XMTR	Transmitter

1.0 INTRODUCTION

The Descent/Phasing Summary Document has been prepared to document in detail the crew procedures and supporting information to be used in training for the F Mission. The document covers the mission phase from CSM-LM undocking to completion of the phasing burn. The procedures contained herein will become controlled procedures upon final issue.

Comments or questions concerning this document should be directed to C. O. Lewis, Flight Procedures Branch, CF24.

2.0 MISSION SUMMARY

The mission phase within the scope of this document begins with undocking of the LM and CSM approximately three-quarters of a revolution prior to DOI. At the time of undocking, the vehicles are in a 58 nm circular orbit, and LM activation and checkout has been completed except for items which could not be performed while in the docked configuration.

The CSM undocks from the LM and station keeps in close proximity while the LM rotates for a visual inspection by the CSM. Upon completion of the inspection, the LM acquires S-BAND lock-on with MSFN and takes over the station keeping while the CSM prepares for the separation burn. During this period the LGC is updated by MSFN (S/V and DOI targeting) and pad data for DOI and the Phasing Burn is read up.

The CSM performs the separation burn 180° prior to DOI. The burn is 2.5 fps radially down. This burn will put the CSM 11,400 ft in front of the LM at DOI. The LM uses the target ΔV Program to change the CSM S/V in the LGC. After separation, the DOI pre-thrust program is run to verify it is loaded correctly, and a Rendezvous Radar and VHF ranging test is run.

After the LM passes into darkness, the IMU is fine aligned to a landing site REFSMAT. Systems and controls checklists are performed and the AGS is updated, configured to follow the DOI PGNS burn, and aligned to the IMU. The DPS thrust program is called and final preparations for the DOI burn are made.

The DOI burn is a retrograde burn of approximately 70 fps which reduces pericynthian to 50,000 ft. The burn is PGNS controlled, using the external ΔV program. Timing is such that pericynthian will occur 15° prior to reaching the target landing site. The AGS, Rendezvous Radar, and VHF ranging are used to verify that the burn was performed correctly.

The AGS is re-calibrated, Landing Radar turned on and checked out, MSFN reacquired, and pre-burn systems and controls checks made. The powered descent braking program is entered to check the operation of that program in making pre-ignition calculations. It is then exited.

Up to this time, the F Mission has been almost identical to the G Mission profile, but at PDI-10 minutes, the G profile is abandoned and the Phasing Burn targeting is loaded in the LGC. At 3 minutes prior to pericynthian, a pitch rate is established which will have the vehicle 0.0.0 (LV) at pericynthian. Landing

radar readings are taken to assess the radar's high altitude capa-
bility, and observations of the landing site are made during the
pass.

At 10 minutes prior to the Phasing Burn, the AGS is updated, con-
figured, and aligned to follow-up the burn. The thrust program
is entered and final preparations are made. The Phasing Burn
occurs 14 minutes past pericynthian and is a posigrade External
ΔV burn of approximately 190 fps. The resulting high apogee orbit
will put the IM below and behind the CSM on the succeeding revolu-
tion so that a lunar landing mission rendezvous can be simulated.

APPENDIX A - VEHICLE OPERATIONS

A. SWITCH DESCRIPTIONS

GUID CONT sw

This switch selects either PGNS or AGS for guidance and control of the LM.

PGNS — Enables the ACA and TTCA, proportional rate command inputs to the LGC, engine ON-OFF signals and gimbal trim commands, translation ON-OFF commands, the primary preamps of the ATCA, and sends the follow-up signal to the AEA.

AGS — Enables the ACA and TTCA, proportional rate commands to the ATCA, gimbal trim commands, the abort preamps of the ATCA, and removes the follow up signal.

MODE SEL sw

LDG RADAR — Landing radar altitude and altitude rate are displayed on the tapemeter and FWD and LAT velocity is displayed on the X-POINTER.

PGNS — LGC computed altitude and altitude rate are displayed on the tapemeter and FWD and LAT velocity is displayed on the X-POINTER.

AGS — AEA computed altitude, altitude rate, and LAT velocity are displayed.

RNG/ALT MON sw

RNG/RNG RT — RR range and range rate data is displayed on the tapemeter.

ALT/ALT RT — Altitude and altitude rate data, from the system selected by the MODE SEL sw, is displayed on the tapemeter.

RATE/ERR MON sw

This switch selects the input for the X-POINTER and FDAI error needle displays.

RNDZ RADAR   –

RR shaft and trunnion angles are displayed on the error needles and LOS rates are displayed on the X-POINTER.

LDG RDR/CMPTR –

Attitude errors (PGNS/AGS) are displayed on the error needles and FWD and LAT velocity (PGNS/LR) on the X-POINTER. (When AGS is selected only LAT velocity is displayed).

ATTITUDE MON sw

PGNS   –

PGNS total attitude and attitude errors are displayed on the FDAI.

AGS   –

AGS total attitude and attitude errors are displayed on the FDAI.

SHFT/TRUN ⅀ sw

This switch selects the scaling for the FDAI error needles when RR shaft and trunnion angles are displayed.

50 DEG   –

Full deflection of the error needles indicates shaft and trunnion angles of 50 DEG.

5 DEG   –

Full deflection indicates angles of 5 DEG.

RATE SCALE sw

25 DEG/SEC   –

Full deflection of the rate needles is 25 DEG/SEC.

5 DEG/SEC   –

Full deflection of the rate needles is 5 DEG/SEC.

ACA PROP sw

This switch allows the crewman to remove power from the ACA transducer primary coils, disabling proportional rate commands. The switch will be used to isolate ACA malfunctions. The direct and hardover modes are still available when disabled.

ENABLE   -   ACA operates normally.

DISABLE   -   Removes 28-volt, 800-cps power from the transducer primary coils.

THR CONT sw

AUTO   -   LGC thrust commands are summed with manual commands from the TTCA for DPS throttle control. Normally the TTCA is in the minimum position (10%) in this mode. LGC commands, plus a 10% bias, are displayed on the CMD side of the thrust indicator.

MAN   -   Manual commands control the DPS throttle and are displayed on the thrust indicator.

MAN THROT sw

This switch selects the TTCA (CDR/SE) which controls the DPS thrust level. (Assuming the THROTTLE-JETS lever is set to THROTTLE)

CDR   -   Enables the CDR's TTCA.

SE   -   Enables the pilots TTCA.

ENG ARM sw

This switch provides arming signals to the APS or DPS while signaling the LGC that the engine is armed. Without the engine arm signal neither engine will fire. The appropriate engine will be armed when the ABORT or ABORT STAGE switches are depressed, regardless of the position of this switch.

ASC   -   The ASC engine is armed.

OFF   --   The arming signals are removed; therefore, this position can be used as a backup means to engine shutdown.

DES   --   The DES engine is armed.

X-TRANSL sw

4 JETS   --   Provides four jets for AGS X-axis translation maneuvers.

2 JETS   --   Provides two jets for AGS X-axis translation maneuvers.

BAL CPL sw

This switch, effective only with AGS, selects either balanced pairs of x-axis RCS jets in a couple or unbalanced x-axis RCS jets for use in maintaining pitch and roll attitude during thrust phases.

ON   --   Enables the four up-firing jets for AGS controlled maneuvers. The switch should be in this position when maximum stabilization and control is required.

OFF   --   Disables the up-firing x-axis jets. The switch will be positioned to OFF to prevent RCS jet firings opposing the direction of motion during powered phases - assuming adequate stability and control can be maintained by the down-firing jets.

ENG GMBL sw

This switch enables or disables pitch and roll DFS gimbal trim commands from the LGC or ATCA. The switch must be placed to ENABLE and the engine must be armed to accomplish the trim function prior to and during a burn. If the ENG GMBL light illuminates during a burn and/or the RCS fuel consumption is excessive the switch should be thrown to OFF.

ENABLE   --   Pitch and roll gimbal trim commands are enabled.

| OFF | - | Power is removed from the actuators and the gimbal mal-function logic is reset. The actuators "lock up" in the last commanded position. |

DES ENG CMD OVRD sw

The switch applies redundant power to the descent engine bi-propellant valves to prevent inadvertent engine shutdown during a critical mission phase. During powered descent, the switch will be ON immediately after ignition and will remain ON until after the landing. The circuit is interrupted by the ABORT STAGE button and the engine STOP button.

| ON | - | Redundant 28 vdc power is applied to the descent engine valves. |

| OFF | - | Removes 28 vdc from the bi-prop valves. |

LDG ANT sw

The switch controls the position of the landing radar antenna.

| AUTO | - | The LGC automatically positions the LR antenna as a function of mission phase. |

| DES | - | The antenna x-axis is driven to a position 24 DEG from the LM body x-axis. The Y and Z antenna axes are 6 DEG from the respective body axes. This is the antenna position during the braking phase of powered descent. |

| HOVER | - | The antenna x-axis is aligned with the body x-axis and the Y and Z axes are 6 DEG from the respective body axes. This is the antenna position during the approach and landing phases. |

DEADBAND sw

MAX — A 5 DEG attitude deadband is provided under AGS control. FDAI attitude error needle scaling is 14.4 DEG.

MIN — A 0.3 DEG attitude deadband is provided under AGS control. FDAI error needle scaling is 1.7 DEG.

ACA/4 JET sw

The switches allow the crew to disable the hardover mode of the ACA in the event of a short or jammed hand controller. All other ACA modes remain operative.

ENABLE — Normal ACA operation.

DISABLE — Interrupts the 28 vdc to the secondary RCS coils.

TTCA/TRANSL sw

The switches allow the crew to disable the translation control function of the TTCA in the event of a short or jammed controller. The throttling function of the controller remains operative.

ENABLE — Normal TTCA operation.

DISABLE — Interrupts ± 15 vdc to the primary RCS coils.

LUNAR CONTACT LIGHT

The lights are illuminated when the lunar surface sensing probes touch the surface, actuating mechanical switches. If serves as the signal for manual engine shutdown prior to lunar impact. The light is blue and extinguishes when the STOP PB is depressed.

T/W INDICATOR

The indicator displays instantaneous x-axis acceleration in lunar g units. It provides a gross check on engine (APS/DPS) performance.

MASTER ALARM LIGHTS

The lights alert the flight crew to critical subsystem malfunctions.
Upon receipt of the signal, the crew should reset the light and refer
to the caution and warning panel. Depression of either switch will
extinguish both lights and terminate the audible tone.

ABORT PUSH BUTTON sw

The switch should be actuated when an abort from powered descent, using
the descent engine is desired. The switch activation arms the descent
engine and signals the LGC and AEA to compute and execute the abort tra-
jectory. The AGS will not issue automatic engine ON/OFF commands unless
this switch is depressed. It is reset by depressing it a second time.

ABORT STAGE PB sw

The switch should be actuated when an abort staging sequence, with ascent
engine ignition is desired. The switch activation will cause the follow-
ing events to occur:

1. The "Abort Stage" discrete is sent to the LGC and AEA.

2. The "Abort Stage" delay is initiated (500 ms).

3. The DPS is shutdown.

4. The APS is pressurized – should be completed in 400 ms.

5. Power is transferred from descent to ascent batteries.

6. At the termination of the delay, the selected guidance system
   issues an engine ON command.

7. A "stage" command is sent to the electro-explosive devices.

If the Abort Stage sequence is initiated in coasting flight an ullage burn
will be required. This switch interrupts the redundant 28 vdc to the DPS
engine valves.

ENGINE STOP sw (2)

The pushbutton switches separately interrupt the "ON" signal to the ascent
and descent engines independent of the position of the ENG ARM switch.
The STOP PB is the primary means of terminating thrust at lunar landing
and should be used to back-up engine shutdown for automatic thrusting
maneuvers. When actuated the latching PB illuminates red and is reset

by a second depression. If it cannot be reset the APS can still be
started and the Abort Stage function can be utilized with a manual
engine start. The switch activation interrupts the redundant 28 vdc
to the DPS engine valves.

