

# Moon to Mars Planetary Autonomous Construction Technology (MMPACT)

Dr. Jennifer Edmunson

NASA George C. Marshall Space Flight Center

22 April 2024

The MMPACT goal is to develop, deliver, and demonstrate on-demand capabilities to protect astronauts and create infrastructure on the lunar surface via construction of landing pads, habitats, shelters, roadways, berms, and blast shields using lunar regolith-based materials

Many infrastructure elements are required for a sustainable human presence on the Moon, and emplacement must be economical

**Critical Technology Needs:**

Excavation

*In Situ* Resource Utilization

Construction

Manufacturing

Power

**Power Plants**

**Launch/Landing Pads**

**Habitats, Refineries,  
Greenhouses**

**Blast Shields**

**Roads**

# Rockets are not *efficient* movers of building materials.

Even with commercial space flight dramatically dropping the launch costs to all-time historic lows, flying pre-built structures doesn't make financial sense. Even flying building materials from Earth to the Moon is cost prohibitive.

**\$ 0.11 per Kg**  
Costs of dry concrete on Earth

**\$ 1,200,000 per Kg**  
Cost to transport concrete to the Moon

**\$ 96,000,000,000**  
Just the dry concrete costs to print a 350 sq. ft. structure like the Chicon House on the Moon.

# Lunar Construction Roadmap

## Phase 1:

Develop & demonstrate excavation & construction capabilities for on-demand fabrication of critical lunar infrastructure such as landing pads, structures, habitats, roadways, blast walls, etc.

**Phase 2:** Establish lunar infrastructure construction capability with the initial base habitat design structures.

## Phase 3:

Build & Outfit the lunar base according to master plan to support the planned population size of the first permanent settlement (lunar outpost).

**Phase 4:** Complete build-out of the lunar base per the master plan and add additional structures as strategic expansion needs change over time.

# MMPACT Objectives

- Develop and demonstrate additive construction capabilities for various structures as materials evolve from Earth-based to exclusively *In Situ* Resource Utilization (ISRU)-based
- Develop and demonstrate approaches for integrated sensors and process monitoring in support of *in situ* verification & validation of construction system and printed structures
- Test and evaluate MMPACT hardware and materials products for use in the lunar environment
- Validate that Earth-based development and testing are sufficient analogs for lunar operations

Demonstration  
Mission 1 (DM-1)

2027

Demonstration  
Mission 2 (DM-2)

Qualification  
Mission 1 (QM-1)

2030's

Qualification  
Mission 2 (QM-2)

# MMPACT Requirements and Assumptions

- Level 1 requirements:
  - The system shall demonstrate lunar construction for future missions
  - The system shall additively construct structures using in-situ resources on the lunar surface
  - The system shall implement both autonomy and remote operations to carry out its tasks

- Mission success is defined as:

- The ability to emplace a structural element with an observed material characteristic

