EXPLORE FLIGHT

WE'RE WITH YOU WHEN YOU FLY

Overview of Commercial High-Speed Market Studies and NASA's Hypersonic Technology Project

Mary Jo Long-Davis, Hypersonic Technology Project Manager
Invited Lecture to AIAA Northern Ohio Section

25 July 2023

Presentation Outline

Introduction to Aeronautics Research Mission Directorate (ARMD)

Independent High-Speed Commercial Vehicle Market Study Results

Next Steps in Developing NASA's High-Speed Commercial Strategy

Hypersonic Technology Project Overview

Summary

NASA Aeronautics – Vision for Aviation in the 21st Century

ARMD continues to evolve and execute the Aeronautics Strategy
<https://www.nasa.gov/aeroresearch/strategy>

6 Strategic Thrusts

-  Safe, Efficient Growth in Global Operations
-  Safe, Quiet, and Affordable Vertical Lift Air Vehicles
-  Innovation in Commercial Supersonic Aircraft
-  In-Time System-Wide Safety Assurance
-  Ultra-Efficient Subsonic Transports
-  Assured Autonomy for Aviation Transformation

U.S. leadership for a new era of flight

ULTRA-EFFICIENT TRANSPORT

Independent High-Speed Commercial Vehicle Market Study Results

Next Steps in Developing NASA's High-Speed Commercial Strategy

Hypersonic Technology Project Overview

Summary

What Are We Trying To Do?

Enable high-speed
commercial flight

To connect people and businesses faster

High-Speed Commercial Vehicle Workshops

4 Govt/Industry Workshops held 2020-2022

Jan 2020

February 2021- Virtual

June 2022

December 2022- Virtual

Industry Feedback On Opportunities/Needs:

- Independent market study
- Hypersonic ground and flight test capability
- Technology development through collaborative agreements
- Regulatory concerns
- International partnerships
- Data protection concerns (export control, classified, CUI, etc.)
- Integration into NAS

FY20/21 High-Speed Market Studies

- The overwhelming number one request that industry had for NASA from the first Commercial High-Speed Workshop was to conduct an independent market study to determine the viability of high-speed / hypersonic commercial travel.
- NASA subsequently funded two contracts, one to Deloitte/SpaceWorks and one to SAIC/Bryce, to study the market given three specific tasks:
 1. Define the market – how many people would be willing to travel and how much revenue could be generated?
 2. Define the business case – can an aircraft (Mach 2-5+) be fielded to serve this market and be able to generate enough profit to make it economically viable?
 3. What are the barriers preventing this market from becoming reality?
- **Deloitte and SAIC spent six months studying the problem; final reports are public**

SAIC/Bryce

- SAIC Report: <https://ntrs.nasa.gov/citations/20210015471>
- SAIC Presentation: <https://ntrs.nasa.gov/citations/20210015472>
- Deloitte Report: <https://ntrs.nasa.gov/citations/20210014711>
- Deloitte Presentation: <https://ntrs.nasa.gov/citations/20210014932>

Deloitte/SpaceWorks

Results– Commercial Markets Exists

Favorable High-Speed Market Characteristics

	SAIC (with Bryce Space and Technology)	Deloitte (with SpaceWorks and NIA)
Mach	3	2 to 4 ⁽¹⁾
Range	4,500 nmi	4,000 nmi to 4,500 nmi
Number of routes⁽²⁾	300	90
Aircraft Size (# PAX)	10 GA or 50 Commercial	20 to 50
Aircraft Cost	\$200M to \$300M	\$131M to \$228M ⁽³⁾

References:

- SAIC Final Report: <https://ntrs.nasa.gov/citations/20210015471>
- Deloitte Final Report: <https://ntrs.nasa.gov/citations/20210014711>

⁽¹⁾ Analysis showed profitable routes up to M5.25

⁽²⁾ Deloitte only considers over-water routes

⁽³⁾ Mach 3 at 4,500 nmi

Results– Market Demand

Deloitte Market Forecasts

PASSENGER

- Market appears strong with several stand-out routes to start.
- Identified a total addressable market of 90 transoceanic routes.
- Includes 2.25M annual passengers and a potential for \$16.5B in revenue.

CARGO

- 40% of consumers surveyed were willing to pay for faster shipping services.
- Would create between a \$7B market for 12-hour shipping to a \$14B market for 5-hour shipping in the first year.

PRIVATE

- Historical private aircraft at comparable sizes and prices indicate that the market would tolerate a Mach 2 jet at \$79M.
- Price much lower than current manufacturers are projecting.

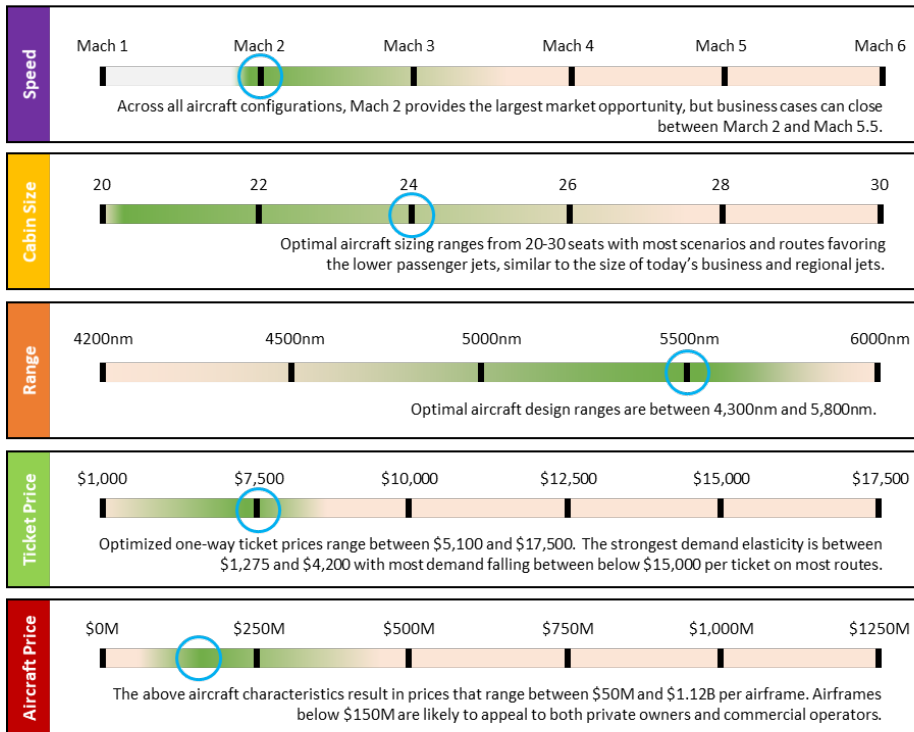

To achieve optimal ROI, industry and government stakeholders will need to leverage existing resources in the defense industrial base while building out the civil side of the market.

Deloitte/SpaceWorks – High-Speed Market Business Case

There are multiple markets scenarios that close economically with technically achievable solutions between Mach 2 and Mach 5.5. The market conditions point towards a Mach 2 to Mach 3 jet that can serve key transatlantic and transpacific routes at market entry and can be utilized for both passenger and private air service.

Aircraft Characteristics

Not Analyzed / Out of Bounds | Optimized Spectrum | Viable Spectrum | Optimized Market Characteristics

Market Characteristics

A Strong Market Picture

Though there are multiple markets scenarios that close economically with technically achievable solutions, our analysis suggests a likely optimized outcome:

Mach 2 Aircraft	\$120M Approximate Aircraft Cost	541 Total Aircraft Demand	Primary Demand Categories: 1. Scheduled passenger service providers (i.e., airlines) for transoceanic routes 2. Jet Card Memberships and Charter (i.e., on-demand) service providers for transoceanic routes 3. High net worth individuals that travel transoceanic routes, often between global wealth centers
	20 Passengers Capacity	5,500 NM Aircraft Range	

While the likely market scenario is economically sustainable and technically feasible, the current regulatory environment, specifically sonic boom restrictions, significantly limits the ability to serve primarily overland routes, such as Los Angeles (LAX) to London (LHR) or London (LHR) to Singapore (SIN) which could attract an additional 1M annual passengers and result in an additional \$3.94B in revenue.