ENGINE START sw

This PB momentary contact switch provides the crew with the capability
to immediately fire the DPS or APS, depending on the position of the
ENG ARM sw. The START sw energizes a latching relay which provides a
continuous engine ON command and a RED light to indicate the relay is
energized. Activation of either STOP sw resets the latching relay,
interrupts the ON signal and extinguishes the light.

+ X TRANSL sw

This PB switch applies 28 vdc to the secondary RCS coils providing 4-jet
translation in +X direction. It is the primary means of providing ullage
for manual APS/DPS burns. The switch is momentary contact and the signal
is removed from the coils when the button is released. If the switch
fails closed the ATT DIR CONT cb must be opened.

DES RATE sw

This switch can be used to control the rate of descent of the LM, in
a semi-manual mode during powered descent. The vehicle must be under
PGNS control in the attitude hold mode. Vehicle attitude is controlled
by the crewman and the DPS throttle by the LGC. Each switch actuation
provides a discrete pulse, changing the rate of descent by 1 fps.
Upward deflections of the switch decrease the descent rate and downward
deflections increase it.

B. CONTROL MODES/SWITCHES

GUID CONT sw	MODE CONT sw's	ATT CONT (selectable per axis)	REMARKS
PGNS	AUTO	MODE CONT	This is the switch configuration for all automatic PGNS maneuvers. Rate compensated steering errors are generated in the DAP and ON/OFF commands are sent to the jet drivers for vehicle control. The crew can

CONTROL MODES/SWITCHES

GUID CONT sw	MODE CONT sw's	ATT CONT (selectable per axis)	REMARKS
			control vehicle yaw attitude in a proportional rate command – attitude hold mode unless there is a program inhibit present.
PGNS	AUTO	PULSE	This position is inoperative. Vehicle control remains automatic.
PGNS	AUTO	DIRECT	A displaced ACA will fire pairs of jets, but since vehicle control is still automatic, the jet firing will conflict with the automatic steering commands.
PGNS	ATT HOLD	MODE CONT	If the extended verb V77 is selected, this is a manual proportional rate command mode. When the hand controller is returned to detent the DAP removes the vehicle rates and reverts to attitude hold. If V76 is selected, this is a minimum impulse mode with a single 14ms jet firing each time the hand controller is moved beyond the pulse/direct switches of the ACA. If no commands, are present the vehicle will drift freely.
PGNS	ATT HOLD	PULSE	Same as AUTO-PULSE.
PGNS	ATT HOLD	DIRECT	Same as AUTO-DIRECT.
PGNS	OFF	MODE CONT, PULSE OR DIRECT	Power is removed from the primary and abort preamps, disabling PGNS control of the RCS jets. The DAP will revert to an idle mode, in which it will not respond to any inputs. The ACA will be operative only in the

CONTROL MODES/SWITCHES

GUID CONT sw	MODE CONT sw's	ATT CONT (selectable per axis)	REMARKS
			"hardover" position (If DIRECT is selected, 2 jet firing is available in that axis). Automatic engine ON/OFF commands and the TTCA's are disabled.
AGS	AUTO	MODE CONT	This is the switch configuration for automatic AGS maneuvers. Steering signals are generated in the AEA. Rate gyro signals are summed with attitude error signals to provide vehicle rate damping.
AGS	AUTO	PULSE	The crew can command vehicle rotation through low frequency pulsing of the RCS jets (approximately 1.5 pulses/sec). Steering signals are interrupted and there is no rate damping.
AGS	AUTO	DIRECT	The crew can command vehicle rotation through 2 jet operation, direct to the secondary coils. Steering signals are interrupted and there is no rate damping.
AGS	ATT HOLD	MODE CONT	This is a manual proportional rate command mode. The control loop maintains the vehicle attitude when the ACA is returned to detent.
AGS	ATT HOLD	PULSE	Same as AUTO-PULSE.
AGS	ATT HOLD	DIRECT	Same as AUTO-DIRECT.
AGS	OFF	MODE CONT PULSE OR DIRECT	Power is removed from the primary and abort preamps disabling AGS control of the RCS jets. The ACA is operative only in the direct modes using the secondary coils. Automatic engine ON/OFF commands and the TTCA's are disabled.
