

# NASA TECH BRIEF

NASA Tech Briefs are issued to summarize specific innovations derived from the U. S. space program and to encourage their commercial application. Copies are available to the public from the Clearinghouse for Federal Scientific and Technical Information, Springfield, Virginia 22151.

## Modified Drill Permits One-Step Drilling Operation

MODIFIED SINGLE-MARGIN RAIL DRILL

### The problem:

To eliminate the necessity, when drilling medium-diameter holes in hard materials, of first drilling with an undersized drill, deburring, and finally reaming the hole to the required size.

### The solution:

Modifying the cutting faces of a drill having the same diameter as that of the desired hole. The drill can then be used in a one-step drilling operation, without chatter upon contact and premature wear.

### How it's done:

The modification consists of a groove across the bottom of each of the cutting faces of the drill flutes. For a drill that has a diameter of  $17/32$  inch, the

proper groove would have a depth of  $1/32$  inch and a radius of 0.030 inch; other size drills would require grooves of corresponding proportions. The area from the point of the drill to the groove, which is in essence a built-in center drill, functions to eliminate chatter.

### Notes:

1. All drills with flutes of adequate size to contain a groove can be modified in this manner.
2. Inquiries concerning this invention may be directed to:
