Fuel2Fire, Enhancing Wildland Fire Emissions Estimates

Our thinking is from the ground perspective, but with a focus on how we can bring the reality of fuels and emissions on the ground to larger-scale models and inventories using satellite data.

Focus of this talk: Investigate the parameters used to estimate wildland fire emissions to enhance these estimates.

- 1) Fuel estimates (ground to satellite) for CONUS; 5**
- 2) GOES-derived diurnal fire cycle; 4**
- 3) Emissions comparisons; 1**
- 4) Validation using 2019 Fire Influence on Regional to Global Environments and Air Quality (FIREX-AQ) data; 2**
- 5) Global fuel estimates (ground to satellite); 1**
- 6) Quantifying small fires from space. 3**

Fuel Characteristics- Fire Intensity- Energy Release- Emissions

Boreal/Temperate Forest Fire:

- 25-50 t/ha
- 100-100,000 kW/m

Savanna Fire:

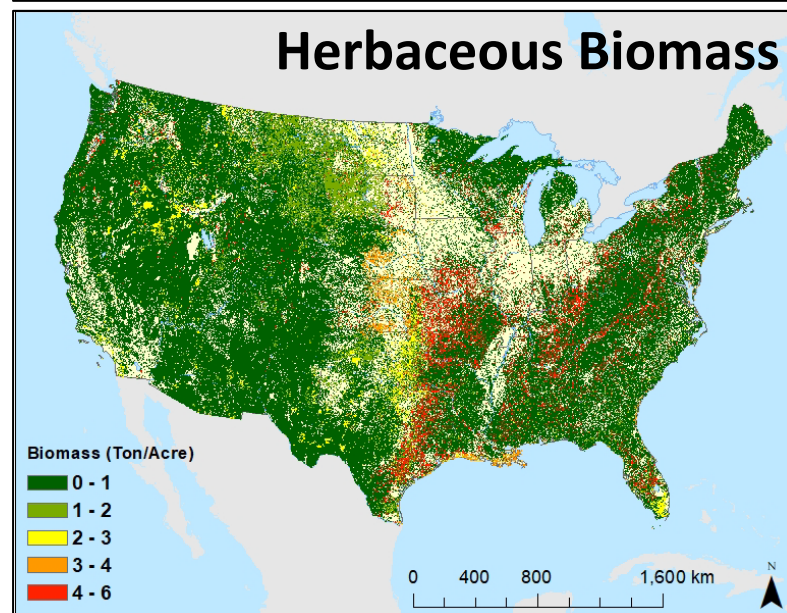

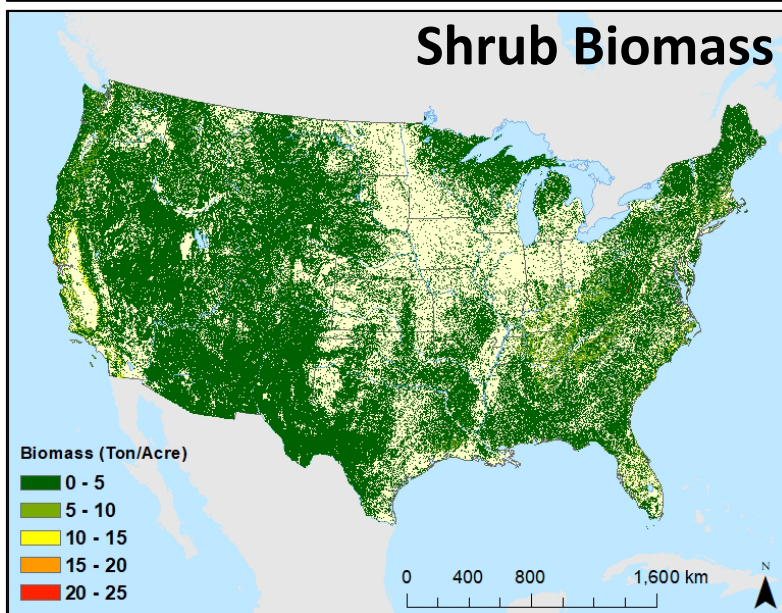

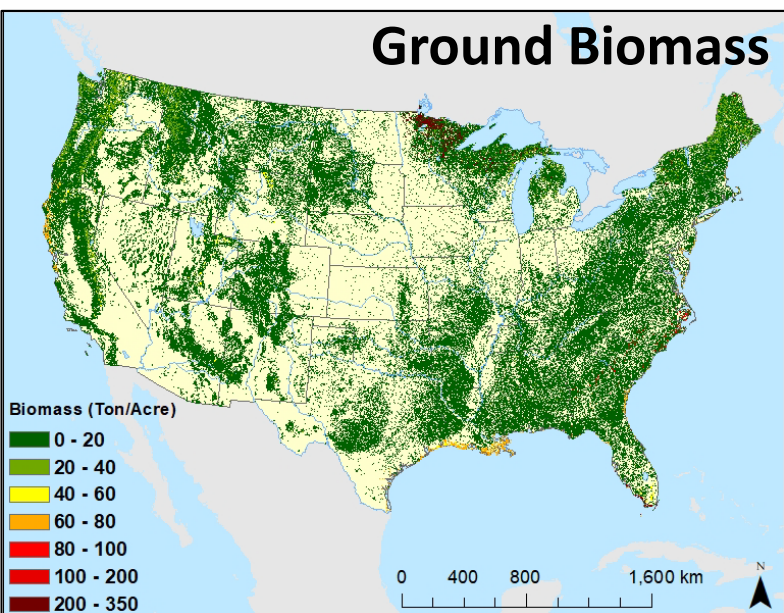

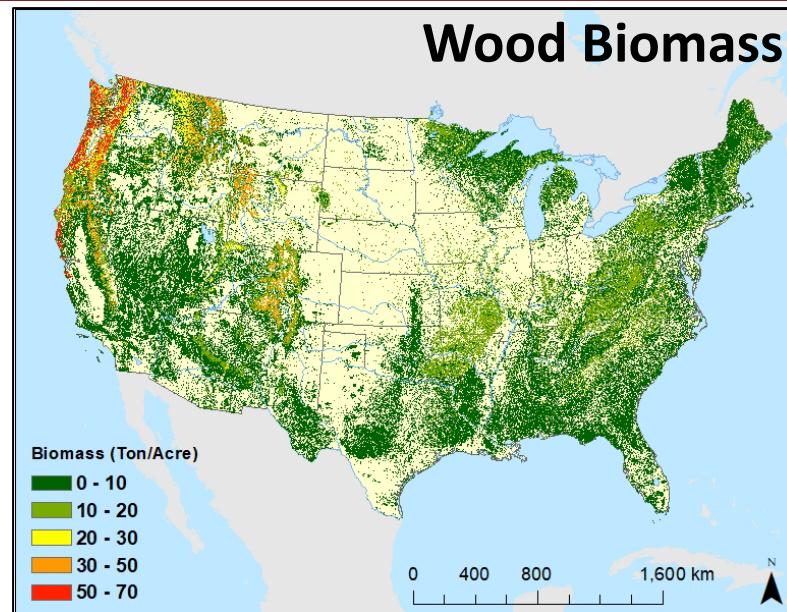

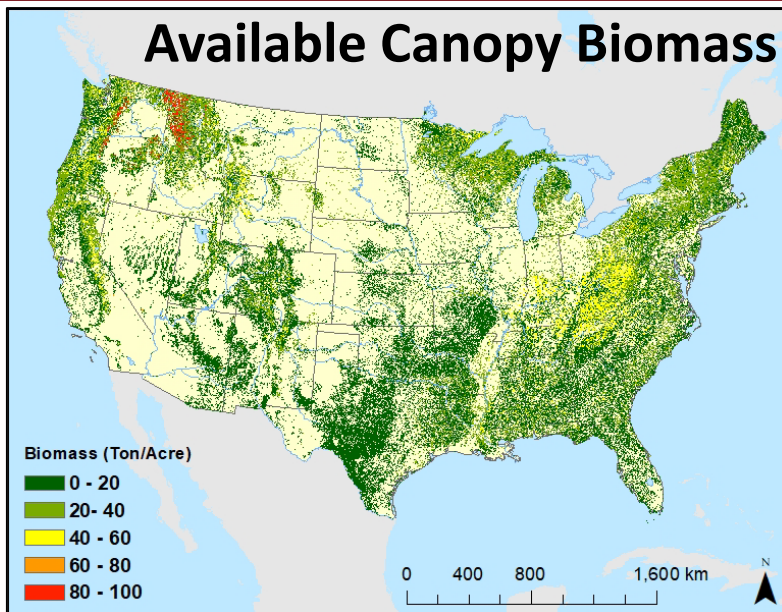

- 10-12 t/ha
- 500-10,000 kW/m

Driving force: Fire Weather & Available Fuel

Over 250 Fuels!

Fuel Decision Table: Allocation of New:Residual

1

Percentage of Fuel Burned in each Fire Weather Category

New (N) burned area / previously burned Residual (R) area

Variable	Extreme N/R	Very High N/R	High N/R	Moderate N/R	Low N/R
Canopy_avai_load	90 / 5	80 / 5	60 / 5	10 / 0	0 / 0
Shrub_tpa_biomass	100 / 0	80 / 5	60 / 5	40 / 5	20 / 5
Herb_tpa_biomass	100 / 0	80 / 5	60 / 5	40 / 5	20 / 5
Wood_tpa_biomass	20 / 40	10 / 20	10 / 20	10 / 10	10 / 5
LLM_tpa_biomass	100 / 0	80 / 5	60 / 5	40 / 5	20 / 5
Ground_tpa_fuel	20 / 40	10 / 20	10 / 20	10 / 10	10 / 5

Total available fuel loading of canopy fuels, including tree crowns, C2 and C3 snags, and ladder fuels.

Total aboveground shrub and herbaceous biomass

Does not include tree boles or C1 snag wood.

Total combustible wood, including downed wood, rotten and lightered stumps, and piled wood.

Litter, lichen and moss biomass

Ground fuels including duff, basal accumulations and squirrel middens

Soja et al., 2004
Pierce et al., 2007
Petrenko et al., 2012

Fuel Decision Table: Flaming to Smoldering

1

Of the FCCS fuel burned in the 'New' burned area and the 'Residual' previously burned area, these carbon fuels are partitioned by flaming and smoldering components, also in accordance with fire weather.

Percentage of flaming/smoldering in each fire weather category

New (N) / Residual (R)

