PROFESSIONAL ENGINEER CERTIFICATION

This 2023 Annual Performance Monitoring Report for the Dense Non-Aqueous Phase Liquid Source Zone, Operations, Maintenance, and Monitoring, Site-Wide Long-Term Monitoring, Hot Spot 6 Air Sparge System, and Hot Spot 6 Phase Two Expansion Construction Completion Report for Launch Complex 34, SWMU CC054, Cape Canaveral Space Force Station, Florida, dated July 2024, has been prepared by or under the responsible supervision, direction, or control of the Florida-licensed professional engineer whose signature and seal appear below. This document and the work described herein complies with standard professional practices and the requirements of Chapter 62-780, Florida Administrative Code (F.A.C.) and other rules of the Florida Department of Environmental Protection according to Rule 62-780.400(1), F.A.C.

EXECUTIVE SUMMARY

This Annual Performance Monitoring Report (PMR) for the Dense Non-Aqueous Phase Liquid (DNAPL) Source Zone (DSZ), Site-Wide Long-Term Monitoring (LTM), and Hot Spot 6 (HS 6) Air Sparge (AS) System presents the results of Year 14 operations and performance monitoring of the hydraulic containment (HC) Interim Measure (IM), details associated with construction and implementation of the HS 6 AS system expansion (Phase Two), and the results of operations and performance sampling of the HS 6 AS IM at Launch Complex 34 (LC34), located at Cape Canaveral Space Force Station (CCSFS), Florida. The timeframe for activities documented in this PMR extends from April 1, 2023 to March 31, 2024. LC34 has been designated Solid Waste Management Unit CC054 under the Kennedy Space Center (KSC) Resource Conservation and Recovery Act Corrective Action Program.

The objective of the HC IM at LC34 is to contain the shallow and deep DSZ and surrounding dissolved-phase trichloroethene (TCE) high concentration plume via operation of a hydraulic containment system (HCS). The pre-IM design 300 micrograms per liter (µg/L) TCE groundwater contour was used to establish the deep zone capture area for deep recovery wells, and the shallow zone capture area was defined by the DSZ. The system began operating in 2010, and in 2015, the system was expanded to provide HC for areas within the 300 µg/L TCE groundwater isocontours of HS 3 and 4. In 2018 and 2019, an investigation was conducted to re-characterize the DSZ, which included investigating TCE mass in Layer 7. This data was subsequently used to optimize the pumping rates of the HCS and install additional recovery wells in Layer 7 to more adequately capture residual contaminant mass.

The operational period for Year 14 of the HCS was from April 1, 2023 to March 31, 2024. Operational runtime for the system was 94 percent during Year 14, with downtime events attributed to planned maintenance, system repairs, and power outages. As of March 31, 2024, a total of 344,849,634 cumulative gallons of groundwater containing 94,656 pounds of chlorinated volatile organic compounds (CVOCs) have been removed by the HCS. During the reporting period covered under this report, the HCS recovered 31,176,393 gallons and approximately 6,319 pounds of CVOC mass. Total combined influent concentrations of TCE have decreased since startup from approximately 280,000 µg/L (January 2010) to 25,000 µg/L (March 2024).

During the reporting period, all effluent concentrations from the HCS (aqueous and vapor) were below regulatory reporting limits, indicating the system continues to operate as intended.

Performance monitoring was conducted in January 2024 within the DSZ to evaluate TCE contamination. Groundwater samples were collected via DPT at nine locations, consistent with previous events between 2017 and 2022. Full vertical profile sampling was completed at each DPT from 8 to 98 feet below land surface (bls), at 5-foot intervals. The DPT performance monitoring results are summarized in this PMR. The results revealed TCE remains at concentrations greater than 11,000 µg/L in the DSZ (1-percent solubility, indicative of DNAPL) at eight of the nine DPT locations and at depths ranging from 28 to 98 feet bls. An overall decreasing trend of TCE concentrations was observed in DPT samples during this reporting period, which is a reduction from the previous event (December 2022) and the peak event in December 2021, where TCE percentages appeared to increase in all depth zones because several recovery wells were turned off during the AS pilot study in the DSZ. The maximum TCE concentration in January 2024 was 1,600,000 µg/L in the 53 feet bls depth interval at DPT594 (previous maximum result in 2022 was 1,800,000 µg/L in the 48 feet bls depth interval at DPT599). This maximum concentration in the 53 feet bls depth interval is in the deep capture zone. During the January 2024 DPT event, the largest portion of TCE mass was observed in the 48 feet bls interval above/within Layer 4. This trend remains consistent with previous years and appears to indicate continued mass discharge from Layer 4 (fine-grained unit).

In addition to DPT sampling, annual groundwater samples were collected from 11 deep monitoring wells in the DSZ area (Layers 7 and 8) in December 2023 to verify vertical and horizontal delineation. Three of the wells were also sampled biweekly to evaluate operations of recovery well RW21D (screened 86 to 106 feet bls), which was installed in January 2023. Of the Layer 7/8 monitoring sampled only annually, results were non-detect or less than groundwater cleanup target levels GCTLs in December 2023, with the exception of one well, IW45D2, which had a cis-1,2-dichloroethene (cDCE), detection greater than the GCTL. Of the three wells sampled biweekly during the operational period, the well located closest to Layer 7 recovery well RW21D (IW44D2, screened 105 to 115 feet bls) had concentrations of TCE, cDCE and vinyl chloride (VC) greater than GCTLs throughout the operational period, but displayed a

decreasing trend since the peak concentrations in September 2023. The maximum TCE concentration during this operational period was 190,000 µg/L at IW44D2 in September 2023, but reduced to 700 µg/L in March 2024, indicating the HCS is still effectively removing mass from the source area. Expansion of the HCS and addition of new recovery wells is ongoing and will continue to be evaluated as the groundwater recovery scheme is optimized. Details of the expansion and optimization will be provided in a future PMR.

The HS 6 AS IM was initiated in 2018 with 160 AS wells and expanded in 2019 with another 140 AS wells. An additional expansion of the HS 6 AS IM was completed during the reporting period covered under this report and details of the construction implementation and startup of the expansion are detailed in Section III of this report. The new expansion, referred to as Phase Two, was implemented between August 17, 2022 and August 28, 2023, and included the installation of 190 air sparge wells to treat an additional 11.2 acres. The original configuration (referred to as Phase One) operated until Phase Two came online, then all but 52 AS wells were turned off so the components could be moved and utilized in the Phase Two area. The 52 AS wells that remain on are in a barrier configuration preventing contaminated groundwater from impacting the treated area. The HS 6 AS system (both Phase One and Two) operated normally during the reporting period covered under this report. Semi-annual performance monitoring of the Phase One configuration was conducted in April and November 2023, consistent with previous years. For the Phase Two configuration, 21 new monitoring wells were installed and sampled quarterly, with a baseline event in July 2023, and quarterly events in November 2023 and February 2024 summarized in this report. Semi-annual monitoring results collected in April and October 2023 show concentrations of contaminants of concern (cDCE, trans-1,2-dichloroethene, and VC) have decreased to less than GCTLs in nearly all wells and not impacting the surface water drainage canal, indicating the HS 6 IM continues to meet objectives. The baseline and quarterly sampling for the Phase Two configuration indicate generally decreasing concentrations in wells within and around the perimeter of the treatment area. At least two more quarters of monitoring will be conducted and once those results are evaluated a reduced the sampling frequency may be considered.

Overall, the tasks associated with Year 14 operation of the HC IM and operation of the HS 6 AS IM were performed in accordance with recommendations included in the previous 2022 LC34 (Year 13) PMR. Evaluation of results from the HC IM and HS 6 IM show that these systems are operating as designed and meeting performance objectives.

The following items are recommended for Year 15 of operation of the HCS (April 1, 2024 through March 31, 2025):

- Continue site-wide LTM on a biennial frequency with the next LTM event in December 2024. This event will include the same 55 wells sampled during the previous 2022 biennial event and one well that was recommended to be relocated, as detailed in the 2022 PMR.

- Continue operation of the HCS with the following actions:

    - Continued operation of the catalytic oxidizer for offgas treatment;

    - Monthly sampling of aqueous effluent from the air strippers, and liquid phase granular activated carbon when online;

    - Quarterly sampling of combined system influent and individual recovery well influent (monthly at Layer 7 and Layer 7/8 recovery wells);

    - Annual vapor-phase sampling;

    - Annual sampling in the DSZ at the same nine DPT locations (DPT593 to DPT601) and depth intervals as the 2023 event; and

    - Annual sampling at 11 Layer 7/8 wells (IW0001D2, IW0042D2, IW0043D2, IW0044D2, IW0045D2, IW0160, IW0161, IW0162, IW0163, IW0164, and IW0165), with biweekly sampling at selected locations as-needed based on results.

    - Once the new Layer 7 air compressor is operational, begin operating recently installed Layer 7 recovery wells.

- Continue operation of the HS 6 AS system with the following actions:
    - Weekly inspection of flow meters, transmitters, and AS system components for leakage and excessive vibration, noise, or abnormal temperatures;
    - Weekly inspection of oil levels and lubrication;
    - Weekly inspection of condensate treatment systems and refrigerated air dryer;
    - Assessment of differential pressure across filtration units and process equipment;
    - Recording of system operational data and comparing data to design conditions and previous operating data;
    - Repairing and cleaning equipment as needed;
    - Routine maintenance and housekeeping as needed; and
    - Semi-annual performance monitoring at 28 wells and three surface water locations sampled for the Phase One configuration and quarterly sampling of 21 wells for the Phase Two configuration.

Results and recommendations summarized in this PMR were presented to the KSC Remediation Team on June 13, 2024, and Team concurrence was received on the path forward (Meeting Minute 2406-M09, Decisions 2406-D34 through D37). It is understood that the Florida Department of Environmental Protection may have questions or additional recommendations based on their review of this report.

SECTION I
INTRODUCTION

This 2023 Annual Performance Monitoring Report (PMR) for the Dense Non-Aqueous Phase Liquid (DNAPL) Source Zone (DSZ), Site-Wide Long-Term Monitoring (LTM), and Hot Spot (HS) 6 Air Sparge (AS) System presents the results of Year 14 operations and performance monitoring of the hydraulic containment (HC) Interim Measure (IM), details associated with construction and implementation of the HS 6 AS system expansion (Phase Two), and the results of operations and performance monitoring of the HS 6 AS IM at Launch Complex 34 (LC34), located at Cape Canaveral Space Force Station (CCSFS), Florida. This site has been designated Solid Waste Management Unit (SWMU) CC054 under the Kennedy Space Center (KSC) Resource Conservation and Recovery Act (RCRA) Corrective Action Program. This PMR was prepared by Tetra Tech, Inc., for the National Aeronautics and Space Administration (NASA) under Indefinite Delivery Indefinite Quantity Contract 80KSC019D0011-80KSC019F0067. The reporting period covered under this PMR is April 1, 2023 through March 31, 2024.

The HC IM for the DSZ was implemented in 2009-2010. The Year 14 operational period for the HC IM was from April 1, 2023 to March 31, 2024. The following activities were completed during Year 14 of the HC IM:

- Continued operation and maintenance (O&M) of the hydraulic containment system (HCS);
- Monthly sampling of primary and secondary air stripper effluent;
- Monthly sampling of the liquid-phase granular activated carbon (LPGAC), when online;
- Annual sampling of seven Layer 7 and 8 recovery wells, with four additional wells sampled more frequently for performance monitoring
- Quarterly sampling of combined system influent and individual recovery well influent;
- Annual vapor-phase sampling (pre- and post-catalytic oxidation unit [CatOx] treatment); and,

- Annual performance monitoring of the HCS via groundwater sample collection at nine DPT locations and 11 monitoring well locations in the DSZ, with selected wells also sampled biweekly (Table 1-1).

The HS 6 IM AS system was implemented in 2018 to prevent plume expansion and migration into the drainage canal and to contain and remediate the HS 6 area located downgradient to the east of the HC IM at LC34. The HS 6 AS system is currently in the operational phase in accordance with the Implementation Work Plan (IWP) (NASA, 2017b) and expansion IWP (NASA, 2018). A second phase (Phase Two) of the HS 6 AS expansion was implemented in accordance with the Phase Two IWP (NASA, 2021a) and revised Phase Two IWP Advance Data Package (ADP) (NASA, 2022a). Details of construction and implementation of the HS 6 Area Phase Two AS system expansion are included in Section III of this report.

The following HS 6 IM activities were completed during the operational period covered under this report:

- Construction completion activities associated with the HS 6 Phase Two expansion, including:
- Pre-construction DPT sampling conducted in August 2022;
- Installation of 190 AS wells in October 2022 – February 2023;
- Installation of 21 performance monitoring wells in November 2022 – January 2023;
- Installation of trenches, piping, utilities, and phased startup in January 2023 – August 2023; and,
- Baseline sampling of the 21 new performance monitoring wells (July 2023) and two quarterly monitoring events (November 2023 and February 2024) for volatile organic compound (VOC) analysis (Table 1-1).

- Semi-annual sampling in April and November 2023 of the original (Phase One) HS 6 performance monitoring network, which includes 28 monitoring wells and three surface water locations for VOC analysis (Table 1-1); and,

- O&M of the HS 6 AS system including the original configuration (Phase One) and Phase Two.

The activities listed above were presented in an ADP during the June 13, 2024 KSC Remediation Team (KSCRT) Meeting and are presented in detail in this report. The ADP and Meeting Minutes from June 13, 2024 are included in Appendix A.

Note, site-wide LTM at LC34 is conducted on a biennial basis to evaluate the dissolved-phase low concentration plume (LCP) and high concentration plume (HCP) at the site. The most recent (2022) biennial LTM sampling results and recommendations are detailed in the 2022 Annual PMR (NASA, 2023b) and are summarized in Section 1.4.31 of this report. During the 2023 monitoring period covered under this report, the LTM network was not sampled; the next biennial LTM sampling event is scheduled for December 2024.

1.1 BACKGROUND

LC34 is located at CCSFS in Section 6, Township 23 South, and Range 38 East, in the False Cape Quadrangle. CCSFS was previously named Cape Canaveral Air Force Station, with formal name change occurring in December 2020. LC34 is bordered to the north by Launch Complex 37, to the south by Launch Complex 20, to the west by ICBM Road (Samuel Phillips Parkway), and to the east by the Atlantic Ocean. The launch pad and associated facilities at LC34 were built in the late 1950s and used by NASA's Apollo Space Program for the launching of Saturn rockets from 1960 to 1968. The Apollo 1 tragedy occurred on the launch pad on January 27, 1967. LC34 became part of the Man In Space National Historic Landmark in 1984.

Historical information suggests that rocket engines and other parts were cleaned at the site using solvent degreasers, most notably trichloroethene (TCE). It is speculated that releases of solvents occurred during cleaning operations through both intentional and unintentional discharges to nearby areas. Based on groundwater and soil sampling data, these releases occurred primarily in

the immediate vicinity of the former Engineering Support Building (ESB) located southwest of the Blockhouse and identified on Figure 1-1. Since shutdown of the launch pad in 1968, LC34 has remained largely inactive, although several site features (e.g., Blockhouse, camera pad, etc.) are still present. Most operational equipment (service towers, fuel storage tanks, piping, etc.) has been dismantled, and the majority of previous on-site buildings and structures were abandoned in place. Native and invasive vegetation has overgrown the majority of the site, and dense wooded areas currently surround the site. Figure 1-1 shows the site location and major site features.

1.2 SITE CHARACTERIZATION

Beginning in 1993, a number of site investigations, engineering studies, and pilot-scale in situ remedial technology demonstrations were conducted at LC34. Extensive soil and groundwater contamination was identified and characterized during these investigations into seven HS areas (Figure 1-2). Chlorinated compounds TCE, cis-1,2-dichloroethene (cDCE), trans-1,2-dichloroethene (tDCE), and vinyl chloride (VC) are the primary contaminants of concern (COCs) and have been detected at trace to high concentrations in groundwater and soil. TCE is also present as a DNAPL in the ESB area and is currently being contained by the HCS.

The majority of the mass of TCE at LC34 is present upgradient (west) of HS 6 within the DSZ. The overall mass of TCE released at the site is unknown. Modeling performed in 2005 estimated the mass of TCE DNAPL at the time as 40,500 pounds in the shallow zone (0 to 50 feet below land surface [bls]) and an additional 33,300 pounds in the lower zone (50 to 120 feet bls) of the surficial aquifer. In 2019, data collected in support of the source area re-characterization study indicated the approximate total TCE mass has been reduced to 32,000 pounds. It is noted, however, that the presence of DNAPL creates a higher degree of uncertainty in this estimate. At HS 6, the TCE daughter products cDCE, tDCE and VC are the primary COCs. The tDCE results only exceeded State of Florida Groundwater Cleanup Target Levels (GCTLs) and cDCE and VC were the only constituents that exceeded Florida Department of Environmental Protection (FDEP) Natural Attenuation Default Concentrations (NADCs), representing 1,500 pounds and 430 pounds, respectively. Currently, the extent of the overall groundwater contaminant plume where COCs exceed GCTLs is approximately 322 acres. Within the overall plume, the hydraulic

capture zone currently covers approximately 10 acres, and the HS 6 treatment area is approximately 14.4 acres.

1.3 LITHOLOGY

Subsurface materials have been subdivided into nine facies (layers) in the LC34 area. Layers 1, 2, 3, 6, and 8 are considered the primary water-transmitting units in the site area and are the focus of the LTM and performance monitoring program. The lithologies of Layers 1 through 8, illustrated on Figure 1-3, are as follows:

- Layer 1 – tan/gray fine sand with shell fragments (approximately 25 feet thick from 0 to 25 feet bls);
- Layer 2 – gray silty clayey fine sand (approximately 5 feet thick from 25 to 30 feet bls);
- Layer 3 – gray silty fine sand with shell fragments (approximately 12 to 15 feet thick from 30 to 45 feet bls);
- Layer 4 – (shallow confining unit) – greenish gray sandy clay unit (less than 1 to 5 feet thick from 45 to 50 feet bls);
- Layer 5 – medium to coarse sand with shell fragments (approximately 12 to 15 feet thick from 50 to 65 feet bls);
- Layer 6 – gray fine to medium “salt and pepper” sand (approximately 15-20 feet thick from 65 to 80-85 feet bls);
- Layer 7 – fine silty gray sand with abundant shell fragments (approximately 15-20 feet thick from 80-85 to 100 feet bls); and
- Layer 8 – fine to coarse sand with shell fragments (approximately 20 feet thick from 100 to 120 feet bls).

- The Hawthorn Group (Layer 9), which directly underlies the lower sand unit (Layer 8) and ranges from 120 to 140 feet bls, is a thick green sandy clay and is considered a regional confining unit.

1.4 SITE HISTORY

This section provides a summary of investigation activities, documents, and what KSC formerly called the Engineering Evaluation (EE) Process and reports for LC34. LC34 was transitioned into the EE Multi-Step Process following installation of the original HC IM in 2008. Per the KSC Decision Process Document (NASA, 2019b), the EE process was developed to characterize and address groundwater contamination through one or more iterative IMs until a final recommendation of groundwater monitoring is appropriate for the site. The steps of the EE process are designed to allow KSCRT members the opportunity to participate in confirmation of groundwater delineation, evaluation of remedial technologies, review of preliminary designs, and evaluation and optimization of the efficacy of treatment systems following installation. The four steps of the EE process include Site Characterization (formerly referred to as Step 1 EE), Remedial Alternatives Evaluation (RAE) (formerly referred to as Step 2 EE), IM Design and Implementation (formerly referred to as Step 3 EE), and IM Optimization and Monitoring (formerly referred to as Step 4 EE), and the results of these steps are presented as ADPs at KSCRT Meetings. Although the individual steps in the EE process are similar to individual phases of the RCRA Corrective Action process, they are not intended as replacements. For example, Site Characterization is similar to a RCRA Facility Investigation (RFI) but does not serve as a replacement for this document or phase. Accordingly, RAE is similar to Corrective Measures Study (CMS), and IM Design and Implementation is similar to Corrective Measures Design (CMD). The last step, IM Optimization and Monitoring, is applicable to active IMs only, as passive IMs would proceed to interim groundwater monitoring after the previous step.

An overview of site activities and document submittals is summarized in the following sections.

1.4.1 RCRA Facility Investigation. The RFI Report for LC34 was submitted in 1999 and included human health and ecological risk assessments (NASA, 1999).

1.4.2 RCRA Facility Investigation Addendum. The RFI Report Addendum for LC34, prepared in July 2003, summarized remediation demonstration projects conducted at the site by the Interagency DNAPL Consortium and RFI Addendum activities conducted in 2002 and 2003 (NASA, 2003). Six demonstration projects were performed at LC34 using the following technologies: chemical oxidation, Six-Phase Heating™, steam injection, emulsified zero-valent iron (ZVI), bioaugmentation, and sequential oxidation/enhanced bioremediation. RFI Addendum field activities included collection of membrane interface probe (MIP) data, soil cores, groundwater level measurements, and groundwater samples.

1.4.3 Corrective Measures Study Report. The CMS identified and evaluated potential remedial technologies based on existing site conditions and contamination identified during RFI and RFI Addendum activities. The selected alternative was hydraulic containment of the DSZ and TCE HCP, monitored natural attenuation (MNA) with IMs in the HCP, and MNA of the LCP (NASA, 2007). The HCP has concentrations of COCs greater than FDEP NADCs, and the LCP has concentrations of COCs greater than GCTLs.

1.4.4 Interim Measure Design. The design details for the proposed IM remediation system, which was focused primarily on the area identified as HS 2, were provided in the 2008 LC34 Interim Measures Design for Hydraulic Containment of the DNAPL Source Zone and Deep TCE Groundwater Plume (NASA, 2008). Additional assessment activities, including MIP and DPT sampling, were conducted in 2008 to refine the horizontal and vertical extent of TCE contamination in the vicinity of the ESB. The deep zone results were used to determine the limits of the capture area for the proposed HCS.

1.4.5 Hot Spot 1 Site Characterization ADP. The HS 1 Site Characterization for LC34, presented at the April 2009 KSCRT Meeting, summarized field investigations conducted to delineate the TCE plume to the NADC (300 micrograms per liter [µg/L]). MIP results, cone penetrometer test (CPT) and lithology data, and DPT and monitoring well sampling results were included in the Site Characterization. Team consensus was reached to install a monitoring well screened from 70 to 80 feet bls in the area of well cluster IW0002, to install piezometers within the capture zone in Layer 5, and to conduct a slug test in the area of the IW0002 well cluster. Team consensus was also reached on the alternatives for the RAE, which included

bioremediation, thermal treatment, large-diameter auger (LDA), and excavation (Meeting Minute 0904-M4, Decisions 0904-D09 through D12).

1.4.6 Interim Measure Work Plan. The DSZ Interim Measure Work Plan (IMWP) presented the activities required to install, operate, and monitor the HC IM (NASA, 2009b).

1.4.7 Hot Spot 1 Site Characterization Addendum. The HS 1 Site Characterization Addendum presented at the October 2009 KSCRT Meeting summarized follow-up field activities completed as proposed at the April 2009 meeting. Slug testing was performed at four Layer 5 monitoring wells. Team consensus was reached to proceed with an Environmental Security Technology Certification Program pilot study to evaluate bioremediation with a partitioning electron donor (PED) in HS 1, beginning with preparation of an IMWP (Meeting Minute 0910-M11, Decision 0910-D34).

1.4.8 Hot Spot 2 Performance Monitoring ADP. A Performance Monitoring ADP was presented at the July 2010 KSCRT Meeting to summarize IM activities conducted since startup of the HCS on December 7, 2009. At the time of the presentation, due to an involved troubleshooting phase, the system had only been operational 65 percent of the time since startup, increasing to an operational runtime of 80 percent following troubleshooting. The treatment system was installed to treat influent groundwater at a peak flow rate of 50 gallons per minute (gpm). The primary components included groundwater recovery via three shallow (screened interval of 15 to 45 feet bls) and six deep recovery wells (screened interval of 50 to 80 feet bls) for DSZ and deep TCE plume containment, primary treatment via air stripping, air stripper off-gas treatment via catalytic oxidation, and treated groundwater discharge to an infiltration gallery and 12 deep injection wells (screened interval of 50 to 80 feet bls). The approved path forward was to install piezometers where performance monitoring data gaps were present; perform a hydraulic capture study in Layers 1, 2, 3, and 6 using pressure transducers; adjust pumping rates to increase hydraulic capture; install additional extraction wells (as needed); and test the use of condensate from the quench as an acid source to lower pH in the air stripper aqueous effluent.

1.4.9 Interim Measure Completion Report. The LC34 HC IM Completion Report, dated April 2011, presented the activities associated with implementation of the HS 2 IM, including construction, commissioning, and startup (NASA, 2011a).

1.4.10 Hot Spots 3 and 4 Site Characterization ADP. The HSs 3 and 4 Site Characterization ADP for LC34, presented at the December 2011 KSCRT Meeting, summarized delineation of TCE contamination to the NADC (300 µg/L), MIP results, CPT and lithology data, and DPT and monitoring well sampling results. Team consensus was reached to install monitoring wells in HS 4 to evaluate TCE concentrations exceeding the NADC in the 6- to 10-foot and 11- to 15-foot bls intervals. Additionally, KSCRT consensus was reached to evaluate expanding the HCS as an optimization in the Performance Monitoring ADP, without first preparing an RAE and IMWP for HSs 3 and 4 (Meeting Minute 1112-M14, Decisions 1112-D20 and D21).

1.4.11 Hot Spot 1 Interim Measures Implementation ADP. The HS 1 IM Implementation ADP for the PED demonstration was presented at the December 2012 KSCRT Meeting. The PED demonstration was the first field implementation using n-butyl acetate (nBA), and the PED was successfully injected into the low-permeability zone. During the pilot test, over 1 million gallons of groundwater were recirculated, with an approximately 92-percent reduction in the mass of chlorinated volatile organic compounds (CVOCs) observed in two recovery wells after 12 months of operation. Team consensus was reached to collect groundwater samples in March 2013 at BW-01B, BW-01C, and BW-01D for analysis of CVOCs, nBA, and methane, ethane, and ethene to evaluate the potential for a second injection event (Meeting Minute 1212-M4, Decision 1212-D5).

1.4.12 Pumping Optimization and Hot Spots 3 and 4 Expansion ADP. The Pumping Optimization and HSs 3 and 4 Expansion ADP, presented at the March 2013 KSCRT Meeting, described a proposed IM pumping optimization and HCS expansion to address HSs 3 and 4. The presentation also included results from a MIP investigation performed to evaluate contaminant magnitude and a hydraulic profiling tool (HPT) investigation performed to evaluate hydraulic permeability variations. The results of the MIP and HPT investigations were correlated to distinguish mobile and stored mass signatures within the HC zone, particularly within the DSZ, and to provide pumping optimization recommendations. KSCRT consensus was reached on

recovery well optimizations at select wells, including adjusting of pump intake invert elevations and isolating screened intervals via water-inflated packers (Meeting Minute 1303-M3, Decision 1303-D9). For the HCS expansion, Team consensus was reached for modification and retrofitting of the treatment system, proposed recovery well locations, pumping rates, and expansion construction plans (Meeting Minute 1303-M4, Decisions 1303-D10 through D14). Of note, HS 4 is no longer within the current HCS capture zone boundary (see Figure 1-2). This is because of the reduction of TCE concentrations in HS 4 over the years and the resulting optimization of the HCS pumping scheme.

1.4.13 Hydraulic Containment Expansion Implementation Work Plan. The Hydraulic Containment Expansion Implementation Work Plan described the activities for expansion of the existing HCS to HSs 3 and 4 in the shallow surficial aquifer and additional source zone recovery in the deep surficial aquifer. The expansion included seven new shallow recovery wells and one deep recovery well, 11 new monitoring wells, and installation of infrastructure and treatment equipment required to accommodate expansion of the hydraulic containment footprint (NASA, 2014).

1.4.14 Hydraulic Containment Expansion Construction Completion ADP. The LC34 Hydraulic Containment IM Expansion Construction Completion ADP, dated September 2015, presented the activities associated with implementation of the expansion of the HC IM, including installation of new recovery wells, installation of packers in selected recovery wells, installation of a new air stripper, refurbishment of the catalytic oxidizer, commissioning, and startup (Meeting Minute 1509-M05; NASA, 2015).

1.4.15 Hot Spot 6 Area of Investigation Site Characterization ADP. The HS 6 Area of Investigation Site Characterization ADP, dated December 2016, summarized delineation, and refinement of the TCE, cDCE, and VC HCPs and HS downgradient of HS 1 using DPT and monitoring well sampling results. Team consensus was reached to collect additional samples at depth at DPT418 and surface water samples from the drainage canal within HS 6 (Meeting Minute 1612-M2, Decisions 1612-D2 through D4).

1.4.16 Hot Spot 6 Area Implementation Work Plan. The Implementation Work Plan for HS 6, dated November 2017, described the AS system installed to remediate contaminated groundwater within the treatment zone and support transition to MNA (NASA, 2017b).

1.4.17 Hot Spot 6 Area Expansion Implementation Work Plan. The Implementation Work Plan for HS 6 Expansion, dated October 2018, described the AS system expansion installed to remediate contaminated groundwater within the treatment zone and support transition to MNA (NASA, 2018).

1.4.18 2018 Operations, Maintenance, and Monitoring Report and Hot Spot 6 Construction Completion Report. The 2018 Operations, Maintenance, and Monitoring Report (OMMR) and Hot Spot 6 Construction Completion Report (CCR), dated June 2019, described the Year 9 operation and performance monitoring of the HCS, results from the biennial LTM event, and provided construction completion details for the HS 6 AS system, which was installed in two stages. Construction of the initial stage of the HS 6 AS system included the installation of 160 AS wells and 11 monitoring wells between February 19, 2018 and July 7, 2018. The AS system operated from July 9, 2018 through January 7, 2019, when it was shut down for the expansion. Construction for the expanded AS system was conducted from November 9, 2018, through April 2, 2019. An additional 140 AS wells and 14 monitoring wells were installed (NASA, 2019c). The expanded system was fully operational in May 2019.

1.4.19 Hot Spot 5 Site Characterization Engineering Evaluation ADP. The HS 5 Site Characterization ADP, dated June 2019, summarized delineation of the cDCE and VC HS located downgradient (south-southwest) of the DSZ using DPT sampling results, as well as HCP and LCP conditions along and to the south of Phillips Parkway. Team consensus was reached that HS 5 was adequately delineated horizontally and vertically, and to also implement a HS 5 AS barrier wall north of Phillips Parkway (Meeting Minute 1906-M12, Decisions 1906-D70 and D71). Note, the HS 5 AS barrier has not been implemented to date because the U.S. Space Force is considering a project that would realign Phillips Parkway in this vicinity.

1.4.20 Soil Interim Measure Report. The Soil Interim Measure Report, dated January 2019, describes the removal of soils contaminated with polychlorinated biphenyls (PCBs),

dioxins/furans, and total recoverable petroleum hydrocarbons from 20 different areas around the site. No Further Action for soil was approved for all 20 areas (NASA, 2019a).

1.4.21 Hydraulic Capture System Investigation Work Plan. The HCS Investigation Work Plan, dated June 2019, described the activities proposed to re-characterize the DSZ, to include investigating and delineating TCE in the Layer 7 lithologic zone. Activities included soil and groundwater sampling at discrete depth intervals to delineate TCE, installation of monitoring wells in the source area, and a pump test to determine the effectiveness of the HCS in Layer 7 (NASA, 2019d).

1.4.22 DSZ Site Characterization Engineering Evaluation ADP. The DSZ Site Characterization Engineering Evaluation ADP, dated October 2019, presented the results of the HCS Investigation including site characterization sampling, TCE delineation, well installation and sampling, updated mass calculations, results of the Layer 7 aquifer testing, and HCS revised pumping rates. During the DSZ site characterization, a Layer 7 recovery well was installed in August 2019 (RW17C, screened from 80 to 95 feet bls) to evaluate feasibility of HCS expansion into the fine-grained unit. Six monitoring wells (IW0160 through IW0165, screened from 105 to 115 feet bls) were also installed in Layer 8 in the source area in August 2019 but outside the TCE >11,000 µg/L contour. Team consensus was reached that TCE was adequately delineated in the source area, and the path forward included preparation of an RAE to evaluate the next phase of the treatment train (Meeting Minute 1910-M02, Decisions 1910-D02-D22).

1.4.23 Electrical Substation T-2 Area Soil Interim Measure Report. The Soil Interim Measure Report Electrical Substation T-2 Area, dated January 2020, described the sampling and removal of PCB-contaminated soil and concrete in a former electrical substation area located along the southeast side of the LC34 launch pad. A fence was installed as an engineering control to prevent exposure to residual PCBs in concrete and soil beneath the concrete where the electrical equipment was previously located. A monitoring well was also installed in this area (IW0122) and groundwater sampling for PCBs was incorporated into the site's biennial LTM program (NASA, 2020a).

1.4.24 2019 Operations, Maintenance, and Monitoring Report for DNAPL Source Zone and Hot Spot 6 Air Sparging System. In the 2019 OMMR, dated April 2020 (NASA, 2020b), it was recommended to discontinue LTM sampling at wells in Layer 3 and Layer 6, which included IW0015D, IW0031D, IW0052D, IW0066D1, and IW0068D because of their proximity to the HCS, abandon wells IW0021S, IW0038S, and IW0038I because of damage or obstructions, and initiate PCB sampling at well IW0122 to monitor the Electrical Substation T-2 IM area. In addition, the frequency of Layer 8 wells IW0001D2, IW0042D2, IW0043D2, IW0044D2, and IW0045D2 was increased from biennial to annual to monitor performance of the HCS. These recommendations and the Year 11 sampling plan were presented in the April 2020 KSCRT meeting and received concurrence from the Team (Meeting Minute 2004-M03, Decisions D05, D06). The monitoring wells recommended for abandonment (IW0021S, IW0038S, and IW0038I) have since been abandoned by the KSC Remediation Program.

1.4.25 Remedial Alternatives Evaluation and DNAPL Source Zone Air Sparge Pilot Study Work Plan. A DSZ RAE Discussion and Pilot Study was presented to the KSCRT in the October 2020 meeting. The DSZ from the 2019 Site Characterization was compared to the historical plume in 2009. It was concluded that the DSZ was relatively the same size, perhaps slightly larger, different configuration, and that it extended into Layer 7. In addition, mass calculations showed that a large majority of the mass was trapped within the fine-grained units, Layer 4 and Layer 7. The on-going RAE was discussed to determine the next implementable step for the treatment train for the DSZ. Preliminary alternatives included LDA with steam and ZVI, in situ thermal treatment, pump-and-treat with microbial amendments, and expansion of the HCS to control Layer 7. The pilot study was developed to determine the feasibility of AS to treat groundwater contamination, within and below confining lithology units. Consensus was reached to conduct the AS pilot study with a work plan developed and submitted for review (Meeting Minute 2010-M4, Decision 2010-D8). The DSZ Air Sparging Pilot Study Work Plan (NASA, 2021b) included design details for installation of AS wells to various depths between 43 and 82 feet bls, and installation of piezometers, vapor monitoring points, and vertical air distribution columns (VADCs) for data collection. The revised work plan was submitted and approved by FDEP in April 2021. The pilot study operated from July 2021 to February 2022, with results presented to the KSCRT in September 2022 (described below).

1.4.26 Hot Spot 6 Area Expansion Phase Two Implementation Work Plan. The Hot Spot Area 6 Expansion – Phase Two Implementation Work Plan, dated January 2021 (NASA, 2021a), described the design to expand the HS 6 AS system area. The design included installation of 76 AS wells to depths of approximately 35 feet bls, to remediate contaminated groundwater within a 4-acre area located north of the existing HS 6 treatment area. The expansion targeted "hot spot" concentrations of cDCE and VC. Elements of the IWP were presented during the December 2020 KSCRT meeting, and consensus was reached to proceed with development of the work plan and implement the project. The IWP was approved by FDEP on June 18, 2021.

Implementation of the expansion was delayed while the U.S. Fish and Wildlife Service reviewed information regarding threatened and endangered species at LC34. Planning for the next expansion proceeded, and in May 2022, FDEP was briefed on additional expansion that would include 116 AS wells and 10 performance monitoring wells over an area of 5.7 acres. FDEP concurred with proceeding without an additional IWP on condition that further expansion would be documented with as-builts in the CCR. The proposed additional expansion was documented in a revised ADP, dated March 2022 (NASA, 2022a).

Implementation of the Phase Two expansion area is complete, with the new AS wells integrated into existing HS 6 AS operations in August 2023. Construction completion, start-up, operation, maintenance, and monitoring, and performance data for the Phase Two expansion area are included in this Annual PMR.

1.4.27 2020 DNAPL Source Zone Operations Maintenance and Monitoring (OM&M), Site-Wide LTM, and HS 6 AS Performance Monitoring Report. Activities and monitoring results associated with the 2020 operational period (April 1, 2020 to March 31, 2021) for the HCS and HS 6 AS system were presented to the KSCRT in June 2021. Site-wide biennial LTM results from 56 wells were also presented, which found no TCE concentrations greater than GCTLs, tDCE greater than the GCTL in only one well, and cDCE and VC concentrations greater than GCTLs in the LCP and NADCs in the HCP at select locations. Trend analysis of the biennial wells showed generally decreasing or stable trends along the plume boundaries with increasing trends in the interior or transitional portions of the plume. KSCRT consensus was reached to continue monitoring on a biennial basis with the next event in 2022, abandon wells found to be

damaged (IW0012S and TMW0001), and continue monitoring one well for PCB analysis (Meeting Minute 2106-M06, Decision D04). Consensus was also reached to continue OM&M of the HCS consistent with the current approach (Meeting Minute 2106-M06, Decision D05) and continue operation of the HS 6 AS IM, but to reduce the performance monitoring frequency from quarterly to semi-annual (Meeting Minute 2106-M06, Decisions D06 and D07) (NASA, 2021c). Monitoring wells IW0012S and TMW0001 were abandoned by the Remediation Program in July 2021 (NASA, 2021d).

1.4.28 2021 DNAPL Source Zone OM&M, and HS 6 AS Performance Monitoring Report. Activities and results associated with the 2021 operational period (April 1, 2021 to March 31, 2022) for the HCS and HS 6 AS system were presented to the KSCRT in June 2022. Results from the HCS showed the system was operating as designed and the IM objective was continuing to be met; however, sampling results from Layer 8 well, IW0162 (screened 105-115 feet bls), showed a TCE detection during the monitoring event. The well was re-developed and subsequent monthly sampling showed increasing concentrations of TCE, with a March 2022 result of 33 µg/L. The increasing concentrations were suspected to be from downward migration enhanced by well re-development. It was recommended to install an additional recovery well, screened 90-100 feet bls, to manage TCE beneath recovery well RW20C (screened 80-95 feet bls). Team consensus was reached to continue OM&M consistent with the current approach and install the new recovery well (Meeting Minute 2206-M04, Decisions D02 and D03). Results from the HS 6 AS system showed that the IM was operating as designed and meeting performance objectives. At that time, the HS 6 expansion was still pending a biological assessment and had not been initiated. Team consensus was reached to continue operating the AS system, and semi-annual performance monitoring of the same wells and surface water locations (Meeting Minute 2206-M04, Decision D01) (NASA, 2022b).

1.4.29 DNAPL Source Zone Air Sparging Pilot Study Report. Pilot study results were presented to the KSCRT in September 2022. The pilot study commenced in July 2021 and ended in February 2022. Data was collected to evaluate radii of influence (ROI), ambient air, vapor emissions, groundwater, and system operations. Data was used to evaluate geotechnical conditions, ROI, vapor emissions and limits, and treatability. The pilot study showed that vapor

capture and treatment would be required if AS was implemented full-scale in the DSZ and that VADCs would be necessary to vent vapors from under Layer 4. The pilot study concluded that a full-scale design should include a conservative 15-foot ROI. Based on findings, Team consensus was reached that AS was a feasible technology for further evaluation in the RAE (Meeting Minute 2209-M03, Decision D07) (NASA, 2022c).

1.4.30 DNAPL Source Zone Area Remedial Alternatives Evaluation ADP. The DSZ RAE was presented to the KSCRT in February 2023. Five alternatives were evaluated: Alternative 1 (DSZ-1) was optimization of the HCS with full-scale expansion into Layer 7; Alternative 2 (DSZ-2) was AS with vapor capture; Alternative 3 (DSZ-3) was LDA with steam and ZVI and AS; Alternative 4 (DSZ-4) was in situ solidification/stabilization with cement and persulfate and AS; and, Alternative 5 (DSZ-5) was a slurry wall with cap and hydraulic control, and emulsified ZVI and vegetable oil injection. The ADP presented details for each alternative and comparisons (e.g., advantages and disadvantages, limitations, cleanup timeframes, sustainability considerations, and projected costs). Short-term (DSZ-1) and long-term (DSZ-3) alternatives were recommended. Team consensus was reached on the short-term alternative (DSZ-1) to optimize the HCS with full-scale expansion into Layer 7 (below 80 feet bls) in the DSZ area where TCE is greater than 300 µg/L (DSZ-1) (Meeting Minute 2302-M04, Decision D01), and also on the long-term alternative (DSZ-3) to conduct a two-phase IM to include LDA with steam and ZVI in the DSZ area where TCE is greater than 11,000 µg/L (except near the Blockhouse), and AS in the DSZ area where TCE concentrations are between 300 µg/L and 11,000 µg/L (Meeting Minute 2302-M04, Decision D02) (NASA, 2023a).

1.4.31 2022 DNAPL Source Zone OM&M, Site-wide LTM, and HS 6 AS Performance Monitoring Report. Activities and monitoring results associated with the 2022 operational period (April 1, 2022 to March 31, 2023) for the HCS and HS 6 AS system were presented to the KSCRT in October 2023. Site-wide biennial LTM results from 55 wells were presented, which found no TCE or tDCE concentrations greater than GCTLs, cDCE and VC concentrations were greater than GCTLs in the LCP and NADCs in the HCP at select locations, consistent with the previous LTM event in 2020, with trends continuing to generally decrease. KSCRT consensus was reached to continue LTM on a biennial basis with the next event in 2024, abandon a well

found to be damaged (CW0002) and re-install it further at the edge of the LCP north along the beach, and continue monitoring one well for PCB analysis (Meeting Minute 2310-M11, Decisions D28 and D29) (NASA, 2023b). The HCS continued to meet operational goals during the reporting period and efficiency was increased with installation of new recovery well RW21D. Consensus was reached to continue OM&M of the HCS consistent with the current approach and continue the annual performance monitoring scheme with selected wells sampled biweekly (Meeting Minute 2310-M11, Decision D30). For HS 6, consensus was reached on continued OM&M of the IM with semi-annual performance monitoring and transition to a new operational scheme once the Phase Two expansion is online (Meeting Minute 2310-M11, Decisions D31-D33).

1.4.32 HS 6 AS Phase Three Expansion Site Characterization and IWP ADP. Activities for site characterization and IWP of the Phase Three Expansion was presented in February 2023. A DPT investigation was conducted in 2023 to refine delineation of two hot spot areas previously exceeding 10xNADC to support air sparging implementation. There were 314 samples collected from 49 locations (spaced 100 feet apart) in Area #1, located west and southwest of the HCS 1-year capture zone, and 275 samples collected from 44 locations (spaced 50 feet apart) in Area #2, located southeast of the launch pad. The proposed expansion design included 192 AS wells total (170 in Area #1 and 22 in Area #2) to treat a total of 9.4 acres (8.3 acres in Area #1 and 1.1 acres in Area #2). Team consensus was reached that Areas #1 and #2 were adequately delineated and to implement the Phase Three expansion of the HS 6 AS IM based on the ADP and submission of a subsequent IWP to FDEP (Meeting Minute 2402-M03, Decisions D02-D04).

1.5 PURPOSE

The purpose of this PMR is to present various activities conducted at LC34 during the Year 14 operational period of the HC IM (April 1, 2023 to March 31, 2024). Activities included operation and performance monitoring of the HCS, construction and implementation of the HS 6 Phase Two expansion, and overall operation and performance monitoring of the HS 6 AS system (original configuration and expansion).

Notes:

Sampling network shown represents the reporting period from April 1, 2023 to March 31, 2024
Samples are analyzed for VOCs by EPA Method 8260D
(1) - Well IW0122 is only analyzed for PCBs by Method 8082 to monitor the T2 Area
* IW0044D2 and IW0162 were on a biweekly sampling schedule during the reporting period
IW0165 was sampled biweekly until October 2023
LTM - Long-Term Monitoring
HCS - Hydraulic Capture System
HS 6 - Hot Spot 6
PM - Performance monitoring
At each DPT location 19 depth intervals are sampled; from 8 to 98 feet below land surface

SECTION II
HCS IM OPERATIONS, EVALUATION, AND PERFORMANCE MONITORING

This section summarizes the performance of the HCS during this reporting period (April 1, 2023, to March 31, 2024) and discusses the performance monitoring sampling results for the overall HC IM. System performance includes evaluation of system runtime, system sampling results, condition of process components, and volume and mass recovery. Sampling logs and field documentation associated with the HCS are provided in Appendix B.

2.1 INTERIM MEASURE OBJECTIVES

The primary objective of the HC IM is to contain the shallow and deep DSZ and surrounding TCE HCP via operation of the HCS. The pre-IM design 300 µg/L TCE groundwater contour was used to establish the deep zone capture area for deep recovery wells, and the shallow zone capture area was defined by the DSZ. In 2015, the original system providing hydraulic containment in the HS 2 area was expanded to provide hydraulic containment of HS 3 and 4. The expanded containment system included areas within the 300 µg/L TCE groundwater isocontours of HSs 3 and 4. Secondary IM objectives include maintaining treatment standards for aqueous and air discharges, maintaining system equipment to sustain plume containment, and maximizing contaminant mass removal.

2.2 HCS OVERVIEW

The following sections provide an overview of the treatment process of the HCS. Sections 2.2.2 and 2.2.3 give a summary of modifications to the process components and O&M procedures during the lifetime of the system including any changes made during this reporting period.

2.2.1 Process Description. This section provides a process description of the LC34 HCS, as operated during the reporting period of April 1, 2023 to March 31, 2024. The HCS layout is shown on Figure 2-1. The piping and instrumentation diagrams are provided on Figures 2-2 through 2-4.

During the current operational period, groundwater was extracted from four shallow zone recovery wells (RW01A, RW02A, RW03A, and RW09A), three deep zone recovery wells (RW01B, RW02B, and RW03B), four Layer 7 zone recovery wells (RW17C, RW18C, RW19C, and RW20C) and from the recovery well that straddles Layers 7 and 8 (RW21D). The pumping rates and scheme for the recovery wells have been adjusted over the course of the IM based on concentrations and mass recovery. Recovery wells have been added, such as RW21D in January 2023, or turned off to optimize the pumping scheme over the course of the IM, to enhance contaminant recovery. Recovery wells selected to be turned off had consistent TCE detections below 300 µg/L. Pumps in each recovery well convey contaminated groundwater (influent) to the treatment system located on the former ESB concrete slab. Flow rates of extracted fluids from individual recovery wells are individually totalized prior to being manifolded. Two 25-micron bag filters, plumbed in parallel arrangement, remove sediment from the water prior to entry into a 500-gallon, 304-stainless-steel, double-walled, equalization tank. A chemical metering pump doses groundwater from the equalization tank with a biodispersant in 15-minute dosage cycles every 8 hours to prevent biological accumulation within treatment system components.

A three-phase, 240-volt, 1.5-horsepower (hp), pump transfers groundwater from the equalization tank into the primary horizontal four-tray air stripper that strips most of the CVOCs from groundwater into the vapor phase. The air strippers are equipped with a three-phase, 240-volt, 20-hp blower rated for 600 standard cubic feet per minute (scfm) that conveys atmospheric air into the secondary air stripper, which then flows into the primary air stripper. Treated groundwater is pumped from the primary air stripper sump to the secondary horizontal four-tray air stripper via a three-phase, 240-volt, 1.5-hp, transfer pump where most, if not all, of the remaining CVOCs are removed from the liquid into the vapor phase. The treated water from the secondary air stripper sump is pumped by a three-phase, 240-volt, 7.5-hp transfer pump through two 50-micron bag filters plumbed in parallel. The treated water is then pumped through two available 1,500-pound LPGAC vessels in series to provide secondary treatment, when necessary. The water is then discharged into 12 deep zone injection wells and an infiltration gallery consisting of two 300-foot-long infiltration gallery laterals. Treated groundwater is metered and injected into the 12 injection wells at flow rates of 2 gpm per well and at pressures less than 5

pounds per square inch (psi), and the remaining flow is discharged to the infiltration gallery located southeast of the ESB area.

Moisture in the CVOC-laden primary air stripper exhaust is removed via a moisture separator. Moisture condensate accumulated in the moisture separator is pumped via a three-phase, 240-volt, 0.5-hp, centrifugal, transfer pump into the equalization tank. Following moisture separation, the exhaust air undergoes treatment via a CatOx unit rated for an air flow of 600 scfm. The unit contains a 50 percent efficient air-to-air heat exchanger, a three-phase, 480-volt, 112-kilowatt, air heater with a watt density of 29 watts per square inch, and specialized catalyst media for destruction of CVOCs. A quench tower reduces the air temperature of the CatOx discharge to less than 130 degrees Fahrenheit (°F) by injecting a fine droplet water aerosol. An acid gas scrubber neutralizes the acidic process stream generated during oxidation of CVOCs in the CatOx. As part of the acid gas scrubbing process, 20-percent sodium hydroxide (NaOH) is injected into a recirculation line via a chemical metering pump connected to a 3,000-gallon double-walled storage tank. The chemical metering pump is controlled by a pH sensor and controller that adjusts the NaOH dosage rates to maintain a near neutral pH within the scrubber sump. Quench and scrubber makeup water is provided via CCSFS potable water service. A 2,000-gallon reservoir tank and booster pump provide continuous flow (3 to 4 gpm) and pressure (60 psi) to the quench and scrubber makeup water feeds. Process water from the air scrubber blow-down is discharged into the infiltration gallery at an average rate of 3 to 4 gpm.

2.2.2 Summary of Component Modifications. This section gives an overview of the changes to the HCS process components over the course of the IM to date. The original system was built in 2009 and full-scale O&M began in May 2010. In February 2015, the system was expanded which added seven shallow recovery wells (RW09A through RW15A) screened 15 to 45 feet bls and one deep recovery well (RW16B) screened 50 to 80 feet bls, removed the air stripper and installed two new air strippers, removed the DNAPL separator because there was no DNAPL present in the influent, replaced the control system with Siemens Human Machine Interface (HMI)/Programmable Logic Controller (PLC), and the CatOx was refurbished with a metal housing and a new catalyst module. The system operated without significant modification between 2015 and 2019. In August 2019, a new recovery well (RW17C) screened from 80 to 95

feet bls was installed which started extracting groundwater at 1 gpm from Layer 7. During the initial startup of RW17C, the two 1,500-pound LPGAC vessels were returned online from August 2019 to November 2019 to ensure system effluent met GCTLs. In January 2021, three additional recovery wells were installed (RW18C, 19C, 20C) in Layer 7 with the same screen interval as RW17C. The LPGAC vessels operated during startup of these recovery wells and have since operated through March 2024. In January 2023, RW21D was installed and screened from 86 to 106 feet bls with the upper nine feet of the screen in Layer 7 and the lower 11 feet in Layer 8. A pumping test was performed that determined 15 gpm was the maximum pump rate the recovery well could accommodate. To operate RW21D at maximum flow and not surpass design gpm of the HCS treatment system, RW12A, RW13A, RW14A, RW15A, RW5B, and RW16B, which had low CVOC recovery, were turned off. Monthly influent sampling indicated that this change did not result in a decrease of CVOC recovery.

2.2.3 Summary of O&M Modifications. This section gives an overview of the changes to the O&M schedule over the course of the IM to date. Further details related to the original commissioning, startup, and prove-out of the system are provided in the 2010 Annual Groundwater Monitoring and Interim Measure Performance Report (NASA, 2011b), and details related to the commissioning, startup, and prove-out of the expanded system are provided in the 2015 CCR (NASA, 2015). The O&M phase initially involved weekly influent and effluent sampling and daily system monitoring. The system sampling frequency transitioned to monthly after the September 22, 2010 sampling event, and this frequency was maintained during 2011 and 2012 O&M activities. Team consensus was reached at the May 2013 KSCRT Meeting to reduce the system influent and air stripper effluent sampling frequencies to quarterly (Meeting Minute 1305-M10, Decision Item 1305-D27). The system was shut down on February 10, 2015, for expansion and modification and startup of the modified system began in May 2015, and full-scale treatment resumed on June 15, 2015. After resumption, quarterly influent and effluent sampling continued until the November 2017 increase in overall flow rate to 83 gpm, after which sampling of air stripper effluent was conducted monthly. The recovery wells installed in Layer 7 (RW17C, 18C, 19C, 20C) and Layers 7/8 (RW21D) are also sampled monthly, as opposed to quarterly with the rest of the recovery wells. Since installation of the Layer 7 recovery wells, the LPGAC effluent has been sampled on a monthly frequency as well.

Since the HCS came online in 2010, the boundaries of the deep and shallow capture zones have changed over time based on system expansion and optimization. The capture zones are continually optimized to ensure IM objectives are met and mass removal is maximized. Of note, HS 4 is no longer within the current HCS capture zone boundaries. This is because of the reduction of TCE concentrations in HS 4 over the years and the resulting optimization of the HCS pumping scheme. During this operational period, the 1-year capture zones covered about 7.8 acres (shallow) and 9.5 acres (deep).

2.3 YEAR 14 OPERATIONAL PERFORMANCE

This section presents operational performance of the HCS during the reporting period, which represents Year 14 of system operation. System influent totalizer data was recorded on a weekly basis and used to evaluate performance parameters such as treated volume. HCS operational data was recorded monthly to track long range performance of the system components. Table 2-1 presents the system operational data recorded during the reporting period.

System downtime is recorded for periods where the system is not operating due to planned and unplanned circumstances. System runtime (i.e., system availability) is then calculated relating the downtime to the total possible runtime of the system. Table 2-2 presents the system runtime data for Year 13. From April 1, 2023 to March 31, 2024, the system availability was 94 percent, a four percent increase from the Year 13 runtime. Minor downtime events occurred throughout the reporting period, which included planned maintenance and system repairs due to wear and tear. Significant maintenance activities are listed in Table 2-3 where the issue and resolution are specified for the affected process component.

2.4 YEAR 14 TREATMENT PERFORMANCE

System sampling results are discussed in this section. The treatment system monitoring plan is provided in Table 2-4. Samples are collected from the aqueous and vapor treatment processes of the HCS. Aqueous sampling consists of sampling the system influent (combined and from individual recovery wells), primary and secondary air stripper effluents, and LPGAC effluent for laboratory analysis of VOCs by United States Environmental Protection Agency (USEPA)

Method 8260D. Vapor sampling includes collection of samples of air stripper exhaust and CatOx scrubber exhaust by USEPA Method TO-15.

Laboratory analytical aqueous results are summarized in Tables 2-5, 2-6, 2-7, 2-8, and 2-11 for recovery well-specific influent, combined influent, primary air stripper effluent, secondary air stripper effluent, and LPGAC effluent, respectively. Destruction efficiencies of the CatOx were monitored via weekly photoionization detector (PID) readings and vapor process sampling. Influent and effluent CatOx laboratory analytical vapor results are summarized in Tables 2-9 and 2-10, respectively. Laboratory analytical reports are included in Appendix C. Note that aqueous system sample results presented in the data tables, figures, and following subsections include only the target COCs. During the operational period, there were several other VOCs detected in the aqueous system samples, such as acetone, chlorobenzene, xylenes, and toluene. Concentrations of non-target analytes were generally much lower than the concentrations of target COCs. There were also low-level non-target analytes detected in the air samples, which were considered in the emissions loading calculations as further discussed in Section 2.5.2. All analytical results are included in the laboratory reports in Appendix C.

2.4.1 Influent Results. During the reporting period, the influent from the individual recovery wells and the combined influent were sampled on a quarterly basis and analyzed for VOCs. The Layer 7 recovery wells (RW17C, 18C, 19C, 20C) and Layer 7/8 recovery well (RW21D) were sampled on a monthly basis for VOCs by USEPA Method 8260D. Individual recovery well influent data are presented in Table 2-5 and shown on Figure 2-5 (quarterly events only), and the combined influent data are presented in Table 2-6. The data trends are summarized in tables below which present the fourth quarterly TCE results for each reporting period.

2.4.1.1 <u>Combined Influent</u>. Samples of the combined influent are collected to evaluate mass recovery and system CVOC loading. Quarterly sampling of the combined influent was conducted on June 23, 2023, September 26, 2023, December 21, 2023, and March 19, 2024. Overall, influent TCE concentrations have decreased since full-scale system startup (January 2010) to Year 14 (March 2024) from 280,000 µg/L to 25,000 µg/L. Year 14 combined influent TCE concentrations ranged from 9,600 µg/L (September 2023) to 30,000 µg/L (June 2023). Year 14 results showed an increase in TCE compared to Year 13 where influent concentrations ranged

from 8,700 µg/L (September 2022) to 17,000 µg/L (April 2022). The higher influent concentrations this year was likely due to the recovery well extraction scheme change where four shallow (RW12, RW13A, RW14A and RW15A) and two deep (RW05B and RW16B) recovery wells exhibiting low influent TCE concentrations were turned off to focus extraction at recovery well RW21D. TCE concentrations from RW21D influent samples were significantly higher than the recovery wells that were turned off turned off (Table 2-5). The table below presents the fourth quarter combined influent results for TCE, cDCE, and VC for each reporting period since startup of the HCS.

Reporting Period	Date	TCE	cDCE	VC
Startup	1/25/2010	191,000	41,100	6,530
Prove-Out	3/20/2010	164,000	40,100	6,460
Year 1	3/10/2011	67,100	16,800	1,600 I
Year 2	3/1/2012	59,800	9,670	1,100
Year 3	1/29/2013	45,600	7,820	939
Year 4	4/3/2014	45,000	6,570	5,510
Year 5	12/30/2014	31,800	4,370	399 I
Year 6	3/4/2016	18,400	9,040	1,110
Year 7	3/15/2017	17,000	6,510	833
Year 8	3/19/2018	16,100	3,730	551
Year 9	3/12/2019	15,600	3,990	684
Year 10	3/12/2020	13,300	2,160	236
Year 11	3/11/2021	12,100	2,450	476
Year 12	3/22/2022	12,000	3,900	360
Year 13	3/31/2023	12,000	3,900	400
Year 14	3/19/2024	25,000	5,100	360 U

Table shows primary COC concentrations (µg/L) at end of each reporting period.
U – Not detected at the associated detection limit.
I – Report value is between method detection limit and quantitation limit.

2.4.1.2 <u>Shallow Recovery Wells – ESB Area</u>. The fourth quarter TCE results for the three original shallow recovery wells in the ESB area are summarized in the table below.

Reporting Period	Date	RW01A	RW02A	RW03A
Startup	1/20/2010	240,000	280,000	41,000
Year 1	5/18/2011	46,800	50,400	2,940
Year 2	2/2/2012	85,000	42,500	427
Year 3	3/11/2013	91,900	39,000	79.5 I
Year 4	4/3/2014	91,800	33,600	60 U
Year 5	12/30/2014	60,200	26,600	371
Year 6	3/4/2016	81,600	35,000	7,150
Year 7	3/15/2017	71,900	27,200	16,300
Year 8	3/19/2018	66,000	17,900	186
Year 9	3/12/2019	58,100	21,600	825
Year 10	3/12/2020	36,800	11,800	262
Year 11	3/11/2021	45,400	14,900	0.35 U
Year 12	3/22/2022	35,000	36,000	34,000
Year 13	3/31/2023	21,000	15,000	6,100
Year 14	3/19/2024	16,000	9,800	1,600 J3

Table shows TCE concentrations (µg/L) at end of each reporting period.
U – Not detected at associated detection limit.
I – Report value is between method detection limit and quantitation limit.
J3 – Estimated value; value may not be accurate; spike recovery or relative percentage difference outside of criteria.

In Year 14, quarterly influent TCE concentrations from the shallow recovery wells in the ESB area were relatively stable when compared to fluctuations experienced in previous reporting periods. Additionally, RW01A, RW02A, and RW03A experienced a decrease in TCE when comparing Year 14 to Year 13 fourth quarter results, as shown in the table above.

Historically, the ESB area shallow recovery wells have had the highest TCE concentrations out of all the operating shallow recovery wells. TCE results from Year 14 at RW01A, RW02A, and RW03A indicate the recovery wells are working as intended and are effectively removing mass within the ESB area shallow capture zone.

2.4.1.3 <u>Shallow Recovery Wells – Outside ESB Area</u>. Results for recovery wells near HS 4 (RW13A, RW14A, and RW15A) are discussed separately from the other four wells (RW09A, RW10A, RW11A, and RW12A) on the eastern side of the HS 3. TCE concentrations for RW09A, RW10A, RW11A, and RW12A are summarized in the table below. RW10A and RW11A were turned off in Year 10 and RW12A was turned off in Year 13 to focus groundwater extraction in areas experiencing higher concentrations. The recovery wells turned off had

consistent TCE results below the IM objective warranting removing them from the extraction scheme. Currently RW09A remains in operation in the area northeast of the DSZ.

Reporting Period	Date	RW09A	RW10A	RW11A	RW12A
Pre-startup	5/27/2015	5,500	3 U	400 U	100 U
Startup	6/4/2015	62,100	67 U	400 U	17,800
Year 6	3/4/2016	8,610	11.6 I	5.4 U	1,200
Year 7	3/15/2017	158	29.2 I	29.6	346
Year 8	3/19/2018	108 I	38.9	33	164 I
Year 9	3/12/2019	36.6 I	24.6	18.6 I	129 I
Year 10	3/20/2020	17 U	NS	NS	6.9 U
Year 11	3/11/2021	35 U	NS	NS	129
Year 12	3/22/2022	44 U	NS	NS	44 U
Year 13	3/31/2023	40 U	NS	NS	40 U(1)
Year 14	3/19/2024	22 U	NS	NS	NS

Table shows TCE concentrations (µg/L) at end of each reporting period.
(1) – Result is from 12/13/2022. RW12A turned off in February 2023.
U – Not detected at associated detection limit.
I – Report value is between method detection limit and quantitation limit.
NS – Not sampled due to recovery well taken offline.

Historical TCE concentrations for RW13A, RW14A, and RW15A are summarized in the table below for reference. Similar to recovery wells RW10A-12A, recovery wells RW13A-15A were turned off in Year 13 because of consistent TCE results less than the IM objective to optimize the system and focus groundwater extraction in areas experiencing higher concentrations. It is noted that elevated non-detect values for TCE in these wells were likely due to sample dilutions from high concentrations of cDCE and VC remaining in these wells and does not necessarily indicate the absence of TCE.

Reporting Period	Date	RW13A	RW14A	RW15A
Pre-startup	5/27/2015	50 U	67 U	470
Startup	6/4/2015	5,000	400 U	3,700
Year 6	3/4/2016	150	14 U	83.7
Year 7	3/15/2017	35 U	19.4 I	35 U

Year 14	NS	NS	NS	NS

Table shows TCE concentrations (µg/L) at end of each reporting period.
(1) – RW13A, RW14A, and RW15A were all turned off in February 2023.
U – Not detected at associated detection limit.
I – Report value is between method detection limit and quantitation limit.
NS – Not sampled due to recovery well taken offline.

2.4.1.4 Deep Recovery Wells – Inside ESB Area. TCE data for deep recovery wells in the ESB area are summarized in the table below.

Reporting Period	Date	RW01B	RW02B	RW03B
Startup	1/20/2010	130,000	940,000	16,000
Year 1	5/18/2011	186,000	152,000	4,840
Year 2	2/2/2012	176,000	126,000	3,210
Year 3	3/11/2013	73,800	66,300	2,220
Year 4	4/3/2014	62,400	59,900	2,140
Year 5	12/30/2014	42,500	72,100	2,520
Year 6	3/4/2016	38,500	35,100	2,270
Year 7	3/15/2017	42,600	33,800	2,370
Year 8	3/19/2018	20,300	34,700	1,850
Year 9	3/12/2019	19,600	38,900	2,320
Year 10	3/12/2020	12,700	22,100	5,470
Year 11	3/11/2021	20,700	20,200	8,960
Year 12	3/22/2022	6,700	19,000	4,700
Year 13	3/31/2023	10,000	20,000	11,000
Year 14	3/19/2024	15,000	21,000	9,300

Table shows TCE concentrations (µg/L) at end of each reporting period.

The TCE concentrations at RW01B, RW02B, and RW03B have decreased significantly since startup. However, the Year 14 fourth quarter TCE results show that RW01B and RW02B

increased since Year 13. It appears TCE concentrations in RW01B have not returned to Year 12 levels since being turned off for the pilot study in Year 12, with concentrations having increased for two consecutive years. TCE recovery at RW03B has returned to similar concentrations since being turned off for the pilot study. In contrast, RW02B was not turned off for the pilot study and while there was a slight decrease, concentrations have been relatively stable since Year 11.

In summary, the recovery wells that were temporarily shut off for the pilot study have (RW03B) returned to Year 12 levels or appear to be (RW01B) returning to levels observed before the pilot study. RW02B which was not turned off for the pilot study continued to have relatively similar concentrations to the prior four years. TCE results from Year 14 at RW01B, RW02B and RW03B indicate the recovery wells are working as intended and are effectively removing the mass within their area of hydraulic influence.

2.4.1.5 Deep Recovery Wells – Outside Contaminant Source Area. The table below summarizes TCE concentrations in deep recovery wells outside of the source area. These recovery wells remained off during this reporting period. RW04B and RW06B were turned off after Year 9 of operation, and RW05B and RW16B were turned off during Year 13. Consistent TCE detections below the IM objective warranted shutting these recovery wells off to focus extraction in areas with higher concentrations. The table below summarizes historical TCE results from deep recovery wells outside of the source area.

Reporting Period	Date	RW04B	RW05B	RW06B	RW16B
Startup	1/20/2010	250,000	250,000	270,000	NP
Year 1	5/18/2011	43,200	77,700	26,600	NP
Year 2	2/2/2012	16,100	57,000	9,320	NP
Year 3	3/11/2013	2,640	47,300	1,360	NP
Year 4	4/3/2014	517	9,050	455	NP
Year 5	12/30/2014	331	2,860	NA	NP
Year 6	3/4/2016	39.9	456	52	2,880
Year 7	3/15/2017	84.5	544	91	1,540
Year 8	3/19/2018	75.7	178	157	497
Year 9	3/12/2019	76.5	108	42.7	159
Year 10	3/12/2020	NS	18.9	NS	65
Year 11	3/11/2021	NS	6.7	NS	35
Year 12	3/22/2022	NS	6.6	NS	22
Year 13	12/13/2022	NS	2.1 I(1)	NS	4.7(1)
Year 14	3/19/2024	NS	NS	NS	NS

Table shows TCE concentrations (µg/L) at end of each reporting period.
(1) –Well turned off in February 2023.
I – Report value is between method detection limit and quantitation limit.
NA – Not analyzed (deactivated in November 2013 and restarted in June 2015).
NP – Well was not present.
NS – Not sampled due to recovery well taken offline.

2.4.1.6 <u>Layers 7 and 7/8 Recovery Wells</u>. Five recovery wells are currently operating in the TCE source zone in Layers 7 and 7/8, and the fourth quarter results are summarized in the table below.

As shown in the table below, when comparing Year 14 to Year 13 fourth quarter results, TCE concentrations decreased at RW17C, RW19C, RW20C and RW21D while TCE concentrations increased at RW18C. Because large concentration fluctuations are common in Layer 7 recovery well samples from month to month, the average concentration over the reporting period was calculated and compared with the average concentrations from Year 13. Using average concentrations, the results for RW17C (210,500 µg/L in Year 13 and 144,583 µg/L in Year 14), RW19C (388,205 µg/L in Year 13 and 252,500 µg/L in Year 14), and RW 20C (184,382 µg/L in Year 13 and 16,458 µg/L in Year 14) aligned with the fourth quarter results that indicated a decrease in TCE. However, the average concentration comparison for RW18C (208,027 µg/L in Year 13 and 103,111 µg/L in Year 14) also indicates a decrease in TCE. Two months prior to the last influent sample collected at RW18C, the recovery well pump had been inoperable allowing

concentrations to rebound likely causing the increase observed when compared to results from previous months in the reporting period.

Unlike RW17C through RW20C, RW21D began operating towards the end of Year 13 and only three months of data was collected; therefore, the average concentration analysis was not performed. Despite this, concentration fluctuations observed at RW21D were minor this year, and it is evident from the monthly sampling results that TCE concentrations are decreasing.

The Layers 7 and 7/8 recovery wells continue to extract the highest concentrations of TCE and will continue to be monitored and the system optimized to attain maximum TCE extraction and reduction.

Reporting Period	Date	RW17C	RW18C	RW19C	RW20C	RW21D
Start-up	8/23/2019	475,000	NP	NP	NP	NP
Year 10	3/12/2020	489,000	NP	NP	NP	NP
Year 11	3/11/2021	429,000	556,000	959,000	593,000	NP
Year 12	3/22/2022	130,000	240,000	470,000	98,000	NP
Year 13	3/31/2023	250,000	270,000	360,000	41,000	42,000
Year 14	3/19/2024	150,000	410,000	210,000	3,200	9,200

Table shows TCE concentrations (µg/L) at end of each reporting period.
NP – Well was not present.

2.4.2 Air Stripper Treatment Results. Air stripper samples are taken on a monthly basis from the effluent at the aqueous discharge of each air stripper and analyzed for VOCs by USEPA Method 8260D. Primary and secondary air stripper effluent data are presented in Tables 2-7 and 2-8, respectively. During Year 14, effluent results from the secondary air stripper had TCE detections greater than its GCTL in July 2023 and January through March 2024. The GCTL exceedance in July 2023 (5.3 µg/L) was anomalous but the consistent exceedances from January to March 2024 were identified to be caused by drilling activities. During this time frame, additional Layer 7 recovery wells were being installed and the IDW generated was pumped back into the system for treatment, per the IDW protocols for LC34. During the monthly air stripper cleanings, silt accumulation was identified in both the primary and secondary strippers caused by the IDW being introduced downstream of the bag filters. As a result, the sediment introduced with the IDW likely reduced the destruction efficiency of the air strippers. Recovery well

installation activities were completed in December 2023 and will be discussed in a future PMR. Results from the subsequent monthly sampling event indicate the issue was resolved; TCE was not detected in the secondary air stripper effluent.

2.4.3 LPGAC Treatment Results. The LPGAC vessels remained online during the entire reporting period to ensure discharge standards were met. The LPGAC effluent data are presented in Table 2-11. There were no detections in any of the monthly effluent samples collected during the reporting period.

2.4.4 Air Stripper Offgas Results. Vapor samples were collected for laboratory analysis on December 21, 2023 from the CatOx influent (combined exhaust from both air strippers) and effluent. Laboratory results indicate that emissions from the CatOx have been consistently less than Hazardous Air Pollutant (HAP) requirements specified in the KSC Title V Air Permit for Remedial Activities, as further discussed in Section 2.5.2.2. Annual air sampling results for CatOx influent and effluent are presented in Tables 2-9 and 2-10, respectively. The results of offgas treatment performance calculations are provided in Table 2-12. The vapor sampling results are further discussed in Section 2.5.2.2 under the HC IM evaluation.

2.5 HC IM OPERATION EVALUATION

The evaluations discussed in this section were completed to verify that the HC IM objectives are being achieved based on data from this reporting period. The evaluations include proper functioning of system components, performance of the water and vapor treatment processes, and total volume and mass recovery.

2.5.1 HC Evaluation. This section presents an overview of the current recovery well scheme and presents the volume and mass recovery data.

A hydraulic capture study was conducted from December 20, 2010, through January 5, 2011, to evaluate the efficacy of hydraulic containment in the shallow and deep zones of the surficial aquifer at LC34. The results of the study determined that the HC IM objective for hydraulic containment was achieved. Results and conclusions of the hydraulic capture study were provided in Appendix D of the 2010 LC34 Annual Groundwater Monitoring and Interim Measure

Performance Report (NASA, 2011b). The hydraulic influence of pumping rate optimization at RW01B, RW02B, RW03B, and RW06B was modeled in 2013, and the modified pumping rates were expected to increase containment relative to existing site conditions. Based on the MIP and HPT study performed in 2013, seven new shallow recovery wells, RW09A through RW015A, were installed in HSs 3 and 4, and one new deep recovery well, RW016B, was installed in HS 2 to further improve plume containment and contaminant removal.

Performance sampling of monitoring wells in the DSZ was suspended beginning in Year 8 of operation based on significant differences between maximum TCE concentrations in recovery well influent and samples collected from the performance monitoring well network. Monitoring well results were consistently lower than influent results. In lieu of sampling monitoring wells to evaluate the system's performance, DPT performance monitoring was initiated in 2017 to provide a high-resolution sampling approach. In 2018, the annual DPT results showed an increase in the maximum TCE concentration from 2017, which indicated a significant amount of remaining TCE mass in the 50 to 80 feet bls zone. The TCE concentrations in this area were investigated as part the 2018-2019 DSZ Site Characterization. As part of this effort, pumping tests were conducted to determine the feasibility of extracting mass from deeper layers in the area. As a result, RW17C (screened from 80 to 95 feet bls) was installed with the intent of operating as a pilot study to determine mass removal over time. Based on the results of RW17C, three additional Layer 7 recovery wells (RW18C, RW19C, and RW20C) were installed in January 2021. The Layer 7/8 recovery well RW21D, screened 86-106 feet bls, was installed in December 2023, and is located south of Layer 7 monitoring well IW0162. Installation of RW21D was prompted by an increase of TCE concentrations in IW0162 beginning in December 2021. RW21D is located in the area of historical DPT location DPT0645, which had a TCE concentration of 521,000 µg/L in the 98 feet bls interval during the 2019 Site Characterization.

Annual DPT sampling continues to be conducted to evaluate the performance of the HCS and monitoring well sampling in Layer 7 and Layer 8 is also conducted on an annual basis. Results from these sampling events are further discussed in Section 2.7.

2.5.2 System Evaluation. The operation of major treatment components and treatment performance are discussed in this section.

2.5.2.1 Evaluation of Major System Components. The following provides an overview of the current conditions and maintenance conducted during this reporting period of the major system process components:

- **Recovery Wells** – Recovery wells are performing at the intended groundwater recovery rates. The flow totalizers were cleaned to ensure accurate readings. Of the 22 total recovery wells that have been installed over the course of HCS operation, 13 recovery wells operated in Year 14: four shallow (RW01A, RW02A, RW03A, and RW09A), three deep (RW01B, RW02B, and RW03B), five Layer 7 (RW17C, RW18C, RW18C, RW19C, and RW20C) and one Layer 7/8 (RW21D). Future activities for the operating recovery wells include normal maintenance and inspection.

- **Groundwater Recovery Pumps** – The submersible pump heads have operated effectively since initial startup, although intermittent pump head or motor replacement is required due to mechanical and chemical degradation over time. Recovery wells RW17C, RW18C, RW19C, and RW20C operate with submersible pneumatic pumps designed with more chemical resistance. Recovery well RW21D operates with a 240-volt electrical submersible pump. No evidence of sediment, mineral, or biological pump head fouling has been observed in the shallow and deep recovery pumps. Sediment buildup in the Layer 7 (fine silty sand) recovery pump heads was observed, and the pumps were pulled and cleaned, as needed. Future activities include continued monitoring conditions of pumps and normal maintenance.

- **Filtration System** – There are two influent bag filters upstream of the equalization tank and two bag filters upstream of the injection wells. The influent bag filters are replaced approximately weekly, and the bag filters upstream of the injection wells are replaced approximately monthly. With the addition of Layer 7 and Layer 7/8 recovery wells (RW17C, RW18C, RW19C, RW20C, and RW21D), an influx of clay/fine particulates was observed that required more bag filter changeouts on the influent side; otherwise, there was no impact on the system during this reporting period. Future activities include continuing the biocide program and the installation and startup of an automated backwash filtration system.

- **Equalization Tank** – No issues were encountered with the equalization tank this reporting period. Future activities include normal maintenance.

- **Air Strippers** – Factors influencing treatment efficiency, such as biofouling, are controlled to the maximum extent possible to maintain removal efficiencies. The trays were washed monthly to remove solids. Continued operation of two air strippers in series is necessary to ensure that discharge compliance is maintained. Future activities include normal maintenance.

- **Blower** – The blower operated normally until November 2022 when the variable frequency drive (VFD) failed. As a result, the blower was wired to bypass the VFD to where the HMI controls the on/off command but does not adjust speed based on a setpoint. The blower now operates at 100 percent while on and has operated normally using the bypass. A manual damper was installed to control air flow and is adjusted as needed to maintain air stripper differential pressure; adjusted from 0 to 30 percent closed where 30 percent closed is after monthly air stripper cleaning and 0 percent closed is approaching cleaning time. No issues were encountered during this reporting period and normal conditions have been observed since the change. Future activities include normal maintenance.

- **Transfer Pumps** – No issues were encountered during this reporting period. Future activities include normal maintenance.

- **Moisture Separator** – The original moisture separator was replaced with a 1,650-gallon holding tank from the decommissioned Components Cleaning Facility groundwater treatment system. The holding tank was modified to operate as a cyclonic moisture separator and is used to reduce friction losses and increase liquid droplet removal efficiency following installation of the new air stripper units in 2015. No issues were encountered during this reporting period. Future activities include normal maintenance.

- **LPGAC** – The LPGAC vessels have operated since February 2021 following installation of the Layer 7 recovery wells and have remained online through the entire reporting period. No issues were encountered with the LPGAC vessels. The LPGAC effluent is

sampled to monitor concentrations of COCs prior to discharge. Secondary treatment via LPGAC has resulted in no discharge exceedances to the infiltration gallery or injection wells during the system's operational period. Future activities include normal maintenance during operation of the vessels and replacing process lines due to weathering.

- **Catalytic Oxidation Unit** – During this reporting period, the CatOx operated as expected with normal maintenance and minor repairs. In January 2024, intermittent interference due to a faulty wire connection was observed causing fluctuations in temperature readings. After the terminals were cleaned and the wire was reconnected, the issue was resolved. In February 2024, a thermocouple in the heater was replaced and a wire connection re-made to a controller in the electrical panel. Future activities include continued maintenance of heater elements and additional insulation every six months with the heater.

- **Quench Tower** – The quench tower operated as normal during this reporting period. In June 2023, a slight leak was noticed from the potable water influent piping and the polyvinyl chloride (PVC) connection was replaced three days later during normal system shutdown. Future activities include normal maintenance and inspection for corrosion/material degradation.

- **Scrubber** – The scrubber maintained normal operation during this reporting period. In September 2023, the re-circulation pump started making a grinding sound during operation, indicting the bearings may seize up. In September during normal system shut down, the re-circulation pump was replaced, and normal operation was observed for the remainder of the reporting period. Future activities include normal maintenance and visual inspection.

- **Injection Wells** – During this reporting period, the injection well flow totalizers were cleaned to ensure accurate readings. No other issues were encountered; future activities include normal maintenance. If the injection pressure exceeds 5 pounds per square inch gauge (psig) at the system manifold, the need for injection well maintenance is evaluated.

- **Infiltration Gallery** – No issues were encountered with the infiltration gallery during this reporting period. Future activities include normal maintenance and monitoring which includes quarterly inspections to ensure that discharge does not result in surface water accumulation. No evidence of surface water has been observed from infiltration gallery discharges.

2.5.2.2 Treatment Performance Evaluation. Evaluation of the water and vapor treatment processes is conducted to ensure the HC IM objectives are being achieved. Below are evaluations for both processes for the data collected during this reporting period.

- **Aqueous Treatment** – Treatment of the aqueous process stream has resulted in no discharge exceedances (CVOC concentrations less than GCTLs), and overall treatment performance has been consistent. Overall, the efficiency of the aqueous treatment process is nearly 100 percent. The average removal efficiency of the strippers continues to be greater than 99.9 percent. The LPGAC, which has been online since February 2021, has provided an effective polishing step for aqueous treatment by reducing CVOC concentrations to less than GCTLs or below laboratory detection limits.

- **Offgas Treatment** – Treatment of offgas from the air stripper has resulted in total HAP and individual HAP emissions less than the limits in the KSC Title V Operating Air Permit. Based on the most recent sample collected on December 21, 2023, offgas treatment efficiencies for TCE, cDCE, and VC were greater than 99.9 percent. The same set of data was used to evaluate emissions loading. Based on the annual sample, the individual HAP emission rate for TCE was 0.0050 pounds per day. This value is less than the KSC Title V permit requirements for individual HAP emissions of less than 2.7 pounds per day (1,000 pounds per year). The total HAP emission rate for all VOCs was 0.0063 pounds per day, which is less than the Title V permit requirement of 6.8 pounds per day (2,500 pounds per year). The total HAP emission rate value includes all the COCs even though cDCE and tDCE are not HAPs, and each analyte that had a result above its respective detection limit to be conservative.

2.5.2.3 Volume and Mass Recovery. As of March 31, 2024, a total of 344,849,634 gallons of groundwater containing 94,656 pounds of CVOCs have been removed by the HCS. Influent concentrations of TCE have decreased since startup from approximately 280,000 µg/L (January 2010) to 25,000 µg/L (March 2024), as shown in Table 2-6. During the operational period covered under this report, approximately 31,176,393 gallons were recovered containing approximately 6,319 pounds of CVOC mass. Groundwater recovery volumes and CVOC mass recoveries are summarized in Table 2-13, with full list included in Appendix D.

2.6 HCS PERFORMANCE MONITORING FIELD ACTIVITIES

To assess the groundwater conditions in the DSZ and evaluate performance of the HCS, annual performance monitoring was conducted at nine DPT boring locations and 11 monitoring well locations in and around the source area. All DPT and monitoring well sampling was conducted in accordance with applicable portions of the NASA Sampling and Analysis Plan (SAP) for the RCRA Corrective Action Program at KSC (NASA, 2017a) and FDEP Standard Operating Procedures (SOPs) (FDEP, 2017).

In December 2023, groundwater samples were collected from one monitoring well in Layer 7 (IW0042D2) and 10 monitoring wells in Layer 8 (IW0001D2, IW0043D2, IW0044D2, IW0045D2, IW0160, IW0161, IW0162, IW0163, IW0164, and IW0165). Peristaltic pumps were used for the purging of wells prior to sampling, and samples were collected using the low-flow purge technique. After collection, groundwater samples were shipped under proper chain-of-custody protocols to Eurofins Environmental Testing Southeast, LLC in Altamonte Springs, Florida, for analysis of VOCs by USEPA Method 8260D.

In January 2024, samples were collected from nine DPT boring locations (DPT593 to DPT601). At each boring location, the upper 5 feet of soil was excavated using a stainless-steel hand auger to verify the absence of underground utilities. Groundwater grab samples were collected by DPT methods via a 4-foot-long stainless-steel retractable screen. Samples were collected at 5-foot intervals from 8 to 98 feet bls, corresponding to the midpoints of the 4-foot screens, via a peristaltic pump through HDPE tubing terminating at the midpoint of the well screen. Typically, a total of 171 samples are collected annually; however, during the January 2024 event, the 83-

foot sample at DPT599 was inadvertently not collected; therefore, a total of 170 DPT samples were collected for laboratory analysis during this reporting period. The DPT samples were delivered under chain-of-custody to Eurofins Environmental Testing Southeast, LLC, in Altamonte Springs, Florida, for analysis of VOCs by USEPA Method 8260D. Note, samples were collected from the same nine locations and depth intervals as the previous annual DPT sampling events since DPT sampling began in 2019.

Groundwater sampling logs and field documentation are provided in Appendix B. Laboratory analytical reports are provided in Appendix C. The following section discusses the DPT and monitoring well analytical results. All analytical results were reviewed by a chemist and data quality manager and were found to have been generated in compliance with good analytical practices. Note that the results presented in the data tables, figures, and following subsections include only the target COCs. During the sampling event, there were several other VOCs detected in the HCS performance monitoring samples, such as low-level detections of 1,1-dichloroethene, carbon disulfide, 1,1,2-trichlorotrifluoroethane, 2-butanone, and chloroethane in several of the annual DPT samples. These detections of non-target analytes were generally less than GCTLs and less than concentrations of target COCs. All analytical results are included in the laboratory analytical reports in Appendix C.

2.7 HCS PERFORMANCE MONITORING RESULTS

2.7.1 DPT – Concentration Results. A summary of the analytical results for the DPT groundwater samples collected in January 2024 is provided in Table 2-14. Figure 2-6 presents the DPT groundwater results for TCE, cDCE, and VC. The TCE results shaded in yellow exceed 11,000 µg/L (1-percent solubility of TCE) and is where potential DNAPL is suspected to be present in relation to the DSZ boundary (the area in which the HCS treatment is focused). TCE concentrations greater than 11,000 µg/L were detected at eight of the nine DPT locations at depths ranging from 28 to 98 feet bls.

For discussion purposes, the DPT depth intervals are being compared to the shallow, deep, and Layer 7 capture zones of the HCS. These depth intervals correlate with the screened intervals of the recovery wells. The shallow capture zone of the HCS is from 15 to 45 feet bls and the deep

capture zone is from 50 to 80 feet bls; therefore, the DPT depth intervals between 8 feet bls and 43 feet bls correlate with the shallow capture zone, and the depth intervals between 53 feet bls and 78 feet bls correlate with the deep capture zone. The 48 feet bls depth interval (DPT sample screened 46 to 50 feet bls) is between the shallow and deep capture zones and represents Layer 4, which is a fine-grained layer. This layer has been considered a shallow confining unit; however, results of re-characterization showing concentrations of CVOCs below Layer 4 suggest this layer has semi-confining properties. The Layer 7 DPT depth interval is between 80 and 95 feet bls, which correlates to depths of recovery wells RW17C, RW18C, RW19C, and RW20C. The 98 feet bls depth interval is below the Layer 7 capture zone, but correlates with the depth of RW21D, screened 86 to 106 feet bls.

In the shallow capture zone (between 15 and 45 feet bls) the maximum TCE concentration in January 2024 was 510,000 µg/L in the 38 feet bls interval at DPT599, located in the south-central portion of the DSZ. This TCE concentration was a significant decrease from the previous year (December 2022) and the first year of DPT sampling (November 2017) concentrations of 1,400,000 µg/L and 1,030,000 µg/L, respectively. Since November 2017, the 28, 33, 38, and 43 feet bls depth intervals at DPT599 have continually had TCE concentrations greater than 11,000 µg/L. In addition to DPT599, three other DPT locations in the northeast and central portions of the DSZ (DPT593, DPT594, and DPT597) had a TCE result greater than 11,000 µg/L, all in the 43 feet bls sample depth.

In the deep capture zone (between 53 and 78 feet bls), the maximum TCE concentration in January 2024 was 1,600,000 µg/L in the 53 feet bls sample at DPT594, which is directly below the Layer 4 semi-confining layer. This result was also the maximum overall detection during the January 2024 event. TCE concentrations at this location have remained stable since the 2019 concentration of 1,580,000 µg/L. In addition to DPT594, located in the north central portion of the DSZ, five other DPT locations in the central and east portion of the DSZ (DPT593, DPT596,DPT597, and DPT599), and one location in the west-central portion (DPT598) had TCE results greater than 11,000 µg/L at varying sample depths within the deep capture zone.

In the depth interval between the shallow and deep capture zones (Layer 4 from 45 to 50 feet bls) the January 2024 maximum TCE concentration was 1,300,000 µg/L at DPT596, located in the

east central portion of the DSZ. Five other DPT locations (DPT593, DPT594, DPT597, DPT600, and DPT601) had TCE results at the 48 feet bls sample depth greater than 11,000 µg/L. The TCE concentration at DPT599 was significantly lower than 11,000 µg/L, which is a significant decrease from the previous event in December 2022 where the 48 feet bls sample at DPT599 was the overall maximum detection (1,800,000 µg/L). TCE was not detected in the 48 feet bls sample at DPT595 and DPT598, but both had elevated non-detect values.

In the Layer 7 capture zone (83 to 93 feet bls), the maximum TCE concentration was recorded at DPT598 in the 83 feet bls depth interval with a result of 530,000 µg/L, just below the deep capture zone. At this location, in the east central portion of the DSZ, and sample depth, concentrations have increased since 2017 with results ranging from 2,500 µg/L in 2017 to the current concentration.

Below Layer 7 (95 to 100 feet bls), the maximum TCE concentration was 110,000 µg/L at DPT598 in the 98 feet bls sample depth. Sampling the 98 feet bls interval at all locations began in 2020 and results at this location have increased from 66,000 µg/L in 2020 to the current concentration. Two other locations had TCE concentrations greater than 11,000 µg/L; DPT594 had a concentration of 34,000 µg/L, and DPT597 had a concentration of 66,000 µg/L. The January 2024 maximum result for this depth interval is a significant decrease compared to the overall maximum of 2,630,000 µg/L reported at DPT954 in November 2021 prior to installation of RW0021D, screened below layer 7 from 86 to 106 feet bls.

2.7.2 DPT – Percent TCE Composition. The table below shows the DPT performance sampling results as average percent composition for each year. The capture zones are specified for the sample depths that are within the recovery well screen intervals. Note, for the 2023 reporting year, the samples were collected in January 2024 and are represented as 2023 for discussion purposes and in the table below. In 2023, the largest portion of the TCE contamination (25.1 percent) was observed just below Layer 4 (semi-confining layer) at 53 feet bls, the upper most interval within the deep capture zone. Historically, Layer 4 has exhibited the highest percentage of TCE, with exceptions in 2018 and 2021 where the highest percent TCE was in the deep capture zone at 78 feet bls and 58 feet bls, respectively. Although the highest average percent composition was not in Layer 4 during this 2023 operational period, the percent

TCE concentrations observed between the depths of 48 and 58 feet bls continue to show that most mass is located within Layer 4 and the upper portion of the deep capture zone. The TCE composition in other depths within the shallow and deep capture zone remain relatively stable. At 78 feet bls, the TCE composition remains relatively stable at 14.4 percent still indicating stored mass at the interval immediately above the Layer 7 fine-grained unit.

	Depth	2017	2018	2019	2020	2021	2022	2023
	8	0.0 %	0.0 %	0.0 %	0.0 %	0.1 %	0.1 %	0.0%

	73	2.3 %	1.4 %	2.0 %	0.3 %	0.1 %	0.4 %	0.6%
	78	13.9 %	**36.5 %**	14.8 %	17.1 %	11.3 %	15.0 %	14.4%
Layer7	83	1.0 %	0.5 %	1.7 %	0.3 %	1.6 %	1.2 %	5.5%
	88	NS	0.2 %	NS	0.1 %	0.3 %	0.2 %	0.9%
	93	NS	0.1 %	NS	0.2 %	0.6 %	0.5 %	1.6%
	98	NS	0.2 %	NS	0.4 %	6.0 %	0.3 %	1.9%

Table shows average TCE composition as percentages for each annual DPT event.
TCE composition determined by averaging the TCE concentrations for each interval and dividing by the total concentration for that year.
Sampling occurred in January 2024 is shown as 2023 reporting year.
Bold indicates the depth interval with highest percent TCE composition.
NS – Not Sampled

2.7.3 DPT – Total TCE Concentration Results. The table below shows total TCE concentration results over time for the capture zones. The values are calculated by summing the individual DPT concentrations from within each zone and are presented in this section in milligrams per liter (mg/L) because of the magnitude of the concentrations.

Zone	2017	2018	2019	2020	2021	2022	2023
Shallow Capture Zone (15 – 45 feet bls)	5,914	3,786	1,990	2,701	6,336	3,573	1,055
Deep Capture Zone (50 – 80 feet bls)	8,764	7,856	5,741	9,373	28,044	8,543	7,912
Layer 7 Capture Zone (80 – 95 feet bls)	159	88	182	104	1,147	357	1,012
Below Layer 7 (95 – 100 feet bls)	NS	NS	NS	NA	NA	52	219
All Capture Zones	14,839	11,731	7,914	12,179	35,529	12,473	10,198

Table shows total (sum of) TCE concentrations (mg/L) for all DPT locations and intervals within capture zones.
In 2020, TCE concentrations in Layer 7 included additional deeper intervals that were added to subsequent reporting periods. The Layer 7 capture zone became operational in August 2019 with installation of RW17C and subsequent installation of four additional Layer 7 recovery wells in January 2021.
In January 2023, the capture zone was extended below Layer 7 with the installation of RW21D.
NA – Not applicable
NS – Not sampled

In the shallow capture zone, the total TCE concentration in the has decreased each year. In recent years. from 2021 to 2022, the total TCE concentration decreased by 43.6 percent (a reduction of 2,763 mg/L) and from 2022 to 2023, the total TCE concentration decreased by 70 percent (a concentration reduction of 2,518 mg/L). During the reporting period covered under this report, the total concentration of TCE in the shallow capture zone is the lowest since DPT sampling began in 2017. Of the nine DPT locations, the individual total concentration of TCE decreased at six locations (DPT594, DPT595, DPT597, DPT598, DPT599, and DPT600) and increased at three locations (DPT593, DPT596, and DPT601) since the previous event in 2022. The greatest decrease in the shallow capture zone occurred at location DPT599, where total TCE decreased from 2,463 mg/L in 2022 to 897 mg/L in 2023, an overall decrease of 64 percent. There were no significant increases in the shallow zone DPT locations compared to 2022; the greatest increase in the shallow capture zone was at DPT593 with an increase from 65.9 mg/L to 110 mg/L.

In the deep capture zone, total TCE concentrations have also exhibited a decrease over the past two years. Between 2021 and 2022, the total TCE decreased by 69.5 percent (concentration reduction of 19,501 mg/L) and between 2022 and 2023, the total TCE concentration decreased by 7.4 percent (concentration reduction of 631 mg/L). The total TCE concentration in the deep

capture zone has been stable since 2017, with the exception of 2021, when the total TCE concentration was 28,044 mg/L. Of the nine DPT locations, the total TCE concentrations at six locations (DPT593, DPT597, DPT598, DPT599, DPT600, and DPT601) in the deep capture zone decreased and at three locations (DPT594, DPT595, and DPT596) the concentration increased when compared to 2022. The greatest decrease occurred at location DPT597, where total TCE decreased from 3,662 mg/L in 2022 to 1,765 mg/L in 2023, an overall decrease of 51.8 percent. In the deep capture zone, the greatest concentration increase occurred at DPT594, from 2,044 mg/L to 3,957 mg/L, an increase of 93.6 percent.

In the Layer 7 capture zone, total TCE concentrations in 2023 increased compared to the previous year. In 2023, the total TCE concentration was 925 mg/L, greater than the 2022 value of 357 mg/L. The location with the greatest increase was DPT598 with an increase from 150 mg/L in 2022 to 591 mg/L in 2023, with increases also apparent in DPT593, DPT594, and DPT597. The remaining locations had decreasing concentrations. The largest proportion of contamination in Layer 7 is located in the 83 feet bls interval; however, the total TCE concentrations are relatively low when compared to the other capture zones. Below Layer 7, concentrations of TCE were observed in the 98 feet bls interval at DPT598 (110 mg/L). The trends above and below Layer 7 indicate potential mass storage surrounding the Layer 7 capture zone.

In summary, the 2023 DPT sampling event showed that the total TCE concentrations in the shallow and deep capture zones continued to decrease for the second consecutive year with 2023 being the lowest total concentrations observed in both capture zones. In the Layer 7 capture zone, the total TCE concentration increased since 2022, but the increase is likely attributed to the recovery well extraction scheme optimization beginning in February 2023 when four shallow recovery wells (RW12-15A) and two deep recovery wells (RW5B and RW16B) were turned off and the Layer 7/8 recovery well (RW21D) started operating. Total TCE concentrations in Layer 7 this year were similar to results experienced during the pilot study (2021) where a similar extraction scheme was temporarily implemented.

2.7.4 DPT – Total cDCE and VC Concentration Results. DPT results from previous years show that the total concentrations of cDCE and VC generally follow similar trends to those

observed for TCE with respect to each capture zone. During the 2023 operational period, however, the total concentrations for both analytes exhibited increasing trends compared to TCE concentrations, which generally decreased in the shallow and deep capture zones since 2022. The increase in groundwater extraction from Layer 7 likely affected the total concentrations of cDCE and VC.

In the shallow capture zone (15 to 45 feet bls) the maximum cDCE concentration was 160,000 µg/L in DPT599 at 43 feet bls, and the maximum VC concentration was 51,000 µg/L in DPT593 at 43 feet bls. Total concentrations of cDCE and VC in the shallow capture zone were 724,122 µg/L and 214,855 µg/L, respectively. The total cDCE concentration decreased and the total VC concentration increased in the shallow zone compared to 2022.

In the deep capture zone (between 50 and 80 feet bls) the maximum cDCE and VC concentrations were 270,000 µg/L in DPT596 at 58 feet bls and 26,000 µg/L also in DPT596 at the 58 feet bls sample depth, respectively. Total concentrations of cDCE and VC in the deep capture zone were 1,189,659 µg/L and 159,674 µg/L, respectively. While the total TCE concentration in the deep capture zone exhibited a decrease, both cDCE and VC experienced an increase compared to 2022.

In the Layer 7 capture zone (80 to 95 feet bls) the maximum cDCE and VC concentrations were 25,000 µg/L in DPT598 at 88 feet bls and 3,600 µg/L in DPT598 at 83 feet bls, respectively. The total concentrations of cDCE and VC in the Layer 7 capture zone were 78,659 µg/L and 9,410 µg/L, respectively. Both cDCE and VC exhibited an increase in the Layer 7 capture zone compared to 2022, similar to the trend in total TCE concentration.

Below the Layer 7 capture zone (95 to 100 feet bls) the maximum cDCE and VC concentrations were 25,000 µg/L and 1,400 µg/L, respectively, both in DPT598 at 98 feet. The total concentrations of cDCE and VC below the Layer 7 capture zone were 27,476 µg/L and 2,558 µg/L, respectively. Both the cDCE and VC total concentrations were greater than the 2022 total concentrations of 36,088 µg/L and 402 µg/L, respectively. The cDCE and VC concentration trends are similar to the TCE trends observed in the depth interval below Layer 7.

2.7.5 Evaluation of Performance Monitoring Using DPT. Concentrations of TCE, cDCE, and VC in DPT groundwater samples collected in December 2023 are still significantly greater than concentrations last observed in performance monitoring well samples collected in December 2016 (prior to implementing performance monitoring via DPT). In December 2016, the maximum TCE concentration was 22,700 µg/L at IW0121, screened from 38 to 43 feet bls. This well was located near DPT597, which by comparison has exhibited high TCE concentrations each year in the 38 and 43 feet bls depth intervals, most notably in 2021 when the TCE concentrations were 122,000 µg/L at 38 feet bls and 1,260,000 µg/L at 43 feet bls. This indicates that the high resolution DPT approach to performance monitoring is continuing to provide a more accurate picture of current conditions in the aquifer and a better indication of where high mass storage remains.

2.7.6 DPT Performance Monitoring and Recovery Well Results Comparison. The individual recovery well influent sample results are shown on Figure 2-5 and included in Table 2-5. The individual recovery well results indicate that the recovery wells continue to adequately capture contamination. The influent from each operating shallow and deep recovery well is sampled quarterly to evaluate HCS operational performance, as discussed in Section 2.4. The recovery wells in Layers 7 and 7/8 are sampled monthly to monitor continued high concentrations experienced at these depths. For comparison purposes, in the discussion below, the January 2024 DPT results (Table 2-14) are being compared to the December 2023 shallow and deep recovery well results because the sample dates are closest to each other. The nine DPT locations are in a grid formation within the DSZ, and the discussion below presents a spatial comparison of the DPT results to the nearest recovery wells in each capture zone.

In the northwestern portion of the DSZ, locations DPT595 and DPT598 are near recovery wells RW02A, RW02B, and RW19C. In the shallow capture zone, TCE had low-level detections in DPT595 with a maximum detection of 26 µg/L in the 28 feet bls sample. At DPT598, TCE was non-detect or less than the GCTL. It is noted, however, that elevated non-detect values for TCE were observed in both DPT samples. In comparison, the December 2023 concentration was 9,300 µg/L at RW02A, greater than the DPT results at this interval. In the deep capture zone, the maximum TCE concentrations were 5,200 µg/L in the 78 feet bls sample depth at DPT595 and

440,000 µg/L in the 78 feet bls sample depth at DPT598. The maximum TCE detection was greater than the December 2023 concentration of 27,000 µg/L at RW02B. In the deeper zone, the recovery wells in the northwest portion of the DSZ had TCE results of 160,000 µg/L (RW17C) and 210,000 µg/L (RW19C). These wells are screened from 80 to 95 feet bls and were designed to capture contamination below the deep zone (greater than 80 feet). The TCE results for this depth zone at 83 to 93 feet bls at DPT595 were low-level detections, and the highest TCE result at DPT598 was 530,000 µg/L at the 83 feet bls interval.

In the northeastern portion of the DSZ, the locations of DPT593 and DPT594 are near recovery wells RW03A, RW03B, RW20C, and RW21D. In the shallow capture zone, at DPT593, the TCE concentration of 110,000 µg/L at 43 feet bls was the maximum result in December 2023. The highest shallow zone result at DPT594 was 21,000 µg/L in the 43 feet bls interval, which was a reduction from the December 2022 maximum of 61,000 µg/L at this location. The TCE concentration in December 2023 for RW03A was 2,300 µg/L. The maximum TCE concentrations for the deep capture zone were 180,000 µg/L at DPT593 in the 58 feet bls interval and 1,600,000 µg/L at DPT594 in the 53 feet bls interval. The TCE concentration at RW03B in March 2024 was 9,300 µg/L. Note during the third quarterly event in December 2023 at this well there was an issue with the pump controller and a sample was not collected. The maximum TCE concentrations at DPT593 and DPT594 for the deeper zone were 31,000 µg/L (88 feet bls) and 88,000 µg/L (93 feet bls), respectively. The TCE concentration at RW20C for December 2023 was 12,000 µg/L. For the Layer 7 capture zone (86 to 106 feet bls), the maximum TCE concentrations at DPT593 and DPT594 were 7,100 µg/L and 34,000 µg/L, respectively. The TCE concentration at RW21D in December 2023 was 12,000 µg/L, after about a year of operation. The maximum TCE results in the DPT samples continued to be greater in the northeastern locations than the northwestern locations for both the shallow and deep capture zones.

In the southern portion of the DSZ, the maximum TCE concentration from DPT locations DPT596, DPT597, DPT599, DPT600, and DPT601 in the shallow zone was 510,000 µg/L at DPT599 at 38 feet bls compared to the nearby recovery well RW01A, which had TCE concentration of 17,000 µg/L. The maximum TCE concentration at the DPTs in the deep zone

was 700,000 µg/L at 58 feet bls (DPT597) compared to the nearest recovery well RW01B, which had TCE concentration of 13,000 µg/L. The maximum TCE concentration at the DPTs in the deeper capture zone was 100,000 µg/L at 83 feet bls (DPT597) compared to the nearby recovery well RW18C, which had a TCE concentration of 73,000 µg/L in December 2023; however, this well had a higher concentration in March 2024 (410,000 µg/L) compared to the 3rd quarterly result. For the locations in the southern portion of the DSZ, the maximum TCE results in the DPT samples were generally greater than the well results in both the shallow and deep capture zones.

In summary, the shallow, deep, and Layer 7 capture zones are represented by higher DPT concentrations compared to concentrations observed in the nearby recovery wells. However, this comparison is more of a qualitative analysis as recovery wells capture a larger interval (30 feet in shallow and deep) compared to DPT results from a specific DPT interval. Overall, the TCE mass within the shallow and deep zones decreased compared to the 2022 operational period. Expansion of the HCS and addition of new recovery wells is ongoing and will continue to be evaluated as the groundwater recovery scheme is optimized. Details of the expansion and optimization will be provided in future PMRs.

2.7.7 Layer 7 and Layer 8 Monitoring Well Results. Currently, 11 monitoring wells are sampled in Layers 7 and 8 to monitor potential vertical migration of TCE in the DSZ area. IW0042D2 in Layer 7 and IW0001D2, IW0043D2, IW0045D2, IW0160, IW0161, IW0163, and IW0164 in Layer 8 were sampled in December 2023 as a part of the annual sampling plan. Additional sampling on a biweekly basis was conducted at Layer 8 wells IW0044D2, IW0162, and IW0165, throughout the reporting period to monitor increased concentrations observed in Layer 8 and to monitor the potential influence of recovery well RW21D. Additional sampling was also conducted at IW0001D2 and IW0161 in October 2023 to evaluate the northeastern and southeastern boundaries of the DSZ, based on a discussion during the October 2023 KSCRT meeting. Sampling results for Layer 7 and 8 monitoring wells are included in Table 2-15 and shown on Figure 2-7.

Of the six wells sampled only in December 2023, results continue to exhibit no detections except for IW0045D2, which had a GCTL exceedance of cDCE (140 µg/L). This well is located on the

southwestern portion of the DSZ along the fluctuating edge of the HCP. Also in this area, the Layer 7 well IW0042D2 had a slight detection of cDCE (0.73 µg/L). Well IW0043D2, which historically had low-level cDCE and VC detections was non-detect for both analytes in December 2023.

Wells IW001D2 and IW0161 had an additional sample collected in October 2023 prior to the annual event in December 2023. There were no detections in the samples collected in October or December. Well IW0165, located along the western edge of the DSZ, had biweekly sampling beginning in March 2023 and continuing until the December 2023 annual event. There were no detections in the biweekly samples. Well IW044D2, located in the central portion of the DSZ near RW0021D, also began biweekly sampling in March 2023 when high concentrations of TCE (360 µg/L) and cDCE (930 µg/L) were first detected. High concentrations of COCs continued throughout the monitoring period with maximum detections of TCE (190,000 µg/L), cDCE (20,000 µg/L), and VC (1,400 µg/L) in September 2023. Since the peak concentrations during the September 2023 event, TCE, cDCE, and VC concentrations have decreased to 660 µg/L, 1,400 µg/L, and 150 µg/L, respectively, at the end of the operational period in March 2023. The increased concentrations in this well are likely due to the influence of RW0021D. Well IW0162 continued a biweekly sampling schedule which had been implemented during the previous operational period (April 2022 – March 2023) to monitor increased concentrations of TCE. During the operational period covered under this report, the maximum concentrations of TCE (15,000 µg/L) and cDCE (1,700 µg/L) were detected in March 2023, but by September 2023 concentrations of both COCs were less than GCTLs, and biweekly sampling was discontinued in February 2024.

Overall, the Layer 7 and 8 monitoring well results indicate that these wells are positioned appropriately to monitor the boundaries of the source area and that recovery well RW021D (screened 86-106 feet bls) is influencing hydraulic control and contaminant capture as planned. Annual sampling of the Layer 7 and 8 monitoring wells will continue to be conducted to evaluate potential migration of contaminants in the DSZ area and performance of RW21D, with continued biweekly sampling at IW044D2 and other wells as needed based on results. As of the date of this

report, expansion of the HCS is ongoing with installation of additional recovery wells in Layer 7, as recommended in the RAE (Alternative DSZ-1 [Meeting Minute 2302-M04, Decision D01]).

Notes:

- Reported system readings were condensed from weekly to monthly to reduce excessive repetitive data.
- Inspections performed weekly at minimum to ensure normal operation.
- After 11/21/2022, the blower's variable frequency drive was bypassed which resulted in air stripper blower speed recordings being suspended. Blower continually operates at 100% now.

°F = Degrees Fahrenheit
gal = Gallons
gpm = Gallons per minute
hertz = Hertz
in. w.c. = Inches of water column
ppmv = Parts per million by volume
psi = Pounds per square inch
psig = Pounds per square inch gauge
scfm = Standard cubic feet per minute
NA = Not Applicable

Table 2-2. Hydraulic Containment System Runtime Summary

Year	Month	Days In Month	Days System Down	Run Time	Downtime Contributing Factor
2023	April	30	0.25	99%	Routine system cleaning
	May	31	0.25	99%	Routine system cleaning
	June	30	4.25	86%	Routine system cleaning; replaced quench cooling water piping
	July	31	0.25	99%	Routine system cleaning
	August	31	2.25	93%	Routine system cleaning; replaced scrubber float
	September	30	2.50	92%	Routine system cleaning; replaced scrubber float
	October	31	0.25	99%	Routine system cleaning
	November	30	0.25	99%	Routine system cleaning
	December	31	3.50	89%	Routine system cleaning; minor shutdown to begin bag filter upgrade
2024	January	31	3.35	89%	Routine system cleaning; troubleshoot thermocouple sensor
	February	28	5.60	81%	Routine system cleaning; troubleshoot thermocouple sensor; PLC controller replaced (lightning strike)
	March	31	0.50	98%	Routine system cleaning
Total		**365**	**23.20**	**94%**	

Notes:
Runtime indicated is from April 1, 2023 to March 31, 2024

Table 2-3. Hydraulic Containment System Issues and Resolutions

System Component	Issue	Issue Date	Resolution	Resolution Date
Quench Tower	Minor leak from potable water influent piping	6/13/2023	PVC connections replaced	6/16/2023
Scrubber	Float switch assembly contacts failed	8/16/2023	Replaced float switch assembly	8/17/2023
Recovery Well (RW03B)	Pump motor and controller in the fault failed	9/15/2023	Replaced pump motor and controller; supply chain issues caused the significant time interval between issue and resolution date	1/4/2024
Scrubber	Recirculation pump bearings seizing	9/15/2023	Replaced recirculation pump	9/17/2023
Control Panel	Lightning struck system and shorted two logic cards in the Programmable Logic Controller	2/5/2024	Replaced both logic cards	2/9/2024
Catalytic Oxidizer	Thermocouple in the catox heater had intermittent glitches causing fluctuations in temperature readings; bad wire connections to controller in electrical panel.	1/26/2024	Thermocouple was replaced and wire connection re-made	2/19/2024

Table 2-4. Hydraulic Containment System Performance Monitoring Plan

Sampling Location	Analysis	Frequency	Analytes
			CVOCs
Aqueous System Sampling			
Combined Influent	USEPA Method 8260D	Quarterly	✔
AS1 Effluent	USEPA Method 8260D	Monthly	✔
AS2 Effluent	USEPA Method 8260D	Monthly	✔
LPGAC Effluent	USEPA Method 8260D	Monthly	✔
Recovery Wells	USEPA Method 8260D	Quarterly(1)	✔
Vapor System Sampling			
AS Exhaust	USEPA Method TO-15	Annually	✔
	Draeger Tube/PID	Monthly	✔
CatOx Exhaust	USEPA Method TO-15	Annually	✔
	Draeger Tube/PID	Monthly	✔

Notes:

(1) Layer 7 recovery wells (RW17C, 18C, 19C, 20C and 21D [Layer7/8]) were sampled monthly during the reporting period.

AS1 = Secondary air stripper
AS2 = Primary air stripper
CatOx = Catalytic oxidizer
CVOCs = Chlorinated volatile organic compounds
LPGAC = Liquid-phase granular activated carbon
PID = Photoionization detector
RW = Recovery well
USEPA = United States Environmental Protection Agency

	19-Mar-24	**9,200**	**3,800**	150 U	140 U

Notes:
- Concentrations in µg/L
- In November 2022 the Layer 7 RWs were not sampled because the system was down
- RW05B, 012A, 013A, 014A, 015A, and 016B were turned off in February 2023
- In October 2023, results for LPGAC and recovery well 21D were likely switched; results on Table 2-5 and Table 2-11 reversed from lab report.
- During the quarterly events in September and December 2023, RW003B was not sampled due to pump controller issues.
- RWs designated with "A" are screened from 15 to 40 ft bls; RWs designated with "B" are screened from 50 to 80 ft bls; RWs designated with "C" 'are screened from 80 to 95 ft bls; and RW designated with "D" is screened
- Bolding indicates a concentration greater than the MDL but less than the NADC
- Shading indicates a concentration exceeding the NADC: TCE = 300 µg/L, cDCE = 700 µg/L, tDCE = 1,000 µg/L, and VC = 100 µg/L.

NADC = Natural Attenuation Default Concentration
NS = Not Sampled
MDL = Method detection limit
RW = Recovery well
TCE = Trichloroethene
cDCE = cis-1,2-Dichloroethene
tDCE = trans-1,2-Dichloroethene
VC = Vinyl chloride
I = Reported value is between the MDL and practical quantitation limit
J = Estimated value
J3 = Estimated value; value may not be accurate. Spike recovery or relative percent difference outside of criteria
L = Indicates value exceeds calibration range
LPGAC = Liquid-phase granular activated carbon
Q = Sample exceeded the accepted holding time
U = Not detected at MDL (associated value)

21-Dec-23	**24,000**	**3,800**	150 U	**290**
19-Mar-24	**25,000**	**5,100**	370 U	360 U

Notes:

(1) Location resampled due to suspect result on March 11, 2013. The April 1, 2013 result was used for mass calculations.

(2) System was down in December due to Programmable Logic Controller replacement. Sampling pushed to January 2021.

(3) Additional sample collected in April 2022 for Year 13 baseline

Concentrations in micrograms per liter (µg/L)

Bolding indicates a concentration greater than the MDL but less than the GCTL

Shading indicates a concentration exceeding the GCTL: TCE = 3 µg/L, cDCE = 70 µg/L, tDCE = 100 µg/L, and VC = 1 µg/L

GCTL = Groundwater Cleanup Target Level
MDL = Method Detection Limit
TCE = Trichloroethene
cDCE = cis-1,2-Dichloroethene
tDCE = trans-1,2-Dichloroethene
VC = Vinyl chloride
U = Not detected at MDL (associated value)
J = Estimated concentration
I = Reported value is between MDL and practical quantitation limit

Notes:

Concentrations in µg/L.

(1) 1-Nov-22, system off due to electrical issue preventing monthly sampling.

Bolding indicates a concentration greater than the MDL but less than or equal to the GCTL

Shading indicates a concentration exceeding the GCTL: TCE = 3 µg/L, cDCE = 70 µg/L, tDCE = 100 µg/L, and VC = 1 µg/L.

GCTL = Groundwater Cleanup Target Level
MDL = Method Detection Limit
NS = Not sampled
TCE = Trichloroethene
cDCE = cis-1,2-Dichloroethene
tDCE = trans-1,2-Dichloroethene
VC = Vinyl chloride
I = Reported value is between MDL and practical quantitation limit
J3 = Estimated value; value may not be accurate. Spike recovery or relative percent difference outside of criteria
U = Not detected at or above MDL (associated value)

Notes:

Concentrations in micrograms per liter (µg/L)

(1) 1-Nov-2022, system off due to electrical issue preventing monthly sampling.

Bolding indicates a concentration greater than the MDL but less than or equal to the GCTL

Shading indicates a concentration exceeding the GCTL: TCE = 3 µg/L, cDCE = 70 µg/L, tDCE = 100 µg/L, and VC = 1 µg/L

GCTL = Groundwater Cleanup Target Level
MDL = Method Detection Limit
NS = Not sampled
TCE = Trichloroethene
tDCE = trans-1,2-Dichloroethene
cDCE = cis-1,2-Dichloroethene
VC = Vinyl chloride
I = Reported value is between MDL and practical quantitation limit
J3 = Estimated value; value may not be accurate. Spike recovery or relative percent difference outside of criteria
U = Not detected at or above MDL (associated value)

Table 2-9. Catalytic Oxidizer Influent Data

Sample Date	TCE	cDCE	tDCE	VC

21-Dec-23	230,000	38,000	360 J	2,500

Notes:

Concentrations in micrograms per cubic meter ($\mu g/m^3$)

TCE = Trichloroethene
cDCE = cis-1,2-Dichloroethene
tDCE = trans-1,2-Dichloroethene
VC = Vinyl chloride
I = Reported value is between method detection limit (MDL) and practical quantitation limit.
J = Estimated value
V = The analyte was detected in both the sample and the associated method blank
U = Not detected at MDL (associated value)

Note:

- LPGAC was taken offline in July 2018. It was reinstated in September 2019 through December 2019 during RW17C startup, then taken offline until February 2021.
- November 2022, LPGAC sample not collected due to system being down.
- Bolding indicates a concentration greater than the method detection limit (MDL) but less than the GCTL.
- Concentrations in µg/L.

TCE = Trichloroethene
cDCE = cis-1,2-Dichloroethene
tDCE = trans-1,2-Dichloroethene
VC = Vinyl chloride
I = Reported value between MDL and practical quantitation limit
J3 = Estimated value; value may not be accurate. Spike recovery or relative percent difference outside of criteria.
U = Not detected at or above MDL (associated value)
NS = Not sampled

Table 2-12. Catalytic Oxidizer Emission Loading and Destruction Efficiencies

Parameter	Influent			
	Result ($\mu g/m^3$)	Calculated Loading		
		(lb/day)	(lb/month)	(lb/year)
Acetone	**1,200 J**	**0.06**	**1.94**	**23.60**
Chlorobenzene	**210 J**	**0.01**	**0.34**	**4.13**

Vinyl chloride	**2,500**	**0.13**	**4.0**	**49**

Parameter	Effluent				
	Result ($\mu g/m^3$)	Calculated Loading			Destruction Efficiency
		(lb/day)	(lb/month)	(lb/year)	
Acetone	4.3 U	1.2E-04	3.5E-03	0.04	99.82%
Chlorobenzene	0.62 U	1.7E-05	5.0E-04	0.01	99.85%
cis-1,2-Dichloroethene	**12**	**6.5E-04**	**0.02**	**0.24**	99.97%
Cyclohexane	**3.3**	**1.8E-04**	**0.01**	**0.06**	99.13%
Dichlorodifluoromethane	**2.0 J**	**1.1E-04**	**3.2E-03**	**0.04**	99.72%
m,p-Xylene	0.4 U	1.1E-05	3.2E-04	3.9E-03	99.80%
Toluene	0.61 U	1.6E-05	4.9E-04	0.01	99.98%
trans-1,2-Dichloroethene	**3.0**	**1.6E-04**	**4.8E-03**	**0.06**	99.17%
Trichloroethene	**93**	**5.0E-03**	**0.15**	**1.83**	99.96%
Vinyl chloride	1.4 U	3.8E-05	1.1E-03	0.01	99.97%

TCE and total VOC emission rates are 5.0E-03 and 6.3E-03 pound per day (lb/day), which are less than the daily HAP level of 2.7 and 6.8 lb/day, respectively.
Influent results show system loading for TCE is 12.4 lb/day and for total VOCs is 14.8 lb/day.
Notes:
- Loading calculated based on the operational flow rate of 600 standard cubic feet per minute.
- Table includes all analytes that were detected for influent and effluent samples (collected 12/21/2023); all other tested parameters are non-detect.
- Bolding indicates a detected parameter above the laboratory method detection limit (MDL).
- Analytes reported as U, 1/2 the MDL used for loading calculation

J = The reported value is between the laboratory MDL and the practical quantitation limit (PQL)
U = Value below the laboratory MDL
HAP = Hazardous Air Pollutant
lb = Pounds
$\mu g/m^3$ = Microgram per cubic meter
VOC = Volatile organic compound

Table 2-13. Mass and Volume Recovery Data

Year	Date	TCE (µg/L)	cDCE (µg/L)	tDCE (µg/L)	VC (µg/L)	Total Influent VOCs (µg/L)	Volume Recovered (gal)		VOC Mass Recovered (lb)

Notes:

- DPT results are considered screening-level only and were reviewed in accordance with internal data protocols; appropriate qualifiers were applied to the data as deemed necessary by the quality reviewer.
- Concentrations reported in micrograms per liter (µg/L).
- Shading indicates > Groundwater Cleanup Target Level (GCTL): TCE = 3 µg/L, cDCE = 70 µg/L, and VC = 1 µg/L.

(1) - Sample was not collected at DPT0599 at 83.0 feet due to a miscount in screens.

TCE = Trichloroethene
cDCE = cis-1,2-Dichloroethene
VC = Vinyl chloride
NS = Not sampled
NA = Not applicable
I = Reported value is between method detection limit (MDL) and practical quantitation limit
J = Estimated concentration
L = Actual value is known to be greater than value given
U = Not detected at or above MDL (associated value)

Notes:

Concentrations in micrograms per liter (µg/L).

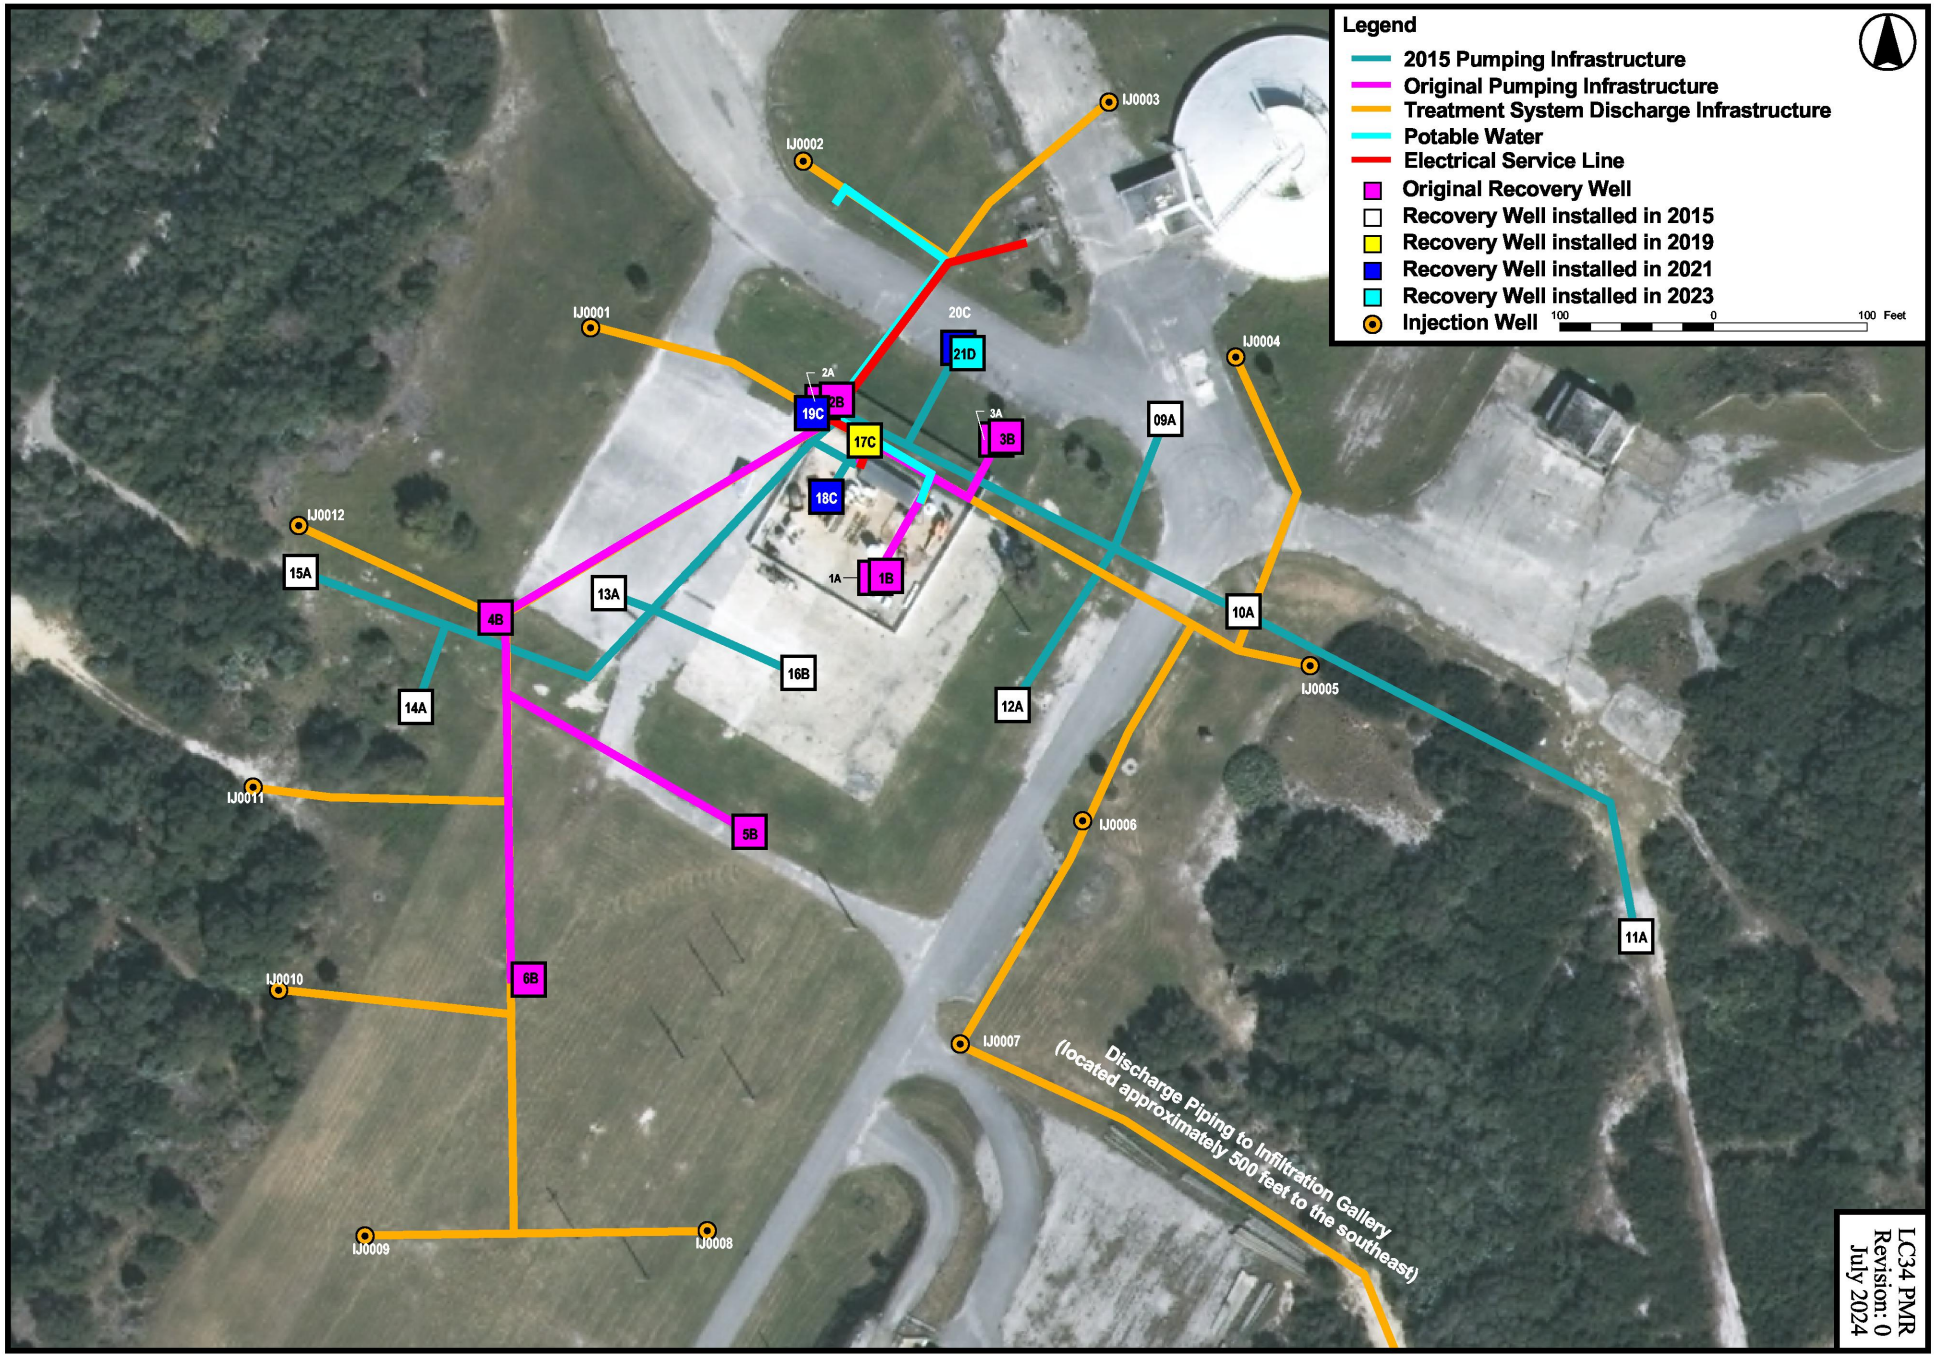
Shading indicates exceeding Groundwater Cleanup Target Level (GCTL), TCE = 3 µg/L, cDCE = 70 µg/L, tDCE = 100 µg/L, and VC = 1 µg/L

TCE = Trichloroethene

tDCE = trans-1,2-Dichloroethene

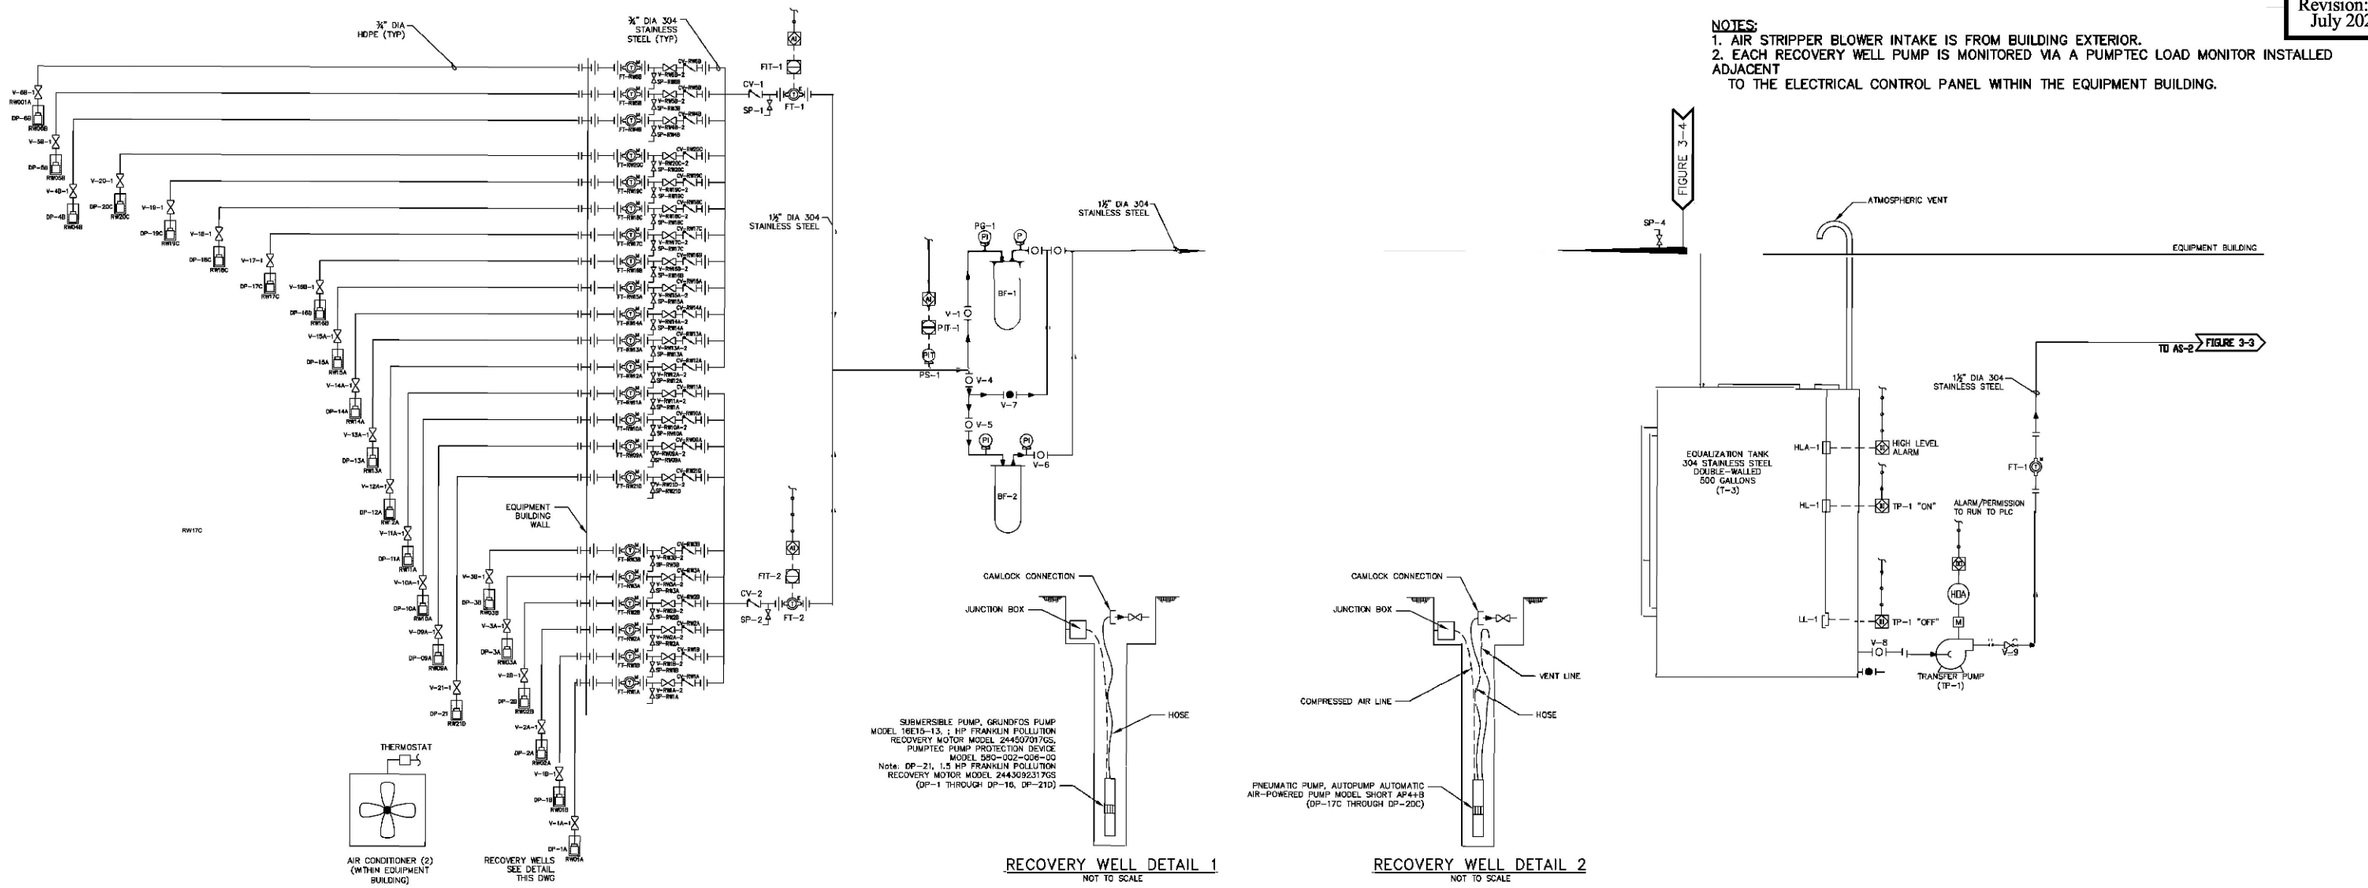
cDCE = cis-1,2-Dichloroethene

VC = Vinyl chloride



I = Reported value is between method detection limit (MDL) and practical quantitation limit

J3 = Estimated value; value may not be accurate. Spike recovery or relative percent difference outside of criteria



L = Actual value is known to be greater than value given

U = Not detected at or above MDL (associated value)

KEY EQUIPMENT ITEMS

P&ID Symbol	Description	Model Info	Qty.
DP-1 through DP-16, DP-21	Submersible Pump, Extraction well pump	SUBMERSIBLE PUMP, GRUNDFOS PUMP MODEL 16E15-13, ¾ HP FRANKLIN POLLUTION RECOVERY MOTOR MODEL 244507017GS, PUMPTEC PUMP PROTECTION DEVICE MODEL 580-002-006-00 Note: DP-21, 1.5 HP FRANKLIN POLLUTION RECOVERY MOTOR MODEL 2443092317GS	17
DP-17C through DP-20C	Pneumatic Pump, Extraction well pump	Auto Pump model SHORT AP4+B	4
FT-1A through FT-21D	Flow totalizer for each extraction well	ISTEC model 1740, 3/4" inlet/outlet	21
FS-1 and FIC-1, FS-2 and FIC-2	Flow sensor and transmitter with digital display	Signet 525 METLEX	2
FS-3 and FIC-3, FS-4 and FIC-4	Flow sensor and transmitter	Signet 38550-1	2
BF-1 to BF-4	Bag filter	KRYSTIL KLEAR model 66-30 (304SS)	2
MP-1, MP-2	Biocide, sequestering agent metering pumps	LMI model AA971-155HV	2
FT-1	Flow totalizer	ISTEC model 1740, 1 1/2" inlet/outlet	1
AS-1, AS-2	4-tray low profile air stripper	QED model EZ Tray 12.4SS, rated for 125 gpm, 600 SCFM at <30" w.c.	1
LGAC-1, LGAC-2	Liquid phase granular activated carbon vessels, located outside	Carbon services model AQ1500, 1500# of carbon each, 50 gpm, <150 psi rating	1
TP-1	Air stripper inlet transfer pump	AMT model 490D-98, 50 gpm at 75' TDH, 1.5 hp	1
TP-2	Air stripper effluent transfer pump	Goulds SSH 5SH, 5.5 inch impeller, 125 gpm at 23 feet, 1.5 hp, VFD controlled	1
TP-3	Air stripper effluent transfer pump	Goulds SSH 4SH, 6-1/16 inch impeller, 125 gpm at 115 feet, 7.5 hp, VFD controlled	1
B-1	Air stripper blower	New York Blower model 29006, 600 scfm at 62" wg, 20 hp, VFD controlled	1
MV-1	Flow dividing motorized valve controlled by PLC signal	?	1
SP-1	Sump Pump	ARD PD air operated pump	1

KEY EQUIPMENT ITEMS

Description	Model Info	Quantity
Electrical catalytic oxidizer	PRM model CATOX-E600, 600 SCFM max flow, integrated control panel and temperature sensors	1
Process heater	Durex Industries, Model FDH48N-5630, 825degF at 600 SCFM, 116 KW max	1
Heat exchanger	Custom made, gauge 14 AL6XN stainless steel, 50% efficiency	1
Catalyst module	Johnson Matthey, Model HALOCAT, 8.6 cu.ft (72 cubes)	1
Pre-scrubber quench tower	Custom made, gauge 14 AL6XN stainless steel, 14"Dx120"H.	1
Scrubber tower	Custom made, FRP, 24"Dx120"H.	1
Moisture separator	PRM model MS120, epoxy coated steel, 4" inlet, 6" outlet, 750 SCFM max flow, 24"Dx60"H, 60-gal liquid capacity	1
CATOX inlet blower	Twin City Fan model TBNS 9N6, 7.5 hp, VFD controlled	1
Moisture separator transfer pump	CT Meyers, Model CT05, 1/2 hp	1
Scrubber effluent transfer pump	Stainless steel centrifugal pump, 1.5 hp	1
Scrubber circulation pump	Stainless steel centrifugal pump, 1.5 hp, VFD controlled	1
Make-up water pressure booster pump	Goulds SS, Model 2HMIF250, VFD controlled	1
Flow sensor and transmitter	Signet 38550-1	3
Flow totalizer	Master Meter, 3/4" classic multi-jet water meter	1
Thermocouple	Pyromation, Model K43U-024-00-8HN34	2
Thermocouple	Pyromation, Model K48UT-012-56C-9HP63	1

SECTION III
HOT SPOT 6 AREA AS SYSTEM EXPANSION - PHASE TWO

This section discusses the activities associated with the implementation of the HS 6 AS System Phase Two expansion conducted between August 17, 2022 and August 28, 2023. As stated in Section 1.4.26, the original expansion design (currently referred to as Phase Two A) included installation of 76 AS wells to depths of approximately 35 feet bls, to remediate contaminated groundwater within a 4-acre area located north of the existing HS 6 treatment area. Elements of the IWP were presented during the December 2020 KSCRT meeting, and consensus was reached to proceed with development of the work plan and implement the project. The IWP was approved by FDEP on June 18, 2021.

Implementation of Phase Two A was delayed while the U.S. Fish and Wildlife Service reviewed information regarding threatened and endangered species at LC34. Planning for the next expansion proceeded, and in May 2022, FDEP was briefed on additional expansion (Phase Two B) that would include 116 AS wells and 10 performance monitoring wells over an area of 5.7 acres. FDEP concurred with proceeding without an additional IWP on condition that further expansion would be documented with as-builts in a CCR. The proposed additional expansion (Phase Two B) was documented in a revised ADP, dated March 2022 (NASA, 2022a).

This report section includes details of construction and implementation of both phases (design presented in 2020 and additional design presented in 2022), collectively referred to as Phase Two, and includes the elements of a stand-alone CCR.

3.1 CONSTRUCTION

Construction activities associated with implementation of the HS 6 Phase Two expansion consisted of pre-construction preparation, mobilization, installation of AS and monitoring wells, installation of piping and manifolds, and associated infrastructure. Ongoing operations, maintenance, and monitoring since startup are discussed in Section IV.

3.1.1 Pre-Construction Activities. Prior to initiating the work, planning and scoping details were discussed with NASA. Project details, including KSC-specific construction requirements

and components of the IWP and Site-Specific Health and Safety Plan (NASA, 2021e), were discussed. As detailed in the IWP, all work was completed in compliance with the KSC Environmental Checklist, including the KSC Record of Environmental Consideration (REC), Utility Locate/Excavation Permit, Threatened and Endangered Species Survey, Wetland Survey, and well permits, as applicable. Permits and forms associated with the HS 6 Phase Two expansion are provided in Appendix E.

Note, the REC was originally issued on March 5, 2021, for the original expansion design including the installation of 76 AS wells (Phase Two A), but because the threatened and endangered species survey identified potential impacts requiring review from the U.S. Fish and Wildlife Service, mobilization was placed on hold pending the issuance of a U.S Wildlife Services Biological Opinion. During that time, the project design was modified to include 116 additional AS wells (Phase Two B) and once the Biological Opinion was received on June 6, 2022, the REC was updated and re-issued on September 9, 2022. All other required permits were updated and re-submitted, and the project proceeded after full approval.

3.1.2 Mobilization. During the week of September 19, 2022, Tetra Tech mobilized to the HS 6 expansion site for initial utility clearance, and to conduct a stake-out survey to demarcate areas of proposed installation activities, including monitoring wells, AS wells, and trenches for piping. Beginning the week of October 3, 2022 an ecological survey was initiated by NASA's wildlife biologist. The ecological survey was conducted in phases in prior to drilling activities in various areas of the site and was completed the week of December 7th, 2022. The ecological survey determined there were no wetlands present within the project area.

3.1.3 Clearing Activities. Because the majority of the system expansion area is within the mowed/maintained areas of LC34, minimal vegetative clearing was needed in only a small area on the southeast side of the perimeter road. Shrub vegetation was removed to allow installation of monitoring wells, AS wells, and piping.

3.1.4 Pre-Construction DPT Sampling. To verify the plume extents in the expansion area, groundwater sampling was conducted via DPT along the center line of the plume from August 17-19, 2022. Samples were collected from 10 boring locations, at four depth intervals per boring

(13, 18, 25, and 34 feet bls), for a total of 40 samples. The locations were consistent with previous DPT samples collected during the 2019-2020 DPT Investigation, which was conducted to delineate areas exceeding 10x NADC concentrations and support the design of the AS system expansion. The DPT samples were submitted to SGS Northeast, Inc., in Orlando, Florida for analysis of VOCs via Method 8260D. The results showed no detections of TCE, but there were concentrations of cDCE and VC greater than GCTLs with selected locations exceeding NADC and 10xNADC values, consistent with previous results. The August 2022 DPT locations and results are shown on Figure 3-1 and results are summarized in Table 3-1. The DPT sample log sheets and field notes are included in Appendix F. Laboratory analytical reports are included in Appendix C.

3.1.5 Monitoring Well Installation. A total of 21 monitoring wells (IW0168 through IW0188) were installed from November 1, 2022 to January 20, 2023 for the purpose of performance monitoring in support of evaluating the plume treatment. The wells were placed within treatment area and around the perimeter of the Phase Two expansion area, as depicted on Figure 3-2.

The monitoring wells were installed using rotosonic drilling technology by Drill Pro, LLC, a Florida-licensed driller. The wells were each constructed with 1-inch diameter pre-packed 0.010-slotted PVC screen, 5 or 10 feet in length, threaded to solid PVC riser. Silica sand (20/30) pack was placed within the well annulus from the bottom of the borehole to 1 foot above the well screen, and 30/65 silica sand was placed an additional two feet above the 20/30 silica sand pack. Each well was sealed with a Portland cement and bentonite slurry to land surface. The monitoring wells were completed with a 3-foot by 3-foot concrete well pads and were “flush-mount” with steel manholes and bolt-down covers. After installation, well top-of-casing and ground surface elevations were surveyed by a Florida-licensed surveyor. Aqueous IDW generated during drilling activities (decontamination fluids and development water) was transferred to the LC34 HCS treatment system. The performance monitoring well construction details are included in Table 3-2.

As shown on Figure 3-2, the eight wells placed around the perimeter of the treatment area are screened from 16 to 21 feet bls. The wells placed in the interior portion of the treatment area

were installed in collocated pairs, screened from 17 to 27 feet bls (to include a 10-foot sampling zone) and 30-35 feet bls.

A field geologist and environmental technician were present during monitoring well installation and were responsible for direction of the drilling subcontractor, monitoring of drilling operations, geologic logging, and recording of well installation and decontamination procedures. Monitoring well screened intervals were verified by the field geologist. Field documentation including well installation log sheets, field notes, well construction diagrams, driller well completion reports, and the surveyor report are included in Appendix G.

Baseline sampling of the 21 new performance monitoring wells (IW0168 through IW0188) was conducted in July 2023, and the first quarterly sampling event was conducted in November 2023, concurrent with the semi-annual sampling of the 28 wells in the original HS 6 performance monitoring network. Performance monitoring activities and results are further discussed in Section IV.

3.1.6 AS Well Installation. A total of 190 AS wells (AS-301 through AS-490) were installed from October 17, 2022 to February 9, 2023, to total depths of approximately 40 feet bls, just above the shallow confining layer in the intermediate zone (Layer 4). Note, there were originally 192 AS wells planned (76 in Phase Two A and 116 in Phase Two B), but during site setup activities, a decision was made to omit two locations because of surface obstructions. During AS well installation, soil cores were collected to verify the depth of the confining layer at 155 representative locations (some of the core samples had no recovery and were not logged and some of the AS wells installed at angles were too shallow to collect cores). Of the 190 AS wells installed, 26 were installed at an angle to avoid surface obstructions such as roadways and concrete pads. The soil cores were interpreted by the geologist to identify the depth of the confining layer and the bottoms of AS well screens were placed directly above the confining layer.

The AS wells were installed using rotosonic drilling technology by Drill Pro, LLC, a Florida-licensed driller. The AS wells were constructed with 1-inch Schedule 40 PVC casings and 40-micron Schumasoil® diffuser well screens (24 inches in length). Casing sections were flush-joint

threaded with neoprene O-rings on the male threaded ends to render the joints air tight. A 20/30 silica sand pack was placed within the well annulus from the bottom of the borehole to 1.5 feet above the well screen and a 3-foot bentonite seal was placed above the sand pack. Each well was sealed with a Portland cement and bentonite slurry to land surface. The AS wells were completed following trenching and piping installation activities, as described in Section 3.1.7.1. Soil IDW generated during the AS well installation (drill cuttings) were returned to the boreholes, aqueous IDW (decontamination fluids and development water) was transferred to the LC34 HCS treatment system. The locations of the AS wells are provided on Figure 3-2. AS well construction details are provided in Table 3-3. Soil boring logs, field notes, AS well construction diagrams, and driller completion reports are included in Appendix G.

3.1.7 AS System Installation.

3.1.7.1 Piping And Utility Installation. A trenching network was excavated to install subsurface compressed air conveyance piping to the AS wells. Trenching and installation commenced on January 30, 2023 and was completed on July 13, 2023. The trenches had dimensions of approximately 24 inches wide by 18-24 inches deep and trenches were excavated with a hydraulic excavator or were hand dug in locations where underground utilities were identified during utility clearance. A trench layout map is depicted on Figure 3-2 and cross-sectional details of the trenches are shown on Figure 3-3. Construction daily activity reports are included in Appendix H. A photographic log is also provided in Appendix H.

Dedicated 1-inch standard dimension ratio (SDR)-11 high-density polyethylene (HDPE) air conveyance piping was plumbed to each AS well (lateral) for compressed air delivery from the AS wells to one of two distribution trailers located on the eastern and western sides of the blockhouse cable tray wall. These distribution trailers were moved from their original locations on the east and west sides of the drainage ditch, but a third existing distribution trailer located southwest of the perimeter road remained in place to supply the newly configured Zone 8 and new Zone 9. Once the AS wells were in place, the two distribution trailers were disconnected, taking Zones 1 through 8 offline (Phase One configuration), and were moved between July 7 and 13, 2023 to their new locations and anchored to the ground in accordance with the Trailer /Equipment Tiedown Plan (NASA, 2001).

The 190 AS wells were installed as part of six new zones (Zones 9-14) to treat an additional 11.2 acres. The 190 new AS wells are spaced 50 feet apart to accommodate a 25-foot ROI with no overlap, and a flow rate of 5 scfm, consistent with the original (Phase One) HS 6 AS system design. A portion of the existing AS system was reconfigured as a barrier to prevent upgradient contamination from impacting the treated area. This portion (Zone 8) has 48 operational AS wells supplied by the third distribution trailer, located on the southeast side of the perimeter road, west of the drainage ditch. The four AS wells designated as Zone 9 were tied into the piping and same manifold supplying Zone 8. Operational information of the current system configuration (238 wells in original and expansion) is further discussed in Section IV. A piping and instrumentation diagram is depicted on Figure 3-4, and the distribution manifold construction detail is depicted on Figure 3-5. A layout of the HS 6 AS zones is depicted on Figure 3-6.

Well quantities per zone and manifold pressures of the HS 6 Phase Two expansion design are presented in the following table.

Zone ID	Manifold ID	Number of Wells	Design Pressure (psig)	Well Flow (cfm)	Manifold Flow (cfm)
8/9*	8	52	30	5	240
10	4	36	30	5	180
11	1	36	30	5	180
12	5	38	30	5	190
13	3	38	30	5	190
14	2	38	30	5	190

* Zones 8/9 – 48 wells were part of the existing system, four were installed and tied into the supply line during the expansion

Once relocated, the distribution trailers were tied into the existing compressor trailer located under the Van Shelter 22004, which houses a 75-hp variable frequency drive rotary screw air compressor. A 2-inch HDPE header pipeline was installed for each zone manifold to connect the lines from the compressor across the cable tray wall to the distribution trailers.

From each AS well manifold outlet, a flow meter (0 to 14 scfm scale range), flow-regulating needle valve, and pressure gauge (0 to 60 psig scale range) were installed on each line. Each outlets exits the through the wall of the distribution trailer and transitions from 0.5-inch flexible

polyurethane tubing to 1-inch male-threaded fittings for connection to the compressed air conveyance lateral pipe to the AS well.

The 2-inch header lines were connected to the compressor system, and the cycling times were programmed via the PLC for the zones (see Section 3.2.1 for cycling details). The manifold/header connections for the expanded system are summarized in the table below.

Zone ID	Manifold Trailer
8/9	Southeast
10	East
11	East
12	West
13	West
14	West

Connections for piping sections and fittings were socket welded using an electric welding plate. All socket welds were completed per piping manufacturer recommendations. AS wellheads were modified to accept the compressed air lateral and completed with connections to the lateral and inspection plugs buried just below ground surface with surveyor-style location hubs above each AS well and marked with survey stakes. Following backfilling of the trenches, pressure tests were conducted for each lateral and header pipe. Tests were typically performed in the mornings to minimize the effect of thermal expansion of the pipes during pressure testing. All installed lines passed the pressure tests.

During backfilling of the trenches, metallic utility detection tape and #10 thermoplastic high heat-resistant nylon-coated (THHN) wire were installed within all trenches at a depth of 1-foot bls for future detection of the IM infrastructure. Trenches were backfilled with native soil, compacted, and resurfaced to match existing conditions.

3.1.7.2 <u>Building and Equipment Installation.</u> The Phase Two AS expansion is utilizing the existing components and electrical supply. The compressor trailer was originally constructed for the Converter Compressor Building site in 2013, and it was relocated to LC34 in 2018 for the HS 6 IM. When it was constructed, appropriate process units, shut-off valves, control valves, sample ports, and/or instrumentation were installed and wired for operation by the equipment vendor. A

telemetry system was installed by the equipment vendor for remote system monitoring and operation and also to notify the operator and project team of system shutdown and/or alarm conditions. The vendor calibrated all instrumentation before the system was mobilized and the instrumentation was recalibrated upon installation at LC34, and electrical connections checked, and equipment rotation verified for proper rotation prior to commission of the original (Phase One) AS operations.

3.2 SYSTEM STARTUP TESTING AND MONITORING

This section identifies the activities conducted during startup of the Phase Two expansion. Subsequent O&M activities and evaluations conducted routinely to monitor system performance of the current configuration of the HS 6 AS system are further discussed in Section IV.

3.2.1 Pulse Setup and Programming. The Phase Two expansion design was implemented to include a specific pulse schedule for designated zones. The eastern distribution trailer was programmed to pulse between zones 10 and 11, for 6-hours each. The western distribution trailer was programmed to pulse between zones 12, 13, and 14, for 6-hours each. The southeast distribution trailer was programmed to run a 6-hour pulse cycle for zone 8/9, which was reconfigured after the remaining zones in the original (Phase One) design were turned off. Pressure regulators at the system manifolds were adjusted to meet the design requirements and then adjusted to ensure that the pressures at the distribution manifolds meet the intended injection pressures at the wellheads. The manifolds were tested during system startup to ensure proper operation. Operational data for the updated system configuration are further discussed in Section IV.

Zone ID	Cycle Time
8/9	06:00 – 12:00
10	18:00 – 00:00
11	12:00 – 18:00
12	12:00 – 18:00
13	00:00 – 06:00
14	06:00 – 12:00

3.2.2 System Startup. After the completion of baseline sampling and after all components were connected, the initial startup testing was conducted over a period of six weeks from July 17, 2023 to August 24, 2023 and the system was fully operational on the week of August 28, 2023. All related health, safety, and emergency response procedures were in place and reviewed before this phase of operation. Before the process system was started, a final check on the alignments and positioning of all motor drives, valves, safety devices, and control set points was conducted.

The objective of this phase was to ensure that all components of the AS system were operating within design parameters and to flow and pressure balance the zones and AS wells. Startup of the AS system was performed gradually with a beginning pressure of 10 psi and increasing the pressure by about 10 percent per week, focusing on each specific manifold zone at a given time, and comparing observations and test data to design and performance criteria.

The overall startup sequence for the AS process system was as follows:

- Ensure that all valves are in the proper position (including valving at the distribution manifolds);
- Ensure that the electrical disconnects are in energized positions;
- Ensure that all alarm conditions on the control panel are cleared;
- Verify that the condensate treatment system is on line and that fluids were drained;
- Verify that all filters are prepared for operation and that condensate drains and piping are in their correct positions;
- Verify that the solenoid valve programming is set for pre-set pulse intervals and set in the AUTO position (entries for spare manifold legs should be set as “OFF”);
- Turn the selector switch for the rotary screw compressor/air dryer to the AUTO position; and
- Verify operating pressures, flows, and temperatures throughout the system and at the system discharge manifolds.

The system was then in automatic operation, and ON/OFF and START/STOP functions of the system were controlled by the PLC. After operation was verified and acceptable at each system location, conditions were inspected at the distribution manifolds. Pressure and flow were verified and balanced at each distribution manifold using a sequenced approach, with flow and pressure adjusted for each manifold and then each AS well. The sequence was terminated when the design and equipment performance complied with specifications, and the system was ready for transition into the O&M phase. Observations, sampling, and other performance testing performed during startup ensured that the system was operating as expected. After the system was running within the expected operating conditions, all components associated with the HS 6 system were checked as part of system startup monitoring. Readings for flow and pressure at each AS well and operation flows, pressures, and temperatures at all monitoring points in the HS 6 AS system were collected. Full operations began the week of August 28th, 2023.

3.2.3 System Evaluations and Maintenance. System evaluations and maintenance checks were conducted daily or weekly during startup. Thereafter, the system transitioned into the routine O&M phase to be conducted monthly. A detailed evaluation of system performance and operation is further discussed in Section IV.

Notes:

- DPT results are considered screening-level only and were reviewed in accordance with internal data review protocols; appropriate qualifiers were applied to the data as deemed necessary by the quality reviewer.
- Concentrations reported in micrograms per liter (µg/L)
- Shading indicates > Groundwater Cleanup Target Level (GCTL): TCE = 3 µg/L, cDCE = 70 µg/L, and VC = 1 µg/L

TCE = Trichloroethene
cDCE = cis-1,2-Dichloroethene
VC = Vinyl chloride
I = Result greater than or equal to method detection limit (MDL), but less than practical quantitation limit
U = Not detected greater than the MDL (associated value)
bls = Below land surface

SECTION IV
HS 6 AREA AS IM OPERATIONS, EVALUATION, AND PERFORMANCE MONITORING

This section discusses activities conducted during the reporting period (April 1, 2023 to March 31, 2024) for the HS 6 AS IM of the Phase One (original configuration), and the Phase Two expansion, and summarizes the results of evaluations conducted regarding system performance.

Phase One (original configuration) of the HS 6 AS system was installed in two phases (for discussion purposes these are referred to herein as Phase One A and Phase One B). Phase One A was construction of the initial system to prevent further discharge of CVOCs into the drainage canal and to prevent the HS from expanding. This phase consisted of 160 AS wells in five zones (Zones 1 through 5), and was installed between February 19, 2018 and July 7, 2018, in accordance with the approved LC34 HS 6 IWP (NASA, 2017b). The full-scale O&M phase for the initial system began on July 9, 2018. After six months of operation, based on rapid contaminant reductions seen in performance monitoring, the HS 6 AS system was expanded to contain and remediate the HS 6 area located down/side-gradient of the HC IM at LC34. Phase One B consisted of 140 AS wells in four zones (Zones 6 through 9). Installation activities associated with the expanded system were performed in accordance with the approved LC34 HS 6 Expansion IWP (NASA, 2018) between November 9, 2018 and April 2, 2019, and full-scale operation resumed in May 2019.

The Phase One 300-AS well operational scheme changed in April 2019 when select AS wells in Zone 1 and Zone 2 were turned off (consisting of 48 AS wells). In January and February 2020, select wells in Zone 3 and Zone 4 were turned off (consisting of 53 AS wells; 35 wells in Zone 3 and 18 wells in Zone 4), which increased the individual AS well flow rate from 5.0 to 5.9 scfm per AS well. These AS wells in Zones 1 to 4 were shut off because performance monitoring results showed IM objectives had been achieved. The remaining 199 AS wells operated until July 2023 when they were shut off during startup of the Phase Two expansion, having also met IM objectives except along the fringe of the DSZ.

Currently, the Phase Two expansion is complete and operational for HS 6 and includes 238 AS wells in seven treatment zones installed to approximately 35 feet bls, spaced approximately 50 feet apart with a 25-foot ROI, and with approximately 5 cfm per AS well. Figure 3-2 depicts the HS 6 trenching, and AS and monitoring well layout (Phase One and Two).

4.1 INTERIM MEASURE SCOPE AND OBJECTIVE

The objective for the HS 6 AS IM is to remediate contaminated groundwater within the treatment zone, to prevent impacts to drainage canals, and support transition to MNA. The overall corrective action objective at HS 6 is to reduce concentrations of the HS 6 COCs (cDCE, tDCE, and VC) to less than FDEP NADCs. The HS 6 AS IM objective was developed to provide a flexible treatment train approach for which certain metrics such as remedial performance, plume dynamics, and natural attenuation characteristics can be evaluated to determine remedial objectives and ultimately an endpoint to the IM. Based on the treatment performance of the IM, AS operations may be modified, as appropriate, to achieve the HS 6 AS IM objective.

4.2 AS SYSTEM OPERATION, MAINTENANCE, AND EVALUATION

Table 4-1 presents runtime data for the HS 6 AS system. Pressure and flow data for each manifold and zone is included in Appendix I. During the operational period from April 1, 2023 to March 31, 2024, the cumulative runtime was 85 percent. From April 1 to July 7, 2023, the original configuration was operating and then the configuration changed when the distribution trailers were moved and connected to the Phase Two expansion and the phased startup began. Phase Two was fully operational on August 28, 2023. Other than downtime associated with installation of the new AS wells, transitioning the system from the original configuration to the new Phase Two layout, and activities associated with startup and initial maintenance, the system operated as planned. The system was shut down prior to performance monitoring events in April, July, and November 2023, and February 2024, and for DPT sampling in the Phase Three expansion area in October 2023.

During the operational period covered under this report, 199 AS wells operated in Zones 3-9 from April 1, 2023 until July 24, 2023, then 238 wells operated through March 31, 2024. The

system is currently operating on a cycled schedule alternating operation between zones, as summarized in the following table.

Zone ID	Manifold ID	Cycle Time Before Phase Two	Cycle Time After Phase Two
1/2	1	Off	Off
4	2	00:00 – 08:00	Off
3	3	00:00 – 06:00	Off
5	4	06:00 – 12:00	Off
6	5	12:00 – 00:00	Off
9	6	00:00 – 06:00	Off
7	7	06:00 – 12:00	Off
8	8	12:00 – 18:00	NA
8/9	8	NA	06:00 – 12:00
10	4	NA	18:00 – 00:00
11	1	NA	12:00 – 18:00
12	5	NA	12:00 – 18:00
13	3	NA	00:00 – 06:00
14	2	NA	06:00 – 12:00

Phase Two became fully operational on August 28, 2023.

The system is monitored remotely, and system evaluations and maintenance activities are conducted in-person by field personnel to evaluate the operational parameters of the system. At a minimum, monthly site visits were conducted during the reporting period, which included the following activities for system evaluation:

- Inspection of flow meters, transmitters, and AS system components for leakage and excessive vibration, noise, or abnormal temperatures;
- Inspection of oil levels and lubrication;
- Inspection of condensate treatment systems and refrigerated air dryer;
- Assessment of differential pressure across filtration units and process equipment;

- Recording of system operational data and comparing data to design conditions and previous operating data;
- Repairing and cleaning equipment as needed; and
- Perform housekeeping.

Maintenance will continue to be executed in a manner that minimizes emergencies or unscheduled shutdowns. Maintenance activities were conducted as planned during the monthly site visits, which included the following activities:

- Balancing individual AS well flows within each manifold zone;
- Redevelop AS wells as needed if fouling occurs;
- Change air compressor oil every 8,000 hours;
- Drain condensate treatment system on a quarterly basis or as needed; and
- Replace filters as needed and/or based on manufacturer's recommendations.

4.3 HS 6 PERFORMANCE MONITORING FIELD ACTIVITIES

Performance monitoring results are used to evaluate the effectiveness of the HS 6 AS IM in reducing concentrations of CVOCs in groundwater by comparing current results to baseline results collected prior to installation of the AS system.

During this reporting period, semi-annual performance monitoring of the original AS IM configuration was conducted in April 2023 and November 2023. For the Phase Two expansion area, three sampling events occurred during this reporting period of the network of 21 new wells. The baseline event for the Phase Two expansion was in July 2023, and the first two quarterly events were in November 2023 and February 2024. Note, the first quarterly event aligned with the second semi-annual event of the original configuration, in November 2023. Table 1-1 presents the performance monitoring network and Figure 3-2 shows the well locations. During this reporting period, the following sampling events were conducted:

- April 2023 - Semi-annual sampling of 28 monitoring wells and three surface water locations (original configuration).

- July 2023 – Baseline sampling of 21 monitoring wells (Phase Two expansion).
- November 2023 – Semi-annual sampling of 28 monitoring wells and three surface water locations (original configuration), and first quarterly sampling of 21 monitoring wells (Phase Two expansion).
- February 2024 – Second quarterly sampling of 21 monitoring wells (Phase Two expansion).

Peristaltic pumps were used for the purging of wells prior to sampling, and samples were collected using the low-flow purge technique. Monitoring well purging and sampling activities and surface water collection were conducted in accordance with the KSC SAP (NASA, 2017a) and FDEP SOPs FS 2100 and 2200 (FDEP, 2017). Water quality parameters such as temperature, pH, conductivity, turbidity, dissolved oxygen (DO), and oxidation-reduction potential (ORP) were measured at each monitoring well using a water quality meter and a flow-through cell. Groundwater samples were collected once the parameters met the stabilization criteria. Surface water samples were collected in accordance with FDEP SOPs, utilizing a peristaltic pump and tubing connected to an extendable pole to obtain a grab sample. Sampling logs and field documentation associated with HS 6 performance monitoring is provided in Appendix F. Field measurements for each sampled location were generally within normal range and consistent with historical values. A summary of water quality parameter data recorded during monitoring well and surface water sampling is provided in Table 4-2.

The groundwater and surface water samples were shipped under chain-of-custody to Eurofins, in Altamonte Springs, Florida, for analysis of VOCs by USEPA Method 8260D. During the events, samples were collected in both unpreserved and preserved vials to ensure headspace fell within accepted criteria as micro bubbles have been observed in preserved vials during previous sampling events at HS 6. Only the sample containers observed to have zero headspace were analyzed by the laboratory. All planned samples were analyzed for the designated parameters recommended in the 2022 PMR (NASA, 2023b). All analytical results for samples collected during the reporting period were reviewed by a chemist and data quality manager and were found to have been generated in compliance with good analytical practices.

4.4 GROUNDWATER ELEVATION SUMMARY

Site-wide water level measurements are typically collected at LC34 during biennial LTM events, from a network of 55 wells, several of which are located in the HS 6 area. The LTM wells are screened in two depth zones: Layer 1 (0 to 25 feet bls) and Layer 2 (25 to 30 feet bls). During the previous LTM event in 2022, groundwater flow contours depicted an easterly flow in the eastern portion of the site and a western and southerly flow in the western portion of the site in both depth zones, with areas of radial flow west and south of the HCS capture zone. These contours were consistent with historical events.

During this reporting period, the LTM network was not scoped for sampling or water level gauging, but water level elevations were collected from the HS 6 wells prior to each performance monitoring event. Prior to measuring depth-to-water, all monitoring wells were uncapped and allowed to equilibrate. This step ensured equilibration of hydrostatic and atmospheric pressure to secure an accurate static water level. All water level measurements were collected from the same permanent point identified on top of the well casing to ensure consistency with historical measurements. Measurements were made to the nearest 0.01 foot using an electronic water level meter. To calculate the groundwater elevation in feet, the depth-to-water was subtracted from the top-of-casing elevation, which was previously determined by survey. All elevations stated herein are referenced to the North American Vertical Datum of 1988 (NAVD88). The water level readings and calculated groundwater elevations for the HS 6 performance monitoring events are included in Table 4-3.

Groundwater contours were developed for the November 2023 performance monitoring event because it had the most robust data set with 28 wells in the original configuration and 21 wells in the Phase Two expansion area. Of the total 49 wells in the HS 6 network, 24 are screened in Layer 1 and 25 are screened in Layer 2. The water level contours are depicted on Figure 4-1 and Figure 4-2.

In Layer 1, the elevations ranged from 4.15 feet in IW0188, located northwest of the blockhouse to 2.98 feet in IW0128 located along the northwest side of the drainage ditch. The Layer 1 elevation contours generally depict an eastern flow direction near the blockhouse and a

southeastern flow direction in the south portion of the site toward the drainage ditch. In Layer 2, the elevations ranged from 4.24 feet in IW0126, located in the southern portion of the site to 3.02 feet in IW0130, located southeast of the drainage ditch. Similar to Layer 1, the Layer 2 wells also depict an easterly flow near the blockhouse and transition to a southeasterly direction toward the drainage ditch.

4.5 HS 6 PERFORMANCE MONITORING RESULTS

Summaries of TCE, cDCE, tDCE, and VC results for baseline and all performance monitoring events to date are presented in Table 4-4 (groundwater) and Table 4-5 (surface water) and on Figure 4-3 (groundwater and surface water). During these sampling events, several other VOC analytes were detected at concentrations less than GCTLs, such as low-level detections of benzene, toluene, acetone, 1,1-dichloroethene, carbon disulfide, 2-butanone, bromodichloromethane, dibromochloromethane, and chloroethane. These results can be found in the laboratory analytical reports in Appendix C. Groundwater and surface water sampling log sheets and field documentation for HS 6 are provided in Appendix F. Groundwater and surface water results for each sampling event (semi-annual sampling of Phase One and baseline/quarterly sampling of Phase Two) are discussed below.

4.5.1 Phase One Semi-annual Performance Monitoring. Semi-annual performance monitoring of the original AS system configuration was conducted in April 2023 and November 2023, with 28 wells and three surface water locations sampled. Note, prior to the first event in April the system was operational (199 AS wells), but prior to the second event in November, the system was shut off except for the 48 AS wells that were reconfigured into a barrier (Zone 8) to prevent groundwater from re-contaminating the treated area. The results of each event are discussed below.

<u>April 2023</u>

TCE was not detected in any of the monitoring wells during the April event. tDCE was detected in several wells, but the concentrations were less than its GCTL of 100 µg/L.

cDCE was detected at a concentration greater than the GCTL of 70 µg/L in two of the 28 wells sampled (IW0134 and IW0135, both located on the west side of the HS 6 area treatment zone closer to the DSZ). In well IW0134, cDCE exceeded the 10xNADC value of 7,000 µg/L with a result of 7,300 µg/L. This result is an increase from the previous concentration of 6,300 µg/L in October 2022, but it's a significant decrease from the baseline concentration of 20,300 µg/L in March 2019. In this well, cDCE concentrations have regularly fluctuated. In IW0135, cDCE was detected above its NADC of 700 µg/L with a result of 770 µg/L. This represents a significant decrease from the baseline concentration of 53,800 µg/L in March 2019, but a slight increase from the previous October 2022 concentration of 400 µg/L. At the other 26 well locations, cDCE was not detected or was detected at a concentration less than the GCTL.

VC was detected at a concentration greater than its GCTL of 1 µg/L in five of the 28 wells. Concentrations ranged from 3.3 µg/L in IW0129 to 5,600 µg/L in IW0134, located on the western boundary of the AS treatment area. This maximum VC detection exceeded the 10xNADC value of 1,000 µg/L. At IW0134, VC has increased during the past four sampling events but is an overall decrease since the baseline value of 8,900 µg/L in March 2019. Well IW0135, which is located along the northwest edge of the AS treatment area just outside the ROI of the AS wells, had a VC concentration of 1,100 µg/L, which also exceeds the 10xNADC value. This result at IW0135 is a significant decrease from baseline concentration of 10,700 µg/L in March 2019. The other three wells that had VC concentrations greater than the GCTL were located around the perimeter of the AS treatment area, which include IW0123, located on the north side of the AS treatment area with a concentration of 5.3 µg/L, and IW0129 and IW0130, both of which are located in the eastern downgradient side of the canal, with VC concentrations of 3.3 µg/L and 14 µg/L, respectively.

In surface water samples, TCE, tDCE, and VC were not detected in any of the locations. cDCE was detected at SW1001 and SW1002 with a concentration of 0.26 µg/L and 0.70 µg/L, respectively. There is no Florida Freshwater Surface Water Cleanup Target Level; however, these concentrations are low-level and do not represent a significant impact to the canal.

November 2023

During the second semi-annual performance monitoring event, the same 28 wells and three surface water locations were sampled. Consistent with the April 2023 event, TCE was not detected in any monitoring wells and tDCE was not detected in any monitoring wells greater than the GCTL.

The cDCE concentrations exceeded the GCTL in the same two wells as the April 2023 event, IW0134 and IW0135, but decreased in concentration. At IW0134, the cDCE concentration was 1,900 µg/L in November 2023, a decrease from the April 2023 concentration of 7,300 µg/L and a significant decrease from the baseline concentration of 20,300 µg/L in March 2019. At IW0135, the November 2023 concentration was 110 µg/L, a decrease from April 2023 NADC exceedance of 770 µg/L and the lowest overall cDCE concentration in this well. cDCE was not detected or was detected lower than its GCTL in the remaining 26 wells.

VC was detected in six of the 28 wells at a concentration greater than the GCTL and of these, one result exceeded 10xNADC of 1,000 µg/L. The concentrations ranged from 1.8 µg/L in IW0123 to 3,700 µg/L in IW0134, which is located along the western boundary of the AS treatment area. The maximum result was a decrease from the April 2023 concentration of 5,600 µg/L. The other well located on the western boundary of the AS treatment area (IW0035) is in the ROI of the reconfigured area (Zone 10) and had a significant decrease in VC concentration from 1,100 µg/L in April 2023 to 12 µg/L in November 2023. This well also showed a significant decrease in cDCE. East of the canal and outside the AS treatment area, VC exceeded the GCTL in wells IW0129 (9.4 µg/L) and IW0130 (30 µg/L). At IW0123 located outside and north of the AS treatment area, VC slightly exceeded the GCTL at 1.8 µg/L. Two wells inside the former treatment area, IW0057I and IW0145, had VC concentrations greater than the GCTL at 7.6 µg/L and 3.7 µg/L, respectively. These results represent increases since the AS wells were shut off.

In the surface water samples, all TCE, tDCE, cDCE, and VC results were non-detect during the November 2023 sampling event.

Overall, the two semi-annual datasets show no detections of TCE and decreasing concentrations of tDCE, cDCE, and VC over the course of the monitoring period. Performance monitoring sampling results indicate the IM is meeting the objectives of reducing concentrations of COCs in groundwater associated with HS 6 (cDCE, tDCE, and VC), and preventing impacts to the drainage canal in support of a future transition to LTM.

4.5.2 Phase Two Baseline and Quarterly Performance Monitoring. Baseline and quarterly performance monitoring of the Phase Two expansion was conducted in July 2023 (baseline), November 2023 (first quarter), and February 2024 (second quarter). The 21 new wells (IW0168 through IW0188) installed to monitor the Phase Two treatment area were sampled during each event. The wells are positioned with 14 located within the treatment area and seven located around the perimeter. The 14 wells within the treatment area are configured into seven pairs with screen intervals in shallow (17-27 feet bls) and deeper (30-35 feet bls) intervals. The deeper screen intervals are placed at the bottom of the AS treatment interval, just above Layer 4. The results of each event are discussed below.

July 2023 - Baseline

TCE was not detected in any monitoring wells during the baseline event, but several of the non-detect values were elevated to greater than 3 µg/L because of dilutions necessary for other target analytes. tDCE was detected in several wells, but all were at concentrations less than the GCTL.

cDCE was detected in all 21 wells and concentrations exceeded the GCTL in 16 of the 21 wells. Of these, nine of the samples exceeded the NADC of 700 µg/L. The maximum cDCE concentration was 6,500 µg/L in well IW0168, located in the treatment area, northeast of the blockhouse. Well IW0168 (screened 17-27 feet bls) is collocated with IW0169 (screened 30-35 feet bls), which had a cDCE result of 67 µg/L, less than the GCTL.

VC was detected in all 21 wells at concentrations greater than the GCTL. Of these, 14 results exceeded the NADC value of 100 µg/L and five results exceeded the 10xNADC value of 1,000 µg/L. The maximum VC concentration was 3,800 µg/L in well IW0168, which also had the maximum cDCE concentration. The collocated deeper well, IW0169, had a lower VC concentration, 1,400 µg/L, that still exceeded the 10xNADC.

Overall, the baseline event prior to startup of the Phase Two expansion showed high concentrations of cDCE and VC in all performance monitoring wells, which was expected prior to initiating treatment in this HS area. As additional samples are collected and evaluated, the reduction in VOC concentrations and overall effectiveness of the treatment system will continue to be evaluated.

November 2023 – Quarter 1

TCE was not detected in any monitoring wells during the first quarterly event, but several of the non-detect values were elevated to greater than 3 µg/L. In several wells, tDCE was detected, but all were at concentrations less than the GCTL.

In all 21 wells, cDCE was detected, and concentrations exceeded the GCTL in 13 of the wells, with six of the samples greater than the NADC. The maximum cDCE concentration was 3,900 µg/L in well IW0168, which also had the maximum cDCE and VC concentration during the baseline event. The maximum cDCE result of 3,900 µg/L was a decrease from the baseline value of 6,500 µg/L. Collocated well IW0169 had a cDCE result of 110 µg/L, which increased from the baseline concentration of 67 µg/L. Compared to the baseline event, cDCE concentrations in the treatment area wells decreased in all wells except for IW0183, which had an increase from less than the GCTL to 77 µg/L. In the perimeter wells, cDCE concentrations in the first quarterly event were similar to the baseline concentrations.

VC was detected in 20 of the 21 wells at concentrations greater than the GCTL. Of these, 12 results exceeded the NADC, and one result exceeded the 10xNADC value. The maximum VC concentration was 3,100 µg/L in well IW0168, which had the maximum VC result during the baseline and also had the maximum cDCE concentration during the baseline and first quarter. The maximum result was a decrease from the baseline concentration of 3,800 µg/L, and in the collocated deeper well, IW0169, the VC concentration reduced from the baseline 10xNADC exceedance of 1,400 µg/L to 370 µg/L. Compared to the baseline event, the VC concentrations in the treatment area decreased in all but two wells. In the perimeter wells, concentrations in four of the seven locations indicated increases in VC.

The November sampling event showed an overall reduction in cDCE and VC concentrations after the first quarter of Phase Two operation.

February 2024 – Quarter 2

TCE was not detected in any monitoring wells during the second quarterly event, but several of the non-detect values remain elevated to greater than 3 µg/L, consistent with the baseline and first quarter. As in the baseline and first quarter, tDCE was detected in several wells, but all concentrations remain less than the GCTL.

In all 21 wells, cDCE was detected, and concentrations exceeded the GCTL in 13 of the wells, with three of the samples greater than the NADC. The maximum cDCE concentration was 1,500 µg/L in well IW0182, which was an increase since the baseline value of 1,100 µg/L in this well, but is a reduction from the first quarter maximum of 3,100 µg/L and the baseline maximum of 6,500 µg/L, both in IW0168. The collocated shallower well, IW0181, had a cDCE result of 19 µg/L, which was less than the GCTL. Compared to the baseline and first quarter events, cDCE concentrations in the treatment area wells decreased in all wells except for IW0169 and IW0182. In the perimeter wells, cDCE concentrations increased in five of the seven wells since the baseline event.

VC was detected in 20 of the 21 wells at concentrations greater than the GCTL, similar to the first quarter. Of these, seven results exceeded the NADC, and one result exceeded the 10xNADC value. The maximum VC concentration was 1,100 µg/L in perimeter well IW0188, located outside the treatment area to the west. The maximum result is an increase from this well's baseline value of 160 µg/L but was a decrease from the maximum baseline concentration of 3,800 µg/L in IW0168. Compared to the baseline event, the second quarter VC concentrations in the treatment area showed a decrease in all but one well. In the perimeter wells, concentrations in three of the seven locations indicated increases in VC, including the maximum concentration in IW0188.

The February 2024 sampling event showed an overall average reduction of approximately 12 percent for cDCE concentrations and 31 percent for VC concentrations after two quarters of performance monitoring of Phase Two. While high concentrations remain, the contaminant

concentrations are decreasing, and it is anticipated that the CVOCs will continue to decrease as treatment in this area continues. Results of continued performance monitoring at HS 6 will be detailed in future PMRs.

Table 4-1. HS 6 AS System Runtime Summary

Year / Configuration		Month	Days In Month	Downtime (Days)	Runtime	Downtime Contributing Factor
2023	Phase One	April	30	14	53%	Performance Monitoring (Phase One semi-annual). Zones 3, 4, 6, 7 running; Zones 5, 8 were off so as not to influence the HS 6 ASW install; shut down for system sampling.
		May	31	1.5	95%	System shut down for Phase Two expansion install.
		June	30	0	100%	None
		July	31	1.5	95%	Phase Two baseline performance monitoring; Relocate two manifold trailers; begin Phase Two phased startup
	Phase Two	August	31	0	100%	Phase Two phased startup ongoing
		September	30	0	100%	None
		October	31	18	42%	DPT Sampling (for Phase Three)
		November	30	10.5	65%	Performance Monitoring (Phase One semi-annual/Phase Two first quarterly)
		December	31	2.5	92%	Performance Monitoring continued
2024		January	31	0	100%	None
		February	29	9	69%	Performance Monitoring (Phase Two second quarterly)
		March	31	0	100%	None
		Total	**366**	**57**	**84%**	

Notes:

- Reporting period is from April 1, 2023 to March 31, 2024
- Phase Two phased startup began July 17, 2023 and was fully operational August 28, 2023

AS = Air sparge
ASW = Air sparge well
DPT = Direct push technology
HS = Hot spot

Notes:

- Water level reading for IW0188 in June 2023 was not recorded because of a data logger error
- Wells IW0166 - IW0188 were installed for performance monitoring of the the HS 6 Phase Two expansion and were gauged in June (baseline), November, and February; all other wells were gauged in April/November 2023
- Elevation is relative to the North American Vertical Datum of 1988 (NAVD88)

bls = Below land surface
NA = Not applicable
T.O.C. = Top of casing

Notes:

Concentrations in micrograms per liter (µg/L)

Shading indicates greater than the Groundwater Cleanup Target Level (GCTL):

TCE = 3 µg/L, cDCE = 70 µg/L, tDCE = 100 µg/L, and VC = 1 µg/L

TCE = Trichloroethene

tDCE = trans-1,2-Dichloroethene

cDCE = cis-1,2-Dichloroethene

VC = Vinyl chloride

I = Reported value is between method detection limit (MDL) and practical quantitation limit

L = Actual value is known to be greater than value given

U = Not detected at or above MDL (associated value)

D = Result was obtained from the analysis of a dilution

V = Analyte was detected in both the sample and associated method blank

Notes:

Concentrations in micrograms per liter (µg/L)

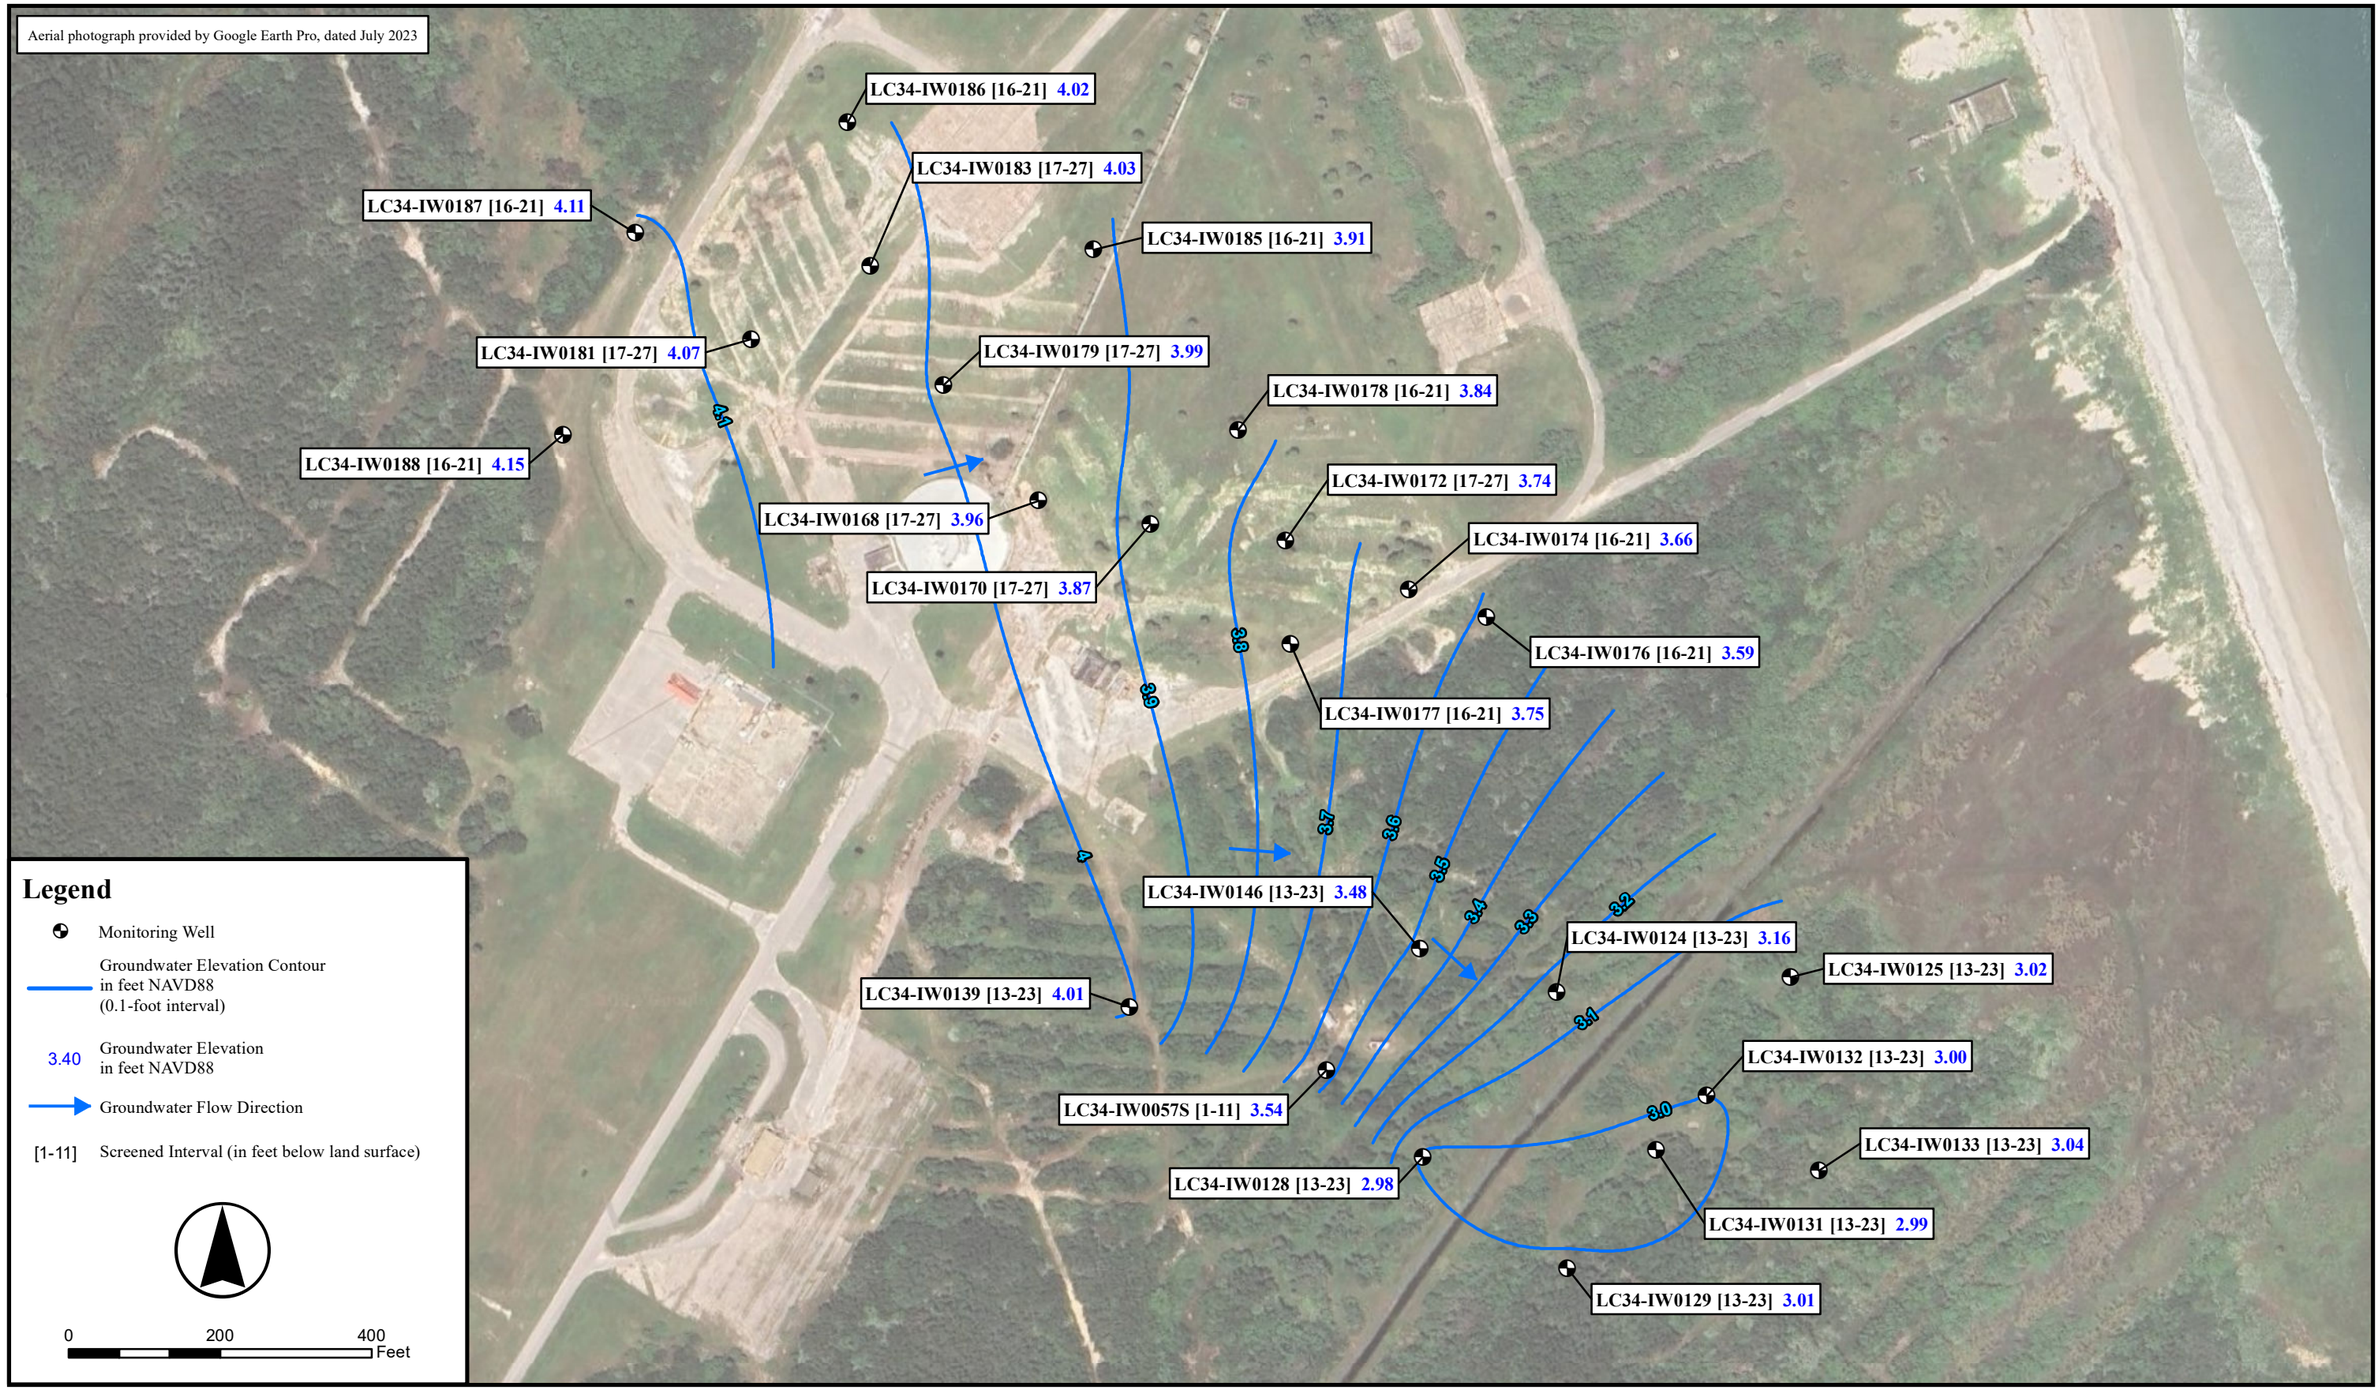
TCE = Trichloroethene

tDCE = trans-1,2-Dichloroethene

cDCE = cis-1,2-Dichloroethene

VC = Vinyl chloride

Shading indicates > Florida Freshwater Surface Water Criteria (FAC 62-777):



TCE = 80.7 µg/L, cDCE = no value, tDCE = 11,000 µg/L, and VC = 2.4 µg/L

U = Not detected at method detection limit (MDL) (associated value)

I = Reported value is between MDL and practical quantitation limit

SECTION V
RECOMMENDATIONS

This section presents the recommendations for the 2024-2025 LC34 operational period scheduled to occur between April 1, 2024 to March 31, 2025. These recommendations were presented to the KSCRT during the June 13, 2024 meeting and received concurrence from the Team (Meeting Minute 2406-M09, Decisions 2406-D34 through D37). The June 2024 ADP and meeting minutes are included in Appendix A.

5.1 SITE-WIDE LONG-TERM MONITORING STRATEGY

The biennial LTM network was not sampled during the reporting period covered under this report; it is scheduled to be sampled in December 2024 and results will be reported in the next report. The recommendations were detailed in the 2022 PMR (NASA, 2023b) and received concurrence from the KSCRT during the October 2023 (Meeting Minute 2310-M11, Decisions D28 and D29). The recommendations included replacement of a damaged monitoring well (CW0002) and continued biennial sampling of 56 wells for VOCs and one well for PCBs. As of the date of this report, the new well (IW0201) was installed in May 2024. Detail of the well installation will be included in a subsequent PMR. The well locations are listed in Table 5-1 and shown on Figure 5-1.

5.2 HYDRAULIC CONTAINMENT SYSTEM

The IM objectives continue to be achieved, and optimizations have resulted in increased treatment and recovery efficiencies. The following items were recommended at the June 2024 KSCRT meeting for the next year of operation (Year 15) and received concurrence from the Team (2406-D34):

- Continued operation of the HC IM consistent with the current approach.
- HCS System Sampling consistent with current approach
- Biweekly sampling in selected Layer 8 monitoring wells to evaluate RW021D operations;

- Monthly sampling of aqueous effluent from the air strippers and LPGAC;
- Quarterly sampling of combined system influent and influent from active individual recovery wells;
- Annual sampling of vapor-phase CatOx influent and effluent;
- Annual sampling at the nine DPT locations in the DSZ (DPT593 to DPT601) at the same depth intervals as the 2023 event; and
- Annual sampling at 11 Layer 7/8 wells (IW0001D2, IW0042D2, IW0043D2, IW0044D2, IW0045D2, IW0160, IW0161, IW0162, IW0163, IW0164, and IW0165). The next annual event is scheduled for December 2024. The recommended sampling plan for 2024-2025 (Year 15) is included in Table 5-1 and Figure 5-1.
- Once the new Layer 7 air compressor is operational, begin operating recently installed Layer 7 recovery wells.

5.3 HOT SPOT 6 AIR SPARGE SYSTEM

The HS 6 AS system is operating as designed and meeting performance criteria and IM objectives. Continued optimization of the current AS system is recommended to enhance and maintain operational objectives and flow rates will be adjusted as determined by performance monitoring. As of the date of this report, the Phase Three expansion is in progress and details of the construction and startup will be documented in a future PMR.

For this operational period, the following items were recommended at the June 2024 KSCRT meeting for the next year of operation and received concurrence from the Team:

- Continued operation of the 238 active ASWs and routine O&M of the system for the operational period of April 1, 2024 to March 31, 2025 (2406-D35).
- Semi-annual performance monitoring at the 28 wells and 3 surface water locations positioned to monitoring the Phase One configuration (Table 5-1) (2406-D36). The next semi-annual samples are scheduled to be collected in May and November 2024.

- Continued quarterly performance monitoring at the 21 wells positioned to monitor the Phase Two configuration (Table 5-1) (2406-D37).

Notes:

Samples are analyzed for VOCs by EPA Method 8260D
(1) - Well IW0122 is only analyzed for PCBs by Method 8082 to monitor the former transformer T-2 Area
* IW0044D2 is currently on a biweekly sampling schedule.
LTM - Long-Term Monitoring
HCS - Hydraulic Capture System
HS 6 - Hot Spot 6
PM - Performance monitoring
At each DPT location 19 depth intervals are sampled; from 8 to 98 feet below land surface

This Advance Data Package (ADP) was prepared for NASA to aid in evaluation of site conditions and remedial actions. This is not a decision document. New information may come to light that makes this ADP outdated.

Objectives

Site Overview

- Background, Remedial History, Site Conditions
- 2023 Sampling Program (Period of performance April 2023 – March 2024)

Hydraulic Containment System (HCS) Operations, Maintenance, and Monitoring (OM&M)

- HCS Operations and Maintenance
- System and Performance Monitoring Sampling Results
- Conclusions / Recommendations

Hot Spot 6 (HS6) Air Sparge (AS) System Phase Two Construction Completion

- Pre-construction DPT sampling
- Performance Monitoring and AS Well Installation
- Trenching, Piping, Conveyance Line Installation
- Startup and Full-Scale Operation

HS6 AS System Performance Monitoring

- Operations and Maintenance (overall system)
- Performance Monitoring Results
- Conclusions / Recommendations

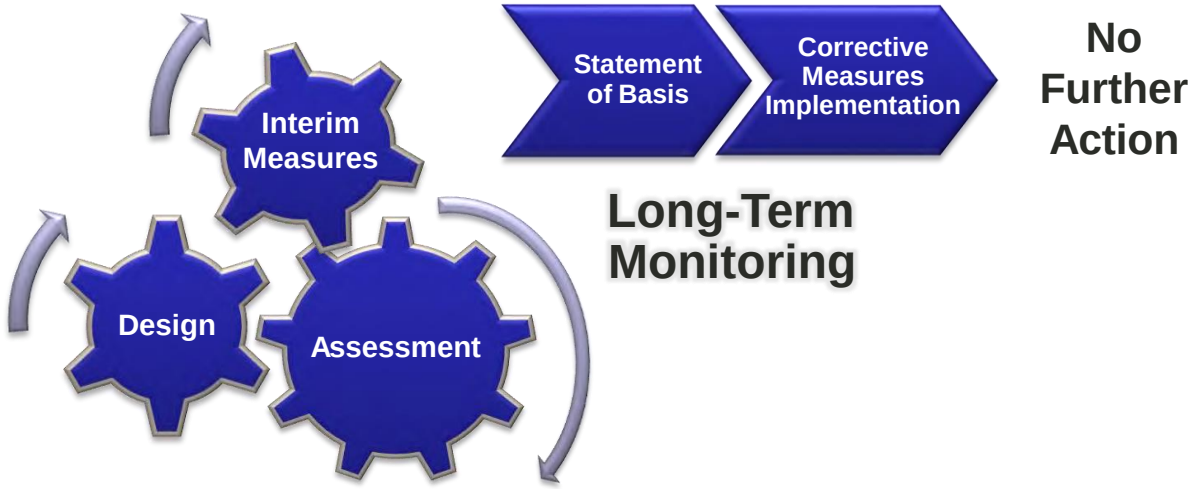
Path Forward

- 2024 System Operations and Sampling Plan

Site Overview: Where we are in the RCRA Process?

Status:

- Site is in Corrective Measures Study for volatile organic compounds (VOCs) in groundwater from a traditional RCRA stand-point
- Adaptive site management is being utilized through on-going assessment, design, and interim measures



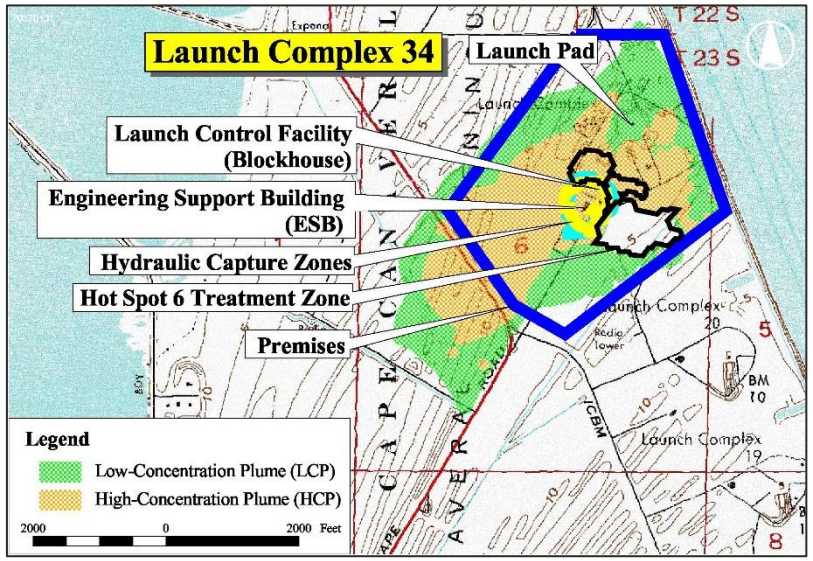
Common terminology:

- Source Zones - areas where dense non aqueous phase liquid (DNAPL) is suspected
- Hot Spot - area where concentrations of VOCs are 10 times greater than Natural Attenuation Default Concentrations (NADCs)
- High Concentration Plume - area where concentrations of VOCs are greater than NADCs
- Low Concentration Plume - area where concentrations of VOCs are greater than Groundwater Cleanup Target Levels (GCTLs)

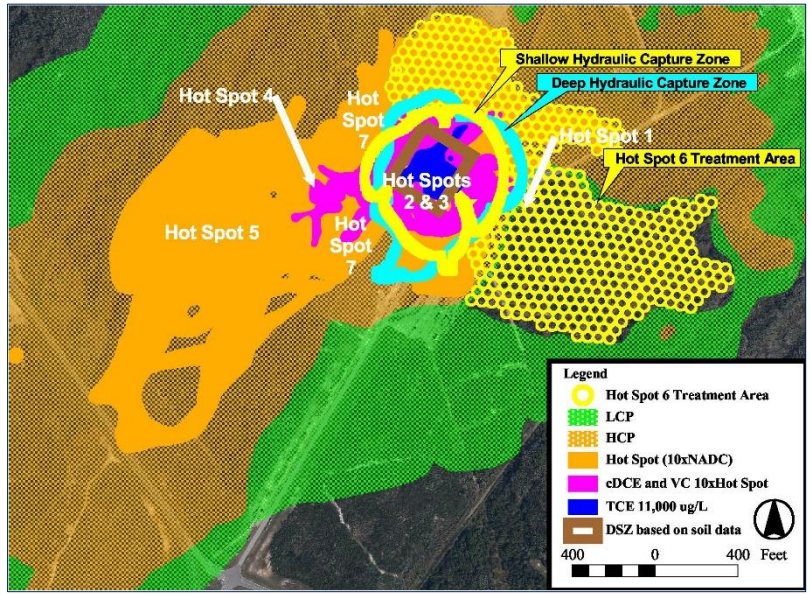
Traditional Linear Approach to RCRA Corrective Actions

KSC Approach to RCRA Corrective Actions (Engineering Evaluation Process)

Site Overview: Background



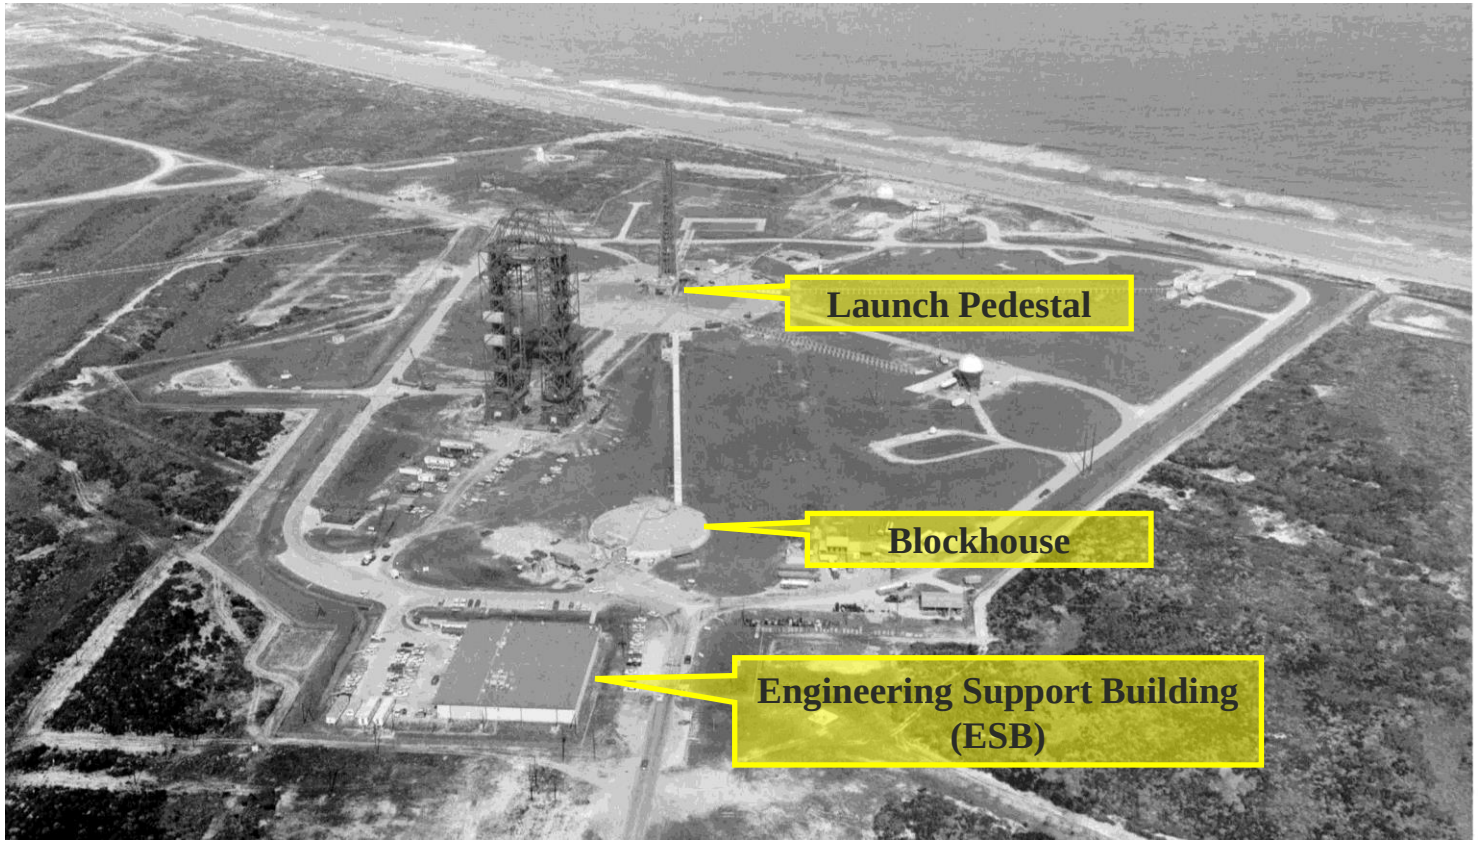
Background:



- Located on a barrier island bounded by the Banana River and Atlantic Ocean
- Pedestal is a regular stop for the KSC Visitor Bus and CCSFS tours
- The Air Force has issued NASA a permit granting the privilege for the use of real property and facilities referred to as the “Premises” for environmental restoration
- Current plume footprint:
  - 314 acres ≥ GCTLs, low concentration plume (LCP);
  - 158 acres ≥ NADCs, high concentration plume (HCP)
  - 52.8 acres ≥ 10xNADC, Hot Spot;
  - 9.3 acres ≥ 10x Hot Spot
- The 2.0-acre DNAPL source zone (DSZ) was originally characterized using soil data, included significant dissolved and sorbed mass with TCE > 300 mg/kg and transition zone to 100 mg/kg and recharacterized in 2018-2019 with groundwater data where TCE > 11,000 µg/L

	CHP	HMFN	WC
SZ:	PCE	TCE	TCE
% solubility:	4%	1%	1%
SZ in acres:	0.05	0.26	0.23
LC34 comparison:	28x	5.4x	6.1x

LC34 Source Zone (1.4 acres) comparison to Central Heat Plant, HMF North and Wilson Corners, as presented in DSZ Site Characterization ADP (October 2019)



Site Overview: Background

Background (continued):

- Construction of Complex 34 began in 1959, designed to support NASA's Saturn 1 and 1B programs
- Seven launches between 1961 and 1968
  - Historical records suggest TCE used to flush rocket engines and for precision cleaning of spaceflight hardware
- **1967:** Apollo 1 cabin fire during a launch rehearsal test taking the lives of Grissom, White, and Chaffee
- **1972:** Service structures and operational equipment scrapped, leaving majority of on-site buildings and structures abandoned-in-place
- **1984:** Declared part of the Man In Space National historical Landmark

Site Overview: Remedial Timeline

1991-1992

Preliminary Assessments

Identified as a high priority site for further investigation through records search, interviews, and site reconnaissance.

1994-1998

Contamination Assessment Report / Site Assessment Report Addendum

Conducted at Facility #21900H (ESB) to investigate 1993 diesel fuel spill. Chlorinated solvents detected in groundwater.

1997-1999

RCRA Facility Investigation

TCE, cDCE, tDCE, VC are the primary contaminants of concern. TCE present as DNAPL in the former ESB area.

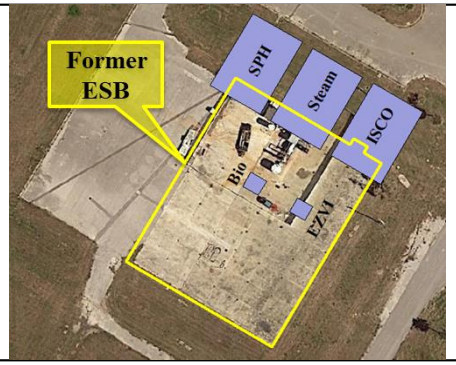
1999/2003

Corrective Measures Study Work Plan

Plan to evaluate data gaps from RFI and potential technologies for the source areas, hot spots, and plume.

2001

PCB-Impacted Soil Interim Measure



Excavated PCB-impacted soils above industrial SCTL at three identified areas from the RFI.

2002-2003

RFI Addendum

Summarized in situ remediation demonstration projects at the ESB. MIP, soil cores, groundwater sampling In situ remediation demonstration test cells:

Chemical Oxidation (ISCO), TCE reduction of 12,700 pounds (43' bls)
Six-Phase Heating (SPH), TCE reduction of 22,719 pounds (43' bls)
Steam Injection, TCE reduction of 23,629 pounds (43' bls)
Emulsified zero-valent iron (EZVI), TCE reduction of 40 pounds (16' to 24' bls)
Bioaugmentation, TCE reduction of 60 pounds (16' to 24' bls)

Site Overview: Remedial Timeline

2007

Corrective Measures Study Report

Corrective measure alternative included a LUCIP to prohibit groundwater use. Recommended corrective action alternative was pump and treat (P&T) to provide hydraulic containment of the DSZ, MNA with supplemental investigations and follow-up Interim Measures to target CVOC Hot Spots in the HCP, MNA in the LCP.

2008/2009

DSZ Interim Measure Design / Work Plan

IM Design and Work Plan for hydraulic containment of the DSZ and deep TCE groundwater plume. IM objective to hydraulically control the DSZ and TCE HCP within HS 2, 3, 4 by groundwater extraction and ex-situ treatment.

2009

Hot Spot 1 Site Characterization / Addendum

Conducted investigations to delineate TCE to NADC. Field activities included MIP, CPT, DPT, and monitoring well sampling.

2011

Interim Measure Completion Report

Installation and operation of the DSZ Hydraulic Containment System (HCS)

2011

Hot Spots 3 and 4 Site Characterization

Delineated TCE to NADC. Field activities included MIP, CPT, DPT, and monitoring well sampling.

