AEC-NASA Tech Briefs describe innovations resulting from the research and development program of the U.S. AEC or from AEC-NASA interagency efforts. They are issued to encourage commercial application. Tech Briefs are published by NASA and may be purchased, at 15 cents each, from the Clearinghouse for Federal Scientific and Technical Information, Springfield, Virginia 22151.

Multipurpose Instrumentation Cable Provides Integral Thermocouple Circuit

The problem:
Using transducers to measure strain, vibration, pressure, etc., throughout a wide temperature range requires close monitoring of transducer operating temperatures. Standard methods use two transducer lead wires and a separate thermocouple for each transducer, resulting in bulky and complex circuitry.

The solution:
A multipurpose cable with an integral thermocouple circuit that shares one of the transducer conductors.

How it's done:
In a typical strain gage configuration, the sheathed cable contains three copper conductors Cu-1, Cu-2, and Cu-3 for gage excitation and output plus a constantan conductor. The constantan conductor forms the negative leg of a copper/constantan thermocouple and uses one of the copper leads as the other leg. This permits measurement of the strain gage (transducer) temperature without increasing the overall size of the device by inclusion of a separate two-wire thermocouple.

Note:
