Use of funds for printing this publication approved by the Director of the Office of Management and Budget June 23, 1971.

AERONAUTICAL ENGINEERING

A Special Bibliography

Supplement 8

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in July 1971 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA)*.

This document is available from the National Technical Information Service (NTIS), Springfield, Virginia, 22151, for \$3.00.

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering.

This supplement to *Aeronautical Engineering—A Special Bibliography* (NASA SP-7037) lists 540 reports, journal articles, and other documents originally announced in July 1971 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*. For previous bibliographies in this series, see inside of front cover.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries* in that order. The citations and abstracts are reproduced exactly as they appeared originally in *IAA* or *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes—subject, personal author, and contract number—are included.

An annual cumulative index will be published.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A71-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc., (AIAA), as follows: Paper copies are available at \$5.00 per document up to a maximum of 20 pages. The charge for each additional page is 25 cents. Microfiche⁽¹⁾ are available at the rate of \$1.00 per microfiche for documents identified by the # symbol following the accession number. A number of publications, because of their special characteristics, are available only for reference in the AIAA Technical Information Service Library. Minimum airmail postage to foreign countries is \$1.00. Please refer to the accession number, e.g., A71-10613, when requesting publications.

STAR ENTRIES (N71-10000 Series)

A source from which a publication abstracted in this Section is available to the public is ordinarily given on the last line of the citation, e.g., Avail: NTIS. The following are the most commonly indicated sources (full addresses of these organizations are listed at the end of this introduction):

Avail: NTIS. Sold by the National Technical Information Service at a standard price of \$3.00 for hard copy (printed, facsimile, or reproduced from microcopy) of 300 pages or less. Documents in the 301 to 600 page range are sold for \$6.00 in hard copy, and those in the 601 to 900 page range are sold at \$9.00. Documents exceeding 900 pages are priced by NTIS on an individual basis. These prices apply retroactively to all documents in the NTIS collection, but in addition, documents of 300 pages or less that are over two years old (from date of announcement in *Government Reports Announcements*, or *STAR* for those items announced only in *STAR*) will have a surcharge of \$3.00 added for a total price of \$6.00. No additional surcharge will be added for documents over 300 pages.

Microfiche is available from NTIS at a standard price of 95 cents (regardless of age) for those documents identified by the # sign following the accession number (e.g., N71-10411#) and having an NTIS availability shown in the citation.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The price is given following the availability line. (An order received by NTIS for one of these documents will be filed at the SOD price if hard copy is requested. NTIS will also fill microfiche requests, at the standard 95 cent price, for those documents identified by a # symbol.)

Avail: NASA Scientific and Technical Information Office. Documents with this availability are usually news releases or informational brochures available without charge in paper copy.

Avail: AEC Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of U.S. Atomic Energy Commission reports, usually in microfiche form, are listed in *Nuclear Science Abstracts*. Services available from the USAEC, and its depositories are described in a booklet, *Science Information Available from the Atomic Energy Commission (TID-4550)*, which may be obtained without charge from the USAEC Division of Technical Information.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts*, and are sold by University Microfilms as xerographic copy (HC) at \$10.00 each and microfilm at \$4.00 each, regardless of the length of the manuscript. Handling and shipping charges are additional. All requests should cite the author and the Order Number as they appear in the citation.

(1) A microfiche is a transparent sheet of film, 105 x 148 mm in-size, containing up to 72 pages of information reduced to micro images (not to exceed 20:1 reduction)

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by British Information Services (BIS), New York City. The U.S. price (including a service charge) is given, or a conversion table may be obtained from BIS.

Avail: National Lending Library, Boston Spa, England. Sold by this organization at the price shown. (If none is given, an inquiry should be addressed to NLL.)

Avail: ZLDI. Sold by the Aentralstelle für Luftfahrtokumentation und -Information, Munich, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability: Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent Office. Sold by Commissioner of Patents, U.S. Patent Office, at the standard price of \$.50 each, postage free.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

SUBSCRIPTION AVAILABILITY

This publication is available on subscription from the National Technical Information Service (NTIS). The annual subscription rate for the monthly supplements, excluding the annual cumulative index, is \$18.00. All questions relating to subscriptions should be referred to the NTIS.

TYPICAL CITATION AND ABSTRACT FROM STAR

TYPICAL CITATION AND ABSTRACT FROM IAA

AERONAUTICAL ENGINEERING

A Special Bibliography (Suppl. 8)

AUGUST 1971

IAA ENTRIES

A71-27819 # Fatigue strength of aircraft skin elements affected by corrosion (Soprotivlenie ustalosti elementov obshivki samoleta, porazhennykh korroziei). A. V. Karlashov, A. I. Radchenko, A. Ia. Zaika, and N. F. Voronkin (Kievskii Institut Inzhenerov Grazhdanskoi Aviatsii, Kiev, Ukrainian SSR). *Fiziko-Khimicheskai Mekhanika Materialov*, vol. 7, no. 1, 1971, p. 53-56. In Russian.

Study of the effect of a series of artificial corrosion pits, simulating local corrosion of the aircraft skin, on the fatigue durability of smooth samples and structural elements of duraluminum. It is shown that in the estimation of aircraft skin corrosion, the most important factor is the pitting density. Allowance must also be made for the effect of stress raisers formed by structural elements. This effect in many cases is much more important to the fatigue strength of the aircraft skin than are corrosion pits. Z.W.

A71-27838 # VTOL propulsion - 1970 perspective. E. P. Cockshutt (National Research Council, Ottawa, Canada). (*Canadian Aeronautics and Space Institute, Annual General Meeting, Ottawa, Canada, May 18, 19, 1970.*) *Canadian Aeronautics and Space Journal*, vol. 17, Apr. 1971, p. 117-129. 15 refs.

Review of the evolution of gas turbine technology over the past 15 years, with emphasis on the trends in pressure ratio, turbine inlet temperature, and weight as they bear on VTOL propulsion. A general system for cataloging VTOL powerplant systems based on a common gas generator is suggested, and the emerging predominance of lifting-fan systems is noted. It is shown that even high-bypass fans produce excess thrust under cruising conditions, hence some of the engines should be shut down in cruise. It is also shown that if high-bypass fans are to be used both in hover and cruise, then some form of variable geometry is needed to cope with the different operating conditions. It is considered that acceptable airworthiness for VTOL aircraft will only be achieved by significant engine reserve capacity to produce engine-out safety. F.R.L.

A71-28032 # Development of high-response data analysis aids for inlet-engine testing. Malcolm Rowe and Mark B. Sussman (Boeing Co., Seattle, Wash.). *Journal of Aircraft*, vol. 8, May 1971, p. 307-311. Contract No. AF 33(657)-69-C-0552.

The paper describes two data analysis aids recently developed to provide easy interpretation of high-response inlet flowfield information. A light bulb display is utilized as an analog simulation of the engine compressor face. Bulbs, on a one-to-one basis with high-response pressure transducers, provide flow visualization of high-

frequency (to 1000 Hz) pressure fluctuations. A second analog device instantaneously sums the inputs of a select number of compressor face probes. Its output signal is used as an index to establish the degree to which the compressor face pulsations are one-dimensional. Data from a recently conducted inlet-engine test program are used to illustrate the operation of both devices. (Author)

A71-28033 # Vortex wakes behind high-lift wings. J. E. Hackett and M. R. Evans (Lockheed-Georgia Co., Marietta, Ga.). *Journal of Aircraft*, vol. 8, May 1971, p. 334-340. 17 refs.

At high wing lift coefficients pertinent to STOL operation, the conventional neglect of vortex roll-up effects can lead to errors when calculating downwash at the tail plane and in the presence of ground or wind-tunnel walls. A classical unsteady treatment in the cross-flow plane, which calculates the roll-up of an initial spanwise row of point vortices, has been modified to allow for the influence of the wing. Additional meaning is thereby given to the streamwise length dimension and hence to aspect ratio and sweep. The effects of height-above-ground and of various tunnel heights and widths are discussed. Under certain limited conditions, notably with part-span flaps or too narrow a tunnel, part or all of the trailing vortex system may move upwards. Consequent changes in the vertical velocity field are additional to conventional estimates involving only the appropriate image system. (Author)

A71-28145 Vacuum heat treating of jet engine components. R. F. Latchaw and D. J. Spillane (General Electric Co., Aircraft Engine Group, Evendale, Ohio). *Metals Engineering Quarterly*, vol. 11, May 1971, p. 24-26.

Vacuum heat treating of jet engine components is described with examples of some brazed and activated-diffusion-bonded hardware, including sheet-metal vanes, cast vanes, and blades. The problems connected with maintenance of the vacuum equipment are briefly reviewed with special reference to the problem of localized surface melting of René 80 high-pressure turbine blades during activated diffusion bonding. Z.W.

A71-28158 A miniature turbulence gauge utilizing aerodynamic lift. Thomas E. Siddon (British Columbia, University, Vancouver, Canada). *Review of Scientific Instruments*, vol. 42, May 1971, p. 653-656.

An advanced version of the aerofoil probe turbulence gauge is described. The new device uses an axisymmetric lifting body sensor of 2.4 mm diam coupled directly to a miniature preamplifier unit (6.35 mm diam). The output voltage varies linearly with the v or w component of turbulence. The device has uniform sensitivity and good signal-to-noise ratio over a nominal frequency range of 10 to 10,000 Hz. A discussion of calibration procedures and application considerations is included. (Author)

A71-28164 Society of the Plastics Industry, Annual Western Conference, 28th, Coronado, Calif., May 5-7, 1971, Proceedings. Los Angeles, Society of the Plastics Industry, Inc., 1971.

171 p. \$7.00.

Recent advances in composite materials and filamentary-composite reinforcement of metal structures are reviewed, with special attention to their use in spacecraft and missiles. Polyimides, in particular, are considered for use in high temperature service, and potential structural applications to the space shuttle are discussed in the light of ongoing studies.

M.V.E.

A71-28168 * **Filamentary composite reinforcement of metal structures.** P. T. Sumida, L. J. Hart-Smith (Douglas Aircraft Co., Long Beach, Calif.), R. A. Pride, and W. Illg (NASA, Langley Research Center, Hampton, Va.). In: Society of the Plastics Industry, Annual Western Conference, 28th, Coronado, Calif., May 5-7, 1971, Proceedings. Los Angeles, Society of the Plastics Industry, Inc., 1971, p. 74-90. 18 refs.

A brief history of filamentary composite reinforced metal aircraft structural components is discussed. Trends in structural reinforcement concepts are enumerated for several different shapes and configurations. Test data are presented for boron/epoxy in combination with aluminum plus additional data on graphite/epoxy materials and hybrids with steel, titanium, and magnesium. The effect of thermally induced locked-in stresses arising from the differences in thermal coefficients of expansion of the various constituent materials is presented. Estimates of weight savings and projected costs of filamentary composite materials are included. Some basic problems which need further investigation and analyses are outlined. (Author)

A71-28176 **Aircraft vortex wake.** S. R. Cann (British Air Line Pilots Association, Hayes, Middx., England). *Shell Aviation News*, no. 394, 1971, p. 8, 9.

Consideration of the trailing vortices shed by the lifting surfaces of an aircraft. Vortex strength varies directly with the lift being produced by the wing and inversely as the speed and the span. Thus it is that at low speeds - i.e., in control zones - that wake effects become important. Encounters of aircraft with wakes produced by other aircraft can result in uncontrollability. Current UK separation standards are summarized. F.R.L.

A71-28177 **Engine condition monitoring.** John Towers (Aer Lingus Teo, Dublin, Ireland). *Shell Aviation News*, no. 394, 1971, p. 16-24.

Description of the methods by which engine condition monitoring (ECM) can be applied to airline operation. The engine parameters used for trend analysis are exhaust gas temperature (EGT); fuel flow (F); low- and high-pressure rotor speeds; and turbine (T) and diffuser (D) case vibration levels. Performance data are recorded by flight crews under steady-state cruise conditions, and the data are then transferred to punch cards at base. The program compares the performance of the gas path parameters for the engine being monitored to a standard engine of the same type at the same thrust setting. It is shown that trends appearing on the ECM printouts were effective in detecting defects and preventing secondary damage. F.R.L.

A71-28211 # **Load estimation methods for preliminary design weight prediction.** R. S. St. John (LTV Aerospace Corp., Dallas, Tex.). *SAWE Journal*, vol. 30, Mar.-Apr. 1971, p. 10-17. 12 refs.

Description of some preliminary load estimation methods used in performance and design concept trade studies required for arriving at candidate systems for detail analysis. These weight estimation techniques are shown to be accountable and at the same time adaptable enough to be useful in all phases of the advanced design environment. M.V.E.

A71-28249 # **Measurement of geomagnetic components from moving platforms.** A. Ia. Rotshtein and I. G. Zhurii (Akademiia Nauk SSSR, Institut Zemnogo Magnetizma, Ionosfery i Rasprostraneniia Radiovoln, Leningrad, USSR). (*Geomagnetizm i Aeronomiia*, vol. 10, no. 5, 1970, p. 883-887.) *Geomagnetism and Aeronomy*, vol. 10, no. 5, 1970, p. 696-699. 10 refs. Translation.

Discussion of direct and indirect methods of measuring geomagnetic components from ships or aircraft in a system of coordinates which is fixed in space. Direct and indirect methods of stabilizing the system of coordinates are also studied. It is shown that direct stabilization methods have the advantage of permitting direct measurement of any geomagnetic component in such a way that the results can be averaged without errors over an arbitrary period of time. V.P.

A71-28250 # **Aircraft refractometer.** V. N. Bormotov, I. D. Gontar', and V. F. Shul'ga (Akademiia Nauk Ukrainkoi SSR, Institut Radiofiziki i Elektroniki, Kharkov, Ukrainian SSR). (*Geomagnetizm i Aeronomiia*, vol. 10, no. 5, 1970, p. 888-892.) *Geomagnetism and Aeronomy*, vol. 10, no. 5, 1970, p. 700-703. Translation.

Discussion of the design and principles of operation of an onboard refractometer operating at the 3.2 cm wavelength. Particular attention is given to the design of the resonator, on which the effectiveness of the instrument depends, and to a circuit by means of which the frequency of two klystron oscillators is phase locked to the resonator resonant frequencies. The block diagram for measuring the frequency difference of the two klystrons is examined. Mounted on an IL-18 aircraft, the device proved to be highly effective under adverse flight conditions at a height of 11 km. V.P.

A71-28282 # **A flow about a low-aspect-ratio delta wing at large angles of attack (Obtiskannia del'ta-krila malogo vidovzheniia pri velikikh kutakh ataki).** R. O. Soroka (Akademiia Nauk Ukrainkoi SSR, Institut Gidromekhaniki, Kiev, Ukrainian SSR). *Akademiia Nauk Ukrainkoi SSR, Dopovidi, Seriia A - Fiziko-Tekhnichni i Matematichni Nauki*, vol. 32, Feb. 1971, p. 174-178. 5 refs. In Ukrainian.

A flow model proposed by Brown and Michel (1954) for a low-aspect-ratio delta wing is used to derive an expression for the lift coefficient as a function of the vortex-line-to-wing-plane slope. The expression is used in a delta wing design with an aspect ratio of 0.7. Good agreement is obtained between the lift coefficient of this design found from this expression and lift coefficients given for comparable wings by Brown and Michel, Mangler and Smith (1959), Johns (1946), and other authors. V.Z.

A71-28304 **The role of military aviation greases in subsonic commercial airplane design.** Douglas C. Sullivan (Boeing Co., Commercial Airplane Group, Renton, Wash.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971; Paper 710411*. 6 p. Members, \$1.00; nonmembers, \$1.50.

The Boeing Co. subsonic commercial airplane design practice is to use military specification greases as preferred lubricants. This standardization practice originated with the 707 prototype, and has been continued throughout design and construction stages of all commercial jet models. Based on service experience and supplementary testing, this approach has proven economical and technically beneficial to the airlines. Preferred military specifications and brief details of supplementary tests are discussed. (Author)

A71-28305 **Airport certification.** Clyde W. Pace, Jr. (FAA, Washington, D.C.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710413*. 5 p. Members, \$1.00; nonmembers, \$1.50.

Discussion of data pertaining to the Airport Certification

Program, including the certification and safety inspection procedures, and a list of minimum safety standards that will be contained in the Federal Aviation Regulations (FAR). Airports served solely by air taxis will not be included in the program unless the air taxis provide contract service for regularly scheduled air carrier aircraft. The program is designed to help put the airport facilities in uniform, safe, and proper order for the present and future airport-oriented activities. M.M.

A71-28306 **The National Airport System Plan - Its history and its potential.** Robert F. Bacon and Elliott B. Perrett, Jr. (FAA, Washington, D.C.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710414.* 11 p. Members, \$1.00; nonmembers, \$1.50.

Discussion of the changes undergone by the National Airport Plan (NAP) since its inception. Since 1946, a document called NAP has been prepared annually to 'specify in terms of general location and type of development the projects considered by the Administrator to be necessary to provide a system of public airports adequate to anticipate and meet the needs of civil aeronautics,' throughout the U.S., including Puerto Rico and the Virgin Islands. The process of developing the NAP is conceived as a continuous planning process both from the standpoint of evolving and refining the criteria by which it comes into being and in the application of the criteria by the field elements of FAA's Airports Service to provide a continuous flow of data into Washington for evaluation and processing. A very essential part of this process is an increasing involvement of airport managements, various elements of FAA, and others having a direct interest in providing input to a plan which it is hoped, will reflect the best effort possible in defining a national system of airports. M.M.

A71-28307 **Expansibility and economy of terminal structures.** Jack D. Downey. *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710418.* 5 p. Members, \$1.00; nonmembers, \$1.50.

Discussion of criteria and problems connected with the future design of airport terminals. It is pointed out that, in planning terminal structures, it must be recognized that economy and expansibility are corequirements and must be mutually involved. Four dimensions of terminal planning and construction should be considered. In addition to the usual dimensions of length, height, and width, time is an equally important component. The linear/unit terminal concept tends to wed these dimensions into a superior facility. The extensive use of dimensional planning can make a facility long-lived. M.M.

A71-28308 **Development progress on CF6 engines.** B. H. Rowe (General Electric Co., Aircraft Engineering Group, West Lynn, Mass.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710421.* 14 p. Members, \$1.00; nonmembers, \$1.50.

The development of commercial engines requires adequate testing to assure reliable low cost operation in service. Problems experienced as a result of severe endurance testing, and the design changes which solved these problems, are described in detail. Adequate performance margin is essential to allow concentrated efforts in the area of reliability and long life. (Author)

A71-28309 **Olympus 593 for Concorde updating of development position.** M. H. Beanland (Rolls-Royce, Ltd., Bristol Engine Div., Bristol, England). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710422.* 11 p. Members, \$1.00; nonmembers, \$1.50.

The development program on the Olympus 593 pure jet twin shaft engine has been in existence about 5-1/2 years. Throughout the program a policy of matching engine rating to aircraft requirements

has been adopted. All engine standards have been checked out by extensive bench endurance testing. Performance requirements have been confirmed by testing in altitude cells and by subsonic flight.

(Author)

A71-28310 **The economics of subsonic transport airplane design, evaluation and operation.** Donald D. Hufford, James A. Ross, and Kenneth W. Hoefs (Boeing Co., Seattle, Wash.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710423.* 12 p. 6 refs. Members, \$1.00; nonmembers, \$1.50.

The interactive and cyclical design, evaluation, and operational system that conceives transport airplanes is described. Some economic consequences of preliminary design variable choices are displayed, followed by an inspection of the 1967 ATA Method and actual direct operating costs. Uses and misuses of the formula costs, as compared to actual cost levels, are considered. Finally, the impact of airplane choice on airline profitability is examined. It is seen that the profit consequences are great enough to require careful attention to economic trades in every step of the design, evaluation, and operational process. (Author)

A71-28311 **The MAC MADAR System - An AIDS model for commercial airlines.** George C. Curtis and Charles F. Elgin (Lockheed-Georgia Co., Marietta, Ga.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710425.* 9 p. 9 refs. Members, \$1.00; nonmembers, \$1.50.

Review of the application of the MADAR (Malfunction Detection, Analysis, and Recording) System in the MAC (Military Airlift Command) environment. Some of the implications of applying a computerized system of this type to alleviate problems in the commercial aviation environment are examined. The MADAR System, an on-board monitor and processor, employs an 8192-word general purpose computer which affords an automatic monitoring capacity of 1024 data points. The system as currently configured monitors 800 signals, providing fault-isolation capability for 1894 LRUs (Line Replaceable Units). Go-no-go decisions relative to proper operation of black boxes, as well as assessment of engine condition by means of the mechanized gas-generator technique, are performed on board the aircraft, and the results are available in real time. This essentially reduces the response time to zero, eliminates dependence on ground computers, and allows the system outputs to be applied to short-term maintenance problems. M.M.

A71-28312 **Development of the Lockheed L-1011's flying stabilizer.** C. A. Whitmore (Lockheed-California Co., Burbank, Calif.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710426.* 13 p. Members, \$1.00; nonmembers, \$1.50.

Longitudinal control on the Lockheed L-1011 is provided by a flying stabilizer. This is the first time such an approach has been used on a United States commercial jet transport. This paper presents the reasons for the choice of longitudinal control systems, and describes the mechanization of the control system with particular emphasis on how it meets Lockheed's safety standards and the Federal Airworthiness Requirements. The status of the ground and flight development tests is discussed. (Author)

A71-28313 **Beryllium brake experience on the C-5A airplane.** Robert D. Gilson (Lockheed-Georgia Co., Marietta, Ga.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710427.* 10 p. Members, \$1.00; nonmembers, \$1.50.

The critical design weight environment necessary to optimize load-carrying efficiency of the C-5A was such that breakthroughs in technology were needed. One such breakthrough was beryllium brakes. From the discovery of beryllium in 1798 its advantages - as

well as its disadvantages - were well known. These are discussed to indicate why beryllium was chosen as the brake heat sink material for the design configuration evolved. A review of current C-5A data is presented, including flight test experience, as well as expected life projection from limited normal operational experience. The re-use of beryllium elements, and cost effectiveness are also discussed. A consideration of the future use of beryllium is indicated, with the conclusion that it will become commonplace in the next decade.

A71-28314 Study of visible exhaust smoke from aircraft jet engines. John Stockham and Howard Betz (IIT Research Institute, Chicago, Ill.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710428.* 19 p. 13 refs. Members, \$1.00; nonmembers, \$1.50. Contract No. FA-69-2208.

Study of the relation between the visibility of in-flight jet exhaust and the AIA smoke number. A method based on photographic photometry was developed for measuring the optical density of smoke plumes. This method was related to visibility and to the smoke number through transmissometer measurements and visibility theory. A portable transmissometer, capable of operating over a wide range of optical pathlengths and under varying ambient light conditions, was fabricated for use in this study. A mathematical expression relating the transmission measurements to the smoke numbers was derived. Liminal visibility requirements of smoke trails, developed from light scattering theory, were correlated with actual visual observations and the transmissometer and photometry measurements. Test results, with the engines investigated, indicate that AIA smoke numbers below 23 were associated with invisible exhaust plumes. Samples of the exhaust smoke showed the particles to be composed of lacy agglomerates. At the nozzle, the geometric median particle diam was 0.052 micron. At a distance of 10 nozzle diam the geometric median particle diam was 0.13 micron at cruise condition.

A71-28316 FAA appraisal of aircraft design for maintainability. James E. Dougherty (FAA, Washington, D.C.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710431.* 10 p. 23 refs. Members, \$1.00; nonmembers, \$1.50.

This paper outlines an appraisal of aircraft design for maintainability as viewed by the Federal Aviation Administration. The basis for FAA's authority in the Act is set forth. The extent of the applicable requirements now in the Federal Air Regulations is traced. Maintenance concepts and examples of adverse airworthiness situations are described. Controls and procedures employed by FAA to account for maintainability of new designs, including MSG-2, are explained. Maintainability guidelines applicable to new designs are advanced.

(Author)

A71-28317 One operator's look at maintainability. William A. Keeler (Eastern Air Lines, Inc., New York, N.Y.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710432.* 6 p. Members, \$1.00; nonmembers, \$1.50.

Spiraling commercial airplane equipment costs will not tolerate operational inefficiency. The airline operator must keep his departure gates well-stocked with mechanically sound equipment if he is to realize a reasonable return on his investment. The role of maintainability in assuring equipment readiness is reviewed from the viewpoint of one airline operator, and six basic keys to good airplane equipment maintainability are discussed.

A71-28318 Development and service experience of the PT6A reduction gearbox. A. W. Stewart and D. Hollingworth (United Aircraft of Canada, Ltd., Montreal, Canada). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710433.* 7 p. Members, \$1.00; nonmembers,

\$1.50.

This paper details PT6 reduction gearbox reliability problems as revealed by development testing and regular service. Initial bench tests showed that despite attempts to design within the state-of-the-art, the application was such as to require an extension of contemporary knowledge of gear design. Cavitation erosion of the planet gear bushings gave rise to some anxiety and excessive wear of coupling splines necessitated a redesign. These and other minor problems were largely resolved before certification and delivery of the first production units. Except for an incident with units operating in Arctic conditions, no significant reliability problems have occurred in regular service. Some wear problems have been corrected with subsequent benefit to overhaul costs but most complaints have been generated by weepage from the propeller shaft oil seal. This was not an operational hazard. Models in current production are little different from the initial production standard, although some have been certified for maximum powers nearly 50% greater than the first units and the minimum approved time between overhauls, for operation in the U.S., is now 3000 hr.

A71-28320 Microbiological contamination of aircraft fuel tanks - Airframe considerations. J. A. Scott (British Aircraft Corp., Ltd., Weybridge, Surrey, England). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710438.* 8 p. 17 refs. Members, \$1.00; nonmembers, \$1.50.

Discussion of microbiological contamination, which became a major problem when jet aircraft using integral fuel tanks began operations in tropical areas. Aircraft operating in such areas should be regularly inspected in order to detect contamination before it reaches serious proportions, and maintenance personnel should be trained to recognize and interpret warning signs. Maintenance practices should be adjusted where possible to minimize the amount of water collecting in fuel tanks. Biocides may be needed under certain conditions. Good fuel-quality control is extremely important, and particular attention is required at the smaller airports. Good results are being obtained with epoxy primer protective coats heavily pigmented with strontium chromate.

A71-28321 Electrical and physical nature of microbial membranes implicated in aircraft fuel quantity probe malfunction. W. B. Engel and R. M. Owen (Douglas Aircraft Co., Long Beach, Calif.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710439.* 10 p. 28 refs. Members, \$1.00; nonmembers, \$1.50.

Demonstration that microbial membranes have a low resistance and could easily short out a fuel quantity probe. To determine how microbial contamination can cause probe malfunction an artificial environment conducive to the rapid growth of microbial membranes was developed. Studies were conducted on membranes grown in this environment to determine their electrical conductive properties, and it was found that the membranes are sufficiently conductive to cause the malfunction. Prolonged association of microbial contamination on the probe surface will result in eventual coating penetration and pitting-type corrosion.

A71-28322 Salt driers assure really dry fuel to aircraft. H. R. Porter, G. R. Deits (Standard Oil Company of California, San Francisco, Calif.), J. A. Bert, and B. C. Anderson (Chevron Research Co., Richmond, Calif.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710440.* 8 p. Members, \$1.00; nonmembers, \$1.50.

Salt driers installed in an airport jet fuel delivery system reduced the fuel water content below saturation, lengthened filter life, and improved the performance of the downstream system components. Systems must be designed and operated to control salt carry-over. The high initial cost of salt driers compared with conventional filter-coalescers may be justified by low operating cost, improved microbial control, and customer satisfaction. Salt driers have a place in airport fuel treating.

A71-28323 From automatic landing to Category III. William Russell (Air Transport Association of America, Washington, D.C.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710441.* 7 p. 5 refs. Members, \$1.00; nonmembers, \$1.50.

Progress toward full all weather landing operation of transport aircraft is evaluated. Experience with Category II instrument approach operations in actual weather is reviewed. The disparity between the lagging implementation of ground facilities in the United States, and the extensive implementation of costly Category II airborne equipment is discussed. Actions needed to provide viable Category IIIa operations are examined, including discussion of procedures to aid in insuring integrity, and the need for implementing Category IIIa facilities in the United States. Implications of the proposed new landing guidance system and of possible independent landing monitors are also examined. Limitations of available weather surveys and a number of economic considerations are pointed out. Aggressive implementation of ground facilities is recommended.

A71-28324 Development testing of the L-1011 Independent Landing Monitor. Gerald Holliday and John A. Gorham (Lockheed-California Co., Burbank, Calif.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710443.* 15 p. Members, \$1.00; nonmembers, \$1.50.