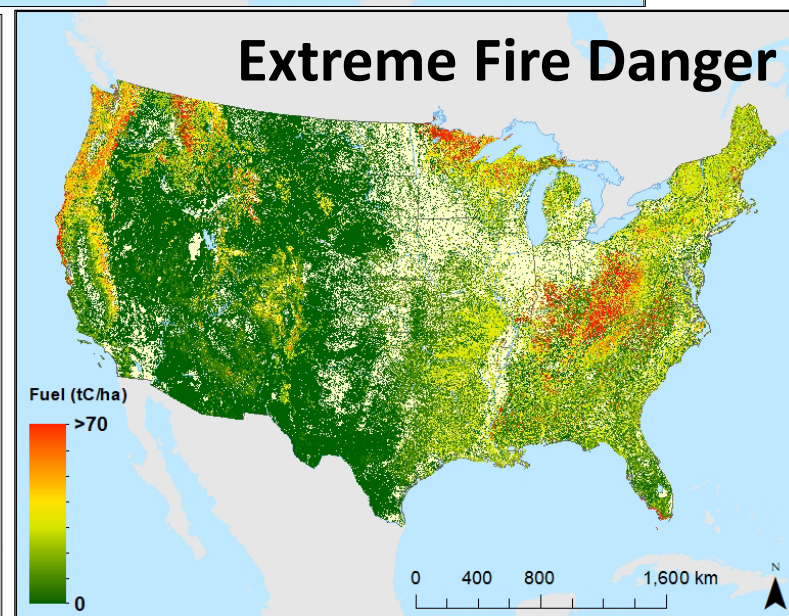

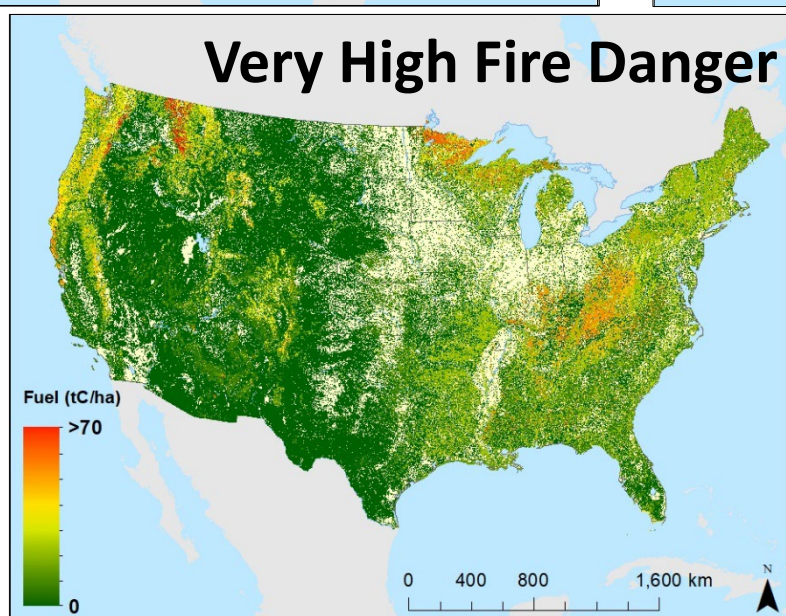

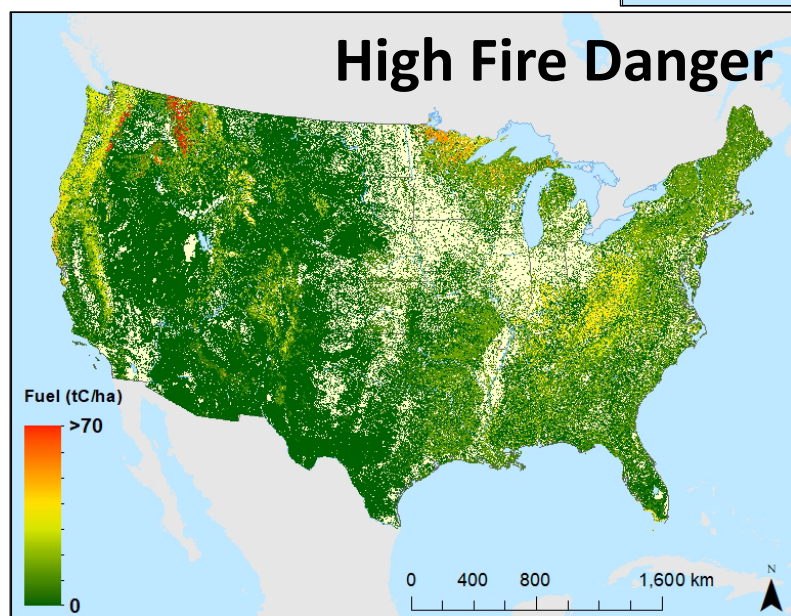

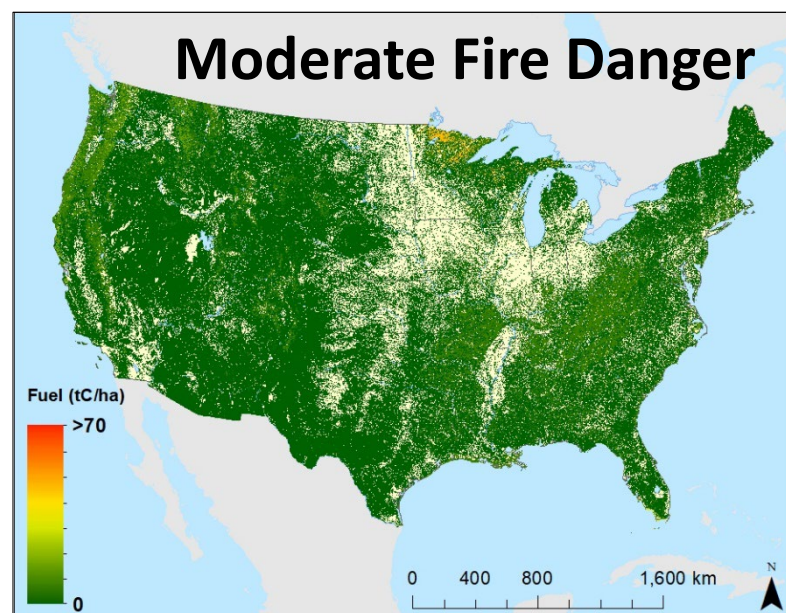