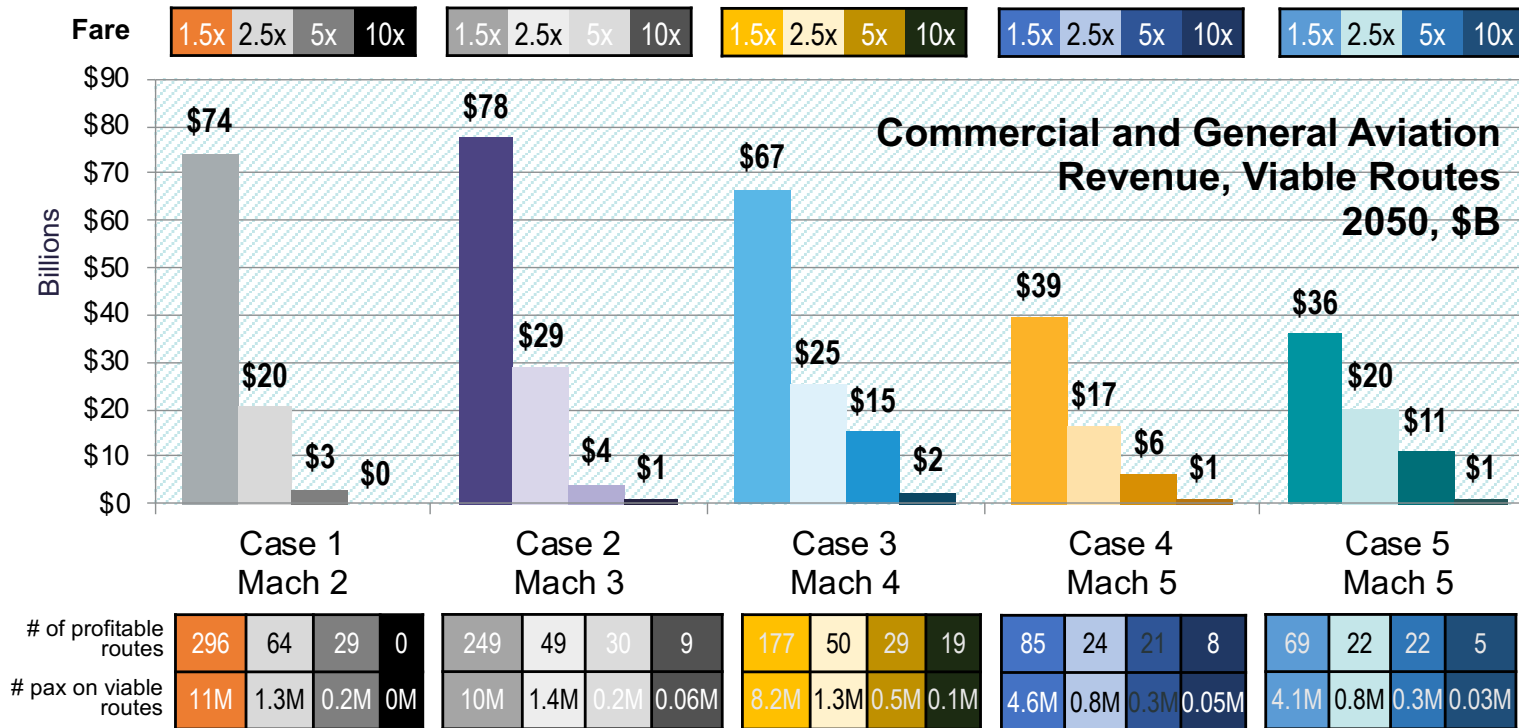

Deloitte/SpaceWorks – Top-Level Economic Findings

- 1. There are multiple aircraft configurations and market approaches that result in positive business cases for their manufacturers and operators (assumed as Initial Rate of Return (IRR) > 25%)**
 - Smaller aircraft (20 – 50 pax) tend to be favored over larger aircraft for several factors, including sales synergies with the private/charter market and higher average passenger load factors on thin routes
 - Slower cruise speed aircraft (Mach 2 – 3) in the 4,000 nmi – 4,500 nmi class are also slightly favored and result in lower ticket prices and therefore larger market sizes. This seems to be a more robust part of the market, but profitable markets exist up to Mach 5
 - North-Atlantic markets remain the largest economic prize, but longer trans-Pacific ranges remain interesting for smaller Mach 2 – 3 vehicles that can reach to 6,000 nmi+
- 2. Results are most sensitive to potential reductions in estimated passenger market size**
 - Fuel cost increases, engine development cost increases, and loss of private/charter sales are also important
- 3. Government contributions via non-recurring offsets or “anchor buys” are helpful**
 - More beneficial for 1) smaller overall aircraft development program (gov’t contributes a larger percentage of the total cost) or 2) higher speed aircraft where predicted annual airframe sales are not as large. However, government contributions are not required for success

SAIC- High-Speed Market Business Case

- Passenger demand is greatest for Case 1 (Mach 2) with 11M passengers
- Revenue is greatest for Case 2 (Mach 3) at \$78B
- Demand (as well as revenue) take a deep fall as the fare increase to 2.5X standard

How is This Different Than Concorde?

Significant increase in the number of wealthy individuals

Then
2M in
U.S.
Worth
\$1M

Now
10M in
U.S.
Worth
\$1M

Today, business travelers account for 12% percent of airlines' passengers, but they are typically twice as lucrative – accounting for as much as 75% of profits.

1980

Then

World-
wide
PAX

2019

Now
4.5B
World-
wide
PAX

Significant increase in number of travelers in general, as well as those willing to pay premium (wealthy individuals & corporations)

Concorde		~M3 Aircraft
100	Aircraft Seats	20-50
50%	Average Load Factor	85%
3	Profitable Routes	~100 (over water)
20	Production Size	300
400 Klb	GTOW	200 Klb
1000s	Annual PAX	3M

To a lesser extent, but not insignificant, are improvements in airframe and propulsion technologies

What Needs To Be Done?

Deloitte | **SpaceWorks**

Challenges for High-Speed Air Travel (1 of 3)

We engaged industry stakeholders directly and conducted open-source research to identify the most critical issues posing constraints on the industry today. We observe the following major challenges across the categories of our analysis:

Category	Challenge
EMISSIONS STANDARDS	Aircraft contribute approximately 2% of total annual global carbon emissions and also emit NOx, driving the FAA and the EPA to pass industry-wide restrictions for aircraft fuel efficiency. Reports indicate that high-speed aircraft could be as much as 5X more pollutive than subsonic vehicles, which presents a challenge from a regulatory perspective.
EXPORT CONTROLS	High-speed aircraft technology has national security implications for supersonic and hypersonic capabilities. Companies will need to satisfy a broad range of applicable regulations, such as ITAR, EAR, and CFIUS. Navigating this environment will require effort on behalf of private stakeholders to ensure compliance, as well as public stakeholders to provide clear and actionable direction.
FLIGHT SHAMING	Recent public outcries over the accelerating impacts from climate change have prompted the public to re-evaluate preconceived social norms of leisure and business air travel. After a series of high-profile climate change action campaigns, public sentiment toward air travel is shifting toward a preference to minimize carbon footprints, leading to 'shaming' individuals flying on commercial or charter planes.
SPEED & NOISE LIMITATIONS	Flying Mach 1 or above creates a sonic boom that can be highly disruptive to communities within proximity to it. National governments including the United States have passed restrictions on the noise level that planes can emit, as well as their speed. For example, in the United States, operators must obtain exemptions from FAA to fly above Mach 1.

Key: Infrastructure, Social, Regulatory & Treaty, Certification, Weather, Environment, Export

37 | 27 | 28 | 29

deduct from ticket demand. | increase the capital investment required to open new airline routes.

unfamiliar for activating commercial high operations. Further, FAA and ICAO are reviewing current regulation to modernize the process for future high-speed aircraft. | various reasons. Operationalizing international operating standards and ensuring compliance will be critical to successfully opening the market.

Eliminating technical and regulatory barriers

Deloitte/SpaceWorks – Barriers / Challenges Heat Map

Challenge	Compliance	Solution	Investment	Ease of Use	Community	Total	Rank Categorization ¹
1. Sonic Boom Restrictions	3	2	3	2	3	13	Barrier
2. Aircraft Certification	3	3	3	1	2	12	Barrier
3. Landing & Takeoff Noise	2	2	2	1	3	10	Barrier
4. Emissions Standards	2	2	2	1	2	9	Significant Challenge
5. Export Controls	3	1	2	2	1	9	Significant Challenge
6. Depressurization Event	1	1	2	2	2	8	Minor Challenge
7. Alternative Fuels	2	2	2	1	1	8	Minor Challenge
8. International Laws	2	2	2	1	1	8	Minor Challenge
9. Heat Sensitivity	1	2	2	2	1	8	Minor Challenge
10. NAS Integration	2	1	1	2	1	7	Minor Challenge
11. Anomalous Radiation Events	2	1	1	1	2	7	Minor Challenge
12. Flight Shaming	1	1	2	1	2	7	Minor Challenge
13. Runway Length	1	3	1	1	1	7	Minor Challenge
14. Time Zone Gaps	1	1	1	2	1	6	Minor Challenge
15. Pilot Certification	1	1	1	1	1	5	Minor Challenge

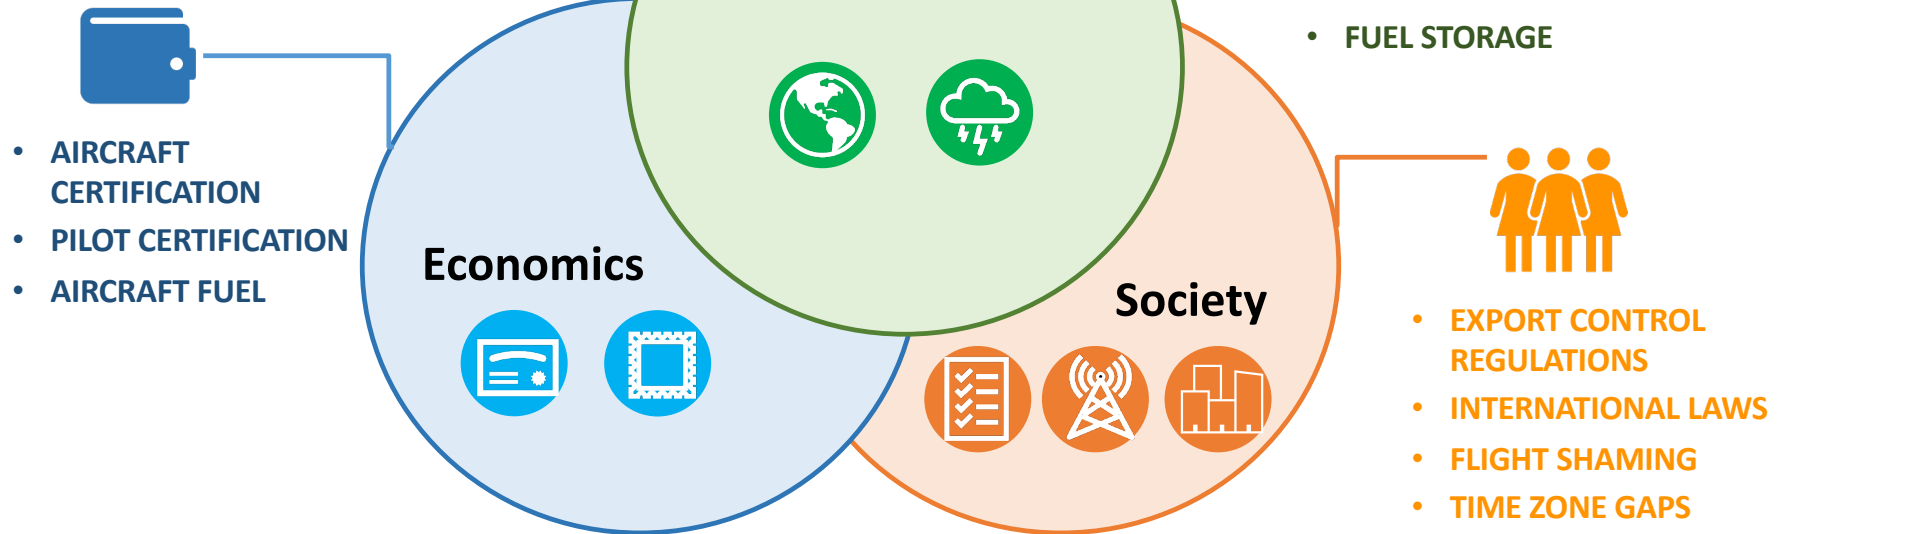

Rank Categorization Key Definitions:

- **Barrier:** an issue that could outright prevent the market from starting.
- **Significant Challenge:** an issue that will likely materially impact the business case.
- **Minor Challenge:** an issue will likely impact the business case only minimally.

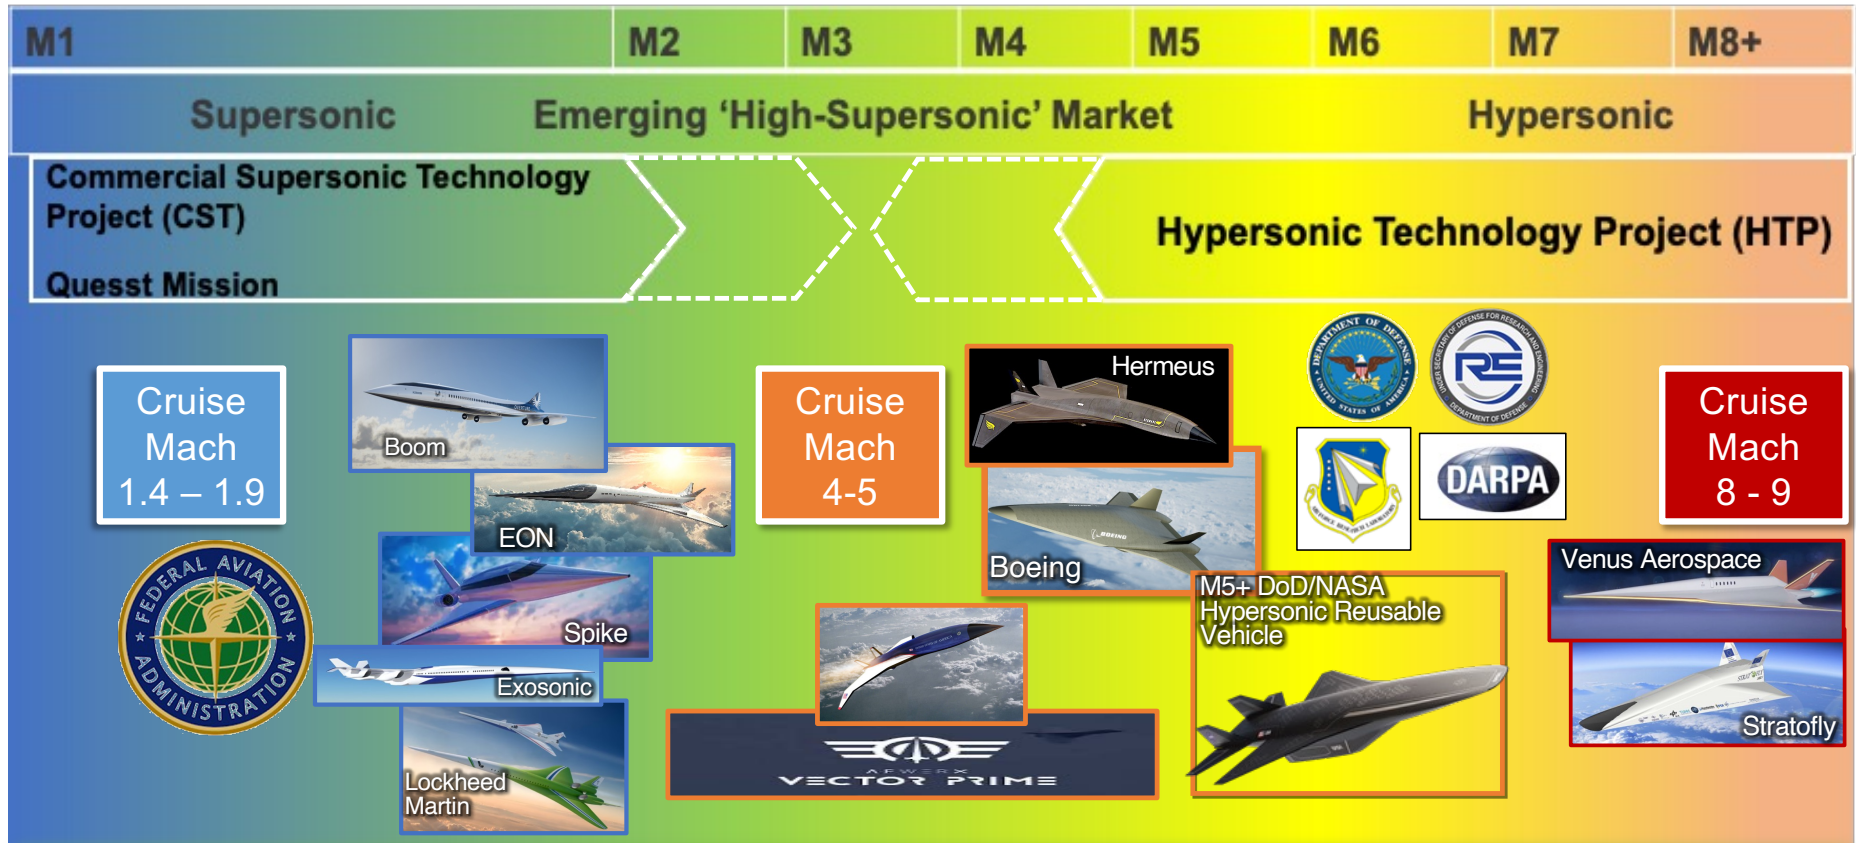

What Is New in Our Approach?

Sustainability

Address sustainability from day one

NASA High-Speed Strategy: Stakeholders

Industry is aggressively pursuing high-speed market; NASA's role is to help make it sustainable

Key Takeaways

Studies concluded potential commercial high-speed markets exist at Mach 2-4, as well as up to Mach 5-5.25

Many of the key barriers for commercial supersonic and hypersonic flight appear to be similar, but there are significant differences resulting from differences in Mach and associated flight conditions

Industry feedback from 3rd High-Speed Commercial Vehicle Workshop (June 2022) reinforced the need for conceptual vehicle studies to assess these barriers and potential solutions in the $2 \leq M \leq 5$ range

High-Speed Investment Opportunities to be Identified by 3QFY24

High-Speed Strategy Next Steps In Work

Development of New High-Speed Commercial Vehicle Conceptual Designs and Technology Roadmaps

- Award contracts for 12-month effort to develop baseline conceptual designs (or preferably families of concepts) and technology roadmaps in the Mach 2-5 range
- Non-proprietary concepts will be key for use in regulatory studies
- Use roadmaps to identify technologies for future NASA investment in FY24 and beyond

Legacy Supersonic N+2/N+3 Conceptual Designs

Acquisition Schedule

- ✓ July 19, 2022- Industry Day Held
- ✓ August 8, 2022 – Released Final Request for Proposal
- ✓ September 20, 2022 – Proposals Received
- ✓ December 16, 2022 – Contracts Awarded
- ✓ February 24, 2023- Contract Kickoff w/Northrop Grumman
- ✓ June 27, 2023- Contract Kickoff w/Boeing

Technology Roadmaps Will Help Identify Areas For Future NASA Investments

Presentation Outline

Introduction to Aeronautics Research Mission Directorate (ARMD)

Independent High-Speed Commercial Vehicle Market Study Results

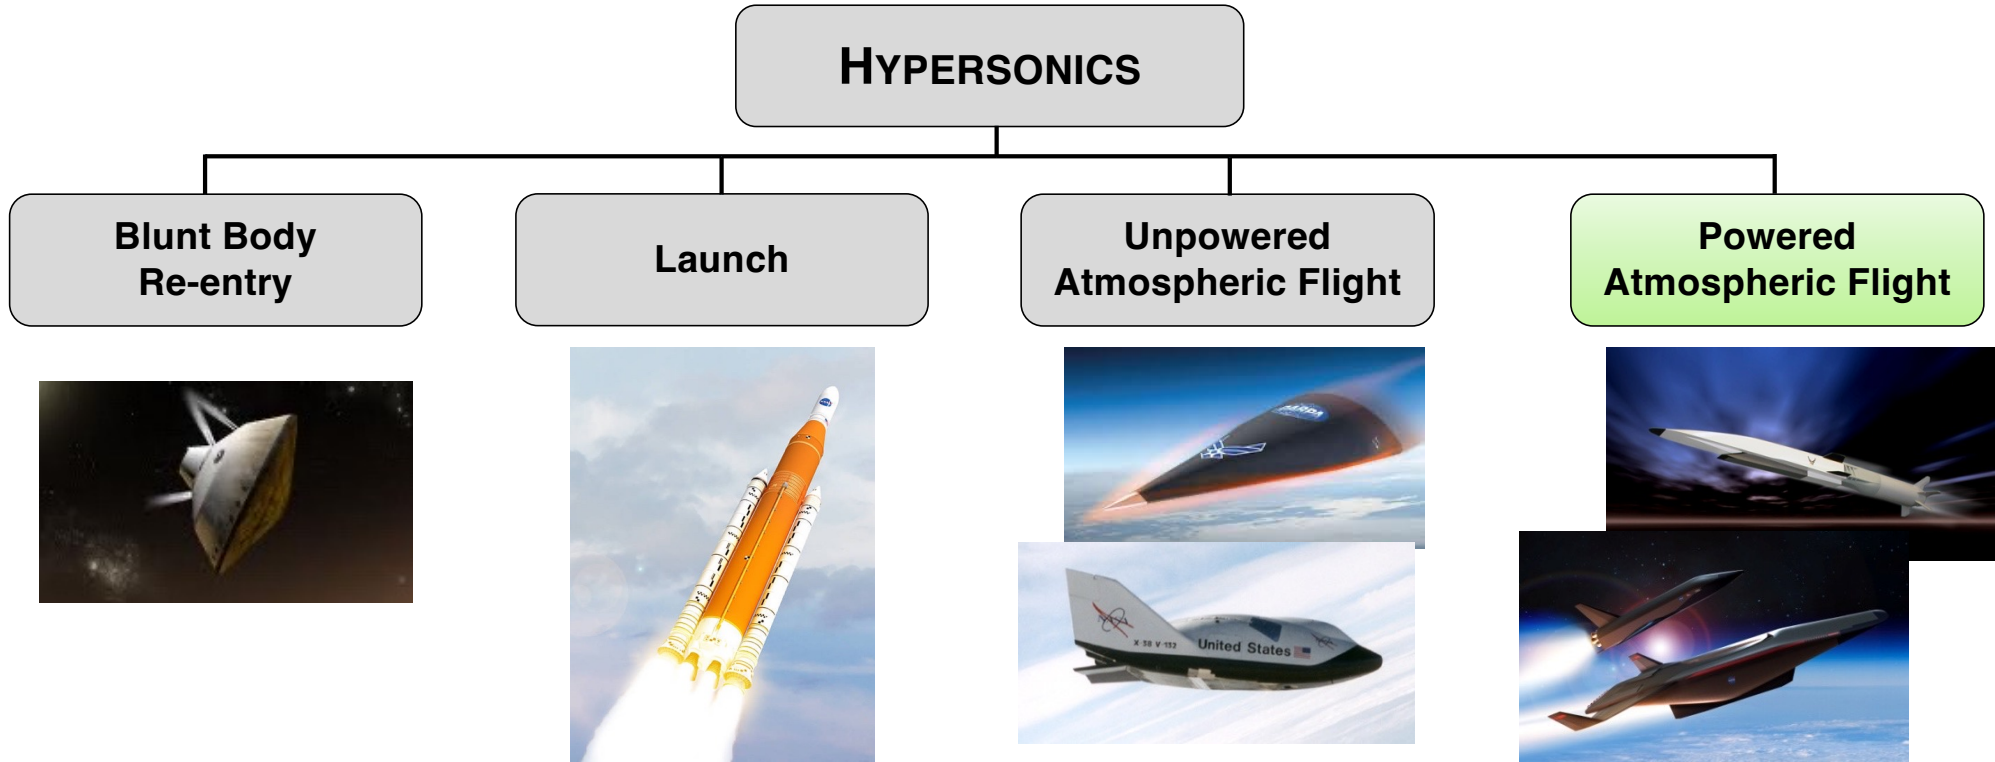

Next Steps in Developing NASA's High-Speed Commercial Strategy

Hypersonic Technology Project Overview

Summary

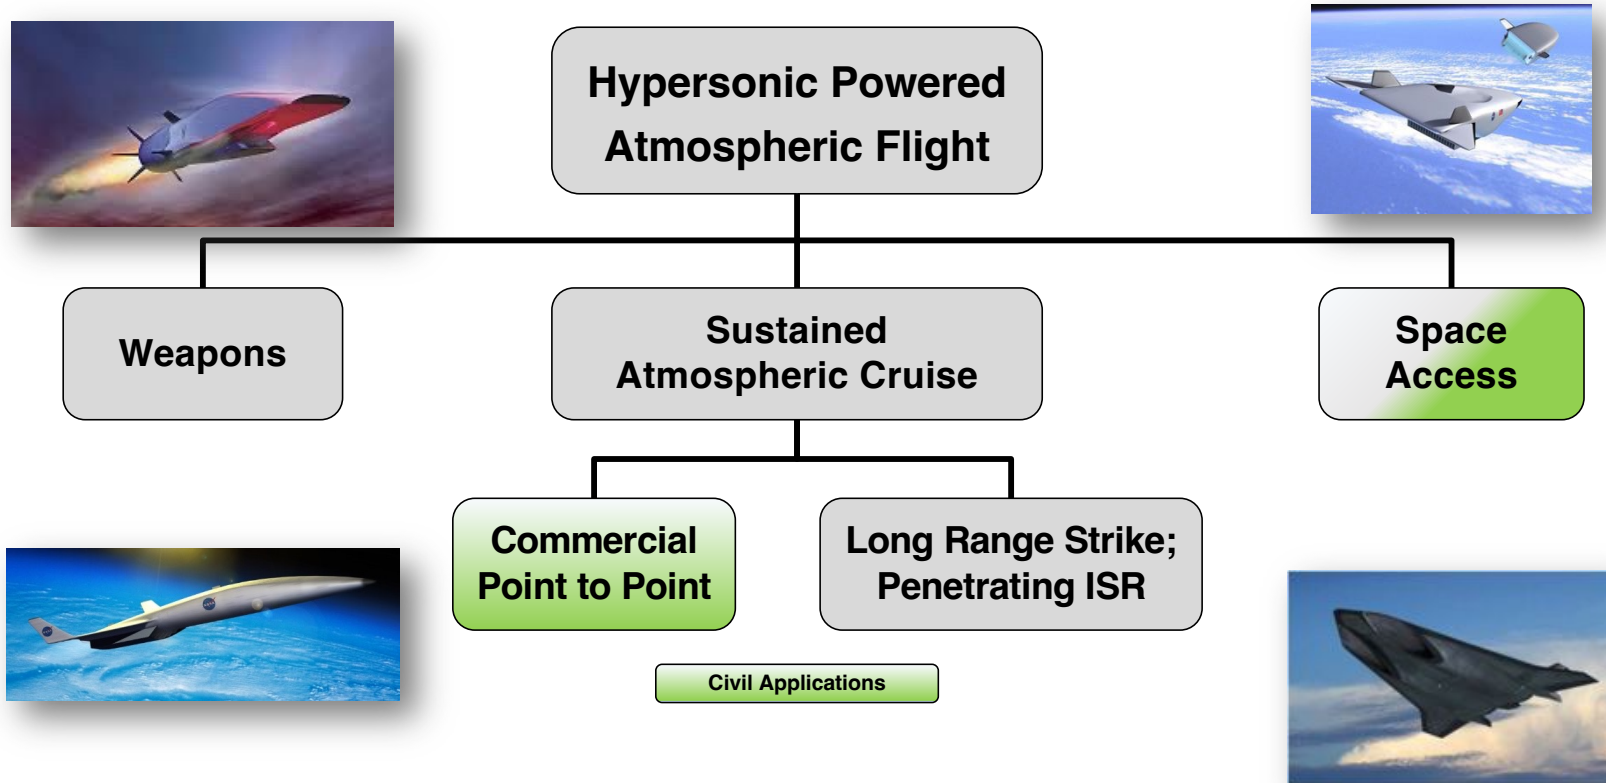

NASA Hypersonic Applications

Multiple NASA applications require mastery of hypersonic flight

HTP Research Focused on Reusable Applications

Partnership between NASA and DoD is critical to progress in hypersonic flight

Envisioning High-Speed Civilian Airspace of Tomorrow

HTP Long-Term Strategy

VISION

Enable routine, reusable, airbreathing hypersonic flight

MISSION

Advance core capabilities and critical technologies underpinning the mastery of hypersonic flight to support U.S. supremacy in hypersonics

APPROACH

Conduct fundamental and applied research to enable a broad spectrum of hypersonic systems and missions

Overarching Strategic Goal

Develop dual-use technologies aligned to reusable vehicle requirements for both civilian and military missions

Key External Partners / Stakeholders

AFRL / DARPA / JHTO-UCAH / AFOSR / ONR / INDUSTRY / UNIVERSITIES

Applied Research Focus- TRL 6 by 2030

Long-Term Strategic Goals

Fundamental Research Focus- TRL 6 by 2040

First Generation Reusable Airbreathing High-Supersonic/Hypersonic Vehicle for Commercial Point-to-Point Mission

Develop enabling technologies via ModSim, Ground Test, and Flight Test for reusable aircraft with speeds up to Mach 8

Next Generation Reusable Airbreathing Hypersonic Vehicle (Sustainable) for Commercial Access to Space Mission

Develop enabling technologies via ModSim, Ground Test, and Flight Test for sustainably-fueled, reusable aircraft with speeds up to Mach 12

Enduring Project Priorities

#1 - Support NASA/DOD partnerships and deliver on external commitments

#2 - Execute Technical Challenges to deliver critical enabling technologies

#3 - Continue NASA-directed research; sustain/grow core competencies and capabilities

#4 - Develop the next generation of U.S. hypersonic experts

HTP Investment Areas in the Barriers to Reusable Hypersonic Flight

System-Level Design, Analysis, and Validation

Materials and Structures for Hypersonic Airframe Components

RT-4.7: **NEW START in FY24**
Materials and Structures for Hypersonic Propulsion Components

Summary

- NASA is developing a strategy to support the commercial high-speed market
- NASA Hypersonic Technology Project (HTP) investments are aligned with dual-use / civil applications
- HTP is addressing major technical barriers
 - System design and analysis including uncertainty quantification
 - Turbine-based combined-cycle propulsion system component research
 - Fundamental research in aerothermodynamics
 - High-temperature, durable materials for engine and airframe applications

Working to enable routine, reusable, airbreathing hypersonic flight