A new, completely independent monitor (capable of operation through Category IIIc weather condition) for use with automatic landing systems is undergoing development by Lockheed for possible use in L-1011 aircraft. Following intensive analysis, a K sub band airborne radar was selected to provide pilot confidence through independent monitoring of the L-1011 (1) dual-dual, fail operative, automatic landing system's performance. Lockheed's airborne flying test bed (CV-240) program has so far provided evidence that the Independent Landing Monitor concept has a definite future in commercial automatic landing applications under reduced visibilities. Visual enhancement would improve the acceptability of near zero-zero operation and consequently reduce the number of unnecessary go-arounds.

A71-28325 * Design criteria for selection of aircraft electric power generation and distribution systems. C. H. Lee (Air Research Manufacturing Co., Los Angeles, Calif.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710444.* 12 p. Members, \$1.00; nonmembers, \$1.50. Contract No. NAS 12-659.

Conventional aircraft use constant-speed drive to generate constant frequency 400-Hz power of relatively good quality and distribute it at 115/200 V. A detailed study revealed that this power type is not the optimal choice for present and future aircraft applications. This paper presents the advantages and disadvantages of various generation and distribution systems and the factors to be considered in selecting an electric power system. For medium and large size STOL aircraft, it appears that variable-frequency generation and high-voltage d-c distribution with secondary square wave a-c distribution may be superior to the conventional system. (Author)

A71-28326 Optimization of military VTOL secondary power systems. Dennis Stein (Boeing Co., Vertol Div., Philadelphia, Pa.) and Jules Vichness (U.S. Army, Air Mobility R & D Laboratories, Fort Eustis, Va.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710445.* 18 p. Members, \$1.00; nonmembers, \$1.50.

Military VTOL/VSTOL aircraft are required to operate in areas where it is impractical to provide ground support equipment to supply types of power needed for system checkout, emergency and standby power, and main engine starting. To provide this capability, the Secondary Power System must be considered on an integrated basis as a major aircraft subsystem which incorporates an auxiliary

power unit (APU) that will provide an alternate source of power, in flight and on the ground, for aircraft hydraulics, pneumatic drives, APU starting, environmental control, main engine starting, electrical power generation, power transfer to accessory gearbox for shaft-driven accessories, plus the power distribution system to interconnect these components. This paper discusses the application of this integrated concept and the associated analyses of operating characteristics of major components. Appropriate interface and compatibility with the total air vehicle is illustrated. Significant parameters such as power, weight, efficiencies, product assurance characteristics, etc., are compared. (Author)

A71-28327 Contemporary approach to commercial powerplant development. G. W. Kleinert (General Electric Co., New York, N.Y.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710449.* 8 p. Members, \$1.00; nonmembers, \$1.50.

Vital to the success of the turbine powered airplane is the degree to which the engine manufacturer can develop the entire powerplant to its fullest maturity early in the life of the airplane system. With increasing demands for shorter powerplant development cycles, to meet the needs of the shorter airframe development cycle, new techniques and methods are being employed to accelerate the development of contemporary powerplants. Equally important to the improved development techniques and methods is the ability to establish and monitor the technical progress early in the powerplant development program. This paper will describe the approach taken in the development of the CF6 family of engines, including techniques established to monitor technical progress. (Author)

A71-28328 Propulsion testing from the aircraft manufacturers' point of view. W. A. Reinhart (Boeing Co., Seattle, Wash.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710450.* 22 p. Members, \$1.00; nonmembers, \$1.50.

Consideration of aircraft propulsion systems in terms of the total aircraft system. The design requirements tend to become more demanding and the development and proof testing more exacting to assure that the test simulation of the critical operating environment is correct and that the instrumentation systems are adequate for accurately and quickly obtaining the required information. Careful judgment and ingenuity are required to obtain the data in a timely and cost-effective manner. Major areas which are becoming more critical with each generation of aircraft are noise reduction and inlet-engine-exhaust system compatibility. Examples of problems which have been faced in recent subsonic aircraft and some of particular interest in such aircraft as the SST are discussed. F.R.L.

A71-28329 Powerplant testing from an operator's perspective. R. E. Totman (United Air Lines, Inc., Chicago, Ill.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710451.* 8 p. Members, \$1.00; nonmembers, \$1.50.

Summary of airline engine performance testing by three precepts: (1) avoid release of engines which will be maintenance problems; (2) prevent rejection of engines which will operate satisfactorily until the next scheduled removal; and (3) reduce testing costs. The methods used most profitably to assign relative weights to the three guidelines are presented, and progress with an automated test cell data acquisition system is outlined. F.R.L.

A71-28330 The costs/reliability relationships of development testing and demonstration. Kirk G. Rummel and Robert B. Aronson (Boeing Co., Vertol Div., Philadelphia, Pa.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710452.* 10 p. Members, \$1.00; nonmembers, \$1.50.

This paper explores the relationships between the costs of

developmental testing and the derived benefits in reliability. The analysis quantifies this relationship for the components of the dynamic system of a specific future helicopter. Distinctions are drawn between test costs related to reliability requirements and those that are not related. Emphasis is placed on the decisionmaking process that is required when formal reliability and maintainability (R & M) demonstration tests are imposed. The statistical aspects of demonstration tests are examined and related to the program manager's informational requirements. (Author)

A71-28331 **Analysis of transmission failure modes.** C. W. Bowen (Bell Helicopter Co., Fort Worth, Tex.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710454.* 7 p. 8 refs. Members, \$1.00; nonmembers, \$1.50.

This paper presents a synopsis of an extensive failure mode investigation and analysis of Bell UH-1 and Vertol CH-47 transmissions. Correlation of these observed field experiences with conventional design stress analysis techniques and preliminary bench test data is presented. Lubrication states as defined by elastohydrodynamic film thickness calculations are shown to offer explanation for the existence of many failure modes which are not predicted by conventional analyses. Simple statistical methods for failure data analysis are employed as an aid to assessing relative gain in reliability afforded through correction of dominant failure modes. The premise is advanced that the key to successful design of advanced helicopter power transmissions featuring significant increases in operational reliability may be found in the application of these lessons. (Author)

A71-28332 **Area navigation in the ATC environment.** E. E. Glanz (Eastern Air Lines, Inc., New York, N.Y.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710455.* 5 p. Members, \$1.00; nonmembers, \$1.50.

Aircraft equipped with computerized Area Navigation Systems have created the need for an entirely new air traffic control environment. This paper will highlight problems encountered as the ATC system begins its evolution toward area navigation, and will suggest operational techniques favorable to a total area navigation ATC environment. Conventional interfaces are no longer useful. Independent systems (computer, controller, pilot, route structure, and aircraft) meet in the cockpit, but satisfactory communications have not been established. Pilot reaction indicates that the information is not now properly presented in the cockpit. Attempts to solve these interface problems have indicated that the solution lies in comprehensive software programs and clear situation displays for the pilot. (Author)

A71-28333 **Requirements, performance and integration of modern navigation aids.** A. B. Winick and D. M. Brandewie (FAA, Washington, D.C.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710456.* 6 p. 9 refs. Members, \$1.00; nonmembers, \$1.50.

The need to improve the efficiency and capacity of the Air Traffic Control and Navigation System has placed greater emphasis on the functional integration of subsystems which have been treated independently in the past. This paper presents results of limited test programs designed to explore the relationship of terminal area navigation and the air traffic control system, and to show the benefits of an optimum combination of both functions. The need for further analysis is indicated with respect to carrying out the third generation system design postulated by the DOT Air Traffic Control Advisory Committee. It is concluded that functional integration of ATC and navigation in the terminal area presents the greatest challenge. In other areas, such as enroute, the availability of new, integrated avionics systems provides an expanded operational capability. (Author)

A71-28334 **Coated columbium for gas turbine engine application.** J. F. Holloway, H. A. Hauser, and E. F. Bradley (United Aircraft Corp., Pratt and Whitney Aircraft Div., East Hartford, Conn.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710460.* 9 p. 9 refs. Members, \$1.00; nonmembers, \$1.50.

Application of coated columbium alloys to gas-turbine engine components operating at metal temperatures above 2000 F. This is a potentially viable alternative to more complex cooling schemes for present nickel-base and cobalt-base superalloys. The major deterrent to the use of this material centers around the performance and reliability of protective coatings such as slurry silicides. Turbine vanes so protected have successfully run in a turbine development engine for 100 hr of steady state and cyclic operation. A film-cooled burner liner of FS-85 columbium alloy sheet material coated with the Sylvania SiCrFe slurry coating has been fabricated and will be rig- and engine-tested. F.R.L.

A71-28335 **High temperature turbine design considerations.** S. N. Suci (General Electric Co., New York, N.Y.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710462.* 13 p. 14 refs. Members, \$1.00; nonmembers, \$1.50.

The major technological developments which have made possible the trend towards higher temperatures in modern aircraft gas turbine engines are discussed. The relative importance of manufacturing processes, material developments, cooling techniques, analytical design procedures, rupture and cyclic life considerations, and aerodynamic and mechanical design improvements are discussed along with illustrative examples and technical data. The need for a balanced design approach is stressed, and examples are given where trade-offs can be made. It is noted that the advances in aircraft engines during the last 10 years have been based on the evolution of sound engineering principles, extensive component and engine development, and careful consideration of the operational requirements rather than a tremendous breakthrough or revolutionary concept in any one area. (Author)

A71-28336 **Military/commercial STOL transport commonality.** Harold F. Kleckner (Douglas Aircraft Co., Long Beach, Calif.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710468.* 11 p. Members, \$1.00; nonmembers, \$1.50.

Military and commercial turboprop STOL transport work at the Douglas Aircraft Company during the past four years has led to the consideration of commonality between the USAF medium STOL transport and a short-range, medium-sized commercial STOL transport. General requirements for the two airplanes appear to be similar and include a cruise speed of Mach 0.75-0.80 for a 500-nautical mile range after takeoff from a 2000-foot airstrip. Both require a wide body; and the payload, furnishings, and equipment yield comparable STOL takeoff weights. Both can be designed with a high wing, a moderate wing loading, and the same STOL lifting concept. A common engine size appears feasible, and basic engine characteristics such as bypass ratio need not be different. Results of a preliminary commonality study are presented in which several cases with varying degrees of commonality are evaluated in terms of costs. The cost benefits of shared development and production were found to outweigh the penalties related to design compromises, resulting in lower costs for both military and commercial operators. (Author)

A71-28337 **STOL engine systems and sensitivity factors.** Joel Godston (United Aircraft Corp., Pratt and Whitney Aircraft Div., East Hartford, Conn.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710469.* 11 p. 22 refs. Members, \$1.00; nonmembers, \$1.50.

The purpose of this paper is to list the possible competitive engine systems for the STOL aircraft likely to be operational in the

late 1970s or early 1980s. The importance of integrating the engine and airframe during the early design phase of the STOL aircraft system is outlined. A description of typical augmented wing and blown flap engine concepts under investigation and the system trade factors affecting aircraft gross weight and potential return on investment are presented. System trade factors including noise, weight, performance, and cost are evaluated to provide an overall view of the compromises that are, or must be made in order that the STOL aircraft engine system be a viable commercial product. The available and required engine technologies are reviewed. (Author)

A71-28338 Prop-Fan - A high thrust, low noise propulsor. George Rosen (United Aircraft Corp., Hamilton Standard Div., Windsor Locks, Conn.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710470.* 12 p. 12 refs. Members, \$1.00; nonmembers, \$1.50.

The Prop-Fan is introduced as a new propulsor type, intermediate between ducted propellers and low bypass fans. Compared to today's fan engines, it offers approximately twice the takeoff thrust/hp at half the tip speed and consequently much reduced noise level. Furthermore, its controllable pitch feature provides more effective reverse thrust at about one-fourth the weight of current flow reversers. Prop-Fan characteristics are particularly well matched to the propulsion requirements of advanced STOL transport aircraft. Highlighted is the uniquely low noise signature of the Prop-Fan. This now permits the design of medium-to-long range STOL transports of high-productivity which will meet the stringent noise level limits for STOL-ports. The paper describes the development status of the Prop-Fan, examines potential aircraft installation arrangements, and presents some representative STOL transport effectiveness comparisons. (Author)

A71-28339 Boeing 747 training developments and implementation. B. M. Tate (Trans World Airlines, Inc., Kansas City, Mo.). *Society of Automotive Engineers, International Simulation and Training Conference, 4th, Atlanta, Ga., May 13, 1971, Paper 710473.* 5 p. Members, \$1.00; nonmembers, \$1.50.

A training program for crew members of the TWA 747 is described. The paper begins with the formulation of general policies and their translation into a ground training program, and continues with descriptions of the classroom, inertial navigation system, and cockpit trainers. The details of the training program are presented, as are a description of the TWA 747 simulator and discussion of anticipated problems. (Author)

A71-28340 The use of simulation to promote safety and economy in flying training. W. P. Moran (American Airlines, Inc., New York, N.Y.). *Society of Automotive Engineers, International Simulation and Training Conference, 4th, Atlanta, Ga., May 13, 1971, Paper 710475.* 6 p. Members, \$1.00; nonmembers, \$1.50.

The combination of simulation and improved training techniques ensures a safe and economical flying training program. In a 5-year period, American Airlines has reduced airplane training and flight check hours by more than 75%. There are strong indications that, for qualified airline crewmen, a goal of total simulation for all training and flight checks will become a reality. (Author)

A71-28467 Effect of axial velocity variation in aerofoil cascades. S. Soundranayagam (Indian Institute of Science, Bangalore, India). *Journal of Mechanical Engineering Science*, vol. 13, Apr. 1971, p. 92-99. 12 refs. Research supported by the North of Scotland Hydro-Electric Board.

The effect of the variation of axial velocity in the incompressible flow through a cascade of aerofoils is discussed and it is shown that changes take place in the flow angles and in the blade

circulation. A method is proposed by which the effect of axial velocity variation on a known two-dimensional flow or alternatively the two-dimensional equivalent of a flow with axial velocity variation can be calculated. The method is very easy to apply. The deviation may increase or decrease depending on the change in blade circulation and the stagger. An increase in apparent deflection through the cascade can be accompanied by a reduction in the blade force. The method would be particularly useful for the interpretation of cascade wind tunnel data and in the design of impeller stages where three-dimensional flows occur. (Author)

A71-28489 # Helicopters as cranes, and carrying external loads. II - The planning and the constructive design of 'crane helicopters' (Kran- und Aussenlastflug mit Hubschraubern. II - Die Auslegung und die konstruktive Gestaltung von Kranhubschraubern). Michael Caspari. *Technisch-ökonomische Informationen der zivilen Luftfahrt*, vol. 7, no. 3, 1971, p. 133-142. In German.

The disadvantages of a use of multipurpose helicopters for flights with external loads are analyzed. The demand for helicopters designed exclusively for applications as a crane was found to be very limited in a market analysis. However, there appear to be good employment possibilities for a helicopter which in addition to serving as a crane can also transport external loads. A number of designs proposed for such a helicopter are described. The landing gear is designed in such a way as to make it possible for the helicopter to land in many cases above the load and pick it up. G.R.

A71-28582 # Assessment of measurement errors in the testing of axial-flow compressors and turbines (K voprosu otsenki pogreshnostei izmerenii pri ispytaniakh osevykh kompressorov i turbin). A. P. Tunakov, Iu. A. Rzhavin, and S. G. Ibragimov. *Kazanskii Aviatsionnyi Institut, Trudy, Seriya Aviatsionnye Dvigateli*, no. 114, 1970, p. 3-17. 5 refs. In Russian.

Experiments performed with single-stage air-driven compressors and turbines with the aim of improving the methods of assessing the accuracy of the parameters measured are described. An analysis of the formulas conventionally used for calculating the rms error of indirect measurements (when the error of the direct measurements is known) shows most of the error involved in the determination of torque and temperature is due to the error contained in the approximating coefficients. The largest error in the determination of the flow rate may be attributed to the errors involved in the flow coefficient and in the coefficient of flow convergence in the measuring orifice. Improved formulas for calculating the principal parameters of turbomachines are proposed. V.P.

A71-28583 # Investigation of the ideal cycle of a continuous-combustion gas turbine with stepwise heat release (overexpansion cycle) (Issledovanie ideal'nogo tsikla gazoturbinnoi ustanovki nepreryvnogo goreniia so stupenchatym otvodom tepla /tsikl s pererasshireniem/). A. P. Tunakov and B. Kh. Perel'shtein. *Kazanskii Aviatsionnyi Institut, Trudy, Seriya Aviatsionnye Dvigateli*, no. 114, 1970, p. 18-30. In Russian.

The thermal efficiency of a cycle in which the gas is cooled after overexpansion and is then compressed in a low-density compressor to the ambient pressure is analyzed. The efficiency of an ideal cycle of this type is compared to that of the Brayton and Carnot cycles, and the parameters of the ideal cycle are evaluated on the basis of several numerical examples. V.P.

A71-28584 # Gasdynamic verification calculations of multi-stage axial-flow compressors on a digital computer (Proverochnyi gazodinamicheskii raschet osevykh mnogostupenchatykh kompressorov na ETsVM). A. P. Tunakov and S. G. Ibragimov. *Kazanskii Aviatsionnyi Institut, Trudy, Seriya Aviatsionnye Dvigateli*, no. 114, 1970, p. 31-47. 6 refs. In Russian.

An algorithm for testing the gasdynamic design of axial-flow compressors, particularly in the final adjustment phase, is proposed. Particularly well suited for calculating the parameters of blade rings, the procedure is suitable for use in the design phase if data on the loss coefficients in empirical formulas have been established. V.P.

A71-28586 # Influence of bypass of air behind the compressor into a variable-area exhaust nozzle on gas turbine jet engine indices (Vliianie perepuska vozdukh posle kompressora v reaktivnoe soplo na pokazateli gazoturbinnnykh reaktivnykh dvigatelei). V. A. Kosterin, V. T. Dudkin, and L. V. Fadeev. *Kazanskii Aviatsionnyi Institut, Trudy, Seriya Aviatsionnye Dvigateli*, no. 114, 1970, p. 58-76. In Russian.

Formulas are derived which define the dependence of a turbojet engine on the energy losses in the afterburner in the case where small amounts of air behind the compressor are applied to the exhaust nozzle. By taking into account the coefficients defining the changes in the gas pressure and temperature behind the turbine owing to the added air, the formulas make it possible to obtain solutions for any energy losses associated with the expansion and the mixing of the added air with gas behind the turbine. V.P.

A71-28589 # Heat and mass transfer in the turbulent flow of a chemically active gas in the manifolds of a hydro-jet engine (Teplomassobmen pri turbulentnom techenii khimicheskii aktivnogo gaza v kanalakh GRD). A. V. Fafurin and Iu. D. Krechetnikov. *Kazanskii Aviatsionnyi Institut, Trudy, Seriya Aviatsionnye Dvigateli*, no. 114, 1970, p. 101-104. 5 refs. In Russian.

A method for calculating the ablation of a heat shield under the effects of a high-enthalpy chemically active gas flow is developed on the basis of boundary layer theory and the corresponding friction and heat transfer laws. The method is based on the assumptions that the components of the main gas flow which react with the wall material form a binary mixture with the reaction products; that all components of the mixture in the boundary layer obey the ideal gas laws; and that the chemical reaction rate is limited by the supply of the oxidizer to the surface rather than by the chemical reaction rate. A closed system of equations describing the flow in an axisymmetric channel in the presence of chemical reactions at the surface is derived. V.P.

A71-28739 Combustion and heat transfer in gas turbine systems; Proceedings of an International Propulsion Symposium, College of Aeronautics, Cranfield, Beds., England, April 15-17, 1969. Edited by E. R. Norster (Cranfield Institute of Technology, Cranfield, Beds., England). Oxford, Pergamon Press, Ltd. (Cranfield International Symposium Series, Volume 11), 1971. 397 p. \$27.

The topics include the combustion system for the Olympus 593 engine, combustion chamber temperature profiles, the RB 162 combustion system for VTOL applications, annular vaporizing combustion chambers, ignition theory and its application to the altitude relighting, the air recirculation ratio in can-type gas turbine combustion chambers, assessment of flame tube temperatures in a combustor operating under SST conditions, radiation heat transfer, and corrosion testing of high-temperature gas turbine alloys. M.M.

A71-28740 The combustion system for the Olympus 593 Concorde engine. D. W. Harvey (Rolls-Royce, Ltd., Bristol, England). In: Combustion and heat transfer in gas turbine systems; Proceedings of an International Propulsion Symposium, College of Aeronautics, Cranfield, Beds., England, April 15-17, 1969. Edited by E. R. Norster. Oxford, Pergamon Press, Ltd. (Cranfield International Symposium Series, Volume 11), 1971, p. 3-17; Discussion, p. 18, 19.

Discussion of the operating conditions, combustion performance

criticality, and altitude relight considerations of the combustion system of the Concorde SST throughout the Olympus engine series. The problem of flame tube wall temperatures is discussed, together with the smoke problem, the introduction of a lightweight fuel system, flame tube design, the use of fully machined cooling rings, and design modifications to improve the mechanical life of the combustion system. Combustion efficiency and pressure loss, and the low-pressure fuel sprayer are also treated. M.M.

A71-28742 The evolution of the RB 162 combustion system for V.T.O.L. applications. J. R. Poyser and H. B. Moxon (Rolls-Royce, Ltd., Derby, England). In: Combustion and heat transfer in gas turbine systems; Proceedings of an International Propulsion Symposium, College of Aeronautics, Cranfield, Beds., England, April 15-17, 1969. Edited by E. R. Norster. Oxford, Pergamon Press, Ltd. (Cranfield International Symposium Series, Volume 11), 1971, p. 33-61; Discussion, p. 62.

Description of the design and development of the RB 162 combustor. The RB 162 combustor incorporated many of the features of the single-reversal chamber but differed in one or two interesting respects. The RB 162 was designed to achieve ignition with the aid of two pressure jet atomizers operative only during the starting cycle. Weight estimates of the complete starter system favored the latter arrangements. In conjunction with combustor rig tests, extensive use has been made of sectioned, full-size perspex models to examine the aerodynamic behavior of the RB 162 combustion engine. Of the substantial volume of testing carried out on the perspex models, typical instances illustrating this approach are given.

A71-28743 Some combustion aspects of plenum chamber burning. A. Sotheran (Rolls-Royce, Ltd., Bristol, England). In: Combustion and heat transfer in gas turbine systems; Proceedings of an International Propulsion Symposium, College of Aeronautics, Cranfield, Beds., England, April 15-17, 1969. Edited by E. R. Norster. Oxford, Pergamon Press, Ltd. (Cranfield International Symposium Series, Volume 11), 1971, p. 63-86; Discussion, p. 87, 88.

A brief explanation is given of the manner in which aircraft performance improvements can be obtained by providing PCB on the high by-pass ratio turbofan engines of subsonic VTOL aircraft of the Harrier type. The necessity of PCB to supersonic developments is noted. An account is then given to the design considerations behind the choice of the 'staggered gutter colander' combustion system for PCB, and of the experimental development program which led, eventually, to the successful demonstration of PCB on an adapted Pegasus engine. (Author)

A71-28745 Ignition theory and its application to the altitude relighting performance of gas turbine combustors. A. H. Lefebvre (Cranfield Institute of Technology, Cranfield, Beds., England). In: Combustion and heat transfer in gas turbine systems; Proceedings of an International Propulsion Symposium, College of Aeronautics, Cranfield, Beds., England, April 15-17, 1969.

Edited by E. R. Norster. Oxford, Pergamon Press, Ltd. (Cranfield International Symposium Series, Volume 11), 1971, p. 105-116; Discussion, p. 117-119, 28 refs.

The various ignition theories fall into two groups: those in which diffusion is considered to be the dominant process in flame initiation; and those in which thermal mechanisms are considered more important. Two equations which show broad agreement with practical experience in regard to the effects of pressure, temperature and velocity, provide quantitative relationships between the main variables influencing the ignition process. The most significant factor influencing ignition performance, however, is velocity. It is suggested that these two equations could prove useful in assessing the relative importance of the various factors influencing ignition performance in practical combustion chambers and in the correlation of ignition data obtained from such systems. M.M.

A71-28748 Cooled gas turbine blades. J. F. Barnes and J. P. Edwards (National Gas Turbine Establishment, Farnborough, Hants., England). In: Combustion and heat transfer in gas turbine systems; Proceedings of an International Propulsion Symposium, College of Aeronautics, Cranfield, Beds., England, April 15-17, 1969.

Edited by E. R. Norster. Oxford, Pergamon Press, Ltd. (Cranfield International Symposium Series. Volume 11), 1971, p. 167-181; Discussion, p. 182. 14 refs.

This paper is concerned with the prediction of metal temperatures in rotating blades and with the aerodynamics of coolant flow into and out of the blades. The section on blade temperatures includes a description of two complementary methods currently used at the National Gas Turbine Establishment. (Author)

A71-28749 Theoretical assessment of flame tube temperatures in a combustor operating at typical S.S.T. conditions. M. Whittaker (Rolls-Royce, Ltd., Bristol, England). In: Combustion and heat transfer in gas turbine systems; Proceedings of an International Propulsion Symposium, College of Aeronautics, Cranfield, Beds., England, April 15-17, 1969.

Edited by E. R. Norster. Oxford, Pergamon Press, Ltd. (Cranfield International Symposium Series. Volume 11), 1971, p. 183-204. 6 refs.

A typical annular vaporizing combustion chamber project with conventional film cooling has been analyzed around a datum supersonic cruise condition. The need for accurate prediction of metal temperatures and a better understanding of the processes involved has been demonstrated by reference to the rapid increase in compressor delivery temperature over the years. It has been shown that the dominant primary zone heat transfer process is flame radiation and every effort should be made to reduce the effective flame radiation temperature and flame emissivity subject to performance considerations. The gain in wall cooling is approximately 25-30 C for 100 C reduction in mean flame temperature and 30 C for 0.1 reduction in flame emissivity. M.M.

A71-28751 Correlation of data and prediction of effectiveness from film cooling injection geometries of a practical nature. G. J. Sturgess (General Electric Co., West Lynn, Mass.). In: Combustion and heat transfer in gas turbine systems; Proceedings of an International Propulsion Symposium, College of Aeronautics, Cranfield, Beds., England, April 15-17, 1969.

Edited by E. R. Norster. Oxford, Pergamon Press, Ltd. (Cranfield International Symposium Series. Volume 11), 1971, p. 229-250. 24 refs.

The simple boundary layer theory of Stollery and El-Ehwany, which has been applied with some success to idealized injection slots, is extended to account for the velocity defect introduced into the injected film by the finitely thick slot lip and the boundary layers which exist on it. The resulting equations are used to provide a correlation group which is tested against the collected experimental data from nine practical injection geometries of greatly differing construction, over wide ranges of velocity and temperature ratios, and slot Reynolds number. For individual geometries effectiveness correlation to plus or minus 5% of unity is achieved; for geometries of the same general class a 'universal' correlation of plus or minus 10% is obtained. Equations are obtained which describe the data within these limits. These equations are shown to be valid for differing mainstream approach boundary layers and differing turbulence levels in both main and injected streams. In view of the present general uncertainties associated with adequately specifying the mainstream conditions for application to the gas-turbine combustion chamber, the present simple equations are both suitable and convenient for predicting film effectiveness for preliminary design work and thermal analysis. (Author)

A71-28754 Fuels for aircraft gas turbine engines. A. Lewis (Shell Research, Ltd., Thornton Research Centre, Chester, England). In: Combustion and heat transfer in gas turbine systems; Proceedings of an International Propulsion Symposium, College of Aeronautics,

Cranfield, Beds., England, April 15-17, 1969.

Edited by E. R. Norster. Oxford, Pergamon Press, Ltd. (Cranfield International Symposium Series. Volume 11), 1971, p. 309-323; Discussion, p. 324, 325. 11 refs.

Consideration of kerosene-type fuels meeting either the British D.Eng.R.D.2494 specifications or the ASTM Jet A or A-1 specifications. These fuels are produced mainly by straightforward distillation processes, with subsequent treatments to remove sulfur and trace components. Combustion problems with either type of fuel have been largely eliminated by the progressive development of the engines although there is a growing preoccupation with the formation and emission of smoke during takeoff and landing. The trend of fuel injection systems is towards greater use of air assistance in atomization and the possible use of fuel vaporization. The possibility of fuel additives for reducing smoke emission is discussed. The problems of bacterial or fungal contamination of aircraft fuel systems still exist. F.R.L.

A71-28756 Some observations of the atomizing characteristics of air-blast atomizers. R. Bryan, P. S. Godbole, and E. R. Norster (Cranfield Institute of Technology, Cranfield, Beds., England). In: Combustion and heat transfer in gas turbine systems; Proceedings of an International Propulsion Symposium, College of Aeronautics, Cranfield, Beds., England, April 15-17, 1969.

Edited by E. R. Norster. Oxford, Pergamon Press, Ltd. (Cranfield International Symposium Series. Volume 11), 1971, p. 343-355; Discussion, p. 356-359. 21 refs.