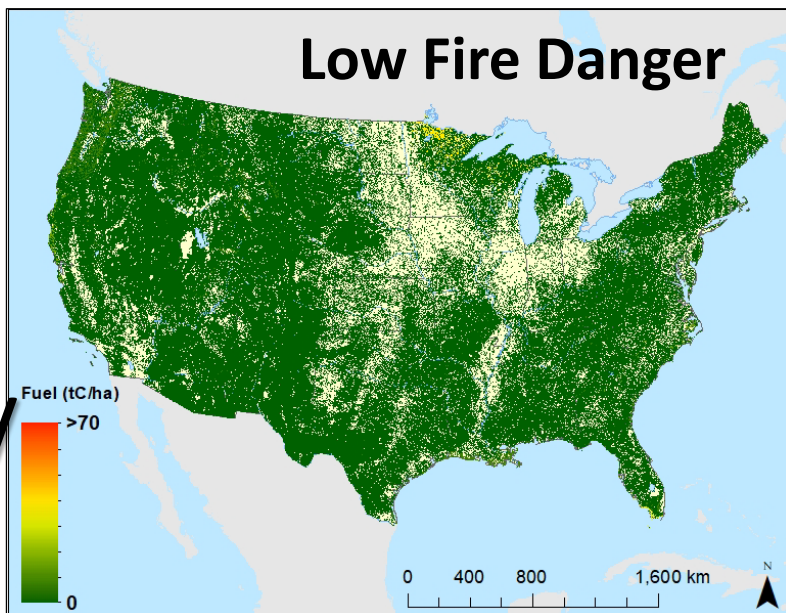

Extreme N / R Very High N / R High N / R Moderate N / R Low N / R

Flaming	90 / 20	80 / 5	70 / 5	60 / 0	50 / 0
Smoldering	10 / 80	20 / 95	30 / 95	40 / 100	50 / 100

