25001-004, XE25024-001, XE25024-002. This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Volatiles
Reanalysis of the following sample was performed outside of the analytical holding time: XE25024-001. The above sample was reanalyzed for Vinyl Chloride recovering outside control limits in hte CCV. All data has been reported.

The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for analytical batch 44290 exceeded acceptance criteria for the following analytes: Acetone. This analyte was biased high and were not detected in the samples affected.

PFAS
Surrogate recovery for the following samples was outside the upper control limit: XE25024-001, XE25024-002. This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Sample Receipt Checklist (SRC)

Client: Tetra Tech Cooler Inspected by/date: KAR / 05/25/2022 Lot #: XG25024

Means of receipt: ☐ Pace ☐ Client ☐ UPS ☑ FedEx ☐ Other:

☑ Yes	☐ No		1. Were custody seals present on the cooler?
☑ Yes	☐ No	☐ NA	2. If custody seals were present, were they intact and unbroken?

pH Strip ID: NA Chlorine Strip ID: NA Tested by: NA

Original temperature upon receipt / Derived (Corrected) temperature upon receipt %Solid Snap-Cup ID: NA

2.3 / 2.3 °C NA / NA °C NA / NA °C NA / NA °C

Method: ☑ Temperature Blank ☐ Against Bottles IR Gun ID: 5 IR Gun Correction Factor: 0 °C

Method of coolant: ☑ Wet Ice ☐ Ice Packs ☐ Dry Ice ☐ None

☐ Yes	☐ No	☑ NA	3. If temperature of any cooler exceeded 6.0°C, was Project Manager Notified? PM was Notified by: phone / email / face-to-face (circle one).
☑ Yes	☐ No	☐ NA	4. Is the commercial courier's packing slip attached to this form?
☑ Yes	☐ No		5. Were proper custody procedures (relinquished/received) followed?
☑ Yes	☐ No		6. Were sample IDs listed on the COC?
☑ Yes	☐ No		7. Were sample IDs listed on all sample containers?
☑ Yes	☐ No		8. Was collection date & time listed on the COC?
☑ Yes	☐ No		9. Was collection date & time listed on all sample containers?
☑ Yes	☐ No		10. Did all container label information (ID, date, time) agree with the COC?
☑ Yes	☐ No		11. Were tests to be performed listed on the COC?
☑ Yes	☐ No		12. Did all samples arrive in the proper containers for each test and/or in good condition (unbroken, lids on, etc.)?
☑ Yes	☐ No		13. Was adequate sample volume available?
☑ Yes	☐ No		14. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
☐ Yes	☑ No		15. Were any samples containers missing/excess (circle one) samples Not listed on COC?
☐ Yes	☑ No	☐ NA	16. For VOA and RSK-175 samples, were bubbles present >"pea-size" (¼"or 6mm in diameter) in any of the VOA vials?
☐ Yes	☐ No	☑ NA	17. Were all DRO/metals/nutrient samples received at a pH of < 2?
☐ Yes	☐ No	☑ NA	18. Were all cyanide samples received at a pH > 12 and sulfide samples received at a pH > 9?
☐ Yes	☐ No	☑ NA	19. Were all applicable NH_3/TKN/cyanide/phenol/625.1/608.3 (< 0.5mg/L) samples free of residual chlorine?
☐ Yes	☐ No	☑ NA	20. Were client remarks/requests (i.e. requested dilutions, MS/MSD designations, etc…) correctly transcribed from the COC into the comment section in LIMS?
☐ Yes	☑ No		21. Was the quote number listed on the container label? If yes, Quote #

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) NA were received incorrectly preserved and were adjusted accordingly in sample receiving with NA mL of circle one: H_2SO_4, HNO_3, HCl, NaOH using SR # NA.
Time of preservation NA. If more than one preservative is needed, please note in the comments below.

Sample(s) NA were received with bubbles >6 mm in diameter.

Samples(s) NA were received with TRC > 0.5 mg/L (If #19 is *no*) and were adjusted accordingly in sample receiving with sodium thiosulfate ($Na_2S_2O_3$) with Shealy ID: NA.

Case Narrative
Tetra Tech
Lot Number: XG01006

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.3 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples were compliant with DOD QSM 5.3 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

Pace is a TNI accredited laboratory; however, the following analyses are currently not listed on our TNI scope of accreditation: Drinking Water: VOC (excluding BTEX, MTBE, Naphthalene, & 1,2-dichloroethane) EPA 524.2, E. coli and Total coliforms SM 9223 B-2004, Solid Chemical Material: TOC

Walkley-Black, Biological Tissue: All, Non-Potable Water: SGT-HEM EPA 1664B, Silica EPA 200.7, Boron, Calcium, Silicon, Strontium EPA 200.8, Bicarbonate, Carbonate, and Hydroxide Alkalinity SM 2320 B-2011, SM 9221 C E-2006 & SM 9222D-2006, Strontium SW-846 6010D, VOC SM 6200 B-2011, Fecal Coliform Colilert-18.

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

Surrogate recovery for the following sample was outside control limits: XG01006-001. Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

LOQ = Limit of Quantitation
U = Not detected at or above the LOD
Q = Out of holding time
V = Detected in the method blank
N = Recovery is out of criteria
W = Reported on wet weight basis
E = Quantitation of compound exceeded the calibration range
P = The RPD between two GC columns exceeds 40%
LOD = Limit of Detection
DL = Detection Limit
I = Estimated result < LOQ and ≥ DL
D = Dilution > 1
Q = Surrogate failure
L = LCS/LCSD failure
S = MS/MSD failure

LOQ = Limit of Quantitation
U = Not detected at or above the LOD
Q = Out of holding time
V = Detected in the method blank
N = Recovery is out of criteria
W = Reported on wet weight basis
E = Quantitation of compound exceeded the calibration range
P = The RPD between two GC columns exceeds 40%
LOD = Limit of Detection
DL = Detection Limit
I = Estimated result < LOQ and ≥ DL
D = Dilution > 1
Q = Surrogate failure
L = LCS/LCSD failure
S = MS/MSD failure

Client: Tetra Tech Cooler Inspected by/date: KAR / 06/30/2022 Lot #: XG01006

Means of receipt: ☐ Pace ☐ Client ☐ UPS ☑ FedEx ☐ Other:

☑ Yes	☐ No		1. Were custody seals present on the cooler?
☑ Yes	☐ No	☐ NA	2. If custody seals were present, were they intact and unbroken?

pH Strip ID: NA Chlorine Strip ID: NA Tested by: NA

Original temperature upon receipt / Derived (Corrected) temperature upon receipt %Solid Snap-Cup ID: NA

3.3 / 3.3 °C NA / NA °C NA / NA °C NA / NA °C

Method: ☑ Temperature Blank ☐ Against Bottles IR Gun ID: 6 IR Gun Correction Factor: 0 °C

Method of coolant: ☑ Wet Ice ☐ Ice Packs ☐ Dry Ice ☐ None

☐ Yes	☐ No	☑ NA	3. If temperature of any cooler exceeded 6.0°C, was Project Manager Notified? PM was Notified by: phone / email / face-to-face (circle one).
☑ Yes	☐ No	☐ NA	4. Is the commercial courier's packing slip attached to this form?
☑ Yes	☐ No		5. Were proper custody procedures (relinquished/received) followed?
☑ Yes	☐ No		6. Were sample IDs listed on the COC?
☑ Yes	☐ No		7. Were sample IDs listed on all sample containers?
☑ Yes	☐ No		8. Was collection date & time listed on the COC?
☑ Yes	☐ No		9. Was collection date & time listed on all sample containers?
☑ Yes	☐ No		10. Did all container label information (ID, date, time) agree with the COC?
☑ Yes	☐ No		11. Were tests to be performed listed on the COC?
☑ Yes	☐ No		12. Did all samples arrive in the proper containers for each test and/or in good condition (unbroken, lids on, etc.)?
☑ Yes	☐ No		13. Was adequate sample volume available?
☑ Yes	☐ No		14. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
☑ Yes	☐ No		15. Were any samples containers missing/excess (circle one) samples Not listed on COC?
☐ Yes	☑ No	☐ NA	16. For VOA and RSK-175 samples, were bubbles present >"pea-size" (¼"or 6mm in diameter) in any of the VOA vials?
☐ Yes	☐ No	☑ NA	17. Were all DRO/metals/nutrient samples received at a pH of < 2?
☐ Yes	☐ No	☑ NA	18. Were all cyanide samples received at a pH > 12 and sulfide samples received at a pH > 9?
☐ Yes	☐ No	☑ NA	19. Were all applicable NH_3/TKN/cyanide/phenol/625.1/608.3 (< 0.5mg/L) samples free of residual chlorine?
☐ Yes	☐ No	☑ NA	20. Were client remarks/requests (i.e. requested dilutions, MS/MSD designations, etc…) correctly transcribed from the COC into the comment section in LIMS?
☐ Yes	☑ No		21. Was the quote number listed on the container label? If yes, Quote # NA

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) NA were received incorrectly preserved and were adjusted accordingly in sample receiving with NA mL of circle one: H2SO4, HNO3, HCl, NaOH using SR # NA.
Time of preservation NA. If more than one preservative is needed, please note in the comments below.

Sample(s) NA were received with bubbles >6 mm in diameter.

Samples(s) NA were received with TRC > 0.5 mg/L (If #19 is *no*) and were adjusted accordingly in sample receiving with sodium thiosulfate ($Na_2S_2O_3$) with Shealy ID: NA.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

COD	Coefficient of Determination.
DL	Detection Limit.
LOD	Limit of Detection.
LOQ	Limit of Quantitation.
Mass	Mass of parameter.
MDL	Method Detection Limit.
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
RRF	Relative Response Factor.
RT	Retention Time.
SDG	Sample Delivery Group.
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.
NI	Manual Integration Code to indicate that the peak was not integrated at all by the computer software.
LT	Manual Integration Code to indicate that the peak in question was inappropriately integrated to an area less than what it should be (i.e., peak area was cut).
GT	Manual Integration Code to indicate that the peak in question was inappropriately integrated to an area greater than it should be (i.e., peak tailing).
BA	Manual Integration Code to indicate that the baseline had to be adjusted correctly by the analyst.
WP	Manual Integration Code to indicate that the wrong peak was chosen.
CO	Manual Integration Code to indicate that the analyst had to split two co-eluting peaks apart that were not (or could not be) separated by the computer system.
RT	Manual Integration Code to indicate that the retention time for the peak in question has shifted from the expected retention time.
INT	Manual Integration Code to indicate that there was electronic interference (i.e., noise).

Qualifier Description

GLOSSARY OF TERMS

Qualifier	Description
B	The same analyte is found in the associated blank.
J	The identification of the analyte is acceptable; the reported value is an estimate.
U	Below Detectable Limits: Indicates that the analyte was not detected.

Case Narrative
Tetra Tech
Lot Number: XG22012

This report supersedes and replaces any prior reports issued under this lot number.

This report was revised September 20, 2022 to update sample IDs.

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.3 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples were compliant with DOD QSM 5.3 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL

B is the y-intercept from the ICAL

Pace is a TNI accredited laboratory; however, the following analyses are currently not listed on our TNI scope of accreditation: Drinking Water: VOC (excluding BTEX, MTBE, Naphthalene, & 1,2-dichloroethane) EPA 524.2, E. coli and Total coliforms SM 9223 B-2004, Solid Chemical Material: TOC Walkley-Black, Biological Tissue: All, Non-Potable Water: SGT-HEM EPA 1664B, Silica EPA 200.7, Boron, Calcium, Silicon, Strontium EPA 200.8, Bicarbonate, Carbonate, and Hydroxide Alkalinity SM 2320 B-2011, SM 9221 C E-2006 & SM 9222D-2006, Strontium SW-846 6010D, VOC SM 6200 B-2011, Fecal Coliform Colilert-18.

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

PFAS
The method blank for prep batch 50101 contained analyte 13C2_6:2FTS greater than the acceptance criteria. The data has been reported.

Samples XG22012-008, XG22012-009 had surrogates recovered outside of the acceptance limits due to confirmed matrix interference.

The following samples required a dilution which was performed outside of the analytical holding time: XG22012-008, XG22012-009. All data has been reported.

Dissolved Gases
The method blank associated with batch 50061 had Methane detected at a concentration that was above the MDL but below ½ the PQL. All samples associated with this method blank that have detections for Methane have been flagged with a "B".

LOQ = Limit of Quantitation
U = Not detected at or above the LOD
H = Out of holding time
B = Detected in the method blank
N = Recovery is out of criteria
W = Reported on wet weight basis
E = Quantitation of compound exceeded the calibration range
P = The RPD between two GC columns exceeds 40%
LOD = Limit of Detection
DL = Detection Limit
J = Estimated result < LOQ and ≥ DL
Q = Surrogate failure
L = LCS/LCSD failure
S = MS/MSD failure

Sample Receipt Checklist (SRC)

Client: Tetra Tech Cooler Inspected by/date: KNR / 07/22/2022 Lot #: XGZ2012

Means of receipt: ☐ Pace ☐ Client ☐ UPS ☑ FedEx ☐ Other:

☐ Yes	☑ No		1. Were custody seals present on the cooler?
☐ Yes	☐ No	☑ NA	2. If custody seals were present, were they intact and unbroken?

pH Strip ID: NA Chlorine Strip ID: NA Tested by: NA

Original temperature upon receipt / Derived (Corrected) temperature upon receipt %Solid Snap-Cup ID: NA

4.4 / 4.4 °C NA / NA °C NA / NA °C NA / NA °C

Method: ☑ Temperature Blank ☐ Against Bottles IR Gun ID: 6 IR Gun Correction Factor: 0 °C

Method of coolant: ☑ Wet Ice ☐ Ice Packs ☐ Dry Ice ☐ None

☐ Yes	☐ No	☑ NA	3. If temperature of any cooler exceeded 6.0°C, was Project Manager Notified? PM was Notified by: phone / email / face-to-face (circle one).
☑ Yes	☐ No	☐ NA	4. Is the commercial courier's packing slip attached to this form?
☑ Yes	☐ No		5. Were proper custody procedures (relinquished/received) followed?
☑ Yes	☐ No		6. Were sample IDs listed on the COC?
☑ Yes	☐ No		7. Were sample IDs listed on all sample containers?
☑ Yes	☐ No		8. Was collection date & time listed on the COC?
☑ Yes	☐ No		9. Was collection date & time listed on all sample containers?
☑ Yes	☐ No		10. Did all container label information (ID, date, time) agree with the COC?
☑ Yes	☐ No		11. Were tests to be performed listed on the COC?
☑ Yes	☐ No		12. Did all samples arrive in the proper containers for each test and/or in good condition (unbroken, lids on, etc.)?
☑ Yes	☐ No		13. Was adequate sample volume available?
☑ Yes	☐ No		14. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
☐ Yes	☑ No		15. Were any samples containers missing/excess (circle one) samples Not listed on COC?
☐ Yes	☑ No	☐ NA	16. For VOA and RSK-175 samples, were bubbles present >"pea-size" (¼" or 6mm in diameter) in any of the VOA vials?
☐ Yes	☐ No	☑ NA	17. Were all DRO/metals/nutrient samples received at a pH of < 2?
☐ Yes	☐ No	☑ NA	18. Were all cyanide samples received at a pH > 12 and sulfide samples received at a pH > 9?
☐ Yes	☐ No	☑ NA	19. Were all applicable NH_3/TKN/cyanide/phenol/625.1/608.3 (< 0.5mg/L) samples free of residual chlorine?
☐ Yes	☐ No	☑ NA	20. Were client remarks/requests (i.e. requested dilutions, MS/MSD designations, etc…) correctly transcribed from the COC into the comment section in LIMS?
☐ Yes	☑ No		21. Was the quote number listed on the container label? If yes, Quote # 24792

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) NA were received incorrectly preserved and were adjusted accordingly in sample receiving with NA mL of circle one: H_2SO_4, HNO_3, HCl, NaOH using SR # NA.
Time of preservation NA. If more than one preservative is needed, please note in the comments below.

Sample(s) NA were received with bubbles >6 mm in diameter.

Samples(s) NA were received with TRC > 0.5 mg/L (If #19 is *no*) and were adjusted accordingly in sample receiving with sodium thiosulfate ($Na_2S_2O_3$) with Shealy ID: NA.

Case Narrative
Tetra Tech
Lot Number: XH16026

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.3 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples were compliant with DOD QSM 5.3 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

Pace is a DoD/DOE accredited laboratory; however, the following analyses are currently not listed on our DoD/DOE scope of accreditation: Drinking Water: pH EPA 150.1, Turbidity EPA 18.01, Metals EPA 200.7

& 200.8, Mercury EPA 245.1, Anions EPA 300.0, Cyanide EPA 335.4, Nitrates EPA 353.2, Orthophosphate & Phosphorus EPA 365.1, EDB/DBCP EPA 504.1, HPC SIMPLATE, Color SM 2120 B-2011, Alkalinity SM 2320 B-2011, Specific Conductance SM 2510 B-2011, Residue-filterable (TDS) SM 2540 C, Calcium Hardness (CaCO2) SM 3500-Ca B-2011, TRC SM 4500 Cl G-2011, pH SM 4500 H=B-2011, E.Coli, Total Coliform; Non-Potable Water: Metals EPA 200.7, Strontium EPA 200.8, Chlorate EPA 300.0, Cyanide EPA 335.4, Phenolics EPA 420.4, 2-Methyl-4,6-Dinitrophenol EPA 625.1, Propane RSK-175, Specific Conductance SM 2510 B-2011, Salinity SM250 B, Residue- total SM 2540 B, Sulfite SM 4500 SO32- B-2011, Amenable Cyanide SM 4500-CN- G-2011, BOD & CBOD SM 5210 B, MBAS SM 5540 C-2011; Solid and Chemical Materials: Boron & Titanium SW-846 6010D, Boron, Molybdenum, & Titanium SW-846 6020B, Alcohols & Glycols SW-846 8015C, Pentachlorophenol SW-846 8151A, Ethyl Acetate, Hexane, & n-Hexane SW-846 8260D, SVOC 1,4-Dioxane, 3&4-Methylphenols, 4-Dimethyl aminoazobenzene, 1,4-Naphthoquinone, 3,5-Dinitroaniline, PETN SW-846 8270E, Amenable Cyanide SW-846 9012B; Boron & Titanium SW-846 6010D, Molybdenum SW-846 6020B, Ethylene Glycol SW-846 8015B, Pentachlorophenol SW-846 8151A, Chloroprene SW-846 8260B, SVOC 1,3,5-Trinitrobenzene, 1,4-Dioxane, 1,4-Naphthoquinone, 1,4-Phenylenediamine, 2,5-Dinitrotoluene, 2,6-Dinitrotoluene, 3-Methylcholanthrene, 4- Aminobiphenyl, 4-Dimethyl aminoazobenzene, 4-Nitroquinoline-1-oxide, 7,12- Dimethylbenzo(a)anthracene, Chlorobenzilate, Diallate, Ethyl methanesulfonate, Isodrin, Isosafrole, Methyl methanesulfonate, n-Nitrosomethylethylamine, n-Nitrosomorpholine, n-Nitrosopiperidine, Piperonyl butoxide, Pronamide, Safrole, 3,5-Dinitroaniline, PETN SW-846 8270E, Oil & Grease SW-846 9071B.

Pace is a TNI accredited laboratory; however, the following analyses are currently not listed on our TNI scope of accreditation: Drinking Water: VOC (excluding BTEX, MTBE, Naphthalene, & 1,2-dichloroethane) EPA 524.2, E. coli and Total coliforms SM 9223 B-2004, Solid Chemical Material: TOC Walkley-Black, Biological Tissue: All, Non-Potable Water: SGT-HEM EPA 1664B, Silica EPA 200.7, Boron, Calcium, Silicon, Strontium EPA 200.8, Bicarbonate, Carbonate, and Hydroxide Alkalinity SM 2320 B-2011, SM 9221 C E-2006 & SM 9222D-2006, Strontium SW-846 6010D, VOC SM 6200 B-2011, Fecal Coliform Colilert-18.

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

PFAS
The method blank, laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for prep batch 52055 exceeded acceptance criteria for the following analytes: 6:2 FTS EIS. The data has been reported.

Surrogate recovery for the following sample was outside the upper control limit: XH16026-002. This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Manual Integration Summary

Tetra Tech

Lot Number: XH16026

Project Name: CRCA - NASA

Project Number: 112G09581

Where applicable, analytes for which manual integration occurred have been flagged with the following:

Qualifier	Technical Justification	Qualifier	Technical Justification	Qualifier	Technical Justification
M-01	Split peak	M-07	Low fit	M-13	Error
M-02	Peak tailing	M-08	Peak not found	M-14	Baseline
M-03	Incorrect auto integration	M-09	Analyte not Identified by the Data System	M-15	Other
M-04	Poor chromatography	M-10	Analyte misidentified by the Data System	M-16	Retention time shift
M-05	Manually assigned peak	M-11	Invalid integration	M-17	Shouldering
M-06	Wrong isomer	M-12	Wrong peak		

A summary of instances where manual integration occurred is included below:

Method	Sample	Run Number	Parameter	Qualifier
PFAS by ID SOP	XH16026-002	1	Perfluorohexanesulfonic acid (PFHxS)	M-03

Report of Analysis

Tetra Tech
Foster Plaza 7
661 Anderson Drive
Pittsburgh, PA 15220
Attention: Alex Murphy

Project Name: CRCA

Project Number: 112G08970

Lot Number:**XI09029**

Date Completed:10/18/2022

10/19/2022 1:37 PM
Approved and released by:
Project Manager II: **Kathy E. Smith**

The electronic signature above is the equivalent of a handwritten signature.

Case Narrative
Tetra Tech
Lot Number: XI09029

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.3 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples were compliant with DOD QSM 5.3 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

Pace is a DoD/DOE accredited laboratory; however, the following analyses are currently not listed on our DoD/DOE scope of accreditation: Drinking Water: pH EPA 150.1, Turbidity EPA 18.01, Metals EPA 200.7

& 200.8, Mercury EPA 245.1, Anions EPA 300.0, Cyanide EPA 335.4, Nitrates EPA 353.2, Orthophosphate & Phosphorus EPA 365.1, EDB/DBCP EPA 504.1, HPC SIMPLATE, Color SM 2120 B-2011, Alkalinity SM 2320 B-2011, Specific Conductance SM 2510 B-2011, Residue-filterable (TDS) SM 2540 C, Calcium Hardness (CaCO2) SM 3500-Ca B-2011, TRC SM 4500 Cl G-2011, pH SM 4500 H=B-2011, E.Coli, Total Coliform; Non-Potable Water: Metals EPA 200.7, Strontium EPA 200.8, Chlorate EPA 300.0, Cyanide EPA 335.4, Phenolics EPA 420.4, 2-Methyl-4,6-Dinitrophenol EPA 625.1, Propane RSK-175, Specific Conductance SM 2510 B-2011, Salinity SM250 B, Residue- total SM 2540 B, Sulfite SM 4500 SO32- B-2011, Amenable Cyanide SM 4500-CN- G-2011, BOD & CBOD SM 5210 B, MBAS SM 5540 C-2011; Solid and Chemical Materials: Boron & Titanium SW-846 6010D, Boron, Molybdenum, & Titanium SW-846 6020B, Alcohols & Glycols SW-846 8015C, Pentachlorophenol SW-846 8151A, Ethyl Acetate, Hexane, & n-Hexane SW-846 8260D, SVOC 1,4-Dioxane, 3&4-Methylphenols, 4-Dimethyl aminoazobenzene, 1,4-Naphthoquinone, 3,5-Dinitroaniline, PETN SW-846 8270E, Amenable Cyanide SW-846 9012B; Boron & Titanium SW-846 6010D, Molybdenum SW-846 6020B, Ethylene Glycol SW-846 8015B, Pentachlorophenol SW-846 8151A, Chloroprene SW-846 8260B, SVOC 1,3,5-Trinitrobenzene, 1,4-Dioxane, 1,4-Naphthoquinone, 1,4-Phenylenediamine, 2,5-Dinitrotoluene, 2,6-Dinitrotoluene, 3-Methylcholanthrene, 4- Aminobiphenyl, 4-Dimethyl aminoazobenzene, 4-Nitroquinoline-1-oxide, 7,12- Dimethylbenzo(a)anthracene, Chlorobenzilate, Diallate, Ethyl methanesulfonate, Isodrin, Isosafrole, Methyl methanesulfonate, n-Nitrosomethylethylamine, n-Nitrosomorpholine, n-Nitrosopiperidine, Piperonyl butoxide, Pronamide, Safrole, 3,5-Dinitroaniline, PETN SW-846 8270E, Oil & Grease SW-846 9071B.

Pace is a TNI accredited laboratory; however, the following analyses are currently not listed on our TNI scope of accreditation: Drinking Water: VOC (excluding BTEX, MTBE, Naphthalene, & 1,2-dichloroethane) EPA 524.2, E. coli and Total coliforms SM 9223 B-2004, Solid Chemical Material: TOC Walkley-Black, Biological Tissue: All, Non-Potable Water: SGT-HEM EPA 1664B, Silica EPA 200.7, Boron, Calcium, Silicon, Strontium EPA 200.8, Bicarbonate, Carbonate, and Hydroxide Alkalinity SM 2320 B-2011, SM 9221 C E-2006 & SM 9222D-2006, Strontium SW-846 6010D, VOC SM 6200 B-2011, Fecal Coliform Colilert-18.

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

Volatiles
Reanalysis of the following samples was performed outside of the analytical holding time: XI09029-001, XI09029-002. Run 1 was analzyed on an instrument that was not calibrated for bromomethane. The continuing calibration verification and laboratory control sample for run 2 failed criteria high for Bromomethane. The samples had no detection for Bromomethane, and all data has been reported.

The LCS associated with batch 55261 had Methyl bromide, Methyl chloride, Vinyl chloride recovered above the acceptance limits. This demonstrates a high bias on analytical results. There were no detections for this compound in the samples associated with this batch; therefore, data quality is not impacted.

Manual Integration Summary

Tetra Tech

Lot Number: XI09029

Project Name: CRCA

Project Number: 112G08970

Where applicable, analytes for which manual integration occurred have been flagged with the following:

Qualifier	Technical Justification	Qualifier	Technical Justification	Qualifier	Technical Justification
M-01	Split peak	M-07	Low fit	M-13	Error
M-02	Peak tailing	M-08	Peak not found	M-14	Baseline
M-03	Incorrect auto integration	M-09	Analyte not Identified by the Data System	M-15	Other
M-04	Poor chromatography	M-10	Analyte misidentified by the Data System	M-16	Retention time shift
M-05	Manually assigned peak	M-11	Invalid integration	M-17	Shouldering
M-06	Wrong isomer	M-12	Wrong peak		

A summary of instances where manual integration occurred is included below:

Method	Sample	Run Number	Parameter	Qualifier
8260D	XI09029-001	1	Acetone	M-03
PFAS by ID SOP	XQ55371-002	1	9-chlorohexadecafluoro-3-oxanone-1-	M-03
PFAS by ID SOP	XQ55371-002	1	N-ethylperfluoro-1-	M-03
PFAS by ID SOP	XQ55371-002	1	N-methylperfluoro-1-	M-03
PFAS by ID SOP	XQ55371-002	1	Perfluorooctanesulfonic acid (PFOS)	M-03
PFAS by ID SOP	XQ55371-001	1	d-EtFOSA	M-03

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

Sample Summary

Tetra Tech

Lot Number: XI09029

Project Name: CRCA

Project Number: 112G08970

Sample Number	Sample ID	Matrix	Date Sampled	Date Received
001	CRCA-ASEffluent-20220908	Aqueous	09/08/2022 1510	09/09/2022
002	CRCA-ASInfluent-20220908	Aqueous	09/08/2022 1525	09/09/2022

Sample Receipt Checklist (SRC)

Client: Tetra Tech Cooler Inspected by/date: MKM2 / 09/09/2022 Lot #: XI09029

Means of receipt: ☐ Pace ☐ Client ☐ UPS ☑ FedEx ☐ Other:

☑ Yes	☐ No		1. Were custody seals present on the cooler?
☑ Yes	☐ No	☐ NA	2. If custody seals were present, were they intact and unbroken?

pH Strip ID: NA Chlorine Strip ID: NA Tested by: NA

Original temperature upon receipt / Derived (Corrected) temperature upon receipt: 3.1 / 3.1 °C %Solid Snap-Cup ID: NA

NA / NA °C NA / NA °C NA / NA °C

Method: ☑ Temperature Blank ☐ Against Bottles IR Gun ID: 8 IR Gun Correction Factor: 0 °C

Method of coolant: ☑ Wet Ice ☐ Ice Packs ☐ Dry Ice ☐ None

☑ Yes	☐ No	☐ NA	3. Were all coolers received at or below 6.0°C? If no, was Project Manager notified? PM was Notified by: phone / email / face-to-face (circle one).
☑ Yes	☐ No	☐ NA	4. Is the commercial courier's packing slip attached to this form?
☑ Yes	☐ No		5. Were proper custody procedures (relinquished/received) followed?
☑ Yes	☐ No		6. Were sample IDs listed on the COC and all sample containers?
☑ Yes	☐ No		7. Was collection date & time listed on the COC and all sample containers?
☑ Yes	☐ No		8. Did all container label information (ID, date, time) agree with the COC?
☑ Yes	☐ No		9. Were tests to be performed listed on the COC?
☑ Yes	☐ No		10. Did all samples arrive in the proper containers for each test and/or in good condition (unbroken, lids on, etc.)?
☑ Yes	☐ No		11. Was adequate sample volume available?
☑ Yes	☐ No		12. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
☑ Yes	☐ No		13. Were all samples containers accounted for? (No missing/excess)
☑ Yes	☐ No	☐ NA	14. Were VOA, 8015C and RSK-175 samples free of bubbles >"pea-size" (¼"or 6mm in diameter) in any of the VOA vials?
☐ Yes	☐ No	☑ NA	15. Were all DRO/metals/nutrient samples received at a pH of < 2?
☐ Yes	☐ No	☑ NA	16. Were all cyanide samples received at a pH > 12 and sulfide samples received at a pH > 9?
☐ Yes	☐ No	☑ NA	17. Were all applicable NH_3/TKN/cyanide/phenol/625.1/608.3 (< 0.5mg/L) samples free of residual chlorine?
☐ Yes	☑ No	☐ NA	18. Was the quote number listed on the container label? If yes, Quote #

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) NA were received incorrectly preserved and were adjusted accordingly in sample receiving with NA mL of circle one: H2SO4, HNO3, HCl, NaOH using SR # NA. ☐
Time of preservation NA. If more than one preservative is needed, please note in the comments below.

Sample(s) NA were received with bubbles >6 mm in diameter.

Samples(s) NA were received with TRC > 0.5 mg/L (If #19 is ***no***) and were adjusted accordingly in sample receiving with sodium thiosulfate ($Na_2S_2O_3$) with Unique ID: NA.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Nancy McLain

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

DL	Detection Limit.
LOD	Limit of Detection.
LOQ	Limit of Quantitation.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
B	The same analyte is found in the associated blank.
J	The identification of the analyte is acceptable; the reported value is an estimate.
U	Below Detectable Limits: Indicates that the analyte was not detected.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

DL	Detection Limit.
LOD	Limit of Detection.
LOQ	Limit of Quantitation.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
B	The same analyte is found in the associated blank.
J	The identification of the analyte is acceptable; the reported value is an estimate.
U	Below Detectable Limits: Indicates that the analyte was not detected.

Case Narrative
Tetra Tech
Lot Number: XJ29006

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report. Where sampling is conducted by the client, results relate to the accuracy of the information provided, and as the samples are received.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved The NELAC Institute (TNI) standards, the Pace Analytical Services, LLC ("Pace") Laboratory Quality Manual, standard operating procedures (SOPs), and Pace policies. Additionally, the DoD QSM version 5.4 has been followed for these samples. Any exceptions to the TNI standards, the Laboratory Quality Manual, SOPs, the DoD QSM, or policies are qualified on the results page or discussed below.

Pace is a DoD/DOE accredited laboratory; however, the following analyses are currently not listed on our DoD/DOE scope of accreditation: Drinking Water: pH EPA 150.1, Turbidity EPA 18.01, Metals EPA 200.7 & 200.8, Mercury EPA 245.1, Anions EPA 300.0, Cyanide EPA 335.4, Nitrates EPA 353.2, Orthophosphate & Phosphorus EPA 365.1, EDB/DBCP EPA 504.1, HPC SIMPLATE, Color SM 2120 B-2011, Alkalinity SM 2320 B-2011, Specific Conductance SM 2510 B-2011, Residue-filterable (TDS) SM 2540 C, Calcium Hardness (CaCO2) SM 3500-Ca B-2011, TRC SM 4500 Cl G-2011, pH SM 4500 H=B-2011, E.Coli, Total Coliform; Non-Potable Water: Metals EPA 200.7, Strontium EPA 200.8, Chlorate EPA 300.0, Cyanide EPA 335.4, Phenolics EPA 420.4, 2-Methyl-4,6-Dinitrophenol EPA 625.1, Propane RSK-175, Specific Conductance SM 2510 B-2011, Salinity SM250 B, Residue- total SM 2540 B, Sulfite SM 4500 SO32- B-2011, Amenable Cyanide SM 4500-CN- G-2011, BOD & CBOD SM 5210 B, MBAS SM 5540 C-2011; Solid and Chemical Materials: Boron & Titanium SW-846 6010D, Boron, Molybdenum, & Titanium SW-846 6020B, Alcohols & Glycols SW-846 8015C, Pentachlorophenol SW-846 8151A, Ethyl Acetate, Hexane, & n-Hexane SW-846 8260D, SVOC 1,4-Dioxane, 3&4-Methylphenols, 4-Dimethyl aminoazobenzene, 1,4-Naphthoquinone, 3,5-Dinitroaniline, PETN SW-846 8270E, Amenable Cyanide SW-846 9012B; Boron & Titanium SW-846 6010D, Molybdenum SW-846 6020B, Ethylene Glycol SW-846 8015B, Pentachlorophenol SW-846 8151A, Chloroprene SW-846 8260B, SVOC 1,3,5-Trinitrobenzene, 1,4-Dioxane, 1,4-Naphthoquinone, 1,4-Phenylenediamine, 2,5-Dinitrotoluene, 2,6-Dinitrotoluene, 3-Methylcholanthrene, 4- Aminobiphenyl, 4-Dimethyl aminoazobenzene, 4-Nitroquinoline-1-oxide, 7,12- Dimethylbenzo(a)anthracene, Chlorobenzilate, Diallate, Ethyl methanesulfonate, Isodrin, Isosafrole, Methyl methanesulfonate, n-Nitrosomethylethylamine, n-Nitrosomorpholine, n-Nitrosopiperidine, Piperonyl butoxide, Pronamide, Safrole, 3,5-Dinitroaniline, PETN SW-846 8270E, Oil & Grease SW-846 9071B.

Pace is a TNI accredited laboratory; however, the following analyses are currently not listed on our TNI scope of accreditation: Drinking Water: VOC (excluding BTEX, MTBE, Naphthalene, & 1,2-dichloroethane) EPA 524.2, E. coli and Total coliforms SM 9223 B-2004, Solid Chemical Material: TOC Walkley-Black, Biological Tissue: All, Non-Potable Water: SGT-HEM EPA 1664B, Silica EPA 200.7, Boron, Calcium, Silicon, Strontium EPA 200.8, Bicarbonate, Carbonate, and Hydroxide Alkalinity SM 2320 B-2011, SM 9221 C E-2006 & SM 9222D-2006, Strontium SW-846 6010D, VOC SM 6200 B-2011, Fecal Coliform Colilert-18.

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

Volatiles
Reanalysis of the following sample was performed outside of the analytical holding time for Acetone which failed below CCV criteria during analysis: XJ29006-001.

Manual Integration Summary

Tetra Tech

Lot Number: XJ29006

Project Name: NASA KSC

Project Number: 112G09581

Where applicable, analytes for which manual integration occurred have been flagged with the following:

Qualifier	Technical Justification	Qualifier	Technical Justification	Qualifier	Technical Justification
M-01	Split peak	M-07	Low fit	M-13	Error
M-02	Peak tailing	M-08	Peak not found	M-14	Baseline
M-03	Incorrect auto integration	M-09	Analyte not Identified by the Data System	M-15	Other
M-04	Poor chromatography	M-10	Analyte misidentified by the Data System	M-16	Retention time shift
M-05	Manually assigned peak	M-11	Invalid integration	M-17	Shouldering
M-06	Wrong isomer	M-12	Wrong peak		

A summary of instances where manual integration occurred is included below:

Method	Sample	Run Number	Parameter	Qualifier
8260D	XJ29006-001	1	Vinyl chloride	M-03
8260D	XJ29006-003	1	Acetone	M-03
8260D	XQ59528-002	1	Methyl acetate	M-03
8260D	XQ60535-002	1	Methyl acetate	M-03
8260D	XQ59671-002	1	Methyl acetate	M-03
8260D	XQ59746-002	1	Methyl acetate	M-03
8260D	XQ59746-003	1	Methyl acetate	M-03

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

Xylenes (total)	1330-20-7	8260D	0.80	U	1.0	0.80	0.40	ug/L	1

Surrogate	Q	Run 1 % Recovery	Acceptance Limits
1,2-Dichloroethane-d4		95	81-118
Bromofluorobenzene		87	85-114
Toluene-d8		95	89-112
Dibromofluoromethane		93	80-119

LOQ = Limit of Quantitation	B = Detected in the method blank	E = Quantitation of compound exceeded the calibration range	DL = Detection Limit	Q = Surrogate failure
U = Not detected at or above the LOD	N = Recovery is out of criteria	P = The RPD between two GC columns exceeds 40%	J = Estimated result < LOQ and ≥ DL	L = LCS/LCSD failure
H = Out of holding time	W = Reported on wet weight basis	LOD = Limit of Detection		S = MS/MSD failure

Effective Date: 8/2/2022

Sample Receipt Checklist (SRC)

Client: Tetra Tech Cooler Inspected by/date: KNR / 10/29/2022 Lot #: XJ29006

Means of receipt: ☐ Pace ☐ Client ☐ UPS ☑ FedEx ☐ Other:

☑ Yes	☐ No		1. Were custody seals present on the cooler?
☑ Yes	☐ No	☐ NA	2. If custody seals were present, were they intact and unbroken?

pH Strip ID: NA Chlorine Strip ID: NA Tested by: NA

Original temperature upon receipt / Derived (Corrected) temperature upon receipt: %Solid Snap-Cup ID: NA

2.1 / 2.1 °C NA / NA °C NA / NA °C NA / NA °C

Method: ☑ Temperature Blank ☐ Against Bottles IR Gun ID: 8 IR Gun Correction Factor: 0 °C

Method of coolant: ☑ Wet Ice ☐ Ice Packs ☐ Dry Ice ☐ None

☑ Yes	☐ No	☐ NA	3. Were all coolers received at or below 6.0°C? If no, was Project Manager notified? PM was Notified by: phone / email / face-to-face (circle one).
☑ Yes	☐ No	☐ NA	4. Is the commercial courier's packing slip attached to this form?
☑ Yes	☐ No		5. Were proper custody procedures (relinquished/received) followed?
☑ Yes	☐ No		6. Were sample IDs listed on the COC and all sample containers?
☑ Yes	☐ No		7. Was collection date & time listed on the COC and all sample containers?
☑ Yes	☐ No		8. Did all container label information (ID, date, time) agree with the COC?
☑ Yes	☐ No		9. Were tests to be performed listed on the COC?
☑ Yes	☐ No		10. Did all samples arrive in the proper containers for each test and/or in good condition (unbroken, lids on, etc.)?
☑ Yes	☐ No		11. Was adequate sample volume available?
☑ Yes	☐ No		12. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
☑ Yes	☐ No		13. Were all samples containers accounted for? (No missing/excess)
☐ Yes	☑ No	☐ NA	14. Were VOA, 8015C and RSK-175 samples free of bubbles >"pea-size" (¼"or 6mm in diameter) in any of the VOA vials?
☐ Yes	☐ No	☑ NA	15. Were all DRO/metals/nutrient samples received at a pH of < 2?
☐ Yes	☐ No	☑ NA	16. Were all cyanide samples received at a pH > 12 and sulfide samples received at a pH > 9?
☐ Yes	☐ No	☑ NA	17. Were all applicable NH_3/TKN/cyanide/phenol/625.1/608.3 (< 0.5mg/L) samples free of residual chlorine?
☑ Yes	☐ No	☐ NA	18. Was the quote number listed on the container label? If yes. Quote # 24792

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) NA were received incorrectly preserved and were adjusted accordingly in sample receiving with NA mL of circle one: H_2SO_4, HNO_3, HCl, NaOH using SR # NA. ☐
Time of preservation NA. If more than one preservative is needed, please note in the comments below.

Sample(s) 001(2) were received with bubbles >6 mm in diameter.

Samples(s) NA were received with TRC > 0.5 mg/L (If #19 is *no*) and were adjusted accordingly in sample receiving with sodium thiosulfate ($Na_2S_2O_3$) with Unique ID: NA.

Case Narrative
Tetra Tech
Lot Number: XJ29007

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report. Where sampling is conducted by the client, results relate to the accuracy of the information provided, and as the samples are received.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved The NELAC Institute (TNI) standards, the Pace Analytical Services, LLC ("Pace") Laboratory Quality Manual, standard operating procedures (SOPs), and Pace policies. Additionally, the DoD QSM version 5.4 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the TNI standards, the Laboratory Quality Manual, SOPs, the DoD QSM, or policies are qualified on the results page or discussed below.

Pace is a DoD/DOE accredited laboratory; however, the following analyses are currently not listed on our DoD/DOE scope of accreditation: Drinking Water: pH EPA 150.1, Turbidity EPA 18.01, Metals EPA 200.7 & 200.8, Mercury EPA 245.1, Anions EPA 300.0, Cyanide EPA 335.4, Nitrates EPA 353.2, Orthophosphate & Phosphorus EPA 365.1, EDB/DBCP EPA 504.1, HPC SIMPLATE, Color SM 2120 B-2011, Alkalinity SM 2320 B-2011, Specific Conductance SM 2510 B-2011, Residue-filterable (TDS) SM 2540 C, Calcium Hardness (CaCO2) SM 3500-Ca B-2011, TRC SM 4500 Cl G-2011, pH SM 4500 H=B-2011, E.Coli, Total Coliform; Non-Potable Water: Metals EPA 200.7, Strontium EPA 200.8, Chlorate EPA 300.0, Cyanide EPA 335.4, Phenolics EPA 420.4, 2-Methyl-4,6-Dinitrophenol EPA 625.1, Propane RSK-175, Specific Conductance SM 2510 B-2011, Salinity SM250 B, Residue- total SM 2540 B, Sulfite SM 4500 SO32- B-2011, Amenable Cyanide SM 4500-CN- G-2011, BOD & CBOD SM 5210 B, MBAS SM 5540 C-2011; Solid and Chemical Materials: Boron & Titanium SW-846 6010D, Boron, Molybdenum, & Titanium SW-846 6020B, Alcohols & Glycols SW-846 8015C, Pentachlorophenol SW-846 8151A, Ethyl Acetate, Hexane, & n-Hexane SW-846 8260D, SVOC 1,4-Dioxane, 3&4-Methylphenols, 4-Dimethyl aminoazobenzene, 1,4-Naphthoquinone, 3,5-Dinitroaniline, PETN SW-846 8270E, Amenable Cyanide SW-846 9012B; Boron & Titanium SW-846 6010D, Molybdenum SW-846 6020B, Ethylene Glycol SW-846 8015B, Pentachlorophenol SW-846 8151A, Chloroprene SW-846 8260B, SVOC 1,3,5-Trinitrobenzene, 1,4-Dioxane, 1,4-Naphthoquinone, 1,4-Phenylenediamine, 2,5-Dinitrotoluene, 2,6-Dinitrotoluene, 3-Methylcholanthrene, 4- Aminobiphenyl, 4-Dimethyl aminoazobenzene, 4-Nitroquinoline-1-oxide, 7,12- Dimethylbenzo(a)anthracene, Chlorobenzilate, Diallate, Ethyl methanesulfonate, Isodrin, Isosafrole, Methyl methanesulfonate, n-Nitrosomethylethylamine, n-Nitrosomorpholine, n-Nitrosopiperidine, Piperonyl butoxide, Pronamide, Safrole, 3,5-Dinitroaniline, PETN SW-846 8270E, Oil & Grease SW-846 9071B.

Pace is a TNI accredited laboratory; however, the following analyses are currently not listed on our TNI scope of accreditation: Drinking Water: VOC (excluding BTEX, MTBE, Naphthalene, & 1,2-dichloroethane) EPA 524.2, E. coli and Total coliforms SM 9223 B-2004, Solid Chemical Material: TOC Walkley-Black, Biological Tissue: All, Non-Potable Water: SGT-HEM EPA 1664B, Silica EPA 200.7, Boron, Calcium, Silicon, Strontium EPA 200.8, Bicarbonate, Carbonate, and Hydroxide Alkalinity SM 2320 B-2011, SM 9221 C E-2006 & SM 9222D-2006, Strontium SW-846 6010D, VOC SM 6200 B-2011, Fecal Coliform Colilert-18.

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

VOCs

The initial calibration verification (ICV) associated with samples XJ29007-001 and XJ29007-002 exceeded control criteria for 112-trichloro-122-trifluoroethane (129%).

Manual Integration Summary

Tetra Tech

Lot Number: XJ29007

Project Name: CRCA

Project Number: 112G09581

Where applicable, analytes for which manual integration occurred have been flagged with the following:

Qualifier	Technical Justification	Qualifier	Technical Justification	Qualifier	Technical Justification
M-01	Split peak	M-07	Low fit	M-13	Error
M-02	Peak tailing	M-08	Peak not found	M-14	Baseline
M-03	Incorrect auto integration	M-09	Analyte not Identified by the Data System	M-15	Other
M-04	Poor chromatography	M-10	Analyte misidentified by the Data System	M-16	Retention time shift
M-05	Manually assigned peak	M-11	Invalid integration	M-17	Shouldering
M-06	Wrong isomer	M-12	Wrong peak		

A summary of instances where manual integration occurred is included below:

Method	Sample	Run Number	Parameter	Qualifier
PFAS by ID SOP	XJ29007-001	1	Perfluorohexanesulfonic acid (PFHxS)	M-03
PFAS by ID SOP	XJ29007-001	2	13C6_PFDA	M-03
PFAS by ID SOP	XJ29007-002	1	Perfluorohexanesulfonic acid (PFHxS)	M-03
8260D	XQ59671-002	1	Methyl acetate	M-03
PFAS by ID SOP	XQ59479-002	1	N-ethylperfluoro-1-	M-03
PFAS by ID SOP	XQ59479-002	1	N-methylperfluoro-1-	M-03
PFAS by ID SOP	XQ59479-002	1	Perfluorooctanesulfonic acid (PFOS)	M-03

If you have any questions regarding this report, please contact the Pace Project Manager listed on the cover page.

LOQ = Limit of Quantitation
U = Not detected at or above the LOD
Q = Out of holding time
V = Detected in the method blank
N = Recovery is out of criteria
W = Reported on wet weight basis
E = Quantitation of compound exceeded the calibration range
P = The RPD between two GC columns exceeds 40%
LOD = Limit of Detection
DL = Detection Limit
I = Estimated result < LOQ and ≥ DL
D = Dilution > 1
Q = Surrogate failure
L = LCS/LCSD failure
S = MS/MSD failure

Effective Date: 8/2/2022

Sample Receipt Checklist (SRC)

Client: Tetra Tech Cooler Inspected by/date: KNR / 10/29/2022 Lot #: XJ29007

Means of receipt: ☐ Pace ☐ Client ☐ UPS ☑ FedEx ☐ Other: ____

☑ Yes	☐ No		1. Were custody seals present on the cooler?
☑ Yes	☐ No	☐ NA	2. If custody seals were present, were they intact and unbroken?

pH Strip ID: NA Chlorine Strip ID: NA Tested by: NA

Original temperature upon receipt / Derived (Corrected) temperature upon receipt %Solid Snap-Cup ID: NA

2.1 / 2.1 °C NA / NA °C NA / NA °C NA / NA °C

Method: ☑ Temperature Blank ☐ Against Bottles IR Gun ID: 8 IR Gun Correction Factor: 0 °C

Method of coolant: ☑ Wet Ice ☐ Ice Packs ☐ Dry Ice ☐ None

☑ Yes	☐ No	☐ NA	3. Were all coolers received at or below 6.0°C? If no, was Project Manager notified? PM was Notified by: phone / email / face-to-face (circle one).
☑ Yes	☐ No	☐ NA	4. Is the commercial courier's packing slip attached to this form?
☑ Yes	☐ No		5. Were proper custody procedures (relinquished/received) followed?
☑ Yes	☐ No		6. Were sample IDs listed on the COC and all sample containers?
☑ Yes	☐ No		7. Was collection date & time listed on the COC and all sample containers?
☑ Yes	☐ No		8. Did all container label information (ID, date, time) agree with the COC?
☑ Yes	☐ No		9. Were tests to be performed listed on the COC?
☑ Yes	☐ No		10. Did all samples arrive in the proper containers for each test and/or in good condition (unbroken, lids on, etc.)? ____
☑ Yes	☐ No		11. Was adequate sample volume available?
☑ Yes	☐ No		12. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
☑ Yes	☐ No		13. Were all samples containers accounted for? (No missing/excess)
☐ Yes	☑ No	☐ NA	14. Were VOA, 8015C and RSK-175 samples free of bubbles >"pea-size" (¼"or 6mm in diameter) in any of the VOA vials?
☐ Yes	☐ No	☑ NA	15. Were all DRO/metals/nutrient samples received at a pH of < 2?
☐ Yes	☐ No	☑ NA	16. Were all cyanide samples received at a pH > 12 and sulfide samples received at a pH > 9?
☐ Yes	☐ No	☑ NA	17. Were all applicable NH_3/TKN/cyanide/phenol/625.1/608.3 (< 0.5mg/l) samples free of residual chlorine?
☑ Yes	☐ No	☐ NA	18. Was the quote number listed on the container label? If yes, Quote # 24792

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) NA were received incorrectly preserved and were adjusted accordingly in sample receiving with NA mL of circle one: H_2SO_4, HNO_3, HCl, NaOH using SR # NA. ☐
Time of preservation NA. If more than one preservative is needed, please note in the comments below.

Sample(s) 001(2) 002(2) were received with bubbles >6 mm in diameter.

Samples(s) NA were received with TRC > 0.5 mg/L (If #19 is *no*) and were adjusted accordingly in sample receiving with sodium thiosulfate ($Na_2S_2O_3$) with Unique ID: NA.

1550 KK arrive at MW32, carry in equip + supplies, clear path
1620 Start purge
1730 End purge
1735 Sample collected, CRCA-MW0032-058.0-20211007
1740 Ice sample, 4°C cooler
1745 Decon equip
1800 Pack DHC/VC reductase for shipping RS CS onsite
1805 CS offsite w/ DHC/VC reductase samples
1815 Depart CRCA for ice
1830 Depart ice for POL
1845 Arrive at POL, equip storage + Decon.
1910 Offsite POL
1940 Office

LAMOTTE TURBIDITY METER CALIBRATION LOG

Calibration Report

Instrument	Aqua TROLL 600 Vented
Serial Number	840822
Created	7/21/2022

[redacted]

Serial Number	742651
Last Calibrated	7/21/2022

Calibration Details

Calibration Point 1

pH of Buffer	4.01 pH
pH mV	154.0 mV
Temperature	28.70 °C

Pre Measurement

pH	4.04 pH
pH mV	154.0 mV

Post Measurement

pH	4.01 pH
pH mV	155.9 mV

Calibration Point 2

pH of Buffer	6.99 pH
pH mV	-9.4 mV
Temperature	28.54 °C

Pre Measurement

pH	6.94 pH
pH mV	-9.4 mV

Post Measurement

pH	6.99 pH
pH mV	-9.5 mV

Calibration Point 3

pH of Buffer	9.95 pH
pH mV	-159.8 mV
Temperature	28.60 °C

Pre Measurement

pH	9.87 pH
pH mV	-159.8 mV

Post Measurement

pH	9.95 pH
pH mV	-161.8 mV

Slope and Offset 1

Slope	-54.83 mV/pH
Offset	-9.9 mV

Slope and Offset 2

Slope	-50.83 mV/pH
Offset	-9.9 mV

ORP

ORP Solution	ORP Standard
Offset	20.0 mV
Temperature	28.64 °C
Pre Measurement	224.9 mV
Post Measurement	223.0 mV

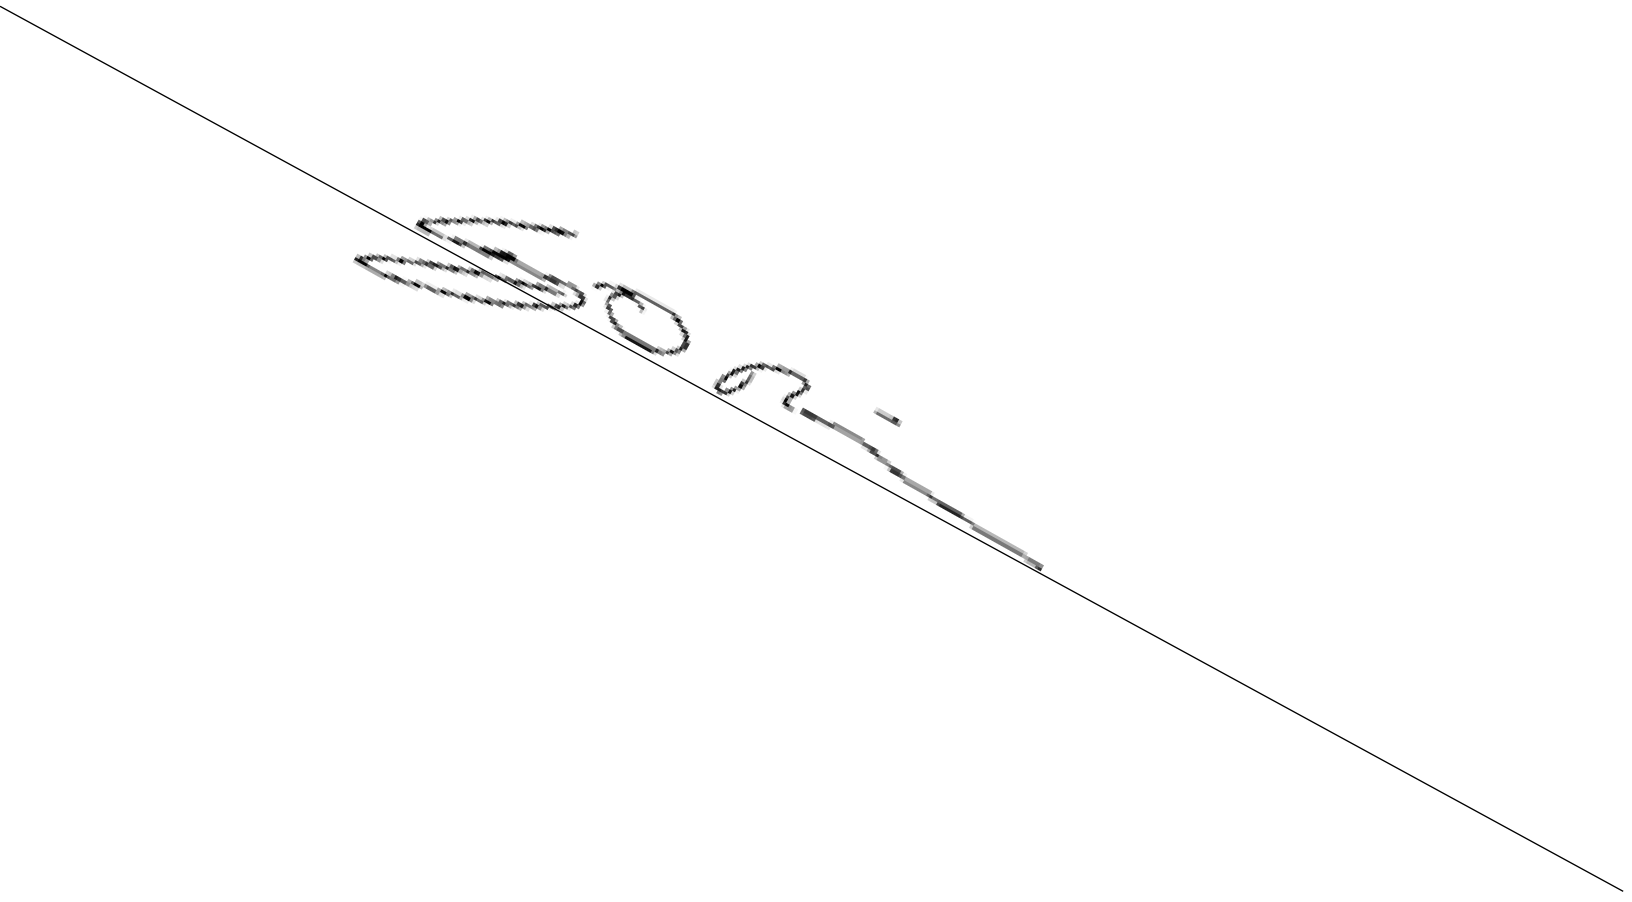
Date:10-24-2022
Weather: sunny
Health and Safety Topics: Tour of site, working around the buildings, chemical hazards near site

Personnel: Cory O'Brien
PPE: level D
Objective: tour of site, collect GW levels

0715	Arrive at site
0830	Chuck arrives at the site to drop off supplies
0850	Chuck leaves site; Cory leaves the site to pick up the equipment at POL
0905	Cory arrives at POL and collects the YSI water quality meter, GEO pump Peristaltic pump, and LaMotte 2020 WE Turbidity meter. Cory then leaves POL to return to CRCA.
0920	Cory arrives at CRCA and starts to open all wells for synoptic gauging
1020	Cory finished opening all of the monitoring wells. (MW 0032 was inaccessible due to vegetation and standing water).
1040	Start water level measurements
1115	Cory drives to POL for a wire to remove tubing from wells
1135	Cory returns from POL with wire to remove dedicated tubing with
1435	Tubing is stuck in monitoring well MW0025. Cory drives to POL to get a different water level indicator that can fit past the tubing
1450	Cory returns to CRCA with the water level indicator and obtains water level from MW0025
1510	Cory packs up equipment and heads off-site for the day



Date: 10/25/2022

Weather: Sunny

Personnel: Cory O'Brien

Health and Safety: Working along, review HASP and Note Marshaling locations at site

PPE: Level D (PFAS compliant)

Objective: Groundwater sampling for PFAS

Equipment: YSI Pro quatro, Lamotte 2020, Geopump II

0730: arrive at the site and start to calibrate equipment issues with calibration solutions; drive to the POL site to find additional calibration solutions

0900: arrive at CRCA and finish calibration. After calibration set up on MW0010 and start groundwater purge. Teflon tubing in the monitoring well was removed and replaced with HDPE

Initial water level: 3.49

Well diameter: 1 inch

1 well volume: 1.72 liters

Sample ID: CRCA-MW0010-010.0-20221025

Sample Time: 0955

Analysis: PFAS

1040: set up on MW0024 HDEP tubing in well.

Initial water level: 3.11

Well diameter: 1 inch

1 well volume: 4.75 liters

Sample ID: CRCA-MW0024-058.0-20221025

Sample time: 1120

Analysis: PFAS

1129: set up on MW0017 Teflon tubing in the monitoring well was removed and replaced with HDPE

Initial water level: 3.17

Well diameter: 1 inch

1 well volume: 4.0 liters

Sample ID: CRCA-MW0017-027.5-20221025

Sample time: 1207

Analysis: PFAS

1140: Dan Forester arrives to show Cory the location of a path to get to monitoring well MW0032

1150: Dan leaves to work on the CRCA air stripper system.

1215: set up on MW0016 Teflon tubing in the monitoring well was removed and replaced with HDPE

Initial water level: 3.10

Well diameter: 1 inch

1 well volume: 1.03 liters

Sample ID: CRCA-MW0016-007.5-20221025

Sample time: 1240

Analysis: PFAS

1310: Set up on MW0005 Teflon tubing in the monitoring well was removed and replaced with HDPE

Initial water level: 3.62

Well diameter: 1 inch

1 well volume: 1.70 liters

Sample ID: CRCA-MW0005-010.0-20221025/ CRCA-FD-20221025-01

Sample time:1330

Analysis: PFAS

1345: Dump purge water into IDW container at the CRCA trailer

1400: Arrive at MW0014 no Teflon tubing in the monitoring well

Initial water level:3.85

Well diameter:1

1 well volume: 0.92 liters

Sample ID: CRCA-MW0014-007.5-20221025

Sample time: 1430

Analysis: PFAS

1445: Arrive MW0015, Teflon tubing located in well, tubing removed, will remove 1 well volume

Initial water level: 3.89

Well diameter: 1 inch

1 well volume: 3.91 liters

Sample ID: CRCA-MW0015-027.5-20221025

Sample time: 1505

Analysis: PFAS

1515: MW0025, HDEP tubing in well

Initial water level 3.98

Well diameter: 1 inch

1 well volume: 8.8 liters

Sample ID: CRCA-MW0025-058.0-20221025 / CRCA-FD-20221025-02

Sample time:1535

Analysis: PFAS

1550: Arrive at MW0007 Teflon tubing in the monitoring well was removed and replaced with HDPE