An optical method of measuring mean droplet size of sprays due to Dobbins is described and has been used to assess the effect of operating variables on the characteristics of an air-blast atomizer. Simple variations in the design of the atomizer indicate ways in which its performance may be improved. Measurements of mean droplet size with ambient pressures ranging from atmospheric up to 200 lb/sq in abs and air-to-fuel ratios covering a wide range show some of the potential advantages of air-blast atomizers for high-pressure gas-turbine engine application. (Author)

A71-28757 Some considerations of the measurement of temperatures within aircraft combustion chambers, using a calorimetric probe. A. F. Schlader, P. Rouiller, and J. Odgers (Université Laval, Quebec, Canada). In: Combustion and heat transfer in gas turbine systems; Proceedings of an International Propulsion Symposium, College of Aeronautics, Cranfield, Beds., England, April 15-17, 1969.

Edited by E. R. Norster. Oxford, Pergamon Press, Ltd. (Cranfield International Symposium Series. Volume 11), 1971, p. 363-379; Discussion, p. 380, 381. 5 refs.

Use of a calorimetric probe to measure gas temperatures in excess of 1200 C, previously accomplished by gas analysis techniques. The device consists of three concentric tubes, the outer two comprising a water jacket around the center one, through which the gas is drawn. Sheathed thermocouples are situated at the entry and exit of the coolant and a further thermocouple is located in the gas stream immediately opposite to the one at the coolant outlet. Both gas and water flows are metered and the original gas temperature is computed by enthalpy balance. The probe design has been modified so as to be applicable to turbine gas combustors. In its present form the equipment should be satisfactory for combustion chamber applications under laboratory conditions. Consideration is also given to an improved design of probe obviating the need for mass flow determination and gas analysis measurements. F.R.L.

A71-28758 The measurement of temperatures and radical concentrations in high-temperature, flowing-gas streams. D. H. Cotton and C. G. Haupt (Shell Research, Ltd., Thornton Research Centre, Chester, England). In: Combustion and heat transfer in gas turbine systems; Proceedings of an International Propulsion Symposium, College of Aeronautics, Cranfield, Beds., England, April 15-17, 1969.

Edited by E. R. Norster. Oxford,

Pergamon Press, Ltd. (Cranfield International Symposium Series, Volume 11), 1971, p. 383-406. 18 refs.

This paper describes methods of measuring temperature and radical concentrations in a rig simulating conditions in a ramjet combustion chamber and nozzle. The line-reversal technique for measuring temperatures was not successful, and the errors are explained in terms of interference by chemiluminescence. Radical concentrations were measured by the lithium-lithium hydroxide method which is described in detail. The results of these measurements show that radical concentrations are frozen at or before the throat of the nozzle. The point of freezing correlates with that predicted by the Bray criterion of sudden freezing, and although the freezing is not instantaneous, these results provide experimental confirmation of the hypothesis and an indication of the limits of its validity. (Author)

A71-28767 High-speed flash photography of jets and study of noises of aerodynamic origin. Marie Merle and J. P. Fragassi (CNRS, Centre de Recherches Physiques, Marseille, France). *SMPTÉ, Journal*, vol. 80, Apr. 1971, p. 282-285. 9 refs. Translation.

In the study of noises coming from gaseous supercritical jets the waves were investigated by four separate methods in order to check the results. With the use of an electronic camera a film was made showing the evolution of acoustic waves. A sound analysis was made using a narrow passband analyzer and a microphone sensitive to high frequency. Schlieren photographs show that the waves on one side are out of phase relatively to those on the other side. Convergent-divergent nozzles were used giving Mach numbers from 1 to 4 comparable to sonic nozzles. The jet has a cellular structure at the exit as shown on shadowgraph pictures. 'Screeches' occur when the jet is overexpanded. A specific ratio of pressure exists for each nozzle which brings about maximum screech. Frequency of oscillation was determined from 16 views filmed by the schlieren and shadowgraph methods. Two schlieren photographs demonstrate that a reflector at the origination of the jet diminishes jet screech by 20 dB. (Author)

A71-28778 How VAST troubleshoots a doppler radar. Joseph J. Stanco (PRD Electronics, Inc., Syosset, N.Y.). *MicroWaves*, vol. 10, May 1971, p. 34, 35.

The application of the VAST (Versatile Avionics Shop Test) computer-controlled system, developed for performing automatic diagnoses and analyses of complete avionic units, to testing failures occurred in an airborne doppler radar receiver transmitter unit aboard a carrier is described. Features of the computer program written for this system are briefly characterized. A block diagram illustrating the system is presented. O.H.

A71-28831 * A comparison of minimum time profiles for the F-104 using Balakrishnan's epsilon technique and the energy method. Lawrence W. Taylor, Jr., Harriet J. Smith, and Kenneth W. Iliff (NASA, Flight Research Center, Edwards, Calif.). In: International Federation for Information Processing, Symposium on Optimization, Nice, France, June 29-July 5, 1969, Proceedings.

Edited by A. V. Balakrishnan, M. Contensou, B. F. de Veubeke, P. Krée, J. L. Lions, and N. N. Moiseev. Berlin and New York, Springer-Verlag (Lecture Notes in Mathematics. Volume 132), 1970, p. 327-335. 11 refs.

Balakrishnan's epsilon technique is used to compute minimum time profiles for the F-104 airplane. This technique differs from the classical gradient method in that a quadratic penalty on the error in satisfying the equations of motion is included in the cost function to be minimized as a means of eliminating the requirement of satisfying the equations of motion. Although the number of unknown independent functions is increased to include the state variables, the evaluation of the gradient of the modified cost is simplified, resulting in considerable computational savings. The unknown control and state variables are approximated by a functional expansion with

unspecified coefficients which are determined by means of Newton's method. Typically 8 to 10 iterations are required for convergence when using the epsilon technique. Comparisons are made of solutions obtained by using this technique and the energy method. (Author)

A71-28841 Plug in relay - Panacea or Pandora's Box. I. Carol (U.S. Army, Electronics Command, Fort Monmouth, N.J.), J. Lerner (U.S. Naval Air Systems Command, Washington, D.C.), I. J. Soper (USAF, Logistics Command, Wright-Patterson AFB, Ohio), and E. U. Thomas (Grumman Aerospace Corp., Bethpage, N.Y.). In: National Association of Relay Manufacturers, Annual National Relay Conference, 19th, Oklahoma State University, Stillwater, Okla., April 27, 28, 1971, Proceedings. Conference co-sponsored by the Oklahoma State University. Scottsdale, Ariz., National Association of Relay Manufacturers, 1971, p. 11-1 to 11-10. 8 refs.

Areas where plug-in relays may be used advantageously are suggested, and some hazards due to use of plug-in relays are examined. Once it has been decided that plug-in relays will be used consideration should be given to minimizing replacement problems in the field. A table listing approaches for minimizing plug-in hazards is provided. Attention is to be given to the fact that equipment which is acceptable for ground support equipment may not be acceptable for safety of flight applications. G.R.

A71-28873 Interference criteria between space-borne and earthbound aeronautical services. B. A. Pontano (COMSAT Systems Integration Laboratory, Clarksburg, Md.). In: Institute of Electrical and Electronics Engineers, Regional Electromagnetic Compatibility Symposium, San Antonio, Tex., October 6-8, 1970, Record.

New York, Institute of Electrical and Electronics Engineers, Inc., 1970, p. V-D-1 to V-D-15. 6 refs.

The feasibility of a VHF aeronautical satellite system which frequency shares the band presently used by the air traffic control (ATC) service is under investigation with the aim of securing efficient utilization of the spectrum. The proposed system will employ a combination of spacial separation, antenna directivity, and frequency offset (channel interleaving) for providing the required intersystem isolation. The geometrical aspects of spacial separation and antenna directivity have been reported elsewhere. The purpose of the present study was to investigate the protection ratios required for compatible intersystem operation. Protection ratios measured in the laboratory for the various operating parameters of detected signal to interference, channel separation, and receiver bandwidth correspond with world-wide usage. The objective measurements are converted to the subjective criteria of intelligibility through a calculation of the articulation index. Protection ratios are provided in tabular form for given intelligibility criteria and operating parameters. (Author)

A71-28880 # Game theory and the use of game planning techniques for aircraft evaluation (Spieltheorie und Planspieltechnik bei der Flugzeug-Evaluation). Andreas Paul Anton Pechota. Eidgenössische Technische Hochschule, Doktor der Naturwissenschaften Dissertation, 1970. 77 p. 16 refs. In German.

Evaluation of new tactical aircraft for the Swiss Air Force by means of extensive operations research studies. Following preevaluation the problem was to choose between a small fleet of high performance aircraft or a larger one of less efficient aircraft. A simple air war game was constructed and theoretically treated. The fleets were evaluated in terms of survival probability and hits obtained. A handplayed noncomputer game was developed which permits allocation of aircraft and other arms of two hostile forces under conditions similar to a hypothetical war. The results are evaluated by a modified Wilcoxon test. In order to use the game in conjunction with a computer, a model is described which can carry out the task of the umpires during a game. F.R.L.

A71-28883 # Potential flow interaction between blade rows in axial-flow compressors. Ching-Yee Ma. Swansea, University College, Doctor of Philosophy Dissertation, 1969. 212 p. 50 refs.

This Ph. D. thesis investigates the potential flow interaction effects between blade rows in an axial flow compressor, and a method of analysis for flow through such multiple cascades of blades having finite thickness with relative motion is presented. The flow is assumed to be incompressible, two-dimensional, and irrotational. The flow equation is formulated in terms of a velocity potential function and is solved by an iterative process based on finite difference approximations. Calculations for several inlet guide vane-rotor (IGV) combinations were carried out, and from these the velocity and pressure fluctuations at any point in the flow can be obtained. Experimental studies indicate that the magnitude of the fluctuation depends critically on the IGV-rotor spacing. At a small interspace the effect of interference between the pressure fields of the IGV and rotor is the major cause of discrete frequency pressure fluctuation and hence of discrete noise. The thesis includes the FORTRAN IV computer program that was written for the analysis and requires only the basic geometry of the blades plus upstream and downstream flow velocities as input. F.R.L.

A71-28884 En route speed control techniques. A. J. Kulikowski. *Journal of Air Traffic Control*, vol. 14, May 1971, p. 5-8.

Analysis of the speed range used in a typical flight profile of a turbojet in an effort to assess its impact on ATC procedures. It is suggested that a uniform range of airspeeds be used by all turbojets transitioning to and from en route altitudes via published directives. These indicated airspeeds should be mandatory unless otherwise authorized by the controller. F.R.L.

A71-28885 A world wide synopsis of turbulence related accidents. David D. Thomas (Flight Safety Foundation, Inc., Arlington, Va.). (*Federal Aviation Administration, Turbulence Symposium, Washington, D.C., Mar. 22, 1971.*) *Journal of Air Traffic Control*, vol. 14, May 1971, p. 16-21.

Review of turbulence-related accidents during the past few years in order to provide perspective on the frequency and severity of such accidents. It appears that turbulence accidents are rarely fatal in air carrier operations, but 50% of those occurring in general aviation is fatal. F.R.L.

A71-28886 3-D radar is here. Albert R. Fellin. *Journal of Air Traffic Control*, vol. 14, May 1971, p. 24, 25.

Discussion of 'beacon numerics,' presently employed in the Atlanta and Indianapolis centers on a common-usage radar site, as a means of using a radarscope net not only for target azimuth and distance but also for direct altitude readout. This equipment gives a numerical readout from any aircraft with the proper equipment. Simplicity of operation is its greatest asset. F.R.L.

A71-28910 Interface circuits drive high-level switches from low-level inputs. J. O. M. Jenkins (Siliconix, Ltd., Swansea, Wales). *Electronic Engineering*, vol. 43, May 1971, p. 45-49.

A universal need exists at present for switching-systems which can provide the interfacing required to drive 'high' voltage level transistor switches from 'low' level (0.5V) logic inputs. Furthermore, the degree of compactness and reliability needed in these systems can only be achieved with the use of i.cs. This is particularly so in avionics systems where switching is required at a 28 V d.c. level.

A71-28938 # Selection of a cam profile for the computing-resolving unit of an altimeter (Vybor profilii kulachka schetno-reshaiushchego uzla vysotomera). L. I. Simakov and A. F. Akhmerov. *Kazanskii Aviatsionnyi Institut, Trudy, Seriya Aviatsionnye Pribory i Avtomaty*, no. 121, 1970, p. 92-99. In Russian.

Discussion of the adjustment of cams of the resilient aneroid sensors of altimeters to make the altimeter readings more accurate. A procedure is described for obtaining cam sets facilitating a more efficient and less laborious cam adjustment process without the necessity of adjusting individual cams. This procedure can be used as a basis for producing precision-profile cams by a programmed process. V.Z.

A71-28940 # Problem of position determination of the neutral layer and critical curvature radius in waffle panels under purely elastoplastic bending (K voprosu opredeleniia polozeniiia neutral'nogo sloia i kriticheskogo radiusa krivizny pri chistom uprugoplasticheskom izgibe vafel'nykh panelei). A. G. Lukashov and M. I. Lysov. *Kazanskii Aviatsionnyi Institut, Seriya Aviatsionnaia Tekhnologiya i Organizatsiia Proizvodstva*, no. 120, 1970, p. 10-24. In Russian.

Refinement of the method proposed by Lukashov and Lysov (1969) for solving problems of locating the critical curvature radius in waffle panels while the latter are shaped into aircraft components. The improved method provides more accurate approximations and includes the following assumptions: (1) the panel material is isotropic in both the elastic and plastic regions, behaves uniformly under tension and compression, and is incompressible beyond the limit of elasticity; (2) cross-sections during bending remain flat; (3) the directions of the adopted coordinate axes coincide with the directions of the main stress and strain axes; (4) the linear dimensions of the component right up to buckling remain invariant; and (5) strain concentrations in the vicinity of stiffener intersections are neglected. M.V.E.

A71-28941 # Research study of optimal treatment routines applicable to an automated orifice-making process (Issledovanie izyskaniia optimal'nykh rezhimov obrabotki primenitel'no k avtomatizirovannomu protsessu obrazovaniia otverstii). A. P. Nazarychev. *Kazanskii Aviatsionnyi Institut, Seriya Aviatsionnaia Tekhnologiya i Organizatsiia Proizvodstva*, no. 120, 1970, p. 25-29. In Russian.

Investigations were performed of the parameters decisive in the optimization of orifice-drilling techniques aimed at obtaining the highest qualitative and quantitative machining performance in the use of drilling equipment operated with the aid of programmed numerical control systems and engaged in the production of long-shaped aircraft components out of elongate profiles and panels. Proper timing of cutting tool resting periods, during which effective heat rejection out of the drilling bit and processed component into the surrounding medium can take place, and adequate allowance for the total drilling depth are found to be the major optimization prerequisites. M.V.E.

A71-28943 # Problem of gear link design for grinding-belt machines (K voprosu proektirovaniia kulisnykh mekhanizmov lentочно-shlifoval'nykh stankov). V. G. Borisovich, F. S. Lunusov, A. U. Gubaidullin, and K. G. Iushev. *Kazanskii Aviatsionnyi Institut, Seriya Aviatsionnaia Tekhnologiya i Organizatsiia Proizvodstva*, no. 120, 1970, p. 52-59. In Russian.

Surface finish requirements of helicopter components are briefly reviewed, and some design aspects of thereto applied grinding equipment are discussed. These components have external surfaces of complex three-dimensional curvature, are heavily loaded, and perform critical key functions. Their service circumstances put forth stringent demands upon the machining characteristics of their surfaces in terms of fine-finished smoothness and of the sign and magnitude of residual stresses. At present, these demands are met mostly through use of grinding-belt machines. The required uniformity and continuity in abrasive belt contact pressure during grinding are ensured by link gear mechanisms whose belt-applying elastic contact rollers are actuated by special hydraulic follow-up systems. The operation of these gear link mechanisms is described and some of their design parameters are analyzed. M.V.E.

A71-28944 # Evaluation of the mechanical properties of alloys and components in aircraft engine production (K otsenke mekhanicheskikh svoystv splavov i detalei v proizvodstve aviadvigatelei). E. N. Darchinov. *Kazanskii Aviatsionnyi Institut, Seriya Aviatsionnaia Tekhnologiya i Organizatsiia Proizvodstva*, no. 120, 1970, p. 60-65. 6 refs. In Russian.

Discussion of approaches intended to raise the reliability of design and production decisions based on evaluations of mechanical characteristics in products of mass processes. It is shown that this reliability can be improved through application of quantitative variables expressing the statistical differences among observed distributions and norms. M.V.E.

A71-28945 # Determination problem of sound limit expenditures per parameter unit in civil transport aircraft design (K voprosu opredeleniia predel'nykh tselesoobraznykh zatrat na edinitsu parametra pri proektirovaniu grazhdanskikh transportnykh samoletov). M. K. Nasrov. *Kazanskii Aviatsionnyi Institut, Seriya Aviatsionnaia Tekhnologiya i Organizatsiia Proizvodstva*, no. 120, 1970, p. 70-74. In Russian.

Formulas for calculating cost-efficient limit expenditures in new commercial aircraft designs are derived and discussed. The attempt is made to include, among other things, the effects of the functional interdependence of amortization amounts and those of additional capital investments. It is felt that the actual operation of the commercial-exploitation process is thereby more accurately reflected in the derived formulas. M.V.E.

A71-28954 Combustion in a flow (Gorenie v potoke). Edited by A. V. Talantov. Kazan, Kazanskii Aviatsionnyi Institut (*KAI, Trudy, Seriya Aviatsionnye Dvigateli*, no. 124), 1970. 204 p. In Russian.

Experimental and theoretical research on combustion processes in turbulent and laminar flows of kerosene and gasoline mixtures, with emphasis on problems encountered in gas turbine engines. Topics treated include measurement of flame propagation rates, effects of flow turbulence on flameout phenomena, effects of flame holder and stabilizer arrangements on combustion parameters, influence of initial combustion parameters on afterburning characteristics, formation of temperature fields in the exhaust ducts of gas turbine engines, gasdynamic stabilization of flames, use of boundary slipstreams for ignition of combustion products in afterburners, and minimization of combustion deposits by appropriate design of fuel injection systems. Numerous design procedures for gas-turbine combustion chambers are described. T.M.

A71-28962 # Role of turbulence intensity during the mixing of plane isothermal slipstreams in an enclosed flow (Rol' intensivnosti turbulentnosti v protsesse smesheniia sputnykh ploskikh izotermicheskikh strui v zakrytom potoke). Iu. V. Vinogradov, V. N. Gruzdev, and A. V. Talantov. In: *Combustion in a flow (Gorenie v potoke)*. Edited by A. V. Talantov. Kazan, Kazanskii Aviatsionnyi Institut (*KAI, Trudy, Seriya Aviatsionnye Dvigateli*, no. 124), 1970, p. 86-97. 5 refs. In Russian.

Experimental study of turbulence effects on the mixing of three plane parallel streams with equal velocities (30 to 70 m/sec) and temperature (313 to 323 K). The level of turbulence was varied by using different grids in the channels prior to entry into a transparent mixing chamber. The central flow contained smoke for photographic visualization of the mixing process in the transparent chamber. The results show that a simultaneous increase of turbulence in all three channels intensifies the mixing process in accordance with turbulent diffusion theory. The effects of increasing turbulence only in the central channel depend on the turbulence ratio between this channel and the outer channels. T.M.

A71-28968 # Comparative estimation of start-up and break-down characteristics of gas-turbine engine combustion chambers with mechanical and air-stream mechanical propellant atomization (Sravnitel'naia otsenka puskovykh i sryvnykh kharakteristik kamery sgoraniia GTD pri mekhanicheskom i vozdušno-mekhanicheskom raspylivanii topliva). I. N. Diatlov. In: *Combustion in a flow (Gorenie v potoke)*. Edited by A. V. Talantov. Kazan, Kazanskii Aviatsionnyi Institut (*KAI, Trudy, Seriya Aviatsionnye Dvigateli*, no. 124), 1970, p. 160-169. In Russian.

Theoretical and experimental study of the effectiveness of propellant atomization with and without air injection in the combustion chamber nozzle of a gas-turbine engine. Tests show that the start-up and burning performance of these combustion chambers can be improved by using air injection during the mechanical propellant atomization process. It is shown that the operational range of combustion chambers can be extended to poorer propellant mixtures by combined air-injection mechanical atomization of the propellant. V.Z.

A71-28969 # Investigation of a gas turbine engine start-up igniter (Issledovanie puskovogo vosplamenitelia GTD). I. N. Diatlov. In: *Combustion in a flow (Gorenie v potoke)*. Edited by A. V. Talantov. Kazan, Kazanskii Aviatsionnyi Institut (*KAI, Trudy, Seriya Aviatsionnye Dvigateli*, no. 124), 1970, p. 170-177. In Russian.

An experimental gas turbine engine igniter with a modified propellant atomizer was designed in an attempt to improve the standard prototype with a mechanical propellant atomizer. The modified atomizer differed from the standard atomizer in that propellant atomization in it was enhanced by air injection. Tests showed that the combined propellant atomization technique improved substantially the igniter performance, expanding considerably the range of steady operation in terms of propellant flow rates and pressure. V.Z.

A71-28970 # Effect of airstream-mechanical propellant atomization on the carbon deposition rates in a gas-turbine engine combustion chamber (Vliianie vozdušno-mekhanicheskogo raspylivaniia topliva na intensivnost' nagarootobrazovaniia v kamere sgoraniia GTD). I. N. Diatlov and V. G. Semenov. In: *Combustion in a flow (Gorenie v potoke)*. Edited by A. V. Talantov. Kazan, Kazanskii Aviatsionnyi Institut (*KAI, Trudy, Seriya Aviatsionnye Dvigateli*, no. 124), 1970, p. 178-185. 6 refs. In Russian.

Experiments are described in which carbon deposition rates in a combustion chamber with airstream propellant atomization were compared with those in a combustion chamber with mechanical propellant atomization. Conditions are found to minimize carbon deposition by improving the air-propellant mixing process. Air-propellant flows are indicated which produce almost no carbon deposits when airstream-mechanical propellant atomization is used. V.Z.

A71-28971 # Effect of the penetrating ability of jets on the peripheral nonuniformity of a gas temperature field at the outlet of a gas turbine engine chamber (Vliianie probivnoi sposobnosti strui na okruzhnuiu neravnomernost' temperaturnogo polia gaza na vykhode iz kamery sgoraniia GTD). Iu. A. Spiridonov, K. V. Kakhovskii, and A. V. Talantov. In: *Combustion in a flow (Gorenie v potoke)*. Edited by A. V. Talantov. Kazan, Kazanskii Aviatsionnyi Institut (*KAI, Trudy, Seriya Aviatsionnye Dvigateli*, no. 124), 1970, p. 186-192. In Russian.

Experimental study of the behavior of a gas flow temperature field at the outlet of a combustion chamber with flame tubes having circular cross sections. It is shown that there is an optimum in the dependence of the peripheral nonuniformity of the temperature field on the penetrating ability of air jets when air is injected into the gas flow through orifices in the flame tube walls. The point of optimum is shown to be a singular point at which the gas flow field undergoes a major structural change. V.Z.

A71-28972 # Generalized characteristic of peripheral non-uniformity in the temperature field of a gas at the outlet of a gas-turbine engine combustion chamber (Obobshchennia kharakteristika okruzhnoi neravnornosti temperaturnogo polia gaza na vykhode iz kamery sgoraniia GTD). Iu. A. Spiridonov and A. V. Talantov. In: *Combustion in a flow (Gorenie v potoke)*.

Edited by A. V. Talantov. Kazan, Kazanskii Aviatsonnyi Institut (KAI, *Trudy, Seria Aviatsonnye Dvigateli*, no. 124), 1970, p. 193-200. In Russian.

A procedure is given for obtaining this characteristic on the assumption that the airstream penetrating ability at the singular point does not depend on the jet momenta, that the air distribution in the ring channel is uniform, and that the orifice diameters in individual sections of the mixing zone are equal. Limiting conditions for the delivery of air jets into the mixing zone, for the hydraulic resistance factor and for the gas motion from the flame tube into the ring channel are discussed. It is shown that for each total orifice area there is an optimal air distribution in the mixing zone with a minimum peripheral nonuniformity of the flow temperature field.

A71-28985 # The effect of flow direction on combined convective heat transfer from cylinders to air. P. H. Oosthuizen and S. Madan (Queen's University, Kingston, Ontario, Canada). *ASME, Transactions, Series C - Journal of Heat Transfer*, vol. 93, May 1971, p. 240-242. National Research Council of Canada Grant No. A-5573.

In combined forced and free convective heat transfer from cylinders, the Nusselt number is shown to depend on the Reynolds number, the Grashof number, the Prandtl number, and the angle α between the directions of the forced flow and the buoyancy force. Previous measurements of convective heat transfer for $\alpha = 0$ deg were extended to investigate the effect of varying α , assuming $\alpha = 0, 90, 135,$ and 180 deg.

A71-29106 Low stratus at Embakasi Airport Nairobi. Dietrich Stranz. *Pure and Applied Geophysics*, vol. 86, no. 3, 1971, p. 118-139. 26 refs.

The relatively frequent occurrence of low clouds over the Embakasi Airport near Nairobi (Kenya) is a great hazard particularly to aircraft without an automatic landing device. Hence, the necessity for the flight direction and control staff to receive early and reliable information regarding low clouds from the meteorologist. The great difficulty is evident from the fact that low stratus can form and also disappear very suddenly. Considerable and sudden local and temporal variations prevent the meteorologist from exactly forecasting the phenomenon. The statistical results obtained from more than five years of observations should provide a means of tackling the problem, but they appear to be inadequate unless the actual state of the atmosphere in its lowest 200 meters near the airfield is taken into account as an additional aid for the forecast. It is pointed out that radiosounding from a site to the northeast and below the level of the airfield would be of more use than that from Dagoretti which lies downstream and at a greater altitude.

A71-29131 # Commercial VSTOL and the jet VTOL transport. Drury Wood (Dornier AG, Friedrichshafen, West Germany). In: *V/STOL in civil aviation*; British Air Line Pilots Association, Annual Technical Symposium, 11th, London, England, November 24-26, 1970, Proceedings. Hayes, Middx., England, British Air Line Pilots

Association, 1970, p. 63-70; Discussion, p. 71-81.

Interpretation of results obtained in testing the Do 31 jet transport built to land and take off vertically. When full throttle is applied the aircraft lifts from the ground with zero roll and accelerates quickly. The takeoff profile is optional with the pilot or is as directed by traffic procedures. The landing approach is the same as that for any conventional jet aircraft with the exception of the lift engine start procedure. It is considered that there can be increased automation of air traffic control and the actual control of the aircraft by electronic systems during takeoff and landing.

A71-29144 # Helicopters as cranes, and carrying external loads. III (Kran- und Aussenlastflug mit Hubschraubern. III). Michael Caspari. *Technisch-ökonomische Informationen der zivilen Luftfahrt*, vol. 7, no. 4, 1971, p. 192-196. In German.

Operational costs of helicopters and the economic value of their use are analyzed. The operational costs consist of direct and indirect operating expenses and overhead expenses. It is found that the employment of helicopters becomes more economical with increasing time of operation. Examples are presented of cases in which the employment of helicopters has great advantages when compared with the use of conventional equipment for load-lifting and transportation. Approaches for increasing the application possibilities of helicopters by decreasing operation costs are examined.

A71-29155 # Measurement of light pressure forces and of aerodynamic forces acting on a body of complex shape in a free-molecule flow (Izmerenie sil svetovogo davleniia i aerodinamicheskikh sil, deistvuiushchikh na telo slozhnoi formy v svobodnomolekuliarnom potoke). L. A. Vasil'ev, T. A. Kuramshin, L. P. Nazarova, and L. I. Travnikova. *Aerodinamika Razrezhennykh Gazov*, no. 5, 1970, p. 113-118. In Russian.

Description of an assembly designed to produce a distribution of light reflected from a body which is similar to the distribution of molecules reflected from this body in a free-molecule flow. The assembly consists of a frame rotating about its vertical axis and of a ring fixed to the frame and rotating about its horizontal axis, both axes intersecting at the center of the ring. A body of complex geometry is suspended at the intersection of the axes on thin steel filaments. A light beam is emitted onto the body from a collimator fixed to the ring, so that the relative positions of the body and the beam remain unchanged during the rotation of the frame and the ring. Radiation reflected from the body in any direction can be measured by photoelectric, bolometric, and photographic recording on this assembly. The theory of this technique is discussed.

A71-29169 # Similarity laws for three-dimensional steady separated liquid and gas flows past bodies (Zakony podobiiia dlia trekhmernogo statsionarnogo otrynnogo obtakaniiia tel zhidkost'iu i gazom). A. A. Nikol'skii. *TsAGI, Uchenye Zapiski*, vol. 1, no. 1, 1970, p. 1-7. 6 refs. In Russian.

Theoretical study of the behavior of ideal fluid flows past low-aspect-ratio bodies with flow separation. Conditions are obtained under which the plane cross section law is asymptotically applicable

to these flows. The conditions are used to reduce the three-dimensional problem to a two-dimensional problem of such flows past two-dimensional bodies. General and specific similarity laws are derived for the reduction process. A low-aspect-ratio wing in a flow consistent with the plane cross-section law is discussed specifically.

V.Z.

A71-29172 # Similarity and variation of the aerodynamical characteristics in the transition region at hypersonic flow velocities (O podobii i izmenenii aerodinamicheskikh kharakteristik v perekhodnoi oblasti pri giperzvukovykh skorostiakh potoka). V. N. Gusev, M. N. Kogan, and V. A. Perepukhov. *TsAGI, Uchenye Zapiski*, vol. 1, no. 1, 1970, p. 24-33. 37 refs. In Russian.

Analysis of the aerodynamic characteristics of simple bodies in hypersonic flows with structural characteristics ranging from those of a free-molecule flow to those of a solid medium. The Boltzmann equation is used as a basis for deriving a similarity criterion for such media. The basic gas dynamical similarity parameter is shown to be a Reynolds number whose viscosity factor is a function of the drag temperature. This parameter is used in a comparison of the theoretical and experimental results.

V.Z.

A71-29175 # Flow in the inlet section of a supersonic diffuser channel when the boundary layer is separated by a shock wave (Tchenie vo vkhodnom uchastke kanala sverkhzvukovogo diffuzora pri otryve pogranichnogo sloia golovnoi volnoi). A. V. Nikolaev. *TsAGI, Uchenye Zapiski*, vol. 1, no. 1, 1970, p. 60-70. In Russian.

Theoretical study of a plane flow in an experimental air inlet with extended rectilinear generatrices. The air inlet design is used for simulation of a shock-wave-separated flow in supersonic diffusers. A jet with a free boundary behind the flow separation point is used as a flow prototype in the simulation experiments. Expressions are obtained for determining the pressure variation profile along the free boundary from data for a critical pressure gradient at the flow separation point.

V.Z.

A71-29176 # Experimental study of heat transfer on spheres and sharp cones in a rarefied hypersonic gas flow (Eksperimental'noe issledovanie teploperedachi na sferakh i tonkikh konusakh v giperzvukovom potoke razrezhennogo gaza). Iu. V. Nikol'skii, G. E. Pervushin, and L. G. Chernikova. *TsAGI, Uchenye Zapiski*, vol. 1, no. 1, 1970, p. 71-77. 7 refs. In Russian.

Wind tunnel vacuum experiments with heat transfer measurements on spheres and sharp cones in rarefied gas flows at zero angles of attack at hypersonic speeds are described. Heat transfer is studied on spheres at Mach numbers from 4.9 to 9.5 and Reynolds numbers from 35 down to 1, and on cones at Reynolds numbers from 100 down to 4, realizing the conditions of transition from a free-molecule flow to a continuous medium flow. Good agreement is obtained between the experimental results and theoretical results obtained by Nikolaev (1962) for viscous hypersonic flows and by Perepukhov (1967) for nearly free-molecular flows.

V.Z.

A71-29182 # Minimum-drag wing-fuselage combination for supersonic speeds (Kombinatsiia kryla z fiuzeliazhem, obladaiushchaia minimal'nym soprotivleniem pri sverkhzvukovykh skorostiakh). Iu. L. Zhilin. *TsAGI, Uchenye Zapiski*, vol. 1, no. 1, 1970, p. 134-139. 5 refs. In Russian.

The variational problem of determining a minimum-drag wing-fuselage combination for prescribed lifting force, longitudinal moment, and volume is examined. It is assumed that the wing thickness is zero at the supersonic leading and trailing edges. For a slender fuselage, the variational problem is solved by the method of successive approximations. In the first two approximations, the problem is reduced to certain variational problems for an isolated wing. The surface of the fuselage in the contact region with the wing

is constructed from the lines of flow at the isolated minimum-drag wing. The third approximation takes an additional deformation of the fuselage surface into account.

V.P.

A71-29183 # Investigation of means of increasing the lift/drag ratio of conical bodies (Issledovanie vozmozhnostei uvelicheniia aerodinamicheskogo kachestva konicheskikh tel). B. L. Zhirnikov and K. P. Petrov. *TsAGI, Uchenye Zapiski*, vol. 1, no. 1, 1970, p. 140-144. In Russian.

The aerodynamic characteristics of cones with a wedge-shaped nose are studied experimentally and theoretically as a function of their geometrical parameters. The experiments were performed for angles of attack ranging from 0 to 18 deg at a Mach number of 1.6 and a Reynolds number of 0.88×10 to the sixth power. The theoretical results were obtained within the framework of Newtonian theory. It is shown that for certain geometrical parameters, the configurations studied have a much greater lift and lift/drag ratio than circular cones. The configurations studied may be well suited for space vehicles reentering the atmosphere at speed above 7 miles/sec.

V.P.

A71-29185 # Approximate calculation of a certain class of gliding trajectories (O priblizhennom raschete odnogo klassa traektorii planirovaniia). V. G. Koniaev. *TsAGI, Uchenye Zapiski*, vol. 1, no. 1, 1970, p. 149-157. In Russian.

Analysis of quasi-stationary gliding trajectories of an aircraft in a planetary atmosphere during constant control of attack and bank angles. Values of parameters are determined at which these trajectories are possible. Approximate formulas are obtained for calculating the longitudinal and lateral ranges of the gliding aircraft as a function of its characteristics.

Z.W.

A71-29188 # Theory for the unsteady curvilinear motion of a lifting surface in a gas (K teorii nestatsionarnogo krivolineinogo dvizheniia nesushchei poverkhnosti v gaza). V. E. Baskin. *TsAGI, Uchenye Zapiski*, vol. 1, no. 2, 1970, p. 18-28. 5 refs. In Russian.

The velocities of gas flows induced by the unsteady curvilinear motion of a lifting surface are expressed in terms of vortex densities. These expressions generalize the Biot-Savart law in such a manner that it becomes valid (in the linear approximation) for arbitrary nonstationary vortices in a gas. The generalization involves an allowance for the delay (lasting on the order of the time required for the passage of the sound signal) in velocity formation when applying the usual Biot-Savart formula to the vortex elements. This yields certain supplementary wavelike components of the induced velocities.

T.M.

A71-29189 # Hypersonic flow around a delta wing (Obtekanie treugol'nogo kryla giperzvukovym potokom). V. P. Kolgan. *TsAGI, Uchenye Zapiski*, vol. 1, no. 2, 1970, p. 29-35. In Russian.

Hypersonic flow around a delta wing at small angles of attack is examined by using the method of pressure sources. The problem is reduced to a singular integral equation which is regularized to yield a Fredholm integral equation of the second kind with a continuous kernel. The results are illustrated by example calculations of the pressure field for a disturbed flow region.

T.M.

A71-29190 # Investigation of the aerodynamic characteristics of elevons on low-aspect wings (Issledovanie aerodinamicheskikh kharakteristik elevonov na kryl'iakh malogo udlineniia). V. G. Mikeladze. *TsAGI, Uchenye Zapiski*, vol. 1, no. 2, 1970, p. 36-45. In Russian.

Calculations of the subsonic and supersonic aerodynamic characteristics of elevons used as longitudinal and lateral control elements on low-aspect wings. The method used for the subsonic velocities is

based on a reciprocity theorem that establishes the relation between the wing's aerodynamic characteristics in forward flow and in reverse flow (where the direction of the oncoming flow's velocity is reversed). Calculations for supersonic velocities are based on the linear theory of supersonic flows. The effects of individual elevon parameters are explained systematically, and flow patterns are described for wings with highly deflected elevons at subsonic, transonic, and supersonic velocities. T.M.

A71-29191 # Influence of the real properties of air on flow parameters around an elliptical cone - Aerodynamic characteristics of elliptical cones at large angles of attack (Vliianie real'nykh svoystv vozdukh na parametry techeniia okolo ellipticheskogo konusa - Aerodinamicheskie kharakteristiki ellipticheskikh konusov pri bol'shikh uglakh ataki). A. P. Bazzhin, O. N. Trusova, and I. F. Chelysheva. *TsAGI, Uchenye Zapiski*, vol. 1, no. 2, 1970, p. 46-52. In Russian.

Calculations of flow around an elliptical cone having a cross-sectional major-to-minor axis ratio of 2 and a vertex angle of 30 deg in the horizontal plane. The cone was oriented at a 30-deg angle of attack in air flows with speeds of 2350, 3356, and 6713 m/sec. The air was treated as a three-component (nitrogen, oxygen, and nitrogen) gas, and its thermodynamic functions were calculated by a standard program. The results are graphically compared with those for a perfect gas, showing relatively small changes in shock-wave positions, pressure ratios, and density ratios when the real gas properties are taken into account. The second part of the study shows the calculated behavior of lift, drag, and pitch-moment coefficients in perfect gas as functions of vertex angles (20, 30, and 40 deg) and angles of attack (30 to 50 deg) at Mach 7. T.M.

A71-29201 # Ballistic wind tunnel for drag measurements on models during free flight at supersonic speeds (Aeroballisticheskaiya truba dlia izmereniia soprotivleniia modelei v svobodnom polete pri giperzvukovykh skorostiakh). L. P. Gur'iashkin, A. P. Krasil'shchikov, and V. P. Podobin. *TsAGI, Uchenye Zapiski*, vol. 1, no. 2, 1970, p. 111-114. 6 refs. In Russian.

A brief description is presented of a wind tunnel, the underlying principle of operation of which is firing model bodies into an oncoming supersonic flow. The wind tunnel was designed for measurements of the drag coefficient and for studies of the characteristics of flow past axisymmetric bodies in the range of supersonic and hypersonic flight velocities. O.H.

A71-29204 # Limiting flows of a viscous fluid with stationary separation zones at Reynolds numbers tending to infinity (O predel'nykh techeniiax viazkoj zhidkosti so statsionarnymi sryvnymi zonami pri Re tending to infinity). G. I. Taganov. *TsAGI, Uchenye Zapiski*, vol. 1, no. 3, 1970, p. 1-14. 14 refs. In Russian.

Quantitative asymptotic results for nondegenerate flow within a separation region with a circulating core are obtained for Reynolds numbers tending to infinity. The global flow pattern at a two-dimensional body with an indefinitely increasing separation zone is analyzed, and the local flow pattern near the body studied in detail. Analysis of the local flow pattern leads to an asymptotic formula for the drag coefficient of a two-dimensional body in the presence of dissipation at Reynolds numbers tending to infinity. A qualitative analysis of the drag coefficient as a function of Re for a plate situated normal to a flow with a stationary separation zone leads to a paradoxical result, according to which the drag of plate normal to the flow becomes at a certain Reynolds number smaller than that of plate at zero incidence at the same Reynolds number. The configuration of the separation zone which corresponds to the limiting state of a flow at Reynolds numbers tending to infinity past a symmetrical two-dimensional body is determined. V.P.

A71-29205 # Hypersonic self-similar flow past a cone moving according to a power law (Giperzvukovoe avtomodel'noe

obtekanie konusa, dvizhushchegosia po stepennomu zakonu). S. K. Betiaev. *TsAGI, Uchenye Zapiski*, vol. 1, no. 3, 1970, p. 15-29. 8 refs. In Russian.

The unsteady hypersonic asymmetric gas flow past a circular cone and wedge moving at a variable velocity is analyzed for the case where the piston analogy of Heus is not applicable. An elliptical zone with an isotropic expansion of weak disturbances and an entropy singularity is contained between the hypersonic regions of the flow. A solution to the problem is obtained with the aid of external and internal asymptotic expansions. Numerical results are obtained by the method of characteristics within the framework of small perturbation hypersonic theory. The theory of self-similar motion proposed can be used for calculating the wave drag coefficient as a function of time for a cone of finite dimensions. It is shown that for a cone accelerated according to a power law, the drag coefficient cannot increase more than twice. V.P.

A71-29207 # Interference between a wing and a jet in cross wind (Interferentsiia kryla i strui v snosiashchem potoke). V. N. Arnol'dov, M. G. Gordon, and A. A. Savinov. *TsAGI, Uchenye Zapiski*, vol. 1, no. 3, 1970, p. 36-44. 7 refs. In Russian.

The influence of a jet expelled at an angle of 90 deg toward the lower wing surface on the aerodynamic characteristics of isolated wings close to and far from a wall is studied experimentally. The factors responsible for the changes in the effective thrust of the jet with an increase of the oncoming flow rate and a decrease of the distance from the wall is analyzed on the basis of experimental and theoretical data on the interaction between jets with initial cross sections of various shape and wings of various relative dimensions and planforms. It is shown that at large distances from the wall (ground), the external flow past the jet plays an important role in the changes of the aerodynamic characteristics of the wing when the oncoming flow rate is increased, while near the ground, the vortices created at the upper wing surface have a favorable influence of the interference between the wing and jet. V.P.

A71-29217 # Phenomenon of vortex formation associated with the oblique flow past a rotor (O iavlenii vikhreobrazovanii pri obtekanii nesushchego vinta kosym potokom). A. V. Larin. *TsAGI, Uchenye Zapiski*, vol. 1, no. 3, 1970, p. 115-122. 9 refs. In Russian.

The structure and shape of the vortex wake behind a multiblade hinged rotor in oblique flow is studied by the cavitation method for various flight loads and various flow conditions at the rotor. The results are analyzed and are illustrated by photographs and sketches. A new effect is observed which consists in the transformation of the outer cycloidal segments of trailing vortices into vortex filaments consisting of several helical loops. V.P.

A71-29222 # Optimal distribution of wing thickness in supersonic flow (Optimal'noe raspredelenie tolshchiny kryla v sverkhzvukovom potoke). I. I. Burakov and Iu. L. Zhilin. *TsAGI, Uchenye Zapiski*, vol. 1, no. 4, 1970, p. 15-21. 5 refs. In Russian.

Determination of the surface shape of a wing having minimum wave drag at zero angle of attack in supersonic flow. The Mach number and the wing's planform are given, and the wing thickness becomes zero at the leading and trailing edges. For high Mach numbers, the problem has a simple solution since the drag does not depend on the planform, and for a given profile, is governed by the distribution of the relative thickness and local chord along the span. A parabolic-profile wing whose thickness varies in proportion to the local chord along the span exhibits minimum drag in this case. Solutions for lower Mach numbers are obtained by using the Ritz method which reduces the problem to the determination of a conditional minimum. T.M.

A71-29224 # Wind-tunnel simulations of viscous hypersonic flows (O modelirovanii viazkikh giperzvukovykh techenii v aerodinamicheskikh trubakh). V. S. Galkin and V. S. Nikolaev. *TsAGI, Uchenye Zapiski*, vol. 1, no. 4, 1970, p. 26-33. 8 refs. In Russian.

Analysis of problems involved in direct wind-tunnel simulation of natural interactions between a hypersonic viscous flow and a laminar boundary layer on a plate positioned at zero angle of attack. Direct simulation implies the possibility of relating the experimental data directly to the natural conditions. This can be done when all the wind-tunnel similarity criteria coincide with the natural criteria or when differences between them cause only slight discrepancies in the aerodynamic characteristics. Calculated data are given for the effects of individual similarity parameters on the lift and drag coefficients, and practical recommendations are included for relating the results of wind-tunnel experiments to natural situations in cases where several similarity parameters diverge simultaneously. T.M.

A71-29228 # Longitudinal stability criteria for a ground-effect airplane (Kriterii prodol'noi ustoychivosti ekranoplana). R. D. Irodov. *TsAGI, Uchenye Zapiski*, vol. 1, no. 4, 1970, p. 63-72. In Russian.

Analysis of factors affecting the longitudinal stability of an airplane which relies on the ground effect for substantial enhancement of its lift properties and of the wing's aerodynamic quality. The advantageous influence of the ground effect increases with decreasing height of the wing's trailing edge over the surface, as measured in fractions of the chord. For a given wing surface area and a given height of the trailing edge (governed by the roughness of the surface), the influence of the ground effect increases with decreasing wing aspect ratio. Some new longitudinal stability criteria associated with these aerodynamic characteristics are defined and developed into supplementary aerodynamic design requirements. T.M.

A71-29229 # Irregular optimal trajectories of a spacecraft during flight in the atmosphere (Neregularnye optimal'nye traektorii apparata pri polete v atmosfere). V. V. Dikusar and A. A. Shilov. *TsAGI, Uchenye Zapiski*, vol. 1, no. 4, 1970, p. 73-83. In Russian.

The control of a spacecraft's angle of attack during atmospheric reentry for minimum flight distances is examined with allowance for load constraints in the case of local inefficiencies of control. This case involves a situation where the local influence of the lifting force on the loads becomes exhausted. The necessary optimality conditions are analyzed, and Pontriagin's maximum principle is used for numerical determination of the spacecraft's maneuvering capabilities. Attention is given to the methodological aspects of solving boundary value problems when calculating irregular optimal trajectories. T.M.

A71-29231 # Allowance for the operational experience in the determination of the lifetime of a structure (Ob uchete opyta ekspluatatsii pri opredelenii sroka sluzhby konstruktssii). V. D. Il'ichev. *TsAGI, Uchenye Zapiski*, vol. 1, no. 4, 1970, p. 92-98. In Russian.

Calculation of the safe service life of currently used structures and its prolongation without increasing the failure probability in storage, taking into consideration the linear accumulation of fatigue damages. To this purpose, the utilization of current load measurements and laboratory fatigue testing is recommended, as well as the use of mileage statistics of aircraft in current operation, including the leader aircraft. Z.W.

A71-29234 # Influence of the vortex system of a wing in the absence of lift on the flow past the wing at small angles of attack (Vliianie vikhrevoi sistemy kryla pri otsutstvii pod'emnoi sily na ego obtekanie pri malykh uglakh ataki). K. K. Fediaevskii and N. N. Fomina. *TsAGI, Uchenye Zapiski*, vol. 1, no. 4, 1970, p. 109-112. In Russian.

The flow characteristics at zero angle of attack and an angle of attack of 5 deg were studied for a small-aspect-ratio thick-section wing (NACA-0018) of rectangular planform with flat tips. A comparison of the transverse velocity fields at these angles of attack shows that the nature of the flow at zero angle of attack is very

similar to that at an angle of 5 deg. The tip vortex closer to the lower surface of the wing intensifies in the transition from zero angle of attack to an angle of attack of 5 deg, while the tip vortex located closer to the upper wing surface hardly changes. It is shown that the flow at zero angle of attack has an influence of lift formation. V.P.

A71-29235 # Investigation of the vortex system of a helicopter rotor (Issledovanie vikhrevoi sistemy nesushchego vinta vertoleta). V. G. Kolkov. *TsAGI, Uchenye Zapiski*, vol. 1, no. 4, 1970, p. 113-117. In Russian.

A smoke visualization technique is applied to a study of the vortex system of a rotor and the induced velocity field over a wide range of positive and negative angles of attack, flight conditions, and unit loads. Expressions describing the dependence of the configuration of the vortex system on the velocity of the oncoming flow and on the unit load at the rotor are proposed. Vortex system configurations are determined for various modes of rotor operation. The range of applicability of existing vortex models is established. V.P.

A71-29256 Elevator-induced manoeuvring loads from the standpoint of airworthiness requirements for sailplanes. Piero Morelli (Torino, Università, Turin, Italy). (*Organisation Scientifique et Technique Internationale du Vol à Voile, Congress, 12th, Alpine, Tex., June 27-July 4, 1970.*) *Aero-Revue*, May 1971, p. 247, 248.

Modifications of International Airworthiness Requirements for Sailplanes are proposed on the basis of criteria previously defined and discussed. The proposed modifications pertain to loads on horizontal tail surfaces and to maneuvering loads. Results of sample calculations of loads for typical sailplanes (a single- and a two-seater) are presented in two tables. M.V.E.

A71-29257 Airfoils for the variable geometry concept. F. X. Wortmann (Stuttgart, Universität, Stuttgart, West Germany). (*Organisation Scientifique et Technique Internationale du Vol à Voile, Congress, 12th, Alpine, Tex., June 27-July 4, 1970.*) *Aero-Revue*, May 1971, p. 249-251.

Wind tunnel tests were run on a pair of geometrically compatible airfoils designed to implement a variable chord concept applicable to sailplanes. The experimental results obtained confirm the expectation based on theoretical calculations and suggest excellent performance probabilities for a variable-chord sailplane. M.V.E.

A71-29261 # The operational proving of automatic flight control systems in the approach and landing phase. R. H. Ashforth. *Aviation Review*, May 1971, p. 14-16.

For the Hawker Siddeley Trident aircraft the autopilot was conceived on the basis that automatic landings in blind conditions could be achieved with a safety margin one order improved from that of the human pilot when making landings. Clearance for fully blind automatic landings is to be achieved in a series of gradual stages. The Category 1 standard of certification is considered. For Category 2 it was necessary to design and develop a radio deviation and comparator system. Lessons learned in developing the Category 3B system could result in an easier operation if they were implemented on future aircraft. G.R.

A71-29262 # Accessories for gas turbine APU's. V. L. Benson. *Aviation Review*, May 1971, p. 18, 19.

The growing importance of the gas turbine Auxiliary Power Unit (APU) for aircraft and their electronic systems is considered. Accessories of the APUs consist of high energy igniters, cables and connectors, thermocouples, and equipment for speed and temperature monitoring. The accuracy and reliability of speed and temperature monitoring equipment is an important factor in the control of an APU. G.R.

A71-29265 # Aerodynamic behaviour of bodies in the wakes of other bodies. W. A. Mair and D. J. Maufl (Cambridge University, Cambridge, England). *Royal Society (London), Philosophical Transactions, Series A*, vol. 269, May 13, 1971, p. 425-437. 21 refs.

Wakes of two-dimensional bluff bodies are described, with emphasis on the properties of the wake which influence the loads on other bodies placed in the wake. The unsteady irrotational flow outside the true wake is included in the discussion. Some limited information on the wakes of three-dimensional bluff bodies is also given. The interaction between two bodies is subdivided into two categories: (1) when the bodies are close together and the upstream body is influenced by the downstream one and (2) when the bodies are so far apart that only the downstream body is affected. Experiments are described in which the load on an aerofoil in the wake of a two-dimensional bluff body was measured. The results are presented in the form of an aerodynamic admittance, and these experiments are used to illustrate the type of problem associated with the determination of the loads on a bluff body in a wake. Experiments are also described which show the large variation of time-averaged load which can be developed on a body which is part of a closely packed complex of bodies, as the orientation of the complex to the wind is varied. (Author)

A71-29276 The 'Mercure' - The first aircraft of a new generation (Le 'Mercure' - Premier avion d'une nouvelle génération). Jean de Galard and Jacques Morisset. *Air et Cosmos*, vol. 9, May 15, 1971, p. 21-36. In French.

Review of the development of the Dassault Mercure short-range aircraft. An extensive study of world air traffic showed that the average distance traveled per passenger was less than 1000 km. Studies by Dassault indicated that aircraft currently in use were poorly suited to their purpose. Thus a twin-jet aircraft was conceived which is larger than the Caravelle, the BAC-111, and the Boeing B-737 now actually in line use. It is considered to be well adapted to short stages and capable of further development by use of new and more powerful engines. F.R.L.

A71-29281 Fuel-optimal landings of jet-supported VTOL aircraft (Treibstoffoptimale Landetrasitionen strahlgestützter VTOL-Flugzeuge). G. Schmidt and A. Weimann (Dornier AG, Friedrichshafen, West Germany). *Ingenieur-Archiv*, vol. 40, no. 2, 1971, p. 96-106. In German.

The present paper considers an optimal control problem, namely fuel-optimal landings of a VTOL aircraft. The aircraft is approximated as a mass point. However, separate main and lift engines, main aerodynamic forces and jet inlet impulse are taken into account. The equations of motion are given for the case of static air mass and a two dimensional translational motion in a vertical plane with pitch attitude constant. Utilizing this mathematical model and Pontriagin's Maximum Principle the analytical equations for computing combined fuel-time-optimal landing transitions are derived. These equations were solved in an analog computer study assuming data of the VTOL jet transport DO 31. A survey and discussion of the results are given. (Author)

A71-29304 An over-view of the airport noise problem. Inder K. Sud (Stanford University, Stanford, Calif.). *Logistics Review*, vol. 6, no. 29, 1970, p. 12-31. 15 refs.

The main sources of aircraft noise on and near airports and the factors affecting its intensity are specified. Legal aspects of airport noise are examined. A detailed discussion is presented of some approaches to alleviate noise and thus improve the relationship between airport and its environs. These approaches include design changes of aircraft engines, nacelle, or airplanes themselves; operation procedures such as special takeoff and landing approaches for noise abatement and use of preferential runways; and compatible land use development around airports. The features of a method to obtain noise characteristics of an aircraft are outlined, and the

method called Noise Exposure Forecast (NEF) for the delineation of noise affected areas is described in detail. Finally, the 'cost' of noise is discussed. O.H.

A71-29308 # Propulsion guidance and stability of the ground effect vehicle with perimetric Coanda fluid boundary (Asupra propulsiei, dirijării și stabilității vehiculului cu efect de sol cu frontieră fluidă Coandă perimetrală). Clement Alecsandriescu. *Transporturi Auto, Navale și Aeriene*, vol. 1 (18), Feb. 1971, p. 66-70. 6 refs. In Rumanian.

Two variants of the propulsion system are presented: (1) the shutter system which is only briefly described and (2) the system using the Coanda effect to obtain a directional change of the flow. Theoretical computations are given for the latter together with details on the braking and stability of the vehicle during turns and at upgrades. N.D.

A71-29309 Roissy-en-France - New major airport for Paris. Gerhard Scheuch (Verein Deutscher Ingenieure, Darmstadt, West Germany). *Airport Forum*, no. 1, 1971, p. 25-31, 33, 34, 36. In English and German.

The new airport is under construction since 1967. It is situated approximately 20 km to the north-east of the Notre Dame cathedral. In its final stage, the airport will be capable of handling 30 million passengers a year. Five separate terminals for six million passengers each will be built at a rate of one per year. The airport will have four runways: two to the north and two to the south. The maximum traffic volume which could be handled by this runway system would be 500,000 aircraft movements a year. The present state of construction is briefly described. Z.W.

A71-29310 The new Melbourne/Tullamarine airport. James M. Eames (Department of Civil Aviation, Melbourne, Australia). *Airport Forum*, no. 1, 1971, p. 39, 40, 42 (5 ff.). In English and German.

General description of the new airport, its facilities, and capacity. A three-story international and domestic passenger terminal with radiating passenger concourses was placed on a 200-acre site on the eastern side of the airport, with its road system connected to an express highway to the city. Five hundred acres to the south were reserved for airline maintenance bases and a future cargo handling area. The airport has two runways: a primary 8500 ft north-south runway to be extended to 12,000 ft, and a secondary east-west runway of 7500 ft, which is also capable of extension. The international departure lounge and its associated areas will be capable of handling up to about 4000 passengers over a peak hour. The domestic terminals are planned to accommodate about 12,000 people an hour in the busiest period. Z.W.

A71-29311 Design principles for airport pavements. Carl E. Gerlach (Stuttgart, Universität, Stuttgart, West Germany). *Airport Forum*, no. 1, 1971, p. 53-60. In English and German.

Analysis of the criteria for estimating the stresses exerted by different types of loads imposed during operation on an airport pavement. Load classification numbers are introduced which make it possible to represent the stress imposed on the pavement by a multiple-wheel landing gear in the form of an isolated single-wheel load of equivalent value. Factors affecting the stresses arising in the pavement on flight operation areas, runways, taxiways, apron and waiting positions, overrun areas, shoulders and strips, and airport roads are discussed, and the suitable type of pavement is recommended for each case. Z.W.

A71-29312 Baggage conveyor system in the New Frankfurt terminal. Karlhans Müller (Flughafen Frankfurt am Main AG, Frankfurt am Main, West Germany). *Airport Forum*, no. 1,

A71-29313

1971, p. 79-84. In English and German.

The new terminal building at Frankfurt's Rhein-Main airport is designed for a capacity of up to 30 million passengers a year, and the percentage of the transfer passengers is about 50%. An automatic luggage conveyor system to the aircraft positions is described. This system uses entirely new methods of luggage handling. Tray pallets which travel on a special wheel and belt track were used for each individual suitcase. The conveyor tracks have a total length of over 18 miles with differences in level of up to 16 ft. Z.W.

A71-29313 **A new concept: UCAT - Ultra Compact Airport Terminal.** Wendell E. Rossman. *Airport Forum*, no. 1, 1971, p. 91-102. In English and German.

The terminal described consists of a closed concourse ring as the link between externally parked aircraft and the internal ground approach. It constitutes an endless chain of segments, each consisting of the three elements: landside, link (terminal), and airside. Each segment is autonomous and as such is a model of the whole. The circular form of the passenger terminal constitutes an optimum solution. Compared to traditional systems, its economics are much more favorable due to the lesser expense of facilities and smaller land requirements. Z.W.

A71-29378 # **Low Reynolds number turbulent flow in large aspect ratio rectangular ducts.** G. S. Beavers, E. M. Sparrow, and J. R. Lloyd (Minnesota, University, Minneapolis, Minn.). American Society of Mechanical Engineers, Paper no. 71-FE-A, 1971. 4 p. 9 refs. Members, \$1.00; nonmembers, \$2.00. NSF Grant No. GK-13303.

Experiments are reported on fully developed turbulent flows at low Reynolds numbers in rectangular ducts of large aspect ratio. Six ducts, with aspect ratios between 15.5:1 and 35.0:1, were employed for the investigation, covering a Reynolds number range from 5000 to 27,000. A friction factor, Reynolds number relation expressed as $0.507 R$ to the -0.30 power was found to be an excellent representation of the experimental data when the equivalent diameter was used as the characteristic length dimension. The Blasius and Prandtl circular tube friction factor relations, generalized by use of the equivalent diameter, gave results within 5% or better of the aforementioned correlation over the Reynolds number range of this investigation. (Author)

A71-29382 **'Third Chance' flight control system.** Michael J. Burke (Grumman Aerospace Corp., Bethpage, N.Y.). *Society of Experimental Test Pilots, Technical Review*, vol. 10, no. 3, 1971, p. 3-9.

The A-6 aircraft was equipped with a backup hydraulic system. The purpose of the system was to provide a means of egress from the combat zone following loss of both hydraulic systems due to battle damage. The system was to supply as a minimum, a control capability to allow ejection in a safe zone with the possibility of a field landing capability. Flight tests were conducted utilizing the 'Third Chance' system only. Aspects of basic navigation are discussed, and the results of an investigation of the landing capability are reported. G.R.

A71-29383 **Yankee escape system.** Ralph Richardson. *Society of Experimental Test Pilots, Technical Review*, vol. 10, no. 3, 1971, p. 10-13.

The new system uses a tractor rocket which pulls rather than pushes, and, thus, solves the problem of crew escape for the low speed, low altitude conditions in which conventional ejection seats encounter formidable stability problems. Escape at higher subsonic speed is comparable to that afforded by the conventional but vastly heavier ejection seat. It is possible to lift the airman out of any seat. To maximize ease of his escape through small apertures, however, a

seat is provided with a design which permits the airman to go through an opening much smaller than possible with the conventional system. G.R.

A71-29384 **Special problems in helicopter handling qualities as influenced by ASW requirements.** J. R. Williford. *Society of Experimental Test Pilots, Technical Review*, vol. 10, no. 3, 1971, p. 31-34, 39.

The pilot is flying as much as 4 hours, sometimes more, on an antisubmarine warfare mission. On this mission he has to come to a hover at 40 feet, perhaps on complete instruments, as often as every 10 minutes. In anything other than a sea state of 2 or 3 the approach to, stability therein, and recovery from a hover at 40 feet on complete instruments is a challenge which is not yet adequately met. Substantial gains in a number of areas are needed if the use of the dipping sonar as prime sensor is to be continued. Needed improvements related to the control and use of the helicopter are discussed. G.R.

A71-29385 **Ejection seat system performance, versus aircraft performance.** Ulf Frieberg (Saab-Scania AB, Linköping, Sweden). *Society of Experimental Test Pilots, Technical Review*, vol. 10, no. 3, 1971, p. 35-39.

The trajectories of open ejection seats under various conditions from the lowest flying speed up to maximum speed are examined and desired trajectories are shown in a graph. It is pointed out that it must be possible to reach ejection seat handles without any delay. Handles mounted at the seat side are recommended. A harness for normal flying should allow the pilot to move freely forward and laterally with the go-forward released while sitting on the survival pack. Leg fixation, head fixation and protection, parachute descent and landings are discussed. G.R.

A71-29387 **The SST.** A. W. Blackburn. *Society of Experimental Test Pilots, Technical Review*, vol. 10, no. 3, 1971, p. 70-75.

Aspects of the worldwide leadership of the U.S. in providing air transport are examined. Threats to U.S. dominance in the air transport field are seen to arise because of the absence of a U.S. SST in the face of the Anglo-French Concord and the Soviet TU-144. The need for Federal funds in order to ensure that the necessary SST technology is in hand to maintain U.S. leadership in the world air transport market is discussed. G.R.

A71-29433 # **On separation control of flow along curved wall by various forms of jets or suction (Controlling characteristics and comparison of effects).** Masayosi Sato and Kenji Matsuoka (Osaka Prefecture, University, Sakai, Japan). In: Japan National Committee for Theoretical and Applied Mechanics, National Congress for Applied Mechanics, 18th, Tokyo Metropolitan University, Tokyo, Japan, November 8, 9, 1968, Proceedings. Tokyo, Chuo Kagaku-Sha, 1970, p. 155-163.

Experimental investigation of the controlling characteristics of the separation position of the two-dimensional incompressible air flow from the turbulent boundary layer along a circular-cylindrical wall by various forms of jets or suction. The results may be used to increase wing lift. It was found that there are stable, unstable, fluctuating, and uncontrollable zones, depending on the control condition. The optimum slit (or porous surface) position in which the control will be carried out most economically will not always coincide with the original separation position of the external flow. For the large attachment angle of the external flow, control by a tangential jet should be adopted; for the small attachment angle the distributed normal suction should be adopted. F.R.L.

A71-29434 # Fatigue of aircraft structures. Fumio Shima (Nihon Aeroplane Manufacturing Co., Ltd., Tokyo, Japan). In: Japan National Committee for Theoretical and Applied Mechanics, National Congress for Applied Mechanics, 18th, Tokyo Metropolitan University, Tokyo, Japan, November 8, 9, 1968, Proceedings. Tokyo, Chuo Kagaku-Sha, 1970, p. 167-176.

Investigation of several fatigue problems involved in aircraft design. Safe-life and fail-safe concepts are explained with reference to an example of a twin-engine transport fatigue test conducted in the phase of initial design. The procedures and results of determining the weak point are shown, as well as the outline of a fail-safe test conducted to acquire data concerning fail-safe of the airframe, crack propagation rate, and residual strength, etc. Some problems for future investigation are suggested. F.R.L.

A71-29448 * # On flow past a supercavitating cascade of cambered blades. C. C. Hsu (Hydronautics, Inc., Laurel, Md.). *American Society of Mechanical Engineers, Fluids Engineering Conference, Pittsburgh, Pa., May 9-12, 1971, Paper 71-FE-6.* 6 p. 14 refs. Members, \$1.00; nonmembers, \$2.00. Contract No. NAS 8-20625.

A linearized theory of supercavitating flow past a straight cascade with arbitrary blade shapes is developed. From the analysis, it is possible to determine the lift and drag coefficients, cavitation number, cavity shape, and exit flow conditions for any given specific cascade geometry, blade shape, cavity length, and initial inflow conditions. The cavitating performance of the cascade is, in general, found to depend strongly on stagger angle, solidity, blade shape, and cavity length. G.R.

A71-29450 # Some results on the heat transfer within resonant cavities at subsonic and supersonic Mach numbers. R. A. White (Illinois, University, Urbana, Ill.). *American Society of Mechanical Engineers, Fluids Engineering Conference, Pittsburgh, Pa., May 9-12, 1971, Paper 71-FE-9.* 6 p. 15 refs. Members, \$1.00; nonmembers, \$2.00. Research supported by the Aeronautical Research Institute of Sweden; NSF Grant No. GK-2053.

An experimental investigation of the heat transfer within two cavities (L/D equal to 1.25 and 2.0) exhibiting self-induced pressure oscillations (commonly referred to as resonance) is discussed. The tests were conducted with free stream Mach numbers between 0.35 and 1.5. The approaching boundary layer and shear layer over the cavities were turbulent at all times. The pattern for the heat transfer coefficient distribution over the cavity walls is in good agreement with that found by other investigators. The effect of the self-induced pressure oscillations, however, is to cause large changes in the level of the heat transfer, with low values occurring at the distinctive peaks of the pressure oscillations. The ratio of the integrated heat transfer within the cavity to the heat transfer from a flat plate with area equal to the area of the cavity opening was found to vary from 1.10 to 0.40, depending on Mach number and cavity resonance conditions. (Author)

A71-29453 # An experimental study of rectilinear jet-flap cascades. T. J. Landsberg and E. Krasnoff (Ingersoll-Rand Research, Inc., Princeton, N.J.). *American Society of Mechanical Engineers, Fluids Engineering Conference, Pittsburgh, Pa., May 9-12, 1971, Paper 71-FE-14.* 8 p. 7 refs. Members, \$1.00; nonmembers, \$2.00.

The performance of two-dimensional jet-flap cascades is determined experimentally. Stream deflection angles are presented as a function of the ratio of jet to mainstream momentum flux at chord spacing ratios of 0.375 and 0.75. Results obtained with conventional jet-flap airfoils (normal blowing near trailing edge) are in good agreement with published theoretical results. Tangential blowing jet-flap airfoils (tangential blowing over a rounded trailing edge) are shown to approximately double the turning effectiveness of the cascade. (Author)

A71-29467 # Skin friction drag and velocity profile measurement techniques in two-phase flow. M. P. Boyce (Texas A & M University, College Station, Tex.) and E. F. Blick (Oklahoma, University, Norman, Okla.). *American Society of Mechanical Engineers, Fluids Engineering Conference, Pittsburgh, Pa., May 9-12, 1971, Paper 71-FE-32.* 11 p. Members, \$1.00; nonmembers, \$2.00. Contract No. DA-31-124-ARO(D)-349.

Two-phase flow in a circular pipe and in a subsonic wind tunnel is considered. The measurement of velocity profiles of particles suspended in a gaseous media is a very significant factor in calculating the drag and boundary layers encountered in such a flow. A detailed account of the flow visualization techniques is provided. The technique utilized was specially developed for gas-solid media. It consists of two strobe lights with color filters connected to each other through a time delay relay system. Measurement techniques of skin friction drag on a flat plate in a wind tunnel, in a gas-solid environment are explained in detail. The photographic and measurement techniques used in the investigation were perfected after a long trial-and-error period. G.R.

A71-29468 # Circumferential traversing technique for intrastage analysis of axial flow compressors. M. Christianson (United Aircraft Research Laboratories, East Hartford, Conn.) and J. Yustinich (United Aircraft Corp., Pratt and Whitney Aircraft Div., East Hartford, Conn.). *American Society of Mechanical Engineers, Fluids Engineering Conference, Pittsburgh, Pa., May 9-12, 1971, Paper 71-FE-33.* 11 p. Members, \$1.00; nonmembers, \$2.00.

The capability and application of the probe traversing instrumentation currently in use at the research laboratory of a U.S. aerospace company are considered, and the data reduction techniques which incorporate methods of mass-flow-averaging are presented. Compressor facilities and the automatic data acquisition system are discussed. Typical rotor and stator blade element performance parameters calculated by the data reduction program are provided. Typical overall compressor performance, at constant speed, based on fixed instrumentation data and circumferential traverse data is presented in a graph. It is concluded that the technique reported allows the flow field to be analyzed in greater detail while reducing the data acquisition time. G.R.

A71-29469 * # High entrainment ejector design. K. E. Hickman, G. B. Gilbert (Dynatech Co., Cambridge, Mass.), and J. H. Carey (American Standard Research Laboratories, Brunswick, N.J.). *American Society of Mechanical Engineers, Fluids Engineering Conference, Pittsburgh, Pa., May 9-12, 1971, Paper 71-FE-34.* 13 p. 9 refs. Members, \$1.00; nonmembers, \$2.00. Contract No. NAS 2-4824.

The use of ejectors is of increasing interest for boundary layer control or control force augmentation in V/STOL aircraft. This paper presents a simplified analytical model which can be used to estimate the performance of high-entrainment constant-area ejectors for such applications. Analytical results are given for ejectors with primary flow pressure ratios above 5 and entrainment ratios from 10 to 40. An experimental program, employing primary flows up to 350 psia and 1200 F, was performed to confirm the analytical model. Test results are reported for a multiple-nozzle ejector with two mixing tube lengths. (Author)

A71-29483 # Visual flight simulation with high information density image storage media (Flugsichtsimulation mit Bildspeichern hoher Informationsdichte). Joachim Wernicke. Berlin, Technische Universität, Fakultät für Maschinenwesen, Dr.-Ing. Dissertation, 1969. 117 p. 72 refs. In German.

The functional principles and performance criteria of visual flight simulation devices are analyzed. The representation of terrain optical textures is considered to be a very important factor for obtaining a realistic image; it creates, however, a major problem of storing very considerable quantities of optical information. From

the point of view of information storage capacity, only two storage principles for general use in the terrain flight simulation are found to be worth considering - i.e., high-resolution photographic plates, and digital memories. A method is described that uses current technology to generate perspective views of a hilly terrain. The method is based on improvements of the television raster shape visual simulation principle. For information storage, a pair of photographic plates (brightness, elevation) is used. A study of digital methods for visual simulation of textured flight scenes reveals the negative result in that both the storage capacity and computing cycles of electronic digital computers will not be sufficient for this purpose in the near future.

A71-29524 # Experimental aeromechanics (Eksperimental'naiia aeromekhanika). S. M. Gorlin. Moscow, Izdatel'stvo Vysshaia Shkola, 1970. 424 p. 19 refs. In Russian.

Explanation of the physical fundamentals, experimental methods, and significance of the results of aerodynamic research. Various types of wind tunnels and shock tubes are described for tests of subsonic, supersonic, and hypersonic velocities. The physical properties of liquids and gases are defined, together with laws governing the behavior of gas flows and the use of similarity criteria. Procedures and equipment for measuring flow parameters are outlined, including methods of introducing necessary corrections into the experimental data. Emphasis is on test methods for determining the aerodynamic characteristics of aircraft, rockets, various types of bluff bodies, surface transport vehicles, and ground-based structures. Flow in tubes, nozzles, and diffusers is also studied.

A71-29525 # Electrical power supply systems of airplanes and helicopters (Sistemy elektrosnabzheniia samoletov i vertoletov). I. I. Lukin and V. V. Liubimov. Moscow, Izdatel'stvo Transport, 1970. 360 p. 12 refs. In Russian.

The theory and practice of electrical power supply systems on aircraft are given in a systematic text intended for use in technical educational courses. Equipment considered includes storage batteries, dc generators, alternators, voltage regulators, current and frequency control systems, overload protection systems, converters, and power transmission and distribution systems. Principles of operation, structural features, circuit diagrams, design procedures, and operational specifications are included. The design procedures are illustrated by examples of electrical and thermal constraints; typical failure modes are demonstrated and various protective devices are explained.

T.M.

A71-29529 # Aircraft materials science and treatment of materials (Aviatsionnoe materialovedenie i obrabotka materialov). D. A. Ryzhinskii and V. N. Romanchuk. Moscow, Izdatel'stvo Mashinostroenie, 1970. 328 p. 17 refs. In Russian.

The fundamentals of steel and cast iron processing are presented, together with the principles of metallography, heat treatment, and thermochemical treatments. The properties of the most important materials used in aircraft structures are examined. Methods used for surface protection of metals and alloys against corrosion are described. The foundry technology and working of metals by extrusion, machining, and welding are described. The requirements concerning the tolerances, fitting, and measurements of machine elements in the aircraft industry are presented. The properties and testing of nonmetallic materials are examined, including paints, resins, plastics, glues, and sound- and electric-insulators.

Z.W.

A71-29530 # Aircraft technician's handbook of electrical equipment (Spravochnik aviatsionnogo tekhnika po elektrooborudovaniiu). V. F. Bliuger and V. G. Breslavets. Moscow, Izdatel'stvo Transport, 1970. 308 p. In Russian.

Structural details, circuit diagrams, and operational specifications of various aircraft electrical devices are given in a form intended for use in maintenance and overhaul operations. Direct current generators, alternators, starter generators, turbine-powered generators, starter motors, and battery systems are examined, and proper maintenance intervals, diagnostic clues, lubrication materials, and electrolyte requirements are described. Various types of cables, wires, insulations, electrical harness configurations, terminals, couplings, and connectors are outlined, and special attention is given to mechanical and electrical countermeasures against electromagnetic interference.

T.M.

A71-29548 # The role of aircraft in the intraurban transportation system for the Detroit metropolitan area. L. A. Riedinger and E. G. Stout (Lockheed-California Co., Burbank, Calif.). *American Institute of Aeronautics and Astronautics, International City Management Association, National League of Cities, and U.S. Conference of Mayors, Urban Technology Conference, New York, N.Y., May 24-26, 1971, AIAA Paper 71-504.* 9 p. Members, \$1.50; nonmembers, \$2.00.

Study of aircraft capabilities in intraurban transportation system in terms of selection and evaluation of aircraft concepts, using the Detroit metropolitan area as a specific example and computer models adaptable to any intraurban or interurban area. Vehicle design, fleet size, cost, terminal location, fares, and frequency are thoroughly considered and optimized on the basis of a realistic market scenario. The propeller-powered deflected-slipstream STOL is the preferred concept, the nearest competitors being the compound helicopter VTOL and the autogyro STOL. All vehicle concepts considered are believed to involve low technical risk in their respective time periods. Current technology is sufficient for the development of the intraurban transport system for the 1975 time period.

M.V.E.

A71-29549 # VTOL in the urban context. M. W. Hellyar (United Aircraft Corp., Sikorsky Aircraft Div., Stratford, Conn.). *American Institute of Aeronautics and Astronautics, International City Management Association, National League of Cities, and U.S. Conference of Mayors, Urban Technology Conference, New York, N.Y., May 24-26, 1971, AIAA Paper 71-507.* 7 p. Members, \$1.50; nonmembers, \$2.00.

Discussion of the merits of helicopter systems operation in, around, and between major metropolitan areas. The performance of New York Airways' metropolitan helicopter service in 1970 without subsidy of any kind indicates that mature management and reliable equipment make profitable operation possible. Larger and more economical helicopters are now emerging from experience with big, high-speed military transport aircraft. These helicopter technology advances make VTOL transportation economically competitive with alternative modes in terms of both cost and time. The helicopter's environmental advantages are also briefly reviewed.

M.V.E.

A71-29550 # STOL - An asset for Manhattan. R. K. Ransone (American Airlines, Inc., New York, N.Y.). *American Institute of Aeronautics and Astronautics, International City Management Association, National League of Cities, and U.S. Conference of Mayors, Urban Technology Conference, New York, N.Y., May 24-26, 1971, AIAA Paper 71-508.* 7 p. Members, \$1.50; nonmembers, \$2.00.

The merits of an integrated short-haul transportation system are considered between centers of industry and commerce 100 to 300 miles apart in a makeup consisting of conventional jet aircraft, STOL aircraft, and high-speed ground transportation. It is felt that the STOL portion of this system can be designed from the outset to operate conveniently, reliably, and economically in congested urban and suburban areas without degrading neighborhoods in terms of noise, air pollution, safety, or ground congestion.

M.V.E.

A71-29551 # Operations research analysis of aircraft noise abatement. Edward B. Ahlers (IIT Research Institute, Chicago, Ill.). *American Institute of Aeronautics and Astronautics, International City Management Association, National League of Cities, and U.S. Conference of Mayors, Urban Technology Conference, New York, N.Y., May 24-26, 1971, AIAA Paper 71-525.* 8 p. Members, \$1.50; nonmembers, \$2.00. Research sponsored by the Air Transport Association of America and the Aerospace Industries of America.

Methods are developed for computing relative costs of various combinations of countermeasures for reducing community noise exposures to various levels in a national system of airport communities by extrapolation from a statistically significant sample of airports. The procedures can be used to seek the minimum-cost of alternate near-minimum cost combinations of countermeasures. Measures for estimating the probable error of problem solutions are incorporated in the formulation. Printed output includes: total costs for reducing noise exposures to various levels and costs associated with engine modifications, airframe modification, operation changes, increments in direct operating costs, and land-use changes. M.V.E.

A71-29578 # Supersonic combustion research techniques in a hypersonic shock tunnel. Raymond John Parsons. Sheffield, University, Doctor of Philosophy Dissertation, 1969. 267 p. 91 refs. Research supported by the Ministry of Technology; Grant No. AF EOAR 67-5.

The use of a hypersonic shock tunnel in the simulation of combustor conditions at flight Mach numbers in excess of 10 is examined, with special reference to instrumentation techniques. The technique of using combustion heated helium as driver gas was shown to correctly simulate combustor conditions from Mach 10 to Mach 16. The starting transients in supersonic ducts were examined to establish criteria for minimizing the starting time and overpressure. These were achieved by evacuating the duct to between 1/10th and 1/30th torr of the running static pressure. The electromagnetic induction method for measuring gas velocity proved to be a novel and acceptable instrumentation technique. Z.W.

A71-29610 # Plane jet of a conducting fluid in a slipstream (Ploskaia struia provodiashchei zhidkosti v sputnom potoke). M. Z. Zhivov and Iu. A. Sokovishin. *Magnitnaia Gidrodinamika*, vol. 7, Jan.-Mar. 1971, p. 49-52. 5 refs. In Russian.

Partial differential equations are derived to describe the expansion of a plane jet of incompressible conducting fluid in a homogeneous slipstream of this fluid. An implicit difference scheme is used for solving these equations in a nonconduction approximation. The results are compared with an approximate asymptotic solution, showing that there is only an insignificant relation between the initial jet profile and the asymptotic drag which acts on the jet during expansion in the same fluid. V.Z.

A71-29633 Materials '71; Society of Aerospace Material and Process Engineers, National Symposium and Exhibit, 16th, Anaheim, Calif., April 21-23, 1971, Proceedings. Anaheim, Calif., Society of Aerospace Material and Process Engineers (Science of Advanced Materials and Process Engineering Series. Volume 16), 1971. 435 p. \$28.50.

Experimental and theoretical studies of the high-temperature oxidation and ablation of superalloys and composites, and advanced processing, testing, and cost evaluation of nonmetallic materials and composites. The development of silane coupling agents for urethane adhesives is described, together with fabrication of hybrid boron-graphite filament composites, three-dimensionally reinforced felt composites, and advanced plastic composites. A description is presented of rain erosion resistant radomes for supersonic aircraft, protective coatings for supersonic flight which are resistant up to 3000 F, and corrosion protection for solid rocket propulsion systems.

A71-29635 Evaluation of coated alloys for turbine components of advanced gas turbine engines. Norman M. Geyer (USAF, Materials Laboratory, Wright-Patterson AFB, Ohio) and Kenneth H. Ryan (General Motors Corp., Allison Div., Indianapolis, Ind.). In: *Materials '71; Society of Aerospace Material and Process Engineers, National Symposium and Exhibit, 16th, Anaheim, Calif., April 21-23, 1971, Proceedings.* Anaheim, Calif., Society of Aerospace Material and Process Engineers (Science of Advanced Materials and Process Engineering Series. Volume 16), 1971, p. 11-29.

A program to evaluate the effects of newly developed coatings on modern superalloys is being conducted by Detroit Diesel Allison Division for the Air Force Materials Laboratories. Hollow thin wall test specimens are employed so results can be related to air cooled turbine components. Phase I testing established correlation of laboratory testing with turbine engine and flight service test results. In Phase II a baseline of performance is established on current commercial coatings for comparison with advanced development coating systems being tested in Phase III. Evaluation includes room and elevated temperature tensile, stress rupture, hot corrosion, oxidation-erosion, ballistic impact, thermal fatigue and high cycle fatigue tests. Test results demonstrate the importance of using thin wall specimens to evaluate the effects of coating systems and thermal environments on alloy properties. (Author)

A71-29642 Aerospace materials selection and verification of structural designs developed by means of high velocity impact testing. John W. Noonan (National Aeronautical Establishment, Ottawa, Canada). In: *Materials '71; Society of Aerospace Material and Process Engineers, National Symposium and Exhibit, 16th, Anaheim, Calif., April 21-23, 1971, Proceedings.* Anaheim, Calif., Society of Aerospace Material and Process Engineers (Science of Advanced Materials and Process Engineering Series. Volume 16), 1971, p. 97-108. 8 refs.

Latest generation of large transport aircraft and high subsonic speed, low-level mission, military aircraft have high susceptibility to catastrophic bird impact damage. New materials and processes under development to cope with this hazard require extensive impact testing for verification of design. Current analysis techniques and standardized test equipment are inadequate for predicting impact strength of windshields and tail surface structures. A pneumatically powered bird gun has been developed at the National Aeronautical Establishment, Ottawa, Canada capable of simulating bird strikes at velocities up to 600 to 700 MPH using birds of 4 and 8 pounds body weight. Velocity prediction and aiming accuracy are considered to be of an unusually high order; unique packaging maintains bird intact up to the target. The gun, types of birds used and instrumentation are described and operational experience is related. (Author)

A71-29645 Rain erosion resistant radomes for supersonic aircraft. Glenn Wintermute (Goodyear Aerospace Corp., Litchfield Park, Ariz.). In: *Materials '71; Society of Aerospace Material and Process Engineers, National Symposium and Exhibit, 16th, Anaheim, Calif., April 21-23, 1971, Proceedings.* Anaheim, Calif., Society of Aerospace Material and Process Engineers (Science of Advanced Materials and Process Engineering Series. Volume 16), 1971, p. 138-161. Contract No. AF 33(615)-67-C-1349.

Materials and processing methods for forming rain erosion resistant ceramic coated plastic structures were studied and evaluated. Manufacturing techniques were developed and optimized for producing fiberglass reinforced polyimide radomes with a thin alumina protective coating. Several prototype radomes were fabricated and were tested by means of a rocket sled at Mach 3 through a simulated rainfield. The radomes successfully passed the test. (Author)

A71-29646 Protective coatings for a hypersonic flight load-bearing refractory alloy control surface. Robert H. Witt (Grumman Aerospace Corp., Bethpage, N.Y.). In: *Materials '71;*

Society of Aerospace Material and Process Engineers, National Symposium and Exhibit, 16th, Anaheim, Calif., April 21-23, 1971, Proceedings.

Anaheim, Calif., Society of Aerospace Material and Process Engineers (Science of Advanced Materials and Process Engineering Series. Volume 16), 1971, p. 162-175K.

A materials effort was made in support of the design, fabrication, and testing of a full-scale control surface (elevator) test article. This paper concerns itself with two primary areas of the total effort, namely oxidation screening tests for coating selection at ambient and reduced pressures and hardware evaluations. It was found that R512C slurry silicide coating on Ta-10W substrate provides a system that has excellent protective and self-healing qualities up to 3000 F. This coating retains usefulness even after short overshoot exposures to temperatures near 3200 F. Final proof of the usefulness of the approach was demonstrated by cycling a full-scale elevator under extreme conditions with severe thermal shock prevailing in each run. Recommendations are included for future work along these lines.

A71-29656 **Advanced composite cost comparison.** D. D. Dial and M. S. Howeth (General Dynamics Corp., Convair Aerospace Div., Fort Worth, Tex.). In: Materials '71; Society of Aerospace Material and Process Engineers, National Symposium and Exhibit, 16th, Anaheim, Calif., April 21-23, 1971, Proceedings.

Anaheim, Calif., Society of Aerospace Material and Process Engineers (Science of Advanced Materials and Process Engineering Series. Volume 16), 1971, p. 302-314.

Relative cost comparisons of advanced composite applications with conventional material components are presented. Specific detailed comparison studies are described for several components selected from a supersonic fighter-bomber. These comparisons include material and labor required to fabricate the wing trailing edge panel, wing pivot fitting doubler, and wing pivot fairings. The wing trailing edge components were manufactured on a research and development basis and did not prove to be cost-competitive. The other two components were produced with either boron-epoxy or graphite epoxy materials and are currently in production. Both of these applications are shown to be cost-competitive with other approaches using conventional materials.

A71-29749 **Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.** Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 453 p.

The topics deal with knowledge of the atmosphere based on scientific observation, stressing thunderstorms and clear air turbulence, considering then the nature and physics of the environmental wind field (including turbulence) from the theoretical point of view. Attention is given to operational aspects and experience, aircraft control and load alleviation, human factors, and structural loads and design.

F.R.L.

A71-29750 * # **Atmospheric turbulence and the air transportation system.** Philip Donely (NASA, Langley Research Center, Hampton, Va.). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings. Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 14 p.

In regard to extreme rough air, the aim must be to increase the chances of survival of the aircraft. In the case of moderate turbulence, the aim is to provide the pilot with control and structural capability for safe operation on a day-to-day routine basis. Operational data on gust accelerations for turbine-powered aircraft are

considered. Approaches involving the avoidance of turbulence are discussed giving attention to the detection system and to forecasting services required. The importance of pilot training, equipment, and pilot stress in mastering difficult situations is emphasized, and ways to reduce or alleviate deficiencies in these areas are investigated. The advisability of increasing structural design criteria for either static strength or fatigue is discussed.

