# Mass Estimation Methods

## Design levels (continuum across mission phases)

- Conceptual (Phases pre-A/A)
- Preliminary (Phases B/C)
- Detail (Phases C/D)

## “Top-down” systems-level modeling

- Curve fits to historical data
- Quick, but low-fidelity
- Conceptual-level design

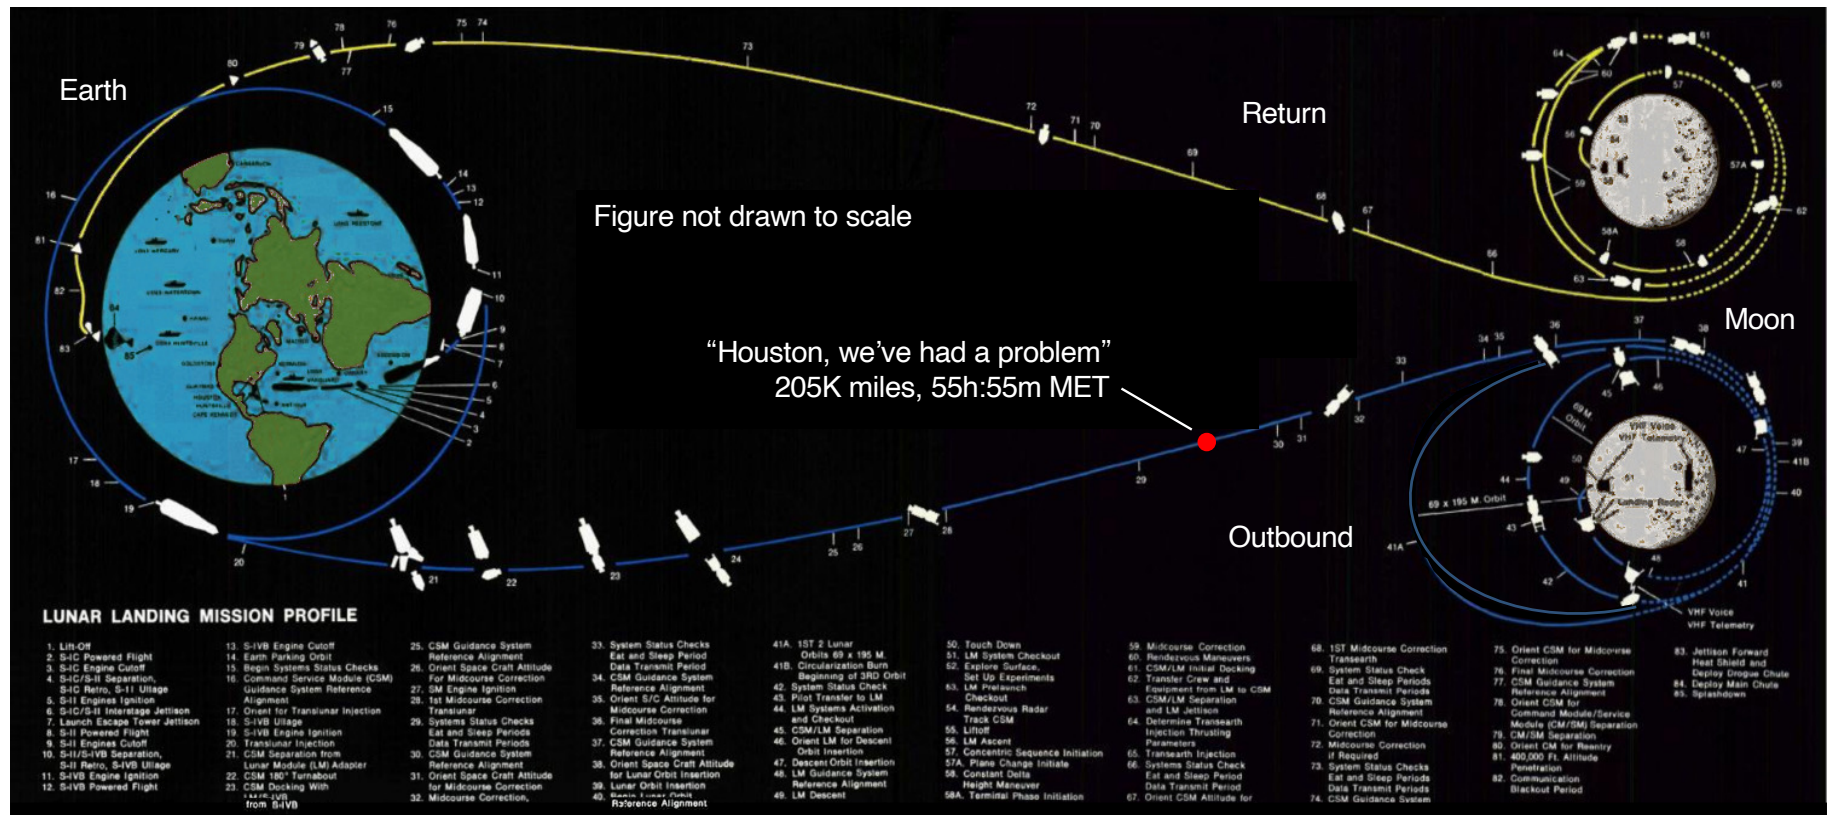

## “Bottom-up” component-level modeling

- Physics-based analysis
- Takes more time, but high(er)-fidelity
- Preliminary/detail-level design