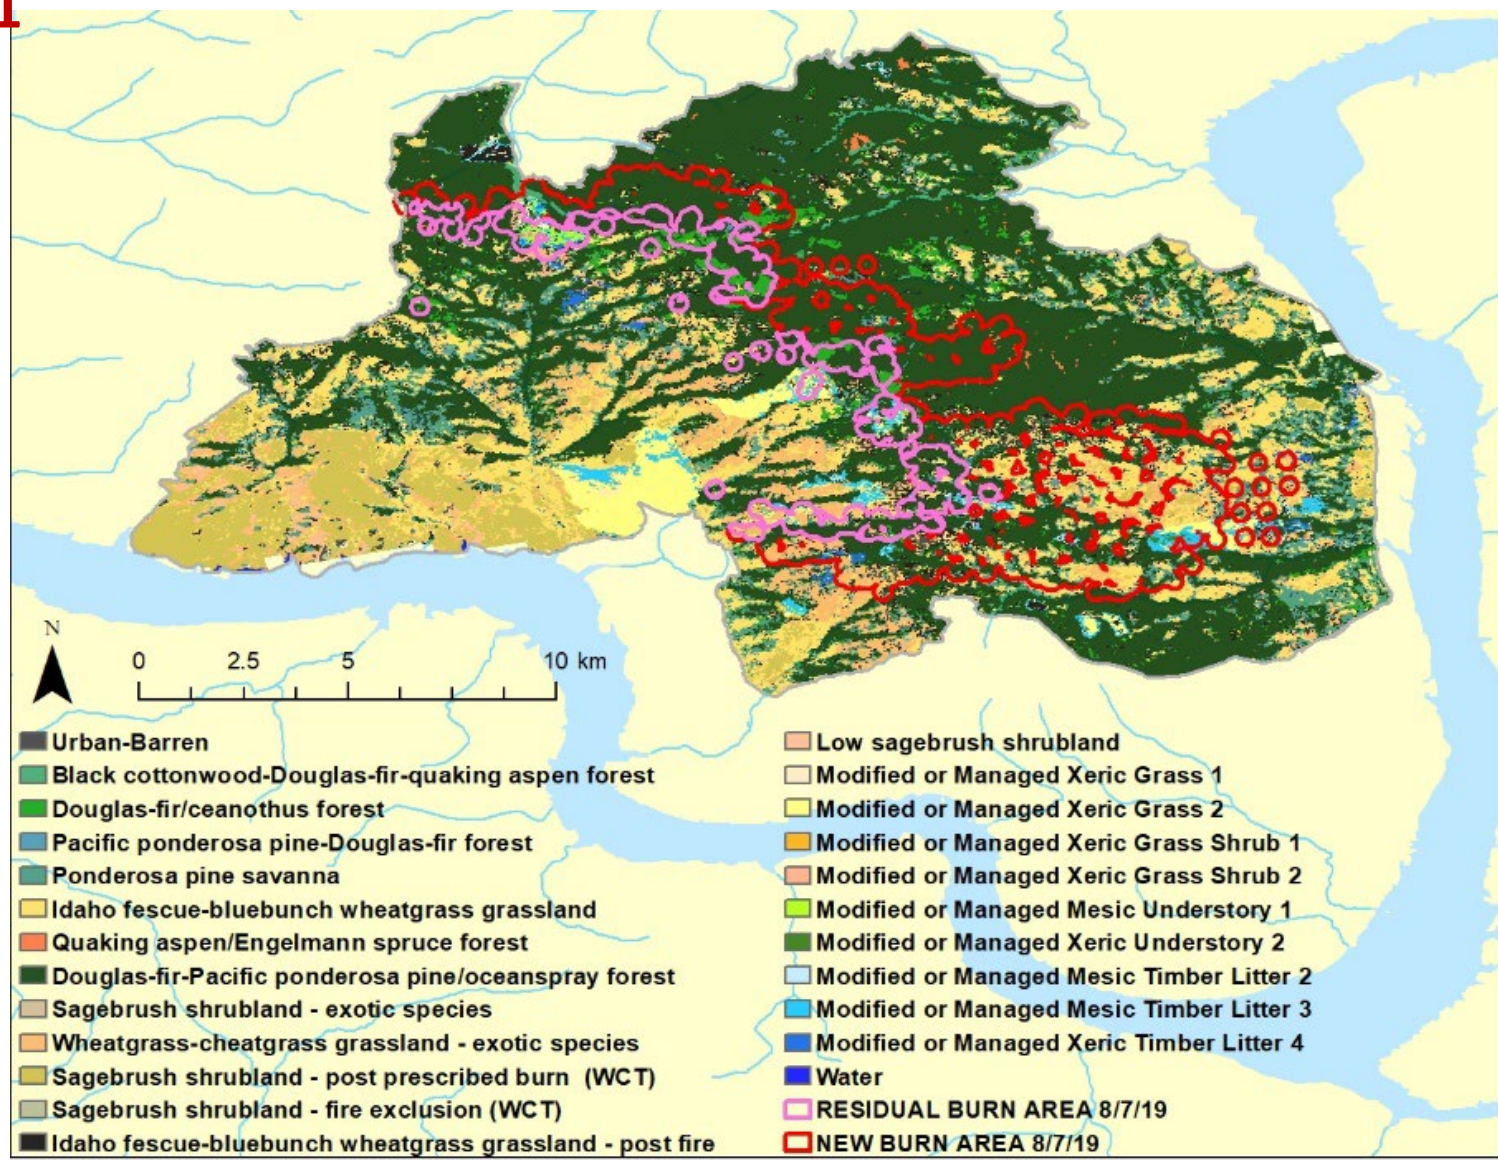

Fuel Available: One 1-km (30m) value/weather

1

FCCS-based Fuel, per Fire-weather-based Fire Danger (severity of potential fire or Fire Radiative Power/Energy, FRP/FRE?)

Emissions Model Comparison

3 With 1 exception Fuel2fire generally the largest estimate

Highest correlation BlueSky $R^2 = 0.94$ (~60% > Fuel2Fire, where most fuels burned)

GFED $R^2 = 0.86$ ~54% < Fuel2Fire Indicated by regression coefficients

Global Carbon Consumption Database

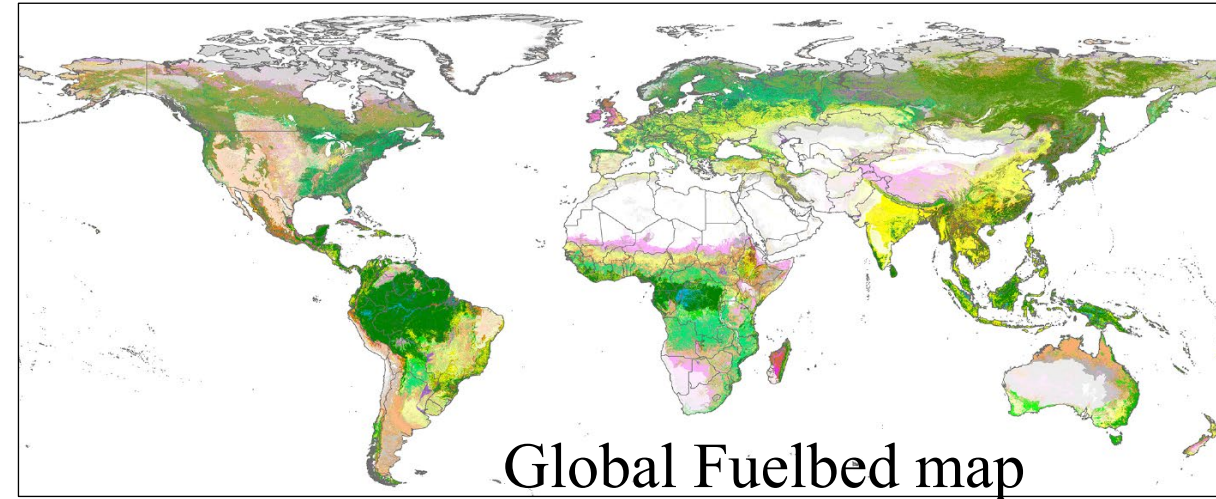

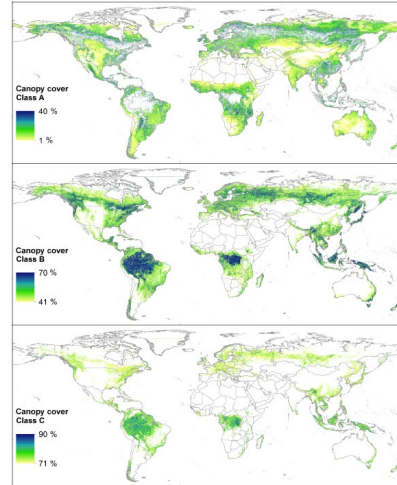

M. Lucrecia Pettinari and
Emilio Chuvieco, 2016

5

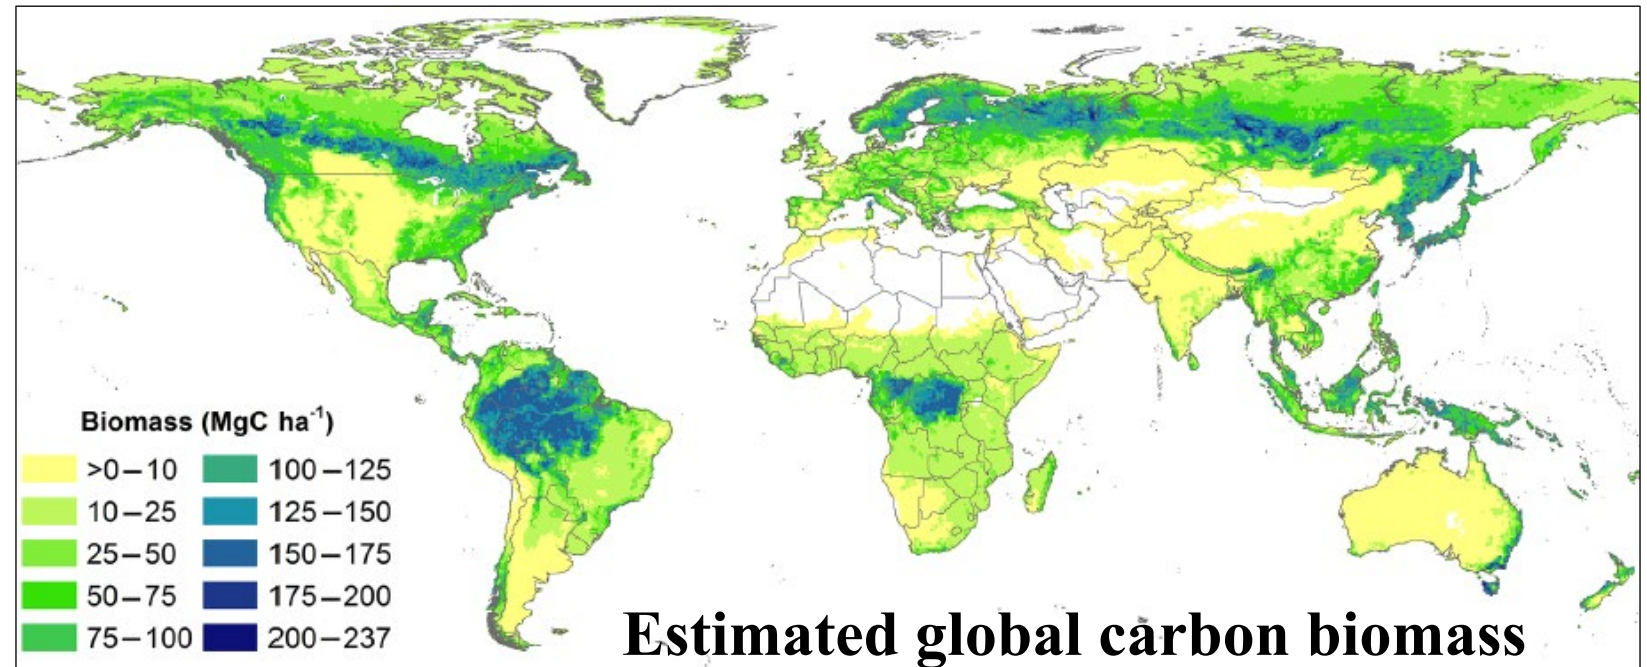

Developed using

- Global fuel map standardized with Fuel Characteristic Classification System (FCCS) biomass parameters
 - Includes: Canopy, Woody, Herb, Shrub, Litter, Lichen, Duff, etc
- ~300m resolution
- 274 main fuelbeds

Pettinari, M. L. & Chuvieco, E.: Generation of a global fuel data set using the Fuel Characteristic Classification System, Biogeosciences, 13, 2061–2076, <https://doi.org/10.5194/bg-13-2061-2016>, 2016.

