# Timeline of Oxygen Environments for Crew Cabins

On Jan. 27<sup>th</sup> 1967, Astronauts Virgil Grissom, Edward White and Roger Chaffee lost their lives when a fire swept through the command module (CM)

- Due to the return of oxygen content levels similar to Earth's atmosphere, the research and development of fire-resistant materials was abandoned
- Some of the previously developed materials stopped being commercially produced

# Fireproof Insulation for Resistive Environments in Materials for Aerospace and Navigation (FIREMAN)

## Aerogels

### Typical properties

- High porosity (>85%)
- Pore size 10-40 nm
- High specific surface area
- Low thermal conductivity
- Low density

### What is an Aerogel?

An open-celled, light weight, porous material derived from a gel in which the liquid is replaced by gas while maintaining the self-assembled three-dimensional structure

*Aerogels made using sol-gel synthesis and supercritical fluid extraction*

# Aerogel Properties Dependent on Structure and Chemistry

## Structure

*Present in all aerogels*

carbon

polymer

- High porosity
- Nano-scale pore size
- Low density
- High internal surface area
- Low Tc and dielectric

## Chemistry

*Varies in aerogels*

- Aliphatic in backbone increases flexibility

- Aromatics in backbone increases strength and temperature resistance

- Functional groups increase capabilities

- Crosslinkers increase chemical stability and mechanical strength

# Polymer Backbone impacts Limiting Oxygen Index (LOI)

- LOI is the minimum concentration of oxygen *in the environment* needed to support combustion of a polymer
- The higher LOI is, the more flame resistant

# Physical Properties of PBI Aerogels

| PBI wt % | Gel Time (min) | Bulk Density (g cm <sup>-3</sup> ) | *Porosity (%) | Shrinkage (%) | Surface Area (m <sup>2</sup> g <sup>-1</sup> ) |
|----------|----------------|------------------------------------|---------------|---------------|------------------------------------------------|
| 20       | ~3             | 0.39 ± 0.01                        | 70.8 ± 0.5    | 25.2 ± 0.3    | 173                                            |
| 15       | ~5             | 0.31 ± 0.01                        | 76.2 ± 0.1    | 26.7 ± 0.2    | 233                                            |
| 10       | ~10            | 0.22 ± 0.01                        | 83.3 ± 0.5    | 28.5 ± 0.5    | 237                                            |
| 7.5      | ~20            | 0.19 ± 0.01                        | 85.6 ± 0.3    | 32.1 ± 0.2    | 183                                            |
| 5        | ~40            | 0.11 ± 0.01                        | 91.9 ± 0.4    | 29.8 ± 0.3    | 216                                            |

\*Skeletal density: ~1.30 g cm<sup>-3</sup>

# Differential Scanning Calorimetry (DSC) Data of PBI aerogels

- Non-reversible heat flow present at  $>200$  °C indicating the presence of further reaction

# Impact of Higher Temperature Post Cure

200°C  
24 hrs.  
N<sub>2</sub>

- Surface area reduction: ~ 30%
- Additional Shrinkage: ~1%
- Porosity Reduction: ~2%
- Skeletal Density change negligible
- Bulk Density Increase: ~2%

# Fourier Transform Infrared Spectroscopy (FTIR) of PBI Aerogels

A: 1620 cm<sup>-1</sup> band N-H stretching (two bands because both primary and secondary)

B: 1330 - 1250 cm<sup>-1</sup> C-N stretch aromatic amines (two bands because both primary and secondary)

Primary /  
Secondary

Secondary

# Thermal Conductivity of PBI Aerogels

- Reduced thermal conductivity in post cured PBI aerogels

# PBI Aerogel Scale-Up Fabrication

- Fabricated 20" x 20" x 0.2" PBI panels equating to ~0.75 kg material

# Flame Propagation Screening in Earth Atmosphere

*Flame Exposure During Testing*

*Flame Exposure During Testing*

- Applied  $\sim 1000^{\circ}\text{C}$  flame to bottom of 3"x6" sample for 25 seconds
- Measured flame propagation and temperature using FLIR camera

# Flame Propagation Screening in Earth Atmosphere

*Run 1*

*Run 2*

*Run 3*

- Flame Influence:  $2.3 \pm 0.5$  cm
- Consumed Length:  $3.8 \pm 0.4$  cm
- Heat Damage:  $5 \pm 0.5$  cm

*Run 1*

*Run 2*

*Run 3*

- Flame Influence:  $1.5 \pm 0.3$  cm
- Consumed Length:  $3.3 \pm 0.3$  cm
- Heat Damage:  $4.3 \pm 0.4$  cm

# Advanced Fire Resistance Testing - University of Dayton Research Institute

**Micro Combustion Calorimeter**

Ref: ASTM D7309

**Cone Calorimeter**

Ref: ASTM E1354

**Vertical Burn Test**

Ref: ISO 14624-1

# Cone Calorimetry Testing Summary

Ref: R. Lyon, Journ. Fire Sci. 2024, Vol. 42(6) 487-513.

Ref: R. Lyon, Journ. Fire Sci. 2024, Vol. 42(6) 487-513.

**GRC-derived insulation is 3-5 orders of magnitude (1000x) more fire resistant than common polymeric materials!**

# Microcombustion Cone Calorimetry Testing Summary

- **Char yield:** Measure of residual mass remaining after pyrolysis

- **Fire Growth Capacity (FGC):** Calculated within ASTM D7309 to give insights into the potential for a material, as a function of its chemical structure, to ignite and grow in fire intensity once ignited

# Vertical Burn Testing Summary

Burn Length % over 12 Second Flame Exposure

Burn Length % over 60 Second Flame Exposure

- Sample passes test if flame does not consume past 6" (sample length), is self extinguished, and there is no melting.

# Limiting Oxygen Index (LOI) Testing Summary

Ref: ASTM D2863

- LOI of initially dried: 33.9%
- LOI of post cured: 35.6%

**Self-extinguishing behavior with limiting oxygen index (LOI) >35 %**

# Polymer Aerogel Innovation and Research (AIR) Laboratories

The Polymer Aerogel Innovation and Research Laboratories are dedicated to advancing the science and engineering of lightweight, high-performance aerogel materials to address the most demanding challenges in aerospace, aeronautics, and advanced technology sectors. Our mission is to pioneer innovative solutions in thermal management, structural insulation, energy absorption, and multifunctional material systems through the design, fabrication, and characterization of next-generation polymer aerogels. By fostering collaboration across government, industry, and academia, we strive to accelerate the transition of laboratory breakthroughs into real-world applications that enable safer, more efficient, and more technically advanced exploration and innovation.
