# Trinidad & Tobago Climate

Using Earth Observations to Monitor Sea  
Level Rise and Identify Vulnerable Areas for  
Restoration Strategies in Trinidad & Tobago

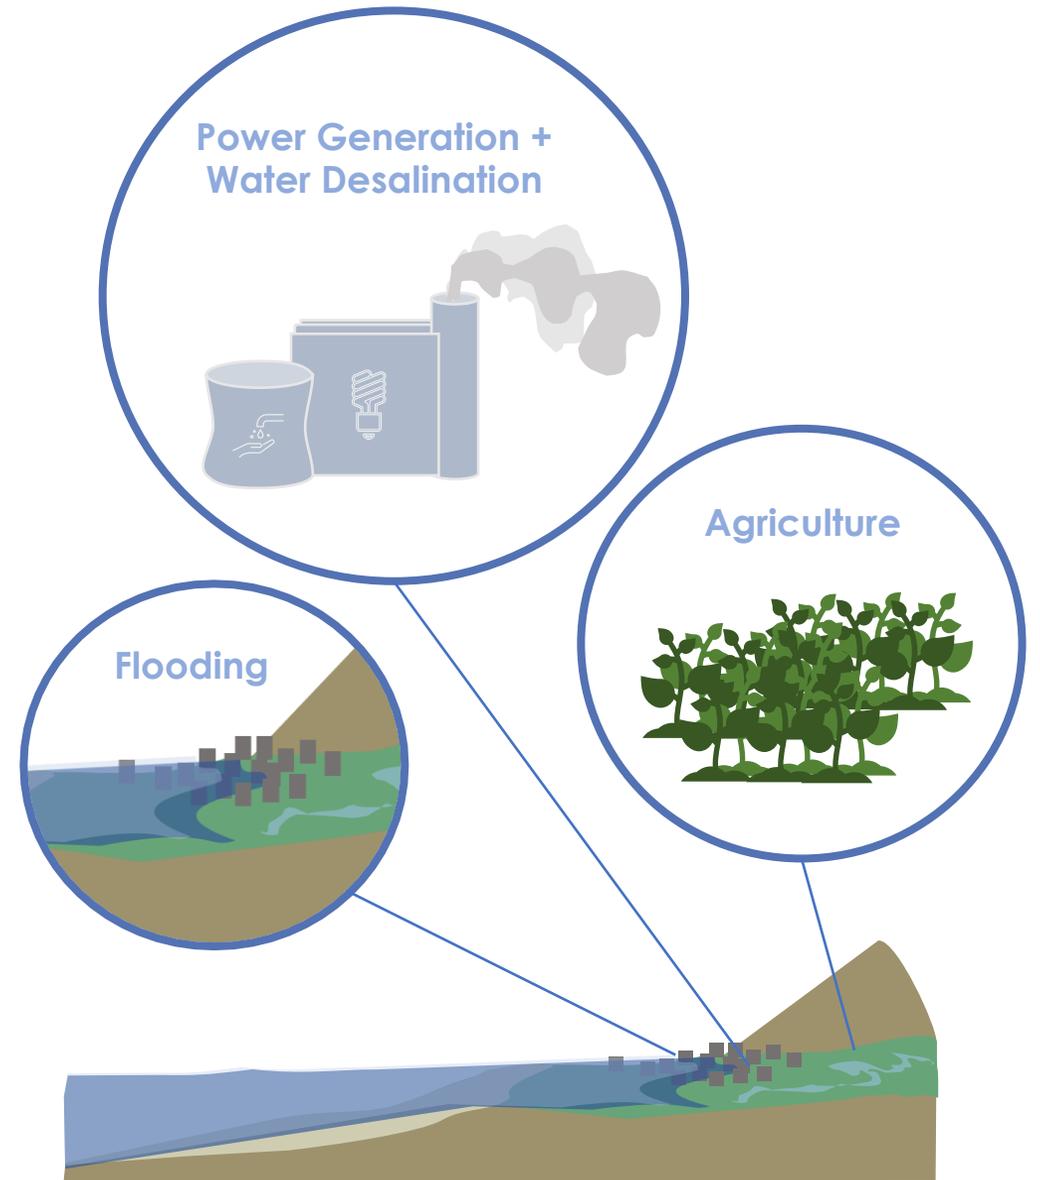

Emilie Flamme, Sambath Jayapregasham, Sarah  
Schneider, Sayona Turner (Analytical Mechanics  
Associates)

Alabama – Marshall | Spring 2025

# Community Concerns

- **Flooding**
- **Land Loss**
- **Brackish Water**
- **Ecological Concerns**
- **Risks to Critical Infrastructure**

# Project Partner

## The Institute of Marine Affairs (IMA)

- Research organization in Trinidad & Tobago
- Collects, analyzes, and disseminates information for program/project implementation

