

What is the role of Usability and Trust in Autonomy?

Jessica J. Marquez, Ph.D.
NASA Ames Research Center

jessica.j.marquez@nasa.gov

A photograph of a space station in orbit above the Earth. The station's complex structure, including solar panels and various modules, is visible against the blackness of space. The Earth's horizon is a bright blue arc with white clouds, curving across the lower half of the image.

**Position: Trust in autonomy is enabled
by systems with high usability.**

NASA Playbook Case Study

State of the Art of Human Mission Operations

International Space Station (ISS)

Mission Control Center

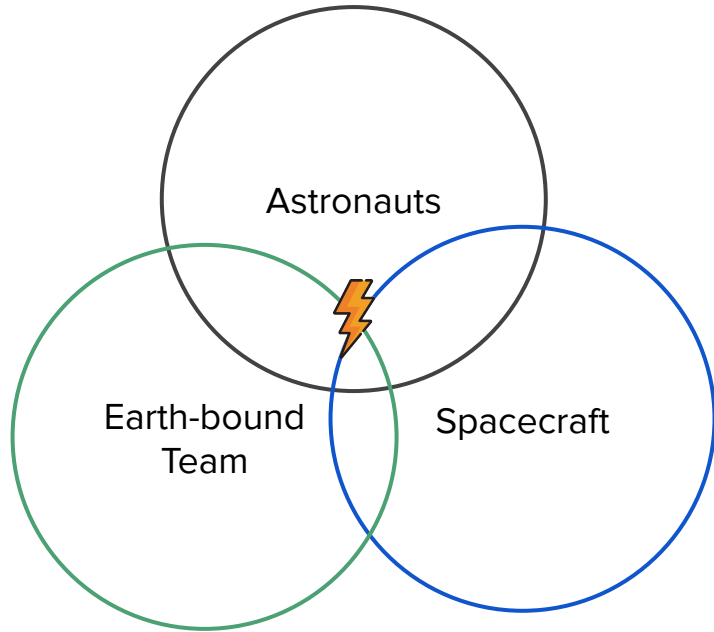

DoD HFE TAG #76, 22 - 26 April, 2024

S/G Daily Ops

A long-exposure photograph of a space station in orbit above Earth. The station is positioned in the upper center of the frame, appearing as a complex of white and metallic structures. Below it, the curved horizon of Earth is visible, showing a gradient from blue to orange. The background is filled with a dense field of star trails, creating a sense of motion and depth. The text "Human spaceflight operations needs to evolve." is overlaid in white, bold font across the lower portion of the image.

Human spaceflight operations needs to evolve.

Towards Earth Independent Operations

Communication transmission delays, limited bandwidth, and periods of no communication require NASA to change operations towards one that is more Earth-independent.

More automation, robotics, & autonomous systems to enable crew autonomy.

Enabling Crew Autonomy through Self-Scheduling

A software tool that enables the crew to manage their own schedule.

- Crew contributes their insight on how to schedule & reschedule activities.
- Minimizes idle time waiting for Mission Control responses.

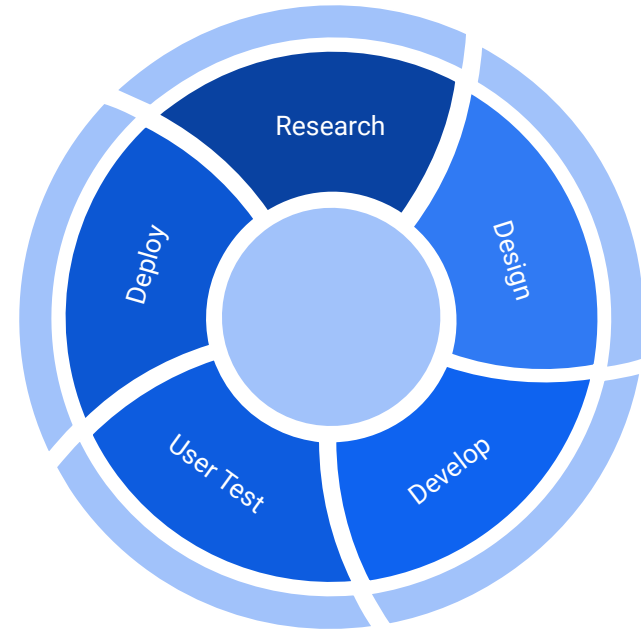

However, new schedules must abide by the mission's constraints and resources while not overwhelming astronauts.

Software tools must introduce more automation to everyday tasking:

- Automated constraint checking & verification.
- Suggested rescheduling.

Human-Computer Interaction (HCI) Process

- Human-Computer Interaction (HCI) Group follows HCI principles.
- Since 2002, HCI group has deployed software tools that enable spaceflight operations.
- Emphasize human-centered design process that includes:
 - Observation of work in operations,
 - Usability testing,
 - Iterative deployment software processes.

Combining Spaceflight & Analog Operational Experience

Mission Control supporting human spaceflight

Spaceflight Earth analog operations

deploying & testing software in analogs

Playbook: self-scheduling & execution software

Designed for tablet

Drag / drop for touch

Collaborative

Schedule for multiple crew members

Incremental Evaluations

Playbook

self-scheduling tasks that were varied, differing complexity, and novel strategies

Subjective Feedback

“Three things you liked about Playbook?”

Over ten years, simple word frequency count indicated that ~15% of positive comments related to usability.

Subjective feedback identified that our tool has high usability.

“Simple, convenient and intuitive design” — NEEMO crew (2014)

“Conveys lots of information concisely” – NEEMO crew (2017)

“Intuitive” – NEEMO crew (2019)

Controlled Laboratory Study

Quantifying self-scheduling performance as a function of scheduling task complexity.

- Controlled lab experiment to measure task effectiveness, efficiency, workload, situation awareness, **trust**, and **usability**.

Experiment Design

Thirty-one participants in a human-in-the-loop experiment used our self-scheduling software tool, Playbook.

- Participants trained and completed nine trials, including a baseline trial.
- Participants completed self-scheduling tasks, creating a timeline that did not have any violations.

Dependent Variables

- *Efficiency & Effectiveness*
Performance
- *Situation Awareness*
- *Workload*
- Trust
- Usability

Trust & usability were measured at the end of the experiment.

Self-Scheduling Task

The screenshot displays a task management interface for a 'Playbook for Test with ESSEX'. It includes a list of tasks and a Gantt chart showing activity scheduling for various groups (COMM, CDR, FE, MS-1, MS-2) over time (06:00 to 14:00 GMT).

Task List:

Activity Name	Cr/w	Execution Notes	Ops Note	Constraints	Priority	Due D
Robotic Arm Proc Review 1 hour and 15 minutes	FE	No Constraints	High Priority		High	Due w In Sca
Exercise-Strength 45 minutes	CDR	Claims Bike	High Priority	claims Bike	High	Due w In Sca
Exercise-Cardio 30 minutes	FE	Claims Treadmill	High Priority	claims Treadmill	High	Due w In Sca
Microfluids Stow	MS-1	No Constraints	High Priority		High	Due w

Gantt Chart Details:

- Groups:** COMM, CDR, FE, MS-1, MS-2
- Activities:** postsleep, dpc..., morn..., eva proc r..., exercis..., node 1..., mic..., 3d print..., exer..., humidifier d..., marr..., midday ..., obt emergency refresh
- Violation Markers:** Red triangles at 09:00 and 09:15.
- Self-Scheduling:** A green arrow indicates a task being dragged from the list to a slot in the Gantt chart.

Drag & drop to self-schedule;
violation markers indicated if
activity's constraint was not
met.

Results

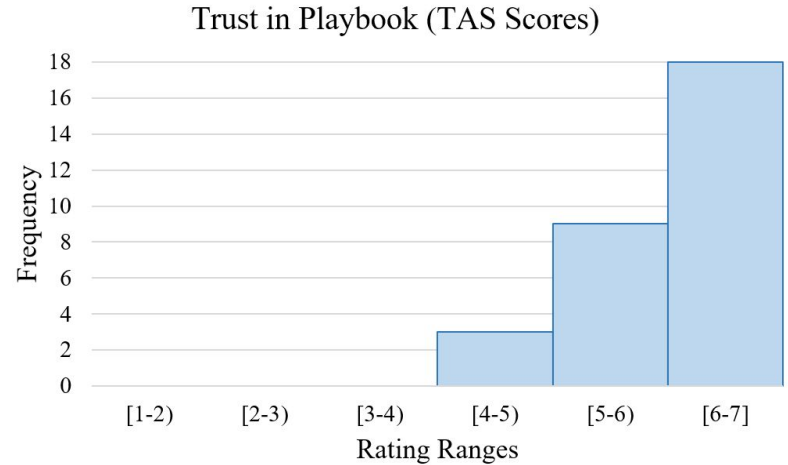

Trust

Trust was measured with the Trust in Automated Systems (TAS) Scale survey.