2012

Hot Spot 1 Interim Measure Implementation

Implemented IM of partitioning electron donor (PED) pilot study. Over 1 million gallons of GW were recirculated with an approximately 92% reduction in CVOC mass.

Site Overview: Remedial Timeline

2013

Pumping Optimization and Hot Spots 3 and 4 Expansion Step 4 / Work Plan

Plan for modification and retrofitting of the HCS, proposed recovery well (RW) locations, pumping rates, and expansion construction

2015

HCS Expansion Construction Completion

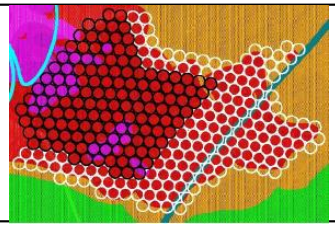
Implemented expansion of the HC IM including installation of new RWs, new air stripper, refurbishment of the catalytic oxidizer, commissioning and startup.

2016

Hot Spot 6 Site Characterization

Delineated CVOCs using DPTs and monitoring well sampling.

2017-2018



Hot Spot 6 Implementation Work Plan / Expansion Work Plan

Original system and expansion design to install AS system within treatment zone and support transition to MNA.

2019

Hot Spot 6 Construction Completion

Presented construction of the AS system installed in two phases. Initial system operated between July 2018 through January 2019. Expansion completed in April 2019; fully operational in May 2019.

2019

Hot Spot 5 Site Characterization

Delineated cDCE and VC using DPT sampling. Consensus reached for adequate delineation horizontally and vertically of hot spot.

Site Overview: Remedial Timeline

2019

Soil Interim Measure

Excavated soils contaminated with PCBs (less than 50 mg/kg), dioxins/furans, and total recoverable petroleum hydrocarbons from 20 different areas around LC34. No Further Action approved for all areas.

2019

DSZ Supplemental Site Characterization

Delineated TCE to 300 µg/L by collecting horizontal and vertical datasets to support optimization of the HCS and preparing a DSZ Remedial Alternative Evaluation. Consensus reached for adequate delineation.

2020

Electrical Substation T-2 Area Soil Interim Measure

Removed PCB contaminated soil and concrete in the area of a former electrical substation located along the southeast side of the launch pad. Remaining contaminated soil is beneath slab and under LUCIP with groundwater monitoring.

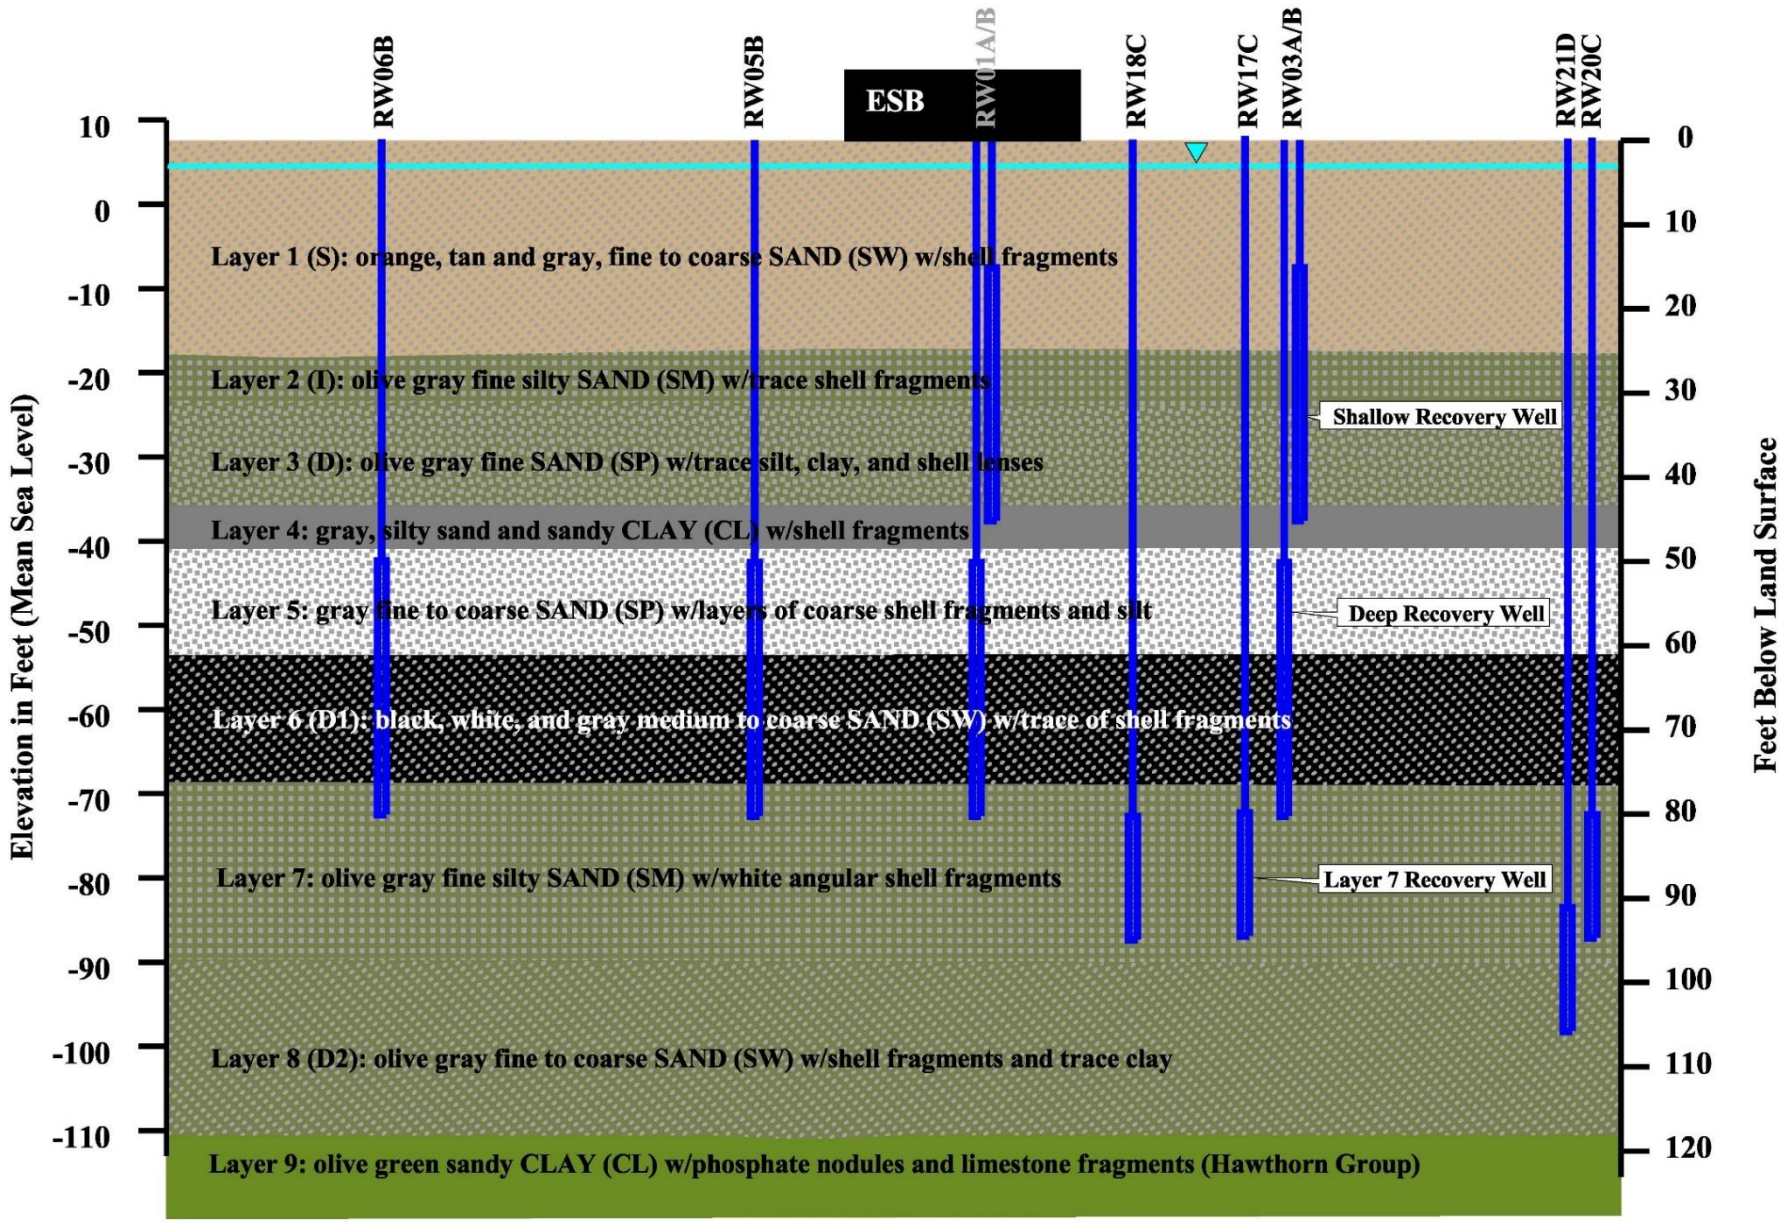
Hot Spot 6 Expansion Phase Two Work Plan

Presented DPT investigation results in support of system expansion. Consensus reached for expansion of system and installation of PM wells.

2022

DNAPL Source Zone (DSZ) and Pilot Study

Pilot study design / implementation from July 2021 to February 2022, in support of ongoing RAE to test air sparging in the DSZ and fine-grained units.

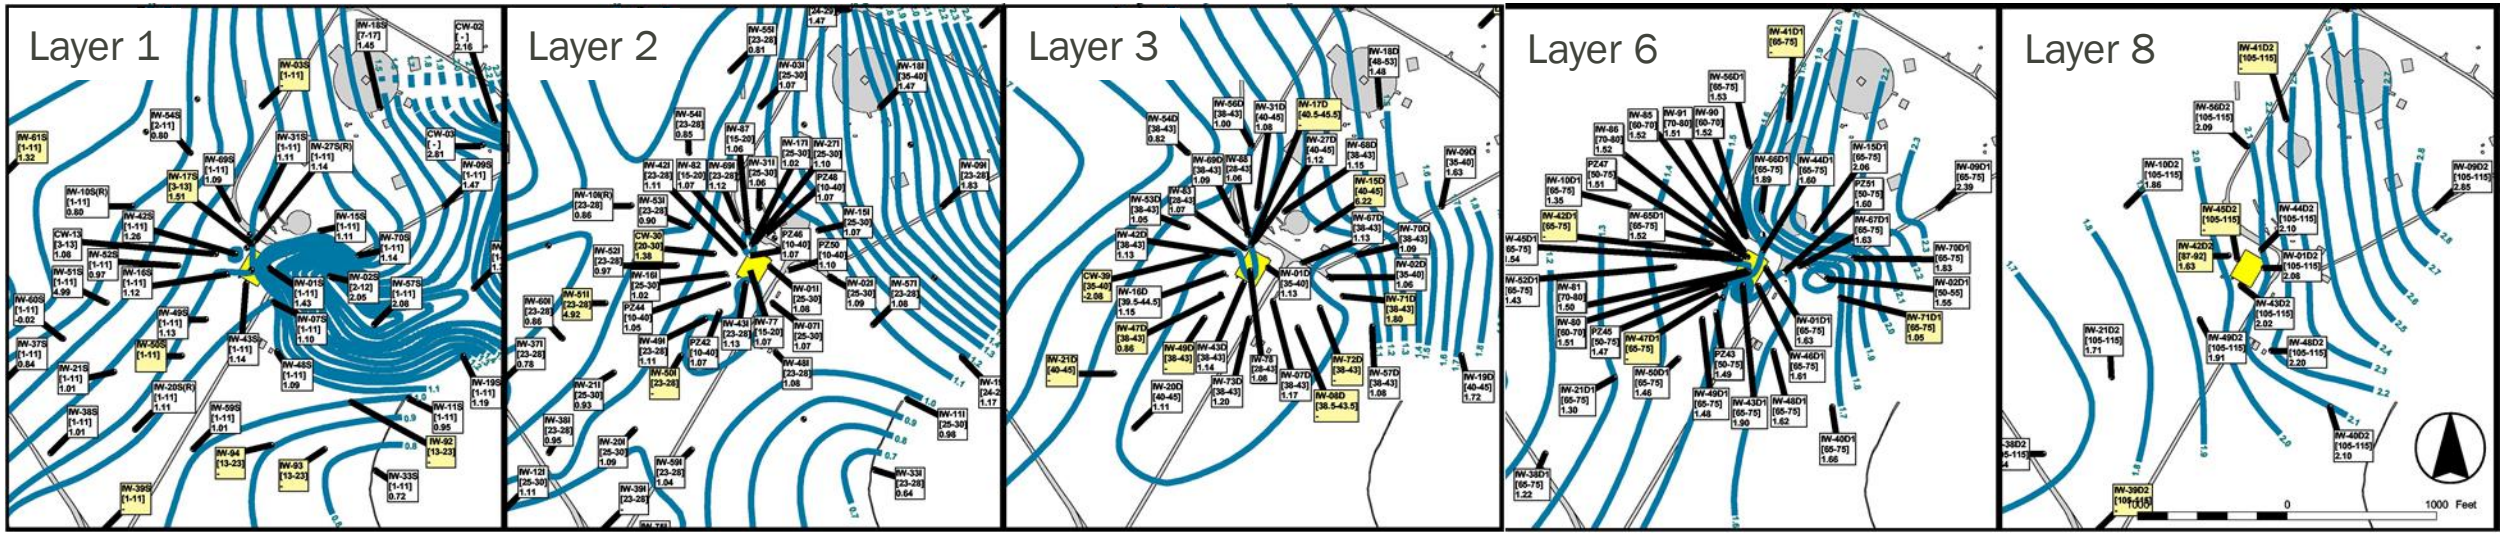


2023

DSZ) Remedial Alternate Evaluation (RAE) and Hot Spot 6 Expansion Phase Two

RAE presented to KSCRT during September 2023 meeting.

Full-scale operation in August 2023, two quarters of PM collected



Site Overview: Geology with Recovery Wells

Site Overview: Lithology

Layer	Description	Photo
1 (S)	orange, tan and gray, fine to coarse SAND (SW) w/shell fragments	
2 (I)	olive gray fine silty SAND (SM) w/trace shell fragments	
3 (D)	olive gray fine SAND (SP) w/trace silt, clay, and shell lenses

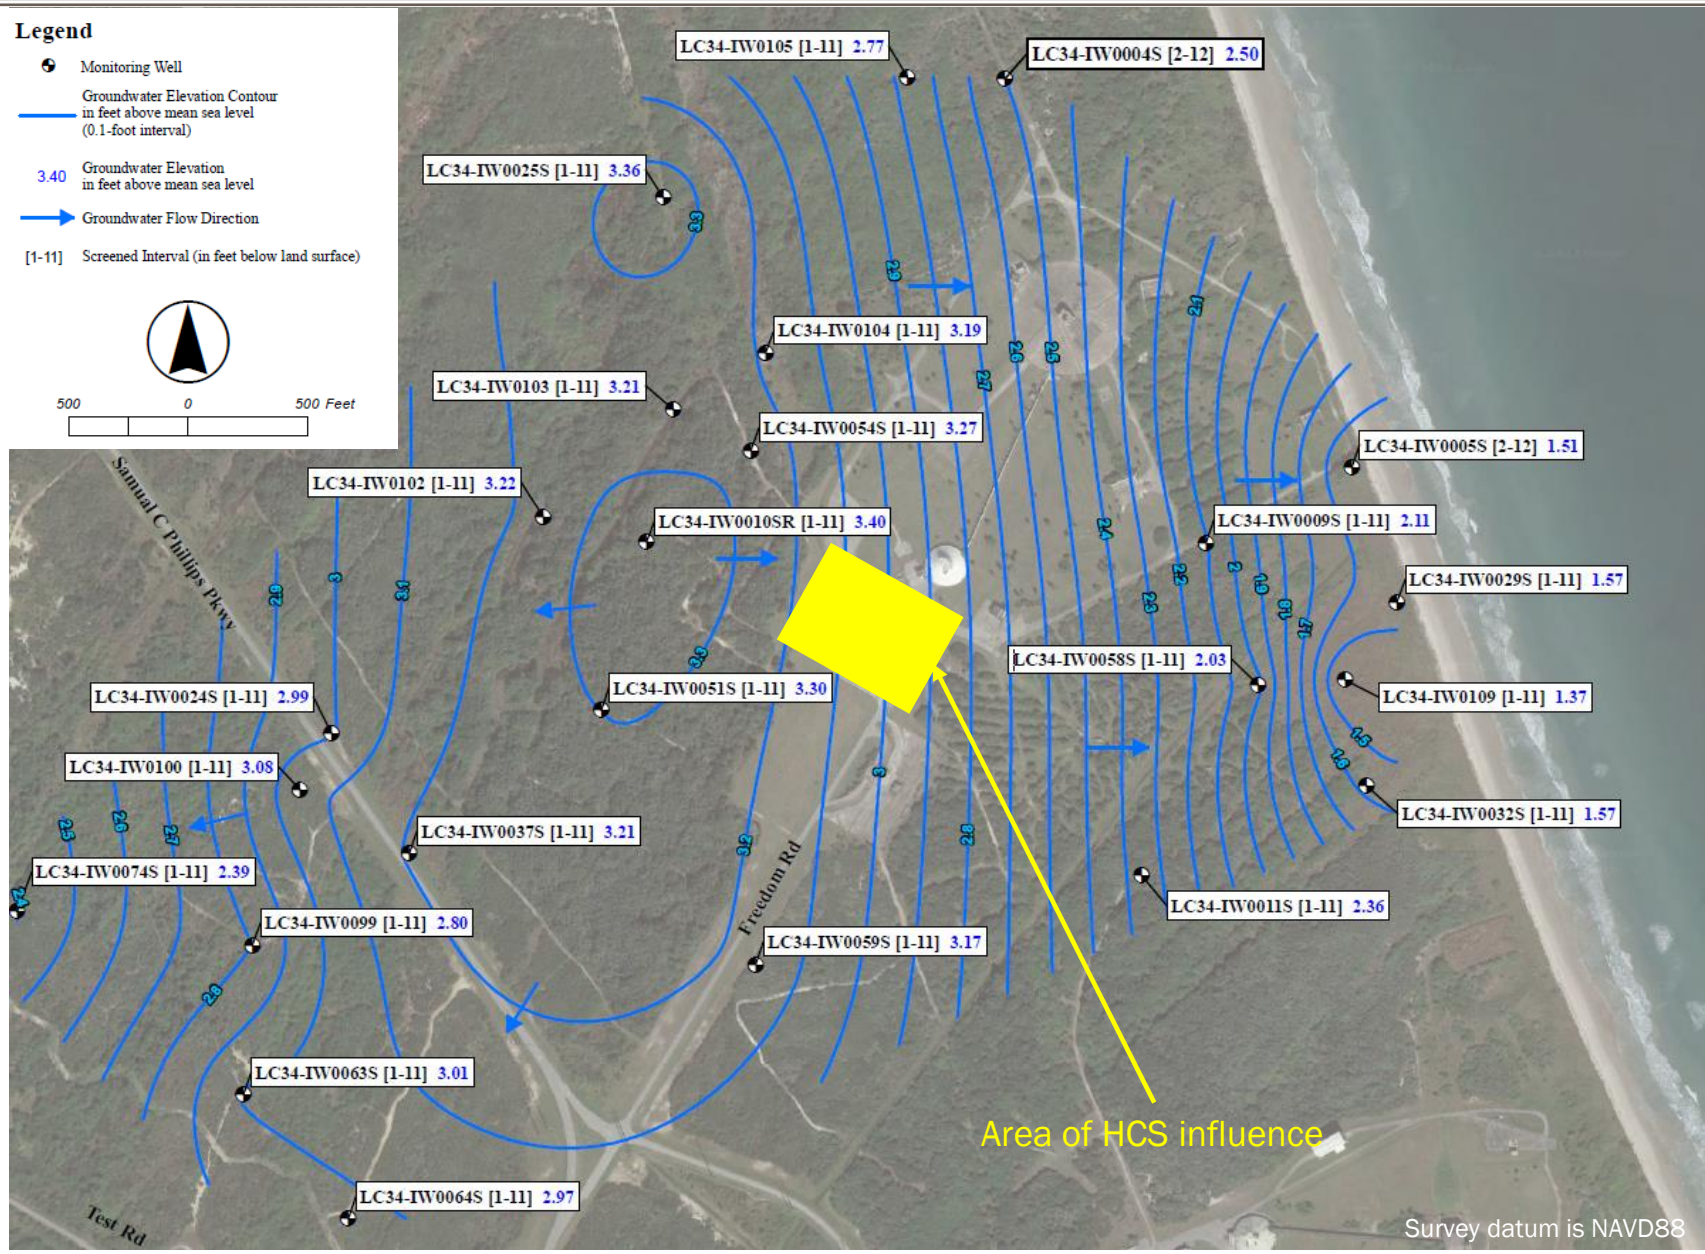
7	olive gray fine silty SAND (SM) w/white angular shell fragments	
8 (D2)	olive gray fine to coarse SAND (SW) w/shell fragments and trace clay	Description from Deep Soil Coring completed in 2002, no photos available
9	olive green sandy CLAY (CL) w/phosphate nodules and limestone fragments (Hawthorn Group)	

Site Overview: Groundwater Contours

Survey datum is North American Vertical Datum of 1988 (NAVD88)

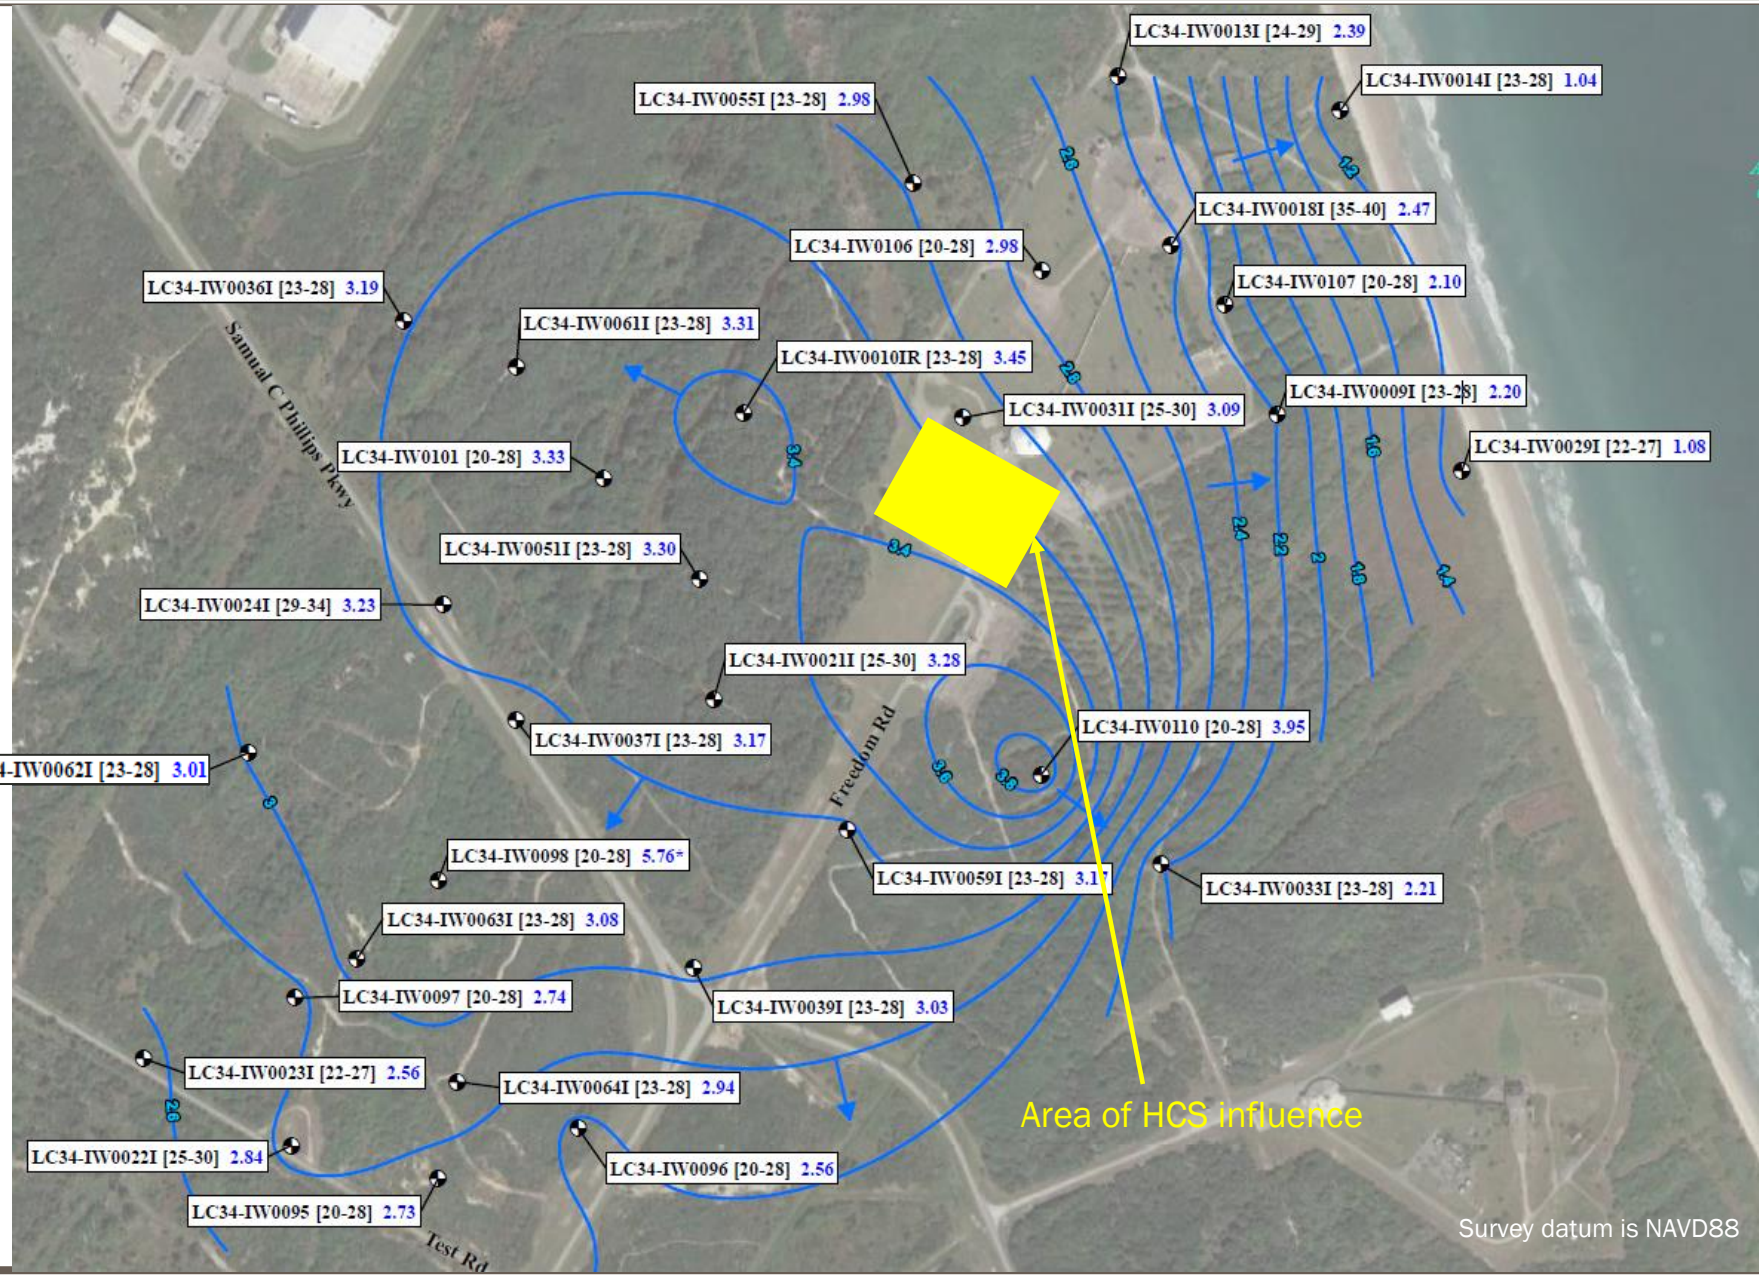


Groundwater Contours:

- Potentiometric maps show groundwater flow patterns prior to HCS operation in December 2009
- In the shallow intervals (Layers 1, 2, and 3) there is localized groundwater mounding near the HCS Compound
- In the deep intervals (Layers 6 and 8) flow is generally to the southeast, southwest, and west
- Decision to discontinue water levels was made during April 2012 KSCRT Meeting (1204-M13, Decision 1204-D24)
- Site-wide water levels collected during biennial LTM events (Layers 1 and 2) contoured to verify consistency with historical readings (most recent February 2023, shown on next slides)

Site Overview: Groundwater Contours – February 2023

Groundwater Contours (continued):



- Layer 1 (screened 0 to 25 ft bls)
- 24 biennial LTM wells used for contouring
- Elevations ranged from 1.37 feet in well IW0109 to 3.40 feet in well IW0010SR
- Flow is radial at wells IW0025S and IW0010SR. Generally, flow is to the east towards the Atlantic Ocean on eastern half of site and generally flows west on western half of site.
- Wells used for contouring were outside of the HCS influence area

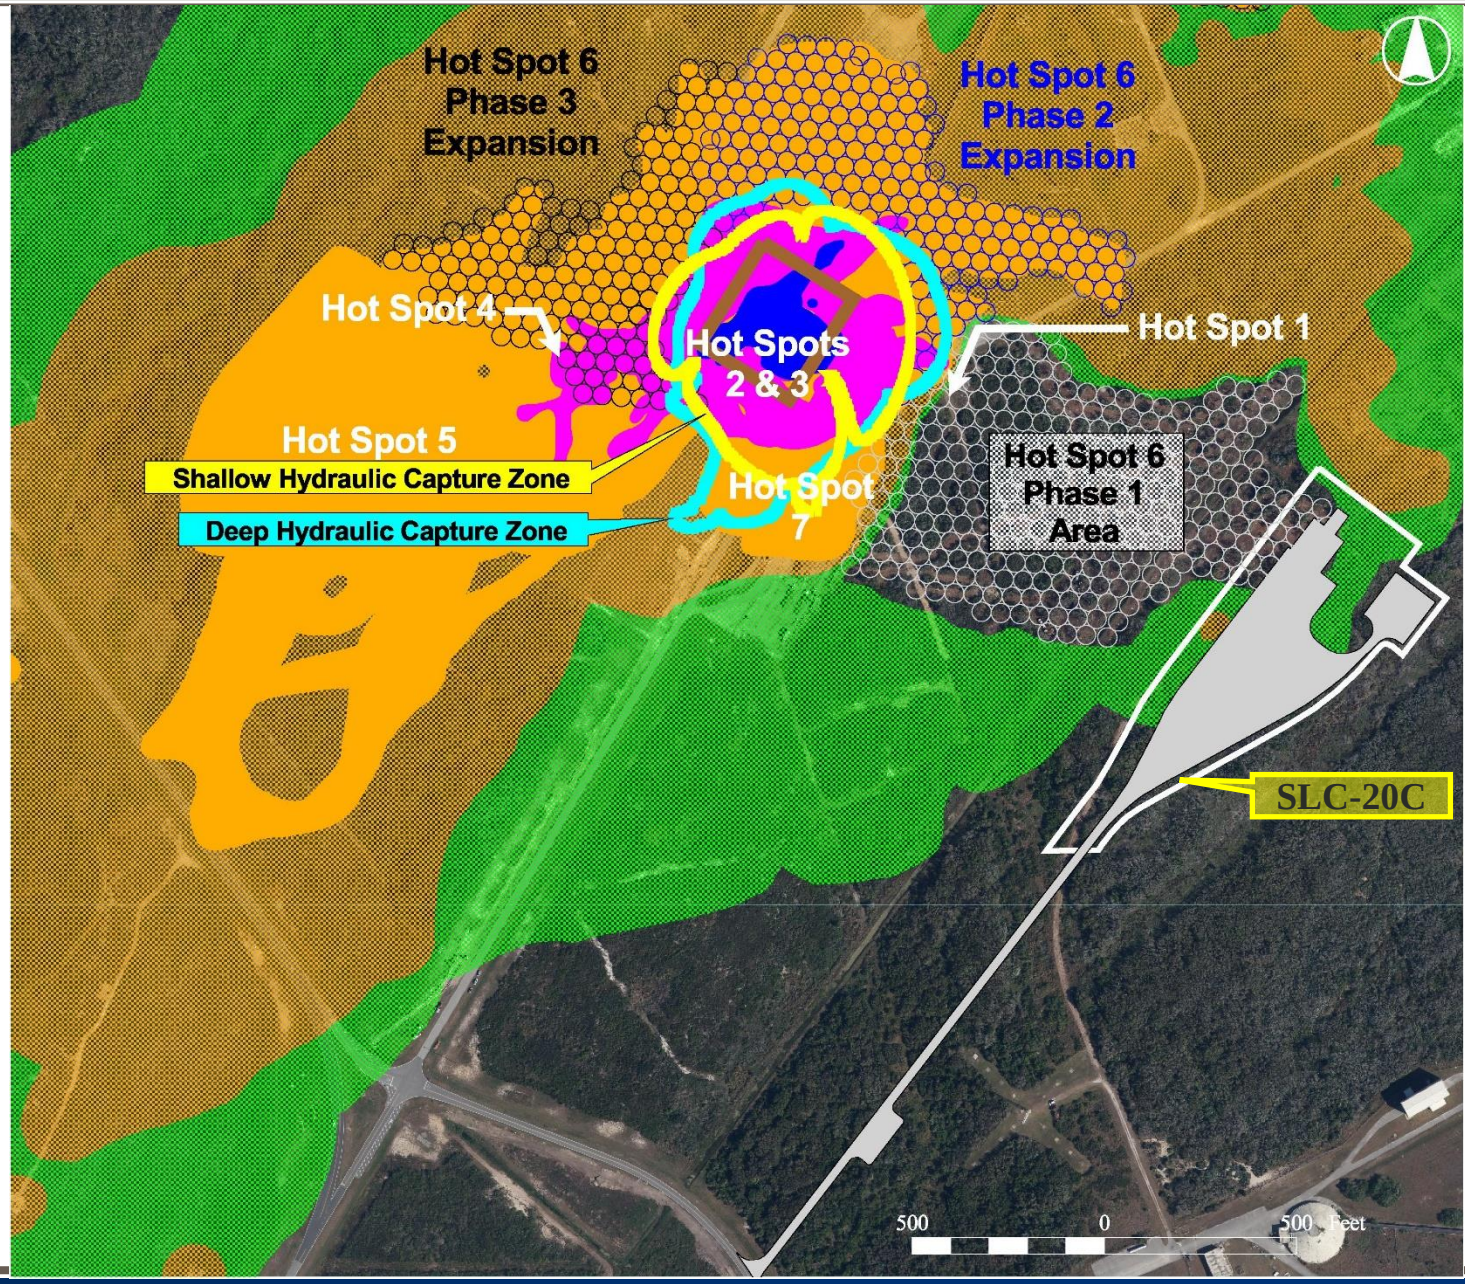
Site Overview: Groundwater Contours – February 2023

Groundwater Contours (continued):

- Layer 2 (screened 25 to 30 ft bls)
- 30 biennial LTM wells used for contouring
- IW0098 damaged, not used for contouring
- Elevations ranged from 1.04 feet in well IW0014I to 3.95 feet in well IW0110
- Groundwater flow appears to be radial from wells IW0010IR and IW0110. Generally, flow is to the east towards the Atlantic Ocean on eastern half of site and generally flows southwest on western half of site
- Wells used for contouring were beyond influence of the HCS

Interim Measures and SLC-20C Pad Sitework

Hydraulic Containment System:



- Start up efforts began in 2009
- Full scale operations since 2010 significantly reducing migration of the DSZ

Hot Spot 6 Air Sparging :

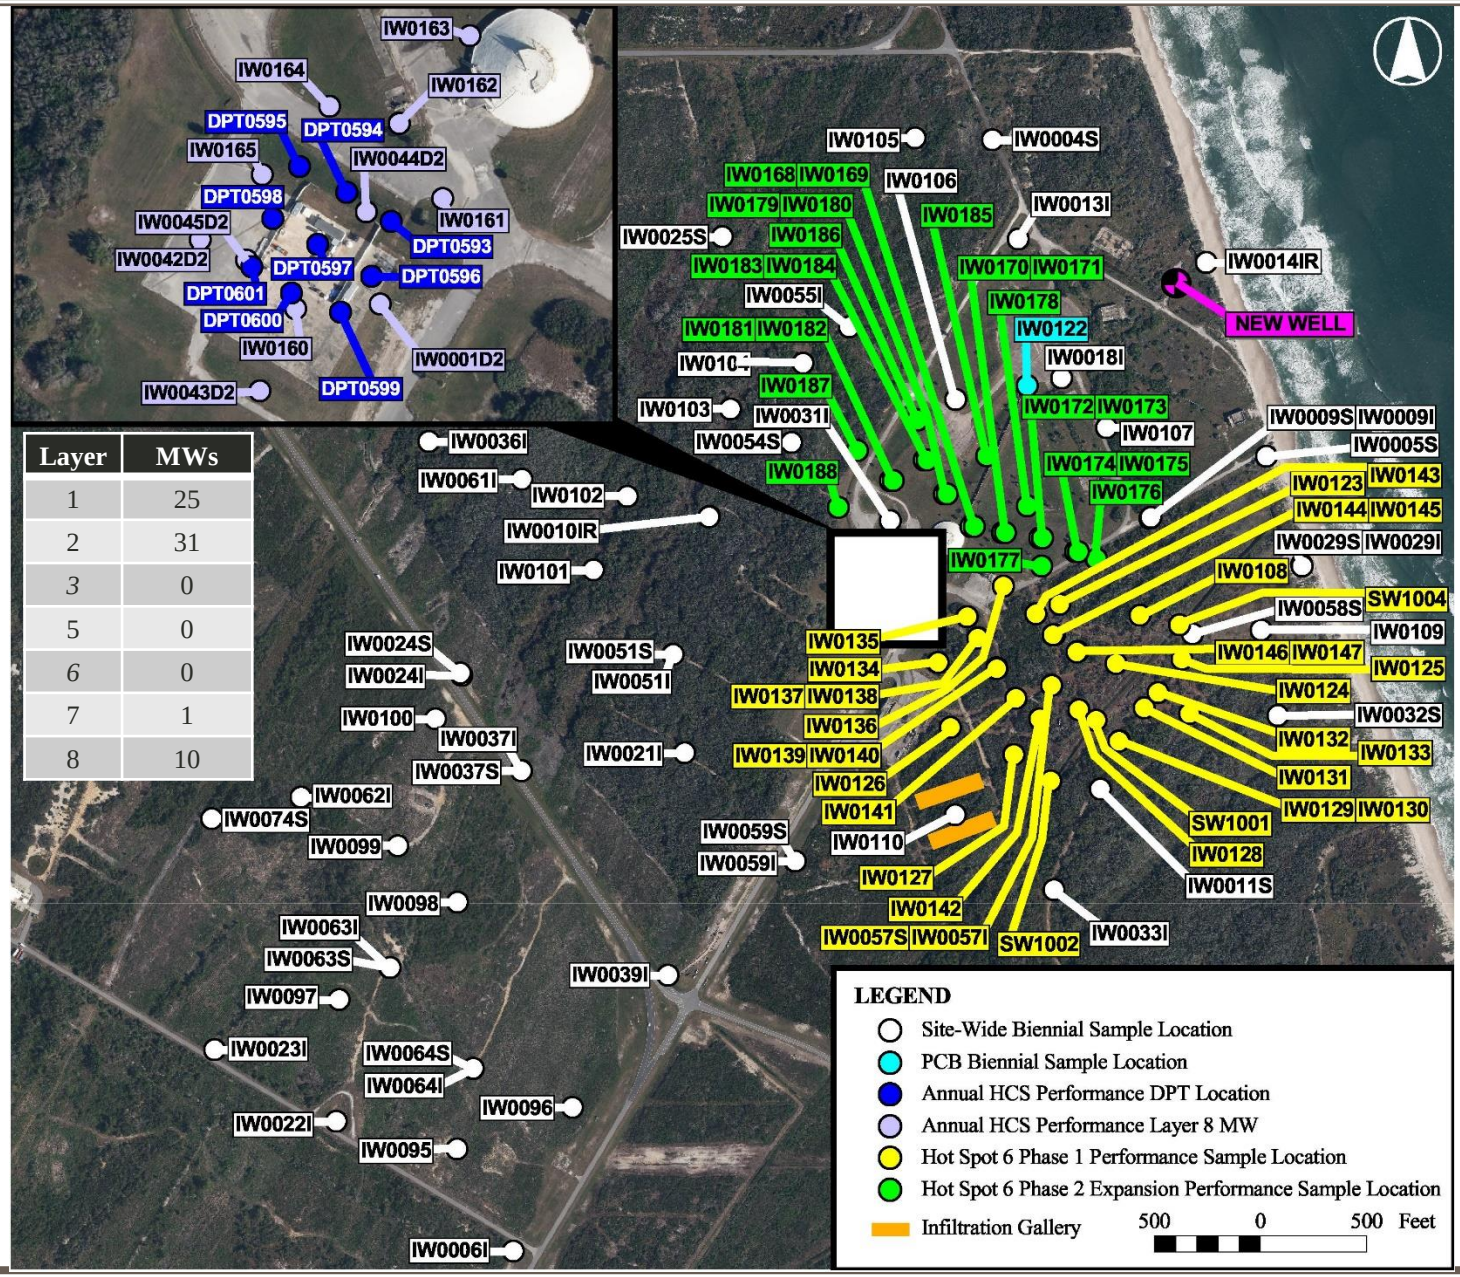
- Original system (Phase One) completed 2019:
  - 300 Air Sparging Wells (ASWs)
  - 14.1 acres of 15.7 acres reduced to <GCTLs
- Expansion (Phase Two) completed 2024:
  - 190 ASWs
  - 11.2-acre treatment zone
- Expansion (Phase Three):
  - Presented to KSCRT in February 2024
  - Two Treatment Areas (Area #1 and Area #2)
  - 192 ASWs
  - 9.4-acres

SLC-20C Pad Sitework :

- 45% Design Development September 2022

2023 - 2024 Sampling Program

Site-wide:



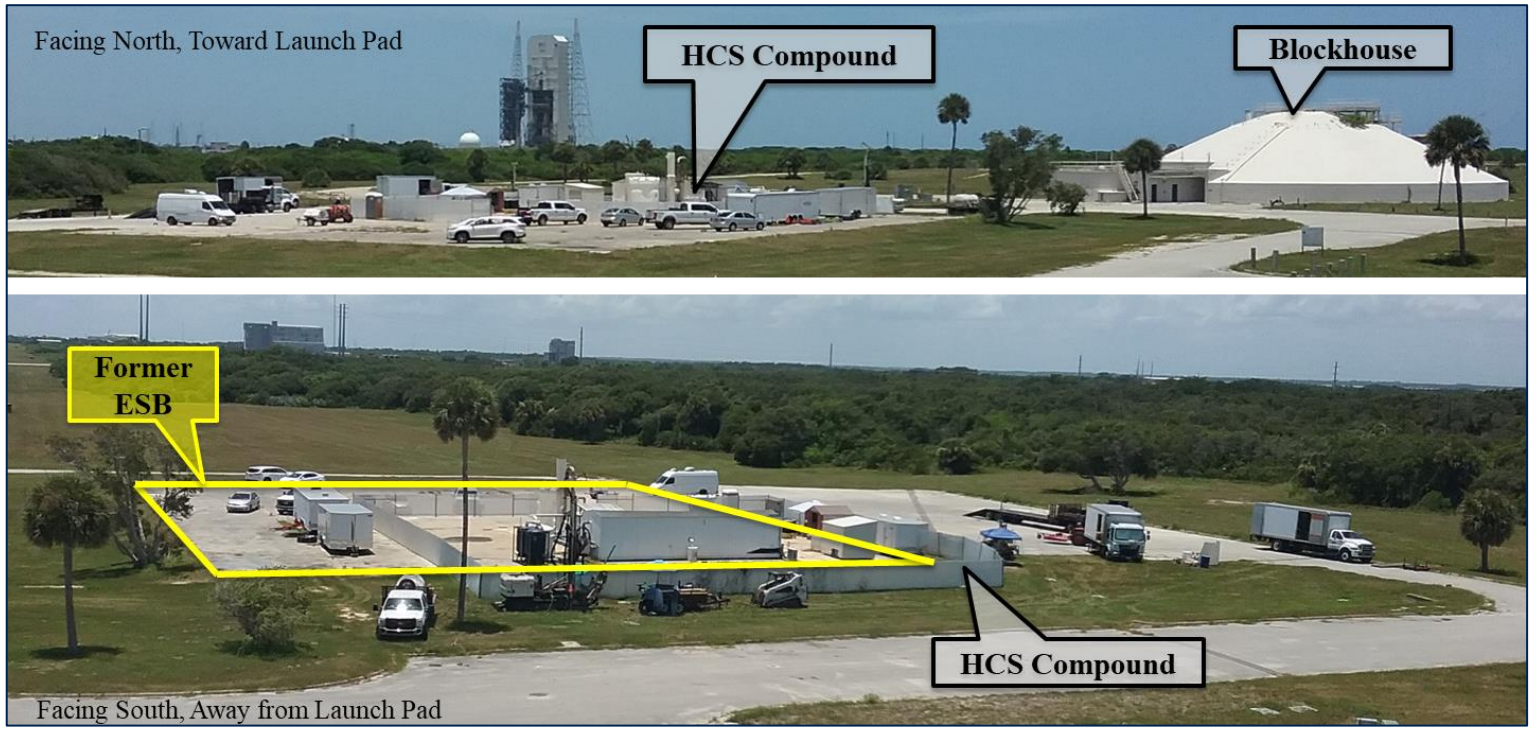
- Biennial (scheduled December 2024):
  - 56 MWs for VOCs, includes new well installation
  - IW0122 for PCBs

HCS OM&M :

- Biweekly, select Layer 8 wells evaluating RW21D operations
- Monthly, air strippers and Liquid-Phase Granular Activated Carbon (LPGAC) effluent samples
- Quarterly, total system influent and active RWs
- Annual:
  - Catalytic Oxidizer (CatOx) influent and effluent
  - DPT Performance Monitoring
    - 9 locations, 5 ft sampling interval 8 to 98 ft bls
  - Performance Layer 8 MWs and Layer 7 IW42D2

Hot Spot 6 Performance Monitoring :

- Quarterly, Phase Two performance monitoring:
  - 21 MWs
- Semi-annual, Phase One performance monitoring:
  - 28 MWs and 3 SWs



Layer	MWs
1	25
2	31
3	0
5	0
6	0

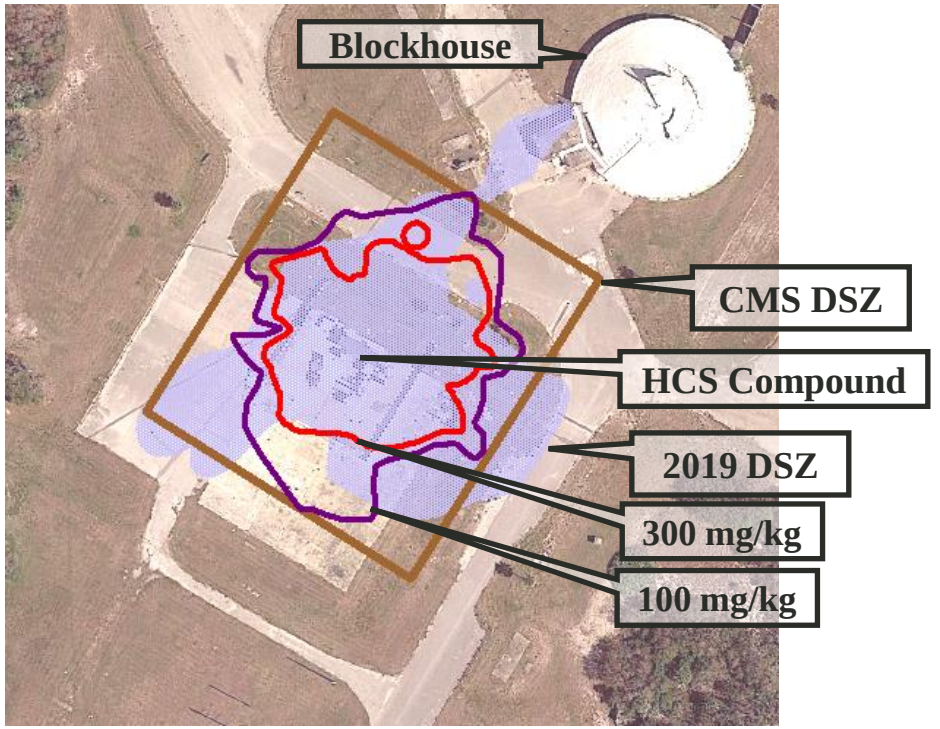
8	10



Hydraulic Containment System Update

Hydraulic Containment IM Overview

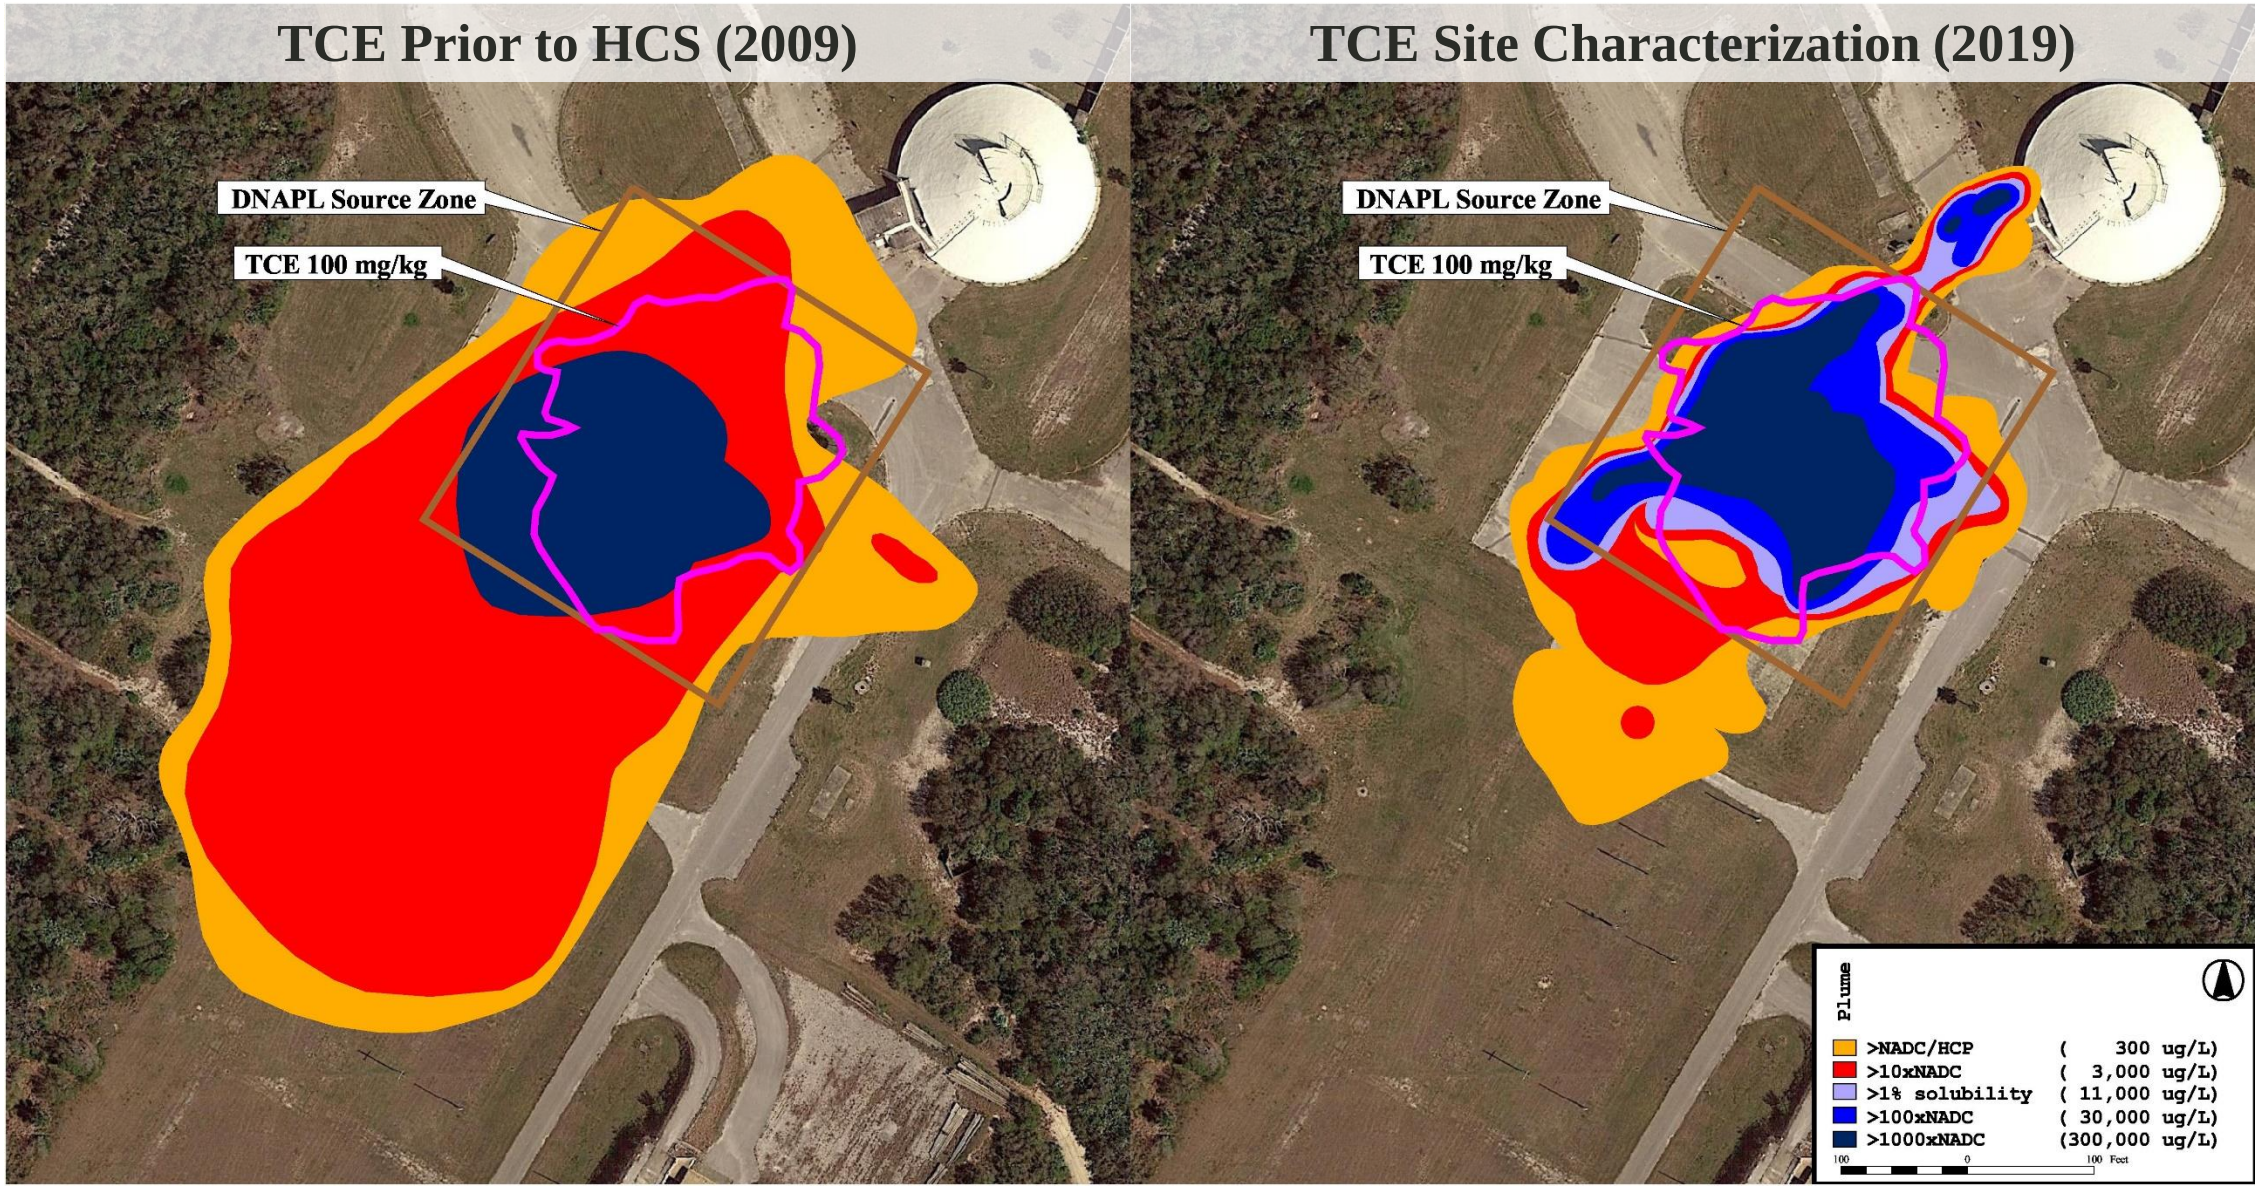
Site Description:

- DSZ defined in the CMS as a 2-acre area to 75’ bls encompassing the extent of TCE DNAPL determined by soil concentrations of TCE ≥ 300 mg/kg and the transition zone to 100 mg/kg, calculated mass of 74,000 and 12,000 pounds, respectively
- DSZ was re-characterized in 2018-2019 with groundwater data where TCE > 11,000 µg/L investigation area footprint was 4.5 acres, including 2.5 acres mowed and maintained and the remainder paved or covered by Blockhouse
- Elevation of former ESB pad is 10 ft and there is a 2 to 3-foot elevation change in ditches and in the field to southwest
- Depth to groundwater approximately is 5 ft bls and groundwater flow within the capture zone is controlled by HCS

Hydraulic Containment IM Overview

HCS History and Description:

- **Objective:** to attain hydraulic control of the DSZ and TCE HCP within Hot Spots 2, 3, and 4 by groundwater extraction and ex-situ treatment
- **2010:** Full-Scale O&M began May 2010
- **2015:** TCE HCP system expansion
  - Occurred from February 10th to May 15th
  - 7 shallow and 1 deep recovery wells installed
  - Installed 2 new air strippers (replaced original)
  - Replaced EOS control system with Siemens HMI/PLC
  - Refurbished oxidizer
- **2017:** Began DPT PM sampling at 9 locations
- **2019:** DSZ Site Characterization and System optimization
  - 1,196 samples (7 had DNAPL) from 89 DPT locations
  - RW17C installed August 2019 (Screened 80-95 ft bls)
  - Layer 8 MWs installed; included in PM sampling
- **2020:** Pilot study IMWP to test air sparging in DSZ fine-grained layers
- **2021:** Additional RWs installed
  - RW18C, 19C, 20C installed February 2021
  - Screened same as RW17C (80-95 ft bls)
  - Revised pumping rates (Flow = 86 gpm)
- **2021-2022:** Pilot Study Implementation
  - July 2021 to February 2022
  - Results / Findings were presented September 2022
- **2023:** RAE
  - Evaluate next step of treatment train for the DSZ area

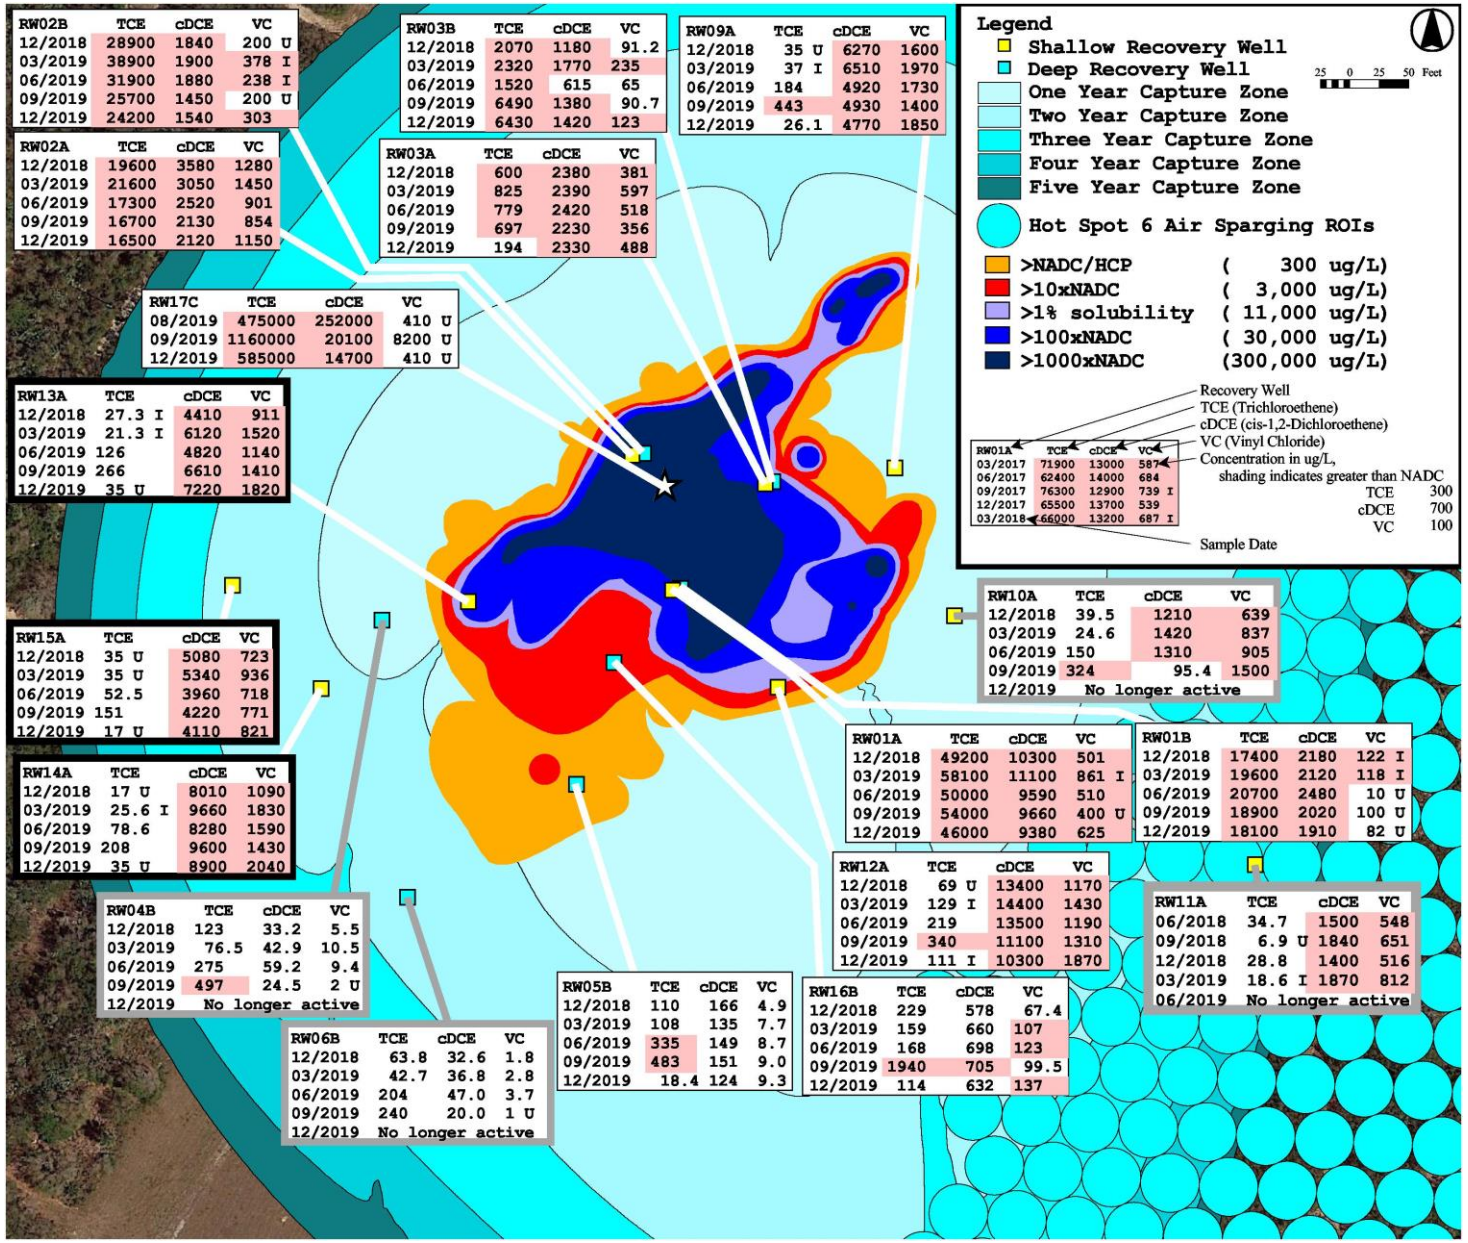


HCS Components

- 10 shallow recovery wells (15 to 45 ft bls)
- 7 deep recovery wells (50 to 80 ft bls)
- 5 deeper recovery wells (80 to 95 ft bls)
- 1 deeper recovery well (86 to 106 ft bls)
- Equalization tank and discharge pump
- 2 air strippers, discharge pump, and carbon treatment for polishing
- Catalytic oxidizer, quench tower, scrubbing unit
- 12 deep injection wells (50 to 80 ft bls) and infiltration gallery discharge

- **2023:** Installed RW21D
  - Installed January 2023 screened 86-106 ft bls
  - RW12A, 13A, 14A, 15A, 05B and 16B turned off to maximize RW21D extraction rate
- **2023-2024:**
  - Upgrading filtration units
  - Installing twenty Layer 7 Recovery Wells

Review of 2019 DSZ Site Characterization



DSZ Footprint Comparison between Historical Delineation and 2019 Site Characterization (Presented in October 2019 KSCRT Meeting)

Review of 2019 DSZ Site Characterization

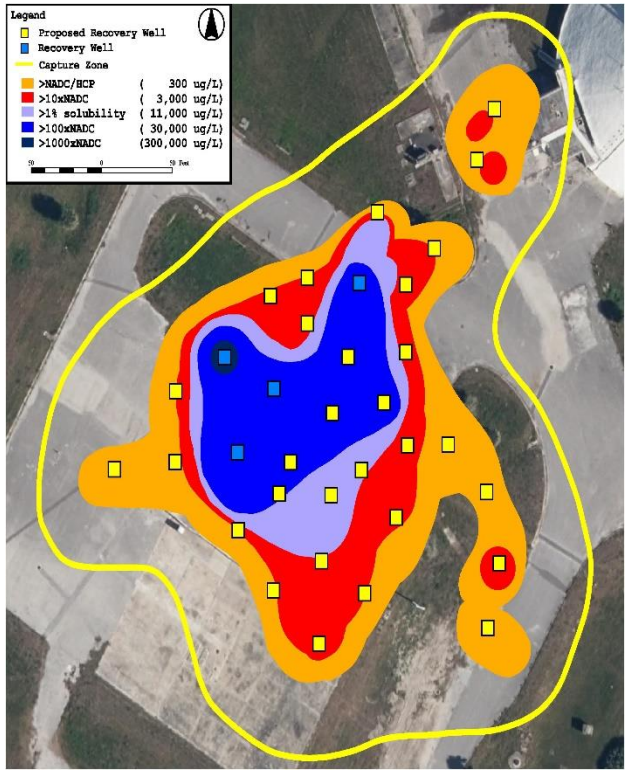
DSZ Site Characterization (October 2019):

- Focused to delineate TCE to 300 µg/L by collecting a robust horizontal and vertical dataset to support optimization of HCS and DSZ RAE
- Pumping Rate Optimizations
  - RW11 turned off within the influence of Hot Spot 6 Air Sparging Treatment Zone
  - RWs 04B, 06B, 10A turned off based on low TCE concentrations
  - Based on cDCE and VC concentrations RWs 13A, 14A, and 15A operating at 3 GPM each increasing system GPM to 83 GPM
  - Added RW17C to the system

Remedial Alternatives

Remedial alternatives evaluation performed and presented in February 2023

Recommended Alternatives:



- Short-term: DSZ-1: Pump and Treat
- Long-term: DSZ-3: Large Diameter Auger (LDA) w/Steam and Zero Valent Iron (ZVI), and Air Sparging

DSZ-1: Optimize HCS with Full-Scale Expansion into Layer 7

- Scale up the HCS to accommodate an expansion containing 30 proposed RWs in layer 7 to establish full capture zone of TCE greater than 300 µg/L
- Scale up includes:
  - Increase process piping diameter
  - 50 hp rotary screw air compressor to operate pneumatic pumps
  - Refurbish CatOX unit
  - Install transfer pumps rated for 135 GPM at 50ft of head
  - Replace bag filters with self-cleaning filter system
  - Install a third infiltration trench

DSZ-1 Overall Timeline

Year	DSZ-1
Year 0	RW Installation, System Modifications, CatOx Refurbishment
Years 1-5	HCS operation with system OM&M
Year 6	HCS operation with system OM&M and CatOx Refurbishment
Years 7-10	HCS operation with system OM&M
Year 11	HCS operation with system OM&M; transition to Vapor-Phase Granular Activated Carbon (VPGAC) and replacement of air stripping units
Year 12-30	HCS operation with system OM&M

Proposed Layer 7 Recovery wells

	Capital Costs	Total Annual Costs	Total
Total (DSZ-1)	$2,524,000	$24,205,000	$26,729,000

Remedial Alternatives

DSZ-3: LDA w/Steam and ZVI, and Air Sparging

- 2 Phases of implementation
  - Phase 1 = LDA w/Steam and ZVI: 1.3 acres (vertically to 98 ft bls)
  - Phase 2 = Air Sparging: 1.5 acres (vertically to 98 ft bls)
- Treatment Process:
  - Phase 1 (LDA w/Steam and ZVI):
    - Steam/hot air and ZVI injection where TCE> 11,000 except near blockhouse, approximately 1.3 acres from 18 ft to 98 ft bls
    - **Vapors:** VOCs to be treated by VPGAC prior to discharge to ambient air (carbon change-outs included in vendor unit rate)
    - **Water:** Moisture from off-gases to be collected in condensate tank, treated by Mobile Air Stripping unit, and reused in ZVI batching operation -or- discharged into existing infiltration gallery
  - Phase 2 (Air Sparging):
    - Implemented 2 years after LDA
    - Install AS Wells with focus around LDA perimeter and Blockhouse area to volatilize dissolved phase TCE

	Capital Cost	Total Annual Costs*	Total
Phase 1: LDA w/Steam and ZVI	$48,996,000	$222,000	$49,218,000
Phase 2: Air Sparging	$2,700,000	$3,745,000	$6,445,000
Total (DSZ-3)			$55,664,000

DSZ-3 Overall Timeline

Year	Phase 1: LDA w/Steam and ZVI	Phase 2: Air Sparging
Years 1-2	Implementation	--
Year 3-4	DPT PM	--
Year 5	MW PM	Implementation
Years 6-9	MW PM	OM&M
Years 10-27	--	OM&M
Year 28	--	Decommission AS System

HCS Annual Operations

Reporting Period Runtime (April 1, 2023 – March 31, 2024)

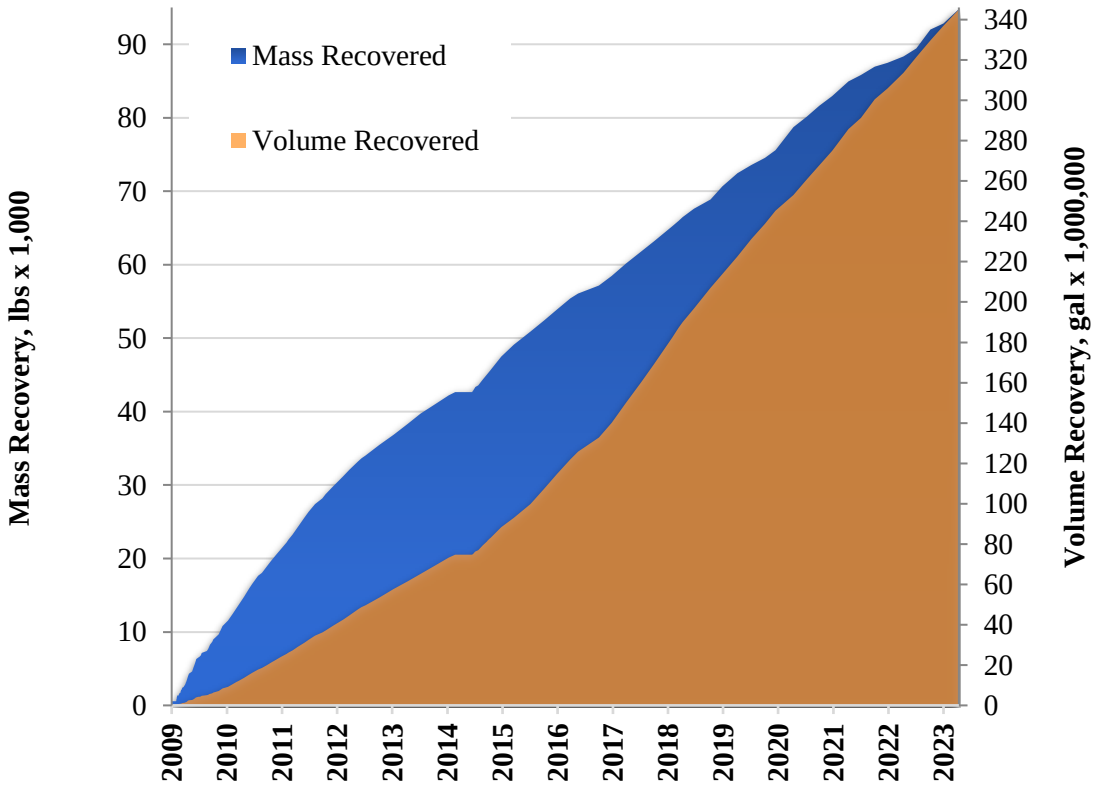
Year	Month	Days In Month	Downtime (days)	Runtime	Downtime Contributing Factor
2023	April	30	0.25	99%	Routine system cleaning
	May	31	0.25	99%	Routine system cleaning
	June	30	4.25	86%	Routine system cleaning; replaced quench cooling water piping
	July	31	0.25	99%	Routine system cleaning
	August	31	2.25	93%	Routine system cleaning; replaced scrubber float
	September	30	2.50	92%	Routine system cleaning; replaed scrubber pump
	October	31	0.25	99%	Routine system cleaning
	November	30	0.25	99%	Routine system cleaning
	December	31	3.50	89%	Routine system cleaning; minor shutodwn to begin bag filter upgrade
2024	January	31	3.35	89%	Routine system cleaning; troubleshoot thermocouple sensor
	February	29	5.60	81%	Routine system cleaning; troubleshoot thermocouple sensor; PLC controller replaced (lightning strike)
	March	31	0.50	98%	Routine system cleaning
Total		**366**	**23.20**	**94%**	

Semi-Routine O&M Items:

- Maintain consumables (bag filters, biodispersent, scrubber packing, sodium hydroxide)
- Calibrate pH sensor in scrubber recirculation line (quarterly)
- Clean air stripper and pump control float (monthly)
- Replace transfer pump seals (as needed)
- Replace totalizer internals (as needed)
- Replace faulty oxidizer heater elements (semi-annual to annual)

System Performance Sampling:

- Biweekly, select Layer 8 wells to evaluate RW21D operations
- Monthly, air strippers and LPGAC effluent samples
- Quarterly, total system influent and active RWs
- Annual:
  - CatOx influent and effluent
  - DPT samples from 9 locations
    - 5 ft sampling interval 8 to 98 ft bls
  - Layer 8 Performance MWs and Layer 7 IW42D2



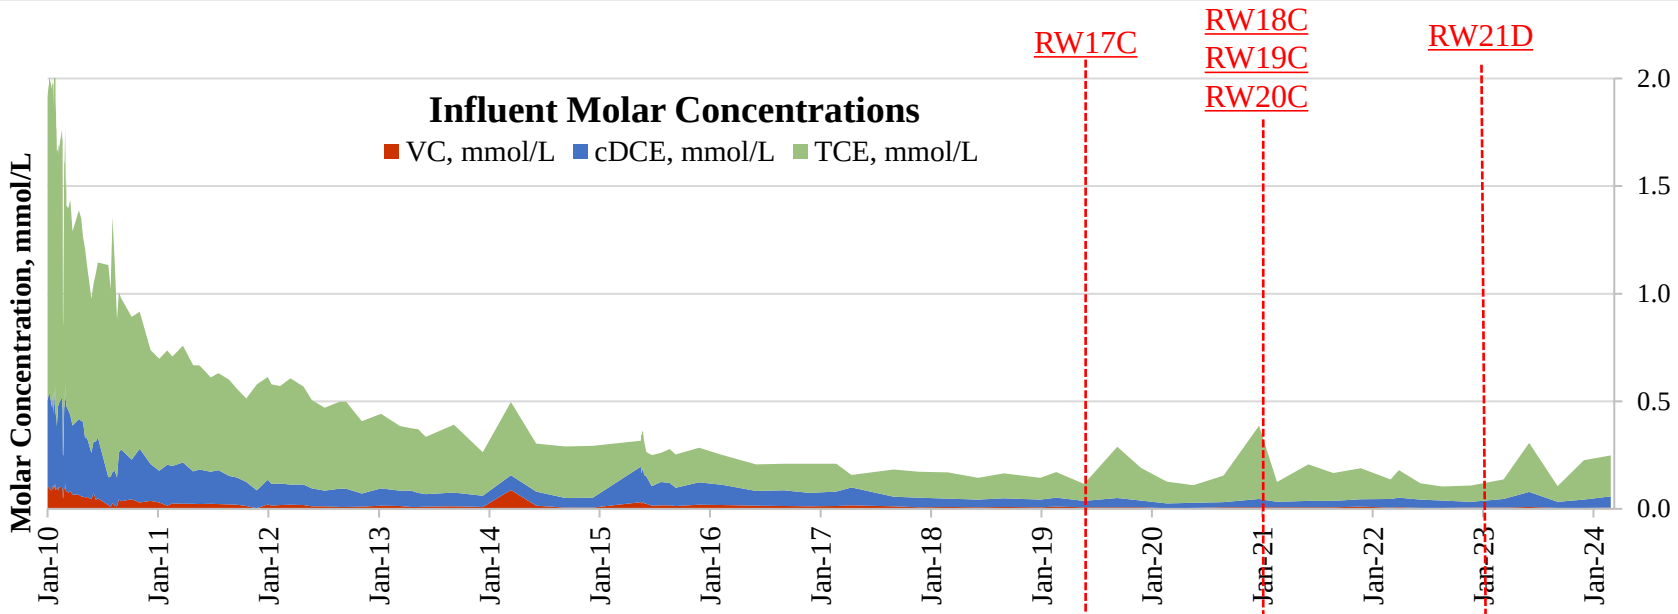
Runtime Comparison based on reporting periods:

- 2018/2019: 81%
- 2019/2020: 89%
- 2020/2021: 85%
- 2021/2022: 94%
- 2022/2023: 90%
- 2023/2024: 94%

HCS Treatment Results

Volume and Mass Recovery

- Reporting Period April 2023 to March 2024:
  - Groundwater recovery: 31,176,393 gallons
  - cVOC mass recovery: 6,319 lbs



Year	Date	Volume Recovered (gal)		VOC Mass Recovered (lb)	
		Annually	Cumulative	Annually	Cumulative
1	2/21/2011	10,384,456	11,540,001	10,782	13,196
2	3/1/2012	15,768,761	27,308,762	10,070	23,265

Influent Trends

- Quarterly sampling of system influent and individual recovery wells
- Monthly effluent sampling of air strippers and LPGAC
- LPGAC online for the full duration of reporting period
- TCE detected exceeding GCTL in second stage air stripper in July 2023 and January through March 2024, silt identified in air stripper during monthly cleaning. Issue caused by Drilling IDW entering system beyond bag filters, April 2024 results indicate issue resolved.

April 2004 TCE µg/L	
Influent:	20,000
1st AS Effluent:	90
2nd AS Effluent:	0.89 U
LPGAC:	0.94 U

- Recommend to continue quarterly influent and monthly effluent sampling

Note:
- Results in µg/L.
- Bold indicates detected concentrations.
- Yellow shaded cells indicate concentration greater than GCTL.

AS = Air stripper
LPGAC = Liquid phase granular activated carbon
I = The reported value is between the laboratory MDL and the practical quantitation limit
U = Value below the laboratory MDL.

System loading (vapor influent)

- TCE = 12.4 lbs (pounds)/day
- Total VOCs = 14.8 lbs/day

Daily Hazardous Air Pollutants (HAP) emission

- TCE = 0.0050 lbs/day
- Total VOCs = 0.0063 lbs/day
- Meets permissible daily individual and total HAP levels of 2.7 and 6.8 lbs/day, respectively

Loading calculated using blower flow rate of 600 standard cubic feet per minute
Table includes all analytes that were detected for influent and effluent samples (collected 12/21/2024); all other tested parameters are non-detect.
Bolding indicates a detected result above the laboratory method detection limit (MDL)
Analytes reported as U, ½ the MDL used for loading calculation
J = The reported value is between the laboratory MDL and the practical quantitation limit.
U = Value below the laboratory MDL

HCS Treatment Results

Maintenance Program:

- Routine Items:
  - System inspections (daily)
  - Clean air stripper and pump control float (monthly)
  - Calibrate pH sensor in scrubber recirculation line (quarterly)
- Semi-Routine Items:
  - Maintain consumables (bag filters, biodispersant, scrubber packing, sodium hydroxide)
  - Replace transfer pump seals (as needed)
  - Replace totalizer internals (as needed)
  - Replace oxidizer heater elements (semi-annual to annual)

	Condition	Performance	Current/Recent Issues	Planned Activities
Recovery wells			Flow totalizers cleaned	Normal maintenance
Submersible pumps			Pump maintenance to prevent failure RW03B had controller issues	Normal maintenance Continue monitoring conditions of pumps
Filtration system			No issues; effective biocide program	Continue biocide program and filter maintenance Self cleaning filter upgrade in progress
Equalization tank			No issues	Normal maintenance
EQ transfer pump			No issues	Normal maintenance
Air strippers			Air strippers fouling	Monthly pull-out tray cleaning
AS blowers			No issues	Normal maintenance
AS transfer pumps			No issues	Normal maintenance
Moisture separator			No issues	Normal maintenance
MS transfer pump			No issues	Normal maintenance
Liquid-phase GAC			No issues	Normal maintenance as operated
Catalytic Oxidizer -Heater			Heater replaced as needed	Maintenance of heater elements and additional insulation every six months
Catalyst Module			Demisters cleaned annually	Monitor condition every six months, additional air samples as needed to confirm status
Heat exchanger			No issues	Normal maintenance
Quench nozzle			Quench nozzle replaced Minor repairs to flow fittings	Normal maintenance
Quench tower			No issues	Normal maintenance Inspect for corrosion/material degradation
Scrubber			No issues	Normal maintenance and visual inspection.
Recirculation transfer pump			Replaced pump	Normal maintenance
Discharge transfer pump			No issues	Normal maintenance
Chemical feed pumps			No issues	Normal maintenance
Injection wells			No issues	Normal maintenance
Infiltration gallery			No issues	Normal operation/inspection

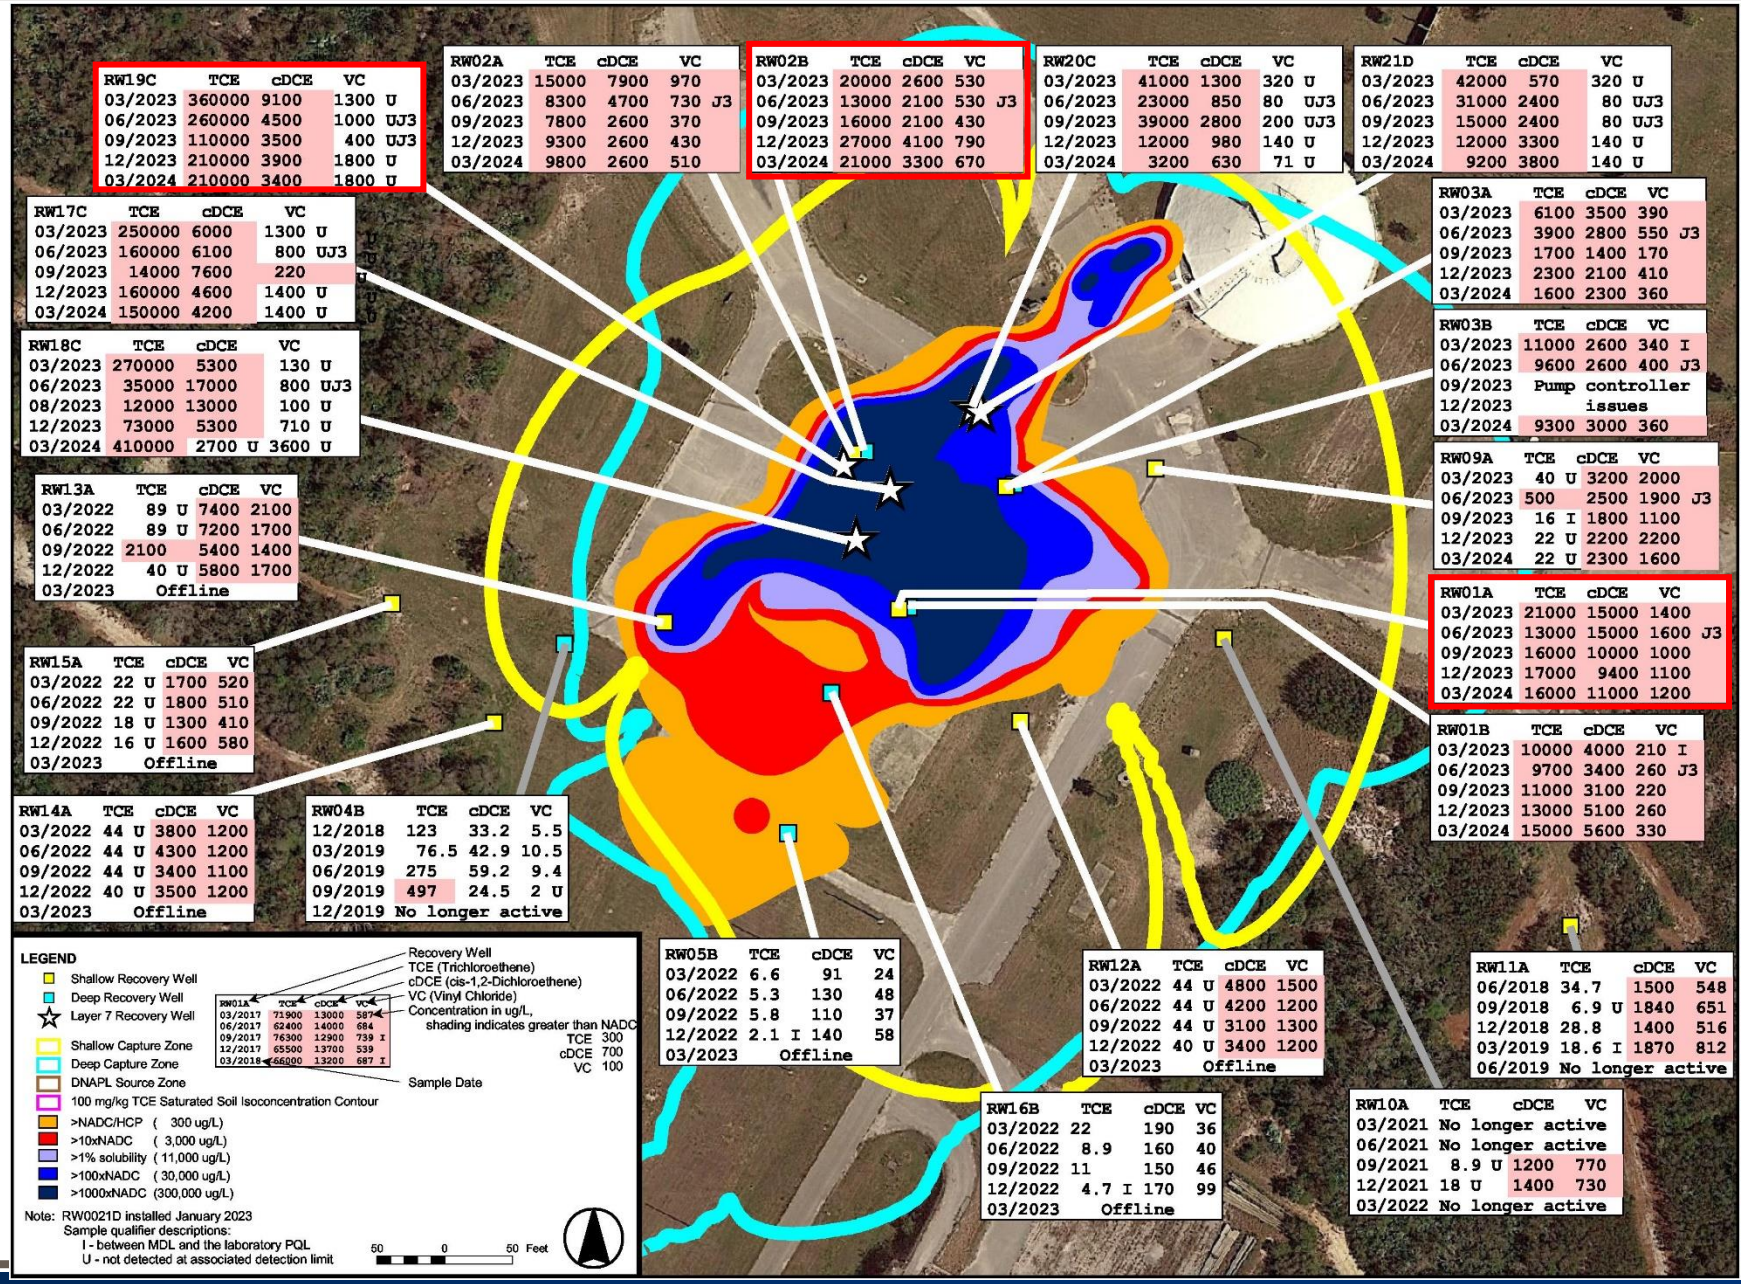
Recovery Well Results

Shallow Capture Zone (15 to 45 ft bls):

- 4 RWs currently online

Deep Capture Zone (50 to 80 ft bls):

- 3 RWs currently online



Deeper Zone (80 to 95 ft bls):

- 4 RWs currently online

RW21D (86 to 106 ft bls):

- Installed January 2023, due to IW162 TCE increases

Layer 7 Recovery Well Results

Layer 7 RWs 17C-20C:

- Screened 80 to 95 ft bls
- Installed:
  - RW17C in August 2019
  - RW18C, 19C, 20C in February 2021
- Each operate at 0.5 GPM:
  - 2% of total influent GPM
  - 20% of TCE mass

Layer 7 RW21D:

- Screened 86 to 106 ft bls, Layers 7 and 8
- Installed January 2023
- Operates at 15 GPM:
  - 18% of total influent GPM
  - 28% of TCE mass

Other zones:

- Shallow Zone:
  - 26% of total influent GPM
  - 14% of TCE mass
- Deep Zone:
  - 54% of total influent GPM
  - 38% of TCE mass

DPT Performance Sampling TCE Results

Annual DPT Performance Sampling:

- Sampled January 2024
- 9 locations sampled (3 by 3 grid)
- 19 sample intervals from 8 to 98 ft bls

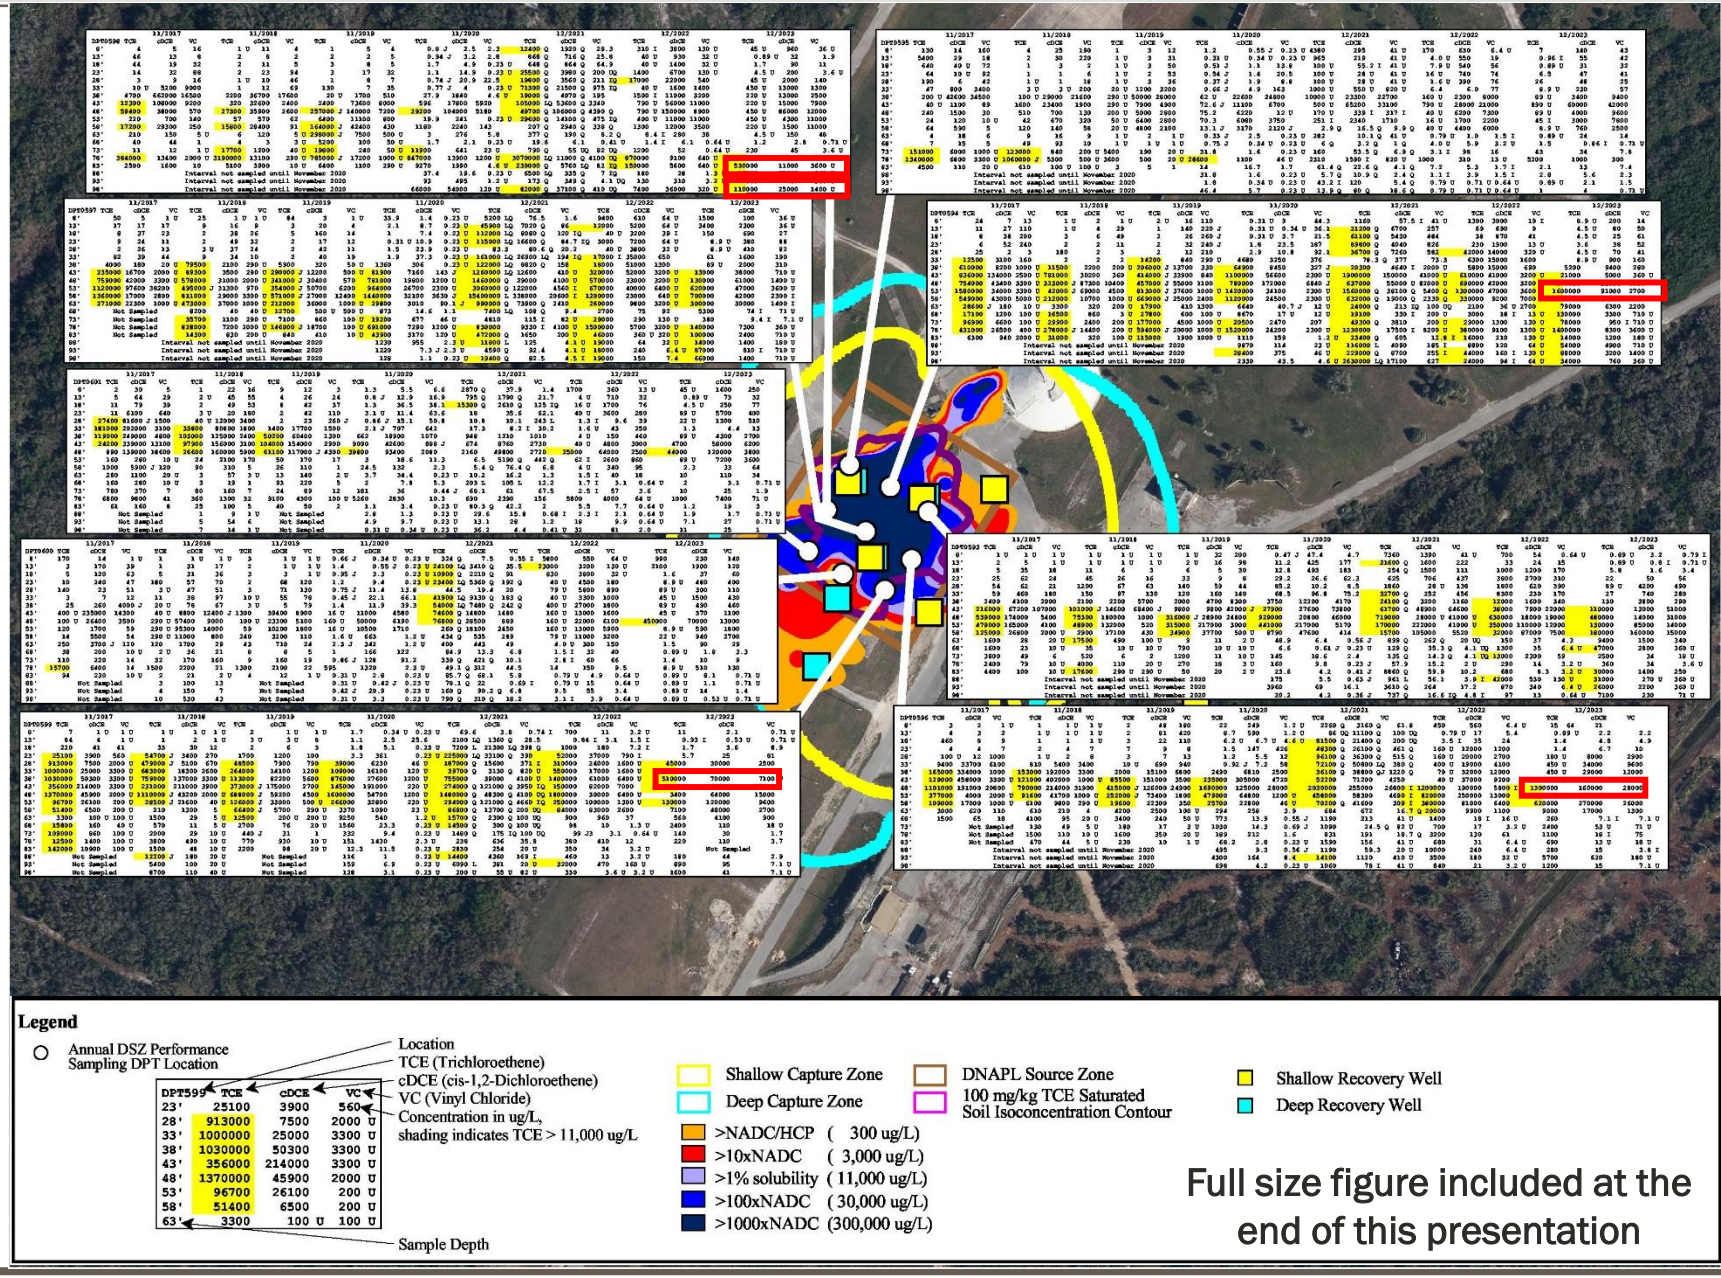
Shallow Capture Zone:

- Recovery wells screened 15 to 45 ft bls
- Highest TCE in DPT599 (38'): 510,000 µg/L

Between Shallow and Deep Capture Zones:

- 45 to 50 ft bls
- Highest TCE in DPT596 (48'): 1,300,000 µg/L

Deep Capture Zone:



- Recovery wells screened 50 to 80 ft bls
- Highest TCE in DPT594 (53'): 1,600,000 µg/L

Layer 7 Capture Zone:

- Recovery wells screened 80 to 95 ft bls
- Highest TCE in DPT598 (83'): 530,000 µg/L

Below Layer 7 (95-100' depth interval):

- Recovery well screened 86 to 106 ft bls
- Highest TCE in DPT598 (98'): 110,000 µg/L

Full size figure included at the end of this presentation

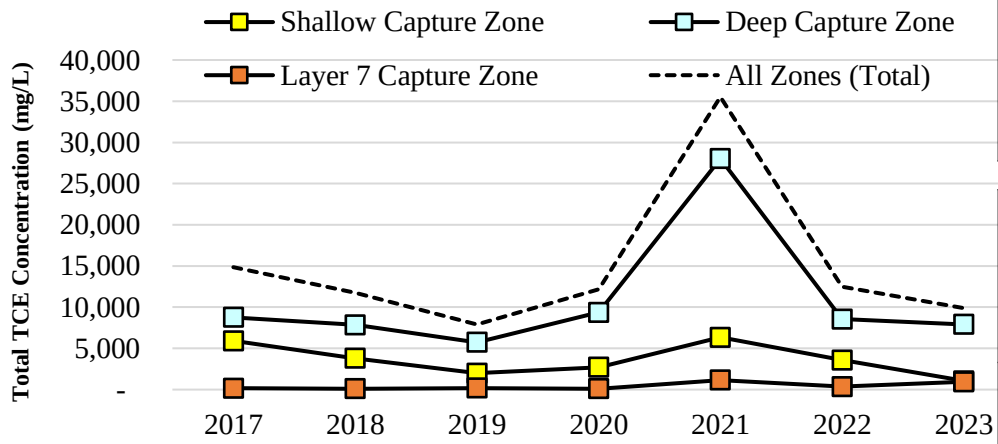
EDL = Elevated Detection Limit; NS = Not Sampled; NA = Not Applicable; Bold indicates detection

All historical data included as a table at the end of the presentation.

* DPT Sampling occurred in Jan 2024; results shown as the reporting year (2023).



Nine DPT locations sampled annually for high resolution performance monitoring of DSZ:

- Sample depths from 8 to 98 ft bls (83 - 98 ft bls samples were added in 2020)
- Capture zones represents sample depths within RW screen intervals

Tables showing TCE results:

- TCE concentrations shown in percent composition over all sample depths for that year and DPT location
- Average TCE composition over all DPTs shown in table on right
- Bars show the relative magnitudes for the percentages
- Line chart shows total TCE concentrations over time for each zone
- Individual TCE concentrations are provided in a supplemental table at the end of the presentation

EDL = Elevated Detection Limit

DPT PM Results – Shallow Capture Zone

- TCE percent composition results for sample depths from 8 to 48 ft bls
  - Shallow capture zone sample depths: 18 feet to 43 feet bls (RWs screened 15 to 45 ft bls)
  - Layer 4 (fine grained unit) sample depth: 48 ft bls
  - Total concentration (Conc.) in the above table is the sum of concentrations at all depths in the shallow capture zone (18 – 43 ft bls); depicted on the line chart vs time
- Total TCE concentration in the shallow zone decreased by 70% compared to 2022
  - *3,573 mg/L in 2022 to 1,055 mg/L in 2023*
- No significant total TCE increases at any DPT location compared to 2022
  - *Largest increase at DPT 593, 65.9 mg/L in 2022 to 110 mg/L in 2023, 70% increase*
- DPT 599 had the largest decrease
  - *2,463 mg/L in 2022 to 897 mg/L in 2023, 64% decrease*
- 53 ft bls, just below Layer 4 holds the majority of contamination
- Highest total TCE concentrations located at DPT 593, 594, 599
- Majority of contamination is located at 48 ft bls, above/within Layer 4
  - *TCE concentration decreased by 8.2% from 2022 to 2023*

EDL = Elevated method detection limit (MDL); Bolding indicates detection greater than the MDL

DPT PM Results – Deep Capture Zone

- TCE percent composition results for sample depths from 53 to 78 ft bls
  - Deep RWs screened 50 to 80 ft bls
  - Total TCE concentration represents all depths in the deep capture zone
  - Line chart shows Total TCE concentration trend at all DPT locations for the deep capture zone
- Total concentration in the deep zone decreased slightly compared to 2022 values
  - *8,543 mg/L in 2022 to 7,912 mg/L in 2023, 7% decrease*
- DPT 594 had the greatest total concentration increase
  - *2,044 mg/L in 2022 to 3,957 mg/L in 2023, 48% increase*
- DPT 597 had the greatest total concentration decrease
  - *3,662 mg/L in 2022 to 1,765 mg/L in 2023, 107% decrease*
- 53 ft bls, just below Layer 4 holds the majority of contamination
- Highest Total TCE concentrations located at DPT 594, 596, 597

DPT PM Results – Layer 7 Capture Zone

- TCE percent composition results for sample depths from 83 to 98 ft bls
  - Layer 7 capture zone sample depths: 83 to 93 feet bls (RW17-20C screened 80 to 95 ft bls, RW21D screened 86 to 106 feet bls)
  - Total TCE concentration represents all depths in the Layer 7 capture zone
  - Line chart shows total TCE concentration of all DPT locations vs time for the Layer 7 capture zone
- Total concentration in the Layer 7 increased compared to 2022 values
  - *357 mg/L in 2022 to 925 mg/L in 2023*
- Majority of contamination in Layer 7 zone located at 83 feet bls, total average concentration increased from 2022
  - *23 mg/L in 2022 to 84 mg/L in 2023*
- DPT 598 had the greatest total concentration increase
  - *150 mg/L in 2022 to 591 mg/L in 2023*
- Highest Total TCE concentrations located at DPT 593, 597, 598

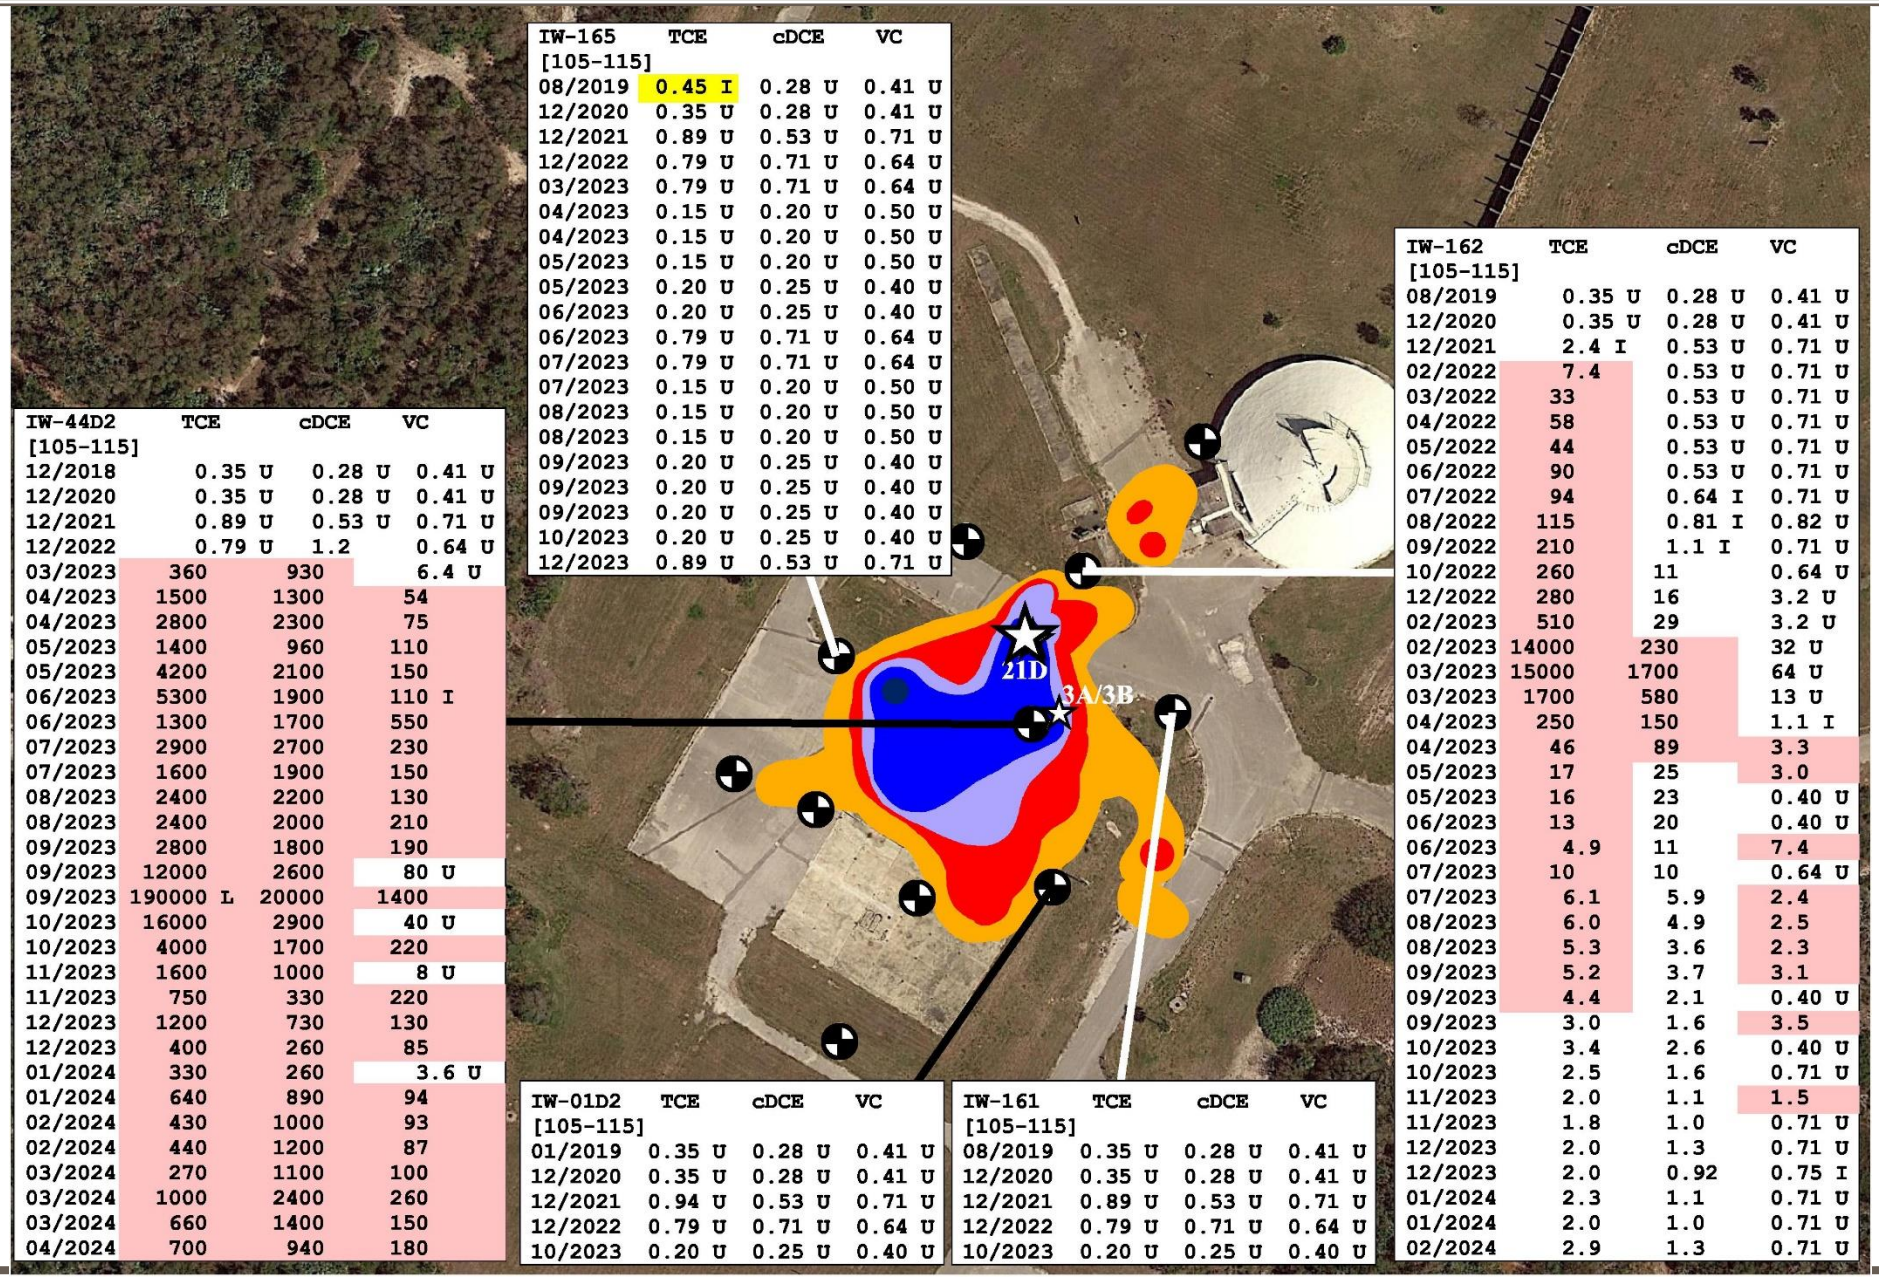
Layer 7 and 8 Annual Groundwater Sampling Results

Annual event:

- Conducted December 2023
- 11 wells sampled annually
  - IW42D2 is screened in Layer 7
  - Remaining wells are Layer 8
  - Detections
    - IW-42D2 low-level cDCE
    - IW-45D2 cDCE at 140 µg/L exceeding GCTL

RW21D (86 to 106 ft bls):



- Installed January 2023 based on DPT0594 98 ft sample having TCE at 59,000 µg/L during Site Characterization and TCE increases in IW162
- Operates at 15 GPM
- Biweekly sampling conducted to evaluate RW21D operations
  - IW-162 sampled initially
  - IWs 44D2 and 165 added
  - At October 2023 meeting FDEP requested IWs 01D2 and 161
  - Following slide presents results

Layer 7 and 8 Groundwater Sampling Results (continued)

RW21D (continued):

- IW-162 TCE was in 2.4 I µg/L December 2021 increased to 280 µg/L in December 2022. Once RW21D began operating TCE increased to maximum 15,000 µg/L then decreased to GCTL in September 2023 and continued to be less than GCTL until February 2024 when sampling was discontinued.
- IWs 44D2 and 165
  - Began sampling March 2023
  - IW-165 less than GCTLs
  - GCTLs exceeded in IW-44D2
    - TCE maximum of 190 L mg/L in September 2023 currently 700 µg/L
    - cDCE and VC follow similar trend
- IWs 01D2 and 161
  - Sampled October 2023 all results less than GCTLs

HCS Conclusions/Recommendations

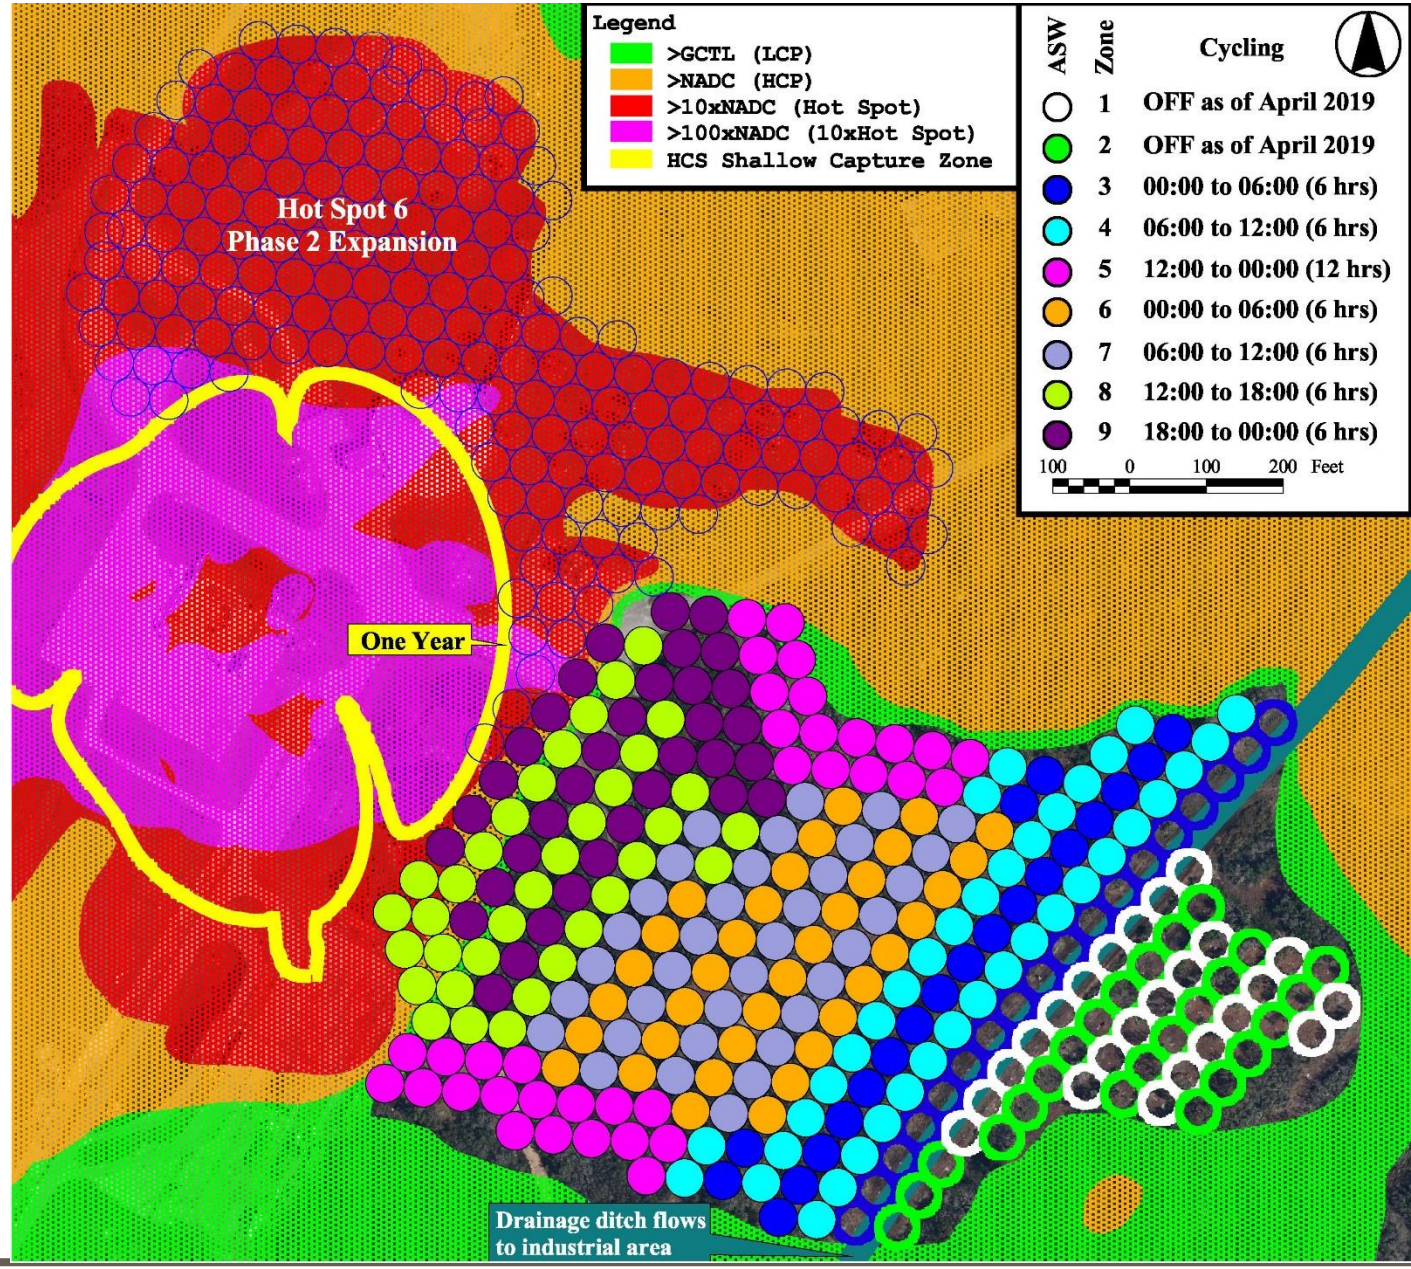
HCS IM

- HCS is operating as designed, effluent groundwater and air results below discharge/emission limits
- RW21D (screened 86-106 ft bls) installed in January 2023 influences on hydraulic control and contaminant capture
  - Bi-weekly sampling results:
    - IW-162 (screened 105-115 ft bls) TCE concentrations reduced to below the GCTL
    - IW-44D2 (screened 105-115 ft bls) TCE concentrations reduced to 700 from 190,000 µg/L (maximum in September 2023)
    - IW-01D2, IW-165, and IW-165 in same screen interval are below GCTLs
- DPT PM results show high TCE concentrations remain in the DSZ, with high percent composition within the fine-grained units (Layers 4 and 7)
- Continue HCS IM OM&M as recommended, with implementation of DSZ-1 from the RAE
  - Expansion of the HCS is on-going with additional RWs being installed within Layer 7

Team Consensus

- Propose continued operations of the hydraulic containment system (April 1, 2024 to March 31, 2025)
- Propose continued OM&M of the HCS consistent with current approach
  - Biweekly, select Layer 8 wells dependent on results
  - Monthly, air strippers and LPGAC effluent samples
  - Quarterly, total system influent and active RWs
  - Annual:
    - CatOx influent and effluent
    - DPT samples from 9 locations (5 ft sampling interval 8 to 98 ft bls)
    - Layer 8 Performance MWs and Layer 7 IW42D2

Hot Spot 6 Phase Two Expansion



Hot Spot 6 Interim Measure - Overview

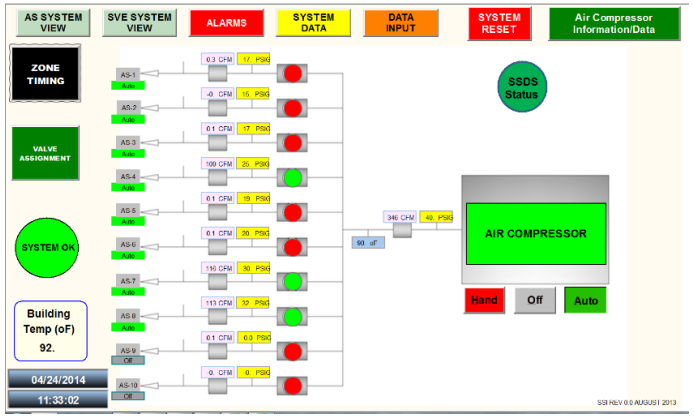
COCs: cDCE and VC exceeding 10xNADCs

Objective: To remediate contaminated groundwater within treatment zone to prevent impacts to drainage ditch and support transition to MNA

Phase One:

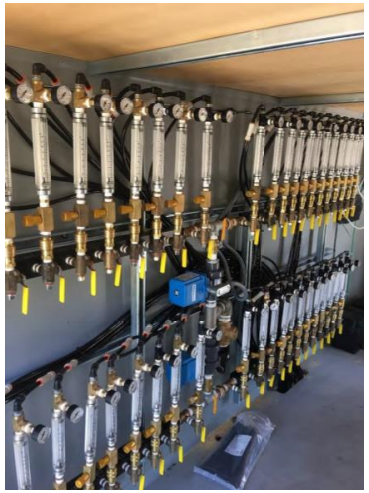
- Operations:
  - Full-scale operations of Zones 1 to 9:
    - Zones 1 to 5 began July 2018
    - Zones 6 to 9 began May 2019 (Phase One Expansion)
  - System Design:
    - 300 AS Wells (ASWs) in 9 treatment zones
      - Zones 1 and 2 turned off April 2019
      - Selected wells in Zones 3 and 4 turned off January 2020
      - Operated 199 ASWs from January 2020 to July 2023
    - Installation depth ~40' bls (Top of Layer 4)
    - 25' ROI, spaced 50' on center (c/c)
    - 5 CFM per ASW
- Sampling:
  - Baseline sampling events July 2018 and May 2019
  - Performance sampling:
    - 28 MWs and 3 SWs for VOCs and field parameters Quarterly events to January 2021
    - Frequency reduced to semi-annual events based on results

Hot Spot 6 Interim Measure - Overview



Compressor Trailer

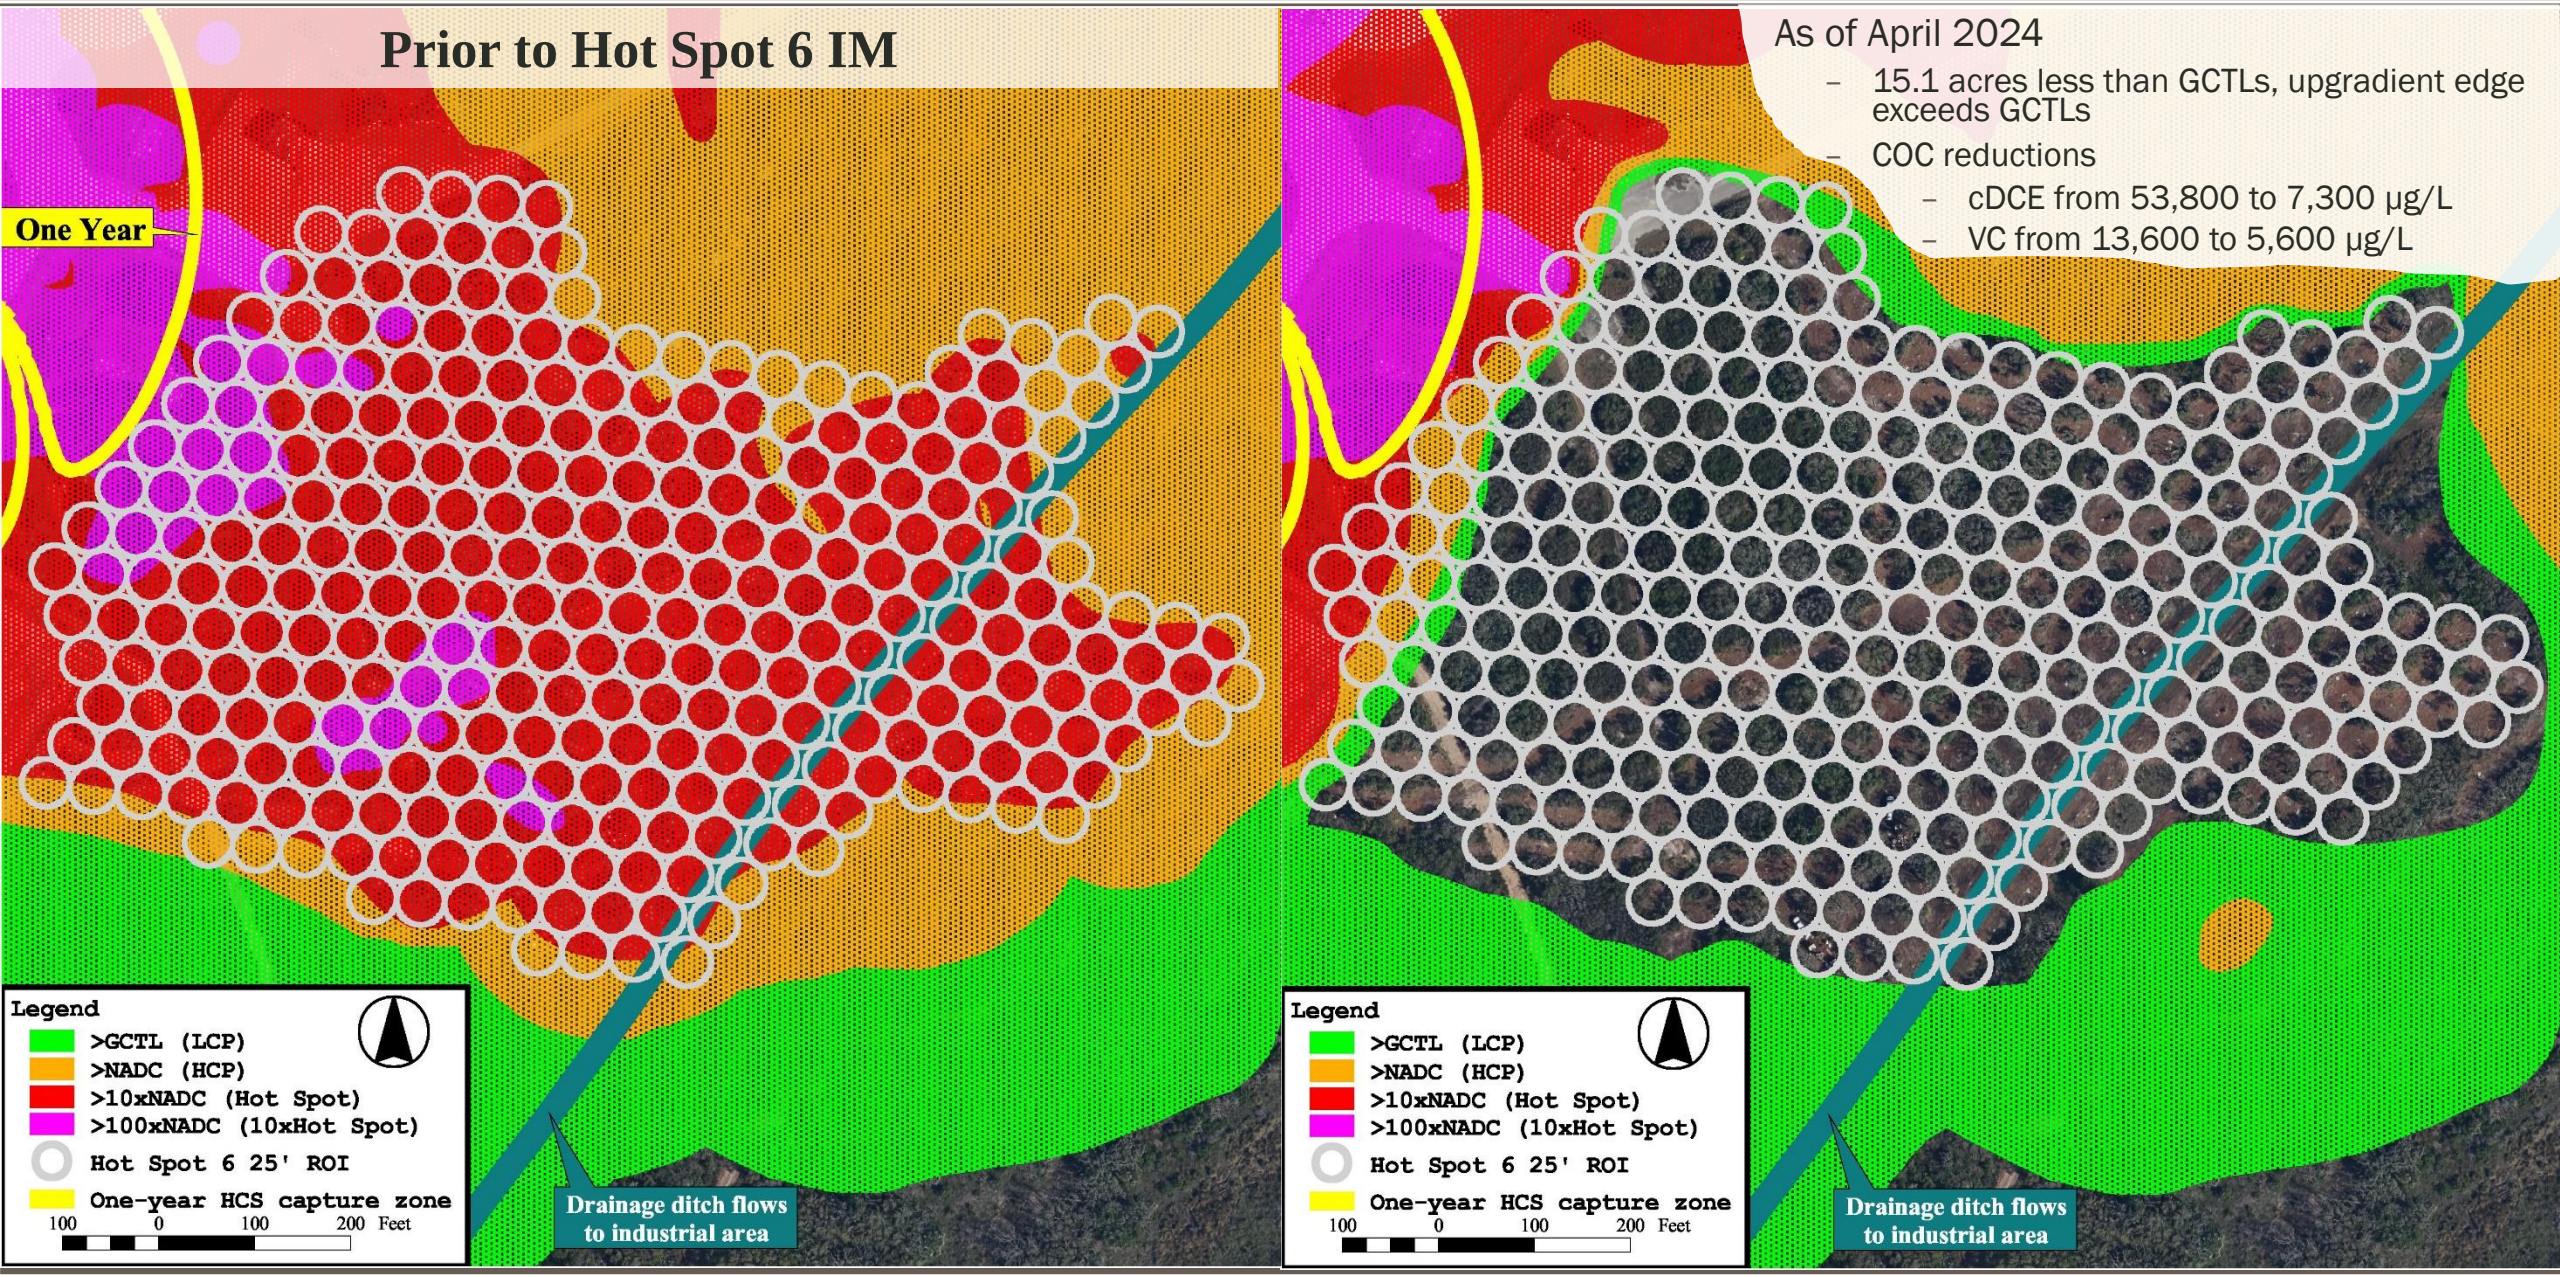
- 75 HP VFD Rotary Screw Air Compressor
- Integrated refrigerated air dryer
- Coalescing and particulate filters
- Oil water separator
- 400 Gallon receiver tank
- 10 manifolds
- Programmable Logic Control and Telemetry
- Compressed air is distributed from compressor trailer via 2” HDPE lines to three manifold trailers to individual ASWs



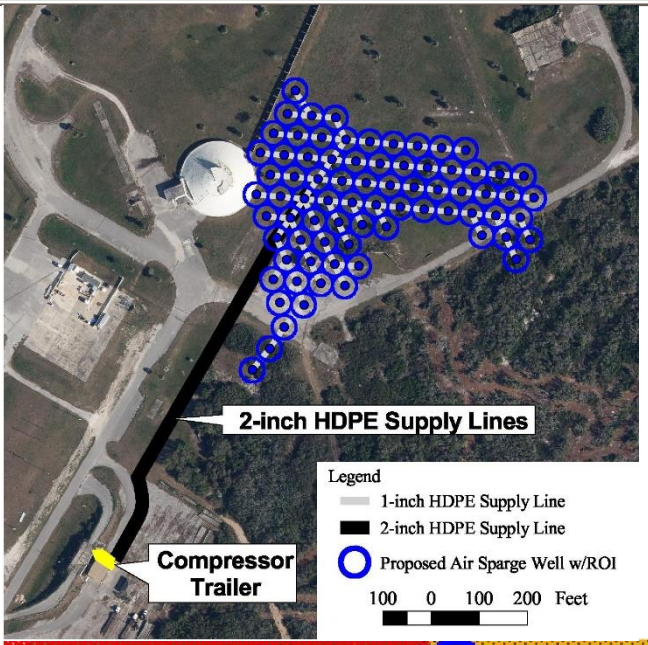
Electrical service from existing transformer MOT-1

- 3-phase, 460-volt, 60-hertz, 800-amp service feed

System HMI

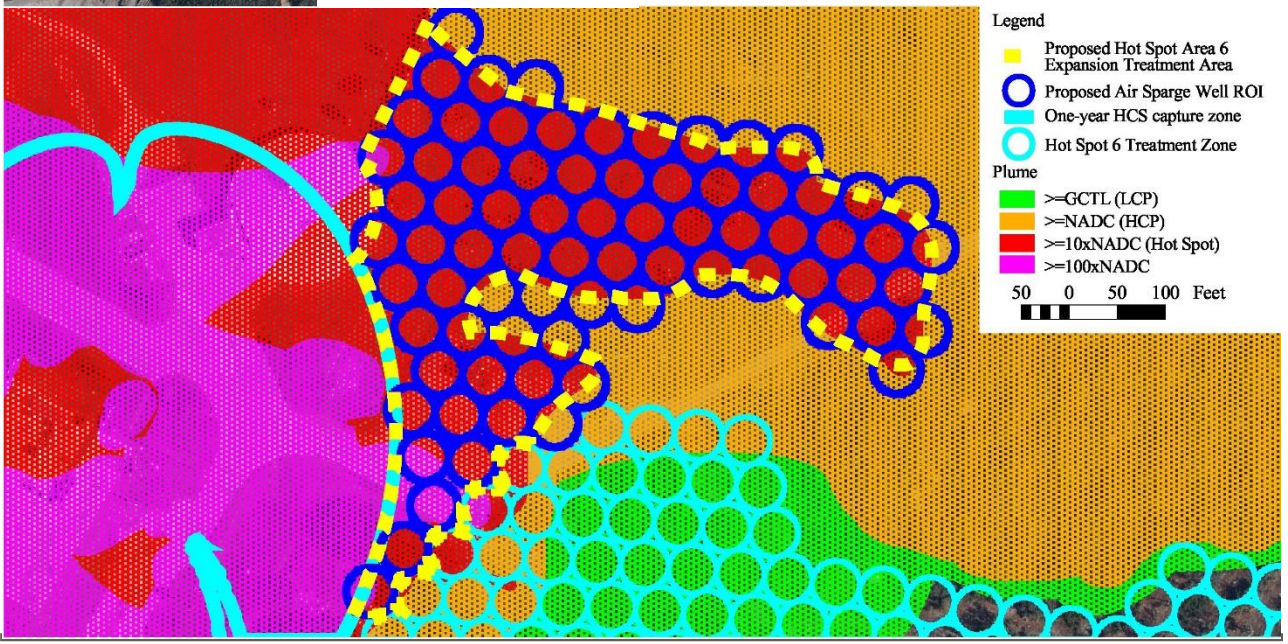


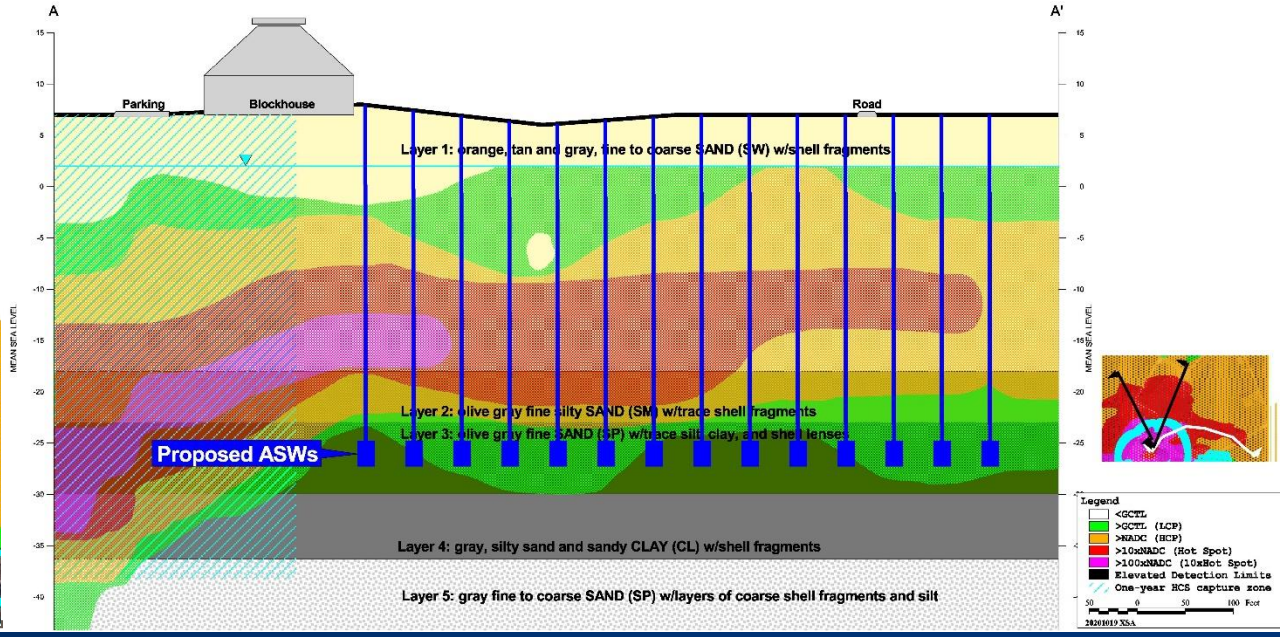
Manifold Trailer



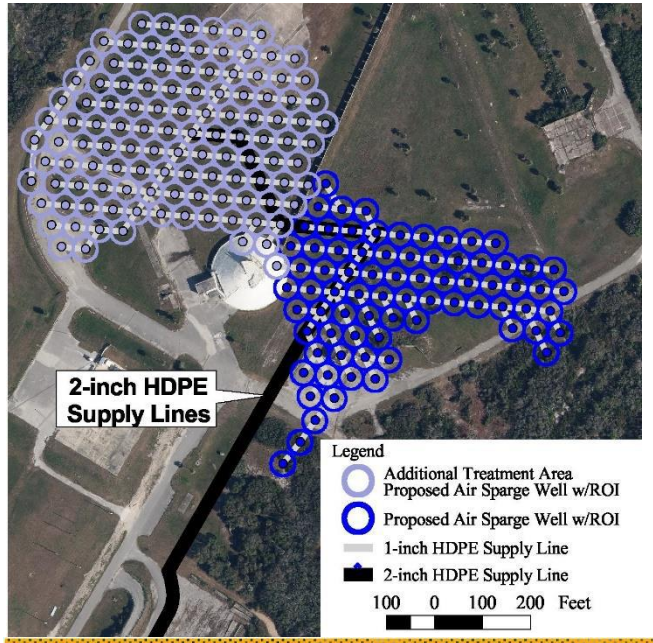
Compressor Trailer

Hot Spot 6 Interim Measure - Overview



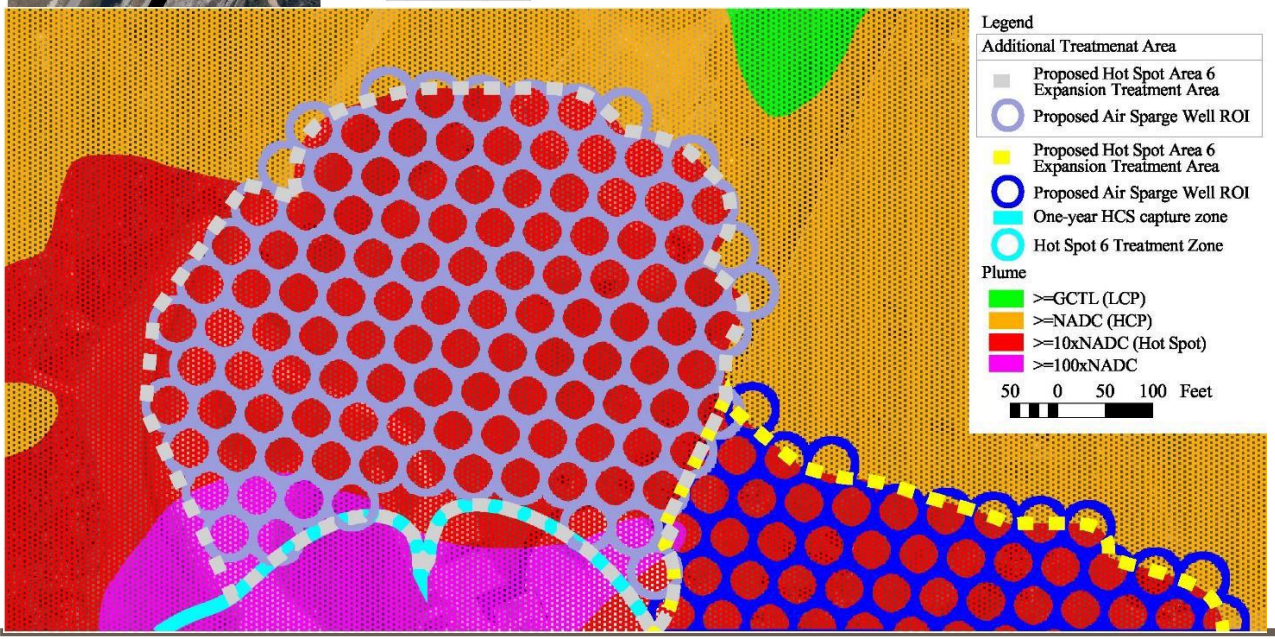


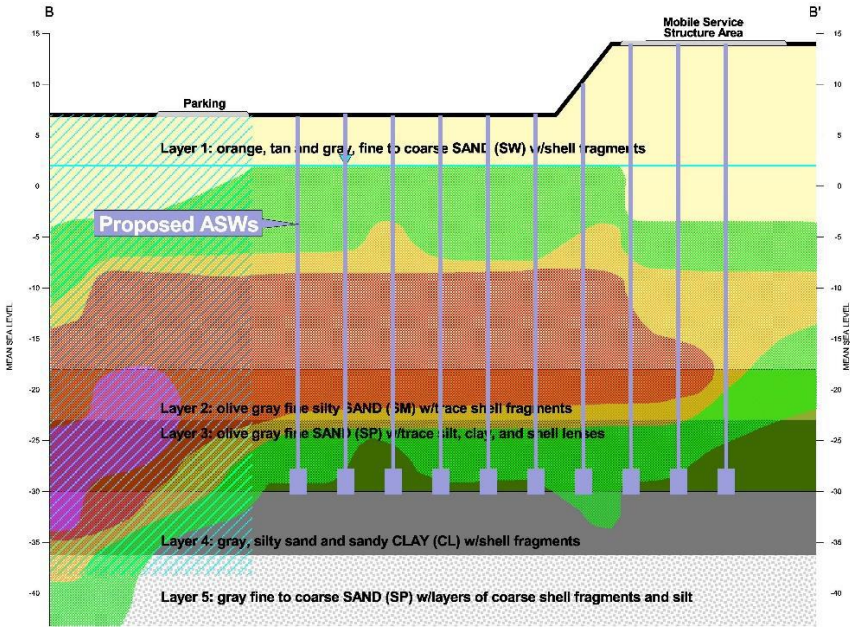
Hot Spot 6 Phase Two Expansion Design



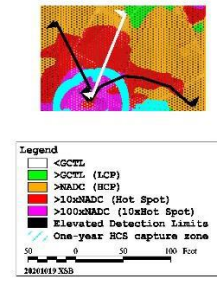
December 2020

- Expansion design included 76 ASWs treating 4 acres, east of blockhouse
- Design parameters:
  - 1-inch ID PVC installed by sonic drilling methods
  - Spaced 50’ c/c based on 25’ radius of influence as proven effective in Hot Spot 6
  - Screen interval 33 to 35 feet bls
  - 5 CFM per ASW
  - 76 ASWs will be split into two manifolded zones supplied by 2-inch diameter HDPE lines
  - 1-inch diameter HDPE lines will supply air to each ASW from the manifold distribution trailer
  - Pressure requirements (33.2 psi):
    - 9.4 psi, pressure loss based on 900 feet of 2-inch HDPE (compressor trailer to manifold trailer)
    - 0.3 psi, pressure loss based on 550 feet of 1-inch HDPE (long run from manifold trailer to ASW)
    - 5.0 psi, ancillary equipment such has elbows, valves, flow meter, pressure gauge, etc.
    - 18.5 psi well head pressure



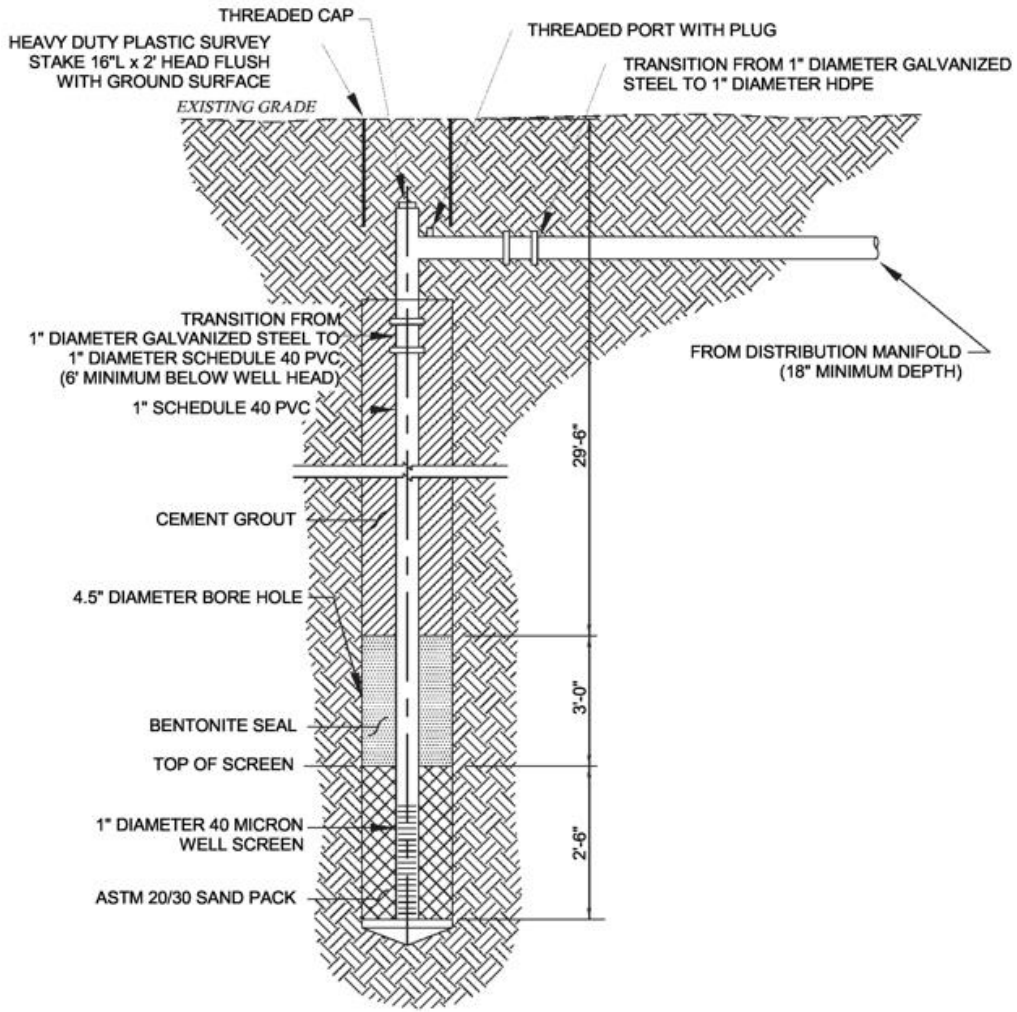


Hot Spot 6 Phase Two Expansion Design



March 2022

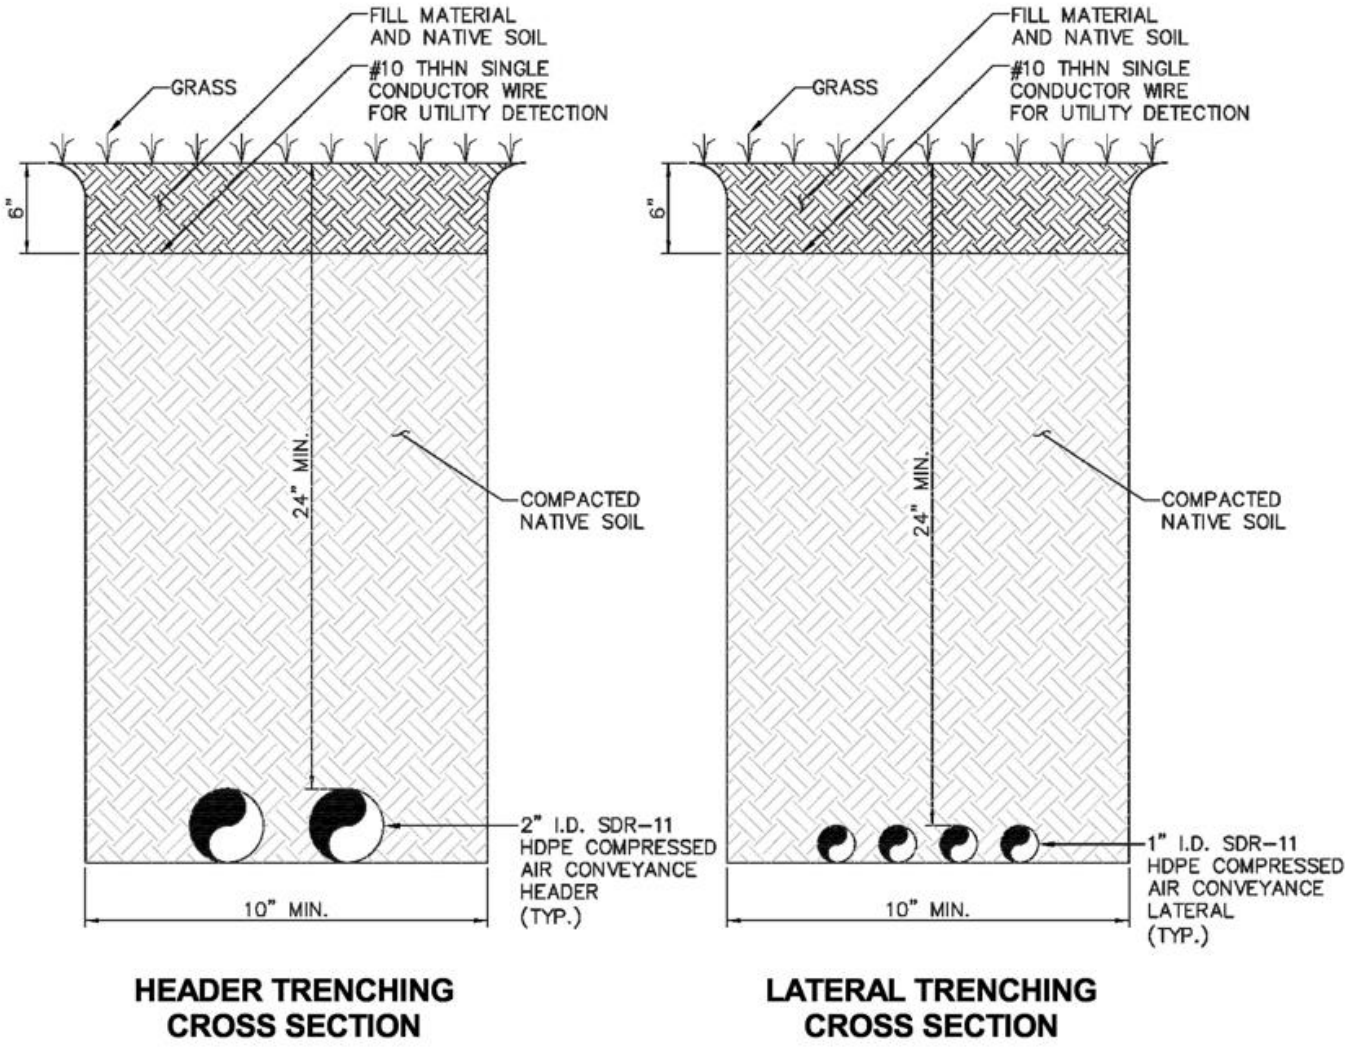
- Expansion design included additional 116 ASWs treating 5.7 acres north of blockhouse
- Design parameters:
  - 1-inch ID PVC installed by sonic drilling methods
  - Spaced 50’ c/c based on 25’ radius of influence as proven effective in Hot Spot 6
  - Screen interval 33 to 35 feet bls
  - 5 CFM per ASW
  - 116 ASWs will be split into three manifolded zones supplied by 2-inch diameter HDPE lines
  - 1-inch diameter HDPE lines will supply air to each ASW from the manifold distribution trailer
  - Pressure requirements (33.2 psi):
    - 17.9 psi, pressure loss based on 1,550 feet of 2-inch HDPE (compressor trailer to manifold trailer)
    - 0.4 psi, pressure loss based on 590 feet of 1-inch HDPE (long run from manifold trailer to ASW)
    - 5.0 psi, ancillary equipment such has elbows, valves, flow meter, pressure gauge, etc.
    - 18.5 psi well head pressure



Hot Spot 6 Phase Two Expansion Design

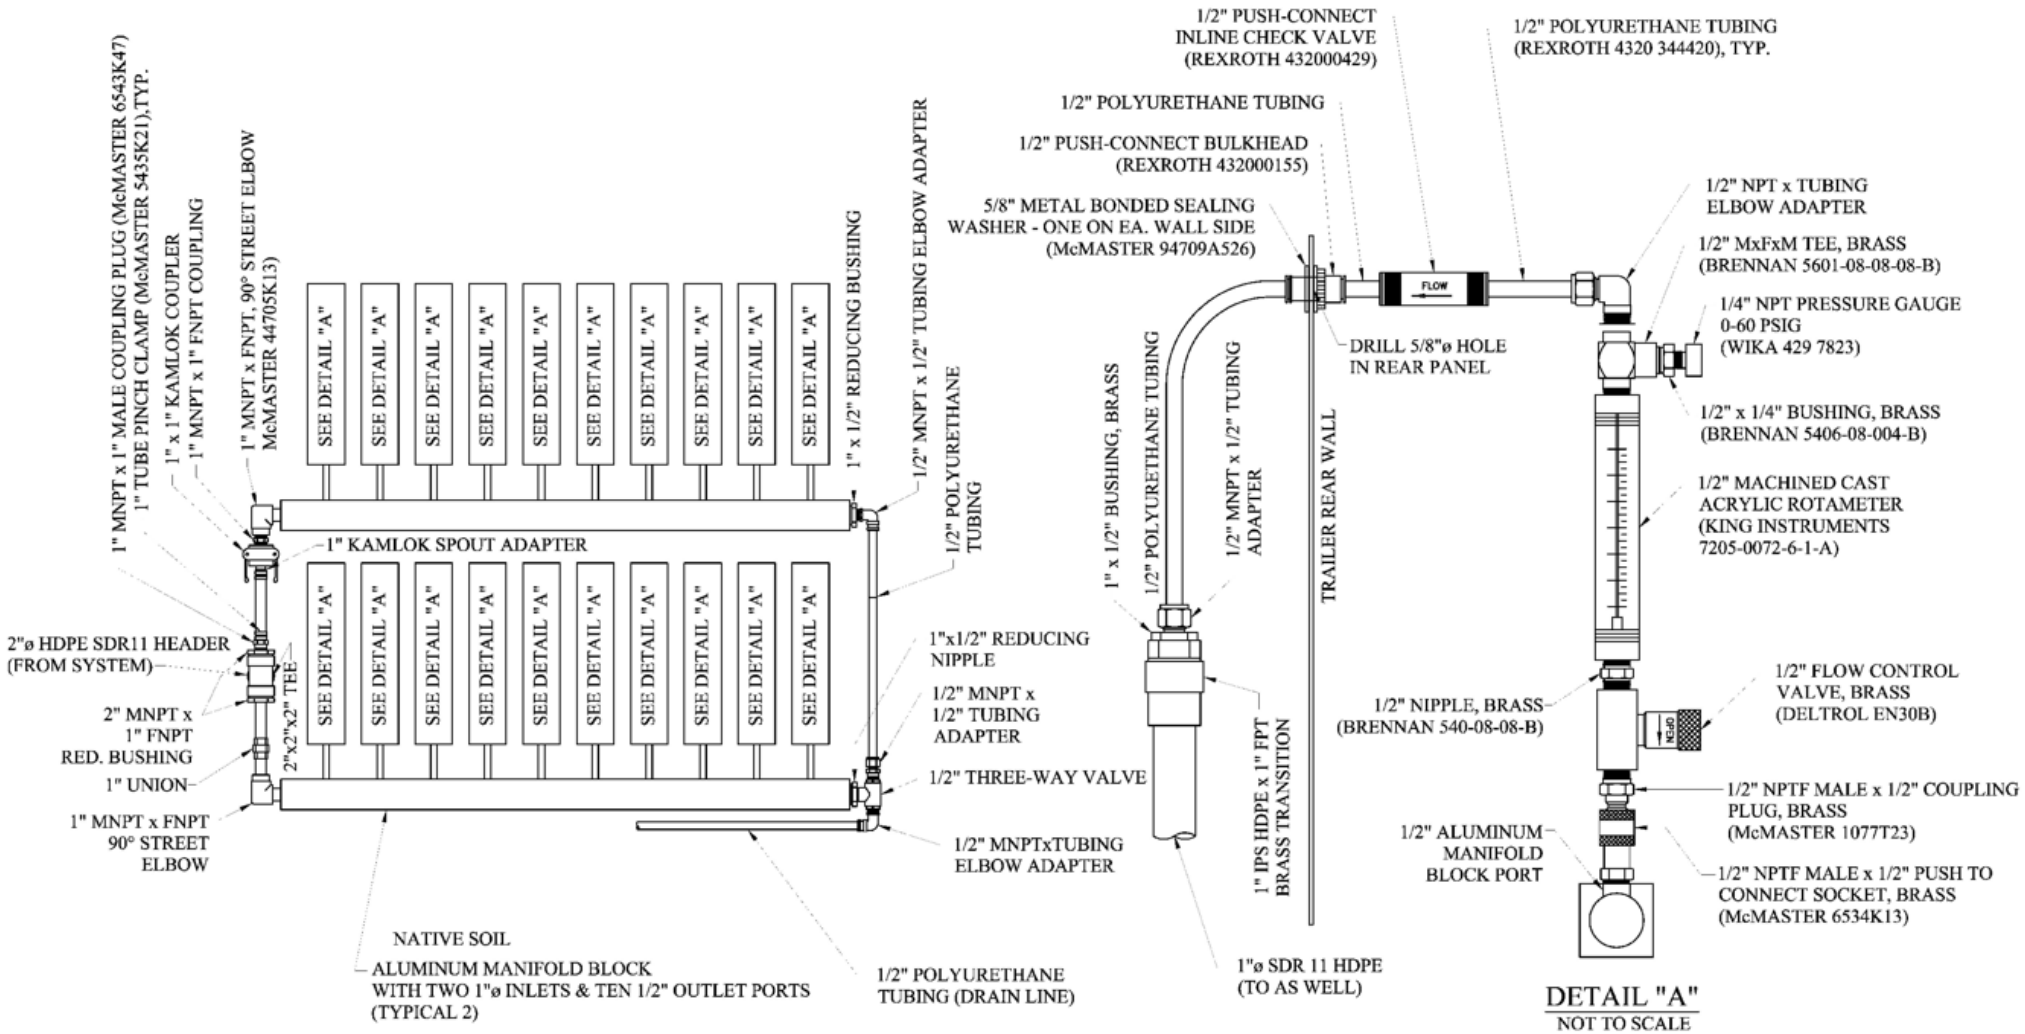
ASW Design

- Rotosonic drilling
- 4.5-inch diameter borehole
- 1-inch ID PVC casing with 1-inch ID Schumasoil® diffuser (20-inches)
- Confirm lithology and place screen on top of confining layer (Layer 4)
- 20/30 silica sand pack to 1.5 feet above screen, and 3-foot bentonite seal, cement/bentonite slurry to surface
- Completion following trenching with direct-buried survey-style hubs above each well
- Angled AS wells in some areas to avoid surface obstructions (roadways, concrete pads)



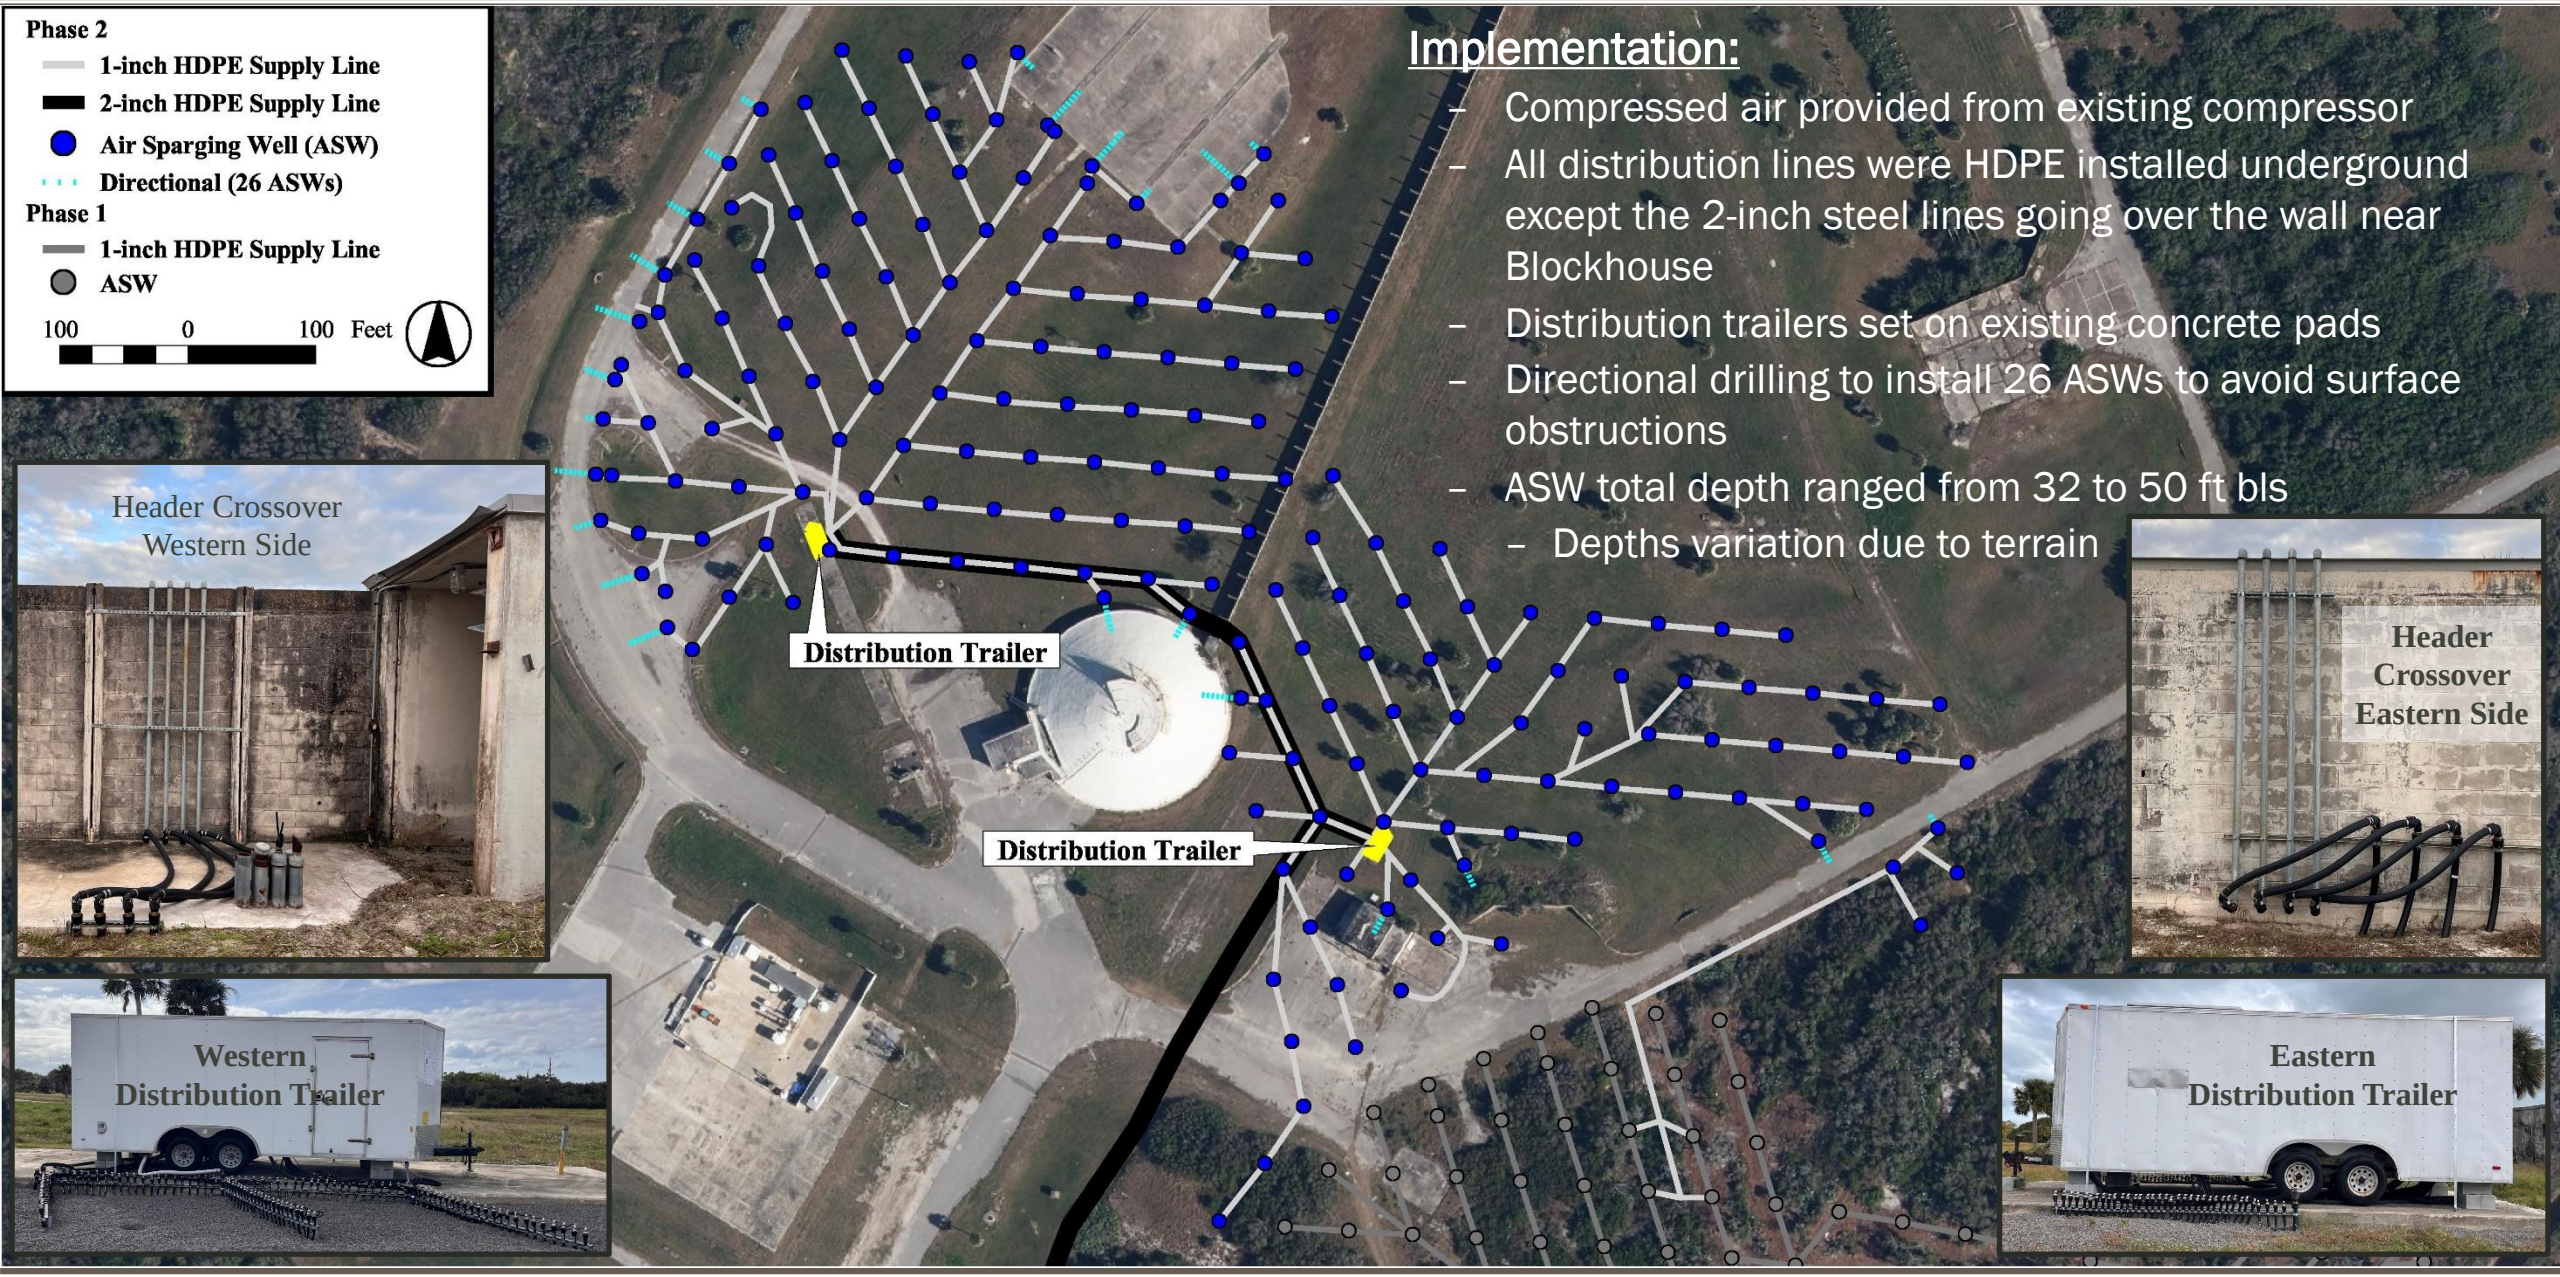
AIR SPARGE WELL DETAIL
NOT TO SCALE

Hot Spot 6 Phase Two Expansion Design



Trench Design

- Approximately 10-inches wide by 30-inches deep
- Excavation using trenching machine
- Hand digging around utilities identified during utility clearance
- 1-inch ID standard dimension ratio (SDR)-11 HDPE lateral air conveyance piping
- 2-inch ID SDR-11 HDPE header air conveyance piping

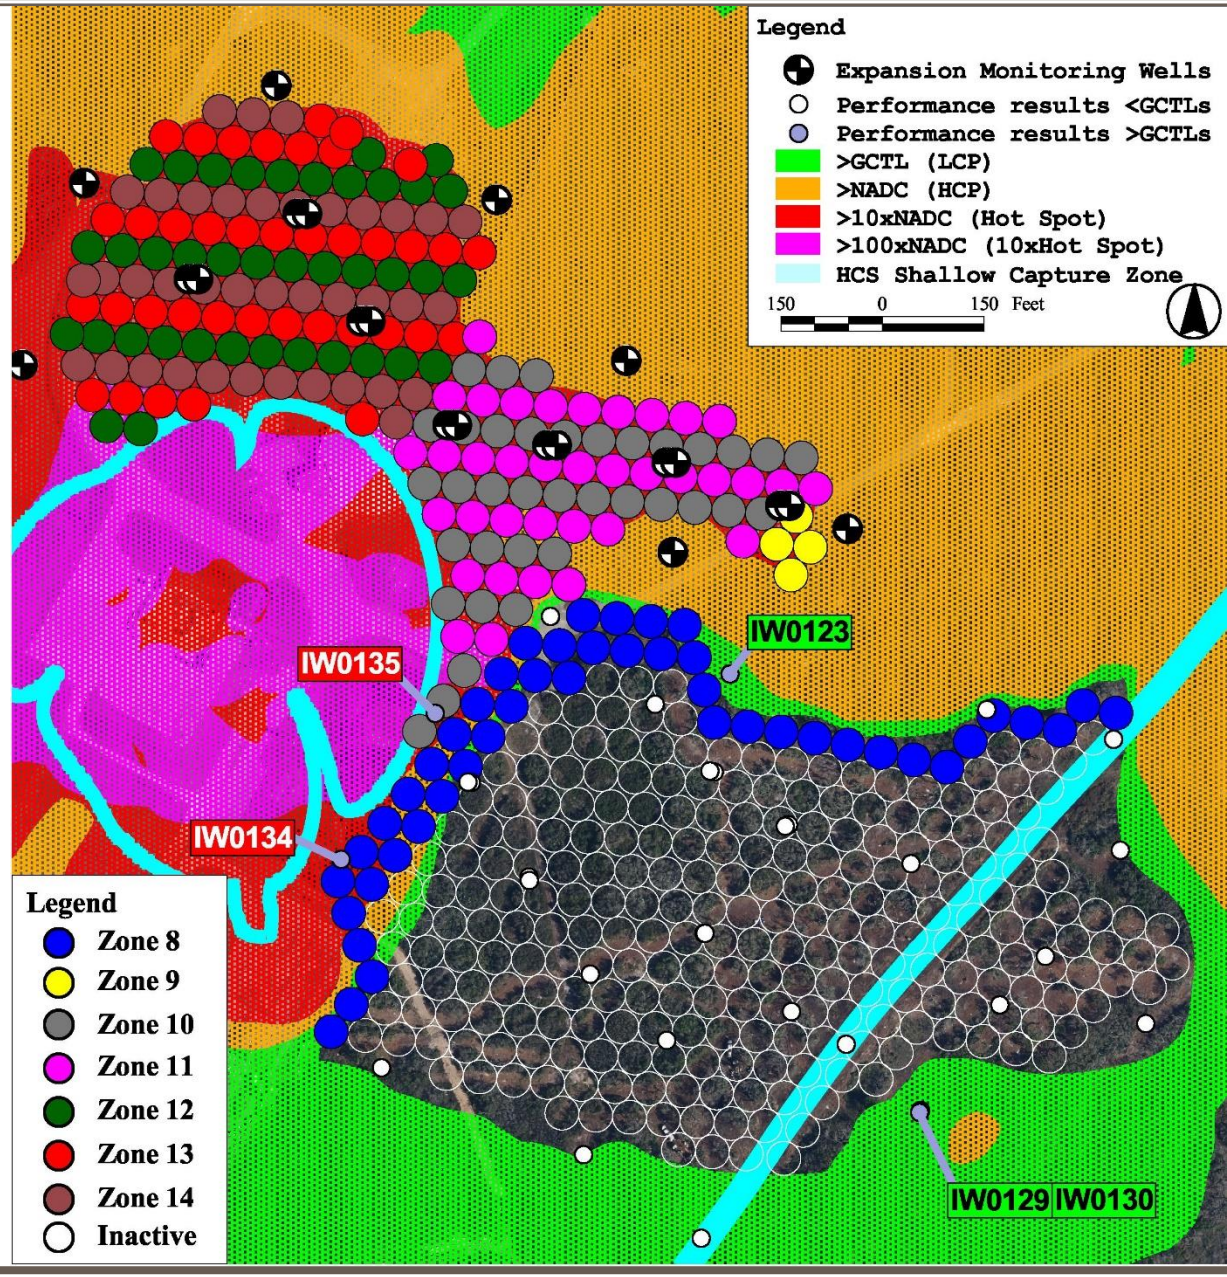


Hot Spot 6 Phase Two Expansion Design

Distribution Manifold Detail

Hot Spot 6 Phase Two Expansion

Implementation:



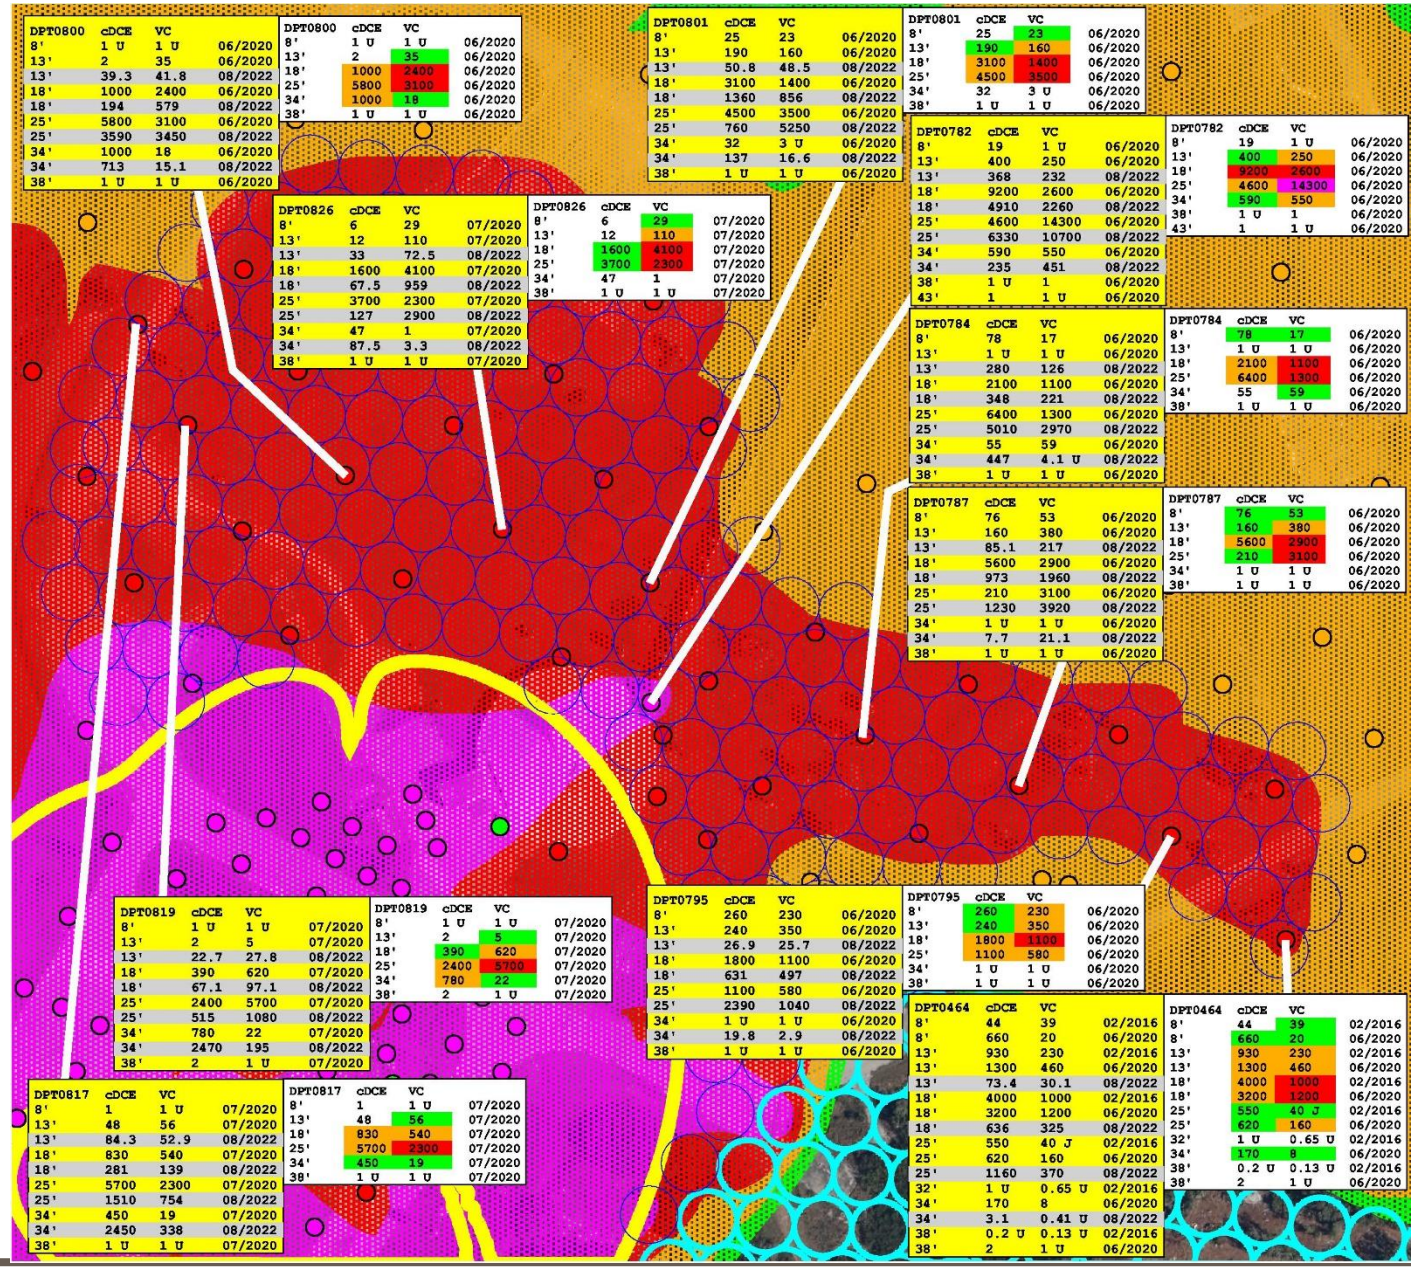
- Compressed air provided from existing compressor
- All distribution lines were HDPE installed underground except the 2-inch steel lines going over the wall near Blockhouse
- Distribution trailers set on existing concrete pads
- Directional drilling to install 26 ASWs to avoid surface obstructions
- ASW total depth ranged from 32 to 50 ft bls
  - Depths variation due to terrain

Hot Spot 6 Phase Two Expansion

Implementation:

- 238 ASWs in 7 treatment zones
- Zone 8 includes 48 existing ASWs reconfigured to prevent upgradient contamination from impacting treated area
- Zones 9 to 14 includes 190 ASWs treating an additional 11.2 acres
- 252 Phase One ASWs shut down where GCTLs have been achieved
- Average installation depth 38 ft bls (Top of Layer 4), soil cores were collected to guide installation depth for each ASW
- 25' ROI, spaced 50' on center (c/c)
- 5 CFM per ASW
- Two of three existing manifold trailers relocated, third trailer supplies air to Zones 8/9
- Existing compressor trailer with supply lines crossing over blockhouse wall

Zone ID	ASWs	Design Pressure (psig)	Well Flow (cfm)	Manifold Flow (cfm)
8/9	52	42	5	260
10	36	35	5	180
11	36	36	5	180
12	38	44	5	190
13	38	43	5	190
14	38	43	5	190

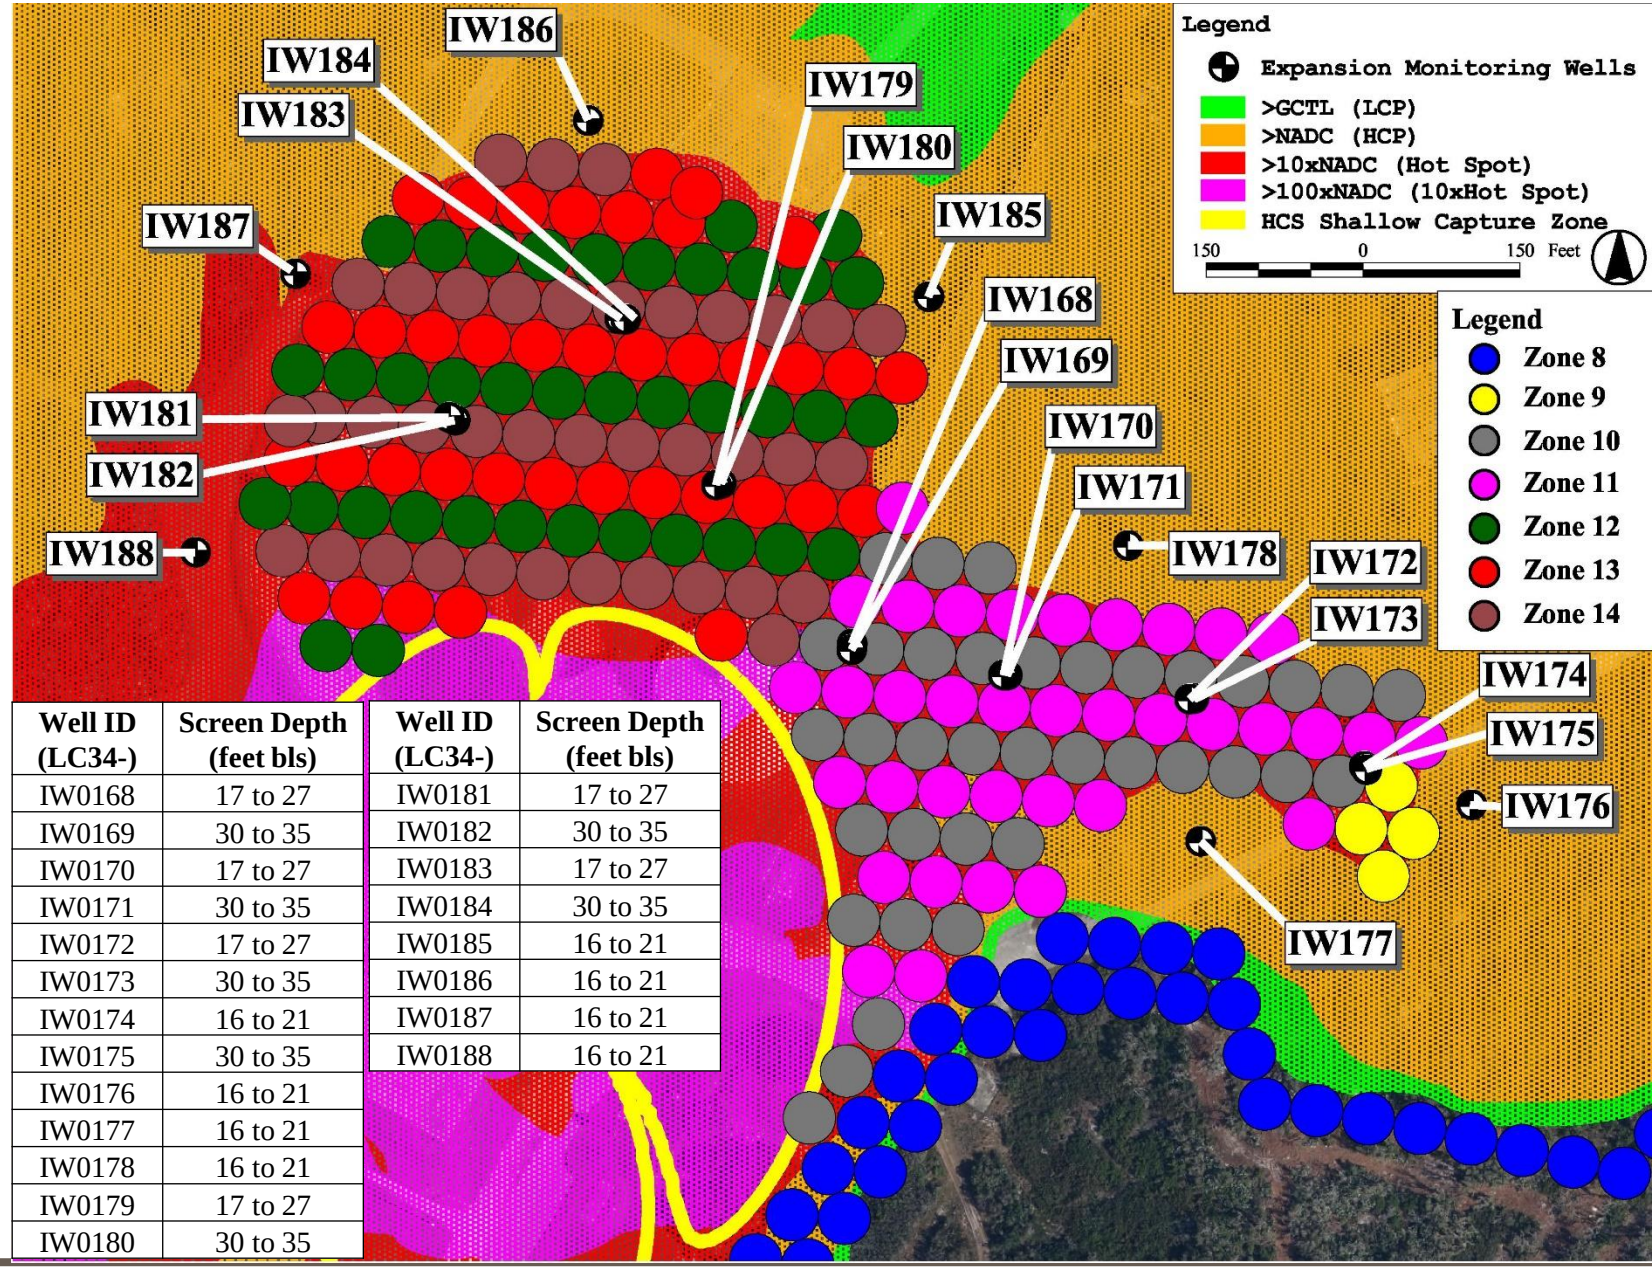


Hot Spot 6 Phase Two Expansion Timeline

Task	Dates
Phase Two Expansion IWP ADP Presented to KSCRT	December 2020
Site-specific Health and Safety Plan	February 2021
Record of Environmental Consideration Issued	March 5, 2021
U.S Fish and Wildlife Survey	Submitted August 12, 2021, Biological Opinion June 22, 2022
Revised Phase Two IWP ADP Presented to KSCRT	March 2022
U.S. Fish and Wildlife Biological Opinion Issued	June 6, 2022
Excavation Permit Issued	July 20, 2022
Pre-Construction DPT Sampling to Verify Plume Centerline	August 17-19, 2022
Revised Record of Environmental Consideration Issued	September 9, 2022
Survey/ Staking Well Locations	September 19-23, 2022
Ecological Survey Conducted by NASA	October 3 - December 7, 2022 (concurrent with drilling)
Air Sparge Well (ASW) Installation	October 17, 2022 - February 9, 2023
Performance Monitoring Well Installation	November 1, 2022 - January 20, 2023
Trenching / Piping / Backfill	January 30 - July 13, 2023
Phase One System Shutdown / Relocate Manifold Trailers	July 7-13, 2023
Baseline Performance Monitoring	July 7-10, 2023
Phase Two System Startup	July 17 - August 25, 2023 (six-week phased startup)
Full Scale Operations	August 28, 2023
First Quarter Performance Monitoring	November 2023
Second Quarter Performance Monitoring	February 2024

Hot Spot 6 Phase Two Expansion

Pre-construction DPT



- DPT samples collected August 2022 along plume centerline to verify plume extents in expansion area
- 10 boring locations consistent with DPTs collected during site characterization
  - DPTs 464, 782, 784, 787, 795, 800, 801, 817, 819, 826
  - Four depth intervals (13, 18, 25, and 34 ft bls)
- Results consistent with previous DPTs
  - TCE no detections; some with elevated non-detect values
  - tDCE all results less than GCTL
  - cDCE exceeded GCTL in all locations, some depths exceeded NADC
  - VC exceeded GCTL in all locations, some depths exceeded NADC and 10xNADC
  - Maximum cDCE 6,330 µg/L and VC 10,700 µg/L both in DPT782 (25 ft bls)

Hot Spot 6 Phase Two Expansion

Monitoring Well Installation

- 21 wells installed November 2022
- Varying screen intervals
  - 8 perimeter (16-21 ft bls)
  - 6 interior shallow (17-27 ft bls)
  - 7 interior intermediate (30-35 ft bls)
- Position and depth based on DPT results during site characterization
- Interior well screen depths cover whole treatment zone (17-35 ft bls)
- Sampling
  - Baseline sampling July 2023
  - Quarterly sampling November 2023 (Q1) and February 2024 (Q2)

Well ID (LC34-)	Screen Depth (feet bls)

Hot Spot 6 Phase Two Expansion

ASW Installation

- October 2022 – February 2023
- 190 AS wells in 7 Zones
- 2-foot screen interval placed directly on top of confining layer (Layer 4 ~40 ft bls)
- Lithology verified/logged by geologist at each boring
- Screen depth varied based on lithology ranging from 30-32 to 38-40 ft bls
- Deeper wells in Zones 12/13/14 adjacent to mobile service structure pad with screens ranging from 43-45 ft bls to 48-50 ft bls
- Angled wells at 26 locations to avoid surface obstructions

Installing angled ASW beneath 3-sided structure, facing northwest, 12/7/22

Hot Spot 6 Phase Two Expansion

Trenching / Piping

- January 30 – July 13, 2023
- Trench network excavated to install air conveyance piping to ASWs
- Trenches ~ 10” wide by 30” deep
- 1-inch HDPE lateral air conveyance piping to each ASW
- 2-inch HDPE header piping to connect lines to manifolds
- 2-inch steel piping to connect header lines over blockhouse wall
- Two manifold trailers relocated to east/west of blockhouse
- Backfilling / grading

Lateral trenches north of blockhouse, facing southeast, 4/28/23

HS6 Phase Two Expansion: Trenching / Piping – January 30 – July 13, 2023

ASW trenching, facing west, 4/28/23

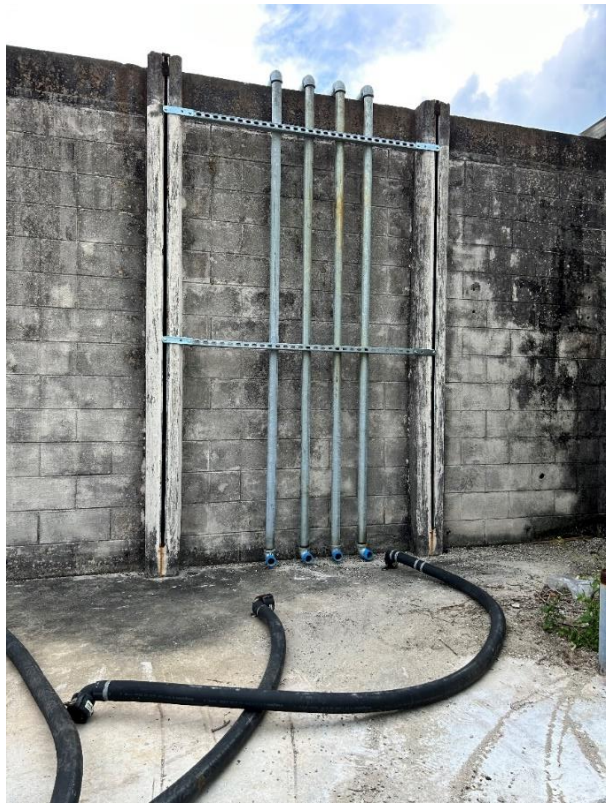
ASW trenching, facing north, 4/28/23

ASW graded backfill, facing east, 4/28/23

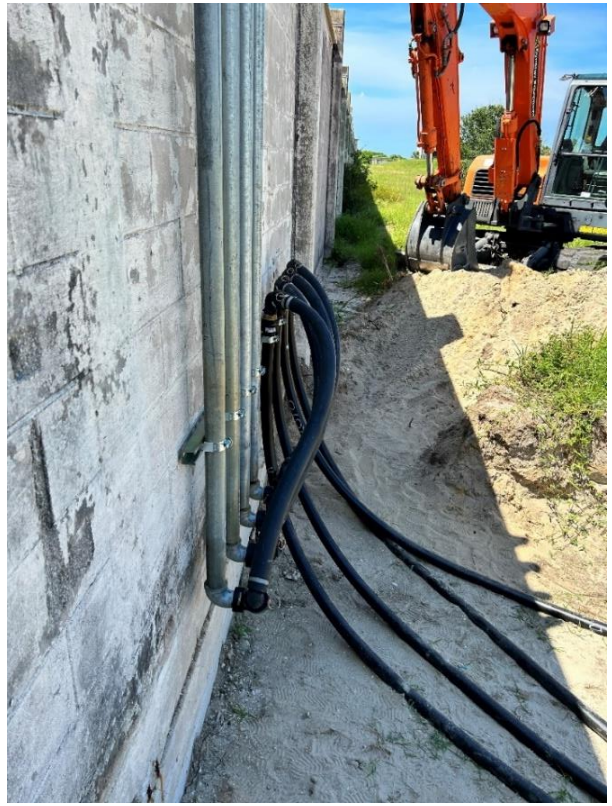
1-inch lateral piping within trench, facing south, 5/9/23

Temporary pipe rack, facing northeast, 5/12/23

Fitting lateral line to ASW, 5/16/23



HS6 Phase Two Expansion: Trenching / Piping – January 30 – July 13, 2023



Header trench across Perimeter Road, facing northwest, 6/13/23

Deploying 2-inch header piping, facing northeast, 6/15/23

Installing 2-inch steel piping over blockhouse wall, 6/28/23

Header piping plumbed to steel with 2-inch cam-lock fittings, 7/6/23

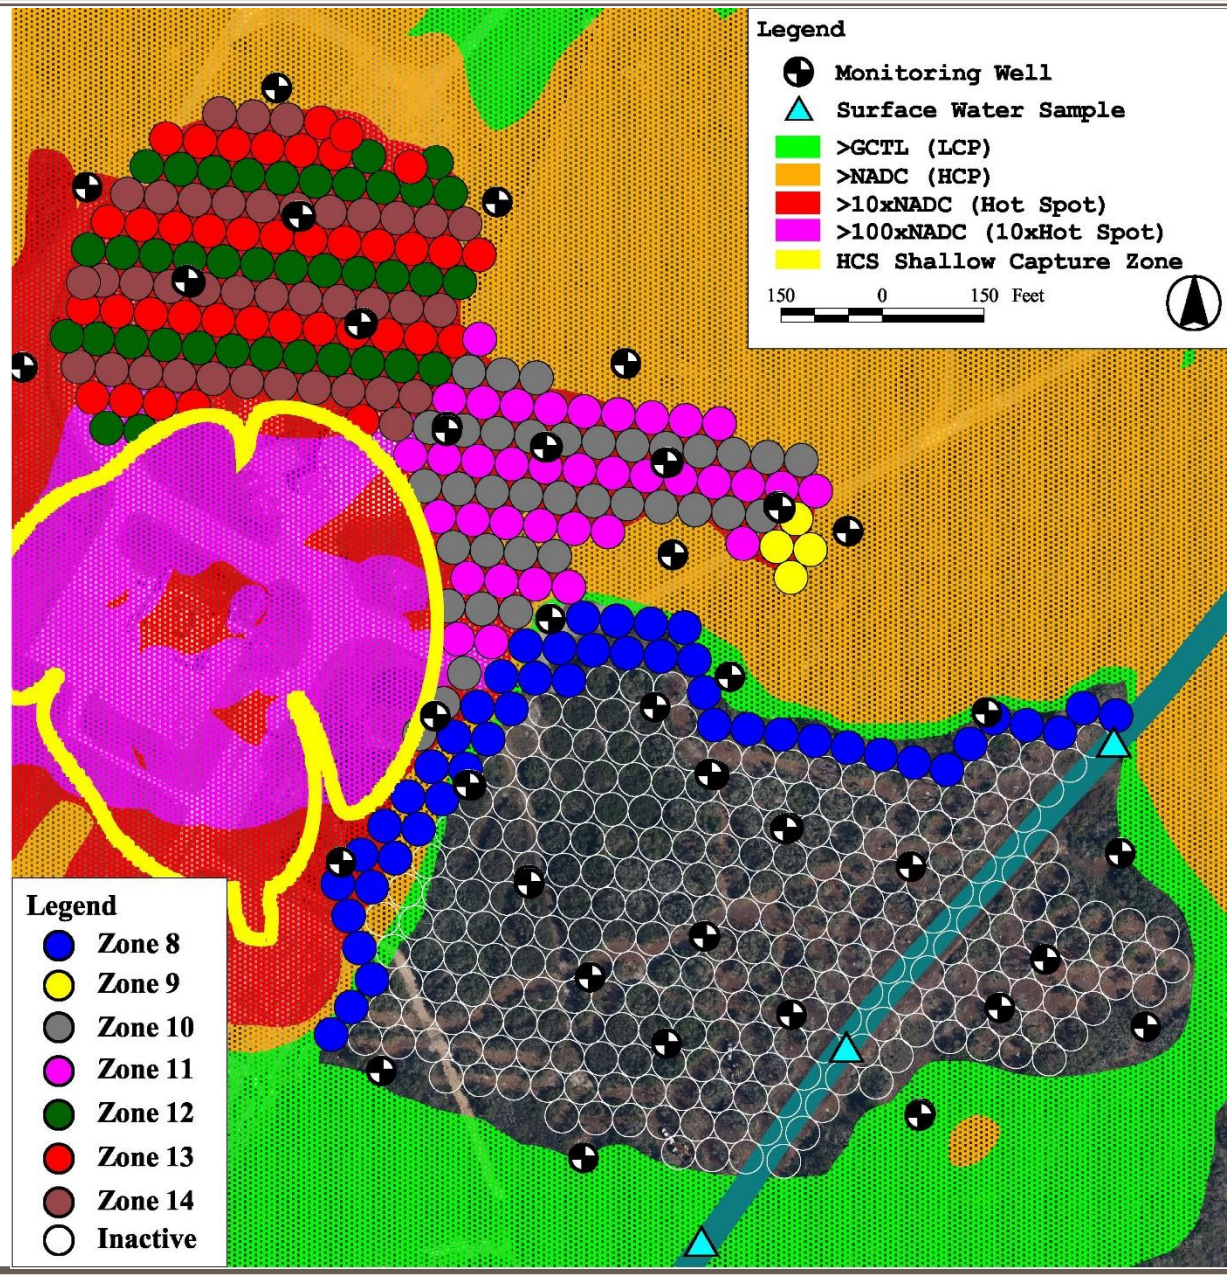
HS6 Phase Two Expansion: Trenching / Piping – January 30 – July 13, 2023

West manifold trailer pad - Racked header and lateral piping with ½-inch flex line to manifold trailer, facing west 7/10/23

East manifold trailer pad - Racked header and lateral piping with ½-inch flex line to manifold trailer, facing west 7/10/23

Relocating manifold trailer, facing north, 7/11/23

Plumbing ½-in flex line to manifold trailer, 7/12/23



West Trailer hookup complete, 7/13/23

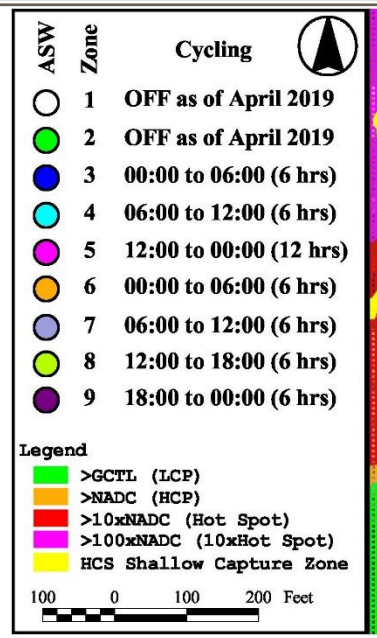
Hot Spot 6 Phase Two Expansion

Phased Startup July 17 – August 25, 2023

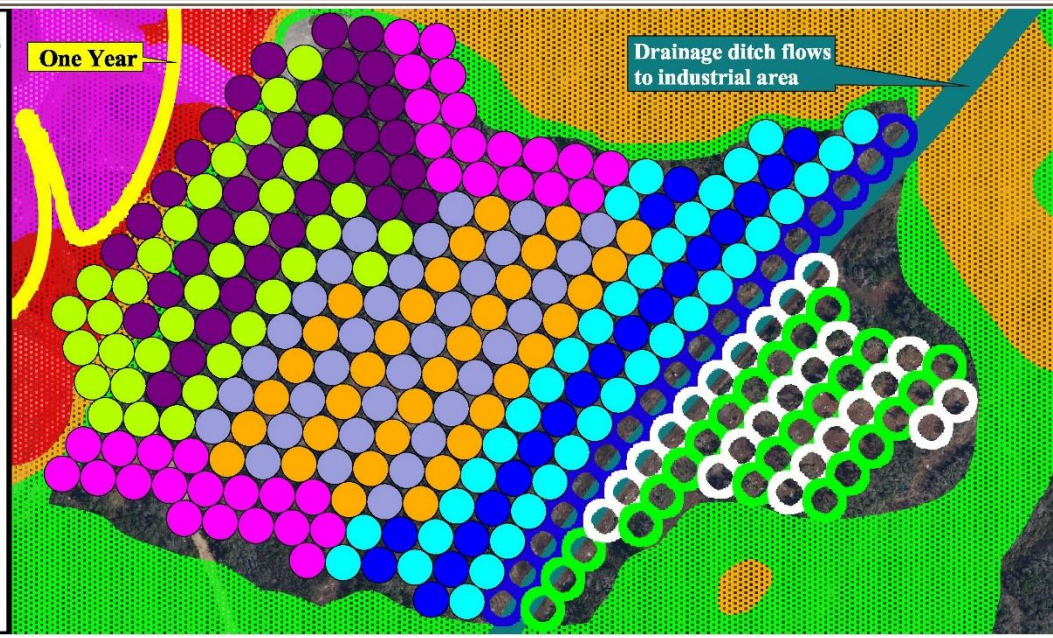
- Manifold trailers connected to existing compressor trailer
- Cycle times for each manifold/zone programmed via PLC
- Startup initiated 7/17/23, all ASWs 10 psi; pressure and flow increased incrementally until design achieved
- Fully operational week of August 28, 2023
- Air Monitoring:
  - Photo-ionization detector (PID) used to monitor breathing zone during system installation, Start Up, and Full-Scale Operations
  - No PID detections in breathing zone
    - *At CCB only PID detections at ground surface where bubbling occurs with instrument intake at bubbling with hand cupped over bubbling, when hand removed and moved up six inches nothing detected*
  - Recommend continuing PID sampling during field events

Zone ID	Manifold Trailer	Cycle Time
8/9	Southeast	06:00 – 12:00
10	East	18:00 – 00:00
11	East	12:00 – 18:00
12	West	12:00 – 18:00
13	West	00:00 – 06:00
14	West	06:00 – 12:00

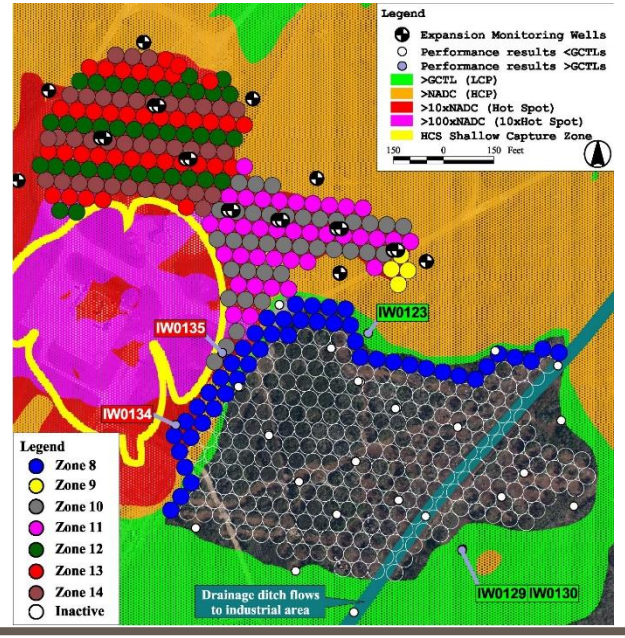
Hot Spot 6 Air Sparging Update



Hot Spot 6 AS System OM&M



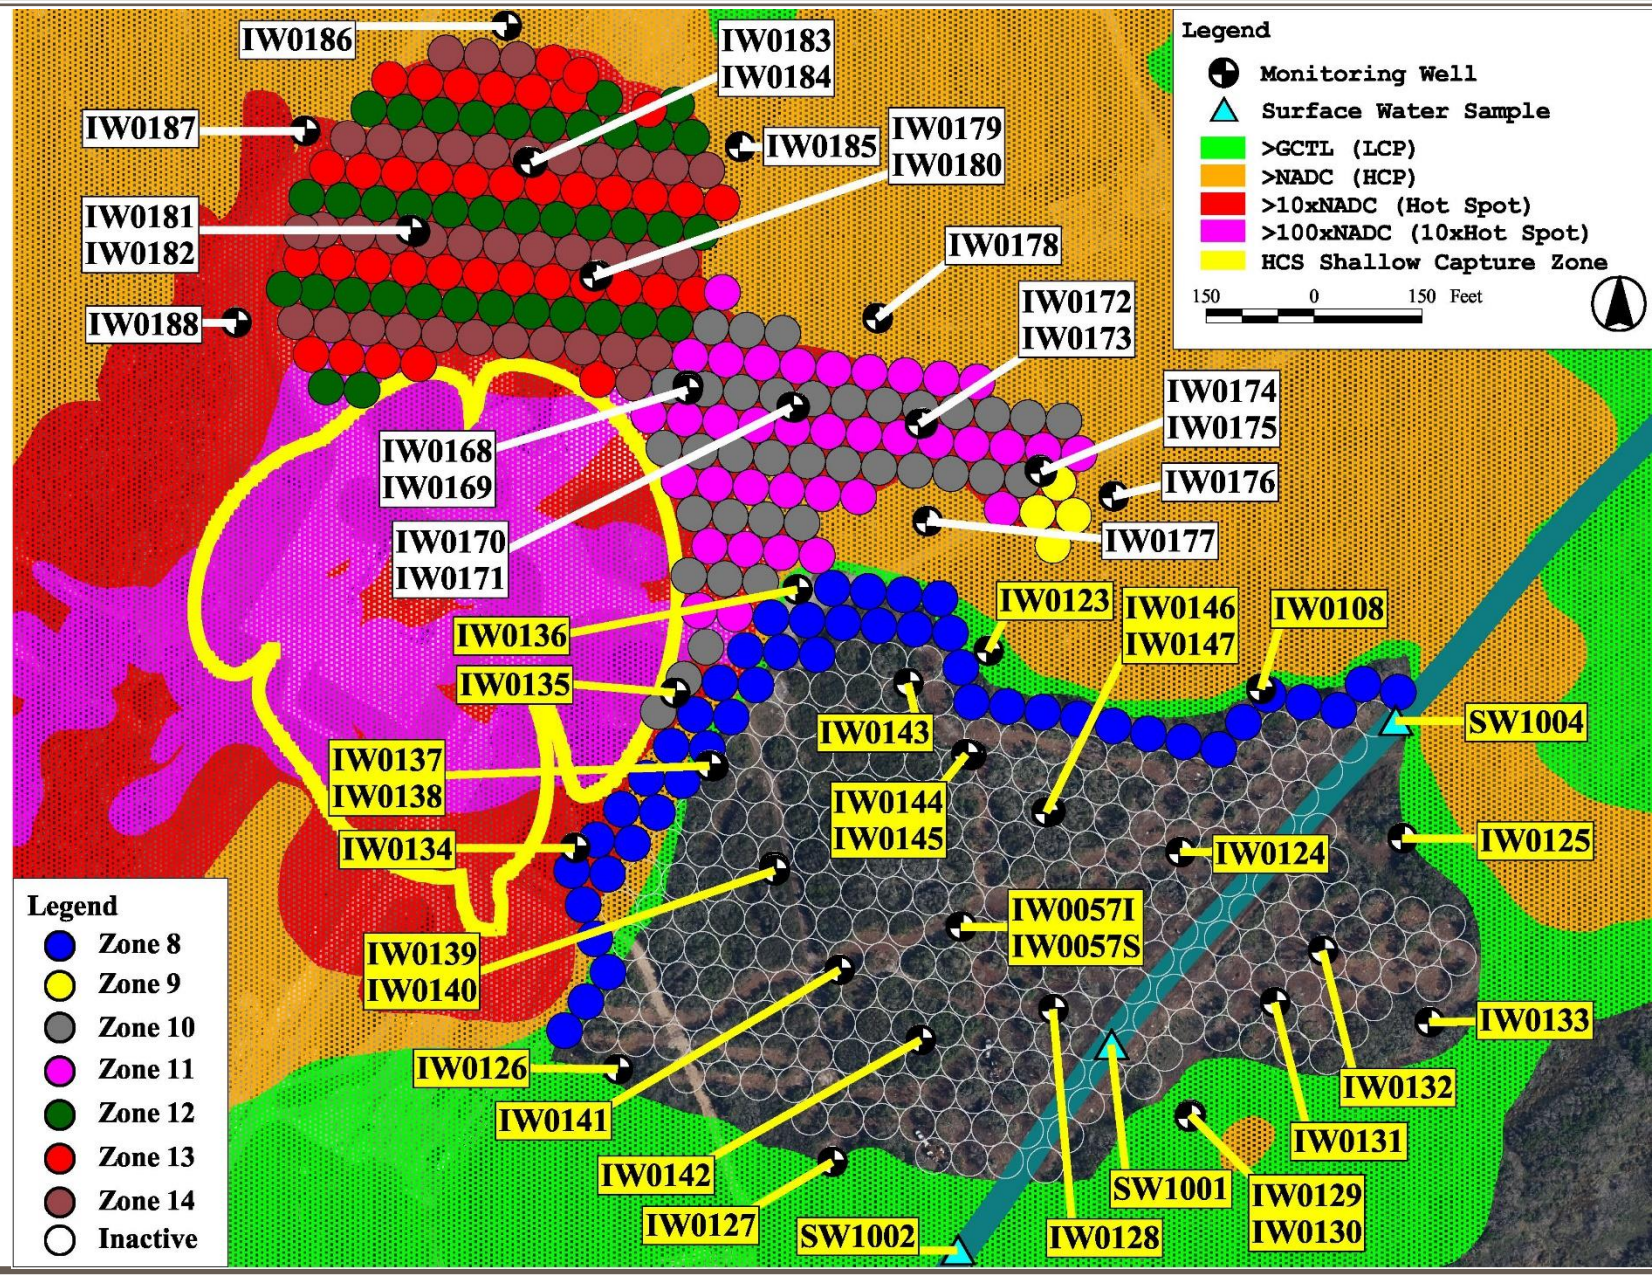
Reporting Period Runtime (April 1, 2023 – March 31, 2024)



Year / Phase		Month	Days In Month	Downtime (Days)	Runtime	Downtime Contributing Factor
2023	Phase One	April	30	14	53%	Semi-annual Performance Monitoring. Zones 3,4,6,7 running; Zones 5,8 were off so as not to influence the HS6 ASW install.
		May	31	1.5	95%	Shutdown for Phase Two installation
		June	30	0	100%	None
		July	31	1.5	95%	Phase Two baseline monitoring
	Phase Two	August	31	0	100%	Phase Two phased startup
		September	30	0	100%	None
		October	31	18	42%	Shutdown for Phase Three DPT
		November	30	10.5	65%	Semi-annual and quarterly Performance Monitoring
		December	31	2.5	92%	Performance Monitoring continued
2024		January	31	0	100%	None
		February	29	9	69%	Quarterly Performance Monitoring
		March	31	0	100%	None
		Total	**365**	**57**	**84%**	

Notes: 1) Reporting period is from April 1, 2023 to March 31, 2024

2) Phase Two startup 7/17/23 and fully operational 8/28/23

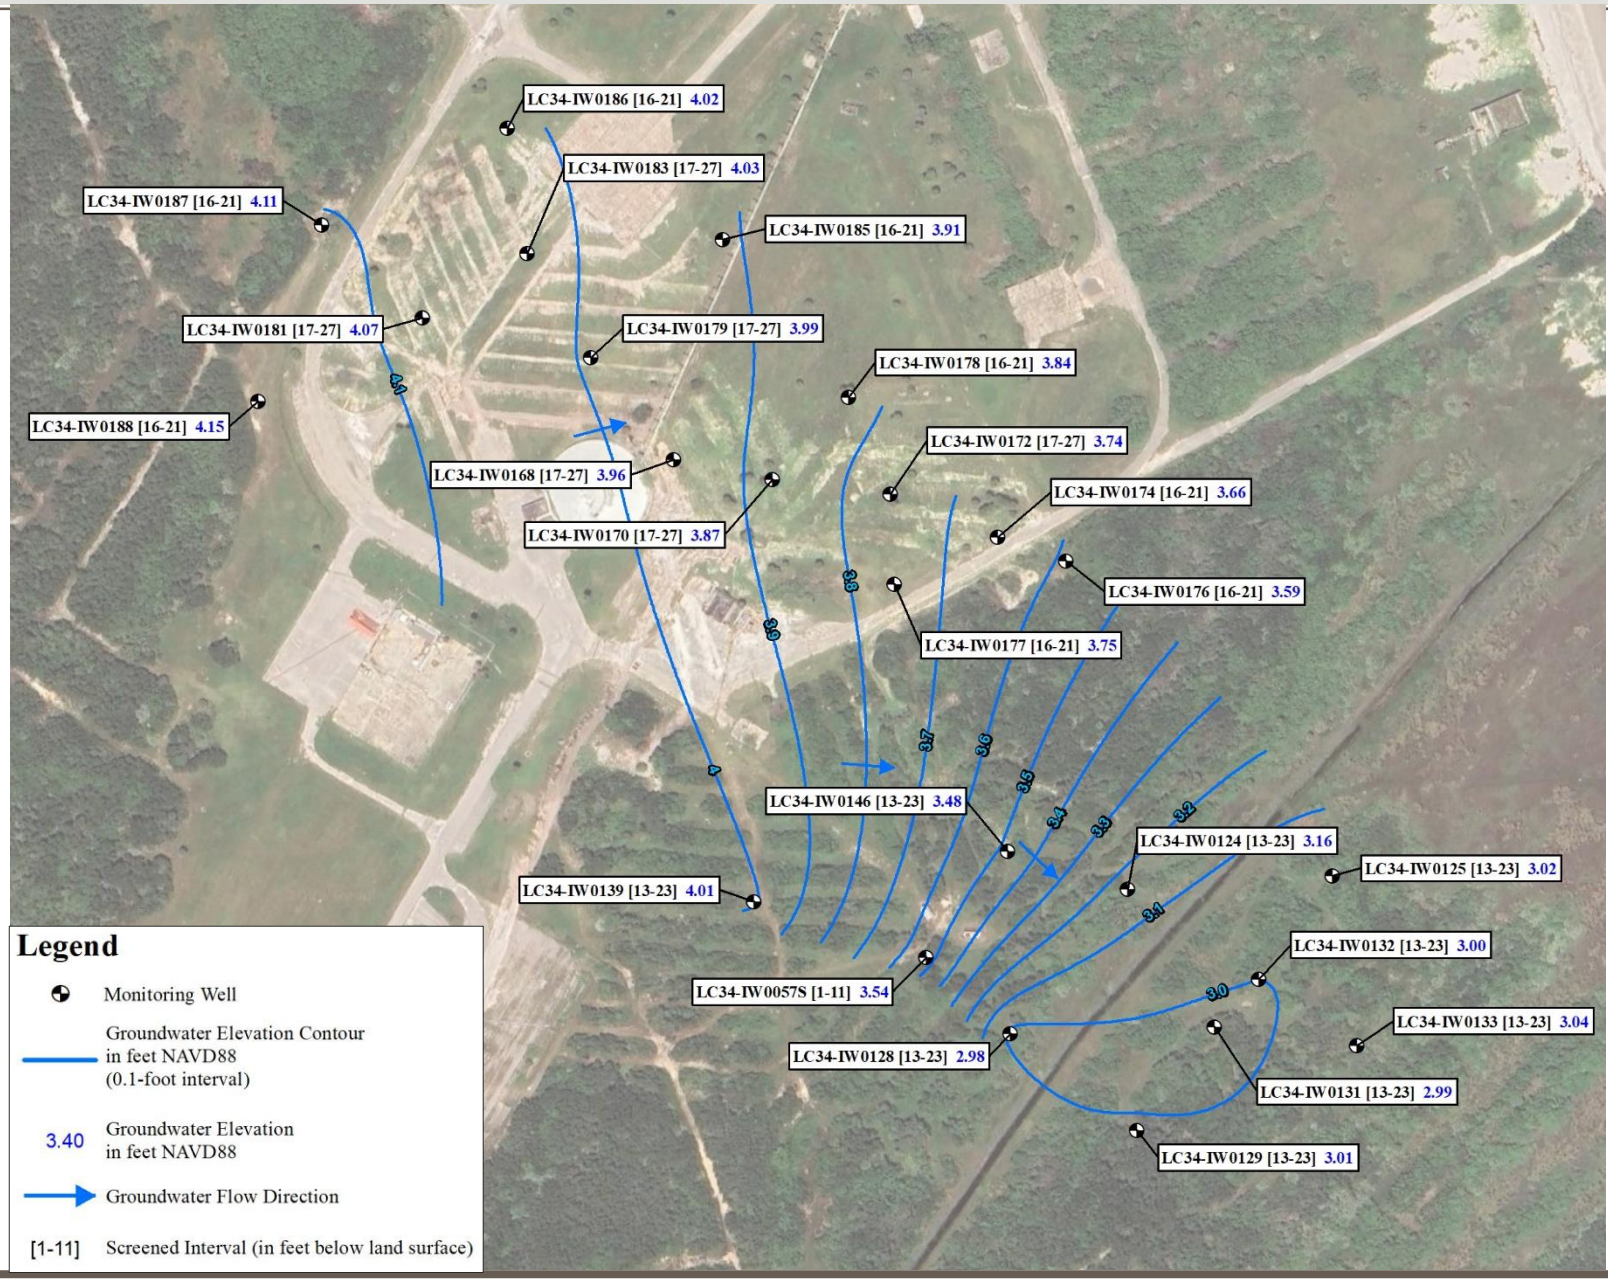


Operations and Maintenance

- Remote monitoring of the system
- Monthly site visits include
  - Inspect system
    - For leakage and excessive vibration, noise, or temperature
    - Oil levels and lubrication, condensate treatment system, refrigerated air dryer
  - Assess differential pressure across filtration units and process equipment
  - Record system operational data and compare to design conditions
  - Balance flow and pressure of manifold zones and individual sparge wells
  - Perform routine maintenance and housekeeping

Hot Spot 6 AS System OM&M – PM Results

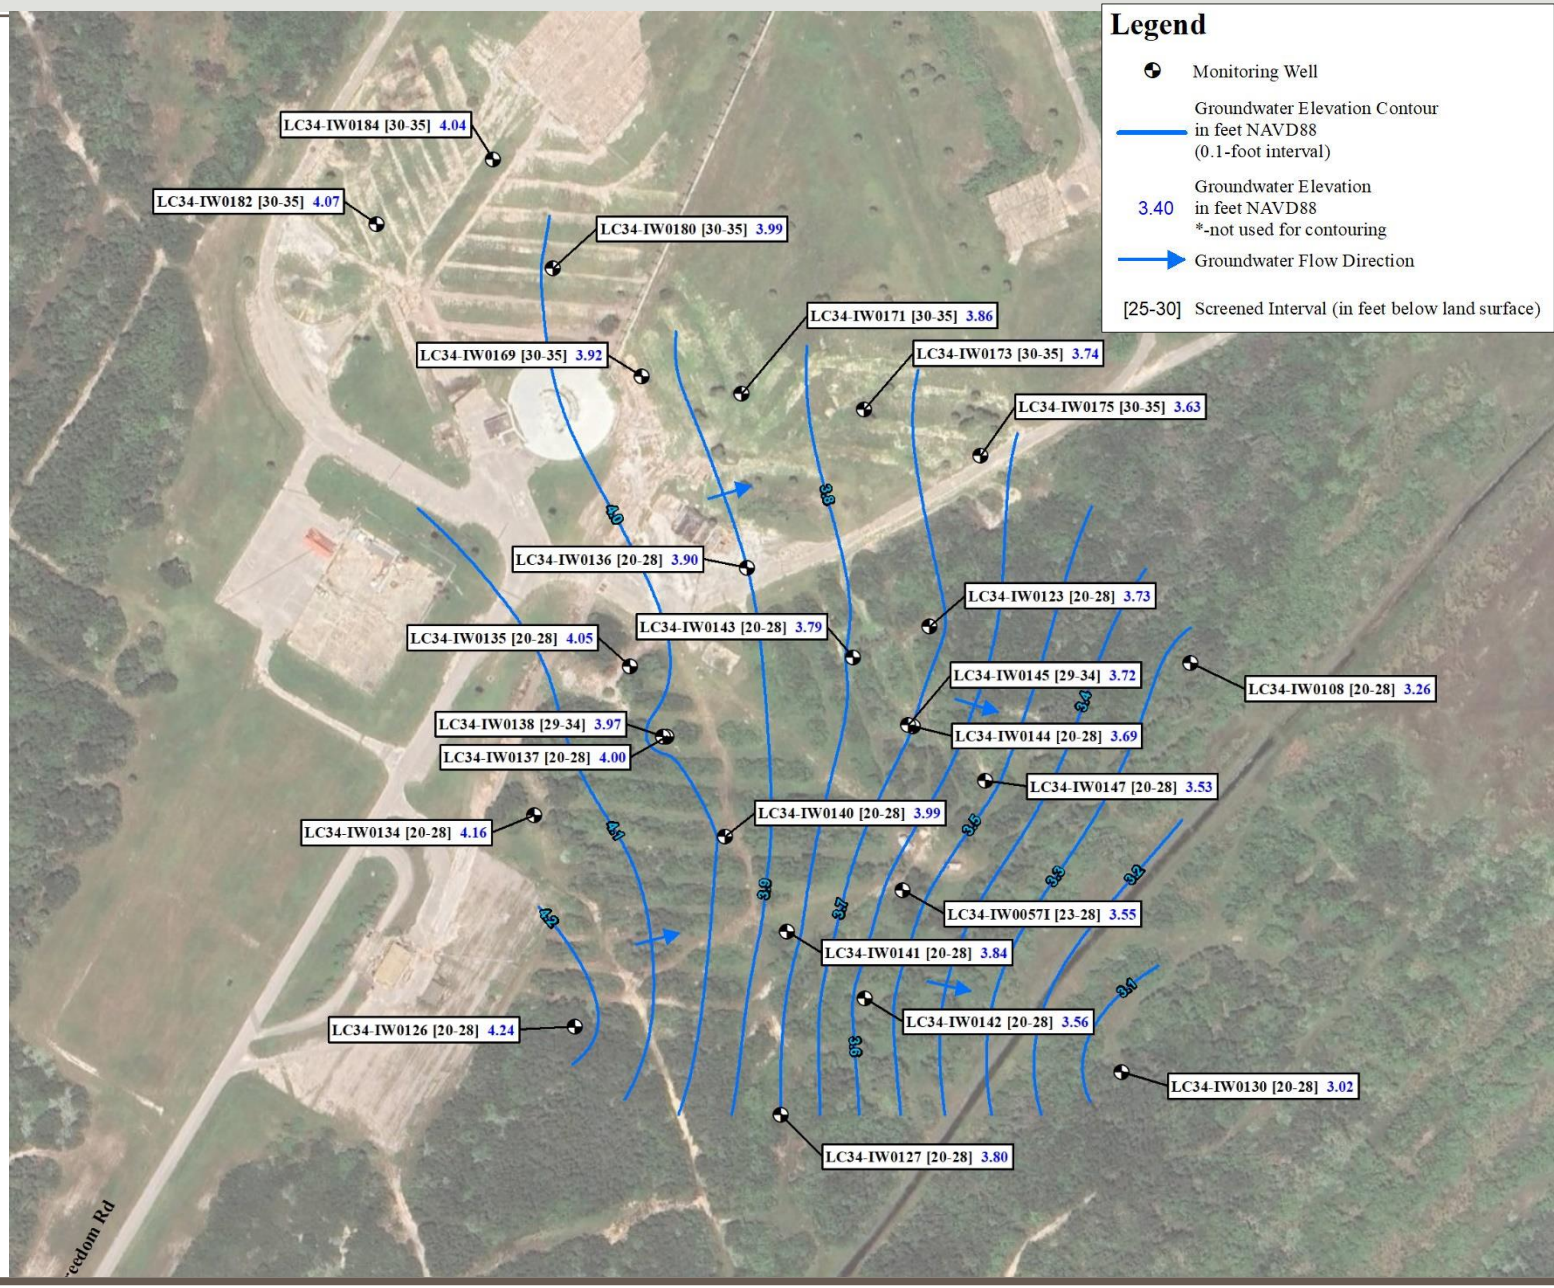
Performance Monitoring (PM) Overview



- Phase One (yellow labels):
  - 28 MWs and 3 SWs
  - Semi-annual sampling
    - April 2023 / November 2023
- Phase Two (white labels):
  - 21 MWs
  - Baseline conducted July 2023
  - Quarterly sampling
    - November 2023 / February 2024
- Water Level gauging during each sampling event
- Samples analyzed for VOCs by 8260D

Hot Spot 6 AS System OM&M – PM Results

Groundwater Elevation Contours HS6 Area

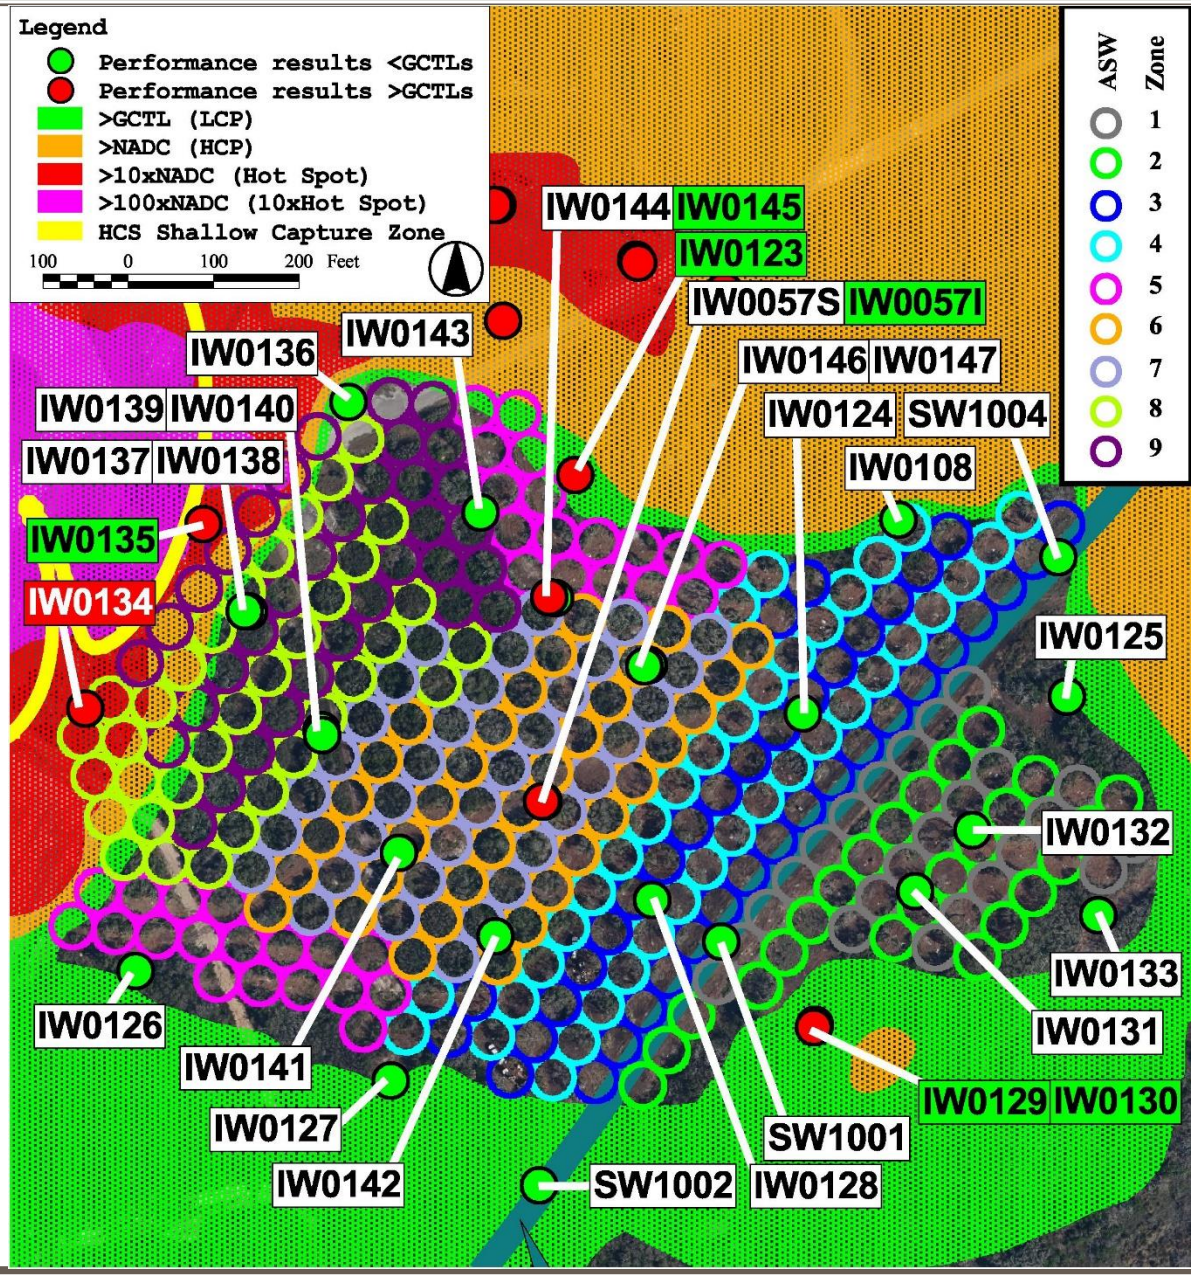


- November 2023 (49 wells gauged):
  - 24 wells screened in Layer 1 (0 to 25 ft bls)
  - Elevations ranged from 4.15 feet (IW0188) to 2.98 feet (IW0128)
  - Contours depict an eastern flow near blockhouse and southeastern flow in southern portion toward drainage ditch

Hot Spot 6 AS System OM&M – PM Results

Groundwater Elevation Contours HS6 Area

- November 2023 (49 wells gauged):
  - 25 wells screened in Layer 2 (25 to 35 ft bls)
  - Elevations ranged from 4.07 feet (IW0182) to 3.02 feet (IW0130)
  - Consistent with Layer 1, contours depict an eastern flow near blockhouse with a southeastern flow toward the drainage ditch



Hot Spot 6 AS System OM&M – Phase One PM Results

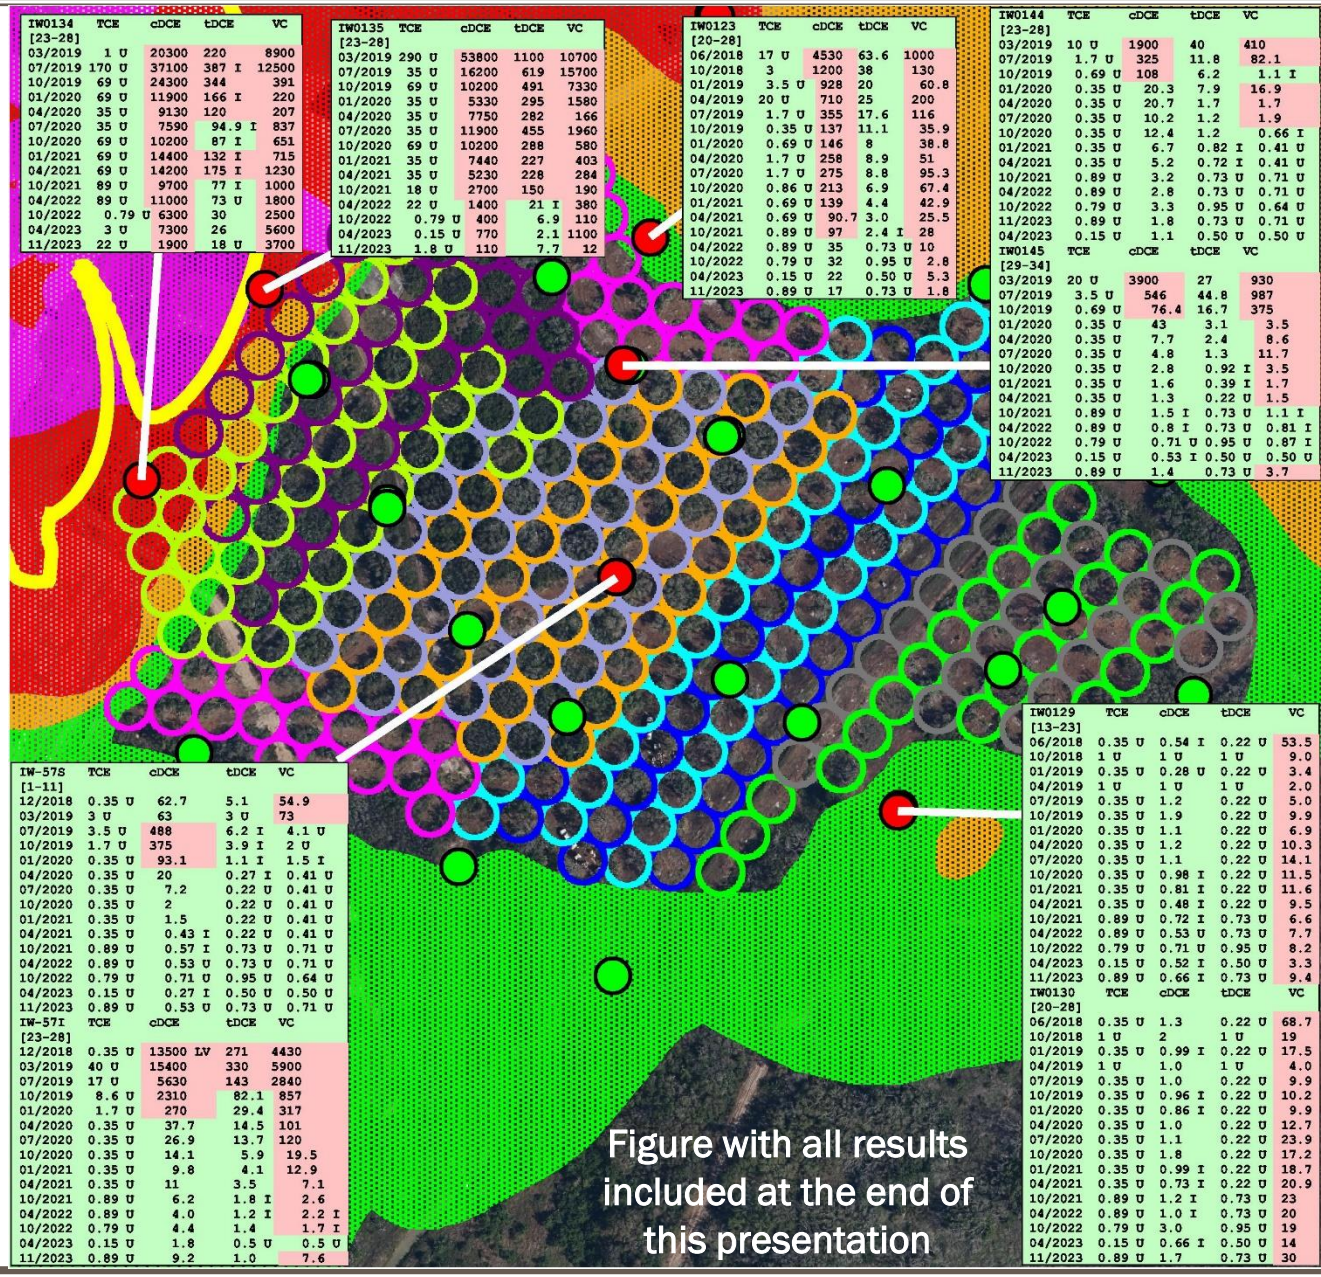
Summary

- One low level detection in SW samples, November BDLs
- November event was the first sampling event conducted with the modified barrier configuration
- Only IW0134 and IW0135, located upgradient adjacent to HCS capture zone, exceeded cDCE and VC >NADC/10xNADC

April 2023 Results

- 23 MWs less than GCTLs
- 3 MWs exceeded VC GCTL
- IW0134 and IW0135 exceed 10x NADCs (cDCE and VC)
- IW0134 maximum cDCE and VC concentrations
- Only detection in SW1001 cDCE at 0.26 I µg/L



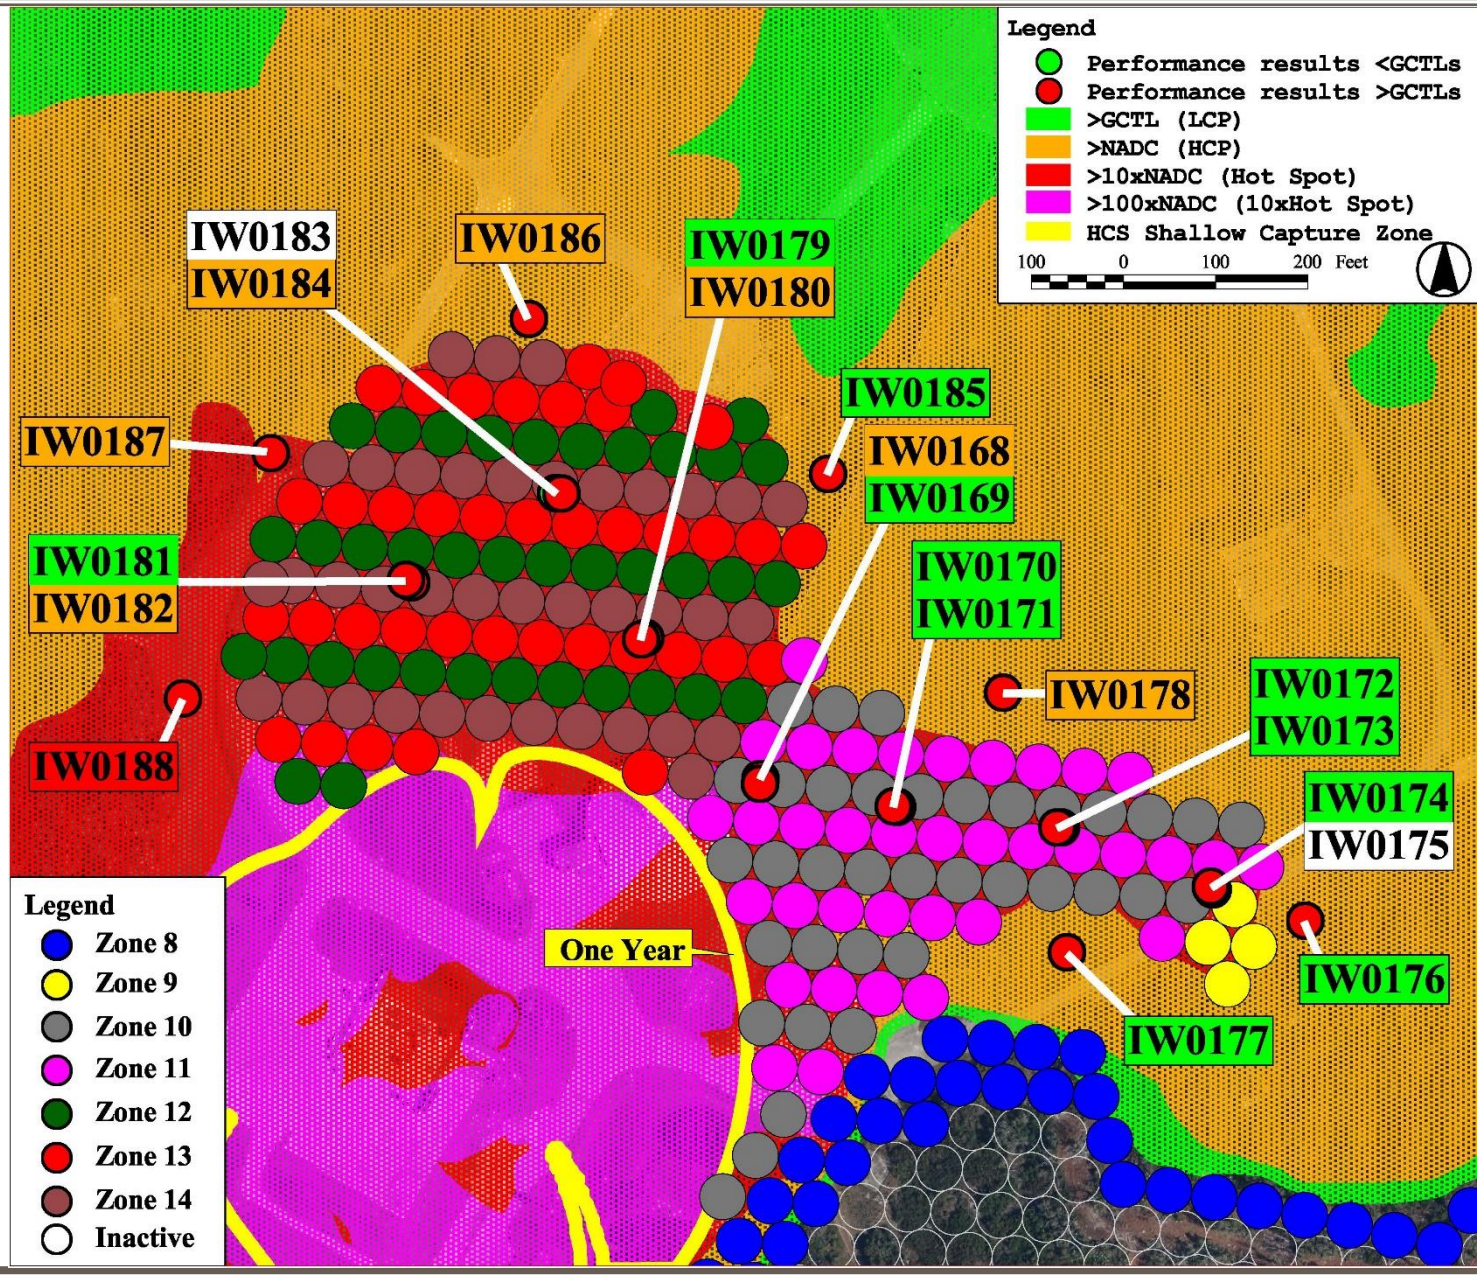
November 2023 Results

- 21 MWs less than GCTLs
- 6 MWs exceeded GCTLs
- IW0134 exceeded 10x NADCs (VC only)
- All SWs BDLs

	Nov 2023		Apr 2024	
	cDCE	VC	cDCE	VC
IW0123	17	1.8	22	5.3
IW0129	0.66 I	9.4	0.52 I	3.3
IW0130	1.7	30	0.66 I	14
IW0057I	9.2	7.6	1.8	0.5 U
IW0134	1,900	3,700	7,300	5,600
IW0135	110	12	770	1,100
IW0145	1.4	3.7	0.53 I	0.5 U

April 2024 Results

- IW057I and IW0145, within former treatment area, decreased to less that GCTLs from November 2023 to April 2024



Hot Spot 6 AS System OM&M – Phase Two PM Results

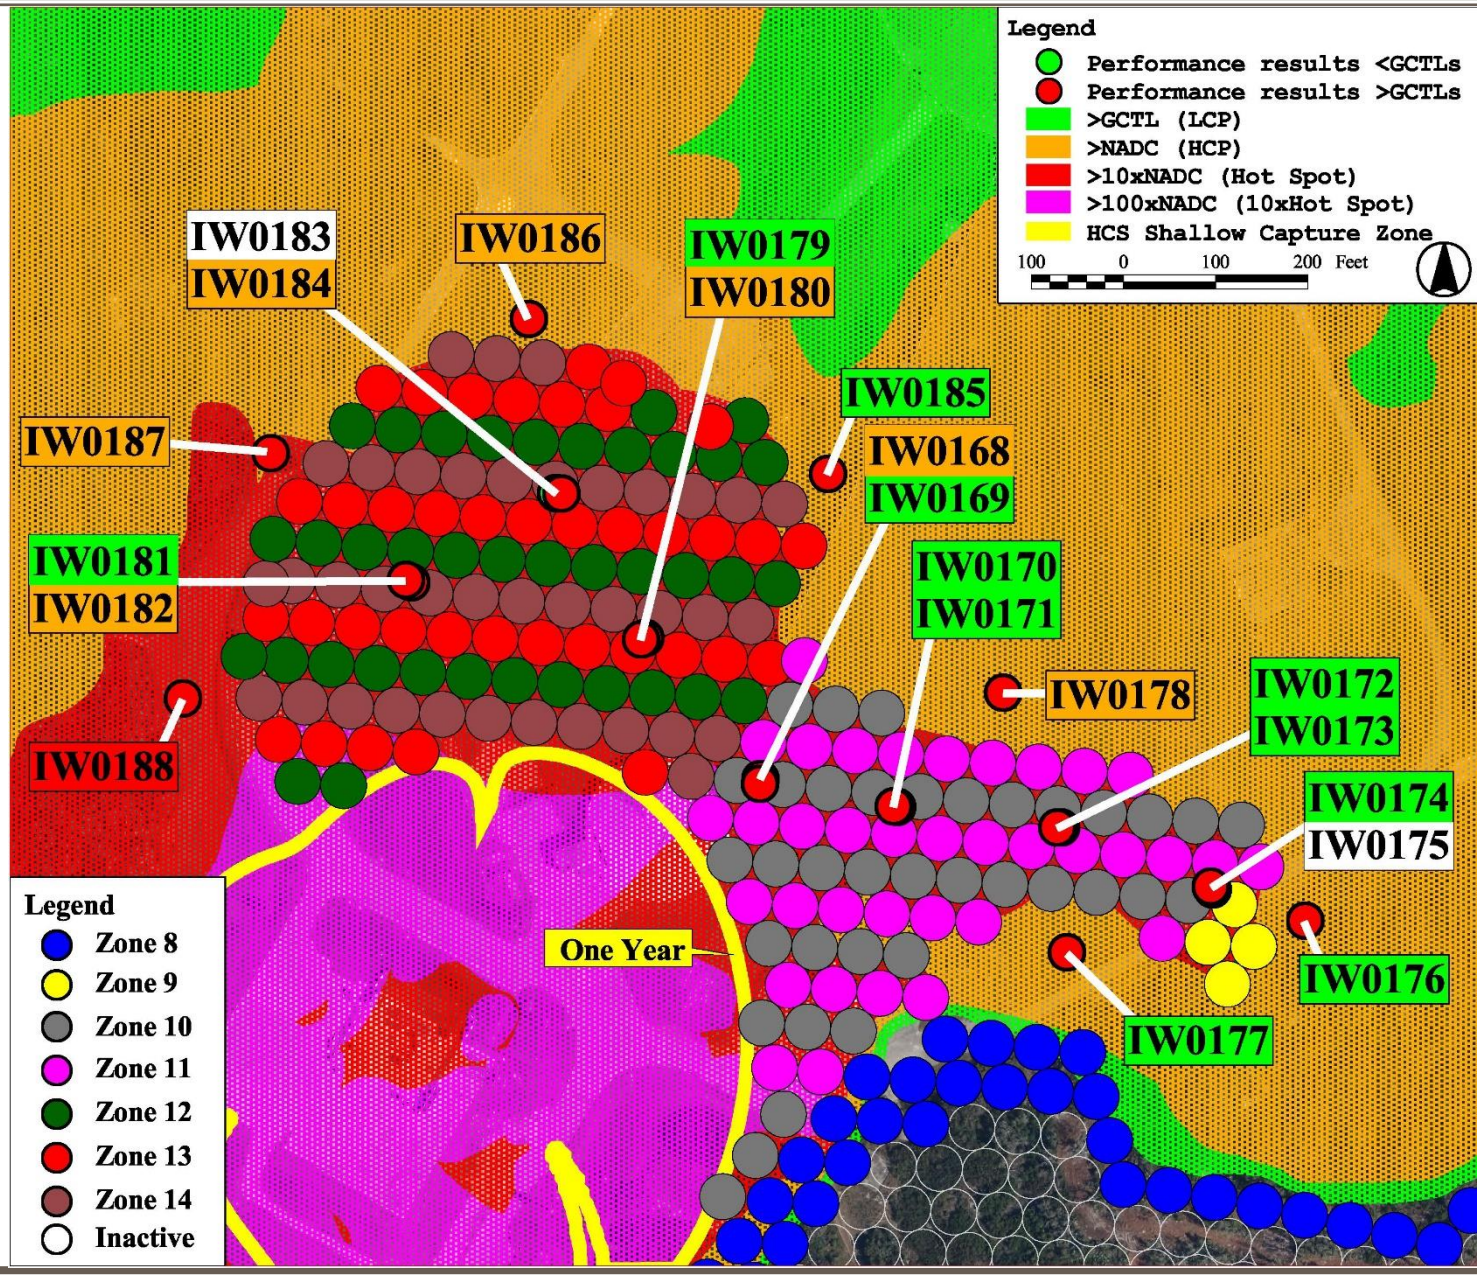
July 2023 Baseline



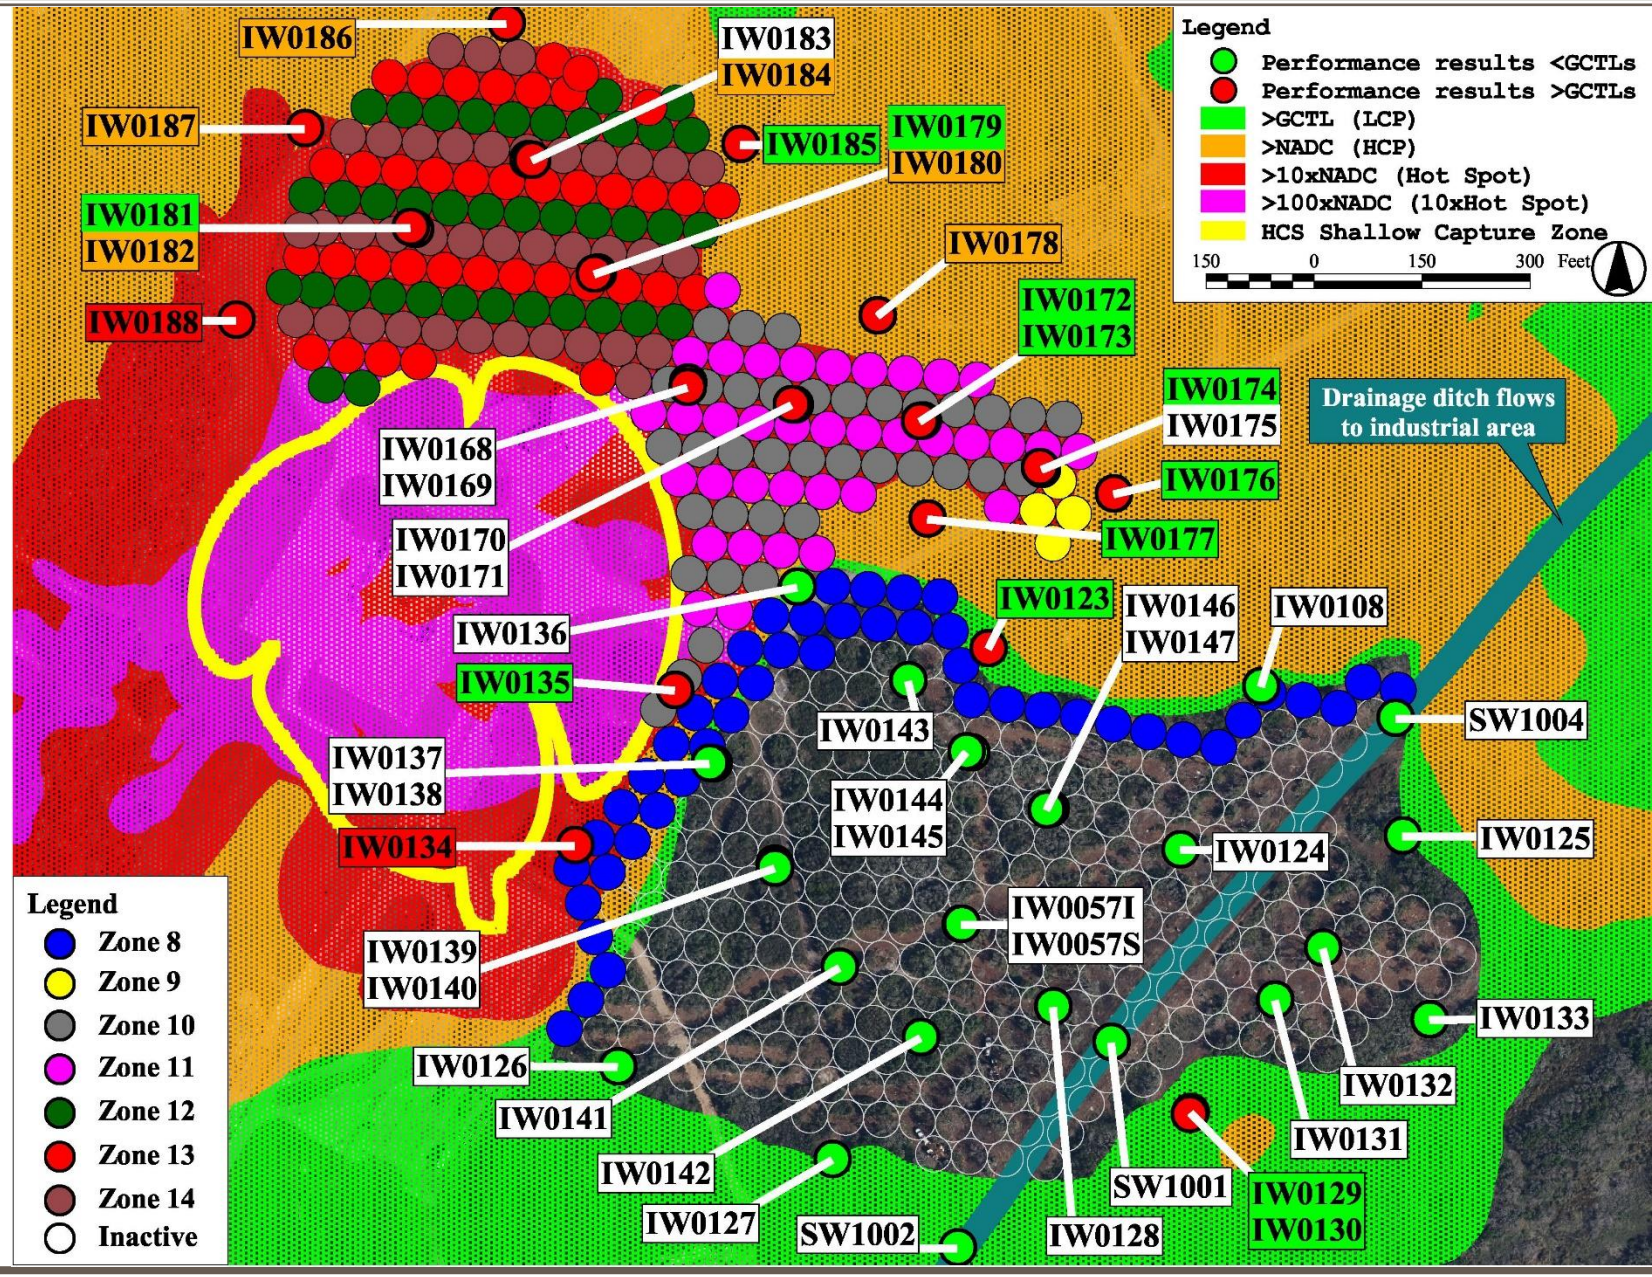
- TCE all results BDL and less than GCTL except IW0169 TCE = 4 U and VC = 1400 µg/L
- tDCE less than GCTL
- IW0175 exceeded GCTL (VC)
- 15 MWs exceeded NADC (cDCE or VC)
- 5 MWs exceeded 10xNADC (VC)
- IW0168 maximum cDCE and VC concentrations

November 2023 Quarter 1

- 8 MWs exceeded GCTLs
- 12 MWs exceeded NADC (cDCE or VC)
- IW0168 exceeded 10x NADCs (VC only)
- IW0168 maximum cDCE and VC concentrations

February 2024 Quarter 2

- IW0175 and IW0183 less than GCTLs
- 11 MWs exceeded GCTLs
- 7 MWs exceeded NADC (cDCE or VC)
- IW0188 exceeded 10x NADCs (VC only)
- Maximum concentrations:
  - cDCE 1,500 µg/L in IW182
  - VC 1,100 µg/L in IW188



HS6 AS System Conclusions/Recommendations

HS6 IM is operating as designed

- Meeting performance criteria
- Meeting objectives:
  - Remediate contaminated groundwater within treatment zone to prevent impacts to drainage ditch
    - Surface water sampling results indicate impacts to drainage ditch have been eliminated
  - Remediate contaminated groundwater within treatment zone to support transition to MNA
    - Performance monitoring results indicate contamination reduced to less than GCTLs in 90% of treatment area
    - Remaining treatment area has substantial contamination reduction

Team Consensus

- Propose continued operations of the air sparing system
- Propose continued semi-annual sampling of 28 monitoring wells and 3 surface water locations in Phase One for VOCs and field parameters,
- Propose continued quarterly sampling of 21 monitoring wells in Phase Two (Q3 and Q4), then present results and plan to reduce sampling frequency to semi-annual.

Path Forward – Site Wide LTM, HCS OM&M, HS6 IM

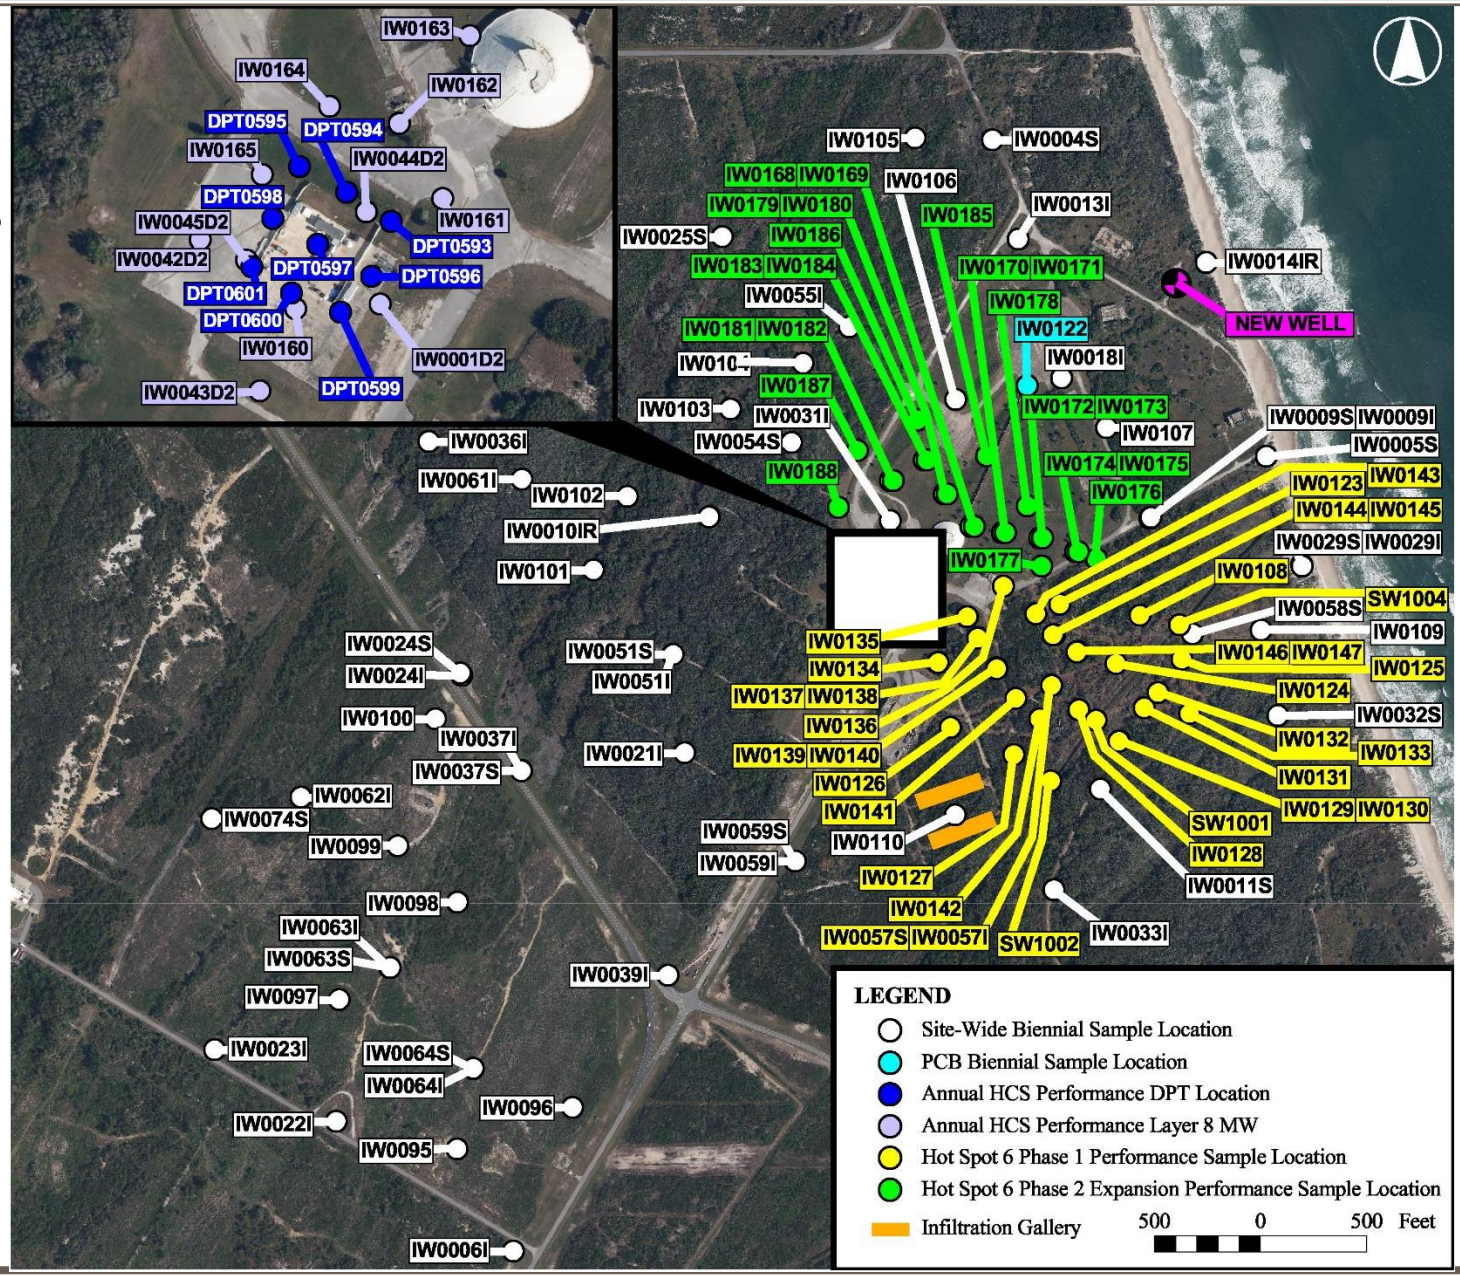
System Operations:

- Operate HCS and Air Sparging System as described

HCS System Sampling:

- Biweekly, select Layer 8 wells to evaluate RW21D operations
- Monthly, air strippers and LPGAC effluent samples
- Quarterly, total system influent and active RWs
- Annual:
  - CatOx influent and effluent
  - DPT samples from 9 locations
    - 5 ft sampling interval 8 to 98 ft bls
  - Layer 8 Performance MWs and Layer 7 IW42D2

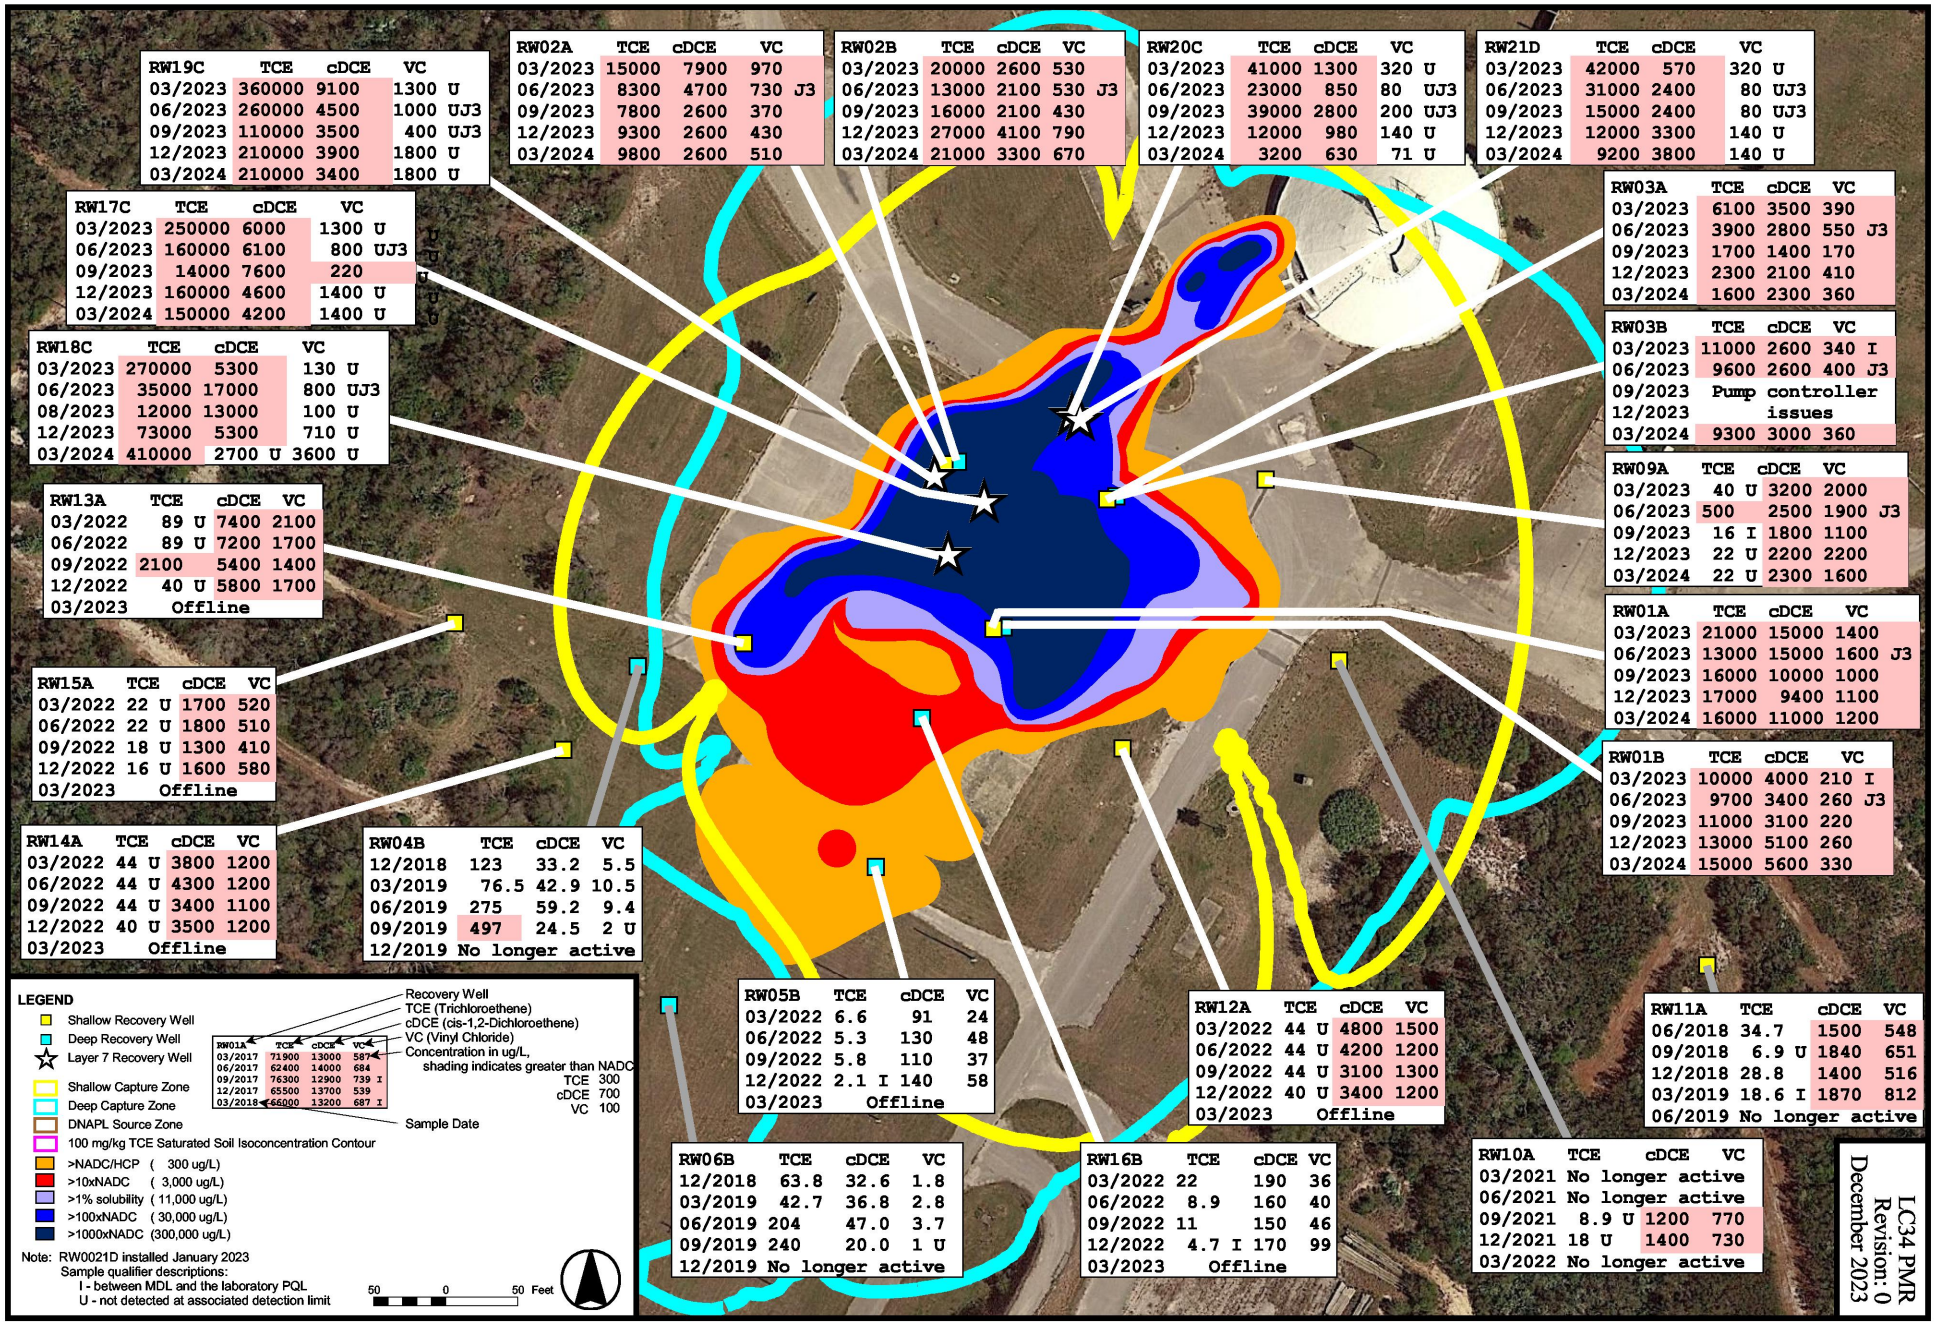
Hot Spot 6 Sampling:



- Quarterly, Phase Two performance monitoring:
  - 21 MWs
- Semi-annual, Phase One performance monitoring:
  - 28 MWs and 3 SWs

Site-wide:

- Biennial:
  - 56 MWs for VOCs, includes new well installation
  - IW0122 for PCBs



Reporting:

- Submit PMR to FDEP to document the activities and results presented in this ADP, April 2024 results will be reported in next year's PMR

Meeting Minutes and Miscellaneous Items

Objective:

Test consensus on the Kennedy Space Center (KSC) Remediation Team (KSCRT) April 2024 meeting minutes and discuss miscellaneous items.

Discussion:

Team consensus was reached that Revision 1 of the meeting minutes and action/decision items for the April 2024 KSCRT meeting will become final. Team members acknowledged and did not object to the fact that these meeting minutes may become public record as part of a final report at a later date **(2406-D01).**

The Team reached consensus to continue semi-annual sampling of SWs 09 and 10 until VC is no longer detected in MW83 and MW84 **(2406-D33).**

Results: Decision Items 2406-D20 through D33

Day 2 - June 13, 2024

2406-M09 Mark Jonnet/Tetra Tech

LC34 Annual Performance Monitoring (SWMU CC054)

Objective: The goal of this ADP is to summarize groundwater interim measures (IMs) and monitoring results for chlorinated volatile organic compounds (CVOCs) from April 1, 2023, through March 31, 2024, that will be documented in the 2024 Performance Monitoring Report.

Discussion: LC34 is located on Cape Canaveral Space Force Station, a barrier island bounded by the Banana River and Atlantic Ocean, with a 314-acre CVOC groundwater plume exceeding State of Florida Groundwater Cleanup Target Levels (GCTLs) referred to as a Low Concentration Plume (LCP). Within the LCP plume is an area of 158 acres that exceeds Florida Department of Environmental Protection (FDEP) Natural Attenuation Default Concentrations (NADCs), 52.8 acres that exceed 10-times NADCs (referred to as Hot Spots), 9.3 acres that exceed 100-times NADCs, and a two-acre trichloroethene (TCE) source zone referred to as the dense non-aqueous phase liquid (DNAPL) Source Zone (DSZ). The DSZ Hydraulic Containment System (HCS) and Hot Spot 6 (HS6) Air Sparging IM were operational during this reporting period and HS6 Air Sparging IM Phase Two Expansion.

A brief site history and background were provided on LC34. The geology at LC34 was shown with the recovery wells intervals. Generally speaking, Layers 1, 2, 3, 5, 6, and 8 are sandy; Layer 4 is clay; Layer 7 is silty; and Layer 9 is the clay of the Hawthorn Group. Layers 4 and 7 have sorbed mass in addition to dissolved mass. Historic site-wide groundwater contours indicate mounding near the HCS compound in the shallow intervals (Layers 1, 2, 3), and flow generally to the southeast, southwest, and west in deeper intervals (Layers 6 and 8). Site-wide potentiometric contours were developed

for Layers 1 and 2 using water level measurements collected in February 2023 from the wells in the biennial sampling program. Groundwater flow in Layer 1 is radial around monitoring wells 10SR and 25S with an easterly component towards the Atlantic Ocean, a southerly component towards Phillips Parkway, and a westerly component. Groundwater flow in Layer 2 is radial around wells 10IR and 110 with a similar easterly component towards the Atlantic Ocean and southeasterly/southwesterly components.

Hydraulic Containment System: The IM objective for the HCS is to attain hydraulic control of the DSZ and TCE HCP within Hot Spots 2, 3, and 4 by hydraulic containment with ex-situ treatment. The HCS began full-scale operation in May 2010, the system was expanded in 2015, and in August 2019 a new recovery well was installed 80 to 95 feet below land surface (ft bls). Three additional recovery wells (80 to 95 ft bls) were installed in February 2021. An additional recovery well (86 to 106 ft bls) was installed in January 2023. The current HCS includes 10 shallow recovery wells (15 to 45 ft bls), 7 deep recovery wells (50 to 80 ft bls), 4 deeper recovery wells (80 to 95 ft bls), 1 recovery well screened 86 to 106 ft bls, equalization tank and discharge pump, 2 air strippers, discharge pump, and liquid-phase granular activated carbon (LPGAC) treatment for polishing (if needed), catalytic oxidizer, quench tower, scrubbing unit, and 12 deep injection wells (50 to 80 ft bls) and an infiltration gallery for discharge of treated water. From January 2024 to March 2024 twenty Layer 7 recovery wells were installed then plumbed to the HCS, once the compressor trailer and additional infiltration gallery are installed these wells will begin operations.

The HCS hydraulically controls the DSZ by utilizing recovery wells to extract contaminated groundwater. The extracted groundwater flows into an equalization tank, which is then treated by two air strippers in series, polished by LPGAC, and subsequently pumped to injection wells and an infiltration gallery. The contaminants in the air stream from the air strippers are destroyed by a catalytic oxidizer. The catalytic oxidizer effluent is cooled in a quench tower and then neutralized by the acid gas scrubber prior to discharge to the atmosphere. During the Year 14 operational period (April 1, 2023, through March 31, 2024), system runtime was 94%. The majority of downtime was due to routine system cleaning, normal maintenance activities, and troubleshooting thermocouple sensor and PLC

controller. Over 31 million gallons of groundwater were treated during Year 14 with 6,505 pounds of CVOCs destroyed. Since HCS operation began, over 345 million gallons of groundwater have been treated with 94,823 pounds of CVOCs destroyed.

Performance sampling is conducted to evaluate the HCS operations. The air strippers' effluent and LPGAC effluent are sampled monthly, individual recovery wells and combined influent are sampled quarterly, and catalytic oxidation influent and effluent (vapor) are sampled annually. In addition, nine locations are sampled annually via direct-push technology (DPT) to evaluate aquifer conditions within the DSZ. At each location, samples were collected in five-foot intervals from 8 to 98 ft bls.

Influent system concentrations varied from 16,490 to 37,430 to 12,724, to 28,240 µg/L over the reporting period. Sample results, as shown on slide 27, indicate that contaminants in groundwater were reduced to less than GCTLs in the GAC effluent during all sampling events in the reporting period.

The catalytic oxidizer influent and effluent sample results were shown on slide 28. The influent results translate to 14.8 lb/day for total VOCs and 12.4 lb/day for TCE, and the effluent results translate to 0.005 lb/day for Total VOCs and 0.0063 lb/day for TCE. Based on the effluent results the catalytic oxidizer continues to meet the permissible daily hazardous air pollutants (HAP) levels of 6.8 lb/day for Total VOCs and 2.7 lb/day for TCE.

Individual recovery wells results, flow rates, and mass recovery rates were summarized on slides 30 and 31. The total recovery well flow rate of 84 gpm was maintained during the reporting period. When recovery well 21D was brought online, recovery wells 12A, 13A, 14A, 15A, and 16B were shut down. TCE was less than detection limits in these wells with the exception of 16B which had TCE detected at 4.7 I µg/L during the December 2022 sampling event. The highest TCE results were detected in RW01A (shallow capture zone), RW02B (deep capture zone), and RW19C (deeper zone), with the highest overall TCE result of 260,000 µg/L from RW19C in June 2023. The four recovery wells in the deeper zone (Layer 7; RWs 17C, 18C, 19C, 20C) are each operating at 0.5 gpm due to the silty lithology in this layer and RW21D operated at 15 gpm a portion of the screen is in Layer 8. As of March 2024, RWs 17C to 20C

represent 2% of total influent GPM and 20% of TCE mass recovered and RW21D represent 18% of total influent GPM and 28% of TCE mass recovered.

Annual DPT sampling was conducted in January2024 to evaluate aquifer conditions within the DSZ. An evaluation of the results by extraction zone was summarized on Slide 32, with the highest TCE results of 510,000 ug/L (shallow capture zone), 1,300,000 µg/L (between shallow and deep capture zones), 1,600,000 µg/L (deep capture zone), 530,000 µg/L (Layer 7 capture zone), and 110,000 µg/L (below Layer 7 capture zone). Sampling results were compared to previous sample events, and tabulated to show TCE concentrations in percent composition over all sample intervals in relation to recovery well capture zone (Slides 33 to 36). Data shows that the majority of contamination is located at 48 ft bls (21.8% above/within Layer 4), 53 ft bls (25.1% directly below Layer 4), and 83 ft bls (5.5% in Layer 7).

Groundwater samples from Layer 7 and 8 monitoring wells were also collected in December 2023 to monitor vertical migration of contamination. All wells sampled were below detection limits, except 42D2, 44D2, 45D2, and 162.

cDCE was detected in 42D2 and 45D2 at 0.73 I and 140 µg/L, the next sampling event for these wells is scheduled for December 2024

TCE has had an increasing trend in IW162 since December 2021. Frequent sampling of this well was implemented in March 2022. TCE increased from 2.4 I to 280 ug/L during the period of December 2021 to December 2022.

RW21D was installed adjacent to RW20C in January 2023 to address the increasing TCE trend in IW162. The planned total depth was 100 ft bls. The materials for this well were a special order by the driller. Prior to the field event Tetra Tech verified the driller received the materials to install the recovery well to 100 feet bls. The driller had an extra 5-foot section of riser they brought onsite. Unaware of the extra 5-foot section, Tetra Tech instructed field person to install the well with the materials driller brought onsite assuming they only had the special ordered materials. RW21D was installed to a depth of 106 ft bls extending approximately five feet into Layer 8. Rather than abandoning the recovery well, NASA decided to operate the

recovery well with a biweekly sampling of IW162 and two additional wells, IW44D2 and IW162. TCE in IW44D2 increased from BDL to 360 µg/L in March 2023 then to a maximum concentration of 190,000 L µg/L in September 2023 decreasing to 250 µg/L in June 2024. TCE in IW162 increased from BDL to 2.4 I µg/L in February 2022 then to a maximum concentration of 15,000 µg/L in March 2023 decreasing to 2.9 µg/L in February 2024, TCE has been equal to or less than GCTL since September 2023. FDEP requested wells 01D2 and 161 be sampled to during the October 2023 KSCRT meeting, these wells were sampled shortly thereafter concentrations were BDL.

The Team reached consensus to continue IM OM&M of the HCS for Year 14, the operational period of April 1, 2024 to March 31, 2025, consistent with the current approach that includes: biweekly samples from select Layer 8 wells dependent on results; monthly sampling of the air stripper's effluent (aqueous), quarterly sampling of the combined influent and individual RW influent (aqueous), and annual sampling of the influent and effluent of the CatOx (vapor), DPT (aqueous), and Layer 7/8 monitoring wells (aqueous) **(2406-D34).**

Hot Spot 6 Phase Two Expansion: The IM objective for the HS6 Air Sparging IM is to remediate contaminated groundwater within the treatment zone to prevent impacts to the drainage ditch and support transition to monitored natural attenuation (MNA). The initial phase of the HS6 IM began full scale operations in July 2018, and was then expanded from 160 air sparging wells (ASWs) to 300 ASWs with full scale operations beginning in May 2019. The 300 ASWs were installed beneath the VOC contamination on the top of Layer 4 (approximately 40 feet bls). The design included an ASW flow rate of 5.0 CFM, and 25 ft radius of influence with ASWs spaced 25 feet apart with no overlap. The system operates in nine treatment zones, with compressed air supplied from a 75-horsepower rotary screw compressor. An expansion including 76 ASWs was presented to the KSCRT at the December 2020 meeting, due to a delay to resolve beach mice being present at the site an additional expansion including 116 ASWs was presented to the KSCRT at the March 2022 meeting was implemented September 2022 to July 2023. System startup activities began July 2023 followed by full scale operations beginning August 28, 2023.

Hot Spot 6 Air Sparging: Phase One and the Phase Two Expansion zones as well as the run time of 84% over the reporting period April 1, 2023, through March 31, 2024. Performance sampling, Phase Two Expansion installation, and Phase Three Expansion DPT delineation efforts contributed to down time. The system is monitored remotely, and if any issues arise a technician is dispatched to troubleshoot and resume operations. Monthly site visits are conducted to ensure the system is operating properly and the system is balanced.

Performance sampling includes semi-annual sampling in the Phase One (28 monitoring wells and 3 surface water locations in the nearby canal/drainage ditch) and Phase Two Expansion baseline and quarterly sampling in November 2023 and February 2024 (21 monitoring wells). The COCs are cDCE and VC that have exceeded GCTLs in the treatment areas. Waterline levels are gauged at all wells sampled during performance sampling events. Slides 63 and 64 depict groundwater elevation contours in the Hot Spot 6 treatment area, groundwater flow is similar to historic flow to the southeast.

Phase One Area performance sampling events were conducted in April and November 2023, all wells within the treatment area were less than GCTLs in April, in November VC in IWs 57I and 145 increase to exceed GCTL at 7.6 and 3.7 µg/L, respectively. The April 2024 results were included to show that both wells decreased to BDL. SW1001 had a detection of cDCE at 0.26 I µg/L, all other surface water samples were BDL. The maximum cDCE and VC of 7,300 and 5,600 µg/L were detected in upgradient IW0134 adjacent to the HCS with concentrations exceeding 10xNADCs during the April event, VC continued to exceed 10xNADC during the November event at 3,700 µg/L. cDCE was also detected in IW0135 at concentrations of 770 (exceeding NADC) and 110 (exceeding GCTL) µg/L during the April and November events. VC was detected exceeding GCTLs in wells 123, 129, 130, and 135 ranging from 1.8 to 30 µg/L and one NADC exceedance of 1,100 µg/L in IW0135 during the April event. All of these wells are beyond the treatment area. The wells with NADC exceedances are on the upgradient side of the treatment area and receive flux from the DSZ.

Phase Two Area baseline and performance sampling events were conducted in July 2023, November 2023, and February 2024. All 21

wells exceeded GCTLs during the baseline event with 14 wells exceeding NADCs and five wells exceeded 10xNADCs with maximum cDCE and VC concentrations occurring in IW0168 at 6,500 and 3,800 µg/L. During the November event all wells exceeded GCTLs with 12 wells exceeding NADCs and IW0168 exceeded 10xNADC. During the February event two wells were less than GCTLs, 11 wells exceeded GCTLs, seven wells exceeded NADCs and IW0188 exceeded 10xNADC with the VC detection and 1,100 µg/L. The average reductions of cDCE and VC from the Baseline to the February events were 12% and 31%.

Test Team consensus to continue operation of the HS6 air sparging system of the active 238 ASWs for the operational period of April 1, 2024, to March 31, 2025 **(2406-D35).**

Test Team consensus to continue semi-annual sampling of 28 monitoring wells and 3 surface water locations associated with previous treatment area for VOCs and field parameters **(2406-D36).**

Test Team consensus to continue quarterly sampling of 21 monitoring wells in Phase Two (Q3 and Q4), then present results and plan to reduce sampling frequency to semi-annual **(2406-D37).**

FDEP noted that an IM Phase 3 Expansion for HS6 was submitted in May 2024. The FDEP is discussing fugitive emissions and submitted for technical review; will see about the technical calculation. What is the timeline on this? NASA responded this was a high priority but not urgent.

Path Forward:
In summary, the path forward will include: (1) Monthly System Sampling will include HCS effluent samples collected from air strippers, LPGAC; (2) Quarterly Sampling will include HCS total system influent, and HCS individual active recovery wells (12 RWs); (3) Quarterly sampling of Hot Spot 6 Expansion Area performance sampling (21 MWs) and semi-annual sampling of Hot Spot 6 performance sampling (28 MWs and 3 SWs); (4) Annual Sampling (December 2024) will include HCS CatOx influent and effluent, HCS DPT samples from 9 locations (8 to 98 ft bls at each boring), and Layer 8 Performance MWs; (5) Biennial Site-Wide LTM Sampling (December 2024) will include sampling of 56 MWs for VOCs and one MW for PCBs.

Results: Decision Items 2406-D34 through D37

2406-M10 Justin Bublitz/HGL

Contractors Road Heavy Equipment Area (SWMU 055) Site Characterization

Objective: The objective of the ADP is to summarize the site assessment history and background, present the updated delineation of chlorinated volatile organic compounds (CVOCs) and distribution of 1,4-dioxane, present screening of remedial technologies and obtain team consensus.

Discussion:
Site Characterization
Preliminary Assessment performed in 1994 which identified CVOCs in groundwater. RCRA Facility Investigation (RFI) activities conducted from 1994 through 1999 identified Trichloroethene (TCE) and degradation breakdown products in groundwater. A Corrective Measures Study and Statement of Basis was completed in 2000 and 2004, respectively. From 2005 through 2009 the site was incorporated into the Vehicle Assembly Building (VAB) Long-Term Monitoring (LTM) program. From 2009 through 2016, Supplemental Site Assessment activities were performed at the site which identified CVOC concentrations exceeding their Florida Department of Environmental Protection (DEP) groundwater cleanup target levels (GCTL), natural attenuation default concentration (NADC) and 10 times the NADC. In 2014, the Statement of Basis was revised to remove polychlorinated biphenyl (PCB) contamination greater than the soil cleanup target levels and include remedies for CVOCs.

Hot Spot 1 Site Characterization and Remedial Alternatives Evaluation ADPs were presented in December 2013 and February 2014, respectively. In May 2014, the Hot Spot 1 Bioremediation Interim Measure (IM) Work Plan was completed. September 2015 through May 2018, bioremediation pre-implementation and implementation were completed at the source zone and hot spot 1. From 2018 through 2020, performance and treatment monitoring were conducted via monitoring well sampling and vapor intrusion monitoring began. From 2021 through present, the site has transitioned into annual groundwater monitoring for VOCs, UIC

APPENDIX B

HCS SAMPLING LOGS AND FIELD DOCUMENTATION
(PRVIDED IN ELECTRONIC VERSION ONLY)

14/Apr/2023 **LC34** **112G08985**

Personnel: Dan Forester
Weather: Sunny
PPE: Level D
Objective: Complete LC34 Bi-Monthly Sampling Event

0645: DF arrives on base, gathers equipment and supplies, calibrates equipment and daily prep

0930: starts purge of LC34-IW0165

1000: Sample LC34-IW0165-110.0 collected for VOC analysis via method 8260D-(MOD) LC34 Custom list.

1000: starts purge of LC34-IW0042D2

1030: Sample LC34-IW0044D2-110.0 collected VOC analysis via method 8260D-(MOD) LC34 Custom list.

1030: starts purge of LC34-IW0162

1100: Sample LC34-IW0162-110.0 collected for VOC analysis via method 8260D-(MOD) LC34 Custom list.

1100: IDW dropped off

14:00 samples transferred to Courier.

SITE NAME: LC34	SITE LOCATION: Kennedy Space Center	
LOC ID: LC34-IW0162	SAMPLE ID: **LC34-IW0162-110.0-20230414** Sample depth (ddd.d)=[bottom of screen (feet bls)-Top depth] x 0.5-bottom of screen (feet bls)	DATE: **04/14/2023**

Calibration Report

Instrument	Aqua TROLL 600 Vented
Serial Number	840822
Created	5/12/2023

[redacted]

Serial Number	1014112
Last Calibrated	5/12/2023

Calibration Details

TDS Conversion Factor (ppm)	0.65
Cell Constant	1.184
Reference Temperature	25.00 °C

Pre Measurement

Actual Conductivity	1,303.6 µS/cm
Specific Conductivity	1,194.4 µS/cm

Post Measurement

Actual Conductivity	1,542.3 µS/cm
Specific Conductivity	1,413.0 µS/cm

[redacted]

Serial Number	839497
Last Calibrated	Factory Defaults

[redacted]

Serial Number	982670
Last Calibrated	5/12/2023

Calibration Details

Calibration Point 1

pH of Buffer	4.01 pH
pH mV	170.2 mV
Temperature	30.10 °C

Pre Measurement

pH	4.17 pH
pH mV	170.2 mV

Post Measurement

pH	4.01 pH

pH mV	173.1 mV

Calibration Point 2

pH of Buffer	6.99 pH
pH mV	-3.8 mV
Temperature	29.94 °C

Pre Measurement

pH	7.06 pH
pH mV	-3.8 mV

Post Measurement

pH	6.99 pH
pH mV	-3.9 mV

Calibration Point 3

pH of Buffer	9.95 pH
pH mV	-175.8 mV
Temperature	30.56 °C

Pre Measurement

pH	9.92 pH
pH mV	-176.2 mV

Post Measurement

pH	9.95 pH
pH mV	-179.1 mV

Slope and Offset 1

Slope	-58.38 mV/pH
Offset	-4.4 mV

Slope and Offset 2

Slope	-58.12 mV/pH
Offset	-4.4 mV

ORP

ORP Solution	ORP Standard
Offset	2.7 mV
Temperature	30.92 °C
Pre Measurement	213.0 mV
Post Measurement	215.7 mV

05/26/2023 **LC34** **112G08985**

Personnel:	Aaron Kupper	(AK)	Eng	Tt
Weather:	Sunny – 80 degrees F			
PPE:	Level D			
Objective:	Sample Layer 7 wells			

0730: Arrive on site. Performed equipment calibration and sample preparation
0835: Purge initiated at IW0165
0859: Purge complete
0900: LC34-IW0165-110.0-20230526 collected. 3 40ml VOA W/ HCL. Analysis: 8260D NASA LC34 Custom List
0905: Purge initiated at IW0044D2
0929: Purge complete
0930: LC34-IW0162-110.0-20230526 collected. 3 40ml VOA W/ HCL. Analysis: 8260D NASA LC34 Custom List
0935: Purge initiated at IW0162
1044: Purge Complete
1045: LC34-IW0162-110.0-20230331 collected. 3 40ml VOA W/ HCL. Analysis: 8260D NASA LC34 Custom List
Note: IDW transferred into HCS system for treatment.
1145: Off site

06/09/2023 **LC34 Layer 7 sampling** **112G08985**

Personnel:	Aaron Kupper	(AK)	Engineer	Tt

Weather: Cloudy, high of 86 degrees f, chance of thunderstorms
Health and Safety (HAS): Topics: PPE; IDW; Hydration, ticks
PPE: Level D
Objective: Sample 3 bi monthly layer 7 wells at LC34.

0730 – AK arrive at CHP. Calibrated equipment, performed daily prep.
0815 – departed to LC34
0855 – started purge at LC34-IW0165-110.0-20230609
0914 – purge complete
0915 – Sample collected. 3 40ml pres. VOA's. Analysis 8260D-(MOD) NASA LC34 Custom. Decon'd equipment. Placed IDW in bucket.
0925 – started purge at LC34-IW0044D2-110.0-20230609
0944 – purge complete
0945 – Sample collected. 3 40ml pres. VOA's. Analysis 8260D-(MOD) NASA LC34 Custom. Decon'd equipment. Placed IDW in bucket.
1000 – started purge at LC34-IW0162-110.0-20230609
1019 – purge complete
1020 – Sample collected. 3 40ml pres. VOA's. Analysis 8260D-(MOD) NASA LC34 Custom. Decon'd equipment. Placed IDW in bucket.
1030 – IDW was pumped into HCS system for treatment.
1035 – departed site

09/01/2023 **LC34** **112G08985**

Personnel: Chuck Sorden (CS) Geologist Tt
Weather: Sunny – 81 degrees F
PPE: Level D
Objective: Complete LC34 Bi-Monthly Sampling Event

0800: CS on base; gathering equipment and supplies; calibrating equipment (See cal sheets); daily prep
0915: CS arrives at LC34; setting up
0950: CS Purging LC34-IW0165
1010: Purging Complete on IW0165
1015: Sample Collected LC34-IW0165-110.0-20230901 8260D
1025: CS Purging LC34-IW0044D2
1045: Purging Complete on IW0044D2
1050: Sample Collected LC34-IW0044D2-110.0-20230901 8260D
1100: CS Purging LC34-IW0162
1120: Purging Complete on IW0162
1125: Sample Collected LC34-IW0162-110.0-20230901 8260D
1145: Site Secured; CS offsite at LC34 to prep samples for delivery to Eurofins Courier

09/15/2023 LC34 112G08985

Personnel: Natalie Fabbri (NF) Env. Scientist Tt
Weather: Sunny and 80°F
PPE: Level D
Objective: Complete LC34 GW monitoring event
0900 arrived at CHP. Calibrated and gathered equipment.
1000 arrived at LC34. Gathered cooler, bottle wear, and items for sampling.
1030 begin purging IW0162.
1046 Sample Collected LC34-IW0162-110.0-20230915 8260D MOD LC34 Custom
1114 Begin Purging IW00442D
1130 Sample Collected LC34-IW00442D-110.0-20230915 8260D MOD LC34 Custom
1145 Begin Purging IW0165
1202 Sample Collected LC34-IW0165-110.0-20230915 8260D MOD LC4 Custom
1237 LC34 Site secured. Heading to CHP to drop off equipment.
1317 CHP site secured; NF offsite.

Site Location:112g08985 LC34 – 112G08985 **Project Name:** bi-monthly sampling

---

Date: 10/13/2023 **Weather:** hot, sunny

Personnel: Cory O'Brien

Health and Safety: Insects, Slips trips, and Falls

PPE: Level D **Objective:** bi-monthly sampling

Equipment: YSI Pro Quatro Lamotte 2020 **Geopump II**

Field Notes:

0750 on-site, gather equipment and perform calibration verification

0830 start purge on LC34-IWO165

0845 Sample LC34-IWO0165-110.0-20231013 collected. Analysis 8260D (MOD) NASA LC34 Custom List

0900 Start purge on LC34-IWO162

0910 Sample LC34-IWO0162-110.0-20231013 collected. Analysis 8260D (MOD) NASA LC34 Custom List

0938 Start purge on LC34-IWO161

0950 Sample LC34-IWO0161-110.0-20231013 collected. Analysis 8260D (MOD) NASA LC34 Custom List

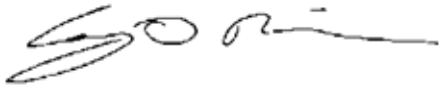
1010 Start purge on LC34-IWOO44D2

1022 Sample LC34-IWOO44D2-110.0-20231013 collected. Analysis 8260D (MOD) NASA LC34 Custom List

1050 Start purge on LC34-IWOOO1D2

1105 Sample LC34-IWOOO1D2-110.0-20231013 collected. Analysis 8260D (MOD) NASA LC34 Custom List

1115 perform post-sample calibration verification.



1130 Put IDW next to the system as instructed by Chuck Sorden

1200 Transfer samples to Chuck Sorden

1230 Drive to CHP

1300 Put Equipment away.

1330 Off Base

Calibration Report

Instrument	Aqua TROLL 600 Vented
Serial Number	840822
Created	11/10/2023

Sensor	**pH/ORP**
Serial Number	982670
Last Calibrated	11/10/2023

Calibration Details

Calibration Point 1

pH of Buffer	4.00 pH
pH mV	157.7 mV
Temperature	22.82 °C

Pre Measurement

pH	3.92 pH
pH mV	157.7 mV

Post Measurement

pH	4.00 pH
pH mV	156.5 mV

Calibration Point 2

pH of Buffer	7.00 pH
pH mV	-14.7 mV
Temperature	22.71 °C

Pre Measurement

pH	7.05 pH
pH mV	-14.8 mV

Post Measurement

pH	7.00 pH
pH mV	-14.6 mV

Calibration Point 3

pH of Buffer	10.00 pH
pH mV	-181.2 mV
Temperature	22.79 °C

Pre Measurement

pH	10.03 pH
pH mV	-181.2 mV

Post Measurement

pH	10.00 pH
pH mV	-179.8 mV

Slope and Offset 1

Slope	-57.44 mV/pH
Offset	-14.7 mV

Slope and Offset 2

Slope	-55.5 mV/pH
Offset	-14.7 mV

ORP

ORP Solution	Zobell's
Offset	32.1 mV
Temperature	22.72 °C
Pre Measurement	228.3 mV
Post Measurement	232.1 mV

Sensor **Conductivity**

Serial Number	1014112
Last Calibrated	11/10/2023

Calibration Details

TDS Conversion Factor (ppm)	0.65
Cell Constant	0.707
Reference Temperature	25.00 °C

Pre Measurement

Actual Conductivity	1,729.8 µS/cm
Specific Conductivity	1,809.2 µS/cm

Post Measurement

Actual Conductivity	1,350.9 µS/cm
Specific Conductivity	1,413.0 µS/cm

Sensor **RDO**

Serial Number	1053518
Last Calibrated	11/10/2023

Calibration Details

Slope	1.140122
Offset	0.00 mg/L

Calibration point 100%

Concentration	7.63 mg/L
Pre Measurement	99.91 %Sat
Post Measurement	100.00 %Sat
Temperature	22.61 °C
Barometric Pressure	1,019.3 mbar

Sensor **Turbidity**

Serial Number	1011684
Last Calibrated	10/30/2023

Calibration Details

Slope	1
Offset	-0.60 NTU

Calibration Point 1

Pre Measurement	0.00 NTU
Post Measurement	0.00 NTU

Sensor **Barometric Pressure**

Serial Number	840822
Last Calibrated	Factory Defaults

Sensor	**Pressure**
Serial Number	825947
Last Calibrated	Factory Defaults

Project Number:112g08985 Click or tap here to enter text. **Project Name:** LC34 biweekly sampling

---

Date: 11/27/2024 **Weather:** warm, clear, sunny

Personnel: Natalie Volk (NAV), Engineer

Health and Safety: heat stress, stinging insects, contaminated water

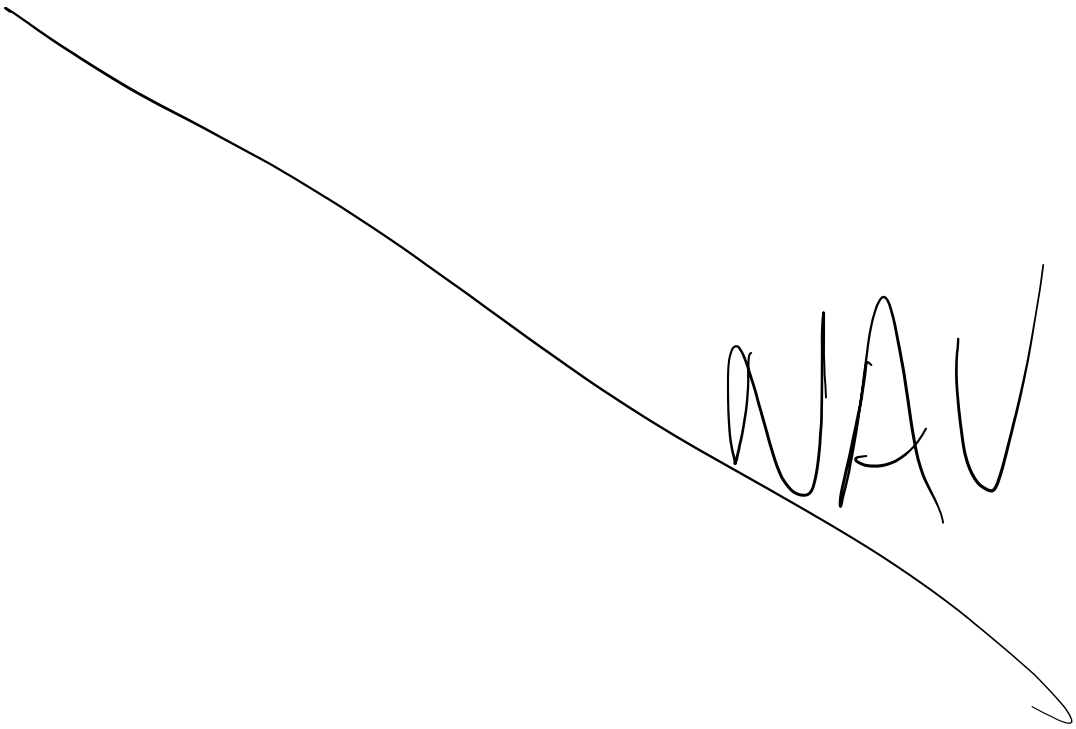
PPE: Level D **Objective:** Collect Biweekly samples at LC34

Equipment: YSI Pro Quatro Geotech Turbidimeter Geopump II

Field Notes:

0930 onsite begin groundwater sampling

0940 begin purge IW0162



0955 collect sample LC34-IW162-110.0-20231127 8260D LC34 Custom list

1008 begin purge IW0044D2

1023 collect sample LC34-IW0044D2-110.0-20231127 8260D LC34 Custom List

1030 end groundwater sampling. IDW purge water recycled through system

1040 off site

Calibration Report

Instrument	Aqua TROLL 600 Vented
Serial Number	840822
Created	12/21/2023

Sensor	**pH/ORP**
Serial Number	982670
Last Calibrated	12/21/2023

Calibration Details

Calibration Point 1

pH of Buffer	4.00 pH
pH mV	153.8 mV
Temperature	19.18 °C

Pre Measurement

pH	3.97 pH
pH mV	153.7 mV

Post Measurement

pH	4.00 pH
pH mV	150.8 mV

Calibration Point 2

pH of Buffer	7.02 pH
pH mV	-9.4 mV
Temperature	19.19 °C

Pre Measurement

pH	6.82 pH
pH mV	-9.3 mV

Post Measurement

pH	7.02 pH
pH mV	-9.2 mV

Calibration Point 3

pH of Buffer	10.05 pH
pH mV	-175.8 mV
Temperature	19.25 °C

Pre Measurement

pH	9.72 pH
pH mV	-175.6 mV

Post Measurement

pH	10.05 pH
pH mV	-172.4 mV

Slope and Offset 1

Slope	-54.04 mV/pH
Offset	-8.3 mV

Slope and Offset 2

Slope	-54.9 mV/pH
Offset	-8.3 mV

ORP

ORP Solution	ORP Standard
Offset	42.1 mV
Temperature	19.87 °C
Pre Measurement	228.3 mV
Post Measurement	230.4 mV

Sensor	**Conductivity**
Serial Number	1014112
Last Calibrated	12/21/2023

Calibration Details

TDS Conversion Factor (ppm)	0.65
Cell Constant	1.073
Reference Temperature	25.00 °C

Pre Measurement

Actual Conductivity	1,151.5 µS/cm
Specific Conductivity	1,306.6 µS/cm

Post Measurement

Actual Conductivity	1,245.3 µS/cm
Specific Conductivity	1,413.0 µS/cm

Sensor	**RDO**
Serial Number	1053518
Last Calibrated	12/21/2023

Calibration Details

Slope	1.1419029
Offset	-0.00 mg/L

Calibration point 100%

Concentration	8.11 mg/L
Pre Measurement	101.73 %Sat
Post Measurement	100.00 %Sat
Temperature	19.83 °C
Barometric Pressure	1,028.1 mbar

Sensor	**Turbidity**
Serial Number	1011684
Last Calibrated	12/21/2023

Calibration Details

Slope	1
Offset	-0.56 NTU

Calibration Point 1

Pre Measurement	0.00 NTU
Post Measurement	0.00 NTU

Sensor	**Barometric Pressure**
Serial Number	840822

Sampling /Purging Equipment Codes: APP = After Peristaltic Pump; B = Bailer; BP = Bladder Pump; ESP = Electric Submersible Pump; PP = Peristaltic Pump; RFPP = Reverse Flow Peristaltic Pump; SM = Straw Method (tubing Gravity Drain); VT = Vacuum Trap; O = Other (Specify)

Calibration Report

Instrument	Aqua TROLL 600 Vented
Serial Number	840822
Created	2/16/2024

Sensor	**pH/ORP**
Serial Number	982670
Last Calibrated	2/16/2024

Calibration Details

Calibration Point 1

pH of Buffer	4.00 pH
pH mV	156.9 mV
Temperature	17.19 °C

Pre Measurement

pH	3.92 pH
pH mV	156.9 mV

Post Measurement

pH	4.00 pH
pH mV	152.8 mV

Calibration Point 2

pH of Buffer	7.02 pH
pH mV	-19.4 mV
Temperature	17.62 °C

Pre Measurement

pH	7.20 pH
pH mV	-19.4 mV

Post Measurement

pH	7.02 pH
pH mV	-18.9 mV

Calibration Point 3

pH of Buffer	10.05 pH
pH mV	-194.7 mV
Temperature	17.52 °C

Pre Measurement

pH	10.41 pH
pH mV	-194.6 mV

Post Measurement

pH	10.05 pH
pH mV	-189.8 mV

Slope and Offset 1

Slope	-58.36 mV/pH
Offset	-18.2 mV

Slope and Offset 2

Slope	-57.86 mV/pH
Offset	-18.2 mV

ORP

ORP Solution	Zobell's
Offset	20.2 mV
Temperature	19.99 °C
Pre Measurement	257.6 mV
Post Measurement	235.7 mV

Sensor	**Conductivity**
Serial Number	1014112
Last Calibrated	2/16/2024

Calibration Details

TDS Conversion Factor (ppm)	0.65
Cell Constant	0.83
Reference Temperature	25.00 °C

Pre Measurement

Actual Conductivity	1,638.2 µS/cm
Specific Conductivity	1,828.3 µS/cm

Post Measurement

Actual Conductivity	1,265.9 µS/cm
Specific Conductivity	1,413.0 µS/cm

Sensor	**RDO**
Serial Number	1053518
Last Calibrated	2/16/2024

Calibration Details

Slope	1.1482536
Offset	-0.00 mg/L

Calibration point 100%

Concentration	8.21 mg/L
Pre Measurement	100.00 %Sat
Post Measurement	100.00 %Sat
Temperature	18.55 °C
Barometric Pressure	1,020.2 mbar

Sensor	**Turbidity**
Serial Number	1011684
Last Calibrated	2/2/2024

Calibration Details

Slope	1
Offset	-0.33 NTU

Calibration Point 1

Pre Measurement	0.00 NTU
Post Measurement	0.00 NTU

Sensor	**Barometric Pressure**
Serial Number	840822
Last Calibrated	Factory Defaults

Sensor	**Pressure**
Serial Number	825947
Last Calibrated	Factory Defaults

PERMISSION TO PUBLISH

Eurofins grants NASA and the U.S. Government permission to reproduce, publish, and distribute Resource Conservation and Recovery Act (RCRA) Program Documents, submitted in 2023 or beyond, hereinafter referred to as “the Work,” in any form, language, or manner, now or hereafter known or developed, throughout the world, and to authorize others to do so on its behalf.

Eurofins certifies that the Work does not infringe any existing copyright, proprietary right, or other right of a third party; and all clearance permissions, if necessary, to use materials of third parties have been obtained.

ANALYTICAL REPORT

PREPARED FOR

Attn: Mr. Mark Jonnet
Tetra Tech, Inc.
Foster Plaza 7
661 Anderson Drive
Suite 200
Pittsburgh, Pennsylvania 15220-2745

Generated 5/8/2023 2:45:49 PM

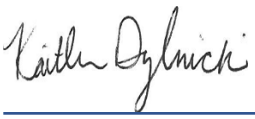
JOB DESCRIPTION

NASA KSC LC34

JOB NUMBER

670-18010-1

Eurofins Orlando
481 Newburyport Avenue
Altamonte Springs FL 32701



See page two for job notes and contact information.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Definitions/Glossary

Client: Tetra Tech, Inc.
Job ID: 670-18010-1
Project/Site: NASA KSC LC34

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.
U	Indicates that the compound was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 670-18010-1

Laboratory: Eurofins Orlando

Narrative

Job Narrative
670-18010-1

Receipt
The samples were received on 4/14/2023 4:00 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 1.0°C

GC/MS VOA
Method 8260D: The continuing calibration verification (CCV) associated with batch 400-621730 recovered outside acceptance criteria, low biased, for Bromomethane, Chloromethane and Dichlorodifluoromethane. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

Method 8260D: The following samples were diluted to bring the concentration of target analytes within the calibration range: LC34-IW0044D2-110.0-20230414 (670-18010-2) and LC34-IW0162-110.0-20230414 (670-18010-3). Elevated reporting limits (RLs) are provided.

Method 8260D: The matrix spike / matrix spike duplicate (MS/MSD) precision for analytical batch 400-622389 was outside control limits. Sample matrix interference and/or non-homogeneity are suspected.

Method 8260D: The following samples were diluted to bring the concentration of target analytes within the calibration range: LC34-RW19C-20230414 (670-18010-9) and LC34-RW20C-20230414 (670-18010-10). Elevated reporting limits (RLs) are provided.

Method 8260D: The matrix spike / matrix spike duplicate (MS/MSD) precision for analytical batch 400-622748 was outside control limits. Sample non-homogeneity is suspected.

Method 8260D: The matrix spike (MS) recoveries for analytical batch 400-622748 were outside control limits. Non-homogeneity is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 8260D: The following samples were diluted to bring the concentration of target analytes within the calibration range: LC34-RW17C-20230414 (670-18010-7), LC34-RW18C-20230414 (670-18010-8) and LC34-RW21D-20230414 (670-18010-11). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Detection Summary

Client: Tetra Tech, Inc.
Project/Site: NASA KSC LC34

Job ID: 670-18010-1

Client Sample ID: LC34-IW0165-110.0-20230414 — Lab Sample ID: 670-18010-1

No Detections.

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Southeast, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Southeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Southeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Southeast, LLC.

LC34-RW21D-20230414 (670-18010-11)	4/14/23	11:40 Eastern		Water			X	3	HOT

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Southeast, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Southeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Southeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Southeast, LLC.

Possible Hazard Identification: Unconfirmed	Sample Disposal (A fee may be assessed if samples are retained longer than 1 month): ☐ Return To Client ☐ Disposal By Lab ☐ Archive For _____ Months
Deliverable Requested: I, II, III, IV, Other (specify) Primary Deliverable Rank: 2	Special Instructions/QC Requirements:

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Definitions/Glossary

Client: Tetra Tech, Inc.
Job ID: 670-18773-1
Project/Site: NASA KSC LC34

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
J1	Estimated value; value may not be accurate. Surrogate recovery outside of criteria.
U	Indicates that the compound was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 670-18773-1

Laboratory: Eurofins Orlando

Narrative

Job Narrative
670-18773-1

Receipt
The samples were received on 4/28/2023 2:30 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 0.5°C

GC/MS VOA
Method 8260D: The continuing calibration verification (CCV) associated with batch 400-623603 recovered above the upper control limit for Chloromethane and Methyl acetate. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D: One of four surrogate recoveries for the following samples were outside the upper control limit: LC34-iw00442-110.0-20230428 (670-18773-1) and (MB 400-623768/4). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Method 8260D: The continuing calibration verification (CCV) associated with batch 400-623768 recovered above the upper control limit for 1,2-Dichloroethane-d4 (Surr). The percent recovery was within acceptance limits; therefore, the data is reported.

Method 8260D: The following sample was diluted to bring the concentration of target analytes within the calibration range: LC34-iw00442-110.0-20230428 (670-18773-1). Elevated reporting limits (RLs) are provided.

Method 8260D: One of four surrogate recoveries for the following sample was outside the upper control limit: (400-237100-A-15 MS). The target analyte reported was within acceptance limits. Therefore, the data is reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Detection Summary

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Southeast, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Southeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Southeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Southeast, LLC.

Possible Hazard Identification	Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Client: Tetra Tech, Inc.
Job ID: 670-19564-1
Project/Site: NASA KSC LC34

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
U	Indicates that the compound was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 670-19564-1

Laboratory: Eurofins Orlando

Narrative

Job Narrative
670-19564-1

Receipt
The samples were received on 5/12/2023 4:34 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 2.3°C

GC/MS VOA
Method 8260D: The continuing calibration verification (CCV) associated with batch 400-625757 recovered outside acceptance criteria, low biased, for Chloroethane and Dichlorodifluoromethane. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

Method 8260D: The continuing calibration verification (CCV) associated with batch 400-625757 recovered above the upper control limit for 1,2,4-Trichlorobenzene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D: The following sample was diluted to bring the concentration of target analytes within the calibration range: LC34-IW004402-110.0-20200512 (670-19564-1). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Detection Summary

Client: Tetra Tech, Inc.
Project/Site: NASA KSC LC34

Job ID: 670-19564-1

Client Sample ID: LC34-IW004402-110.0-20200512 — Lab Sample ID: 670-19564-1

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Southeast, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Southeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Southeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Southeast, LLC.

Possible Hazard Identification *Unconfirmed*	***Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)*** ☐ *Return To Client* ☐ *Disposal By Lab* ☐ *Archive For _____ Months*

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.
L	Off-scale high. Actual value is known to be greater than the value given.
U	Indicates that the compound was analyzed for but not detected.
V	Indicates that the analyte was detected at or above the method detection limit in both the sample and the associated method blank and the value of 10 times the blank value was equal to or greater than the associated sample value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 670-20418-1

Laboratory: Eurofins Orlando

Narrative

Job Narrative
670-20418-1

Receipt
The samples were received on 5/26/2023 3:00 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 6.0°C

GC/MS VOA
Method 8260D: The method blank for analytical batch 680-781169 contained Toluene above the method detection limit (MDL). Associated samples were not re-analyzed because results were less than the reporting limit (RL) OR practical quantitation limit (PQL).

Method 8260D: The following sample was diluted to bring the concentration of target analytes within the calibration range: LC34-IW044D2-0110.0-20230526 (670-20418-2). Elevated reporting limits (RLs) are provided.

Method 8260D: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 680-781169 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

Method 8260D: The continuing calibration verification (CCV) associated with batch 680-781169 recovered outside acceptance criteria, low biased, for 2-Hexanone. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

Method 8260D: The continuing calibration verification (CCV) associated with batch 680-781169 recovered above the upper control limit for 1,1-Dichloroethene, Carbon disulfide, Carbon tetrachloride, Chloromethane, Methylene Chloride, trans-1,2-Dichloroethene, Trichlorofluoromethane, Vinyl chloride and 1,1,2-Trichloro-1,2,2-trifluoroethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D: The laboratory control sample duplicate (LCSD) for analytical batch 680-781169 recovered outside control limits for the following analytes: Dichlorodifluoromethane and Vinyl chloride. These analytes were biased high in the LCSD and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D: The continuing calibration verification (CCV) associated with batch 680-781475 recovered above the upper control limit for 2-Hexanone, Acetone, Carbon disulfide, Chloroethane, 2-Butanone (MEK), 4-Methyl-2-pentanone, Trichlorofluoromethane and Methyl acetate. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for analytical batch 680-781475 recovered outside control limits for the following analytes: 2-Hexanone, Acetone, Carbon disulfide, 2-Butanone (MEK), 4-Methyl-2-pentanone and Methyl acetate. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-781475.

Method 8260D: The following sample was diluted to bring the concentration of target analytes within the calibration range: LC34-IW044D2-0110.0-20230526 (670-20418-2). Elevated reporting limits (RLs) are provided.

Method 8260D: The result for trichloroethene was above the upper calibration range and is reported as an Estimated ("E / L") value in sample: LC34-IW044D2-0110.0-20230526 (670-20418-2) . A second dilution was attempted but was not reported due to internal standard failure.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Detection Summary

Client: Tetra Tech, Inc.
Project/Site: NASA KSC LC34

Job ID: 670-20418-1

Client Sample ID: LC34-IW0165-0110.0-20230526 — Lab Sample ID: 670-20418-1

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Project/Site: NASA KSC LC34 HCS

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates that the compound was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 670-20576-1

Laboratory: Eurofins Orlando

Narrative

Job Narrative
670-20576-1

Receipt
The samples were received on 5/31/2023 3:05 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 2.0°C

GC/MS VOA
Method 8260D: The following samples were diluted to bring the concentration of target analytes within the calibration range: LC34-RW20C-20230531 (670-20576-5), LC34-RW19C-20230531 (670-20576-6), LC34-RW18C-20230531 (670-20576-7) and LC34-RW17C-20230531 (670-20576-8). Elevated reporting limits (RLs) are provided.

Method 8260D: The following samples were diluted due to the nature of the sample matrix: LC34-RW21D-20230530 (670-20576-1) and LC34-AS2-20230531 (670-20576-4). Elevated reporting limits (RLs) are provided.

Method 8260D: The following sample was diluted to bring the concentration of target analytes within the calibration range: LC34-RW19C-20230531 (670-20576-6). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Accreditation/Certification Summary

Client: Tetra Tech, Inc.
Job ID: 670-20576-1
Project/Site: NASA KSC LC34 HCS

Laboratory: Eurofins Houston

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
Florida	NELAP	E871002	06-30-23

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8260D		Water	Cyclohexane

Method Summary

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Southeast, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Southeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Southeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Southeast, LLC.

Possible Hazard Identification	Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
J1	Estimated value; value may not be accurate. Surrogate recovery outside of criteria.
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.
L	Off-scale high. Actual value is known to be greater than the value given.
U	Indicates that the compound was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 670-21193-1

Laboratory: Eurofins Orlando

Narrative

Job Narrative
670-21193-1

Receipt
The samples were received on 6/9/2023 4:00 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 1.0°C

GC/MS VOA
Method 8260D: Surrogate recovery for the following sample was outside the upper control limit: LC34-IW0165-110.0-20230609 (670-21193-1). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Method 8260D: The surrogate recovery for the blank associated with analytical batch 680-783473 was outside the upper control limits.

Method 8260D: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-783473.

Method 8260D: The continuing calibration verification (CCV) associated with batch 680-783473 recovered above the upper control limit for Bromomethane, Chloroethane, Chloromethane, Trichlorofluoromethane and Vinyl chloride. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for analytical batch 680-783473 recovered outside control limits for the following analytes: Vinyl chloride. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D: Surrogate recovery for the following sample was outside control limits: LC34-IW0162-110.0-20230609 (670-21193-3). Evidence of matrix interferences is not obvious.

Method 8260D: The continuing calibration verification (CCV) analyzed in batch 680-783726 was outside the method criteria for the following analyte(s): 2-Hexanone, Chloroethane, Dichlorodifluoromethane, 2-Butanone (MEK), 4-Methyl-2-pentanone and Vinyl chloride. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8260D: The laboratory control sample (LCS) for analytical batch 680-783726 recovered outside control limits for the following analytes: 2-Hexanone, Acetone, Carbon disulfide, 2-Butanone (MEK), 4-Methyl-2-pentanone and Methyl acetate. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D: The method blank for analytical batch 680-783726 contained Carbon disulfide above the method detection limit (MDL). The detection was less than half of the reporting limit (RL)) OR practical quantitation limit (PQL).; therefore, the data has been qualified and reported.

Method 8260D: The following sample was diluted to bring the concentration of target analytes within the calibration range: LC34-IW0044D2-110.0-20230609 (670-21193-2). Elevated reporting limits (RLs) are provided.

Method 8260D: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 680-783726 were outside control limits. Sample matrix interference is suspected.

Method 8260D: The native sample, matrix spike, and matrix spike duplicate (MS/MSD) associated with analytical batch 680-783726 were performed at the same dilution. Due to the additional level of analyte present in the spiked samples, the concentration of Acetone in the MS/MSD was above the instrument calibration range. The data have been reported and qualified.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Detection Summary

Client: Tetra Tech, Inc.

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Southeast, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Southeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Southeast, LLC attention immediately If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Southeast, LLC.

Possible Hazard Identification	Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
J1	Estimated value; value may not be accurate. Surrogate recovery outside of criteria.
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.
U	Indicates that the compound was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 670-21998-1

Laboratory: Eurofins Orlando

Narrative

Job Narrative
670-21998-1

Receipt
The samples were received on 6/23/2023 3:40 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 0.5°C

GC/MS VOA
Method 8260D: The closing continuing calibration verification (CCVC) associated with batch 680-786972 recovered above the upper control limit for 1,1-Dichloroethane, Bromomethane, Chloromethane and Dichlorodifluoromethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D: The following samples were diluted to bring the concentration of target analytes within the calibration range: LC34-RW1A-20230623 (670-21998-5), LC34-RW1B-20230623 (670-21998-6), LC34-RW2A-20230623 (670-21998-7), LC34-RW2B-20230623 (670-21998-8), LC34-RW3A-20230623 (670-21998-9), LC34-RW3B-20230623 (670-21998-10), LC34-RW9A-20230623 (670-21998-11), LC34-RW17C-20230623 (670-21998-12), LC34-RW18C-20230623 (670-21998-13), LC34-RW19C-20230623 (670-21998-14), LC34-RW20C-20230623 (670-21998-15) and LC34-RW21D-20230622 (670-21998-16). Elevated reporting limits (RLs) are provided.

Method 8260D: The following analyte(s) recovered outside control limits for the LCS associated with analytical batch 680-786972: Vinyl chloride. This is not indicative of a systematic control problem because these were random marginal exceedances. Qualified results have been reported.

Method 8260D: The continuing calibration verification (CCV) associated with batch 680-786972 recovered above the upper control limit for Vinyl chloride. Non-detections of the affected analytes are reported. Any detections are considered estimated.

Method 8260D: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-786972.

Method 8260D: Surrogate recovery for the following sample was outside the upper control limit: LC34-GAC-20230623 (670-21998-1). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Method 8260D: The continuing calibration verification (CCV) associated with batch 680-787170 recovered above the upper control limit for 1,1-Dichloroethene, Bromomethane and 1,1,2-Trichloro-1,2,2-trifluoroethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D: The laboratory control sample (LCS) for analytical batch 680-787170 recovered outside control limits for the following analytes: 1,1-Dichloroethene. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-787170.

Method 8260D: The initial calibration verification (ICV) analyzed in batch 680-786805 was outside method criteria for the following analyte(s): Bromomethane, Chloromethane, Dichlorodifluoromethane, Vinyl chloride and 1,1,2-Trichloro-1,2,2-trifluoroethane. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8260D: The method blank for analytical batch 680-787036 contained Carbon disulfide above the method detection limit (MDL). Associated samples were not re-analyzed because results were less than half of the reporting limit (RL) OR practical quantitation limit (PQL).

Method 8260D: The continuing calibration verification (CCV) associated with batch 680-787036 recovered above the upper control limit for

Job ID: 670-21998-1 (Continued)

Laboratory: Eurofins Orlando (Continued)

1,1,2,2-Tetrachloroethane, 2-Hexanone, Bromomethane, 1,2-Dibromoethane (EDB), Isopropylbenzene, m,p-Xylenes, o-Xylene, Toluene and Xylenes, Total. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D: The laboratory control sample duplicate (LCSD) for analytical batch 680-787036 recovered outside control limits for the following analytes: 1,1,2,2-Tetrachloroethane, 1,2-Dibromoethane (EDB), Isopropylbenzene, 4-Methyl-2-pentanone, o-Xylene and Xylenes, Total. These analytes were biased high in the LCSD and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D: The following sample was diluted to bring the concentration of target analytes within the calibration range: LC34-Influent-20230623 (670-21998-4). Elevated reporting limits (RLs) are provided.

Method 8260D: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-787036.

Method 8260D: The initial calibration verification (ICV) analyzed in batch 680-786713 was outside method criteria for the following analyte(s): Bromomethane. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Southeast, LLC places the ownership of method analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed the samples must be shipped back to the Eurofins Environment Testing Southeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Southeast, LLC attention immediately If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Southeast, LLC.

Possible Hazard Identification	Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)
Unconfirmed	☐ Return To Client ☐ Disposal By Lab ☐ Archive For _____ Months

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.
U	Indicates that the compound was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 670-22009-1

Laboratory: Eurofins Orlando

Narrative

Job Narrative
670-22009-1

Receipt
The samples were received on 6/23/2023 3:40 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 0.5°C

GC/MS VOA
Method 8260D: The continuing calibration verification (CCV) associated with batch 680-786001 recovered above the upper control limit for 1,1,2,2-Tetrachloroethane, 2-Hexanone, Acetone, cis-1,3-Dichloropropene, 2-Butanone (MEK), 4-Methyl-2-pentanone and trans-1,3-Dichloropropene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D: The continuing calibration verification (CCV) associated with batch 680-786001 recovered outside acceptance criteria, low biased, for Bromomethane, Dichlorodifluoromethane and Trichlorofluoromethane. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

Method 8260D: The laboratory control sample (LCS) for analytical batch 680-786001 recovered outside control limits for the following analytes: 2-Hexanone, Acetone, Bromoform, 2-Butanone (MEK), 4-Methyl-2-pentanone, o-Xylene and Methyl acetate. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D: The laboratory control sample duplicate (LCSD) for analytical batch 680-786001 recovered outside control limits for the following analytes: 1,2-Dibromo-3-Chloropropane, 2-Hexanone, Acetone, Dichlorodifluoromethane, 2-Butanone (MEK), 4-Methyl-2-pentanone and Methyl acetate. These analytes were biased high in the LCSD and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-786001.

Method 8260D: The continuing calibration verification (CCV) associated with batch 680-786080 recovered above the upper control limit for 1,2-Dibromo-3-Chloropropane, Trichlorofluoromethane and 1,1,2-Trichloro-1,2,2-trifluoroethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D: The continuing calibration verification (CCV) associated with batch 680-786080 recovered outside acceptance criteria, low biased, for Bromomethane and Dichlorodifluoromethane. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

Method 8260D: The laboratory control sample (LCS) for analytical batch 680-786080 recovered outside control limits for the following analytes: 4-Methyl-2-pentanone. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

Method 8260D: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for analytical batch 680-786080 recovered outside control limits for the following analyte(s): 4-Methyl-2-pentanone. 4-Methyl-2-pentanone has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. These results have been reported and qualified.

Method 8260D: The laboratory control sample duplicate (LCSD) for analytical batch 680-786080 recovered outside control limits for the following analytes: Ethylbenzene, Isopropylbenzene, 2-Butanone (MEK), 4-Methyl-2-pentanone, m,p-Xylenes, o-Xylene, Styrene and Xylenes, Total. These analytes were biased high in the LCSD and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-786080.

Job ID: 670-22009-1 (Continued)

Laboratory: Eurofins Orlando (Continued)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Detection Summary

Client: Tetra Tech, Inc.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Client: Tetra Tech, Inc.
Job ID: 670-22766-1
Project/Site: NASA KSC LC34 HCS

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J1	Estimated value; value may not be accurate. Surrogate recovery outside of criteria.
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.
U	Indicates that the compound was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 670-22766-1

Laboratory: Eurofins Orlando

Narrative

Job Narrative
670-22766-1

Receipt
The samples were received on 7/7/2023 4:32 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 4.4°C

GC/MS VOA
Method 8260D: The matrix spike (MS) recoveries for analytical batch 860-111855 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

Method 8260D: Surrogate recovery for the following sample was outside control limits: (860-52798-B-10 MS). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Detection Summary

Client: Tetra Tech, Inc.
Job ID: 670-22766-1
Project/Site: NASA KSC LC34 HCS

Client Sample ID: LC34-IW0162-110.0-20230707 — Lab Sample ID: 670-22766-1

Analyte	Result	Qualifier	PQL	MDL	Unit	Dil Fac	D	Method	Prep Type
cis-1,2-Dichloroethene	10		1.0	0.71	ug/L	1		8260D	Total/NA
Trichloroethene	10		5.0	0.79	ug/L	1		8260D	Total/NA

Client Sample ID: LC34-IW0044D2-110.0-20230707 — Lab Sample ID: 670-22766-2

Analyte	Result	Qualifier	PQL	MDL	Unit	Dil Fac	D	Method	Prep Type
1,1-Dichloroethene	11		1.0	0.74	ug/L	1		8260D	Total/NA
trans-1,2-Dichloroethene	12		1.0	0.95	ug/L	1		8260D	Total/NA
cis-1,2-Dichloroethene - DL	2700		25	18	ug/L	25		8260D	Total/NA
Trichloroethene - DL	2900		130	20	ug/L	25		8260D	Total/NA
Vinyl chloride - DL	230		50	16	ug/L	25		8260D	Total/NA

Client Sample ID: LC34IW0165-110.0-20230707 — Lab Sample ID: 670-22766-3

No Detections.

This Detection Summary does not include radiochemical test results.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.
U	Indicates that the compound was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

REVISION

The report being provided is a revision of the original report sent on 7/26/2023. The report (revision 1) is being revised due to update of result and narration for detection of trichloroethene in method blank that was not initially reported..

Receipt
The samples were received on 7/21/2023 2:55 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 2.2°C

GC/MS VOA
Method 8260D: The initial calibration verification (ICV) analyzed in batch 400-627009 was outside method criteria for the following analyte(s): Bromomethane. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8260D: The continuing calibration verification (CCV) associated with batch 400-634409 recovered above the upper control limit for Methyl acetate. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data have been reported.

Method 8260D: The continuing calibration verification (CCV) associated with batch 400-634409 recovered outside acceptance criteria, low biased, for Dichlorodifluoromethane. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

Method 8260D: The following sample was diluted to bring the concentration of target analytes within the calibration range: LC34-IW0044D2-110.0-20230721 (670-23640-2). Elevated reporting limits (RLs) are provided.

Method 8260D: The laboratory control sample (LCS) for analytical batch 400-634565 recovered outside control limits for the following analyte: Bromomethane. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

Method 8260D: The continuing calibration verification (CCV) associated with batch 400-634565 recovered above the upper control limit for Bromomethane and Chloromethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 400-634565 were outside control limits for Bromomethane due to high bias for this analyte on this day of analysis.

Method 8260D: The method blank for analytical batch 400-634565 contained Trichloroethene above the reporting limit (RL). Associated sample(s) were not re-extracted and/or re-analyzed because results were greater than 10X the value found in the method blank.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Detection Summary

Client: Tetra Tech, Inc.
Project/Site: NASA KSC LC34

Job ID: 670-23640-1

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Southeast, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Southeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Southeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Southeast, LLC.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Definitions/Glossary

Client: Tetra Tech, Inc.
Job ID: 670-24141-1
Project/Site: NASA KSC LC34

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.
U	Indicates that the compound was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 670-24141-1

Laboratory: Eurofins Orlando

Narrative

Job Narrative
670-24141-1

Receipt
The samples were received on 7/31/2023 12:31 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 1.5°C

GC/MS VOA
Method 8260D: The following samples were diluted to bring the concentration of target analytes within the calibration range: LC34-RW17C-20230731 (670-24141-4), LC34-RW18C-20230731 (670-24141-5), LC34-RW19C-20230731 (670-24141-6), LC34-RW20C-20230731 (670-24141-7) and LC34-RW21D-20230731 (670-24141-8). Elevated reporting limits (RLs) are provided.

Method 8260D: The matrix spike (MS) recovery for analytical batch 400-636199 was outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

Method 8260D: The continuing calibration verification (CCV) associated with batch 400-636199 recovered outside acceptance criteria, low biased, for Dichlorodifluoromethane. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

Method 8260D: The initial calibration verification (ICV) analyzed in batch 400-633903 was outside method criteria for the following analyte(s): Bromomethane. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Detection Summary

Client: Tetra Tech, Inc.

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Southeast, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Southeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Southeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Southeast, LLC.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Definitions/Glossary

Client: Tetra Tech, Inc.
Job ID: 670-24475-1
Project/Site: NASA KSC LC34

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.
U	Indicates that the compound was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 670-24475-1

Laboratory: Eurofins Orlando

Narrative

Job Narrative
670-24475-1

Receipt

The samples were received on 8/4/2023 3:50 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 2.3°C

GC/MS VOA

Method 8260D: The continuing calibration verification (CCV) associated with batch 400-636212 recovered above the upper control limit for Methyl acetate. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data have been reported.

Method 8260D: The continuing calibration verification (CCV) associated with batch 400-636212 recovered outside acceptance criteria, low biased, for 1,1,2-Trichloro-1,2,2-trifluoroethane, 1,1-Dichloroethene, Bromomethane, Carbon disulfide, Chloromethane and Dichlorodifluoromethane. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

Method 8260D: The matrix spike / matrix spike duplicate (MS/MSD) precision for analytical batch 400-636212 was outside control limits. Sample matrix interference and/or non-homogeneity are suspected.

Method 8260D: The continuing calibration verification (CCV) associated with batch 400-636385 recovered outside acceptance criteria, low biased, for Carbon disulfide and Dichlorodifluoromethane. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

Method 8260D: The following sample was diluted to bring the concentration of target analytes within the calibration range: LC34-IW0044D2-110.0-20230804 (670-24475-2). Elevated reporting limits (RLs) are provided.

Method 8260D: The continuing calibration verification (CCV) associated with batch 400-636385 recovered above the upper control limit for 1,2-Dichloroethane-d4 (Surr). The percent recovery was within limits. Therefore, the data is reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Detection Summary

Client: Tetra Tech, Inc.
Project/Site: NASA KSC LC34

Job ID: 670-24475-1

Client Sample ID: LC34-IW0165-110.0-20230804 — Lab Sample ID: 670-24475-1

No Detections.

Client Sample ID: LC34-IW0044D2-110.0-20230804 — Lab Sample ID: 670-24475-2

Analyte	Result	Qualifier	PQL	MDL	Unit	Dil Fac	D	Method	Prep Type

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Southeast, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Southeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Southeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Southeast, LLC.

Possible Hazard Identification	*Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)*

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

ANALYTICAL REPORT

PREPARED FOR

Attn: Mr. Mark Jonnet
Tetra Tech, Inc.
Foster Plaza 7
661 Anderson Drive
Suite 200
Pittsburgh, Pennsylvania 15220-2745

Generated 8/25/2023 2:43:25 PM

JOB DESCRIPTION

NASA KSC LC34

JOB NUMBER

670-25336-1

Eurofins Orlando
481 Newburyport Avenue
Altamonte Springs FL 32701

See page two for job notes and contact information.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Definitions/Glossary

Client: Tetra Tech, Inc.
Job ID: 670-25336-1
Project/Site: NASA KSC LC34

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.
U	Indicates that the compound was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 670-25336-1

Laboratory: Eurofins Orlando

Narrative

Job Narrative
670-25336-1

Receipt
The samples were received on 8/18/2023 4:12 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 1.5°C

GC/MS VOA
Method 8260D: The continuing calibration verification (CCV) associated with batch 400-638093 recovered outside acceptance criteria, low biased, for Dichlorodifluoromethane. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

Method 8260D: The following sample was diluted to bring the concentration of target analytes within the calibration range: LC34-IW0044D2-110.0-20230818 (670-25336-2). Elevated reporting limits (RLs) are provided.

Method 8260D: The matrix spike duplicate (MSD) recovery for analytical batch 400-638093 was outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

Method 8260D: The initial calibration verification (ICV) analyzed in batch 400-633903 was outside method criteria for the following analyte(s): Bromomethane. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8260D: The continuing calibration verification (CCV) associated with batch 400-638289 recovered outside acceptance criteria, low biased, for Dichlorodifluoromethane. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Detection Summary

Client: Tetra Tech, Inc.
Project/Site: NASA KSC LC34

Job ID: 670-25336-1

Client Sample ID: LC34-IW0165-110.0-20230818 — Lab Sample ID: 670-25336-1

No Detections.

Client Sample ID: LC34-IW0044D2-110.0-20230818 — Lab Sample ID: 670-25336-2

Analyte	Result	Qualifier	PQL	MDL	Unit	Dil Fac	D	Method	Prep Type

LC34-IW0162-110.0-20230818 (670-25336-3)	8/18/23	10:45 Eastern		Water			X	3	use caution site high in TCE. unp incase of HDSP

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Southeast, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Southeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Southeast, LLC attention immediately If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Southeast, LLC.

Possible Hazard Identification	Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)
Unconfirmed	☐ Return To Client ☐ Disposal By Lab ☐ Archive For _____ Months
Deliverable Requested: I, II, III, IV, Other (specify) Primary Deliverable Rank: 2	Special Instructions/QC Requirements:

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Definitions/Glossary

Client: Tetra Tech, Inc.
Job ID: 670-25814-1
Project/Site: NASA KSC LC34 HCS

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.
U	Indicates that the compound was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 670-25814-1

Laboratory: Eurofins Orlando

Narrative

Job Narrative
Client: Tetra Tech
Client PM: Mark Jonnet
Project: NASA KSC LC34
Project Number: 112G08985
Job: 670-25814-1

Receipt
The samples were received on 8/28/2023 1:18 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 1.5º C.

GC/MS VOA
Method 8260D: The continuing calibration verification (CCV) associated with batch 680-796088 recovered above the upper control limit for Chloromethane and Trichlorofluoromethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for analytical batch 680-796088 recovered outside control limits for the following analytes: Trichlorofluoromethane. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D: The following samples were diluted to bring the concentration of target analytes within the calibration range: LC34-RW17C-20230828 (670-25814-4), LC34-RW18C-20230828 (670-25814-5), LC34-RW19C-20230828 (670-25814-6), LC34-RW20C-20230828 (670-25814-7) and LC34-RW21D-20230828 (670-25814-8). Elevated reporting limits (RLs) are provided.

Method 8260D: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-796088.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Detection Summary

Client: Tetra Tech, Inc.
Project/Site: NASA KSC LC34 HCS

Job ID: 670-25814-1

Client Sample ID: LC34-GAC-20230828 — Lab Sample ID: 670-25814-1

No Detections.

1,1,2-Trichloro-1,2,2-trifluoroethane	58	U	250	58	ug/L			09/01/23 14:10	250

Client: Tetra Tech, Inc.
Project/Site: NASA KSC LC34 HCS

Job ID: 670-25814-1

Client Sample ID: LC34-RW18C-20230828
Date Collected: 08/28/23 10:35
Date Received: 08/28/23 13:18

Lab Sample ID: 670-25814-5
Matrix: Water

Method: SW846 8260D - Volatile Organic Compounds by GC/MS (Continued)

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Southeast, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Southeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Southeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Southeast, LLC.

Possible Hazard Identification	*Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)*

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

ANALYTICAL REPORT

PREPARED FOR

Attn: Mr. Mark Jonnet
Tetra Tech, Inc.
Foster Plaza 7
661 Anderson Drive
Suite 200
Pittsburgh, Pennsylvania 15220-2745

Generated 9/8/2023 1:18:24 PM Revision 1

JOB DESCRIPTION

NASA KSC LC34

JOB NUMBER

670-26136-1

Eurofins Orlando
481 Newburyport Avenue
Altamonte Springs FL 32701

See page two for job notes and contact information.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Job ID: 670-26136-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.
U	Indicates that the compound was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 670-26136-1

Laboratory: Eurofins Orlando

Narrative

Job Narrative
670-26136-1

REVISION

The report being provided is a revision of the original report sent on 9/7/2023. The report (revision 1) is being revised due to update of the reporting limit for cyclohexane..

Receipt
The samples were received on 9/1/2023 3:56 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 2.8°C

GC/MS VOA
Method 8260D: The continuing calibration verification (CCV) associated with batch 680-796791 recovered above the upper control limit for Chloromethane and Trichlorofluoromethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: LC34-IW0165-110.0-20230901 (670-26136-1), LC34-IW0044D2-110.0-20230901 (670-26136-2) and LC34-IW0162-110.0-20230901 (670-26136-3).

Method 8260D: The continuing calibration verification (CCV) analyzed in batch 680-796791 was outside the method criteria for the following analyte(s): Chloroethane. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8260D: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for analytical batch 680-796791 recovered outside control limits for the following analytes: Chloromethane and Trichlorofluoromethane. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-796791.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Detection Summary

Client: Tetra Tech, Inc.
Project/Site: NASA KSC LC34

Job ID: 670-26136-1

Client Sample ID: LC34-IW0165-110.0-20230901 — Lab Sample ID: 670-26136-1

No Detections.

Client Sample ID: LC34-IW0044D2-110.0-20230901 — Lab Sample ID: 670-26136-2

Analyte	Result	Qualifier	PQL	MDL	Unit	Dil Fac	D	Method	Prep Type

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Southeast, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Southeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Southeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Southeast, LLC.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates that the compound was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 670-26913-1

Laboratory: Eurofins Orlando

Narrative

Job Narrative
670-26913-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 9/16/2023 8:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 0.8°C

GC/MS VOA
Method 8260D: The continuing calibration verification (CCV) associated with batch 680-798769 recovered above the upper control limit for 1,1,2-Trichloro-1,2,2-trifluoroethane, Bromomethane and Chloroethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is impacted: (CCVIS 680-798769/3).

Method 8260D: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-798769.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Detection Summary

Client: Tetra Tech, Inc.
Project/Site: NASA KSC LC34

Job ID: 670-26913-1

Client Sample ID: LC34-IW0162-110.0-20230915 — Lab Sample ID: 670-26913-1

Analyte	Result	Qualifier	PQL	MDL	Unit	Dil Fac	D	Method	Prep Type
cis-1,2-Dichloroethene	2.1		1.0	0.25	ug/L	1		8260D	Total/NA

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Definitions/Glossary

Client: Tetra Tech, Inc.
Job ID: 670-27575-1
Project/Site: NASA KSC LC34

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.
U	Indicates that the compound was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 670-27575-1

Laboratory: Eurofins Orlando

Narrative

Job Narrative
Client: Tetra Tech
Client PM: Mark Jonnet
Project: NASA KSC LC34
Project Number: 112G08985
670-27575-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 9/28/2023 8:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 0.5°C and 1.2°C

GC/MS VOA
Method 8260D: The following samples were diluted to bring the concentration of target analytes within the calibration range: LC34-Influent-20230926 (670-27575-4), LC34-RW1A-20230926 (670-27575-5), LC34-RW1B-20230926 (670-27575-6), LC34-RW2A-20230926 (670-27575-7), LC34-RW2B-20230926 (670-27575-8), LC34-RW3A-20230926 (670-27575-9), LC34-RW9A-20230926 (670-27575-10), LC34-RW19C-20230926 (670-27575-12), LC34-RW20C-20230926 (670-27575-13) and LC34-RW21D-20230926 (670-27575-14). Elevated reporting limits (RLs) are provided.

Method 8260D: The continuing calibration verification (CCV) analyzed in batch 680-800909 was outside the method criteria for the following analyte(s): Bromomethane, Chloroethane, Chloromethane, Dichlorodifluoromethane, Methyl acetate, Trichlorofluoromethane and Vinyl chloride. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8260D: The laboratory control sample (LCS) for analytical batch 680-800909 recovered outside control limits for the following analytes: Chloromethane and Vinyl chloride. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D: The laboratory control sample duplicate (LCSD) for analytical batch 680-800909 recovered outside control limits for the following analytes: Chloroethane. These analytes were biased high in the LCSD and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for analytical batch 680-800909 recovered outside control limits for the following analytes: Chloroethane.

Method 8260D: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-800909.

Method 8260D: The continuing calibration verification (CCV) associated with batch 680-801117 recovered above the upper control limit for Trichlorofluoromethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Job ID: 670-27575-1 (Continued)

Laboratory: Eurofins Orlando (Continued)

Method 8260D: The following sample was diluted to bring the concentration of target analytes within the calibration range: LC34-RW17C-20230926 (670-27575-11). Elevated reporting limits (RLs) are provided.

Method 8260D: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-801117.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Client Sample ID: LC34-Influent-20230926

Lab Sample ID: 670-27575-4

Date Collected: 09/26/23 12:45

Matrix: Water

Date Received: 09/28/23 08:00

Method: SW846 8260D - Volatile Organic Compounds by GC/MS