A71-29751 # **An assessment of atmospheric turbulence data for aeronautical applications.** Jan N. Garrison (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, Ohio). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 18 p. 35 refs.

Turbulence models currently used for aircraft design attempt to answer questions regarding the probability for the aircraft to encounter a gust input of any given magnitude, and the power spectral density of the gust input. The Low-Low Altitude Critical Atmospheric Turbulence Project is discussed. The data obtained in this project confirmed that lateral gusts are somewhat more severe than vertical gusts at very low altitudes. Turbulence in the free atmosphere is considered, and general conclusions regarding CAT activity are drawn. Aspects of turbulence in and around thunderstorms are examined.

G.R.

A71-29752 # **Comparison of thunderstorms over Oklahoma and Malaysia based on aircraft measurements.** J. T. Lee (NOAA, National Severe Storms Laboratory, Boulder, Colo.) and A. McPherson (Royal Aircraft Establishment, Bedford, England). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 12 p.

A Canberra WH793 and the RB57F, a USAF weather reconnaissance aircraft, were used in the thunderstorm investigations. The results obtained for Oklahoma and for Malaysia were similar except for the longer duration of turbulence patches over Oklahoma. This difference corresponds to the differing echo patterns in the two areas. It appears that the energy of larger Malaysian thunderstorms is less than that of the larger Oklahoma thunderstorms, since the former evidences less overall vertical development, smaller top diameter, and, from analysis of soundings, less energy appears to be available for it.

A71-29753 # **Flight studies of clear air turbulence - The current position and further research needs.** G. K. Mather (National Aeronautical Establishment, Ottawa, Canada). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 12 p. 7 refs.

A highly instrumented T-33 was used in the studies. Aircraft instrumentation was designed to measure the three orthogonal components of turbulence along the major aircraft axes and the fluctuating static temperatures. The mean horizontal wind and temperature fields could also be determined. The turbulence energy budget is discussed and the flight data are analyzed. It is pointed out that two aspects of the results reported may be applicable to the problem areas of CAT forecasting and airline operations.

A71-29755 # Measurements of stratospheric airflow and clear air turbulence, up to 63000 ft, over and downwind of mountainous terrain. J. M. Nicholls (Meteorological Office, London, England). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 12 p. 15 refs.

Two series of flights have been made over the Western USA. Important features of the flow patterns obtained on 4 days during the project are described. The results obtained indicate that clear air turbulence is associated with two distinct features of vertical cross sections of air flow over and downwind of mountains, namely large isentropic oscillations in the flow, and negative wind shear zones which were disturbed by orographically induced waves. The largest stratospheric oscillations in the flow patterns, in which turbulence was frequently found, were usually located almost over the mountain.

G.R.

A71-29756 # Measurement of extreme mechanical turbulence during low level flights by Mirage A3-76. C. K. Rider, M. R. Thomson, and F. E. Verinder (Department of Supply, Aeronautical Research Laboratories, Melbourne, Australia). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 8 p.

On Sept. 11, 1969, an instrumented Mirage fighter-aircraft carried out three flights in an area of severe low level turbulence. Acceleration maxima of +3.5 g, -1.5 g were recorded. True gust velocities have been computed for 5400 sec of recorded data. Results presented apply to conditions experienced for more than five hours on the one day. All records were obtained on the same track, about 100 miles long at pressure-height levels between 2900 and 4200 f.

A71-29763 # Partially trapped waves. F. H. Berkshire and F. W. G. Warren (Imperial College of Science and Technology, London, England). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 8 p. 9-refs.

Consideration of atmospheric models which contain an upper layer above the tropopause in which the Scorer parameter (which depends on the undisturbed atmospheric parameters) becomes large. Waves which would be trapped in the troposphere by a neutral stratosphere are thus able to pass through the tropopause and propagate into the higher regions of the atmosphere.

F.R.L.

A71-29764 # Operational forecasting and analysis of turbulence. W. Boynton Beckwith (United Air Lines, Inc., Chicago, Ill.). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 13 p. 11 refs.

Consideration of turbulence as it affects transport aircraft, using the Fairchild or Lockheed accelerometer records as an indication that is quite consistent with the subjective evaluation assigned to an event by an experienced airline pilot. Moderate turbulence is defined as that which a transport aircraft registers on its recorder as an excursion from the 1.0g reference of plus or minus 0.50 to 0.75g. Severe turbulence is equivalent to an excursion of plus or minus 1.0g

or more. The records cited are considered to be invaluable in obtaining a better understanding of the mesoscale structure of turbulence and its effect on airspeed, altitude and, indirectly, pilot reaction. Attention is given to thunderstorm turbulence, CAT and weather-induced turbulence, the forecasting of mountain waves, low level wind shears, and detection equipment.

F.R.L.

A71-29765 # Development of airborne remote clear air turbulence (CAT) detection equipment. Andrew S. Carten, Jr. and Wilbur H. Paulsen (USAF, Cambridge Research Laboratories, Bedford, Mass.). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 10 p. 16 refs.

Investigation of methods for detecting CAT ahead of an aircraft with the intent to achieve an operationally useful system. Major attention is given to laser and infrared techniques. It is pointed out that the pulsed Doppler laser is expensive and cumbersome, while the relatively inexpensive infrared systems are on the verge of practical use.

F.R.L.

A71-29767 # Stratospheric turbulence and temperature change measurements from the Coldscan program. J. I. MacPherson (National Aeronautical Establishment, Ottawa, Canada) and E. G. Morrissey (Department of Mines and Technical Surveys, Meteorological Service, Ottawa, Canada). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 11 p. 8 refs.

Project Coldscan has been expanded to include the relationship of the nature and severity of the recorded phenomena to meteorological conditions and the underlying terrain. Eighty-three Coldscan flights to date have shown that moderate stratospheric turbulence occurred about 0.5% of the time above 40,000 ft and tended to be concentrated over mountains. More frequent, and perhaps more important to the SSTs, are the encounters with temperature waves and horizontal temperature gradients exceeding 2.5 C in β n mi. These averaged 0.8 encounters per 1000 n mi tended to show a peak in their distribution at 60,000 ft, and were associated with turbulence of at least moderate intensity only 1/6 of the time. Although the largest temperature changes have been encountered only over mountains to date, a considerable number of temperature changes with gradients up to this level have been measured on the SST routes off the east coast of North America.

M.M.

A71-29768 # Air turbulence - Hidden and revealed. M. N. Morss (British Air Line Pilots' Association, Hayes, Middx., England). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 6 p.

Discussion of primary and secondary effects of air turbulence and of criteria for avoiding it. It is pointed out that air turbulence might be better avoided by action in the following areas: (1) observation and forecasting over smaller scale sections of airspace; (2) detection of even moderate or light turbulence; (3) direct communications and more effective involvement of ATC personnel in the handling of data; and (4) provision of ATC techniques and equipment which recognize turbulent and turbulence-prone areas as nonvalid airspace. It is noted that the effects can also be minimized by a reexamination of aircraft design characteristics and automatic flight control modes.

M.M.

A71-29770 # Lessons to be learned from accidents attributed to turbulence. Alan I. Brunstein (National Transportation Safety Board, Bureau of Aviation Safety, Washington, D.C.). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 12 p.

Analysis of air carrier accidents caused by air turbulence from 1964 to 1969 in the total number of 441 accidents, including 97 involving turbulence. The main lessons learned from turbulence-involved accidents are: (1) turbulence is one of the major in-flight weather problems; (2) airborne weather radar is an excellent thunderstorm-avoidance tool; (3) airborne weather radar must be maintained and operated properly; (4) training should be formalized in the use and interpretation of airborne weather radar; (5) recurrent airborne weather radar training is desirable; (6) CAT forecasts need considerable improvement; (7) CAT detection systems, airborne and ground-based, are needed; and (8) real-time weather data are needed on the ground, and most certainly in the cockpit. M.M.

A71-29771 # Turbulence experience recorded by CAADRP. J. R. Sturgeon (Royal Aircraft Establishment, Farnborough, Hants., England). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 10 p. 8 refs.

Discussion of the characteristics of flight in severe turbulence, encountered during 23,000 flying hours, from an analysis of analog trace records of 65,000 hr of operational civil flying including airspeed, normal acceleration, height, air temperature, control surface and flight attitude parameters. Attention is drawn to variations in rate of climb of up to 8000 ft/min, maneuver accelerations of up to 0.7 g and rapid control surface movements recorded during automatic and manual flight in severe atmospheric disturbances. The possibilities of reducing structural loads by improved aircraft system design, maintenance and operational practices, are considered, and an example of variation in the performance of nominally identical aircraft is given. M.M.

A71-29772 * # Control considerations in severe turbulence. A. Gerald Rainey, William D. Grantham, and William P. Gilbert (NASA, Langley Research Center, Hampton, Va.). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 16 p. 20 refs.

The intensive studies which seem to have solved the 'jet upset crisis' of the early 1960s are briefly reviewed. Some recent information adding to the primarily longitudinal results obtained previously, concerning the possible influence of lateral-directional characteristics, particularly an unstable spiral mode, is described. The need for a rational, quantitative method of estimating optimum turbulence penetration conditions and the results of initial attempts to provide such information is presented. The basic transonic aerodynamic characteristics of advanced transport aircraft have been reviewed and, although no immediate controllability problems are obvious, it is suggested that the characteristics of such transports in severe turbulence will need to be examined carefully prior to fleet operations. (Author)

A71-29773 # Development of an approach and landing system with special reference to the effects of turbulence. R. M. P. McManus (Hawker Siddeley Aviation, Ltd., Hatfield, Herts., England). In: Royal Aeronautical Society, International Conference

on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 9 p.

Some investigation results are discussed about an automatic aircraft landing system's inadequate responses to air turbulence effects the system was supposed to neutralize. It was found that the largest disturbing input to the aircraft was turbulence. With hind sight it was determined that by modification of the original system it was possible to improve the response to turbulence. Buildings near airfields affecting the airflow in threshold areas probably cause the most significant gusts. M.V.E.

A71-29774 * # Analysis of subjective ratings for the XB-70 airplane response to atmospheric turbulence and controlled inputs. Ronald J. Wilson and L. J. Ehernberger (NASA, Flight Research Center, Edwards, Calif.). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 11 p. 14 refs.

Description of the XB-70 crew's subjective evaluation of the aircraft's response in comparison with measured accelerations. The turbulence response of the crew station and other fuselage locations is evaluated, and the crew's reaction to controlled sinusoidal excitations of the airframe during flight is examined. Results show that the pilot subjective ratings of turbulence intensity in comparison to the accelerations measured at the pilot's station and the center of gravity caused some overlap of acceleration range. For a given acceleration range, 0.15 to 0.25g, the turbulence could have been rated from light to severe. The pilot ratings were also more severe for a given acceleration range than had been recommended by previous reporting criteria. M.M.

A71-29775 # Gust effects on V/STOL aircraft. Grant B. Skelton (Honeywell, Inc., Minneapolis, Minn.). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 15 p.

Description of a mathematical gust model suitable for analyses of flight in the lowest 100 meters of the atmosphere. The model is useful for takeoffs and landings of all aircraft and for significant portions of typical V/STOL flight profiles. The model consists of eight gusts generated by eight white noise sources, eight filters, and three delay lines. It is based upon good mean wind profile data, spotty gust spectral data, and very sparse probability data. The model was grossly simplified in order to be convenient for aircraft gust response analyses without having to pay a severe approximation price. Hybrid simulation flights of the Ryan XV-5 V/STOL in turbulence showed that the wing-to-tail transport delay and the spanwise shear of head-on and vertical gusts were important and had to be retained in the gust model. The simulation tests also showed that the XV-5 flew nonlinearly at low airspeeds. M.M.

A71-29776 * # Control of V/STOL aircraft in turbulence. Robert L. Swaim (Purdue University, West Lafayette, Ind.). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 12 p. 18 refs. Grant No. NGR-15-005-069.

Description of the nature of flight path control (guidance and maneuvering) problem and the attitude control (stability augmentation) problem for V/STOL aircraft. An analytical approach and

design methodology, based on the state variable methods of modern control theory, and which structures the stability augmentation system required for satisfactory handling qualities, while simultaneously yielding minimum required values of stabilization control power, is described. The process uses power spectral density descriptions of the homogeneous turbulence environment. Additional stabilization control power is frequently required to counter the effects of heterogeneous or discrete turbulence typified by wind shears and vortex patterns generated by obstacles such as trees, hills, and buildings. Such turbulence is nonstatistical in nature and generates nonlinear input disturbances to an aircraft which are best analyzed by a momentum transfer approach. M.M.

A71-29777 # Some effects of designing for increased safety in turbulence. M. W. Salisbury (British Aircraft Corp., Ltd., London, England). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings. Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 12 p.

The development of cruise altitude limitations to provide adequate buffet margins in turbulence is reviewed, and the problems facing the aircraft designer in establishing and improving the allowable operating altitudes are discussed. The effect of lags in flow separations due to the rapid change of incidence in a gust is illustrated by a read-out from a gust encounter. Finally it is shown that an autopilot mode designed for use in turbulence can reduce the pitch and 'g' excursions as well as improve the structural fatigue life. (Author)

A71-29779 * # Simulation techniques used in investigating aircraft accidents. Richard S. Bray and Seth B. Anderson (NASA, Ames Research Center, Moffett Field, Calif.). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 10 p.

The use of simulation techniques is discussed, first for the general case of a typical turbulence 'upset' to show how simulation techniques can be used to uncover possible reasons for the upset. Next, the techniques are applied to two specific accidents to show the degree of simulator sophistication needed to match the accident conditions properly. Finally, several important factors are discussed that should be considered in using simulation techniques for accident investigations. O.H.

A71-29782 # Commercial aircraft flying in turbulence - Some considerations. Scott Flower (Pan American World Airways, Inc., New York, N.Y.). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings. Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 9 p.

Factors that affect the pilot's ability to fly in turbulence - i.e., aircraft characteristics, instrumentation, procedures, pilot training, and kinesthetic cues - are discussed. They are confronted with the capabilities of the B747 aircraft and the efficiency of other tools provided by the airline industry to their pilots for successful flight in turbulence. O.H.

A71-29784 # Gust loads for structural design. J. Taylor (Royal Aircraft Establishment, Farnborough, Hants., England). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 16 p. 9 refs.

An examination is made of the gust loads encountered by aircraft on research flights taking a large number of time intervals of about 1 minute. A simple means of describing the intensity of the turbulence and the number of gusts per kilometer is devised. The procedure is used to examine records from a few tens of thousand flying hours and to define the loads to be expected on different aircraft. The method allows an examination to be made of selected short traverses of turbulence either in research or operational flying and to appraise their intensity relative to average conditions. A combination of the data from research and operational flying can be made to give information that can be used to define design requirements. (Author)

A71-29785 # Some results on gust alleviation. Gabriel Coupry (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings. Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 12 p. 6 refs.

A method is described which provides gust alleviation without any change to the flight mechanics of the aircraft. In this method, the aircraft movement is corrected, assuming that the turbulent field is known. Turbulence is measured, in real time, aboard the aircraft with the aid of data supplied by vanes, gyrometers, and accelerometers. Orders to the controls are determined as a linear functional law of turbulence. The functional law is determined using Wiener's mathematical approach, in the case of a turbulent field characterized by a rational power spectrum. For actual power spectra which are no longer rational, an expansion in Laguerre functions is added to Wiener's solution. The validity of the theory was checked on an analog computer which was excited by actual records of in-flight measured turbulence. Some flight tests that have been performed are discussed. O.H.

A71-29786 # Design for lateral gusts. H. P. Y. Hitch (British Aircraft Corp., Ltd., Weybridge, Surrey, England). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 8 p.

The dynamic response of aircraft with a T-tail configuration to lateral gusts is examined. It is shown that the conventional antisymmetric analysis is inappropriate and an analysis involving both antisymmetric and symmetric motion is needed. Values obtained by the current isolated gust procedure and those obtained by the proposed design envelope procedure are presented and compared. O.H.

A71-29787 # The effects of atmospheric turbulence on handling qualities and structural loads. William H. Austin, Jr. (USAF, Aeronautical Systems Div., Wright-Patterson AFB, Ohio). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 11 p. 5 refs.

Traditionally, handling qualities and structural loads have been regarded as independent aeronautical engineering disciplines when, in fact, they are very closely interrelated, particularly when atmospheric

ic turbulence is considered. It is shown that lack of consideration of the two disciplines together can lead to unfortunate results. Use of a high authority stability augmentation system can yield results that will improve handling qualities and reduce structural loads, though similar results could be attained by careful attention to inherent stability, particularly Dutch roll damping. Recognition of the basic interaction of handling qualities and structural loads by engineering management is of utmost importance, and constant vigilance is required to insure that adequate consideration is given to the interactions during design of an aircraft. (Author)

A71-29788 # The analysis of normal accelerations experienced by fleets of transport aircraft. N. I. Bullen (Royal Aircraft Establishment, Farnborough, Hants., England). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 11 p. 6 refs.

An analysis of fatigue load meter records from a fleet of transport aircraft is made to examine the variation in the occurrence of loads and to determine whether differences between aircraft are significant. It is shown how the knowledge so gained can be applied to determine appropriate factors to allow for times when the fatigue load meter is inoperative. Seasonal variations of counting rates are discussed. (Author)

A71-29789 # An analysis of gust velocities for application to aircraft design. F. K. Atnip and J. Gault (Boeing Co., Seattle, Wash.). In: Royal Aeronautical Society, International Conference on Atmospheric Turbulence, London, England, May 18-21, 1971, Proceedings.

Conference co-sponsored by the American Institute of Aeronautics and Astronautics and the Canadian Aeronautics and Space Institute. London, Royal Aeronautical Society, 1971. 11 p. 14 refs.

Factors necessary to establish appropriate gust criteria for the design and for monitoring the fatigue life of aircraft are examined. They include: frequency distributions of gust velocities in patches of turbulence; frequency distributions of the rms values of gust velocities for the patches; and the form of gust velocity power spectral densities and frequency distributions of associated integral scale lengths. Effects of aircraft speed on turbulence statistics are also examined. O.H.

A71-29811 Trends in the development of aeronautical turbojet engines (Tendenze nello sviluppo dei turbogetti aeronautici). Salvatore Caggiani. *Rivista Aeronautica*, vol. 47, Apr. 1971, p. 643-664. 11 refs. In Italian.

Survey of the current state of development of subsonic and supersonic turbojet engines. The engines considered are built by Pratt and Whitney, GE, and Rolls-Royce. Engines manufactured by smaller companies are also reviewed. The particular aspects considered are general engine architecture, dependable operation and reliability, specific weight and specific consumption. It is pointed out that all the innovations and refinements made to turbojet engines, besides requiring lengthy tests, necessitate expensive investments and a selection of materials which are ever more difficult to produce and purchase. M.M.

A71-29819 A comparison of the performance of three model axial flow turbines tested under both steady and pulse flow conditions. H. Daneshyar, J. H. Horlock (Cambridge University, Cambridge, England), K. J. Edwards (D. Napier and Son, Ltd., Liverpool, England), M. S. Janota (Queen Mary College, London, England), R. D. Pearson (Bath University of Technology, Bath,

England), and R. Shaw (Liverpool, University, Liverpool, England). *Institution of Mechanical Engineers, Proceedings*, vol. 184, pt. 1, no. 61, 1969-1970, p. 1119-1131; Communications, p. 1132; Author's Reply, p. 1133. 10 refs.

Specifications are given and test performance analysis is made to determine the suitability of these turbine designs for turbocharger application. Test results are given in a form allowing the turbine efficiencies to be plotted vs mean dimensionless blade speed irrespective of the pulsation level. The test data displays can be directly used for design purposes and in matching calculations, permitting the assessment of the efficiency penalty due to pulse flow, of the effect of pulse flow on turbine size selection, and of the preferred degree of reaction under pulse flow. Further tests under modified pulse conditions with a significant windage period are suggested. V.Z.

A71-29826 Testing of lubricants for the Olympus 593. T. F. Blenkiron (Rolls-Royce, Ltd., Bristol Engine Div., Bristol, England). (*Symposium on Lubricant Test Devices and Their Relation to Service Conditions, Paisley College of Technology, Paisley, Scotland, Sept. 7-11, 1970.*) *Wear*, vol. 17, May-June 1971, p. 367-379. Research supported by the Ministry of Technology.

Discussion of new types of lubricant and new methods of evaluating lubricants for the Olympus 593 supersonic engine. The main requirements for a lubricant for the Concorde engines are defined in terms of bulk thermal stability, resistance to breakdown in a hot bearing, oil mist coking, and gear load carrying. The rigs used to evaluate these various properties are described, and some of the reasons for the choice of these particular rigs are given. Problems which may arise on mainshaft bearings are split into two groups, fatigue at high load, and wear due to skidding at low load. The test rigs and methods used to explore these phenomena are described. It is noted that fatigue is relatively well understood but skidding at low loads is a much more complex matter. Minor lubricant problems have arisen on early standards of engine but these have now been overcome and performance of the oils is satisfactory. It is concluded that oil evaluation methods are successfully screening out unsatisfactory oils. M.M.

A71-29833 # Measurements of static strains on titanium under rapid heating. T. E. H. Lemon (British Aircraft Corp., Ltd., Guided Weapons Div., Bristol, England). *Strain*, vol. 7, Apr. 1971, p. 66-73. 7 refs. Research sponsored by the Ministry of Technology.

Resistance changes with temperature were measured for various types of strain gauges on a titanium specimen subjected to different conductive heating rates. The tests were conducted for the purpose of developing a practical strain measuring system for a triangular titanium wing heated to 520 deg C at a maximum rate of 40 deg C per sec. The results show that the Microdot SG 420 strain gauge was the only sensor suitable for this application. Gauge preparation and connection procedures are outlined. T.M.

A71-29860 Thrust measurement of great accuracy of aircraft propulsion systems giving particular attention to a hydraulic force measurement device. II (Schubmessung grosser Genauigkeit an Flugtriebwerken unter besonderer Berücksichtigung einer hydraulischen Kraftmesseinrichtung. II). Joachim Fruböse. *Archiv für technisches Messen und industrielle Messtechnik*, May 1971, p. 85-88. 7 refs. In German.

Relations between the displacement of the piston of the device on one side and the oil pressure and the pressure to be measured on the other side are investigated. Factors connected with diametrical clearance and roundness of the edges have an effect on these relations. The quantity of oil flowing through the device is determined, and questions of calibration and measurement accuracy are discussed. A sensitivity of 0.04 per cent was obtained. G.R.

A71-29868 * # An evaluation of theories for predicting turbulent skin friction and heat transfer on flat plates at supersonic and hypersonic Mach numbers. Edward J. Hopkins and Mamoru Inouye (NASA, Ames Research Center, Moffett Field, Calif.). *AIAA Journal*, vol. 9, June 1971, p. 993-1003. 65 refs.

An evaluation of existing theories is presented, which is restricted to flat plates, cones, and wind-tunnel walls on which the flow is essentially isothermal and isobaric. It is suggested that the Van Driest II theory (1956) be used to predict the turbulent skin friction for the design of supersonic and hypersonic vehicles until additional direct measurements of skin friction are made. This theory with an assumed Reynolds analogy factor of 1.0 should also be used to predict the heat transfer to surfaces exposed to hypersonic Mach numbers. For heat transfer predictions to near adiabatic surfaces exposed to supersonic and lower Mach numbers, the use of a Reynolds analogy factor of 1.2 is recommended. For the incompressible case, also required for compressible transformation theories such as that of Van Driest, additional direct measurements of skin friction are needed at extremely high and low Reynolds numbers before the Kármán-Schoenherr formula can be accepted without reservation. O.H.

A71-29887 * # Effect of angle of attack on boundary-layer transition at Mach 21. Michael C. Fischer and David H. Rudy (NASA, Langley Research Center, Hypersonic Vehicles Div., Hampton, Va.). *AIAA Journal*, vol. 9, June 1971, p. 1203-1205. 8 refs.

Boundary-layer transition at angles of attack in the range from 0 to 3 deg was studied on a slender cone in a nominal Mach-20 flow promoted on the leeward ray and essentially fixed on the windward ray. The obtained angle-of-attack transition results directly conflict with previously reported results with a cone of identical geometry tested in the same facility. The results obtained are believed to illustrate the correct trends as the results from the previous measurements were probably adversely influenced by the questionable method of detecting transition. M.V.E.

A71-29889 # Pressures on boat-tailed afterbodies in transonic flow with a low-thrust jet. D. M. Sykes (City University, London, England). *AIAA Journal*, vol. 9, June 1971, p. 1206-1208.

Extension of Sykes' (1970) previous base drag study of axisymmetric afterbodies to pressure distributions on a family of afterbodies at stream Mach numbers from 0.8 to 1.2 and to the effect of a low-thrust jet on these pressures. The base pressure coefficient change with jet flow and the afterbody drag coefficient variation for various afterbody geometries with jet flow are illustrated in diagrams and briefly discussed. M.V.E.

A71-29890 # Effect of yaw of repose on ballistic match of similar projectiles. H. R. Vaughn and G. G. Wilson (Sandia Laboratories, Albuquerque, N. Mex.). *AIAA Journal*, vol. 9, June 1971, p. 1208-1210. 6 refs. AEC-supported research.

Using a given aeroballistic axis system, the yaw of repose part of the motion of a shell is considered. In the light of yaw of repose theory, it is shown that the ratio of roll moment of inertia to the static margin predominates in controlling the yaw of repose angle magnitude in the usual projectile problem. Aside from the drag-to-weight ratio, which dominates any projectile ballistic match problem, the yaw of repose is shown to be the single most important projectile parameter. M.V.E.

A71-29910 # Aerodynamic research on high lift systems. F. Mavriplis (Canadair, Ltd., Montreal, Canada). *Canadian Aeronautics and Space Journal*, vol. 17, May 1971, p. 175-183. 8 refs.

This paper describes two-dimensional flow research conducted at Canadair to develop high lift system technology for advanced STOL aircraft. First a theoretical method was developed which uses a

vorticity distribution on the airfoil contour and can calculate the potential flow pressure distribution on multielement airfoils with deflected leading edge devices and slotted trailing edge flaps. Second, a wall blowing technique was developed which is essential for obtaining reliable two-dimensional wind tunnel data for airfoils in the high lift condition, and for testing effectively complex high lift models. Comparisons of calculated and experimental data obtained on some of the complex configurations tested at NAE using the wall blowing technique demonstrate the usefulness of the methods used and the approach to the design of future high lift systems. (Author)

A71-29911 # The Yak-40 aircraft flight test procedures. K. B. Bekirbaev, A. D. Miranov, and I. I. Sneshko (Iakolev Design Bureau, Moscow, USSR). (Canadian Aeronautics and Space Institute, Flight Test Symposium, Montreal, Canada, Feb. 9, 1971.) *Canadian Aeronautics and Space Journal*, vol. 17, May 1971, p. 185-188.

The flight testing of the Yak-40 jet passenger aircraft for compliance with the Civil Airworthiness Requirements of the USSR was performed in the three stages of manufacturer's, government, and service tests. A series of special ground tests and investigations, such as wind tunnel tests, static structural and vibration tests, preceded the manufacturer's flight tests. The manufacturer's tests were carried out simultaneously on four experimental aircraft, together with government flight testing. Service tests were carried out on six production aircraft. The service tests, including some flights under special route conditions, amounted to 2,482 flights. The Yak-40 is undergoing certification tests by the Italian authorities to prove compliance with the technical standards of the U.S. Federal Aviation Regulations. Demonstration flights of the Yak-40 have been made in 36 countries in Europe, Asia and America. M.M.

