SUMMARY

Cells of *Pseudomonas* (Hydrogenomonas) saccharophila have been analyzed for their amino acid composition. Seventeen amino acids of the cellular proteins were quantitatively determined. The free amino acid pool accounted for less than 3 percent of the total amino acids of the cells.

INTRODUCTION

In recent years, considerable interest has developed in the hydrogen bacteria as potential sources of food in bioregenerative life support systems (ref. 1). Preliminary studies by Calloway indicated that these organisms, when fed to rats, can satisfy at least part of the nutritive requirement for proteins. Little information is available, however, regarding the amino acid content of this group of organisms.

During studies on the induced synthesis of enzymes by *Pseudomonas saccharophila* (ref. 2), the amino acids of its cellular proteins and of its free amino acid pool were determined. While this organism is generally cultivated in the presence of organic carbon sources, it was first isolated as a hydrogen bacterium (ref. 3). The organism thus grows autotrophically, with hydrogen as its energy source (refs. 3 and 4), or heterotrophically. As these properties are shared by most members of the genus *Hydrogenomonas* (ref. 5), it is felt that data on *P. saccharophila* would be of interest.

MATERIALS AND METHODS

Cells of *P. saccharophila* were cultivated heterotrophically on a synthetic medium containing 0.2 percent lactate as the only organic component (ref. 6). Conditions for growing, washing, and harvesting the cells are given elsewhere (ref. 7).

For analysis of the amino acid pool, cells were extracted with 1 percent picric acid, after which the picric acid was removed in a Dowex 2 column (ref. 8). The cells were then lyophilized and analyzed. Total amino acids were prepared by hydrolyzing washed cells in 6N HCl for 24 hours. Quantitative amino acid analyses were performed using a Beckman amino acid analyzer.
RESULTS

Table I gives the results of analyses for the amino acids of the pool and of the cellular proteins.

</table>

<sup>a</sup>μM of free amino acids in the pool comprise 2.77 percent of the total μM of amino acids in P. saccharophila (see, also, ref. 9).

<sup>b</sup>Uncorrected for decomposition during hydrolysis. Usual values for decomposition during 22 hours of hydrolysis at 110° C are: threonine, 3 percent; serine, 7 percent; tyrosine, 10 percent.
The aeronautical and space activities of the United States shall be conducted to or so contribute to the expansion of human knowledge of phenomena in the atmosphere and space. The Administration shall provide for the useful practical and appropriate dissemination of information concerning its activities and the results thereof.

NASAA SCIENTIFIC AND TECHNICAL PUBLICATIONS

TECHNICAL REPORTS: Scientific and technical information considered important, complete, and a lasting contribution to existing knowledge.

TECHNICAL NOTES: Information less broad in scope but nevertheless of importance as a contribution to existing knowledge.

TECHNICAL MEMORANDUMS: Information receiving limited distribution because of preliminary data, security classification, or other reasons.

CONTRACTOR REPORTS: Technical information generated in connection with a NASA contract or grant and released under NASA auspices.

TECHNICAL TRANSLATIONS: Information published in a foreign language considered to merit NASA distribution in English.

TECHNICAL REPRINTS: Information derived from NASA activities and initially published in the form of journal articles.

SPECIAL PUBLICATIONS: Information derived from or of value to NASA activities but not necessarily reporting the results of individual NASA-programmed scientific efforts. Publications include conference proceedings, monographs, data compilations, handbooks, sourcebooks, and special bibliographies.

Details on the availability of these publications may be obtained from:
