Space Mining is Coming:
Implications for Space Exploration and Terrestrial Mining

Keynote to World Mining Congress
New Mining Frontiers

June 27, 2023
Why We Explore Space

- Why Explore: It’s What Humans Do!
- National Pride, International Prestige
- Scientific Advancement, New Insights
- Encourage International Cooperation, Global Partnerships
- Security, Long-term Survival of the Human Species
- Stimulate Economic Development & Expansion
- Make Life Better on Earth
Why We Explore Space

- Why Explore: It’s What Humans Do!
- National Pride, International Prestige
- Scientific Advancement, New Insights
- Encourage International Cooperation, Global Partnerships
- Security, Long-term Survival of the Human Species
- Stimulate Economic Development & Expansion
- Make Life Better on Earth

These drive technology and science and human mission decisions within NASA.

These drive national strategy and public interest.

These are now extra drivers for NASA technology and mission decisions.
ARTEMIS: Humanity’s Next Giant Leap

“The United States will lead an innovative and sustainable program of exploration with commercial and international partners to enable human expansion across the solar system and to bring back to Earth new knowledge and opportunities. Beginning with missions beyond low-Earth orbit, the United States will lead the return of humans to the Moon for long-term exploration and utilization, followed by human missions to Mars and other destinations.”

Moon to Mars
- Returning Americans to the Moon: 1st Woman & 1st Person of Color By 2025
- Learning to live and work on the Moon
- Translating lessons learned so that the United States has capabilities and operational experience for a mission to Mars
- Inspires the next generation of explorers, researchers, scientists, and engineers worldwide
**Artemis Architecture Segments**

**HUMAN LUNAR RETURN**
Initial capabilities, systems, and operations necessary to reestablish human presence and initial utilization (e.g., science) on and around the Moon.

**FOUNDATIONAL EXPLORATION**
Expansion of lunar capabilities, systems, and operations supporting complex orbital and surface missions to conduct utilization (e.g., science) and Mars-forward precursor missions.

**SUSTAINED LUNAR EVOLUTION**
Enabling capabilities, systems, and operations to support regional and global utilization (e.g., science), economic opportunity, and a steady cadence of human presence on and around the Moon.

**HUMANS TO MARS**
Initial capabilities, systems, and operations necessary to establish human presence and initial utilization (e.g., science) on Mars and continued exploration.
NASA Lunar Robotic Program: Commercial Lunar Payload Services (CLPS)

CLPS is an innovative, service-based, competitive acquisition approach that enables rapid, affordable, and frequent access to the Lunar surface via a growing market of American commercial providers.

Delivery Site: Gruithuisen Domes
Provider: TBD
CP-21 | 2026

Delivery Site: Reiner Gamma
Provider: IM
CP-11 | 2024

Delivery Site: South Pole Region
Provider: Intuitive Machines (IM)
TO2-IM | Q1 2023

Delivery Site: Shackleton Connecting Ridge
Provider: IM
TO PRIME-1 | Q3 2023

Delivery Site: NE Oceanus ProcCELLarum near Gruithuisen Domes
Provider: Astrobotic
TO2-AB | Q1 2023

Delivery Site: Mare Crisium
Provider: Firefly
TO19D | 2024

Delivery Site: Schrödinger Basin
Provider: Draper
CP-12 | 2025

Delivery Site: Haworth Crater
Provider: Masten
TO19C | Nov 2023

Delivery Site: South Polar Region
Provider: TBD
CP-22 | 2026

Updated 10/24/2022
NASA INFRASTRUCTURE GOAL: Develop exploration technologies and enable a vibrant space economy with supporting utilities and commodities

Scalable Space Mining production/utilization capabilities including sustainable commodities* on the lunar & Mars surface

<table>
<thead>
<tr>
<th>COMMERCIAL SCALE WATER, OXYGEN, METALS &amp; COMMODITY PRODUCTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Lunar resources mapped at meter scale for commercial mining</td>
</tr>
<tr>
<td>• 10’s of metric tons of commodities per year for initial goal commercial usage</td>
</tr>
<tr>
<td>• Scalable to 100’s to 1000’s metric tons per year</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>IN SITU DERIVED FEEDSTOCK FOR CONSTRUCTION, MANUFACTURING, &amp; ENERGY</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Initial goal of simple landing pads and protective structures</td>

<tr>
<td>• Crop production habitats and processing systems</td>
</tr>
<tr>
<td>• Consumables for life support, EVAs, and crew rovers/habitats for growing human space activities</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>COMMODITIES FOR COMMERCIAL REUSABLE IN-SPACE AND SURFACE TRANSPORTATION AND DEPOTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>• 30 to 60 metric tons per lander mission</td>
</tr>
<tr>
<td>• 100’s to 1000’s metric tons per year of for Cis-lunar Space</td>
</tr>
<tr>
<td>• 100’s metric tons per year for human Mars transportation</td>
</tr>
</tbody>
</table>

All activities depicted not currently funded or approved. Depicts “notional future” to guide technology vision.

*Commodities are items and consumables that can be eventually sold.
NASA Moon To Mars Objectives and Space Mining

Resource Assessment

Characterize accessible Lunar and Martian resources, gather scientific research data, and analyze potential reserves to satisfy science and technology objectives and enable In-Situ Resource Utilization (ISRU) on successive missions.

Infrastructure, Space Mining, and Usage

Demonstrate industrial scale ISRU capabilities in support of continuous human lunar presence and a robust lunar economy.

Demonstrate technologies supporting cislunar orbital/surface depots, construction and manufacturing maximizing the use of in-situ resources, and support systems needed for continuous human/robotic presence.

Responsible Space Mining

Establish procedures and systems that will minimize the disturbance to the local environment, maximize the resources available to future explorers, and allow for reuse/recycling of material transported from Earth (and from the lunar surface in the case of Mars) to be used during exploration.
Space Mining and Processing – ‘Prospect to Product’

Space Mining and Processing involves any hardware or operation that harnesses and utilizes ‘in-situ’ resources to create commodities* for robotic and human exploration and space commercialization.

Destination Reconnaissance & Resource Assessment
Assessment and mapping of physical, mineral, chemical, and water/volatile resources, terrain, geology, and environment.

Resource Acquisition, Isolation, & Preparation
Atmosphere constituent collection, and soil/material collection via drilling, excavation, transfer, and/or manipulation before Processing.

Resource Processing
Chemical, thermal, electrical, and or biological conversion of acquired resources and intermediate products into:
- Mission Consumables
- Feedstock for Construction & Manufacturing

Water/Volatile Extraction
A subset of both Resource Acquisition and Processing focused on water and other volatiles that exist in extraterrestrial soils.

- Space Mining does not exist on its own. It must link to users/customers of its products.

*Commodities are items and consumables that can be eventually sold.
Space Mining Must Operate as Part of A Larger Architecture

- Elements and interdependencies must be designed with Space Mining product usage in mind from the start to maximize benefits
  - Transition from Earth-supplied to ISRU-supplied
  - Guided by overarching Site Master Plan

Transportation to/from Site:
- Delivery (P)
- Propellants & Depots (S)

Power:
- Generation, Storage, & Distribution (P)
- ISRU-derived electrical /thermal (S)

Commodities Storage and Distribution:
- Water & Cryogenic Fluids (CFM)
- Manufacturing & Construction Feedstock

Coordinated Mining Ops:
Areas for:
- i) Excavation
- ii) Processing
- iii) Tailings
- iv) Product Storage

Maintenance & Repair
Logistics Management
- Replacement parts (P)
- Feedstock (S)

Living Quarters & Crew Support Services
- Water, $O_2$, $H_2$, Gases (S)
- Trash/waste (P)
- Nutrients (S)

Construction and Outfitting
- Feedstock for roads and structures (S)

P = Provided to ISRU
S = Supplied by ISRU
*italic* = Other Disciplines
Time and Spatial Evolution of Lunar Resources and Commodities for Commercial and Strategic Interests

- ISRU starts with the easiest resources to mine, requiring the minimum infrastructure, and providing immediate local usage.
- The initial focus is on the lunar South Pole region (highland regolith and water/volatiles in shadowed regions).
  - ISRU will evolve to other locations, more specific minerals, more refined products, and delivery to other destinations.

Commodities

- Oxygen
- Water
- Bulk & Refined Regolith
- Raw & Refined Metals (Al, Fe, Ti)
- Silicon and Ceramics
- Construction Feedstock
- Manufacturing Feedstock
- Fuels, Plastics, Hydrocarbons
- Food/Nutrient Feedstock
Major Areas of Common of Interest for Terrestrial and Space Mining and Processing

- Promote innovation and apply new/disruptive technologies in operations; AI/ML, robotics, automation, big data, etc.
- Increasing resource exploration assessment/mapping orbital and ground capabilities to reduce timeline
- Mining in extreme climates/environments
- Small footprint, minimal material movement, sustainable (and decarbonized) operations
- Stable, predictable, and agreed upon regulatory regime
- Government support and incentives to attract investment and maintain competitiveness
- Skilled, diverse, and inclusive workforce and personnel safety
Common Space and Terrestrial Driving Attributes

Technologies, Design, and Operations

Resource Assessment – Mapping – Valuation
1. High confidence in resource reserves

Infrastructure for Mining and Processing
2. Continuous renewable power at multiple and remote locations
3. High accuracy positioning, navigation, and timing (PNT) in non-GPS environment
4. Secure, distributed, high bandwidth communication network
5. Edge compute to optimize communications network.

Operations for Mining and Processing
6. High level of autonomy for all operations
7. Minimize on-site human/crew involvement, esp. high risk operations
8. On-site part manufacturing
9. Minimize logistics and ease maintenance
10. Electrification of all mechanisms and platforms
11. Data rich environment with real-time measurements
Common Space and Terrestrial Driving Attributes

Safety and Environmental Impact

Safety
12. Minimize time critical safety operations
13. Apply wearables to personnel in the operating environment

Environmental Impact
13. Minimize release/exposure of corrosive/hazardous reagents and fluids to crew/space suits and environment
14. Mitigate environment impacts on hardware/operations and vice versa
15. Continuously and distributed environmental monitoring
16. RemEDIATE sites at completion of operations
Space Mining Law and Legal Aspects to Consider

Overarching Legal Framework for Space Resources

- Art. I: “Outer space, including the Moon and other celestial bodies, shall be free for exploration and use by all States.”
- Art. II: “Outer space, including the Moon and other celestial bodies, is not subject to national appropriation.
- Art. IX: State parties “shall conduct all their activities in outer space . . . with due regard to the corresponding interests of all other States Parties to the Treaty.”

UN Framework on Space Resources

- **Overarching Legal Framework**
  - **Outer Space Treaty**
  - **UN Framework on Space Resources**
    - **Art. I:** Outer space, including the Moon and other celestial bodies, shall be free for exploration and use by all States.
    - **Art. II:** Outer space, including the Moon and other celestial bodies, is not subject to national appropriation.
    - **Art. IX:** State parties “shall conduct all their activities in outer space . . . with due regard to the corresponding interests of all other States Parties to the Treaty.”

Non-Binding Agreement on Conduct for Space Resources

- **Artemis Accords**
  - The ability to extract and utilize resources on the Moon, Mars, and asteroids will be critical to support safe and sustainable space exploration and development.
  - The Artemis Accords reinforce that space resource extraction and utilization can and will be conducted under the auspices of the Outer Space Treaty, with specific emphasis on Articles II, VI, and XI.

National Laws for Space Resources

- **US**
- **Luxembourg**
- **Japan**
- **UAE**

**Space Resources**

**International Space Resources Governance Working Group**

**The Hague**

**Building Blocks for the Development of an International Framework on Space Resource Activities**

November 2019
Emphasize Industry Involvement

Mining Economics and Mining Phases*

➢ Define Initial and Long-term Customer Needs and ISRU-derived Products
➢ Advance ISRU Technologies/Systems (thru solicitations, Public - Private Partnerships, Challenges)
➢ Focus NASA Work to Reduce Risk and Promote Investment (fundamental research, technology development, facilities, etc.)
➢ Promote Industry-led development thru End-to-End Production of Commodities

Exploration Phase
- Reserve Definition
- Mining and Recovering Technology Readiness

Development Phase: Feasibility study, contractual and legal aspects, and financing

Production
- Build-up Phase: Startup and initial production
- Plateau Phase: Production rate remains steady
- Decline Phase: Reserves begin to dwindle

Remediation
- Shutdown/removal of mining equipment
- Mine site reclamation

Government support in Exploration Phase may be key to lunar commercial success

* Sommariva, A. et al, ‘The Economics of Moon Mining', International Academy of Astronautics, Torino, Italy, June 17-19, 2019
Transition to Lunar Mining and Processing Circular Economies*

The Circular Economies needs to:
- Take into consideration not just the flow of the mining-processing products but the hardware and infrastructure associated with both the production and consumption side (ex. excavators and propulsive hoppers)
- Minimize disposal amounts
- Manage mining waste

*Circular Economy graphic inspired by fusing two graphics

- Afreen Siddiqi, Ph.D., "From Sustainable Development to Exploration: Concepts from Living on Earth for Forging Futures on Moon and Mars", Artemis and Ethics Workshop, NASA HQ, Washington D.C., April 12-14, 2023
The Space Perspective: a Long-range View

- Space Mining can reduce mission and architecture mass and costs
  - Allows us to use fewer launches to get supplies to our destination – propellant, consumables, construction materials, etc.
- Space Mining can increase safety for crew and enhance mission capabilities, allowing us to explore farther from Earth with more independence.
- Learning to use space resources can help us on Earth
- Planetary preservation is important in responsibly using space resources.

Thank You. Questions?

New ISRU Envisioned Future Priorities at:
https://techport.nasa.gov/framework
Backup
Space Resource Utilization Is Synergistic with Terrestrial Needs

- Improve water cleanup techniques
- Advance food/plant growth techniques and nutrient production
- Reduce or eliminate cement and asphalt – renewable materials
  - Alternative construction techniques – 3-D printing, no Portland cement
  - Remote operation and automation
- Increase safety
- Reduce maintenance and logistics
- Increase mining and processing efficiency
- Improve environmental compatibility
- More efficient power generation, storage and distribution
- Increase renewable energy: Use sun, thermal, trash, and alternative fuel production
- Reduction of Carbon Dioxide emissions

Promote *Reduction, Reuse, Recycle, Repair, Reclamation*

...for benefit of Earth, and living in Space.
What are the Barriers to Commercial ISRU?

Today: There is Neither a Production Capability or Market

### Barriers

**Resource Uncertainty**
- Resource Exploration
- Reserve Estimation

**Mining Technology Readiness**
- Demonstrated Scale
- Demonstrated Operations

**Customers**
- Known users/market
- Market growth potential

**Sustainable Operations**
- Reliable/Cheap Transportation
- Logistics and Maintenance
- Infrastructure

**Regulatory**
- Legal Framework
- Product/Property Rights
- Standards
- Taxes

### What Can/Should Be Done?

- Increase global resolution of resource information
- Campaign of resource exploration missions (Gov. & Industry)
- Agreement/standards for reserve estimation (ex JORC/NI43-101)

- Government/industry partnerships & space mining institute
- Spin-in/Spin-off Technologies into Terrestrial Applications
  - Incentives for insertion; greener/safer innovations

- Demonstrate technologies, production rate, and product quality

- Terrestrial market use of technology/capability
- Demonstrate product usage
- Develop space transportation & infrastructure growth around ISRU
- Gov. as anchor tenant once demand has been established
- Enable bootstrapping through stepwise incentives

- Utilize additive manufacturing for high wear parts
- Governments help establish initial transportation, power, communication, and surface infrastructure
- Establish common interfacing standards

- Establish international agreements (Artemis Accords)
- Establish stable legal and regulatory framework
- Establish tax incentives/flow-through shares
- Enable ownership enforcement
Dual Path that includes both Water Mining and Oxygen/Metal from Regolith
- Regolith Processing and O₂/Metal Path supports Surface Construction activities
- Ground development of multiple critical technologies in both pathways underway to maximize success and industry involvement
- Resource assessment missions to obtain critical data on mineral and water/volatile resources have started
  - Significant uncertainty if existing missions are sufficient to define resources for design and site selection

---

**Proposed missions and timeline are contingent on NASA appropriations, technology advancement, and industry participation, partnerships, and objectives**
# What are the Challenges? - ISRU Development & Implementation

## Space Resource Challenges

| R1 | What resources exist at the site of exploration that can be used? |
| R2 | What are the uncertainties associated with these resources? Form, amount, distribution, contaminants, terrain |
| R3 | How to address planetary protection requirements? Forward contamination/sterilization, operating in a special region |

## ISRU Technical Challenges

| T1 | Is it technically and economically feasible to collect, extract, and process the resource? Energy, Life, Performance |
| T2 | How to achieve high reliability and minimal maintenance requirements? Thermal cycles, mechanisms/pumps, sensors/calibration, wear |

## ISRU Operation Challenges

| O1 | How to operate in extreme environments? Temperature, pressure/vacuum, dust, radiation, grounding/plasma charging |
| O2 | How to operate in low gravity or micro-gravity environments? Drill/excavation force vs mass, soil/liquid motion, thermal convection/radiation |
| O3 | How to achieve long duration, autonomous operation and failure recovery? No crew, non-continuous monitoring, time delay |
| O4 | How to survive and operate after long duration dormancy or repeated start/stop cycles with lunar sun/shadow cycles? ‘Stall’ water, lubricants, thermal cycles |
| O5 | How to operate responsibly with minimal impact to science and the environment |

## ISRU Integration Challenges

| I1 | How are other systems designed to incorporate ISRU products? |
| I2 | How to optimize at the architectural level rather than the system level? |
| I3 | How to manage the physical interfaces and interactions between ISRU and other systems (esp. with International Partners and multiple companies)? |
| I4 | How to ensure critical exploration and infrastructure capabilities are delivered in the correct sequence and in a timely manner? |
| I5 | How to grow a commercial ecosystem of supply-demand? |

*Scale up, Long-duration, & Environmental testing with Realistic simulants Required*