# Apollo Program LOR Mission Profile

Significant schedule, cost, performance advantages over other proposed modes

Decouples S/C, LV designs

# Saturn V Launch Vehicle for Apollo

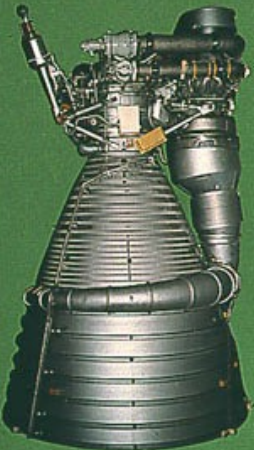

(all klbm)	Gross	Prop	Dry
• Apollo S/C, IU	118	—	—
• S-IVB 3rd stage	265	236	29

# Saturn V Ascent Performance

# Saturn V/S-IC Ascent Perf. (cont'd)

PARAMETERS	UNITS	PITCH PLANE	
		MAGNITUDE	RANGE TIME (SEC)
Attitude Error	deg	0.83	117.4
Angular Rate	deg/s	-0.97	69.1
Average Gimbal Angle	deg	0.23	90.6
Angle-of-Attack	deg	1.82	117.1
Angle-of-Attack/ Dynamic Pressure Product	deg-N/cm <sup>2</sup>	4.93	91.4
Normal Acceleration	m/s <sup>2</sup>	-0.331	95.5

**Max. control params. in S-IC flight**

**Maximum dynamic pressure**

- 3.5 N/cm<sup>2</sup> ~ 5.1 lbf/in<sup>2</sup>
- Range time ~ 83 sec.
- ~ 8 pct. >  $q$  at max.  $q$ - $\alpha$

# Saturn V/S-IC Flight Loads

Compression loads at **max.  $q$ - $\alpha$** , **S-IC CECO** and **OECO** conditions

*What about LV bending at liftoff and ECO?*

Maximum bending moment at **max.  $q$ - $\alpha$**  condition

# S-IC Intertank Mass Estimation

## S-IC Intertank

- $L = 22 \text{ ft}$ ,  $R = 33 \text{ ft}/2$
- Al 2024;  $\rho = 0.1 \text{ lbm/in}^3$ ,  $E = 10.1 \text{ Mlbf/in}^2$

## Liftoff load case

Vehicle mass above intertank aft ring  
 $= (6530 - 1620) = 4910 \text{ klbm}$

Multiply by  $1.2g$  at liftoff  $= 5892 \text{ klbf}$

Divide by  $(\pi * 33 \text{ ft})$  for compression line  
load  $N_x = 4736 \text{ lbf/in} = \sigma_x * t$

From NASA SP-8007,  $\sigma_x = \gamma * E * t / R / \sqrt{3 - 3\mu^2}$   
(cyl. shell buckling)  $= 0.6 * \gamma * E * t / R$  for  $\mu = 0.3$

## S-IC Intertank Mass Estimation (cont'd)

$$\sigma_x = (N_x = 4736 \text{ lbf/in})/t, R = 396 \text{ in.}/2$$

Apply FS = 1.4 to loads, and assume  $\gamma = 1$

$$4736 \text{ lbf/in} * 1.4 \text{ FS}/t = 0.6 * 1 * 10.1 \text{ Mlbf/in}^2 * t / 198 \text{ in.}$$

$$t^2 = (4736 * 1.4 * 198 \text{ in.}) / (0.6 * 10.1 \text{e}6)$$

$$t = 0.465 \text{ in. for monocoque shell wall}$$

$$\text{Estimate intertank mass} = 2 * \pi * R * t * L * \rho$$

$$\begin{aligned} \text{Mass} &= \pi * 396 \text{ in.} * 0.465 \text{ in.} * 264 \text{ in.} * 0.1 \text{ lbm/in}^3 \\ &= 15.3 \text{ klbm} \end{aligned}$$

Compare to reported S-IC intertank mass of 13.2 klbm from Whitehead (+2.1 klbm; +16%)

# S-IC/S-II Interstage Mass Estimation

## S-IC/S-II Interstage

- $L = 18.3 \text{ ft}$ ,  $R = 33 \text{ ft}/2$
- Al 2024;  $\rho = 0.1 \text{ lbm/in}^3$ ,  $E = 10.1 \text{ Mlbf/in}^2$

## Liftoff load case

Vehicle mass above interstage aft ring

$$= (6530 - 5040) = 1490 \text{ klbm}$$

Multiply by  $1.2g$  at liftoff = 1788 klbf

Divide by  $(\pi * 33 \text{ ft})$  for compression line load

$$N_x = 1437 \text{ lbf/in} \text{ (~ 1/3 of S-IC intertank load)}$$

$$1437 \text{ lbf/in} * 1.4 \text{ FS/t} = 0.6 * 1 * 10.1 \text{ Mlbf/in}^2 * t / 198 \text{ in.}$$

$$t = 0.256 \text{ in.}; \text{ est. mass} = 2 * \pi * R * t * L * \rho = 7.0 \text{ klbm}$$

(reported interstage mass = 9.7 klbm)

# S-II Thrust Structure Mass Estimation

## S-II Thrust Structure (conical frustum)

- $L = 9.3$  ft;  $R = 33$  ft/2 fwd, 17.5 ft/2 aft
- Al 2024;  $\rho = 0.1$  lbm/in<sup>3</sup>,  $E = 10.1$  Mlbf/in<sup>2</sup>

## S-II stage ignition load case

Vehicle mass = 1490 klbm; engine thrust =

$5 \times 230$  klbf = 1150 klbf  $\Rightarrow F/\text{mass} = 0.77g$

Compression line loads  $N_x = 1743$  lbf/in aft,  
and 924 lbf/in forward

Buckling load from SP-8019,  $P_{cr} = \gamma \frac{2\pi E t^2 \cos^2 \alpha}{\sqrt{3(1 - \mu^2)}}$

$t^2 = 1.33 \cdot P_{cr}/E$ ;  $t = 0.460$  in.

Est. mass =  $2 \cdot \pi \cdot R_{avg} \cdot t \cdot L \cdot \rho / \cos \alpha = 6.4$  klbm  
(reported interstage mass = 7.3 klbm)

# Space Transportation System

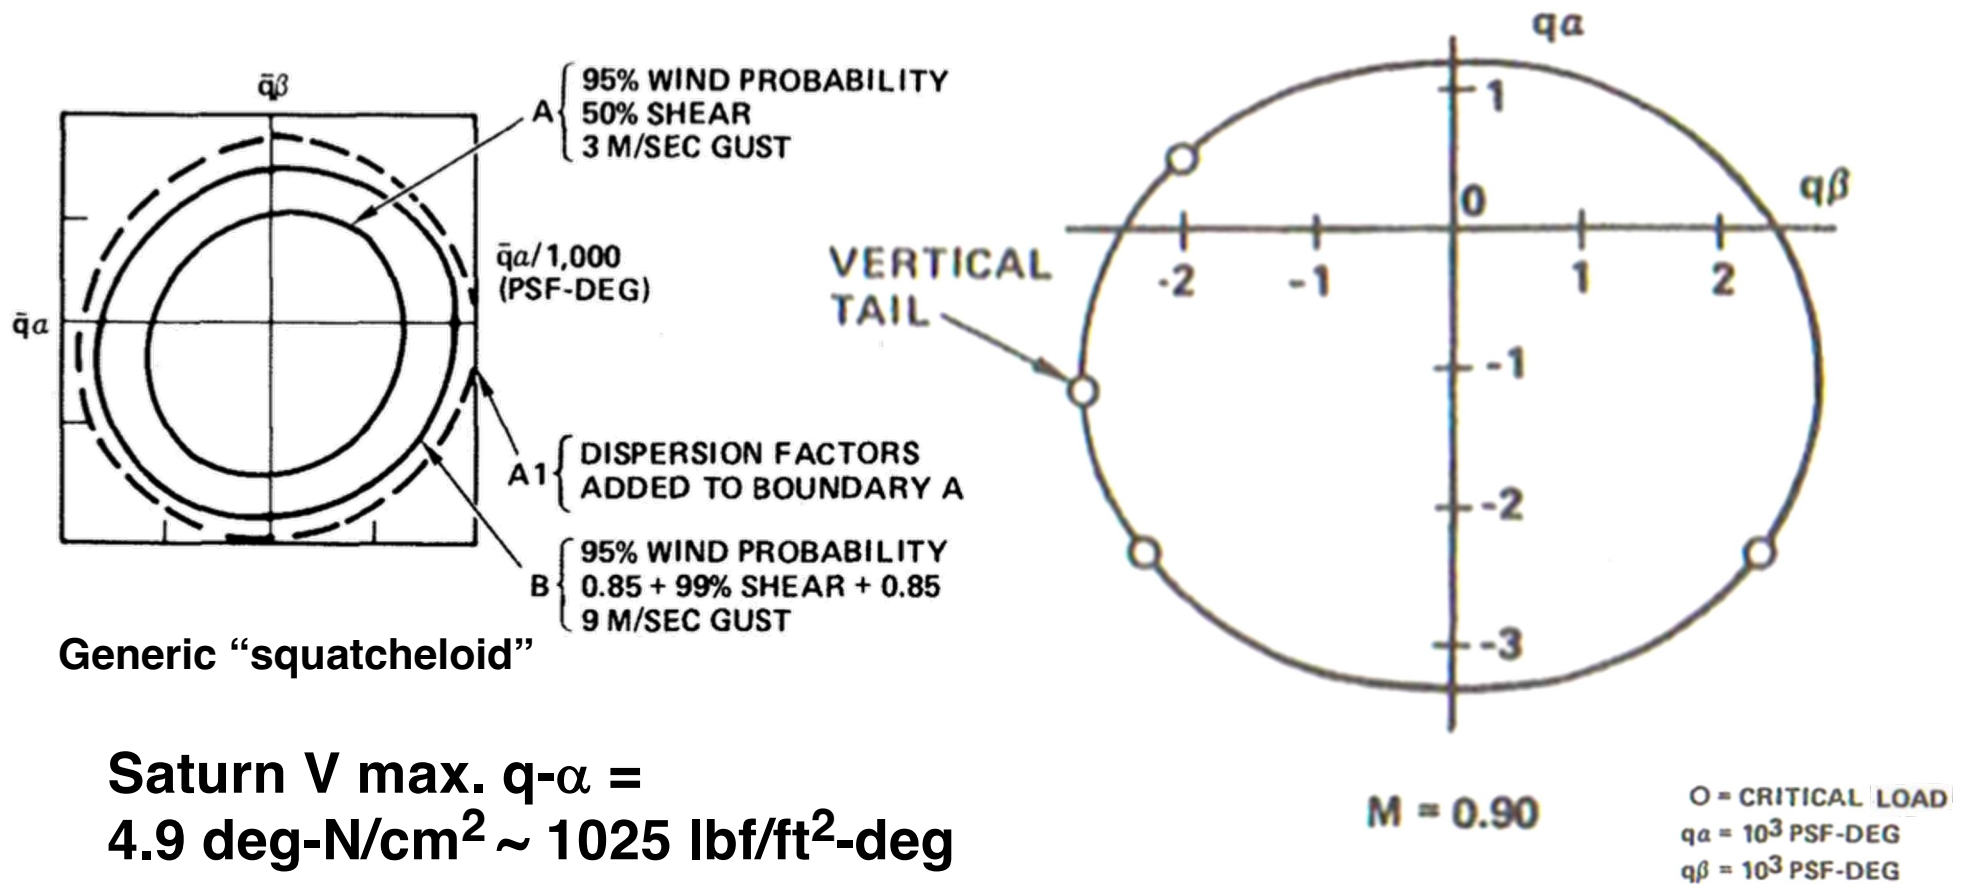

Space Shuttle composed of Orbiter with 3 LO<sub>2</sub> / LH<sub>2</sub> reusable engines (SSMEs), External Tank (ET), and 2 Solid Rocket Boosters (SRBs).

# Shuttle Flight Loads

For *asymmetric* vehicles,  $q\text{-}\alpha$  (normal force) and  $q\text{-}\beta$  (transverse force) are critical, vs.  $\text{max.-}q$  for *symmetric* LVs

Saturn V max.  $q\text{-}\alpha$  =  
4.9 deg-N/cm<sup>2</sup> ~ 1025 lbf/ft<sup>2</sup>-deg

# Space Shuttle Main Propulsion

## 1st stage SRB

- Low Isp, High thrust
- Solid prop

- ## 1st & 2nd stage SSME
- High Isp, Low thrust
  - LO<sub>2</sub>/LH<sub>2</sub> prop

### Space Shuttle Main Engine

Propellants	LO <sub>2</sub> - LH <sub>2</sub>
Power level, klbf	SL/vacuum
- Rated 100%	370.0/470.8
- Nominal 104.5%	393.8/488.8
- Full 109%	417.3/513.3
Chamber pressure at 109%, Full power level	3008 psia
Specific impulse, I <sub>sp</sub> , vacuum	452 seconds
Throttle range	67 to 109%
Engine mass	7480 lbm