- Jian et al., 1998.

Participants reported relatively high trust in Playbook.

- Average trust score: 5.94 (SD = 0.64)

Results

Usability

User Experience Questionnaire (UEQ) characterizes usability across six factors (attractiveness, perspicuity, efficiency, dependability, stimulation, and novelty)

- Schrepp, Hinderks, & Thomaschewski, 2014

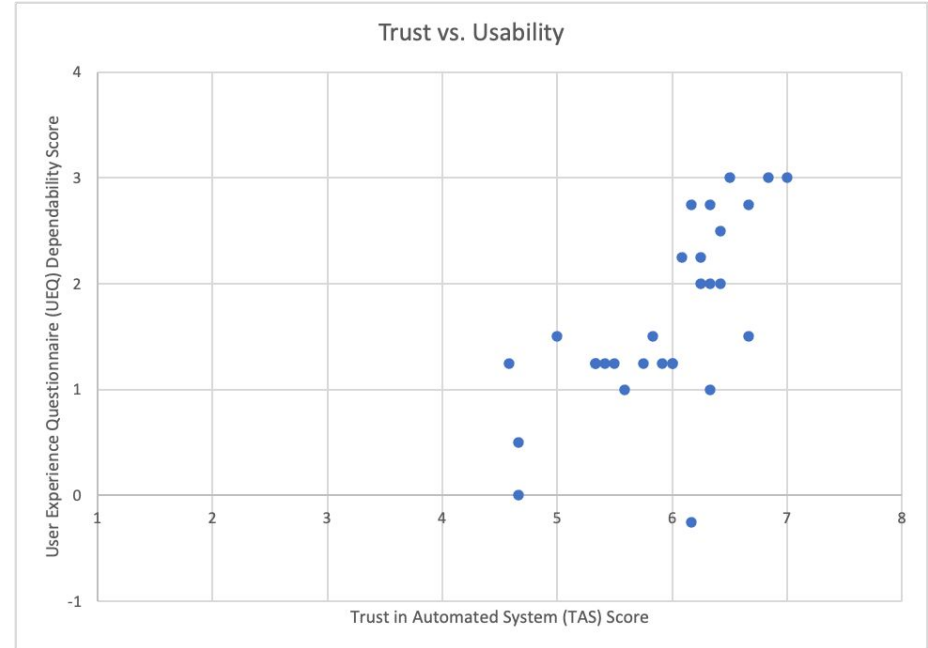

Playbook's usability was evaluated positively on most UEQ metrics.

Correlations Between Usability & Trust

Significant correlations between trust and all of the UEQ metrics.

- Strong correlation ($r > 0.5$) with UEQ
 - attractiveness, $p < 0.001$;
 - efficiency, $p < 0.001$;
 - dependability, $p < 0.001$;
 - stimulation, $p < 0.001$; and
 - novelty, $p < 0.01$.
- Moderate correlation between trust and perspicuity, $r(27) = 0.41$, $p < 0.01$.

Discussion

We confirmed subjective feedback about Playbook's high level of usability as well as found it correlated with learned trust.

Learned trust (Hoff & Bashir, 2015) develops from a user's (past or current) interactions with a system, which are driven by system performance and design features.

- Since participants did not have previous experience with Playbook, this trust is based on use during the experiment.

We did not find correlations between trust and other measures (workload, covariates such as dispositional trust & experience in scheduling).

Future work: collecting trust & usability within analog setting.

Concluding Remarks

- We identified a strong relationship between trust and usability.
- Other research has found a relationship between these factors. However, within the space domain, we have not identified any study that directly explored this relationship.
- Findings suggest that highly usable advanced software enables trust in automated systems for future autonomous crew.

What are NASA's Standards for future systems?

- From NASA Spaceflight Human-System Standard 3001, Vol. 2 (Rev. D) - Human Factors, Habitability, and Environmental Health (2023):
 - Standards emphasize Human-Centered Task Analysis, Human Error Analysis, and Iterative Developmental Testing.
 - Standards also include requirements for Operability (effectiveness & efficiency), Usability, and Situation Awareness, while minimizing Errors and excessive Workload.
