Introduction

- eXposed Root On-Orbit Test System
- Tech Demo: Hydroponic-aeroponic
- Launched in February 2022 (NG-17)
- Short/long-term crops such as leafy greens, tomato, radish and pea
- Grow outs on ISS: June 2022 – October 2022
- KSC sample processing: January 2023- February 2023

XROOTS Molecular Workflow

Sample processing

DNA Extraction

Polymerase Chain
Reaction (PCR)

Illumina MiSeq

Fungi – Internal
transcribed
spacer (ITS)

Bacteria – 16S
rRNA region
(16s)

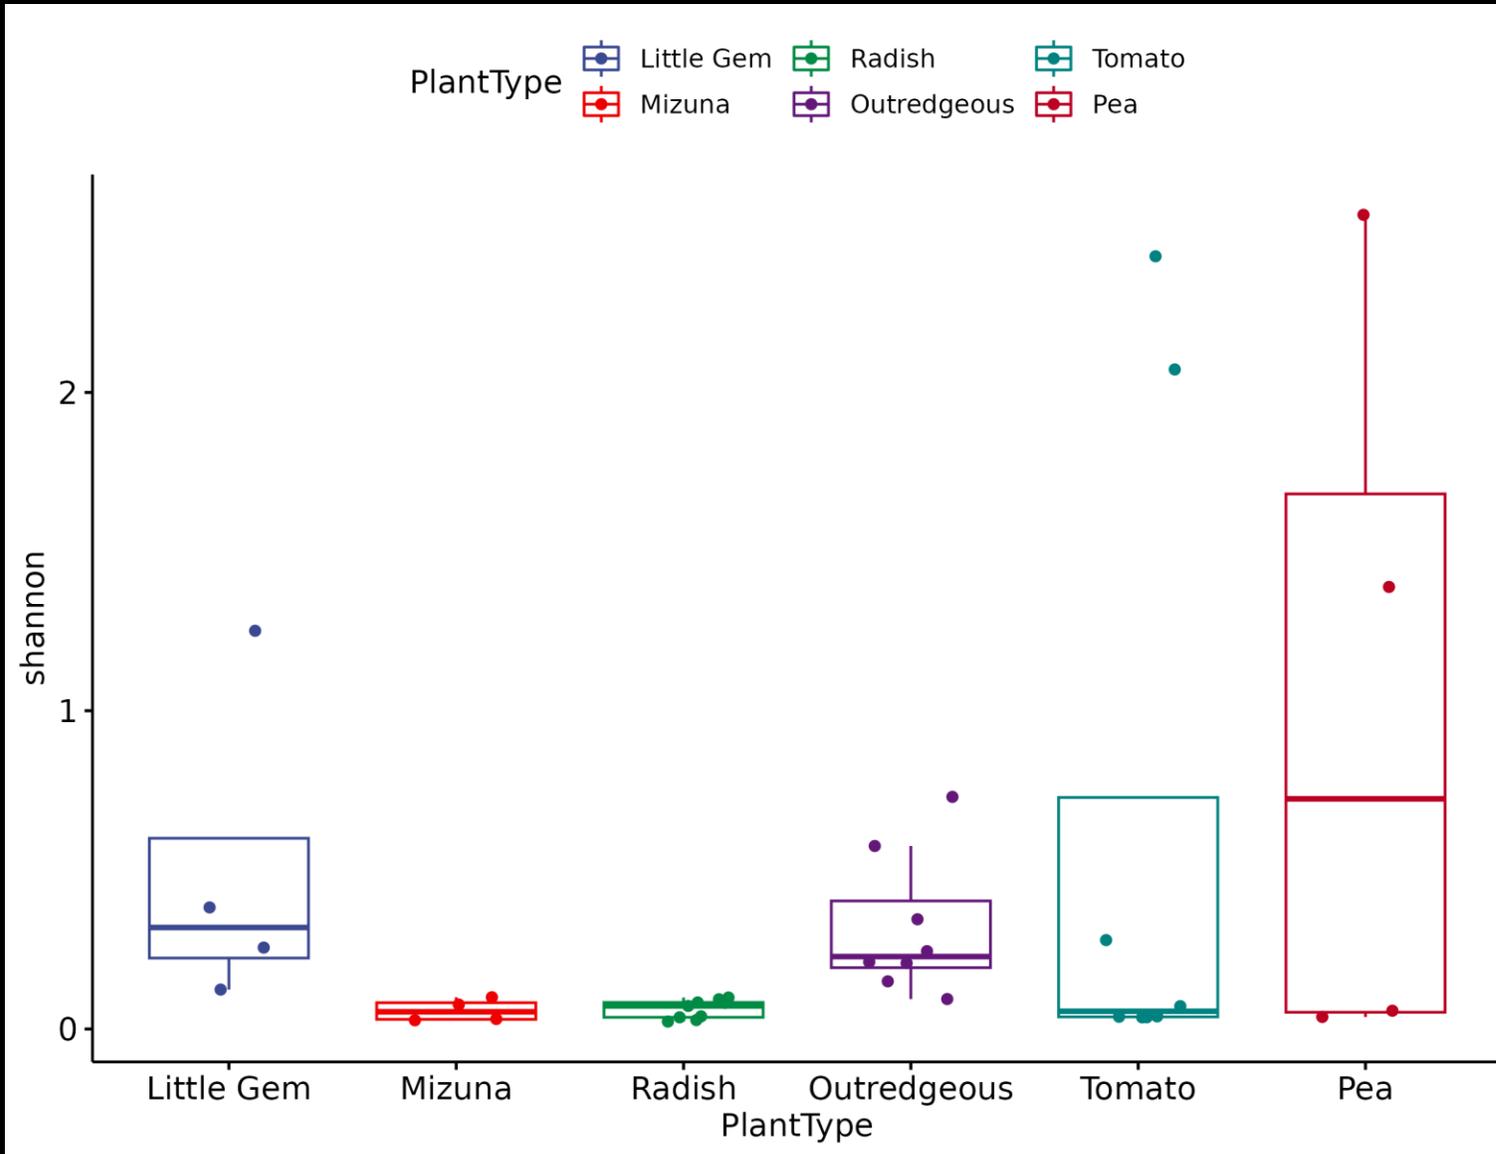

Kraken 2 – UNITE

QIIME2 – Silva

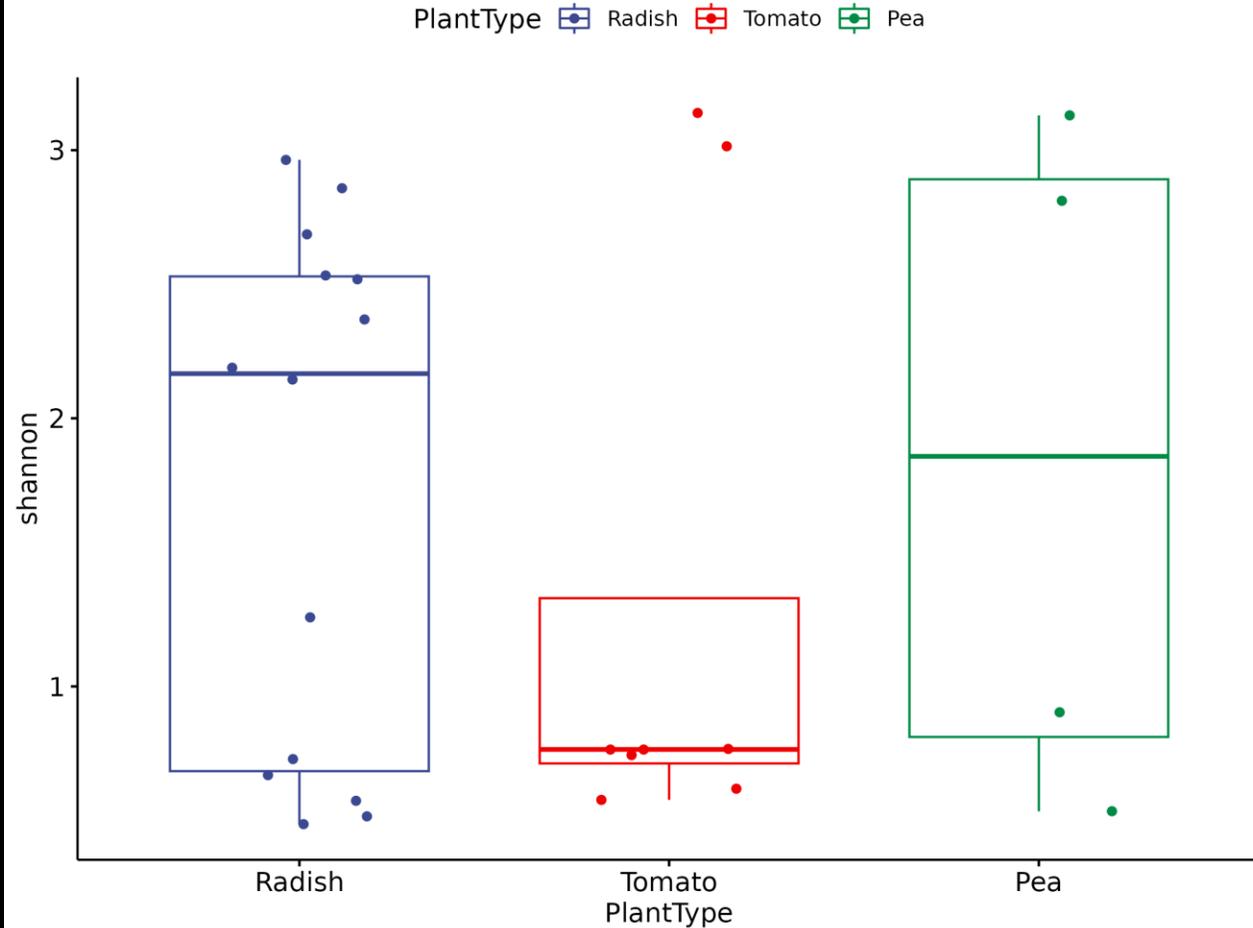

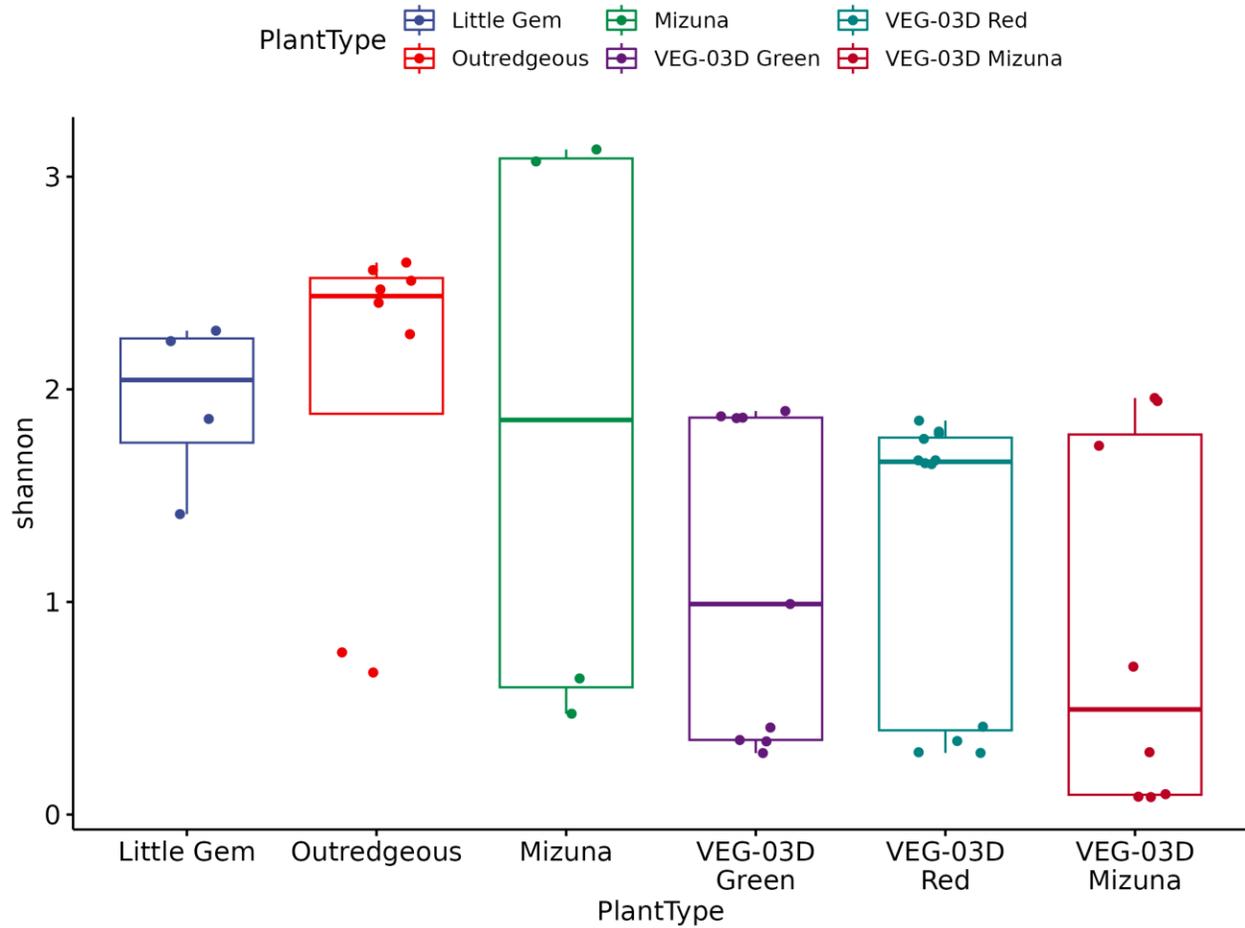

Alpha Diversity of Fungi

Dominant Fungal Genera:
Fusarium, Penicillium, Aspergillus, Cystobasidium

Alpha Diversity of Bacteria

Dominant Bacterial Genera:

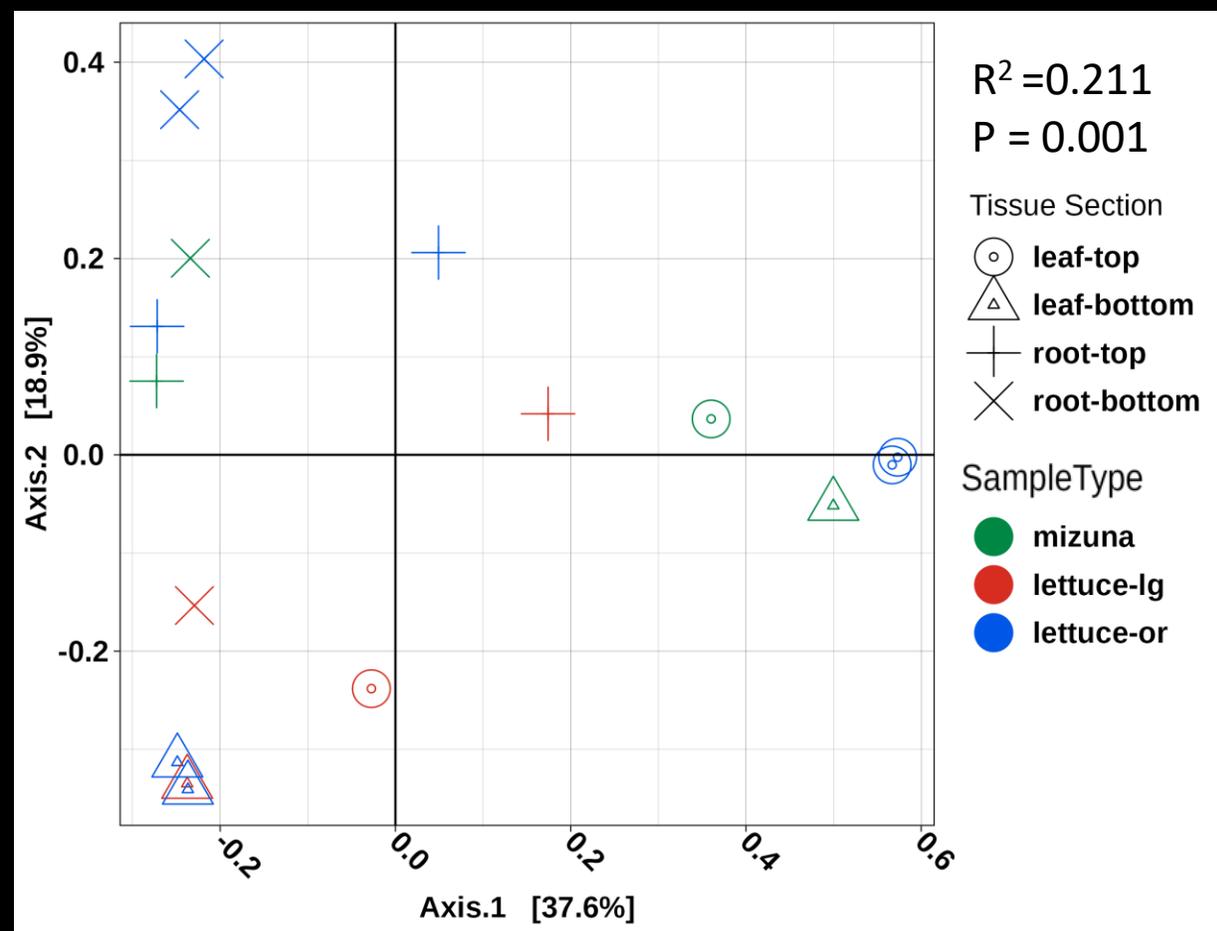

Pseudomonas, *Chryseobacterium*, *Rhodococcus*, *Pseudoxanthomonas*, *Mycobacterium*