# Shuttle ET/SRB Interface Details

# Shuttle Has Very Complex Load Paths

## Liftoff mass

- Orbiter - 232 klbm structure
  - 32 klbm payload
- ET - 1.373 Mlbm LO2
  - 229 klbm LH2
  - 59 klbm structure
- SRBs - 2@ 1.107 Mlbm prop.
  - 2@ 192 klbm structure
- Total mass = 4.53 Mlbm

## Liftoff thrust

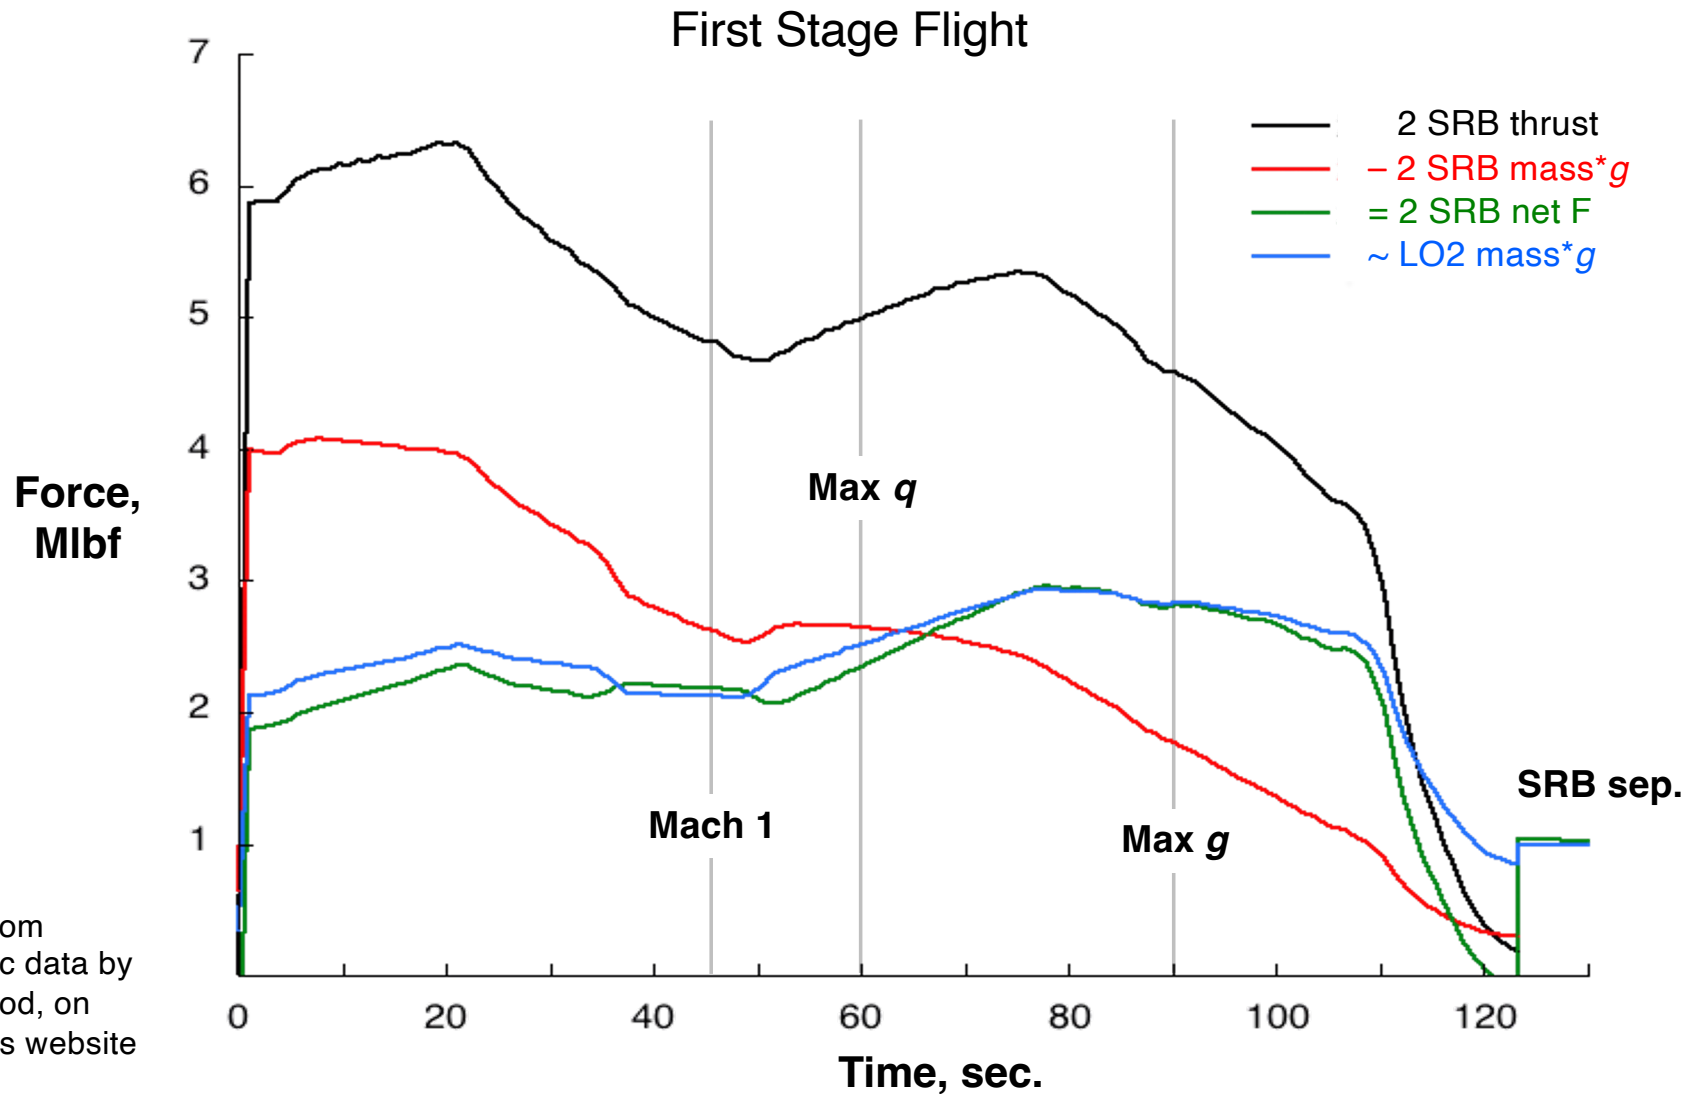

- SSMEs - 3@ 370 klbf
- SRBs - 2@ 2.9 Mlbf (85 pct. liftoff)
- Total thrust = 6.96 Mlbf

=> SRBs push themselves and LO2 mass uphill to staging

Compare to simple load paths for Saturn V and similar vehicles...

# Shuttle Ascent Loads Analysis

Derived from  
SpaceCalc data by  
W. Harwood, on  
CBS News website

## **When Do The SRBs Separate?**

**$P_c < 50$  indicator light at  $\sim 120$  sec.**

- SRB chamber pressure  $P_c < 50$  lbf/in<sup>2</sup>**
- Indicates imminent SRB separation**

**Est. SRB nozzle throat  $R = 27$  in.  $\Rightarrow A = 2290$  in<sup>2</sup>**

**At liftoff, SRB thrust  $F = 2.9$  Mlbf,  $P_c = 1000$  lbf/in<sup>2</sup>**

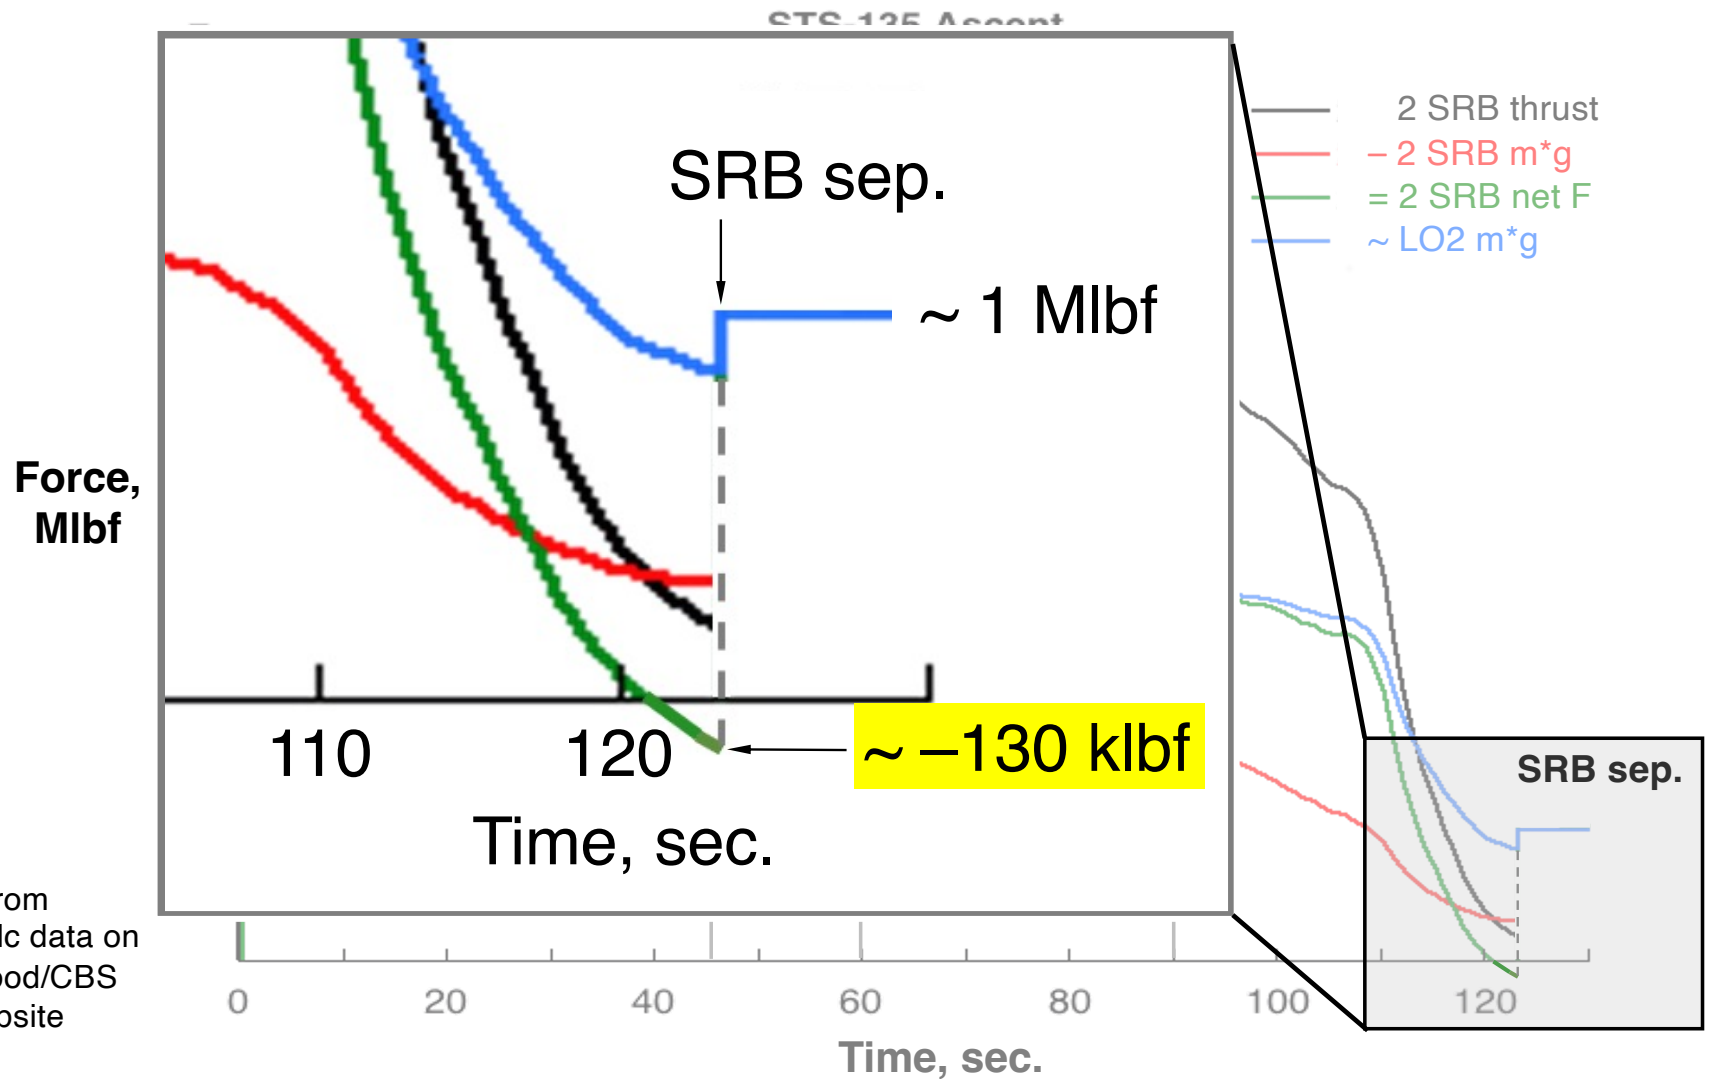

**$\Rightarrow$  Nozzle efficiency  $e = F/P_c \cdot A = 1.27$**

**At separation, SRB thrust  $F = P_c \cdot A \cdot e = 145.4$  klbf**

**- Net axial force = (145.4 klbf – SRB mass $\cdot 1g$ )**

**$\Rightarrow$  Approx.  $-50$  klbf (drag) per SRB**

# Shuttle Ascent Loads Analysis

Derived from  
SpaceCalc data on  
W. Harwood/CBS  
News website

# Space Shuttle SRB Mass Estimation

## Solid Rocket Booster (each)

- Assume cylinder;  $L = 149$  ft,  $R = 12$  ft/2
- D6AC steel;  $0.284$  lbm/in<sup>3</sup>,  $200$  klbf/in<sup>2</sup> tensile yield
- $1000$  lbf/in<sup>2</sup> peak internal pressure