Environmental

Technological

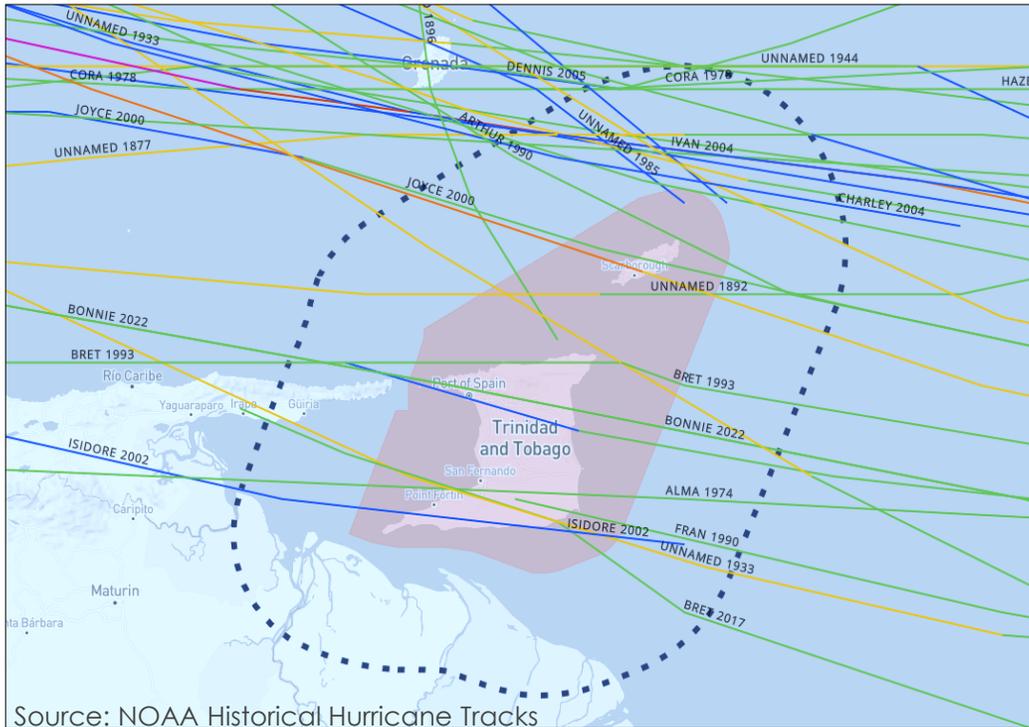

Socioeconomic

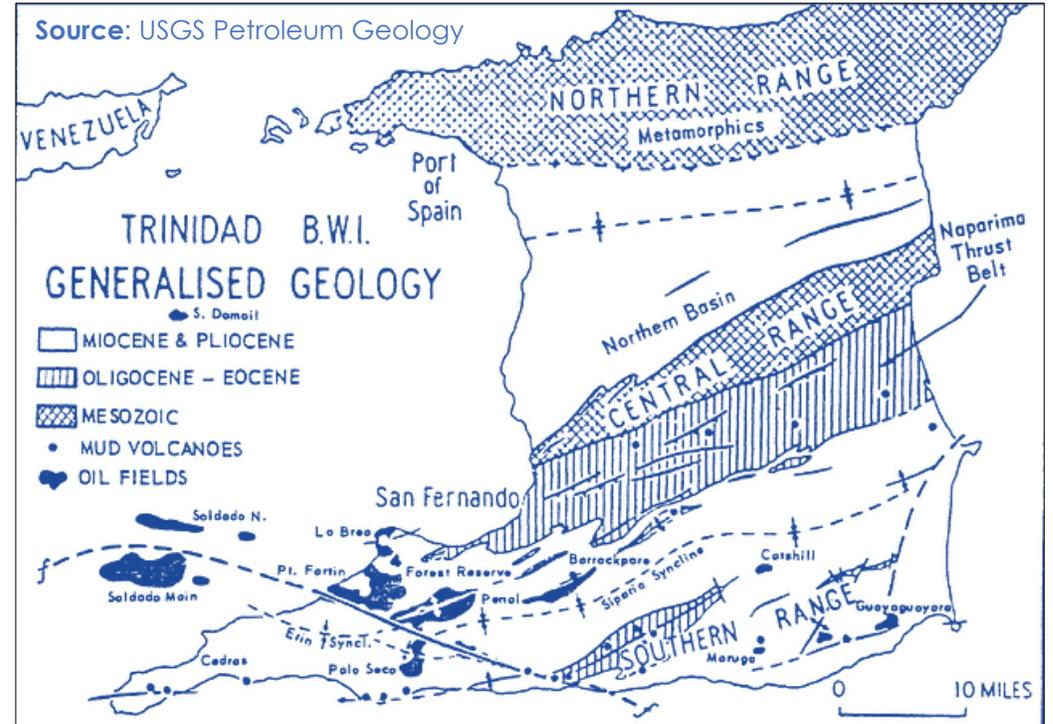

# Background

## Hurricanes + Tropical Storms

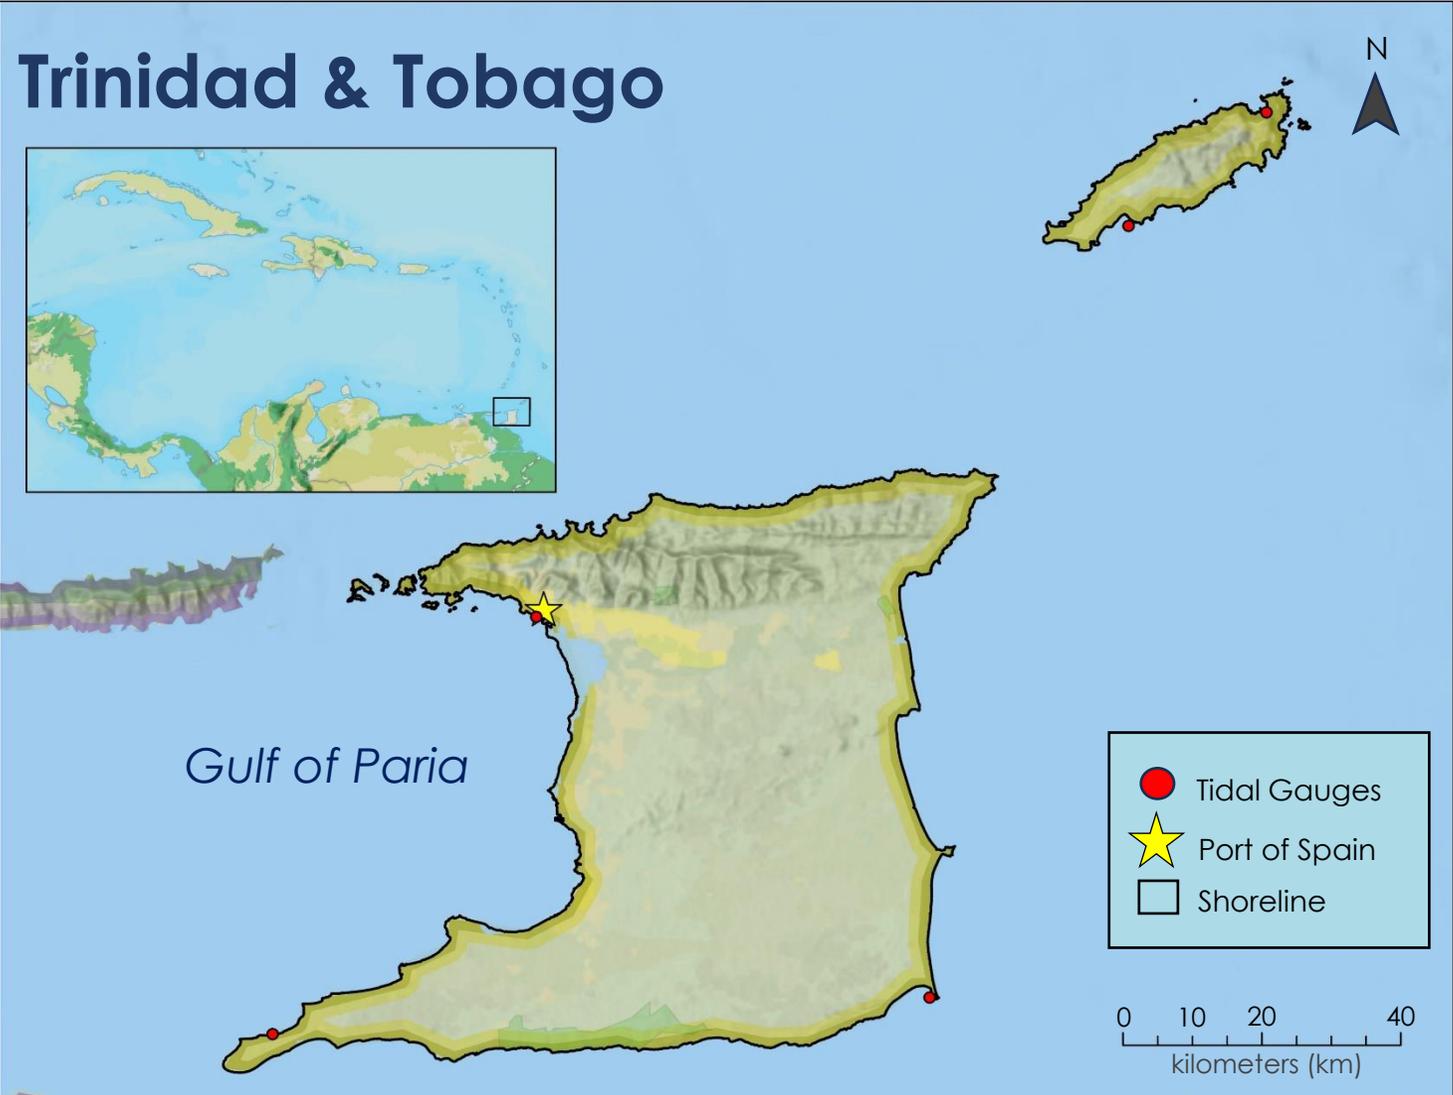

Historical hurricane paths crossing within 50 km of Trinidad & Tobago from 1856 to 2023.

## Earthquakes + Land Subsidence

Geological map of Trinidad depicting fault lines.