A71-29925 * # A review of the mass-flux probe. Lloyd N. Krause and George E. Glawe (NASA, Lewis Research Center, Cleveland, Ohio). *American Institute of Physics, American Society of Mechanical Engineers, Instrument Society of America, and National Bureau of Standards, Symposium on Flow - Its Measurements and Control in Science and Industry, Pittsburgh, Pa., May 9-14, 1971, Paper. 28 p. 22 refs.*

The mass-flux probe is used to measure the mass flow rate per unit cross-sectional area of supersonic streams. The probe consists of an aspirating tube with a supersonic inlet which 'swallows' the shock and ingests the stream flow tube. The mass flow rate per unit area of the stream is determined by measuring the flow rate of ingested gas through the probe at a convenient downstream station, and then dividing by the probe's inlet area. The instrument has been applied to studies of supersonic boundary layers, and of high-enthalpy, high-temperature gas flows, such as may occur in hypersonic flight. This review presents a description of the instrument, a historical review of work reported in the literature, and a discussion of the factors influencing performance. These factors include probe inlet geometry, angle of attack, and Reynolds and Mach number effects. (Author)

A71-29930 * # Airbreathing nuclear propulsion - A new look. Frank E. Rom (NASA, Lewis Research Center, Cleveland, Ohio). *U.S. Air Force Office of Scientific Research, Symposium on Advanced Propulsion Concepts, 6th, Niagara Falls, N.Y., May 4-6, 1971, Paper. 23 p. 19 refs.*

Aircraft with gross weights of at least one million pounds are necessary to make nuclear aircraft practical. However, the example of the Lockheed C-5 and the Boeing 747, which weigh almost one million pounds, has shown the practicality and profitability of very large subsonic aircraft. The major obstacle to the use of an aircraft nuclear powerplant is the problem of public safety in major aircraft accidents. An experimental investigation of techniques for prevention of reactor containment vessel rupture during impact has shown very encouraging first results. The safety problems of reactors for air cushion vehicles are small compared to aircraft because of the lower speeds of travel and because they would travel on the surface of the

earth and mainly over water. Nuclear powered air cushion vehicles are, therefore, potentially much closer to practical application. A good economic performance potential for nuclear air cushion vehicles is predicted. G.R.

A71-29938 Aspects of air law and civil air policy in the seventies. H. A. Wassenbergh (KLM - Royal Dutch Airlines, Schiphol Airport, Netherlands). The Hague, Martinus Nijhoff, 1970. 176 p. 295 refs. \$7.55.

General characteristics of the international civil aviation policy and regulation, and the concepts of national versus international approach to civil aviation are first briefly outlined. Problems involved in the national control of the air traffic market, freedom traffic classification, exchange of routes and traffic rights, route specifications, and equal opportunity for carriers to compete are examined. The role of nonscheduled services in relation to scheduled services is investigated, inclusive tour traffic and noninclusive tour charter traffic are compared, and traffic rights for charter carriers are considered. The growing need of cooperative arrangements between air carriers is emphasized, and features of various agreements are dealt with. A short analysis is also presented of the 1970 U.S. international civil aviation policy. O.H.

A71-29944 # Helicopter designs (Konstruktsiia vetroletov). V. N. Dalin. Moscow, Izdatel'stvo Mashinostroenie, 1971. 275 p. 11 refs. In Russian.

This book contains a comprehensive coverage of modern helicopter technology including aerodynamic properties of these aircraft, their power plants and engines, rotor, wing and rudder designs, transmission and control systems, and manufacturing. Particular attention is given to component weight, fatigue and cost minimization and to strength analysis of the components working under variable loads. The book is written to assist students attending courses in helicopter design offered at schools for technicians in this field. V.Z.

A71-30014 Map presentations for future ATC displays. G. R. Beaumont (Computing Devices of Canada, Ltd., Ottawa, Canada). *CATCA Journal*, vol. 3, Spring 1971, p. 16-19.

The major points to be considered in the selection of a mapping technique for use in future air traffic control (ATC) radar display systems are outlined. Two techniques for presenting map information on radar displays - i.e., the Vector Drawn Map (VDM) and the Optically Projected Map (OPM) method - and the possibilities of their updating are considered. It is shown that for either method, a similar amount of effort will be required to achieve an update. In the VDM system, the update is essentially a computer program change which will generate a new map data list for storage in computer memory. For the OPM system, the map update will be a cartographic change followed by a film generation cycle. The OPM system is shown to offer significant advantages over the VDM system from the human factors viewpoint. The availability of bright colors, coupled with the correct choice of color selection for various classes of data, can greatly enhance operator interpretation of a radar-map composite image. O.H.

A71-30053 Dynamic testing; Society of Environmental Engineers, Symposium, Imperial College of Science and Technology, London, England, January 5, 6, 1971, Proceedings. Volumes 1 & 2. London, Society of Environmental Engineers, 1971. Vol. 1, 125 p.; vol. 2, 140 p. Price of two volumes, \$19.20.

Various theoretical, technological and practical aspects, including impedance testing, flight instrumentation for Concorde, and vibration data analysis. V.Z.

A71-30055 # The flight test instrumentation installation for the Concorde SST. B. Roantree (British Aircraft Corp., Ltd., Fairford, England). In: Dynamic testing; Society of Environmental Engineers, Symposium, Imperial College of Science and Technology, London, England, January 5, 6, 1971, Proceedings. Volume 1. London, Society of Environmental Engineers, 1971, p. B1-B18.

Description of Concorde SST flight test equipment for measuring a total of 3000 parameters tape-recorded continuously during a complete flight with the aid of the Pulse Code Modulation recording system backed up by FM tape decks, photographic paper records, direct display pen recorders, and 450 visual instruments. The measured values include pressures, temperatures, stresses, angular and linear positions, and accelerations. The test equipment also includes analog recording systems, an accident recording system, and a digital replay system. Details on the Pulse Code Modulation System are given. V.Z.

A71-30068 * The response of a simply supported plate to 'N' waves at oblique incidence. A. Craggs (Alberta, University, Edmonton, Alberta, Canada). *Journal of Sound and Vibration*, vol. 16, May 22, 1971, p. 293-307. 5 refs. Grant No. NGR-52-025-003.

A numerical method is used to compute the response of a simply supported plate to an 'N' wave arriving at oblique incidence. The factors influencing the response under these conditions are (1) the ratio of the pulse duration to the fundamental period of the plate and (2) the convection forcing terms which are different for each mode. Also, asymmetric modes are excited, which do not make any contribution when the wave is at normal incidence to the plate. The computed results show that both the convection terms and the asymmetrical modes make a significant contribution to the form of the response for the displacements, velocities and accelerations, though their effects are more dominant in the accelerations than for any other parameter. (Author)

A71-30070 # Pressure-altitude assembly for high-altitude balloons. Oscar L. Cooper (National Center for Atmospheric Research, Boulder, Colo.). *Facilities for Atmospheric Research*, Dec. 1970, p. 16-21.

A full-range pressure-altitude transducer assembly is described that has been developed for use in high-altitude balloon flights. The transducer is of the capacitive type, using a thin taut-diaphragm sensing element positioned between two stationary capacitor plates. The space between the diaphragm and one of the stationary plates is evacuated and sealed. The space on the other side of the diaphragm is exposed to ambient pressure. The capacitances change as the absolute ambient pressure changes. A diode rectifier circuit detects the capacitor current and develops a dc voltage across a resistor. This voltage is linear with pressure. The three transducers in the assembly cover the full ambient range expected in balloon flights. M.V.E.

A71-30158 Aviation's place in transport; Royal Aeronautical Society, Two Day Convention, London, England, May 12, 13, 1971, Proceedings. London, Royal Aeronautical Society, 1971. 246 p.

Among the subjects treated are areas of growth in air transport, long haul air transport, V/STOL prospects for civil aviation, prospects for the development of air traffic in competition with other modes, and aviation within the total transport system. F.R.L.

A71-30159 # The total transport demand. Gabriel Bouladon. In: Aviation's place in transport; Royal Aeronautical Society, Two Day Convention, London, England, May 12, 13, 1971, Proceedings. London, Royal Aeronautical Society, 1971. 11 p.

Examination of the possibility that transport and travel demand will become a future economic constant, such as housing, clothing,

and food. It appears that in the USA transport consumption in miles per capita doubles every 24 years. The rate of travel expansion is even greater in Europe and Japan. The basic motivations for travel are psychological, sociological, and economic. A progressive price increase in air transport of around 15% over the next 12 years may be expected, due to the fight against pollution and other problems. F.R.L.

A71-30160 # Areas of growth in air transport. M. E. L. Spanyol (Hawker Siddeley Aviation, Ltd., Kingston-on-Thames, Surrey, England). In: Aviation's place in transport; Royal Aeronautical Society, Two Day Convention, London, England, May 12, 13, 1971, Proceedings. London, Royal Aeronautical Society, 1971. 19 p.

Examination of the circumstances leading to growth in the different sectors of air transport. The mechanisms which generate traffic are outlined. Since scheduled air transport services are geared primarily to the requirements of the major urban communities, and urban populations travel more frequently than rural populations, it is considered more realistic to relate air traffic to urban populations than total populations. The cost and value of air transport, the capital requirement of aviation, business and leisure air travel, corporate aviation, and future developments are discussed. F.R.L.

A71-30161 # Future prospects for air transport - Long haul air transport. C. H. Jackson. In: Aviation's place in transport; Royal Aeronautical Society, Two Day Convention, London, England, May 12, 13, 1971, Proceedings. London, Royal Aeronautical Society, 1971. 14 p.

Consideration of long haul air transport, which is essential to international affairs and commerce. Annual growth rates ranging according to area from 11 to 14% during the next 15 years, and from 7 to 10% thereafter are anticipated. The distribution of growth shows increases of average journey length, with eventually only about one third of the total traffic being over journeys of 3000 to 5000 mi. In general, the development prospect seems to be of continuing and painstaking effort to enable long haul operators to do what they are now doing in air transport, but on a bigger scale, more efficiently, and more acceptably to the public at large. F.R.L.

A71-30162 # V-STOL - Prospects for civil aviation. J. T. Stamper (Hawker Siddeley Aviation, Ltd., Kingston-on-Thames, Surrey, England). In: Aviation's place in transport; Royal Aeronautical Society, Two Day Convention, London, England, May 12, 13, 1971, Proceedings. London, Royal Aeronautical Society, 1971. 43 p.

Reappraisal of what the customer, as exemplified by the operator, the passenger and the community, needs and expects from the aircraft industry. Customer needs are classified under the major headings of convenience, regularity, comfort, safety, community acceptance, low total cost, and flexibility. A number of the more promising types of STOL and V-STOL aircraft are briefly described, and various configurations are presented. F.R.L.

A71-30163 # A B.A.C. view of V./S.T.O.L. John H. Quick (British Aircraft Corp., Ltd., Weybridge, Surrey, England). In: Aviation's place in transport; Royal Aeronautical Society, Two Day Convention, London, England, May 12, 13, 1971, Proceedings. London, Royal Aeronautical Society, 1971. 58 p.

Results of an extensive comparative study of VTOL and STOL aircraft. It is concluded that the STOL loses out on site area, but not by a sufficient margin to be decisive. The STOL is much less costly, and is at least equal to and possibly better than the VTOL on the basis of noise production. It should also produce less toxic gas, and is capable of being developed more quickly than the VTOL. F.R.L.

A71-30164 # Prospects for the development of air traffic in competition with other modes. J. R. Collingbourne. In: Aviation's place in transport; Royal Aeronautical Society, Two Day Convention, London, England, May 12, 13, 1971, Proceedings. London, Royal Aeronautical Society, 1971. 19 p.

Review of evidence concerning the division of travellers among various modes of travel, followed by examination of the way scheduled passenger air transport has progressed in competition with other modes in the U.S. Attention is drawn to certain features considered to be of general application and indicative of future trends. Some estimates of the sensitivity of the demand for a VTOL service are presented. It is considered that the long term prospects for the growth of air travel are intrinsically good because an effect of increasing affluence is that people tend to take more and longer trips. F.R.L.

A71-30165 # Aviation within the total transport system. Keith Legg (Loughborough University of Technology, Loughborough, Leics., England). In: Aviation's place in transport; Royal Aeronautical Society, Two Day Convention, London, England, May 12, 13, 1971, Proceedings. London, Royal Aeronautical Society, 1971. 22 p. 13 refs.

Consideration of the broad transport issues that follow from detailed study of transport demand, communications and future air transport prospects, because it is here that the greatest difficulty seems to be encountered in making good decisions. It is suggested that transport policy, organization and decision must be coordinated and originate from the highest level within a framework of systematic overall studies which define the constraints and resource limitations within which the total transport system must operate. It is emphasized that the purpose of transport is to satisfy social demand and it must do this with the minimum of inconvenience to the nonuser. F.R.L.

A71-30200 Sonic-boom analog for investigating indoor acoustical waves. Sui Lin (Toronto, University, Toronto, Canada). *Acoustical Society of America, Journal*, vol. 49, May 1971, pt. 1, p. 1386-1392. 7 refs. Research supported by the National Research Council of Canada.

Acoustical waves induced by sonic booms in a room with an open window are investigated by using an electrical analog. The good agreement between the results from the electrical analog and those of Vaidya shows that the electrical analog is a suitable device for investigating the room response to sonic booms. (Author)

A71-30218 # Universal equations of the laminar boundary layer on a rotating wing (Universal'nye uravneniia laminarnogo pogranichnogo sloia na vrashchaisushchemsia kryle). V. V. Bogdanova. *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, Mar.-Apr. 1971, p. 84-93. 8 refs. In Russian.

The motion of an incompressible fluid in the boundary layer on a blade rotating uniformly about an axis perpendicular to the wing span is analyzed. A solution is obtained by a parametric method involving the introduction of the series in parameters that are functions of the boundary layer. A corresponding system of universal equations is derived and is integrated over a wide range of parameters. The influence of rotation on boundary layer separation and other boundary layer characteristics is determined. V.P.

A71-30227 # Motion of a viscous gas in sectorial gas bearings (Dvizhenie вязкого газа в секторных газовых подшипниках). B. S. Grigor'ev. *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, Mar.-Apr. 1971, p. 167-171. 5 refs. In Russian.

Investigation of the influence of clearance changes with time on the aerodynamic characteristics of a gas journal bearing where one of the surfaces is divided by axial grooves into a number of sectors. The groove widths are large in comparison with the clearance, and the

surface between each groove has a characteristic profile. If the rotating surface is the one that is grooved and profiled, the clearance is time dependent, and the problem is nonstationary. When the fixed surface is grooved and profiled, the clearance is independent of time, and the corresponding problem is stationary. A method is described for calculating the aerodynamic lift and drag coefficients of such bearings. The problem is studied in a two-dimensional approximation, and a sinusoidal surface profile is assumed
T.M.

A71-30239 # DC-10 airplane characteristics for airport planning. Long Beach, Calif., Douglas Aircraft Co., 1971. 180 p.

DC-10 airplane specifications required by airport operators, airlines, and engineering consultant organizations for general airport planning information. Tables, graphs, and drawings illustrate general dimensions, ground clearances, interior arrangements, access clearances, payload-range characteristics, takeoff and landing distances, ground maneuvering space requirements, and parking requirements. Terminal servicing requirements, ground servicing connections, towing specifications, and ground pneumatic power needs are described, along with jet engine exhaust velocities, temperatures, and noise characteristics in terminal operating conditions. Pavement data include footprint diagrams, maximum pavement loads, landing gear loading characteristics on pavement, and flexible and rigid pavement requirements according to different design procedures.
T.M.

A71-30264 # Approximate method of calculating the aerodynamic characteristics of a wing in the presence of a cylindrical body (Priblizhennyi metod rascheta aerodinamicheskikh kharakteristik kryla v prisutstvii tsilindricheskogo tela). V. A. Graivoronskii. *Samoletostroenie i Tekhnika Vozdushnogo Flota*, no. 23, 1970, p. 3-8. In Russian.

The attached steady flow of an ideal incompressible fluid past a low-aspect-ratio wing mounted on a cylindrical body is analyzed in a linear formulation of the problem. The wing is assumed to be slender and slightly warped, and its surface to be located close to the meridional plane. The wing is simulated by a system of horseshoe vortices, the free vortices trailing off at a certain angle to the plane of the wing chord. The cylindrical body is simulated by plane dipole with a vortex system obtained by mapping the wing vortices onto the cylinder. The direction of the free vortices is determined from the local velocities at points behind the wing, while the intensity of the vortices is determined from the boundary conditions at certain points behind the wing.

A71-30300 # Concorde power plant fire protection system. R. A. Davis (Graviner /Colnbrook/, Ltd., Slough, Bucks., England). *Aircraft Engineering*, vol. 43, May 1971, p. 26-30.

The prototype Concorde is fitted with a Graviner high temperature Firewire Triple F.D. continuous element system for fire detection, and a similar medium-temperature system for engine bay overheat detection. On preproduction and production aircraft to comply with airworthiness requirements, these detection systems have been augmented by a new Graviner optical system that uses the

UV radiation emitted by a fire to detect engine combustion chamber flame burn through. An automatic extinguisher is used, and a fuel tank vent pipe ignition protection system is provided. Operation of the system is only achieved if light in the wave band of 0.3 to 1.1 microns passes in front of the detector's silicon cell.

A71-30301 # The Westland WG.13 Lynx. Aircraft Engineering, vol. 43, May 1971, p. 32-36.

The WG.13 is a high performance helicopter, the general purpose version of which operates at a maximum all up weight of 8000 lb. It is powered by two Rolls-Royce BS.360.07.26 free turbines, which are mounted side by side, behind the main rotor and on top of the fuselage upper decking. Conformal gears are employed in the highly loaded output stage of the main gearbox and transmit the engine power to a four-bladed semirigid main rotor and a four-bladed tail rotor. The main rotor blades are constructed of stainless steel, aluminum honeycomb, and glass reinforced plastic.

A71-30302 The major development trends in air transport and European co-operation. H. Ziegler (Société Nationale Industrielle Aérospatiale, Paris, France). *Aeronautical Journal*, vol. 75, May 1971, p. 309-319.

Characteristics and aspects of air transport in the coming years are examined. Air transport will be used more and more both for passengers and freight, and the major trends are increased speed and capacity, development of STOL aircraft, and a third level transport serving small urban communities. The necessity of uniting the efforts of manufacturers and of a close European cooperation is emphasized.

A71-30311 * **Airborne data acquisition system for atmospheric and meteorological research.** Michael R. Smith (Mississippi State University, State College, Miss.) and Richard A. Johnson (Mississippi State University, NASA Mississippi Test Facility, Bay St. Louis, Miss.). In: Instrument Society of America, International Aerospace Instrumentation Symposium, 17th, Las Vegas, Nev., May 10-12, 1971, Proceedings. Edited by B. Washburn. Pittsburgh, Instrument Society of America (Instrumentation in the Aerospace Industry. Volume 17), 1971, p. 15-21. Grant No. NGL-25-001-32.

This paper presents the efforts of researchers at Mississippi State University to utilize space-age technology in the development of a self-contained, airborne data acquisition system for use in atmospheric and meteorological studies. The compact, lightweight airborne data acquisition system (ADAS) is capable of recording variables or transmitting eighteen variables in its present configuration and is suitable for use in a single-engine aircraft. Utilizing both an on-board analog recorder and a telemetry system for data acquisition, the prototype system has undergone extensive bench and flight testing at the MSU-MTF Research Center at the NASA Mississippi Test Facility. The prototype system has been utilized in several environmental science investigations associated with atmospheric diffusion processes and weather modification. (Author)

A71-30318 **Realtime graphic flight test becomes a reality.** L. D. Crowley (Douglas Aircraft Co., Long Beach, Calif.). In: Instrument Society of America, International Aerospace Instrumentation Symposium, 17th, Las Vegas, Nev., May 10-12, 1971, Proceedings. Edited by B. Washburn. Pittsburgh, Instrument Society of America (Instrumentation in the Aerospace Industry. Volume 17), 1971, p. 61-68.

An integrated Flight Test Data System has been developed which combines a digital airborne acquisition/recording system with a telemetry/microwave link to a computerized ground station featuring the latest cathode ray tube graphic display units. Data are processed in realtime via the telemetry link and postflight via the airborne recorded data tapes. Flight test engineers control data processing via special keyboards permitting them to output finished time plots or tabulations of data. Although many problems were encountered during the design, development, and implementation phases, the data system has been operational since the first flight of the DC-10 aircraft and is presently in use on four aircraft involved in developmental and FAA certification test programs. The performance of this new system has permitted DC-10 test programs to remain on or ahead of schedule and has gained widespread acceptance among flight crew, engineering, and administrative personnel. (Author)

A71-30319 **Airborne Integrated Data System.** D. D. Crompton (Douglas Aircraft Co., Long Beach, Calif.). In: Instrument Society of America, International Aerospace Instrumentation Symposium, 17th, Las Vegas, Nev., May 10-12, 1971 Proceedings. Edited by B. Washburn. Pittsburgh, Instrument Society of America (Instrumentation in the Aerospace Industry. Volume 17), 1971, p. 69-74.

Data obtained on a new Airborne Integrated Data System during flight testing of commercial aircraft are producing meaningful results. This report describes the capabilities of the system and traces the development program from receipt of equipment to its use on the aircraft. The system is modularly constructed in 400-channel units and is capable of handling a variety of inputs in the range of 5 millivolts to 30 volts, with a separate amplifier for each channel. On-board monitoring includes time-of-day, decimal displays, and bar chart displays. The airborne system is complemented by a telemetry-microwave link and a ground-based station having an on-line computer and displaying real-time graphic displays. (Author)

A71-30320 **'Safe Weigh' - An accurate and economical on board weighing system.** S. B. Moore (Vought Aeronautics Corp., Dallas, Tex.). In: Instrument Society of America, International Aerospace Instrumentation Symposium, 17th, Las Vegas, Nev., May 10-12, 1971, Proceedings. Edited by B. Washburn. Pittsburgh, Instrument Society of America (Instrumentation in the Aerospace Industry. Volume 17), 1971, p. 75-79.

An 'On Board' weighing system has been designed and prototyped to determine the gross weight and center of gravity location of a light helicopter. The system consists of load sensors, basic electrical circuitry, and visual indicators. The system components are described with particular emphasis on the unique sensor design and the total simplicity of the system. Operational performance of the prototype system is presented. Applications of the system to fixed wing aircraft are cited and benefits of increased efficiency and safety are highlighted. (Author)

A71-30321 **High frequency rake probes for inflight intake airflow distortion measurements.** Amnon Brosh and John C. Kicks (Kulite Semiconductor Products, Inc., Ridgefield, N.J.). In: Instrument Society of America, International Aerospace Instrumentation Symposium, 17th, Las Vegas, Nev., May 10-12, 1971, Proceedings. Edited by B. Washburn. Pittsburgh, Instrument Society of America (Instrumentation in the Aerospace Industry. Volume 17), 1971, p. 80-86. 10 refs.

The forthcoming application is discussed of the ultraminiature integrated sensor (IS) of the newly developed 'E' type, with high-temperature capability, to a family of high-frequency rake probes to be used in the intakes of high-performance airplanes. It is shown how solutions to severe problems associated with high temperature flight operations may be obtained from such IS applications. E-type IS calibration qualification testing and ground tests are in progress now. .M.V.E.

A71-30322 **Altimeter-airspeed and Mach number transducers.** Sidney Herman and Stephen A. Hluchan (Bourns, Inc., Riverside, Calif.). In: Instrument Society of America, International Aerospace Instrumentation Symposium, 17th, Las Vegas, Nev., May 10-12, 1971, Proceedings. Edited by B. Washburn. Pittsburgh, Instrument Society of America (Instrumentation in the Aerospace Industry. Volume 17), 1971, p. 87-95.

An improved pressure transducer is described that is constructed around a unique diaphragm design which accepts nonlinear pressure inputs and provides an electrical potentiometer output linear with the desired variable. It consists of a diaphragm pressure sensor, a beam wiper actuator, and a continuous resolution potentiometric output element. The convolution design of the diaphragm sensor permits responses in an inverse relation to nonlinear inputs with a subsequently normalized element output. Inputs with slope deviations as great as 30:1 have been compensated for by combinations of mechanical and electrical devices and methods. This unique, patent-applied design results in inherent compensation for temperature and vibration effects. (Author)

A71-30323 **Atmospheric temperature deviations from the International Standard and its effect on barometric altimeters.** Peter

Holman Smith (Boeing Co., Seattle, Wash.). In: Instrument Society of America, International Aerospace Instrumentation Symposium, 17th, Las Vegas, Nev., May 10-12, 1971, Proceedings

Edited by B. Washburn. Pittsburgh, Instrument Society of America (Instrumentation in the Aerospace Industry, Volume 17), 1971, p. 96-102. 8 refs.

This paper describes airplane altimeter errors caused by atmospheric temperature deviations from the International Standard Atmosphere and suggests a system design to substantially reduce them. In particular, the problem of providing accurate height values for airplanes on approaches and at cruise altitudes in horizontal temperature gradients is discussed. A schematic diagram of a servo-operated altimeter with an integral temperature correction circuit is described. The method of correction is shown to be derived from a comparison between the actual Static Air Temperature (SAT) and the theoretical temperature value associated with the apparent altitude derived from the static pressure value sensed by the air data computer. Other atmospheric variables and the means by which they are accounted for in existing altimetry are briefly described. The basic equation for the tropospheric pressure-height relationship is quoted so as to demonstrate its dependence upon a standard temperature gradient. The appendix shows how curves of altimeter reading errors versus true altitude for temperature deviations were derived. Reference is made to an automatic temperature and pressure data transmission system that could continuously correct airplane altimeters according to values detected at the touch-down point.

A71-30324 **The design and fabrication of transducers for the measurement of fluctuating pressures from DC to over 100 KHz in jet engine testing.** Anthony D. Kurtz (Kulite Semiconductor Products, Inc., Ridgefield, N.J.). In: Instrument Society of America, International Aerospace Instrumentation Symposium, 17th, Las Vegas, Nev., May 10-12, 1971, Proceedings.

Edited by B. Washburn. Pittsburgh, Instrument Society of America (Instrumentation in the Aerospace Industry, Volume 17), 1971, p. 103-116.

This paper will deal with the design considerations involved in making miniature pressure transducers in a wide variety of dimensions and configurations for jet engine testing. Attention will be given to solid state fabrication considerations as the diaphragm diameter is changed from .200 in. to .030 in. In particular, frequency response, power dissipation, voltage capability, strain level, output and compensation for thermal effects will be discussed. (Author)

A71-30325 **Fluctuating pressure measurements from DC to over 100 KHz in jet engine testing.** John E. Fischer (General Electric Co., Evendale, Ohio). In: Instrument Society of America, International Aerospace Instrumentation Symposium, 17th, Las Vegas, Nev., May 10-12, 1971, Proceedings.

Edited by B. Washburn. Pittsburgh, Instrument Society of America (Instrumentation in the Aerospace Industry, Volume 17), 1971, p. 117-123. 44 refs.

Fluctuating pressure measurements have become a very important and necessary tool in the development of advanced design jet engines at General Electric. Current miniature transducers used with very sophisticated calibration and data acquisition equipment cover an extremely wide range of frequencies and pressure levels. System design, calibration and limitations are discussed and typical applications are shown. In most applications measurement accuracy is now limited by errors introduced by interference effects from probes or rakes required for support and mechanical integrity in contrast to the limits which have been imposed by transducer capabilities in the past. (Author)

A71-30327 **GO/NO-GO engine tester.** John F. Moran and Harris P. Shay (General Electric Co., Utica, N.Y.). In: Instrument Society of America, International Aerospace Instrumentation

Symposium, 17th, Las Vegas, Nev., May 10-12, 1971, Proceedings.

Edited by B. Washburn. Pittsburgh, Instrument Society of America (Instrumentation in the Aerospace Industry, Volume 17), 1971, p. 131-134.

This paper describes a low cost, simply operated system for evaluation of the condition of an aircraft engine. The self-contained portable unit connected to engine mounted sensors automatically computes critical engine characteristics and compares them to absolute limits prestored as a function of corrected speed. Characteristics are also compared with values from previous tests to detect abnormal trends. Current values of characteristics are displayed and then punched on a card for use as reference in subsequent tests.

A71-30329 **Holography and optical data processing in aerospace instrumentation.** Otto M. Friedrich, Jr. and Arwin A. Dougal (Texas, University, Austin, Tex.). In: Instrument Society of America, International Aerospace Instrumentation Symposium, 17th, Las Vegas, Nev., May 10-12, 1971, Proceedings.

Edited by B. Washburn. Pittsburgh, Instrument Society of America (Instrumentation in the Aerospace Industry, Volume 17), 1971, p. 141-153. 44 refs. Research supported by the Joint Services Electronics Program and the Texas Atomic Energy Research Foundation.

Recently developed holographic techniques, optical data processing principles, and laser properties beneficial for aerospace instrumentation are reviewed. High intensity, highly collimated or directional, spatial- and temporal-coherent optical beams are readily generated with present laser systems. In optical holography, both the phase- and the amplitude of optical waves are recorded as intensity variations that are produced by the interference of two or more optical waves. Optical data processors usually employ the optical diffraction produced by a simple lens. The ability of an optical lens to perform two-dimensional Fourier transforms at the speed of light is an advantage which optical processors have over conventional electronic systems. Experimental and analytical investigations are being performed on several holographic techniques and on the following optical data processing systems: optical analyzers, filters, signal correlators, pattern recognition units, analog computers and simulators. (Author)

A71-30333 * **The dynamic characteristics of a five component oscillating balance.** Ping Tchong (Old Dominion University, Norfolk, Va.). In: Instrument Society of America, International Aerospace Instrumentation Symposium, 17th, Las Vegas, Nev., May 10-12, 1971, Proceedings.