From strength of materials, hoop stress  $= P \cdot R / t \Rightarrow t = P \cdot R / \sigma$   
Shell wall thickness  $t = (1 \text{ klbf/in}^2 \cdot 1.4 \text{ FS}) \cdot (72 \text{ in.}) / 200 \text{ klbf/in}^2$   
 $= 0.504 \text{ in.}$

Shell mass  $= 2 \cdot \pi \cdot R \cdot t \cdot L \cdot \rho$   
 $= 2 \cdot \pi \cdot (72 \text{ in.}) \cdot (0.504 \text{ in.}) \cdot (149 \text{ ft}) \cdot (0.284 \text{ lbm/in}^3)$   
 $\sim 115,800 \text{ lbm}$

Est. SRB mass  $= \text{shell mass} \cdot (\text{"systems \& growth" factor} \sim 1.75)$   
 $\sim 202,600 \text{ lbm}$  (vs. actual SRB mass  $192,946 \text{ lbm}$ )

## **SLWT Structural Sizing - “Top-down”**

### **SLWT LH2 Tank**

- Cylindrical tank,  $R = 331 \text{ in.}/2$**
- Barrel  $L = 928 \text{ in.}$**
- Ellipsoidal domes,  $H = 124 \text{ in.}$**

**Calculate tank volume =  $\pi * R^2 * L + 4\pi * R^2 * H/3$**

- Total tank volume =  $54,452 \text{ ft}^3$**
- Predicted tank struct. mass =>  $37.1 \text{ klbm}$**

**Actual tank struct. mass =  $23,886 \text{ lbm}$**

**(~ 35 pct below predicted)**

**=> Develop correction factor =  $0.65$**

# From Heineman, JSC-26098, Nov. 1994

37.1 klbm

Tank  
mass,  
lbm

# SLWT Structural Sizing - “Bottom-Up”

## SLWT LH2 Tank Barrel

- Cylindrical tank;  $L = 928$  in.,  $R = 331$  in./2
- $38.7$  lbf/in<sup>2</sup> proof test pressure
- Al-Li 2195;  $72$  klb/in<sup>2</sup> yield,  $0.098$  lbm/in<sup>3</sup>

From strength of materials,

- Barrel skin  $t = P \cdot R / \sigma \Rightarrow t = 0.089$  in.
- Skin mass  $= 2 \cdot \pi \cdot R \cdot L \cdot \rho \cdot t = 8417$  lbm
- Apply  $1.80$  average NOF\*  $\Rightarrow 15,151$  lbm
- Apply  $1.54$  acreage NOF  $\Rightarrow 12,962$  lbm

Actual orthogrid barrel mass =  $13,477$  lbm

( $60$  pct > skin;  $11$  pct < avg,  $4$  pct > acreage)

\* NOF = empirical *non-optimum factor*

# Ares V Structural Sizing - “Bottom-Up”

## Core Stage LH2 Tank Barrel

- Cylindrical tank;  $L = 1506$  in.,  
 $R = 396$  in./2
- 43.4 lbf/in<sup>2</sup> proof test pressure
- Al-Li 2195; 72 klb/in<sup>2</sup> yield,  
0.098 lbm/in<sup>3</sup>

Orthogrid unit cell

Barrel panel

Core LH2 tank

Ares V  
Launch  
Vehicle

## Ares V Structural Sizing (cont'd)

HyperSizer analyses performed to size integrally-machined panel for flight load cases; 0.160-in. skin thickness

- Proof pressure-sized skin thick. = 0.112 in.; *coarse* panel wt. = 448 lbm; 689 lbs w/ 1.54 acreage NOF
- Orthogrid areal wt. = 3.54 lbm/ft<sup>2</sup>; *intermediate* panel wt. = 958 lbm; 1188 lbs w/ 1.24 NOF
- Orthogrid unit cell wt.= 2.25 lbm; *refined* panel wt. = 1100 lbm; 1133 lbs w/ 1.03 NOF

Ares V load paths are *very different* from Shuttle ET  
=> Proof-pressure sizing probably not appropriate...

## **Concluding Remarks**

**A brief overview of classical and other selected structural mass estimation methods is presented**

### **Saturn V examples**

- S-IC intertank (+2.1 klbm; +16%)**
- S-IC / S-II interstage (−2.7 klbm; −28%)**
- S-II thrust structure (−0.9 klbm; −12%)**

### **Space Shuttle examples**

- Load paths during first-stage flight**
- Solid Rocket Booster (+9.7 klbm; +5%)**
- SLWT LH2 tank, barrel (+13.2/−2.0 klbm; +55/−14%)**

### **Ares V example**

**Use these techniques with great care and suspicion!**