# Study Area

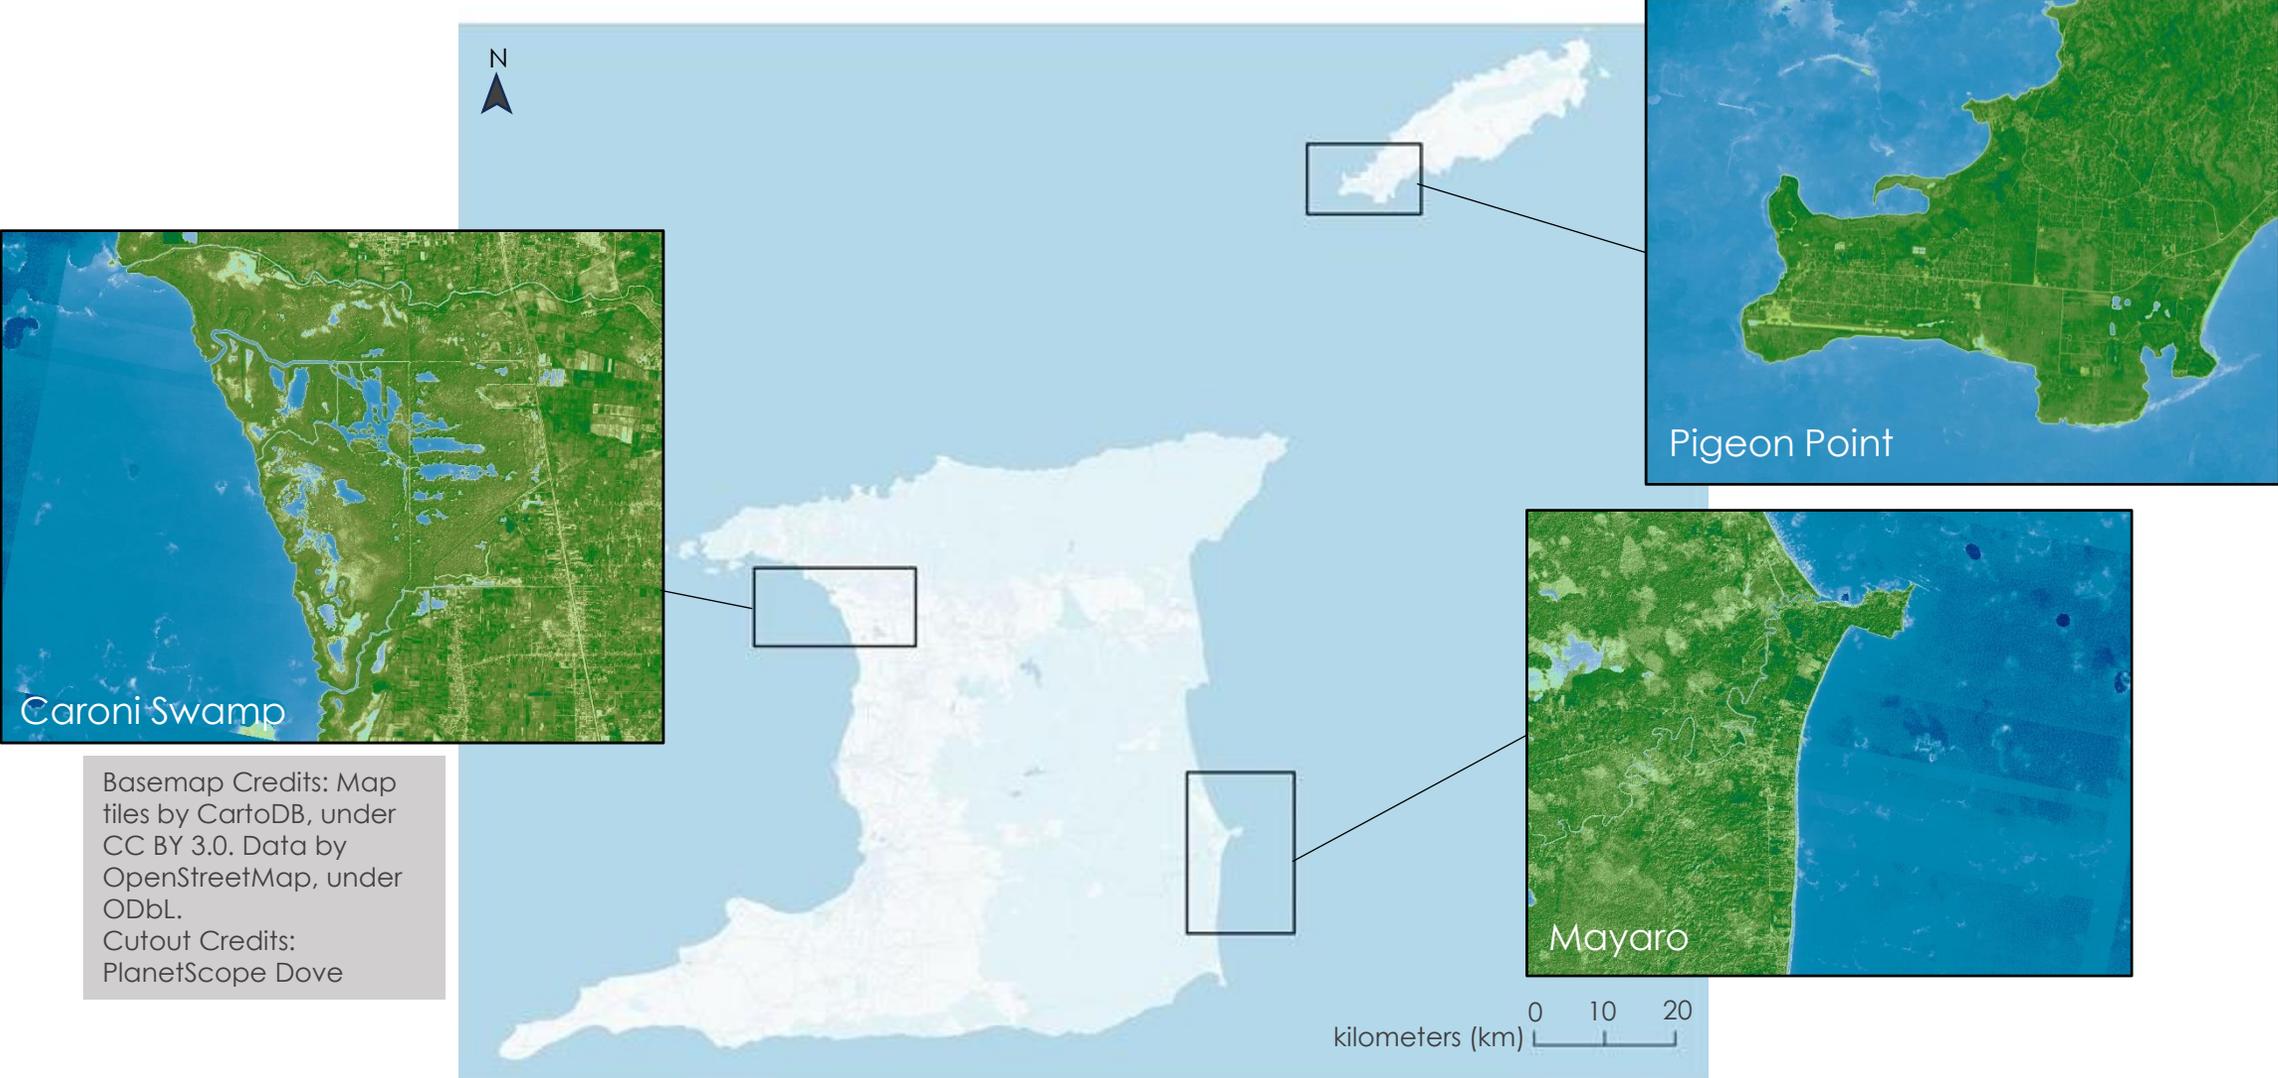

## Study Period

- **10-year Span** (2015, 2020, 2024)
- **Dry Season** (5 months):
  - January – April
  - December
- **Study Focus** (7 months):
  - January – June
  - December