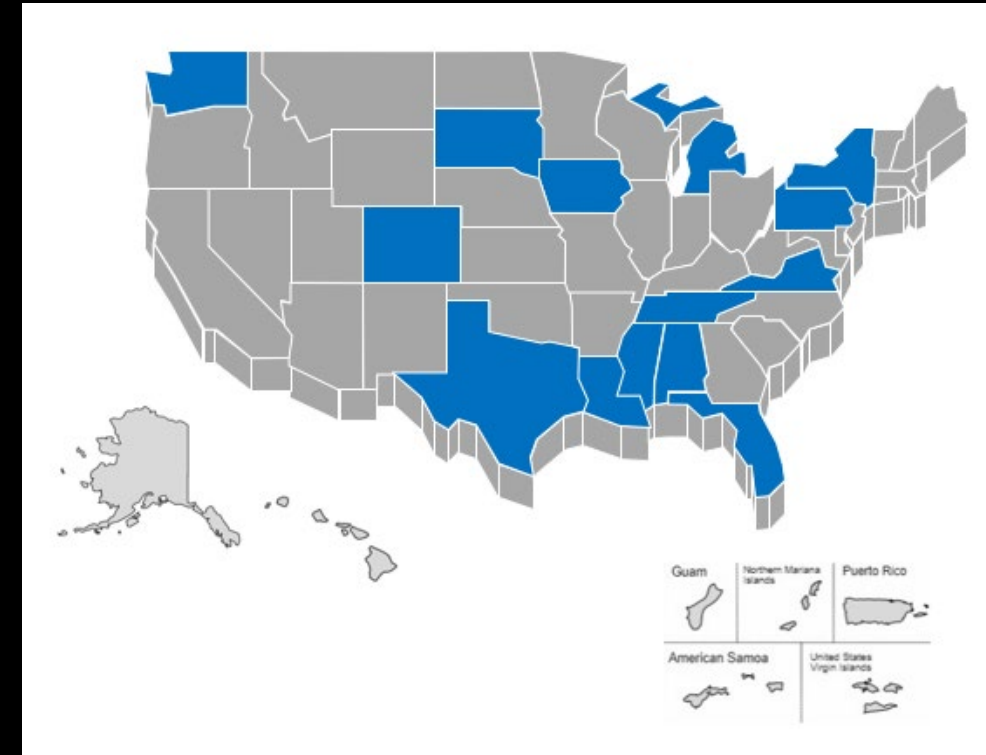

- Assumptions:

- South polar region regolith
  - South polar region lighting

# Collaborations and Partnerships

- Contributing partners and/or stakeholders
  - NASA Centers: MSFC, LaRC
  - OGA: AF Civil Engineering Center, Air Force Special Operations Command (AFWERX), Defense Innovation Unit (In Discussions), Texas Air National Guard, United States Air Force
  - Academia: Clarkson University, Drake State, Iowa State University, Mississippi State University, Pennsylvania State University, Sinte Gleska University, University of Alabama in Huntsville, University of Mississippi, University of Tennessee Knoxville
  - Industry: Blue Origin LLC, Dr. Holly Shulman, ICON Technology, Jacobs Space Exploration Group
- Target applications
  - Industry partner plans to commercialize construction technology on the Moon
  - Potential application for Artemis and Space Force, construction of a sustainable human exploration base

# MMPACT Materials

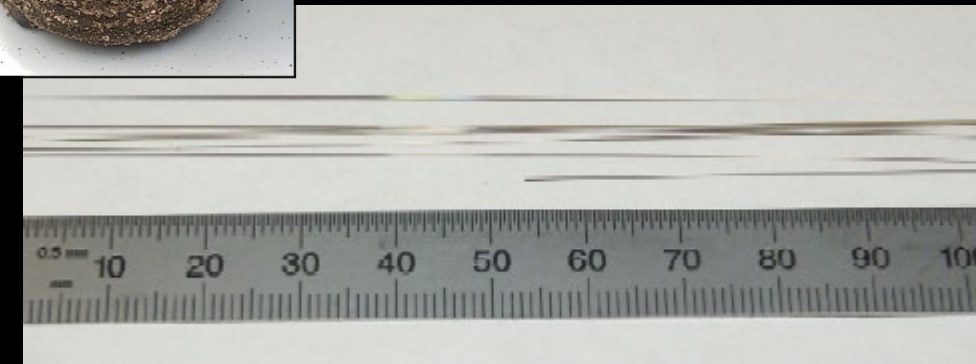

- Binder-Based Materials

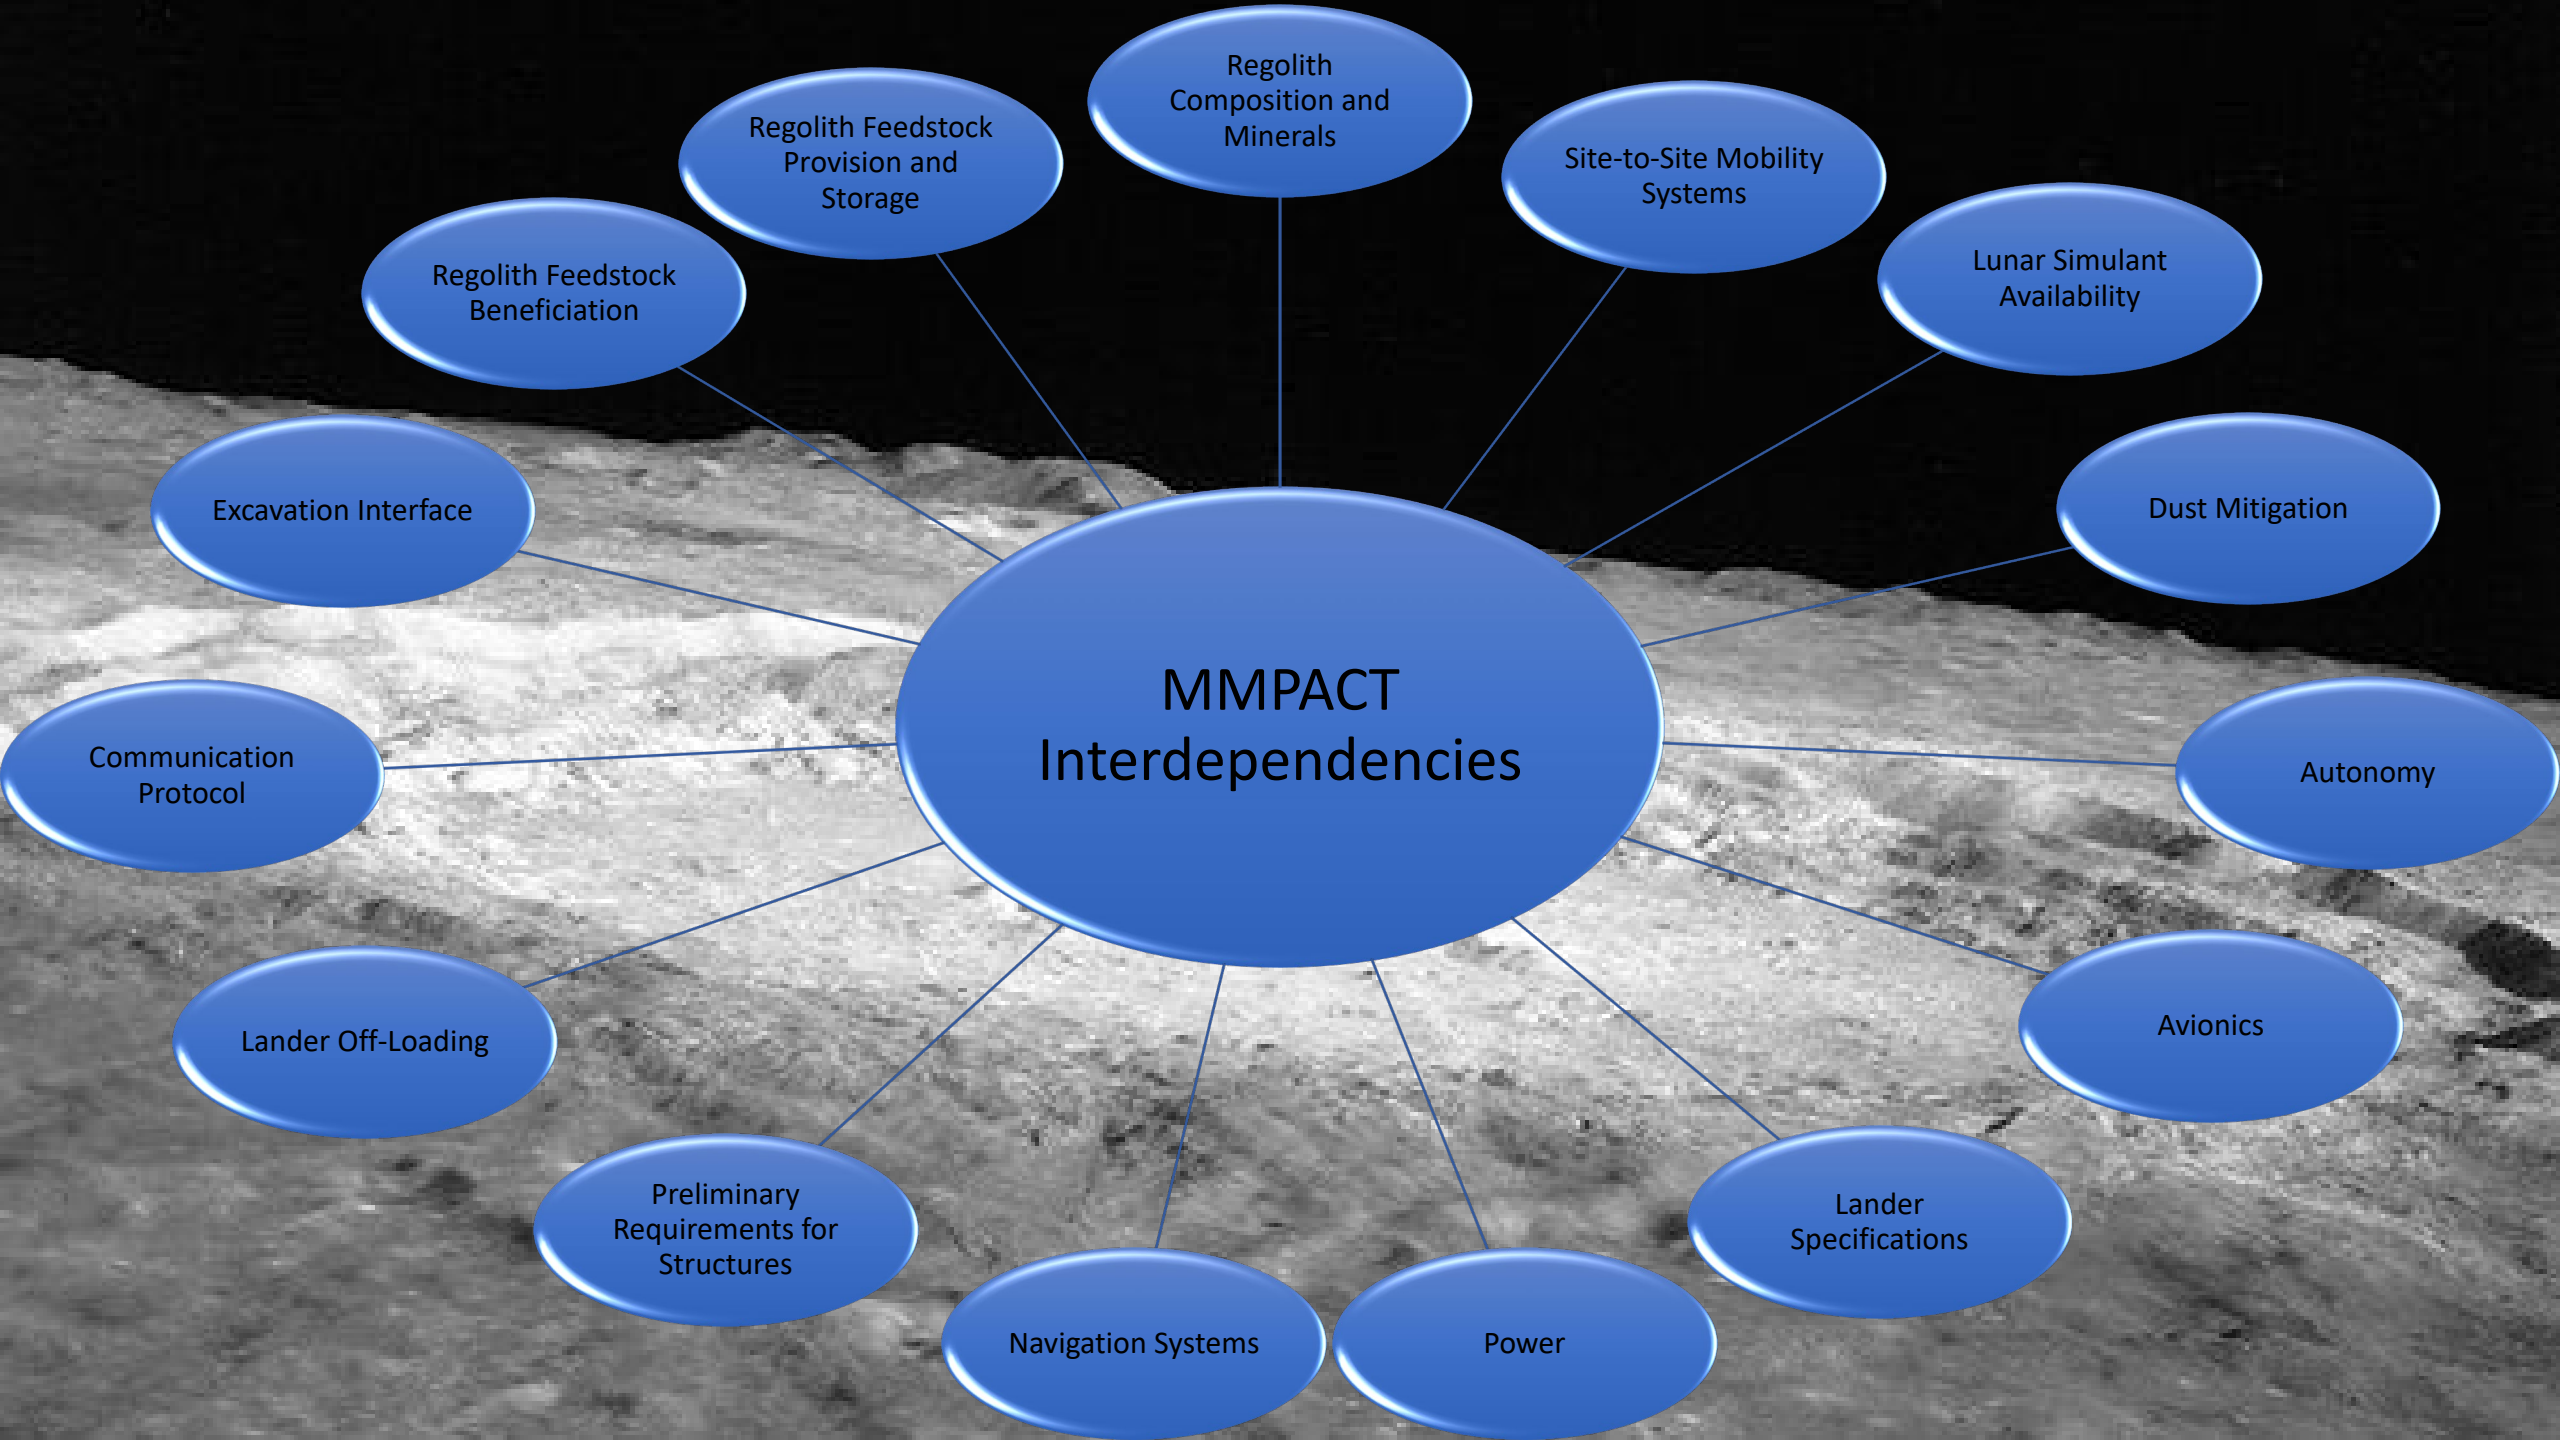

- Ordinary Portland Cement
- Magnesium Oxide-Based Cements
- Sodium Silicate
- Calcium Sulfo-Aluminate
- Geopolymers
- Polymers
- Sulfur Concrete

- 100% Regolith-Based Materials

- Microwave Sintering
- Laser Vitreous Material Transformation (VMX)
- Molten Extrusion
- Molten Casting

# MMPACT Interdependencies

Regolith Feedstock Provision and Storage

# Technology Gaps

- Scalable processes for extraction and/or purification (e.g., ionic liquids)
- Effective methods of dust mitigation
- Advanced materials for lunar and martian surface use
  - Controlled Coefficient of Thermal Expansion materials
  - Seals for hatches/penetrations
  - Composite parts (e.g., with regolith/basalt fibers)
  - Recyclable materials
  - Environmental durability
- Production of manufacturing and construction feedstock from in-situ resources
  - Creating additional alloys and binders (cements) from regolith
- Machining, joining, and assembly of ISRU-based materials
- Process monitoring and part verification
- Power infrastructure necessary for large-scale construction