Initial water level: 3.39

Well diameter: 1 inch

1WELL volume: 1.75 liters

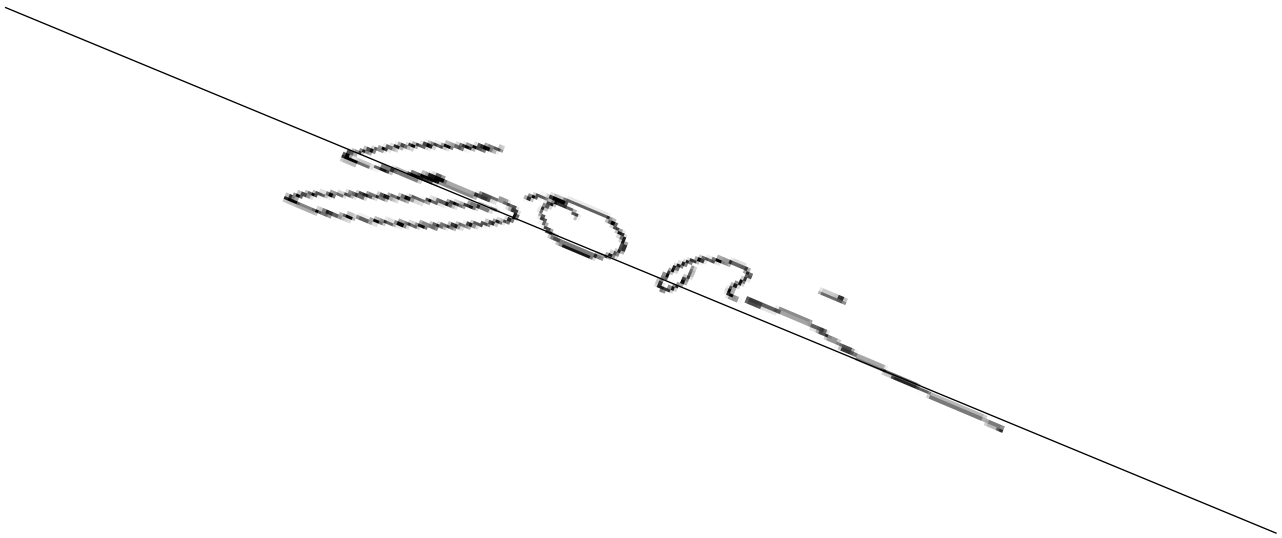
Sample ID: CRCA-MW0007-0007.5-20221025

Sample time: 1612

Analysis: PFAS

1625: Collect Field Blank CRCA-FB-20221025

1630: Cory leaves the site



Date: 10/26/2022

Weather: Sunny

Personnel: Cory O'Brien

Health and Safety: Working alone, Working near roadway, Biological hazards

Objective: Groundwater sampling

Equipment: YSI Pro Quattro, Lamotte 2020, Geopump II

0730: Arrive at CRCA, review Health and safety topics and calibrate equipment

0900: set up on MW0006, Teflon tubing in the monitoring well was removed and replaced with HDPE.

Initial water level:3.42

Well diameter: 1inch

1 Well volume: 1.73 liters

Sample ID: CRCA-MW0006-010.0-20221026

Sample time:0925

Analysis: PFAS

0950: set up on MW0003

Initial water level: 3.99

Well diameter: 1 inch

1 Well volume: 1.65 liters

Sample ID: CRCA-MW0003-010.0-20221026

Sample time: 1015

Analysis: PFAS

1025: set up on MW0018

Initial water level: 4.01

Well diameter: 1 inch

1 Well volume: 8.84 liters

Sample ID:CRCA-MW0018-058.0-20221026

Sample time:1050

Analysis: PFAS/ VOC 8260

1130: set up on MW0013, Teflon tubing was removed from the well and replaced with HDPE

Initial water level: 4.58

Well diameter: 1 inch

1 well volume: 3.8 liters

Sample ID:CRCA-MW0013-027.5-20221026

Sample time:1155

Analysis: PFAS

1215: set up on MW0011, Teflon tubing was removed from the well and replaced with HDPE

Initial water level: 3.95

Well diameter: 1 inch

1 well volume: 0.9 liters

Sample ID: CRCA-MW0011-007.5-20221026

Sample time:1240

Analysis: PFAS

1250: set up on MW0012, Teflon tubing remove from the well and replaced with HDPE

Initial water level: 3.94

Well diameter: 1 inch

1 well volume: 3.9 liters

Sample ID: CRCA-MW0012-027.5-20221026 / CRCA-FD-20221026-03

Sample time: 1320

Analysis: PFAS

1340: move to the trailer to dump IDW into the system

1355: set up at MW0022

Initial water level:3.29

Well diameter: 1 inch

1 well volume: 5.5 liters

Sample ID: CRCA-MW0022-035.0-20221026

Sample time: 1425

Analysis: PFAS

1415: set up at MW0023

Initial water level: 3.35

Well diameter: 1 inch

Well volume:8.94 liters

Sample ID: CRCA-MW002-058.0-20221026

Sample time: 1503

Analysis: PFAS

1515: arrive at MW0004, no tubing in well

Initial water level: 3.01

Well diameter: 1 inch

Well volume: 1.79

Sample ID: CRCA-MW0004-010.0-20221026

Sample time: 1540

Analysis: PFAS

1535: Arrive at MW0009, Teflon touring in well is removed and replaced with HDPE, well cap broke when removing, replace with new cap.

Initial water level: 3.60

Well diameter 1 inch

Well volume 1.71 liters

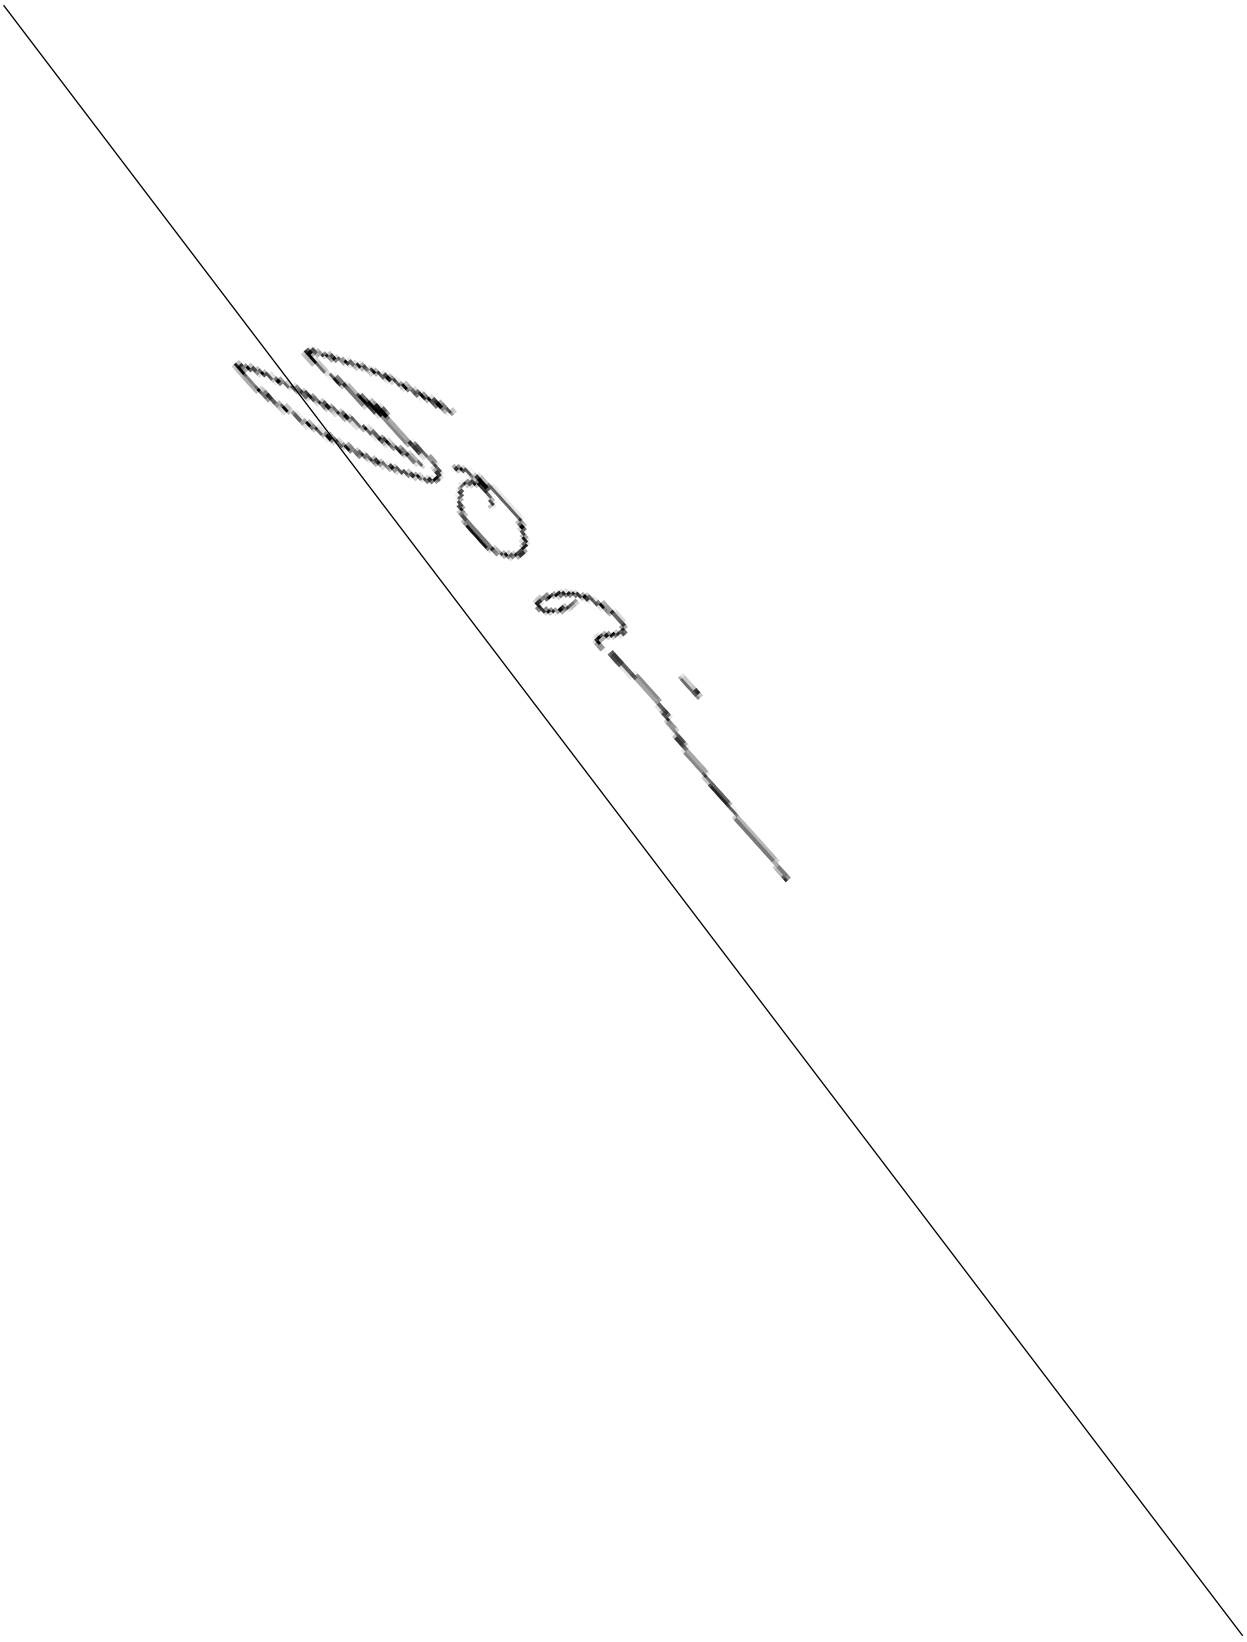
Sample ID: CRCA-MW0009-010.0-20221026

Sample time: 1606

Analysis: PFAS

1630: Collect field blank CRCA-FB-20221026

Cory leaves site



Date: 10/27/2022

Personnel: Cory O'Brien, Chuck Sorden

Weather: Sunny/ Temp 77 F / Barometric Pressure 760mmHg

Health and Safety: Biologicals

PPE: Level D (SA 1.8 compliant)

Objective: Collect Air samples and groundwater samples

Equipment: YSI, Lamotte 2020, Geopump II

0730: Arrive on site and calibrate equipment

0830: set up summa canisters for 8 hour ambient air samples.

0910: Set up CRCA-AMB01-20221027 and start sample

Cannister: 9205

Flow controller: 007416

Initial pressure >30

0920: Have difficulty with canister and regulator not fitting properly for AMB02. Call Chuck Sorden (Tetra Tech) Chuck arrives at the site and assists in fixing the canister

0940: Set up CRCA-AMB02-20221027

Canister:

Flow Controller:

Initial pressure: 23

1016: Set up CRCA-VMP01-20221027 for 1 hour air sample

Canister: 10544

Flow Controller: 012348

Initial pressure: >30

1020: Set up CRCA-VMP02-20221027 for 1 hour air sample

Canister: 012499

Flow Controller: 09882

Initial pressure: >30

1025: Set up CRCA-VMP03-20221027 for 1 hour air sample

Canister: 005017

Flow Controller: 006709

Initial pressure: >30

1030: Set up CRCA-VMP04-20221027 for 1 hour air sample

Canister: 021397

Flow Controller: 008402

Initial pressure: >30

1116: Shut off summa canister at CRCA-VMP01-20221027

Final pressure: 09

1120: Shut off summa canister at CRCA-VMP02-20221027

Final pressure:01

1125: Shut off summa canister at CRCA-VMP03-20221027

Final pressure:09

1130: Shut off summa canister at CRCA-VMP04-20221027

Final pressure:02

1145: Chris Adkison arrives at the site

1225: Collect equipment blank CRCA-EB-20221027 from the water level indicator using laboratory-provided PFAS free water.

1235: Set up on MW0002

Initial water level: 3.09

Well diameter: 1 inch

Well volume: 4.78

Sample ID: CRCA-MW0002-035.0-20221027

Sample Time: 1250

1251: set up on MW0001

Initial water level: 3.05

Well diameter: 1 inch

Well volume: 1.79

Sample ID: CRCA-MW0001-010.0-20221027

Sample time:1305

Analysis: PFAS

1325: Check the pressure on the summa canister at AMB02; canister is almost out of pressure. Close canister.

Final pressure: 1

1326: Call Alex Murphy (Project Manager) and explain that the 8 hour sample is out of pressure and asked if the sample should be recollected with a new summa canister. Alex states that he will call the NASA RPM and explain the situation.

1335: Set up on MW0008, Teflon tubing in well was removed and replaced with HDPE

Initial water level: 4.18

Well diameter: 1 inch

Well volume: 1.62 L

Sample ID: CRCA-MW0008-010.0-20221027

Sample Time: 1355

Analysis: PFAS

1430: Set up on MW0031

Initial water level: 4.15

Well diameter: 1 inch

Well volume: 8.82 L

Sample ID: CRCA-MW0031-058.0-20221027

Sample Time: 1440

Analysis: PFAS/ VOC 8260

1500: SGS calls to say they are at the badging office for sample pick up.

Field blank CRCA-FB-20221027 collected

Cory departs for badging office

1515: Cory transfers samples under Chain of Custody to SGS personnel

1548: Set up on MW0028

Initial water level: 1.71

Well diameter: 1 inch

Well volume: 9.19 L

Sample ID: CRCA-MW0028-058.0-20221027

Sample Time: 1605

Analysis: PFAS

1610: Set up on MW0027

Initial water level: 1.64

Well diameter: 1 inch

Well volume: 5.75 L

Sample ID: CRCA-MW0027-035.0-20221027

Sample Time: 1625

Analysis: PFAS

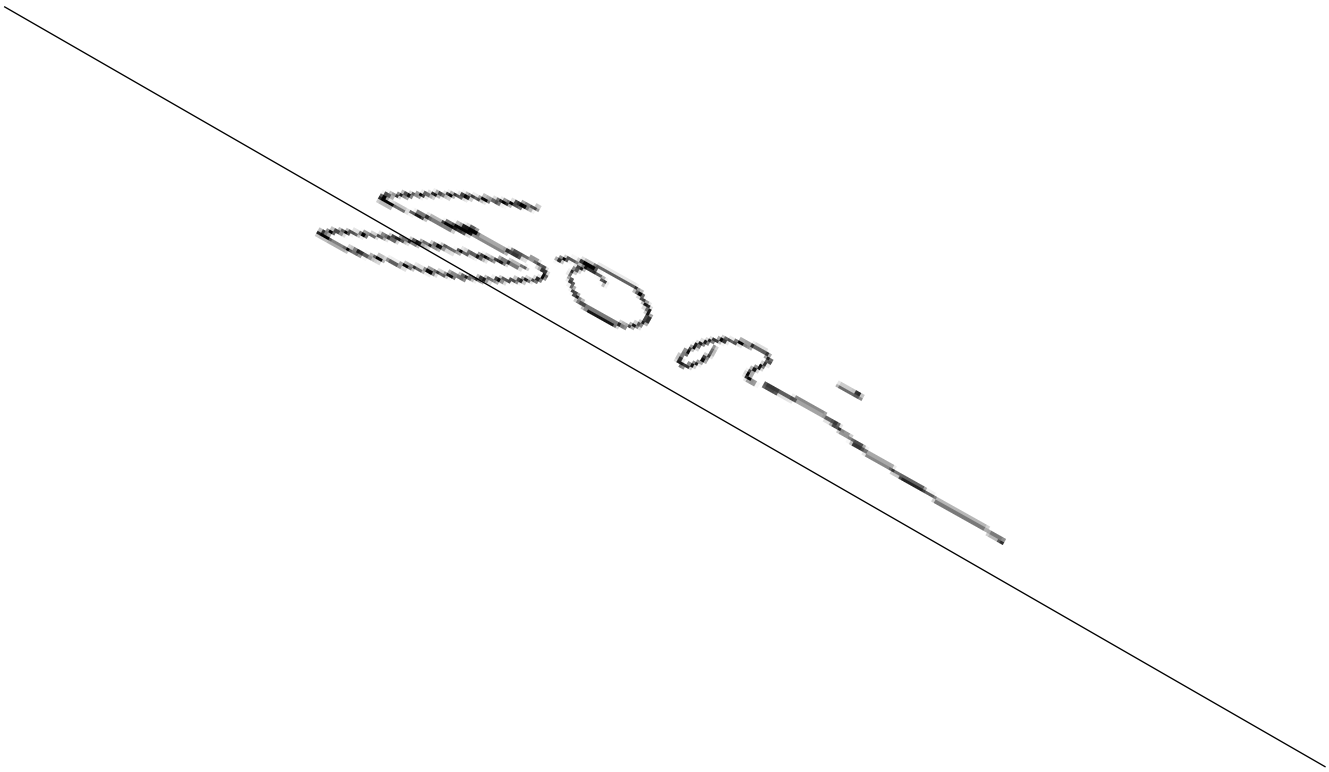
1710: close summa canister at AMB01

Pressure 03

1720: leave the site to go to FedEx and ship summa canisters

1745: summa canisters shipped via FedEx overnight to Pace Laboratories

Tracking # 604055279236 / 604055279225



Date: 10/28/2022

Personnel: Cory O'Brien

Weather: Sunny

Health and Saftey: working near road, water hazards

PPE: Level D (SA 1.8 compliant)

Objective: Groundwater sampling

Equipment: YSI, Geo pump 2, Lamotte 2020, in-situ

0720: arrive on site, review health and safety, calibrate equipment

0800: set up on MW0026

Initial water level: 1.75

Well diameter: 1 inch

Well volume: 1.98 L

Sample ID: CRCA-MW0026-010.0-20221028

Sample Time: 0830

Analysis: PFAS

0840: set up on MW0030

Initial water level:2.25

Well diameter: 1 inch

Well volume: 9.1L

Sample ID: CRCA-MW0030-058.0-20221028 / CRCA-FD-20221028-04

Sample time:0915

Analysis: PFAS

0922: set up on MW0029

Initial water level:

Well diameter: 1 inch

Well volume: 8.77 L

Sample ID: CRCA-MW0029-035.0-20221028

Sample Time: 0940

0950: Set up on MW0020, Teflon tubing in the well was removed and replaced with HDPE tubing

Initial water level: 4.50

Welll diameter: 1 inch

Well volume: 8.77 L

Sample ID: CRCA-MW0020-058.0-20221028

Sample Time: 1025

1040: Set up on MW0021

Initial water level: 4.61

Well diameter: 1 inch

Well volume: 5.37 L

Sample ID: CRCA-MW0021-035.0-20221028

Sample time: 1116

1130: move to system trailer and dump IDW into system. Set up cart to sample inside well.

1200: leave site for EOR training

1300: return to site from EOR training

1337: MW0019

Initial water level: 4.39

Well diameter: 1 inch

Well volume: 8.79 L

Sample ID: CRCA-MW0019-058.0-20221028

Sample Time: 1355

Analysis: PFAS/ VOC 8260

1440: MW0032

Initial water level: 2.50

Well diameter: 1 inch

Well Volume: 9 L

Sample ID: CRCA-MW0032-058.0-20221028

Sample Time: 1455

Analysis: PFAS/ VOC 8260