MODIS Vegetation Continuous Field (VCF)

6

Digitizing Small Burned Area

Challenges in agricultural lands are:

Burn scars recover quickly

Polar orbiting satellites are not overhead 2 times/day (MODIS, VIIRS)

Geostationary satellites have a lower 2-km resolution

Flints Hills grasslands and Everglades crops

6

A lack of complete fire emissions inventories hinders the ability of federal, state and local health and Air Quality managers and regulators to monitor, evaluate, track, and statistically analyze fire and smoke impacts.

Performance of Satellite products

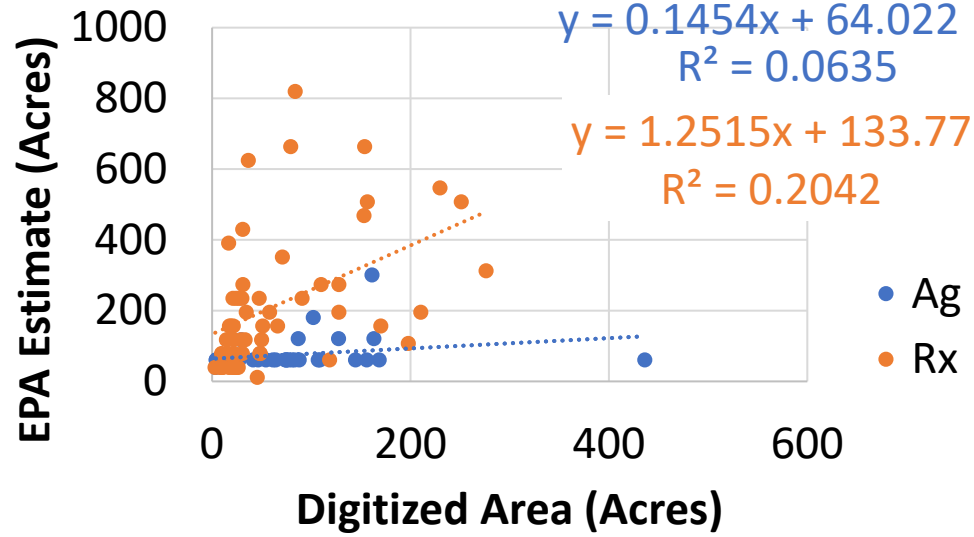

Fire Detection Products		
Satellite	Flint Hills, KS Captured	Everglades Agriculture Area, FL Captured
MODIS Aqua	8%	4%
MODIS Terra	20%	16%
VIIRS Suomi	35%	10%
VIIRS NOAA20	33%	13%
All satellites	47%	30%

MODIS Burned Area Product			
Region	Intersection (Agreement)	Commission (Overestimate)	Omission (Missed)
Flint Hills, KS & OK	65%	8%	27%
Everglades Agriculture Area, FL	24%	23%	53%

Comparisons of Burned Area in Iowa croplands (ditches, prescribed, agriculture burning)

and Digitized Total Area

EPA Annual Fire Inventory (2019) and
Digitized Total Area

Conclusions:

Each base dataset can be used to enhance any existing model, moving more closely to a land-based reality, because we now have the data and computer capacity.

- Fuel can be used with fire weather or Fire Radiative Power/Energy**
- Diurnal cycles can be applied by fire by day**
- Small fires can be calibrated by land cover type and regions**

Fuel2Fire, Enhancing Wildland Fire Emissions Estimates:

The devil is in the detail and defined by the purpose of the emission estimates

Methods for Emissions

Daily Fire Emissions Methodology

$$C_t = A \times B \times F_c \times C_b$$

[Seiler and Crutzen, 1980]

A = Area Burned (VIIRS/MODIS)

B = Biomass Density (FCCS)

$F_c = 0.5$ (Assumed biomass carbon)

C_b = Fraction of biomass consumed (Weather)

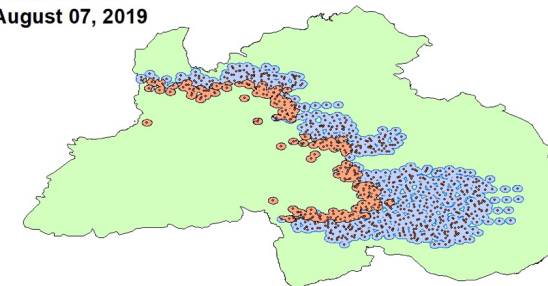

-Diurnal Cycle Derived from 5-min GOES FRP Observations

-Output 1-sec ICARTT Emissions

[Soja et al., 2004; Pierce et al., 2007; Pierce et al., 2009; Wiedinmyer et al., 2011]