Leafy Greens (16S)

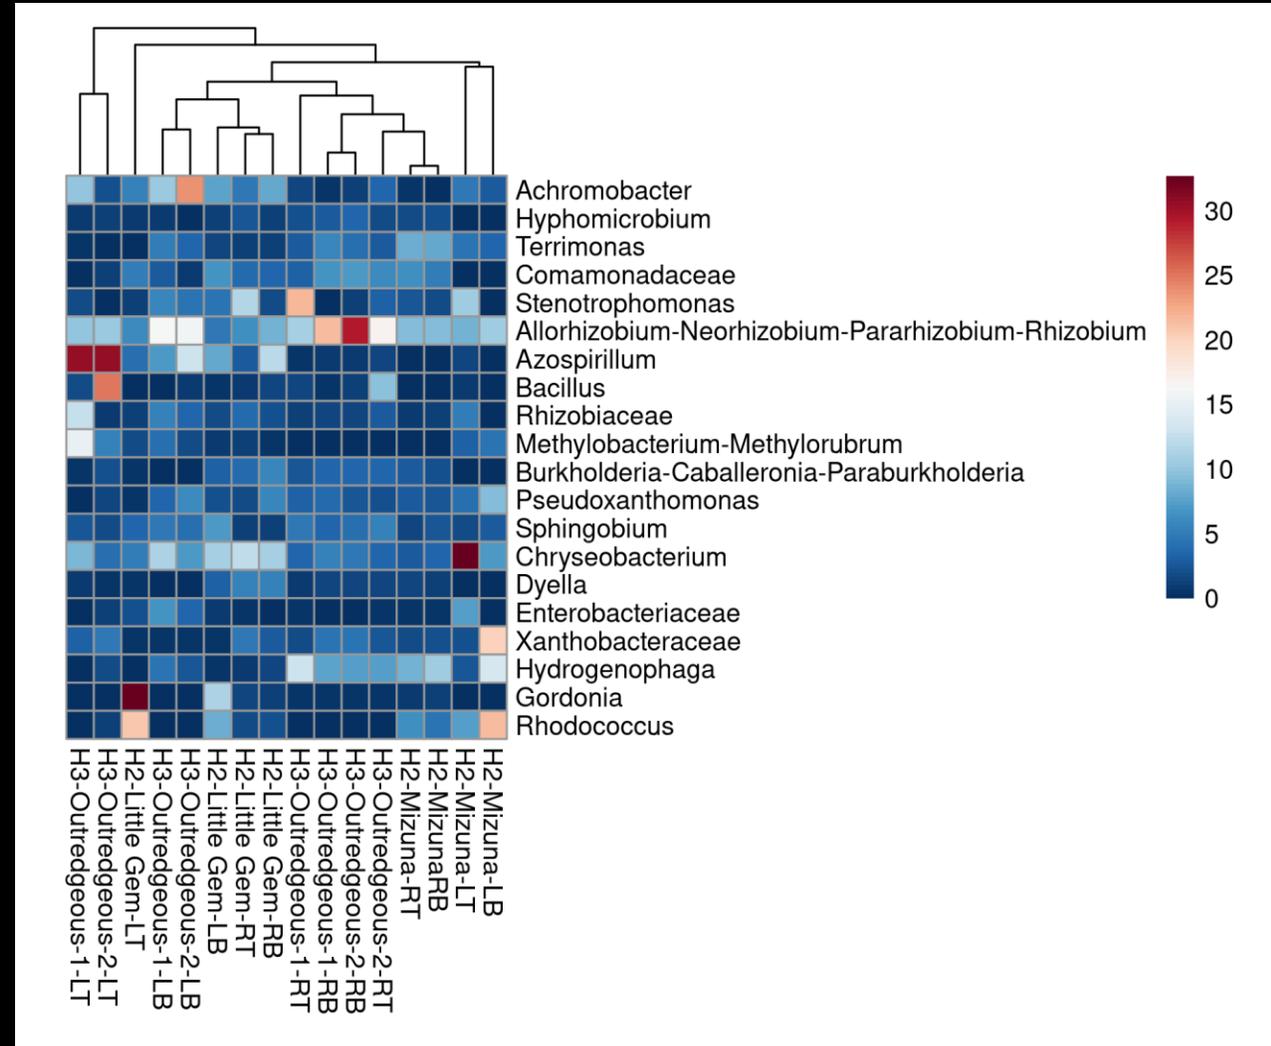

Mizuna (*Brassica rapa* var. *nipposinica* n = 1)

Little Gem (*Lactuca sativa* cv Little Gem n = 1)

'Outredgeous' (*Lactuca sativa* cv. 'Outredgeous' n = 2)

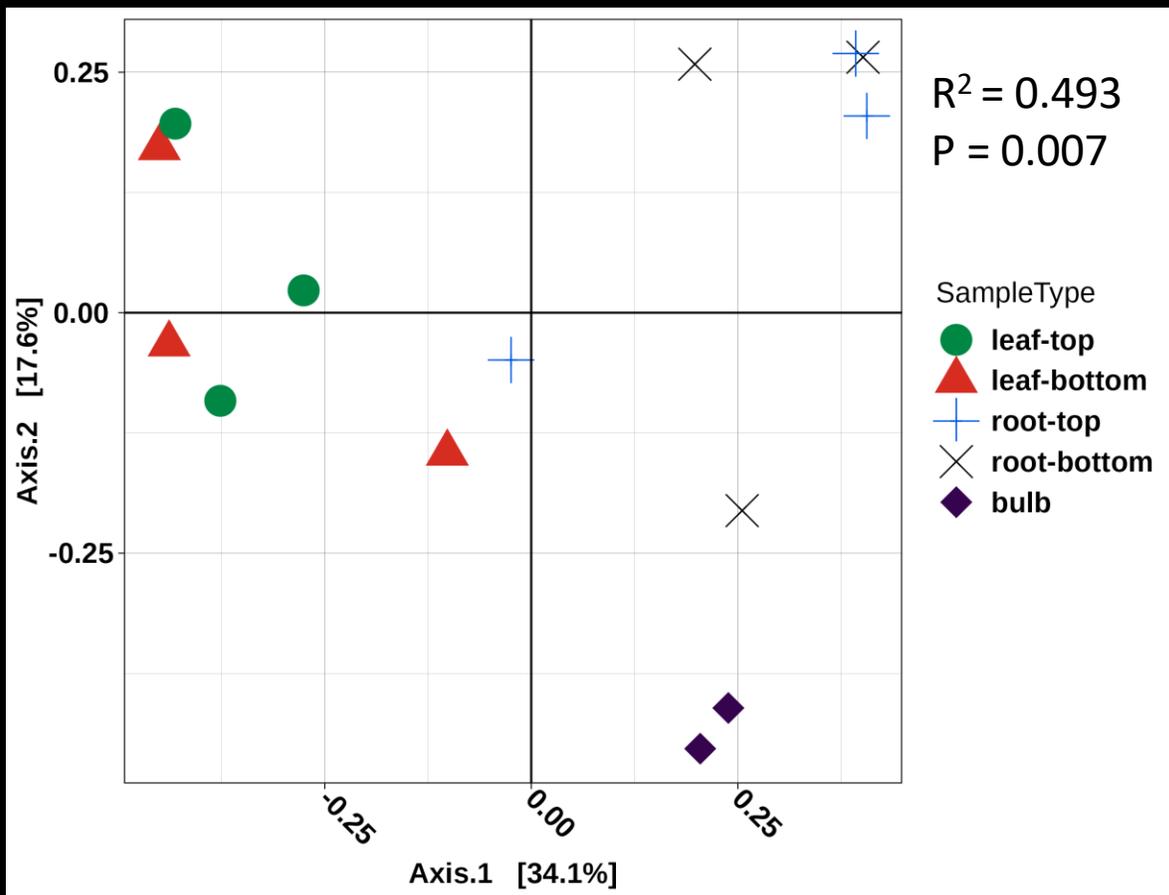

Principle Coordinate Analysis - Beta Diversity

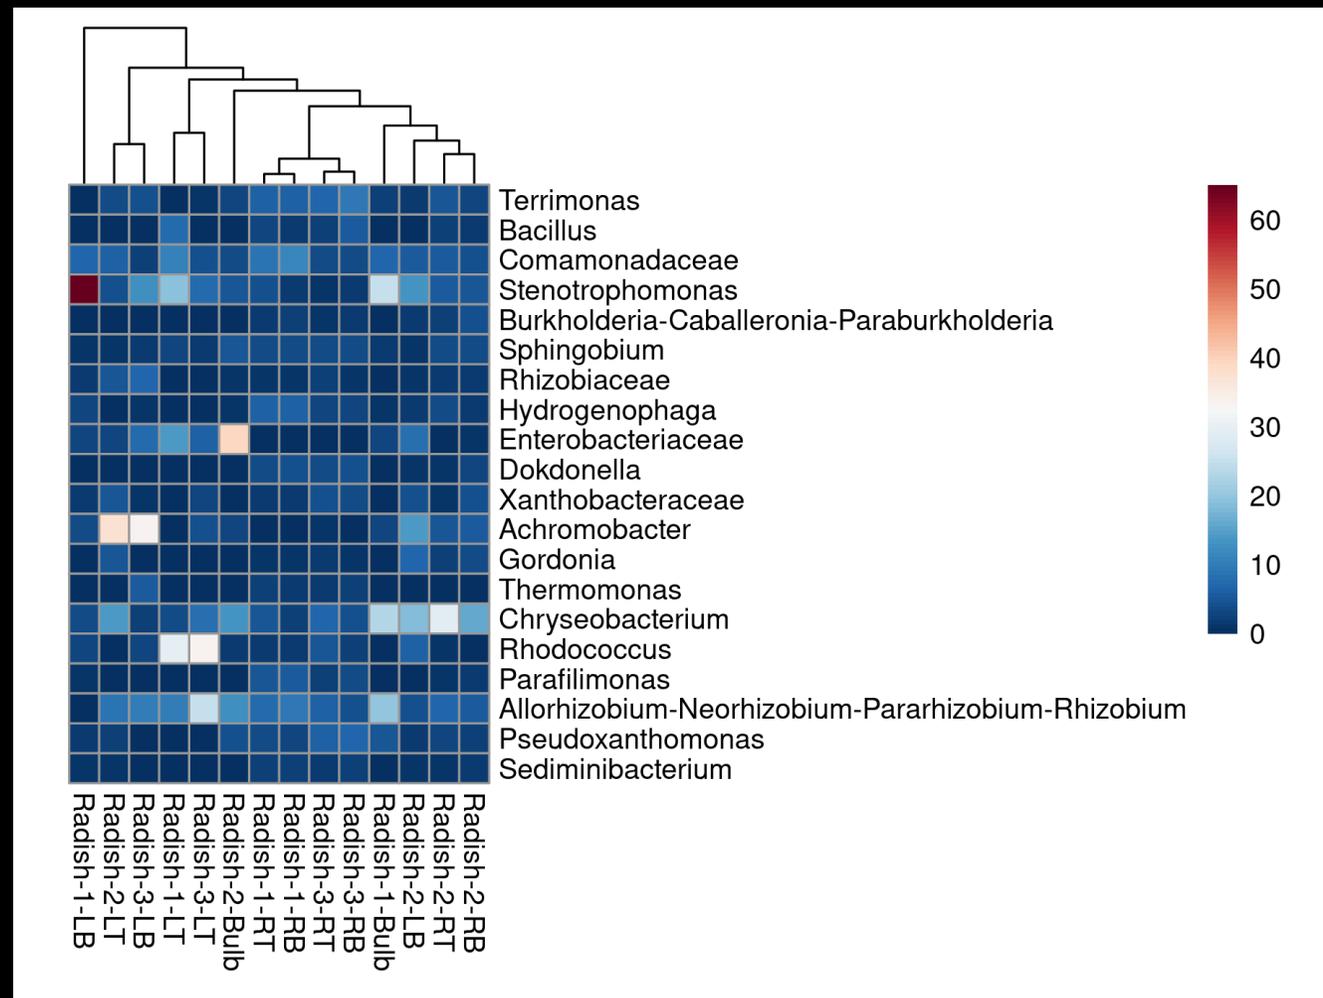

Heatmap showing Percent Read Abundance of top 20 Genera (Pseudomonas removed)

Radish (16S) – *Raphanus sativus* cv. Cherry Belle (n = 3)

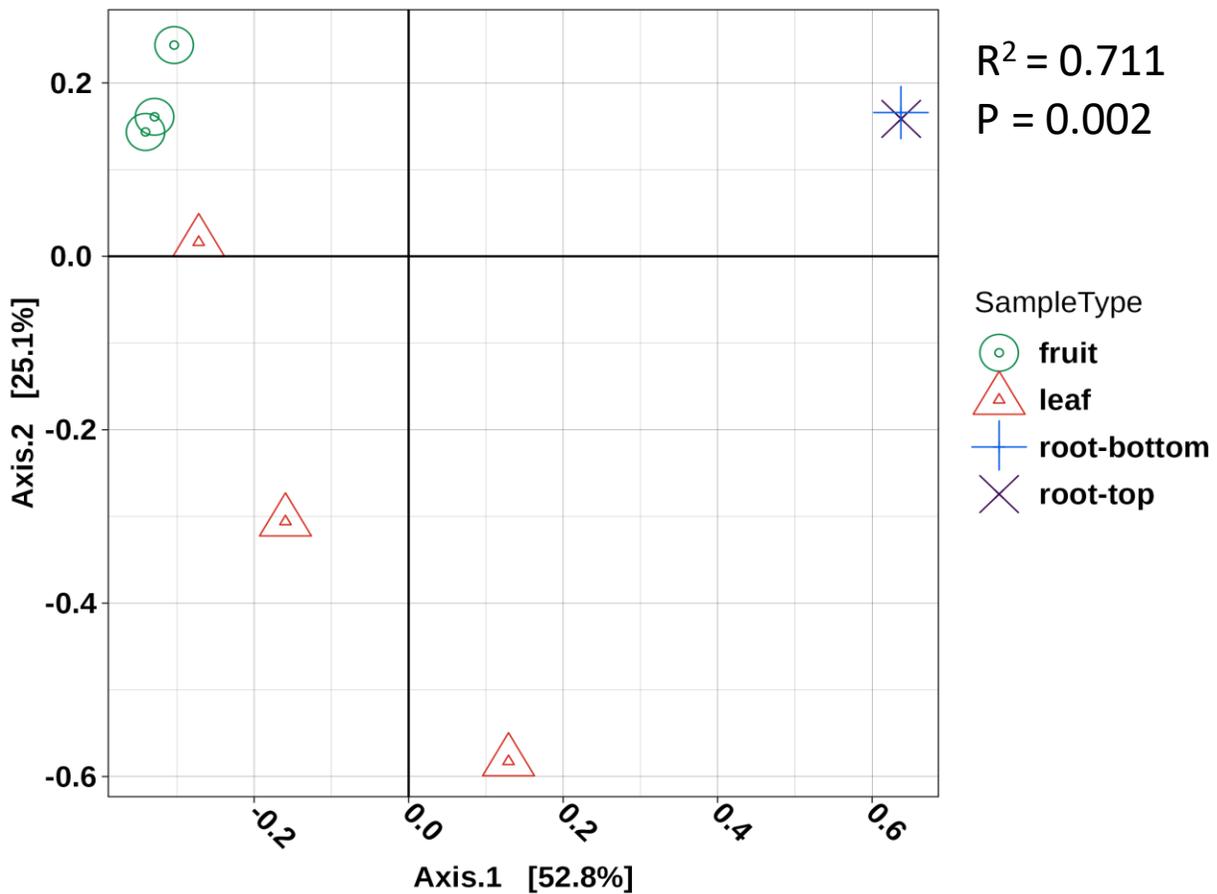

Principle Coordinate Analysis - Beta Diversity

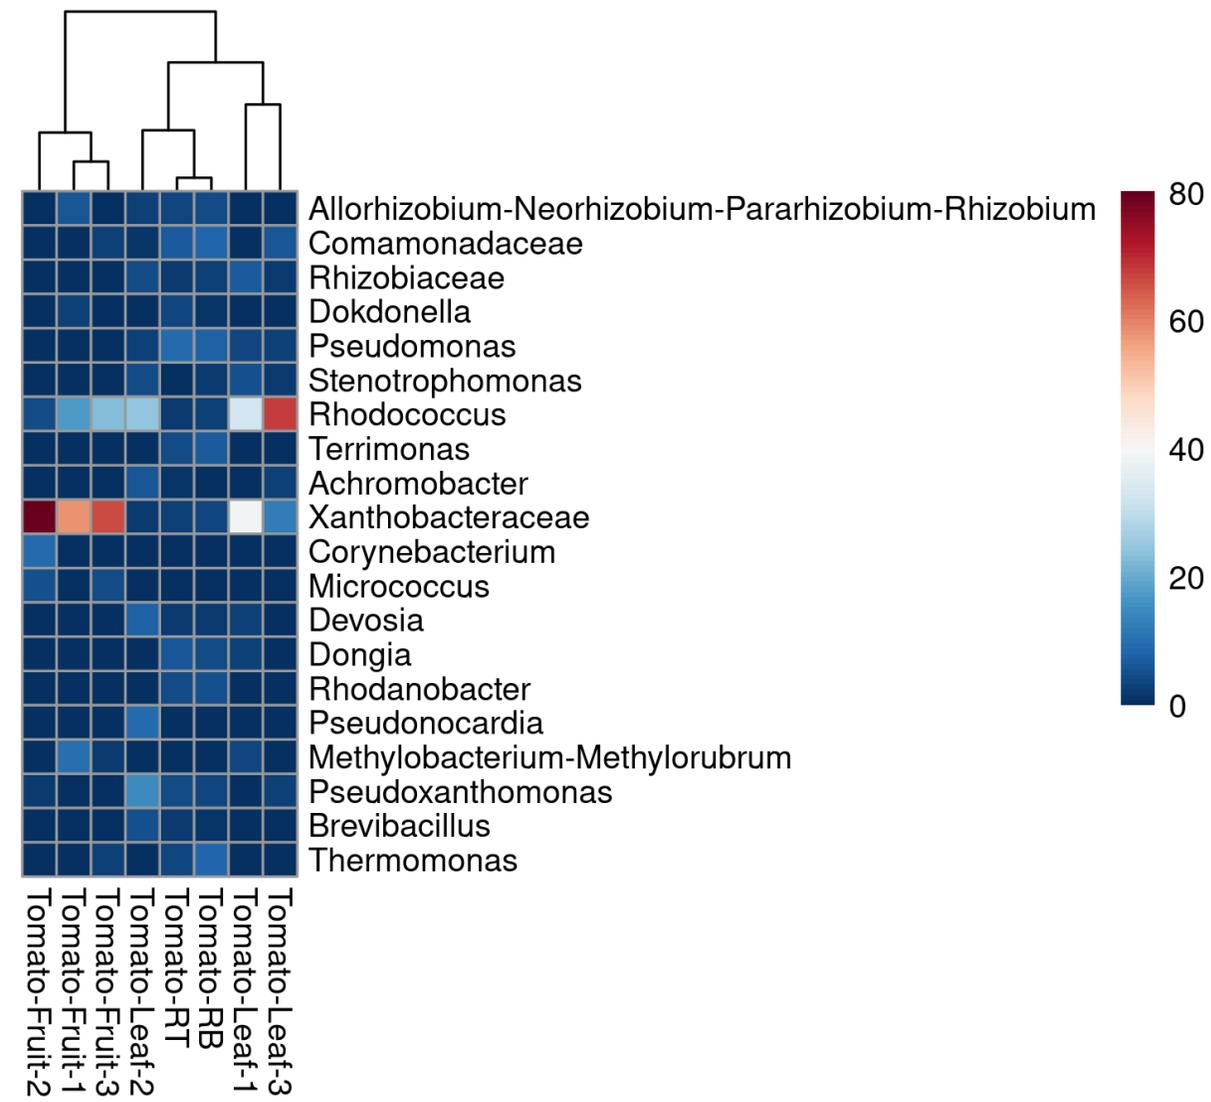

Heatmap showing Percent Read Abundance of top 20 Genera (Pseudomonas removed)

Tomato (16S) – *Solanum lycopersicum* L. cultivar-Micro-Tina (n = 1)

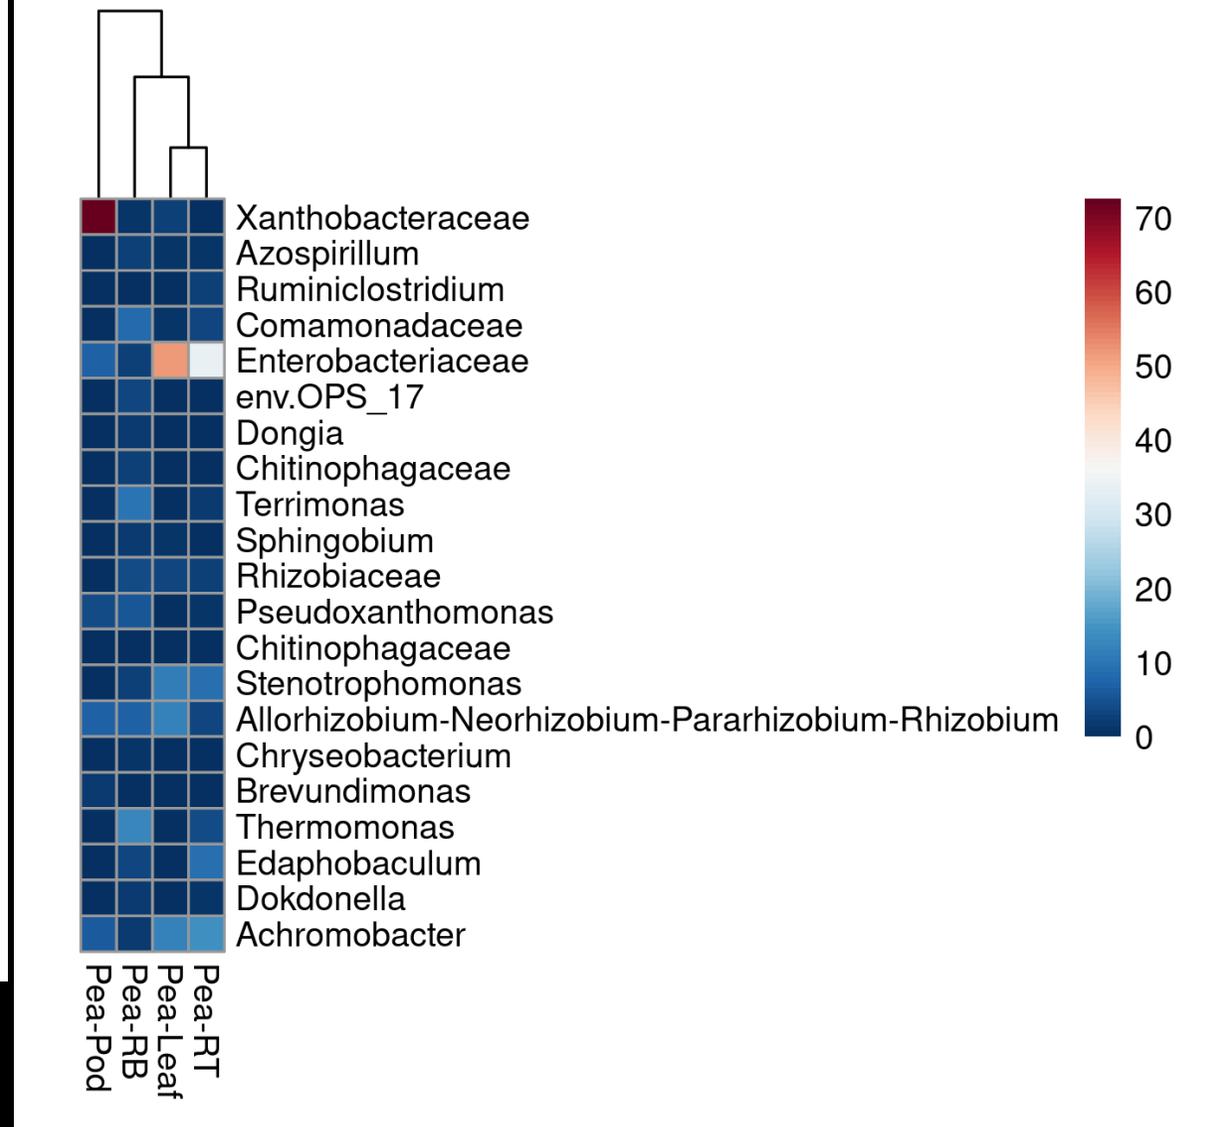

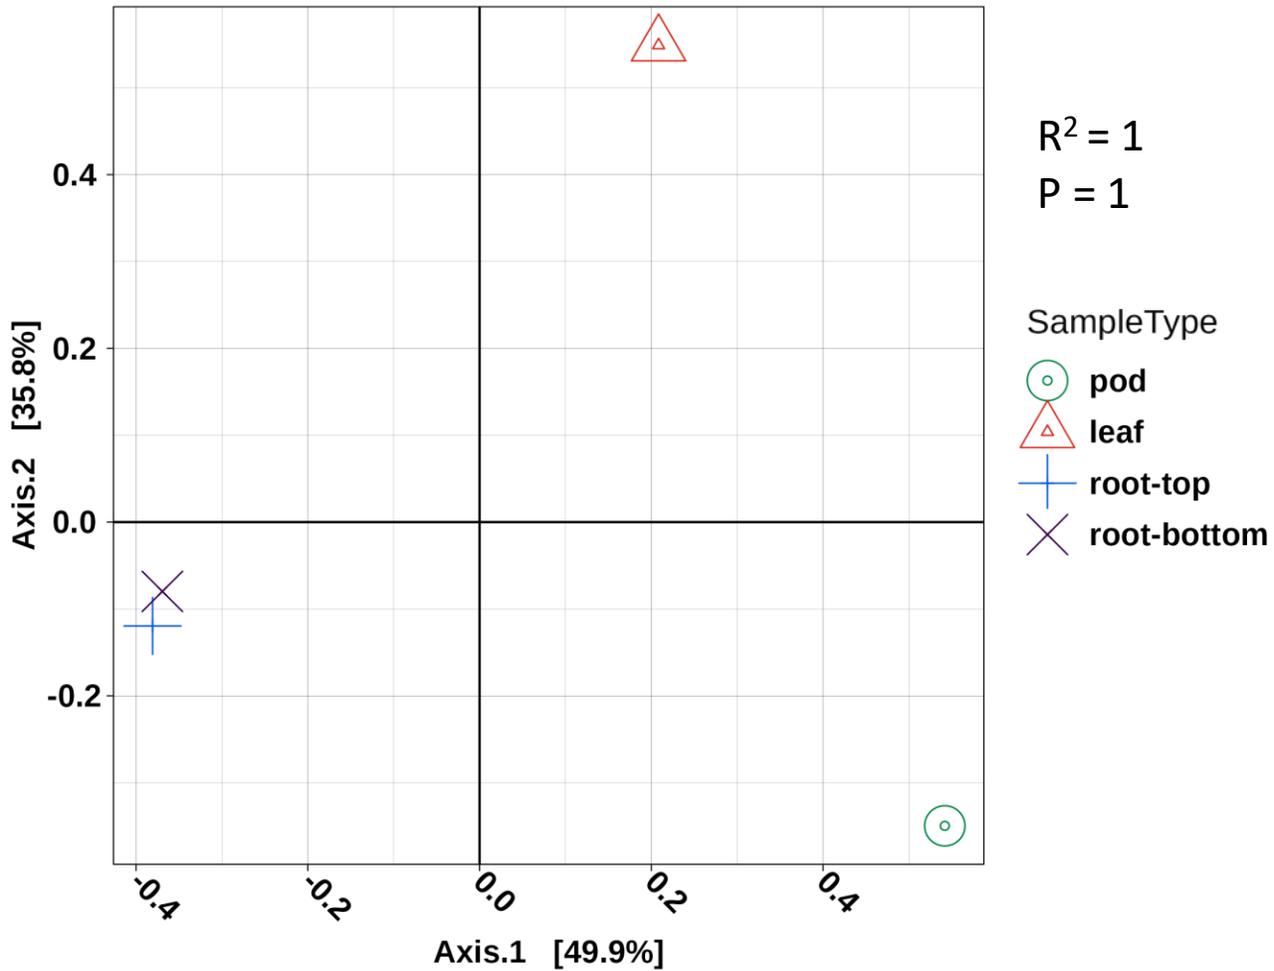

Principle Coordinate Analysis - Beta Diversity

Heatmap showing Percent Read Abundance of top 20 Genera (Pseudomonas removed)

Pea (16S) – *Pisum sativum* cv. Earligreen (n = 1)

Principle Coordinate Analysis - Beta Diversity

Heatmap showing Percent Read Abundance of top 20 Genera (Pseudomonas removed)

Conclusions

- Tech demo successful: plants were grown in hydroponic/aeroponic system
- No human pathogens were detected
- Alpha diversity for bacteria was slightly higher than previous tech demos in Veggie (Leafy Greens).
- Tomato alpha diversity was lower than radish or pea.
- This study helps with a fundamental understanding of plant microbiome research on the International Space Station.