# Case Study Areas

# Project Objectives

1

Quantify shoreline variation over 10-year study period

2

Estimate sea level rise until 2050

3

Project future shoreline extent in 2050

Image Credit: IMA

# Data Types

## Ground-level Data

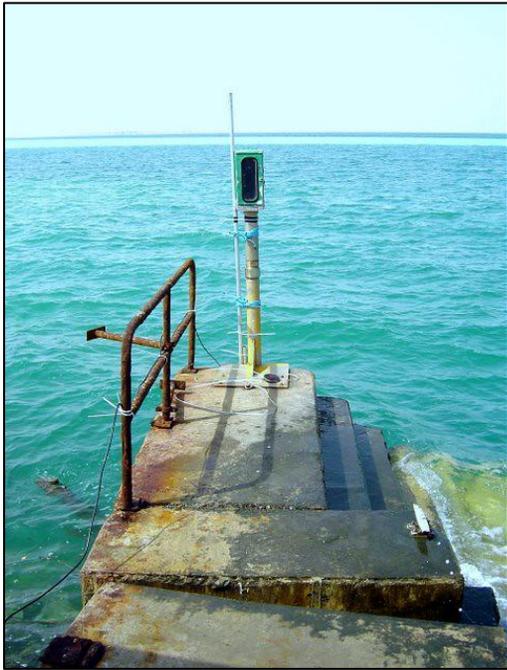

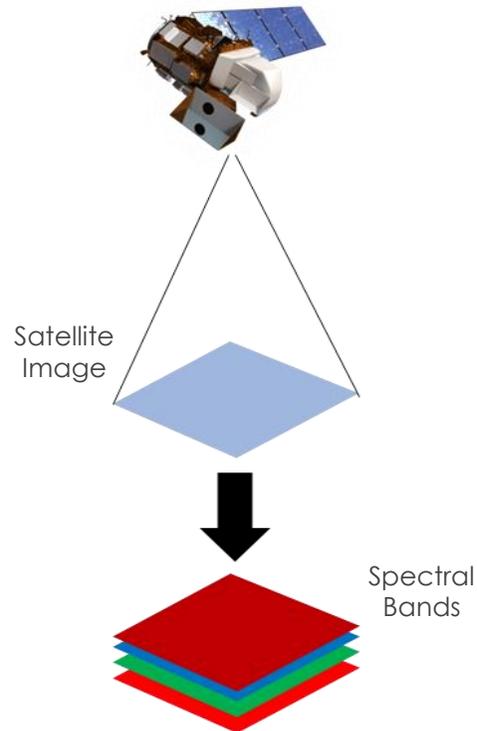

Image Credit: Travelling Steve, Flickr

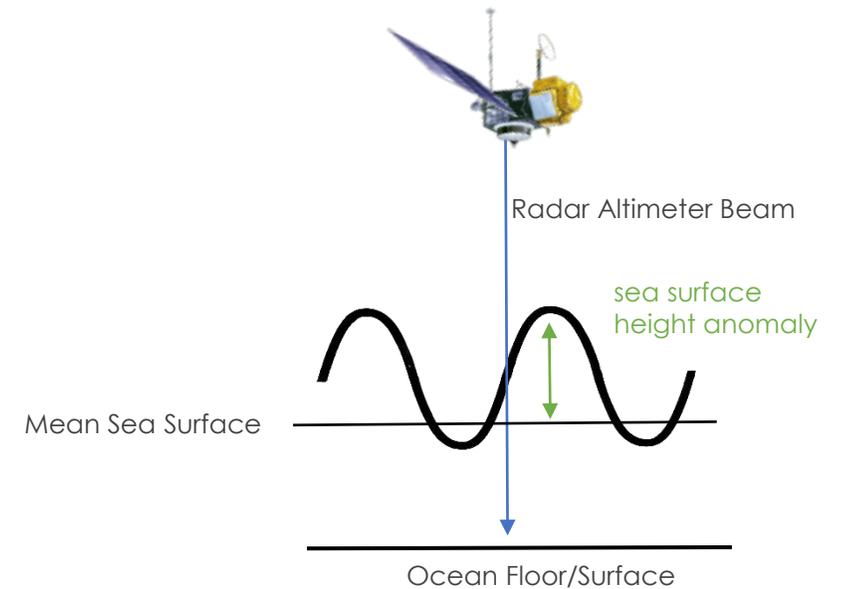

Tidal gauge data from UNESCO's Intergovernmental Oceanographic Commission (IOC) captures sea surface height from Earth's surface

## Multispectral Imagery Data

Multispectral EO data consists of spectral bands. The NIR band is ideal for shoreline delineation.

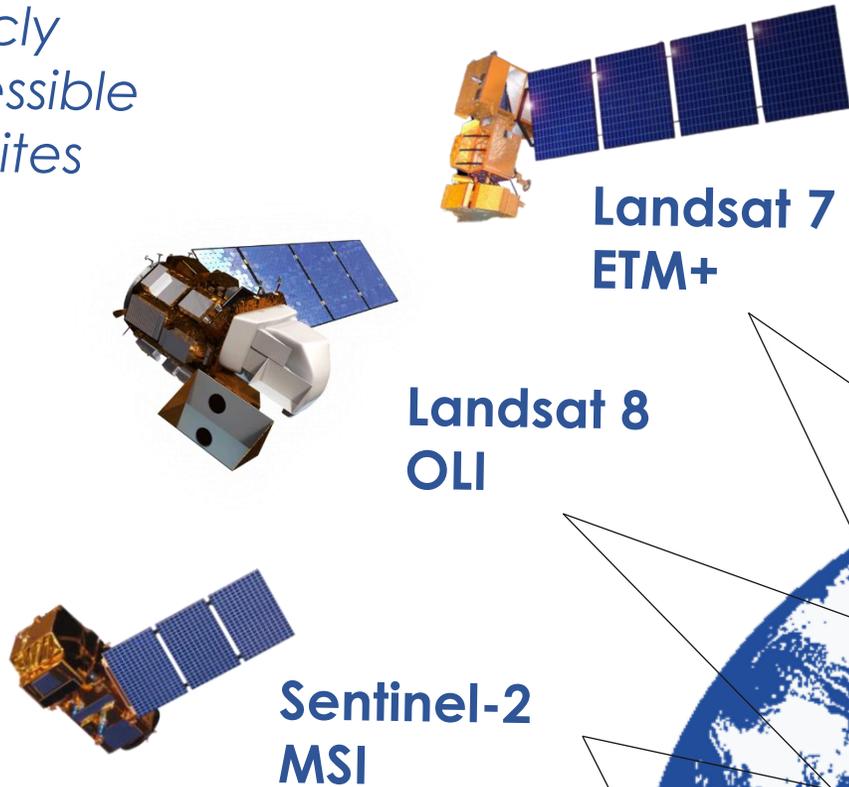

## Radar-based Altimetry Data

Altimetry captures the height of the sea surface by measuring the difference between the water's surface, and the height of the Earth's ellipsoid.

# Data Analysis – Change in Sea Surface

## Predicted Sea Level Rise in Trinidad & Tobago from 2020 - 2050

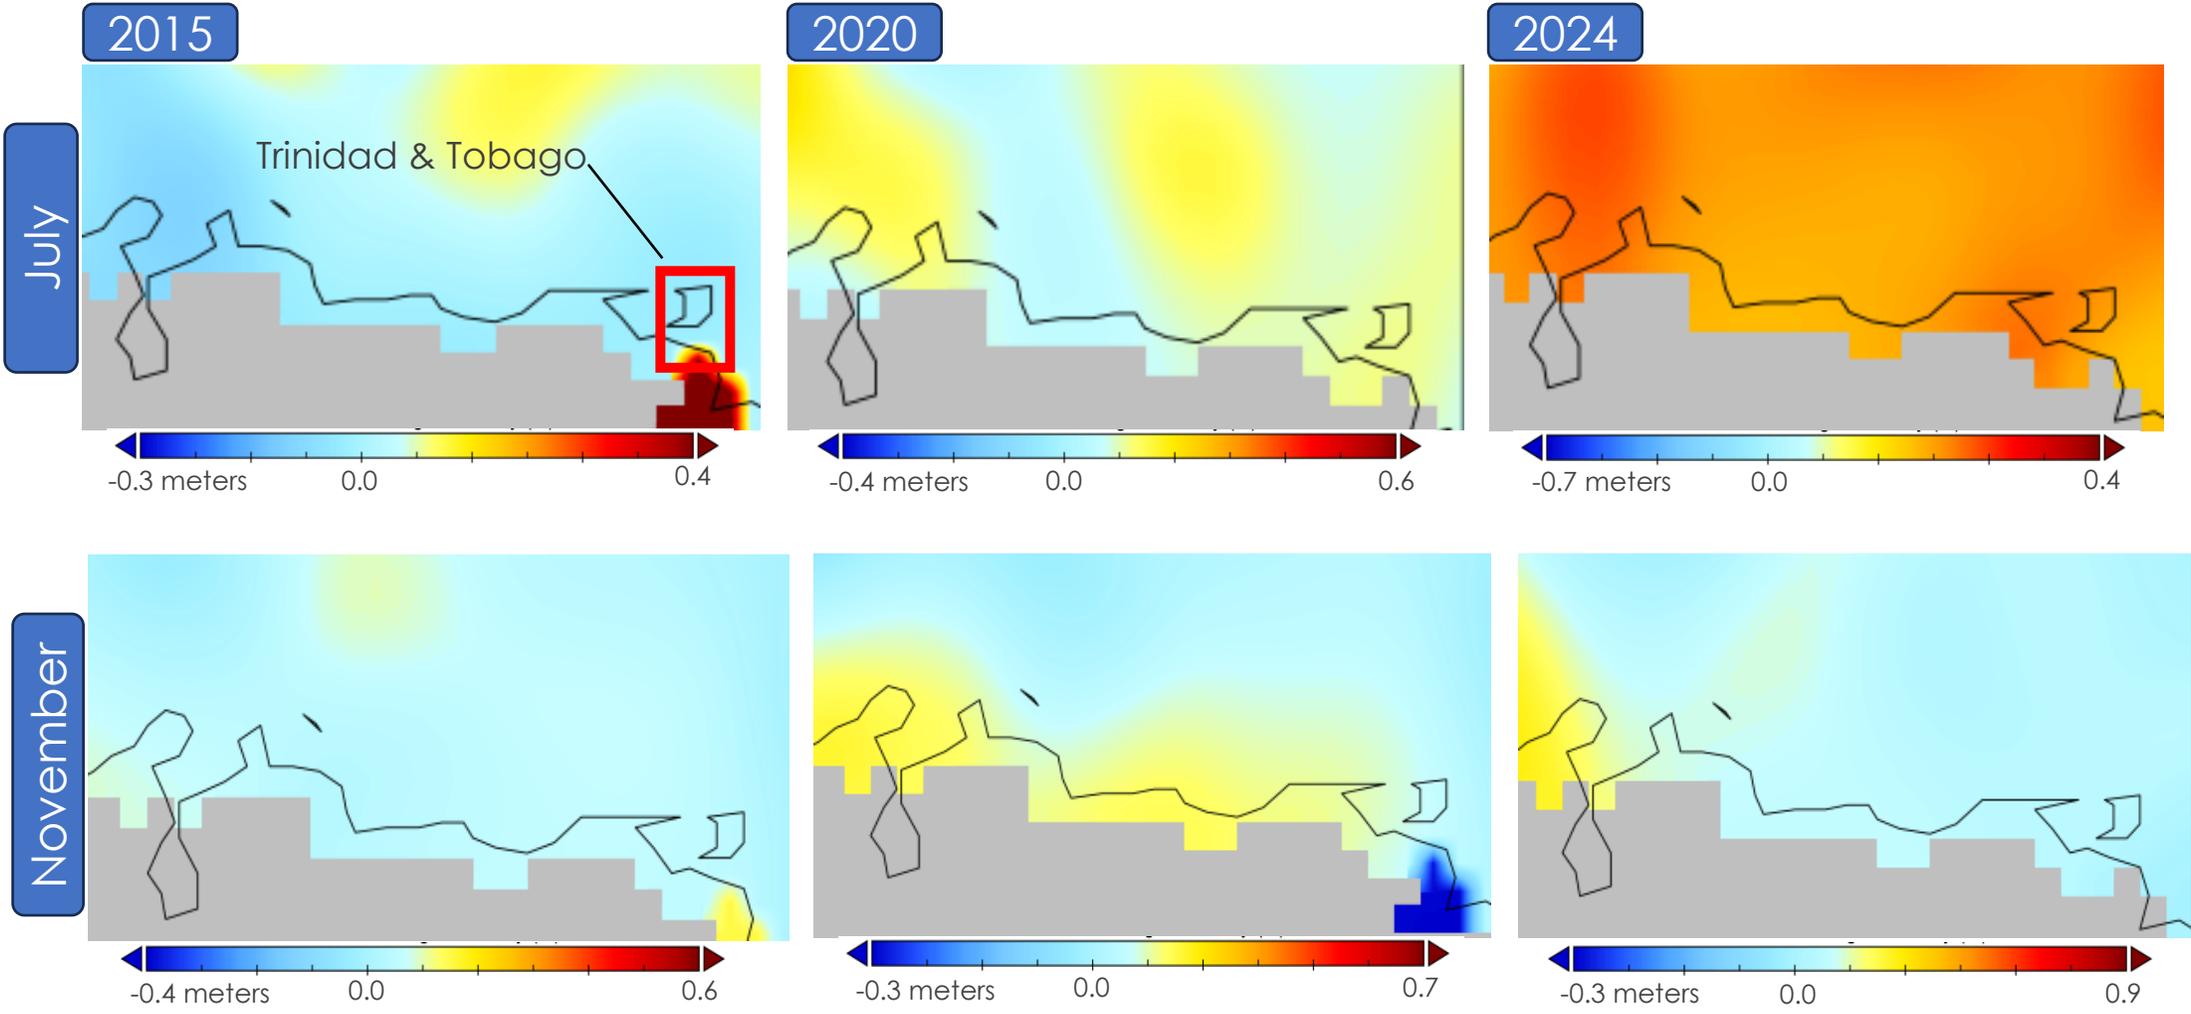

**Tidal gauge data used to estimate relative sea level change over study period from 2015-2024.**

# 2050 Sea Level Rise Projection + Impact Areas

Basemap & Cutout Credits: Map tiles by CartoDB, under CC BY 3.0. Data by OpenStreetMap, under ODbL.

