

LIFTOFF ENVIRONMENTS

ER42 Fluid Dynamics Branch POC: Matt Casiano

A Launch Environment, or Liftoff Environment, represents a source of loading during the hold-down or liftoff phase of a rocket launch. A launch vehicle is subjected to transient and oscillatory pressure loading on its exterior surfaces induced by engines and boosters during vehicle hold-down and liftoff. These pressure loads are a principal source of structural vibration which may result in the malfunction of vehicle components or the fatigue of exterior skin panels or component brackets. Additionally, the pressure loading gives rise to sound pressure inside the crew cabin which may impact the crew's health, safety, or ability to communicate.

Computational Acoustics using COMSOL: Liftoff Acoustics (Intensity)

Computational Simulation using COMSOL: Ignition Overpressure & Duct Overpressure

SLS Subscale Model Acoustic Test

Computational Fluid Dynamics using Loci/STREAM-VoF: Igniter Shock

Pressure Response on Vehicle

- | | |
|--|---|
| (1) Hydrogen Pop | (4) Booster Igniter Shock |
| (2) Engine Nozzle Flow Transient and Engine Overpressure | (5) Booster Ignition Overpressure & Duct Overpressure |
| (3) Hold-Down Acoustics | (6) Liftoff Acoustics and Infrasonic Acoustics |

Hydrogen Burn-Off Igniters during SLS Hold-Down

Ignition Overpressure Protection and Sound Suppression System

For the Space Launch System, the Launch Environments include Excess Hydrogen Pop, Core Stage Engine Overpressure, RS-25 Nozzle Flow Transient Acoustics, Hold-Down Acoustics, Booster Igniter Shock, Ignition Overpressure & Duct Overpressure, Liftoff Acoustics, and Infrasonic Acoustics.

Computational Acoustics, Computational Fluid Dynamics, Scale Model Acoustic Testing, Reduced-order Modeling, Data Processing, and Signal Processing are the primary tools and procedures used in predicting and quantifying Launch Environments.