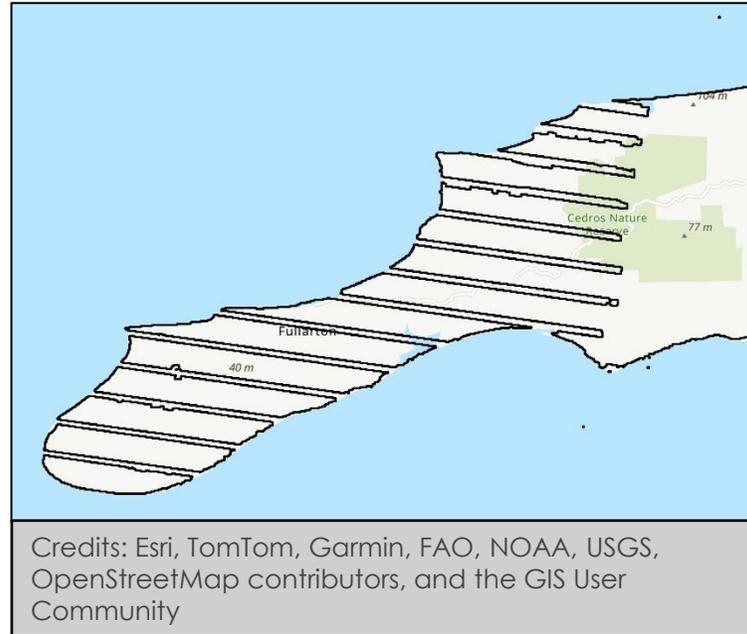

# Data Analysis – Altimetric Sea Surface Anomaly

# Errors + Uncertainties

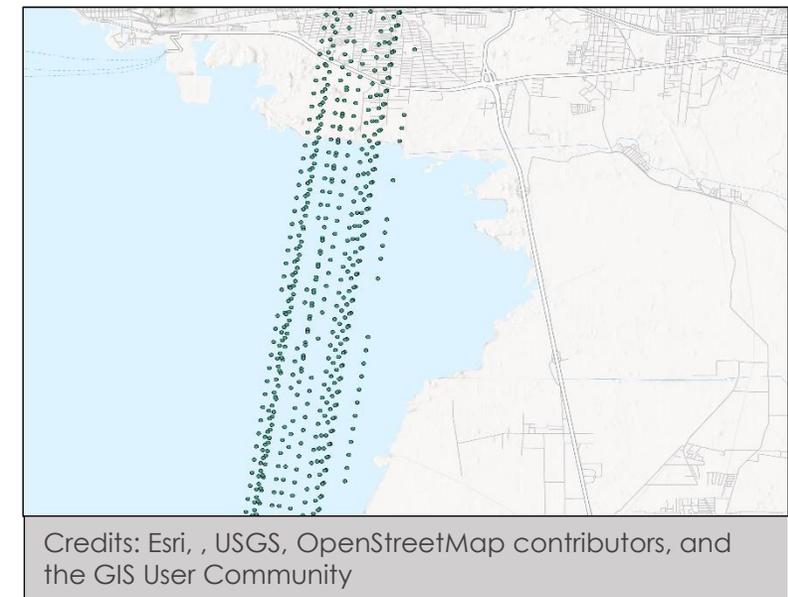

Limited reliability of tidal gauge data limited due to gaps created by tidal gauge inactivity.

| Tidal Gauge     | % Availability of Tidal Gauge between 2015-2024 |
|-----------------|---|
| Port of Spain   | 92%   |
| Scarborough     | 76%   |
| Cedros Bay      | 48%   |
| Galeota         | 34%   |
| Charlottesville | 23%   |

Landsat 7 scanline error shown in shoreline result for 2015 shoreline.

Altimetry data with noise and gaps in the photon data.

# Conclusions

1

The feasibility of shoreline delineation is dependent upon sufficient imagery, with limited cloud-cover, covering the spatial and temporal extent of the study.

2

Linear regression results predict rise in sea level consistent with the global model estimates. Altimetry is an adequate compliment to tidal gauge information and can supplement gaps in the data.

3

Future shoreline extent in 2050 will be impacted by sea level rise, however this will not impact the coast evenly in Trinidad and Tobago.

Overall, we emphasize the role **publicly accessible earth observation data** can play in generating results for decision-makers in Trinidad & Tobago as they address the impacts of a changing climate.

# Future Recommendations

- **Harmonized Landsat and Sentinel (HLS) imagery** can be evaluated to generate **more reliable** shoreline composites for shoreline delineation.
- Publicly available **Sentinel-1 Synthetic Aperture Radar (SAR)** imagery and commercial LiDAR imagery (if available) can be used to **avoid cloud cover** issues that affect both shoreline delineation and area change calculations.
- Future feasibility studies should include and develop processes to **include altimetry data** to measure changes in sea surface height. Altimetry data can be evaluated in a timeseries to **encapsulate sea level rise** over decades.
- Continued focus on **publicly accessible data** and satellites should remain a critical component of any future feasibility studies for Trinidad & Tobago or similar geographies.