Edited by B. Washburn. Pittsburgh, Instrument Society of America (Instrumentation in the Aerospace Industry, Volume 17), 1971, p. 184-190. Contract No. NAS 1-9434.

The dynamic characteristics of a five-component strain-gaged oscillating balance used in wind-tunnel stability testing are presented. An experimental investigation was performed to determine the frequency response of the balance. The results indicated that the balance response is like that of a multidegree-of-freedom vibrational system. It was found that the interactions and the component sensitivities are frequency dependent. Peak interactions were generally found to be one order of magnitude larger than the corresponding static values at the natural frequencies of the system. In view of this finding it becomes apparent that the dynamic nature of the balance should be considered in reducing dynamic stability data. (Author)

A71-30334 **Application of a digital computer to the closed-loop control of a wind tunnel model trajectory simulation system.** J. A. Wolfe (Vought Aeronautics Corp., Dallas, Tex.). In: Instrument Society of America, International Aerospace Instrumentation Symposium, 17th, Las Vegas, Nev., May 10-12, 1971, Proceedings.

Edited by B. Washburn. Pittsburgh, Instrument Society of America (Instrumentation in the Aerospace Industry, Volume 17), 1971, p. 191-201.

A wind tunnel testing system, which obtains the motion of an aerodynamic body by moving a sting supported model in response to the aerodynamic loads acting upon it is in use at the LTV High Speed Wind Tunnel. The instrumentation, system servo controls, and the closed loop operating feature which includes a digital computer to solve the equations of motion are presented. Testing procedures, operating experience, and system accuracy are discussed. (Author)

A71-30337 Sensing and communications technologies for wayside headway control systems. Gerald P. Esmer (Bendix Corp., Ann Arbor, Mich.). In: Instrument Society of America, International Aerospace Instrumentation Symposium, 17th, Las Vegas, Nev., May 10-12, 1971, Proceedings. Edited by B. Washburn. Pittsburgh, Instrument Society of America (Instrumentation in the Aerospace Industry. Volume 17), 1971, p. 255-270. 9 refs.

The current status of sensors suitable for determining headway - i.e., the separation in time between two vehicles traveling on a guideway - was surveyed with interest focused on short headways of 10 to 500 ft. Technologies surveyed for applicable hardware included rapid railroad traffic control, industrial control, and military and aerospace instrumentation. Communication techniques and equipment applicable to personal rapid transit systems were also surveyed. Modulation techniques investigated included: amplitude modulation, frequency shift keying, and phase modulation. Tone signaling was also studied. Coding techniques were evaluated for personal transit systems, with a burst noise model assumed. The use of open wire, twisted pair, and coaxial cable for near term personal rapid transit applications was studied and the limits of applicability of each determined. The limits of applicability of baseband data transmission were also reviewed, and modems for modulated data transmissions were surveyed. O.H.

A71-30341 MODAPS - Advanced instrumentation for automated modal vibration testing. Ronald W. Budd (Hughes Aircraft Co., El Segundo, Calif.). In: Instrument Society of America, International Aerospace Instrumentation Symposium, 17th, Las Vegas, Nev., May 10-12, 1971, Proceedings. Edited by B. Washburn. Pittsburgh, Instrument Society of America (Instrumentation in the Aerospace Industry. Volume 17), 1971, p. 327-338. 7 refs.

The design, capabilities, and utilization of MODAPS, a system designed to provide real-time engineering unit data to be used for timely decisions on mode acceptability and purity, are described. This includes engineering unit data, mode shape data, generalized mass term data, orthogonality check data, and orthographic view plots. The system comprises analog subsystems, digital interfaces, and an on-line miniature computer. It has a frequency response of 0.75 to 800 Hz and a dynamic range of 80 dB. The system provides more modes per day and more accurate data than was previously possible. A typical modal test is described and the advantages of using an automated approach are discussed. O.H.

A71-30382 # Air traffic control and data processing in France. J. Villiers and J. F. Vivier. *Eurocontrol*, vol. 3, no. 2, 1970, p. 16-22. Translation.

Review of the basic ideas behind the installation of automatic data processing equipment for the use of the French ATC services. The use of computers to process the large volume of flight plan data makes it possible to compensate for the limited processing capacity resulting from the badly coordinated intellectual activity of a team of air traffic controllers. For the development of the French system experiments were conducted under conditions to be found in an actual ATC environment. Details of methods and implementation are presented, and variations of the CAUTRA (Automatic Traffic Coordinator) systems are described. F.R.L.

A71-30383 # The MADAP air traffic control system as seen by Eurosystem. *Eurocontrol*, vol. 3, no. 2, 1970, p. 23-29. Translation.

Description of the Maastricht Automatic Data Processing and Display System (MADAP) which employs eight digital computers and is intended to facilitate the task of controlling aircraft in the upper air space of the Benelux countries and West Germany. The system aids the controller in this task of issuing instructions by relieving him of the effort involved in memorizing all factors of the air traffic situation; by presenting him with synthetic data enabling him to make decisions swiftly and efficiently; and by warning him in advance of decisions that must be taken. There is no communication of a digital nature between MADAP and the aircraft being controlled, thus the controller remains the master link in the chain. F.R.L.

A71-30394 A note on the optimum averaging time of wind information for conventional aircraft landings. W. R. Sparks and Barbara Keddie. *Meteorological Magazine*, vol. 100, May 1971, p. 129-134.

Anemometer measurements are averaged over a certain time interval, and the resulting average wind speed for this interval is used to estimate the average wind speed for some future period of 4 to 5 sec just before touchdown when the aircraft is descending from about 30 to 15 m. During this period, the aircraft would travel about 300 m. An attempt is made to evaluate the optimal averaging time for the anemometer measurements from the viewpoint of ensuring maximum accuracy of the extrapolated average wind speed value for the 300-m run. From a detailed analysis of wind measured by a single anemometer 10 m above open level ground and by consideration of Shiotani's (1966) observations with a horizontal array of anemometers, it is concluded that the optimal averaging time for wind measured by a single anemometer should not be less than four minutes. T.M.

A71-30395 Some aspects of wind information required in the landing of aircraft. Barbara Keddie. *Meteorological Magazine*, vol. 100, May 1971, p. 134-143. 5 refs.

Single-anemometer wind measurements were made each second over a period of about one hour for six independent wind regimes. A detailed analysis was made of the maximum difference between a mean wind speed $U(t)$ measured over 4.5 min and the mean wind speed $U(300)$ occurring 10 min later over a period during which the aircraft descends from 30 to 15 m and travels a distance of 300 m. The maximum value of $U(300)-U(t)$ in various samples of sizes from 4 to 20 min was predicted by assuming a normal distribution. Theoretical curves were derived which were in reasonable agreement with curves drawn from the analyzed data. Comparisons were also made between the actual and predicted values of (1) the maximum deviation of $U(300)-U(t)$ from the mean in various samples, and (2) the maximum difference in various samples. Finally, data from different sampling periods or runs of wind were compared so that if the maximum departure of one sample from the mean wind was known the maximum departure for other samples could be estimated. T.M.

A71-30398 # Computer aided design of civil transport plane. Jiro Kondo (Tokyo, University, Tokyo, Japan). *Japan Society for Aeronautical and Space Sciences, Transactions*, vol. 13, no. 23, 1970, p. 37-46. 8 refs.

Discussion of CAD (Computer Aided Design), a program by which it is possible to conduct a fundamental design of an aircraft meeting such specifications as number of passenger seats, maximum range, maximum cruising speed, and takeoff or landing run. It can also take account of future technical advances. Airframe configuration, aerodynamic performance, propulsion systems, weight, cost of construction, operating cost, and other capabilities are automatically obtained. In order to determine the accuracy of CAD, it was applied to civil transport aircraft of known specifications. Except for a rather large discrepancy in field length, agreement of CAD results with the specification of actual aircraft is satisfactory. F.R.L.

A71-30420 V-12 has civil, military missions. Donald C. Winston. *Aviation Week and Space Technology*, vol. 94, June 7, 1971, p. 14-19.

Description of the Soviet Mil V-12 heavy lift helicopter (88,000 lb maximum payload), which is powered with four turbine engines rated at 6500 shp each. The side-by-side rotor configuration is considered to offer the greatest stability and reliability. The two rotors are cross-shafted, hence the V-12 can maintain flight on any two engines. The cargo hold, entered by clamshells opening outward and upward, is more than 90 ft long. The civil missions of the V-12 include transport of oil and gas equipment and pipe into isolated areas, and supply of remote settlements north of the Arctic Circle.

F.R.L.

A71-30443 Vortex theory for a propeller of constant aerodynamic pitch and study of the wake configuration with the aid of the smoke trail method (incompressible fluid) (Note sur la théorie tourbillonnaire de l'hélice à pas aérodynamique constant et sur l'étude de la configuration du sillage à l'aide de la méthode des filets de fumée /fluide incompressible/). R. Pélissier (Aix-Marseille, Université, Marseille, France). *Journal de Mécanique*, vol. 10, June 1971, p. 191-203. 8 refs. In French.

Approximate analytical expressions are derived for the pitch of vortex streets in the rotational plane of a propeller as a function of the propeller's mode of operation and its geometrical characteristics. Smoke-trail visualization of the pitch of vortex streets in the wake is also described. The results are useful in studies of the pitch distributions of vortex streets along the length of the blade and can be utilized for evaluation of the propeller's aerodynamic efficiency.

T.M.

A71-30454 The role of kinetics in engine emission of nitric oxide. L. S. Caretto, L. J. Muzio, R. F. Sawyer, and E. S. Starkman (California, University, Berkeley, Calif.). *Combustion Science and Technology*, vol. 3, no. 2, Apr. 1971, p. 53-61. 27 refs. Research supported by the National Air Pollution Control Administration.

The use of chemical kinetic calculations to predict the formation of nitric oxide in spark ignition engines and gas turbine combustors is reviewed. Although the basic chemical kinetic mechanism is the same in both cases, differences in thermodynamics and fluid mechanics account for different NO emission levels. In spark ignition engines it is necessary to account for temperature gradients in the engine. In gas turbines the NO kinetics are frozen before the NO is formed in equilibrium amounts. (Author)

A71-30473 French research on metallic matrix composites. Michel Sindzingre (Paris, Ecole Nationale Supérieure des Mines, Corbeil-Essonnes, Essonne, France). (*Deutsche Gesellschaft für Metallkunde, Tagung Verbundwerkstoffe, Konstanz, West Germany, Oct. 23, 1970.*) *Zeitschrift für Metallkunde*, vol. 62, May 1971, p. 365-371. 19 refs.

The mechanical properties of composites consisting of an aluminum matrix reinforced by boron fibers are presented. The experimental and control techniques used are described. The different structures obtained by unidirectional eutectic solidification of nickel and cobalt based alloys are shown. The resistance to tensile deformation and creep of these alloys is reported. Finally some investigations of new composite materials which are not reinforced unidirectionally but rather isotropically within a plane are described. (Author)

A71-30517 # Use of miniaturized microphones in the study of the sound radiation of vibrating modes in rotating machines (Utilisation de microphones miniaturisés à l'étude du rayonnement sonore de modes vibratoires dans les machines tournantes). B. Baërd, P. Harel, J. Lambourin, and M. Perulli (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *Association Française des*

Ingénieurs et Techniciens de l'Aéronautique et de l'Espace and Groupement des Acousticiens de Langue Française, Colloque d'Acoustique Aéronautique, 2nd, Paris, France, May 4, 5, 1971, Paper. 19 p. 7 refs. In French.

Measurements of nonstationary pressures have been made at ONERA inside turbomachines by means of compact capacitive detectors. The characteristics of the pressure fields measured on stationary blades are compared with those of the sound field outside the machine in order to derive a first approximation of the location of the noise sources. The characteristics of the space-time structure of the various vibrating modes in the duct in cylindrical coordinates are studied. The propagation properties of the duct are derived and compared with theory. The measurements have been made partly in an experimental ONERA fan and then on a SNECMA compressor model. M.M.

A71-30518 # Experimental studies on absorbent materials used in turboreactor ducts (Etudes expérimentales sur les matériaux absorbants utilisés dans les conduits de turboréacteurs). J.-P. Bernard (SNECMA, Paris, France). *Association Française des Ingénieurs et Techniciens de l'Aéronautique et de l'Espace and Groupement des Acousticiens de Langue Française, Colloque d'Acoustique Aéronautique, 2nd, Paris, France, May 4, 5, 1971, Paper.* 17 p. In French.

Resonators, as the only type of absorbing structures capable of industrial utilization for the attenuation of sound produced by a turboreactor blower, have been investigated. A test installation in which the wall of an air duct situated between two reverberating chambers was clad with the absorbing structures was used for this purpose. Using this installation, the effects of the flow velocity, the characteristics of the absorbent structure, the transverse dimension of the duct, and the cladding of two opposite surfaces of the duct were examined. Results are presented and compared with those obtained using an experimental compressor, the ducts of which were lined with optimized absorbing structures taking into account the previously obtained parameters. A good agreement was achieved. O.H.

A71-30519 # Noise measurements in the large Modane wind tunnel (Mésures de bruit dans la grande soufflerie de Modane). C. Broll (ONERA, Modane, Savoie, France). *Association Française des Ingénieurs et Techniciens de l'Aéronautique et de l'Espace and Groupement des Acousticiens de Langue Française, Colloque d'Acoustique Aéronautique, 2nd, Paris, France, May 4, 5, 1971, Paper.* 10 p. 5 refs. In French.

Study of noise produced during a series of aerodynamic tests on a helicopter rotor. It was found that at frequencies below 2500 Hz the noise level of the rotor is greater by several dB than the noise level of the wind tunnel and the driving motor. The results make it possible henceforward to correct rough measurements and to perform future acoustic tests on rotors and propellers under good conditions. F.R.L.

A71-30520 # Preliminary results in a study of the infrared emission of a hot jet (Résultats préliminaires de l'étude de l'émission infrarouge d'un jet chaud). J.-F. de Belleval, M. Perulli (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France), G. Richter, and C. Schmidt (SNECMA, Paris, France). *Association Française des Ingénieurs et Techniciens de l'Aéronautique et de l'Espace and Groupement des Acousticiens de Langue Française, Colloque d'Acoustique Aéronautique, 2nd, Paris, France, May 4, 5, 1971, Paper.* 25 p. 9 refs. In French.

IR and acoustic measurements were compared, and it was found that the emissions of the electromagnetic and acoustic energies can be attributed to the same sources. On this basis, IR probing is used for investigating the aerodynamic parameters of a hot jet. Crossed-beam IR measurements are made by means of two mirrors whose axes are orthogonal to each other and perpendicular to the jet axis. The mirrors focus the IR emission from the jet onto lead sulfide IR

detectors. The results obtained up to the present are discussed, including axial and transverse profiles of the turbulence intensity and the axial profile and distribution of frequency. Z.W.

A71-30521 # Determination of sound fields of aircraft in flight by treatment of noise measurements (Détermination des champs sonores des avions en vol par traitement des mesures de bruit). Jean Gaudron (Société Nationale Industrielle Aérospatiale, Toulouse, France). *Association Française des Ingénieurs et Techniciens de l'Aéronautique et de l'Espace and Groupement des Acousticiens de Langue Française, Colloque d'Acoustique Aéronautique, 2nd, Paris, France, May 4, 5, 1971, Paper.* 30 p. In French.

Study of the sound field attached to an aircraft, which involves knowledge of the perceived noise level. Some test procedures involving the flight path of the aircraft and the acquisition of flight parameters are described. Flight parameters to be controlled are the engine operating conditions and the speed of the aircraft. It is shown that the attitude of the aircraft is of importance in the production of noise perceived on the ground. F.R.L.

A71-30522 # Predictive calculations of attenuation of absorbing ducts adaptable to bypass jet engines (Calculs de prévision d'atténuation de conduits absorbants adaptables à des réacteurs double flux). F. Haffner (Société Bertin et Cie., Plaisir, Yvelines, France). *Association Française des Ingénieurs et Techniciens de l'Aéronautique et de l'Espace and Groupement des Acousticiens de Langue Française, Colloque d'Acoustique Aéronautique, 2nd, Paris, France, May 4, 5, 1971, Paper.* 31 p. In French.

Classical Morse theory is used for calculating noise attenuation in the ducts of a compressor. According to this theory, a monochromatic acoustic wave propagating in a duct is composed of a series of elementary waves called modes. In the case of sound-absorbing duct walls, the modes are attenuated and their phase velocity is modified. Equations determining the attenuation of each mode are solved for rectangular, circular, and annular duct cross sections. Two hypotheses are assumed for the energy distribution over different modes at the duct inlet: (1) energy is uniformly distributed over different modes, and (2) the propagating wave is a plane one. The theoretical and experimental results are compared for different materials and for rectangular duct cross sections. Z.W.

A71-30523 # Influence of the presence of a plane on the measurement of line-containing spectra (Influence de la présence d'un plan sur la mesure de spectres contenant des raies). J. Jacques (CNRS, Centre de Recherches Physiques, Marseille, France) and P. Thomas (SNECMA, Paris, France). *Association Française des Ingénieurs et Techniciens de l'Aéronautique et de l'Espace and Groupement des Acousticiens de Langue Française, Colloque d'Acoustique Aéronautique, 2nd, Paris, France, May 4, 5, 1971, Paper.* 20 p. In French.

Study of complex noise emission spectra resulting from the superposition of a continuous component and peaks. Some applicable theoretical expressions are established which make it possible to calculate the level separations due to the presence of a perfectly reflecting plane and relative to either all the spectrum, or to frequency bands corresponding to a chosen analytical mode. Experimental confirmation was made in a soundproof room by measuring the influence of reflection interfaces for the synthetic noise spectra obtained either by means of electroacoustic sources or by use of a model jet and a compression chamber. The satisfactory agreement between the theoretical and experimental results shows that the spectrum of a sound source in the presence of a perfectly reflecting plane is predictable commencing with the knowledge of the free field spectrum. F.R.L.

A71-30524 # Experimental verification and application of a method of calculation for the sound spectrum of jets on the ground

and in the air (Vérification expérimentale et application d'une méthode de calcul du spectre sonore des jets au sol et en vol). M. Kobrynski (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *Association Française des Ingénieurs et Techniciens de l'Aéronautique et de l'Espace and Groupement des Acousticiens de Langue Française, Colloque d'Acoustique Aéronautique, 2nd, Paris, France, May 4, 5, 1971, Paper.* 14 p. 9 refs. In French.

The work discussed is a continuation of an investigation by Kobrynski (1969). The sound pressure level at a point of the ground during the overflight of an aircraft is considered, and a mathematical relation for expressing the sound pressure level observed with satisfactory approximation is derived. The studies discussed are based partly on theoretical results reported by Ribner (1969) and partly on experimental results. The method of calculations proposed utilizes a new expression which is representative for the directivity of jet noise. The theoretical results are compared with experimental data, and the areas of agreement are defined. G.R.

A71-30526 # Fluctuation of sound pressures created by a fan in a very low speed subsonic wind tunnel test stream (0.10 less than V less than 20 m/sec) (Fluctuations de pressions sonores créées par un ventilateur dans une veine de soufflerie subsonique très basses vitesses /0,10 less than V less than 20 m/s/). J. Moinard and C. Froger (Centre d'Etudes et Recherches des Charbonnages de France, Verneuil-en-Halatte, Oise, France). *Association Française des Ingénieurs et Techniciens de l'Aéronautique et de l'Espace and Groupement des Acousticiens de Langue Française, Colloque d'Acoustique Aéronautique, 2nd, Paris, France, May 4, 5, 1971, Paper.* 21 p. In French.

Discussion of anomalies which can cause large errors in the calibration of anemometers at very low wind speeds. The anomalies are due to a region of acoustic waves, the principal noise source being the fan which moves the air in the wind tunnel. To construct a high quality wind tunnel aerodynamic studies must be supplemented by acoustic studies which do not exclude adjustments on the full-scale model. F.R.L.

A71-30527 Development progress - New transport engines: JT9D. G. P. Adamson (United Aircraft Corp., Pratt and Whitney Aircraft Div., East Hartford, Conn.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710419.* 12 p. Members, \$1.00; nonmembers, \$1.50.

The means by which Pratt and Whitney Aircraft is bringing about improvements in its JT9D engine are described. The JT9D engine, having accumulated a year and a half of commercial service, benefits both from a product improvement effort aimed at developing fixes for current operating problems and from development work on advanced JT9D models designed to power future transport aircraft. An extended comparison between the current JT9D-3A engine and the first advanced JT9D (the JT9D-7) illustrates the product improvement process in detail. (Author)

A71-30528 JT9D development for airline operation. G. E. Woodger (United Aircraft Corp., Pratt and Whitney Aircraft Div., East Hartford, Conn.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710434.* 13 p. Members, \$1.00; nonmembers, \$1.50.

The Pratt and Whitney Aircraft JT9D engine is described with respect to the ways in which it has been designed to meet the requirements of airline operators. Chief emphasis is placed on the engine's simplicity of construction, provisions for condition monitoring, and capability for maintenance, along with its improved noise and smoke emission characteristics. Specific maintenance problems and their solutions are presented. (Author)

A71-30529 New developments in product support. H. Bayer (Douglas Aircraft Co., Long Beach, Calif.) and J. Woodworth (National Airlines, Inc., Miami, Fla.). *Society of Automotive*

Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710437. 10 p. Members, \$1.00; nonmembers, \$1.50.

The use of maintenance cost data can be successfully employed as a design constraint for product support. This paper summarizes the process used in translating quantitative maintenance cost requirements into specific design criteria. It describes the airline operator's use of such data and how he then passes cost objectives on to the aircraft manufacturer. The various steps used in the design process are described from a manufacturer's standpoint. Examples are given to show the relationship of cost to resulting maintainability improvements. Finally, the airline operator's viewpoint is presented which calls for more stringent compliance with previously determined maintenance concepts and procedures. The paper closes with a look at future program requirements. (Author)

A71-30530 **Powered wheels - A concept for parking and taxiing of commercial transport airplanes.** B. C. Hainline, B. K. Sellereite, K. V. Swanke (Boeing Co., Commercial Airplane Group, Renton, Wash.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710446.* 14 p. 8 refs. Members, \$1.00; nonmembers, \$1.50.

The concept of powered wheels as applied here is the propelling of an airplane on the ground by direct traction of landing gear wheels using onboard power and under direct control of the pilot. This concept suggests an improvement in economic and ecologic factors associated with ground operation of commercial transport airplanes. For the concept to be economically feasible, penalties for addition of airborne equipment must be overbalanced by savings in fuel, engine operating time, ground equipment, ground personnel, and terminal space and by increased airplane productivity. The use of direct wheel traction can improve the airport and terminal environment by reducing air pollution, jet blast, and noise from main propulsion engines during taxi and parking. This paper is a preliminary look at requirements, configurations, and trades that require further investigation to establish the role of powered wheels in future air transportation. (Author)

A71-30531 **Design integration - The key to effective engine condition monitoring.** K. B. Kochanski and D. W. Leiby (General Electric Co., New York, N.Y.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710447.* 12 p. Members, \$1.00; nonmembers, \$1.50.

As aircraft increase in size and required capital investment, the incentives for development and application of techniques and methods for optimizing the availability of the aircraft become increasingly attractive. Currently, a family of techniques, which can be broadly defined as engine condition monitoring, is being applied to reduce the downtime assignable to the aircraft power plant. The mechanical health of the engine is assessed through such techniques as parameter monitoring, vibration analysis, oil monitoring, bore-scope inspection, and radiography to provide problem detection, isolation, and trend monitoring. The effectiveness of a condition monitoring system depends upon the realization of a compatible interface between the basic engine design and installation, and the monitoring system, as well as the application of effective diagnostic logic to the acquired data. The purpose of this paper is to examine the design interface requirements for selected monitoring techniques and the analytical methods for data interpretation, and to recommend the design features needed to enhance the monitoring capabilities to approach the optimum overall condition monitoring system. (Author)

A71-30532 **Electronic Engine Condition Analysis System.** H. J. Moses (United Aircraft Corp., Hamilton Standard Div., Windsor Locks, Conn.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper*

710448. 11 p. Members, \$1.00; nonmembers, \$1.50.

A new systems approach has been developed and applied to achieve the inspection, diagnosis, and prognosis of gas turbine engine health by electronic means. The approach combines the power of the special purpose digital computer together with advanced engine fault isolation techniques to achieve a complete operational and maintenance interface. System elements are described and typical examples discussed. Practical applications of the system to several engine models have been made with favorable results. (Author)

A71-30533 **Area navigation systems and displays.** Frank F. Wright, William R. Beckman (Lockheed-California Co., Burbank, Calif.), and T. J. Newman (AMBAC Industries, Inc., Arma Div., Garden City, N.Y.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710457.* 20 p. Members, \$1.00; nonmembers, \$1.50.

Description of different classes of area navigation systems (RNAV), and review of the operational advantages of pilot displays. The use of National Airspace System ground radio navigation aids by airborne navigation receivers and other sensors forms the basis for the RNAV systems that, coupled with appropriate air traffic control techniques, promise to improve the movement of aircraft throughout the national airspace. Three classes of RNAV equipment are reviewed: the Mark I, simple yet requiring considerable pilot manual operation; the Mark II, virtually automatic with new cathode-ray tube multifunction/navigation displays for the pilot; and the Mark III, based upon use of self-contained inertial navigation systems installed in today's large jets. M.V.E.

A71-30534 **INS projections and improvements - Capabilities in the future.** Christopher L. Bearden (American Airlines, Inc., New York, N.Y.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710458.* 6 p. Members, \$1.00; nonmembers, \$1.50.

ARINC 561 Inertial Navigation Systems (INS) have received wide acceptance in the Commercial Air Transport Industry. Many innovative improvements to these systems have been developed in recent years. Increased functional capability is planned for the near future such as vertical navigation and accuracy improvement using radio navigation aids. (Author)

A71-30535 **The future of STOL.** Richard D. FitzSimmons and William E. Thurman (National Aeronautics and Space Council, Washington, D.C.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710464.* 6 p. Members, \$1.00; nonmembers, \$1.50.

Individual DOT, DOD, and NASA STOL roles and missions are discussed, including the supporting rationale that will allow the agencies to collectively address STOL systems implementation and create an environment in which the free enterprise system can assume its rightful role and provide a profitable, safe, environmentally satisfactory new air transportation service that is truly responsive to the desires of the public. It is felt that appropriate involvement of the Federal Government is essential for defining a STOL-development timetable. M.V.E.

A71-30536 **Comparison of STOL design criteria for commercial and military transport aircraft.** Jesse C. Peaslee (Boeing Co., Seattle, Wash.). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710465.* 13 p. Members, \$1.00; nonmembers, \$1.50.

The characteristics of STOL transport aircraft designed for military missions resemble those developed for commercial air transport. A military aircraft with approximately 30,000-lb payload capacity correlates reasonably well with 120-150 passenger commercial aircraft. When reasonable margins of safety are applied to takeoff and landing criteria, the military transport designed for

2000-ft landing and takeoff distances could probably be certified at about the same landing and takeoff distances for civil use. However, many STOL military design details are not defined well enough to assure that similar commercial aircraft would be economical in airline use. Conversely, the criteria for acceptable levels of noise for commercial STOL aircraft might result in a less than optimum aircraft for military service. (Author)

A71-30537 **Lift ratings of V/STOL propulsion units.** W. Thomas (General Electric Co., Aircraft Engine Group, West Lynn, Mass.) and E. G. Smith (General Electric Co., Cincinnati, Ohio). *Society of Automotive Engineers, National Air Transportation Meeting, Atlanta, Ga., May 10-13, 1971, Paper 710471.* 31 p. Members, \$1.00; nonmembers, \$1.50.

Lift ratings for V/STOL propulsion units are identified based on the requirements of the aircraft system. Typical V/STOL handling criteria are applied in the derivation of the lift rating method. Analytical techniques are presented for the evaluation of contributing factors associated with both the aircraft and propulsion system characteristics. Two typical aircraft systems are used to determine representative levels of lift ratings for the propulsion units. (Author)

A71-30538 **Development of an individualized ground training program for DC-10 flight crews.** W. P. Moran (American Airlines, Inc., New York, N.Y.). *Society of Automotive Engineers, International Simulation and Training Conference, 4th, Atlanta, Ga., May 13, 1971, Paper 710472.* 9 p. Members, \$1.00; nonmembers, \$1.50.

In an effort to reduce flight crew ground training time, while at the same time maximizing learning efficiency, American Airlines is making use of specialized, individualized, programmed instruction, with increased emphasis on the use of 'hands-on' training equipment, to transition experienced crewmen to the DC-10 airplane. This paper explains the concept of identifying the specific operating requirements unique to this airplane and the development of a program to train crewmen to proficiently perform these operating requirements. It also covers briefly the principal training hardware developed to support this program. (Author)

A71-30604 # **Approximate transfer functions for large aspect ratio wings in turbulent flow.** L. T. Filotas (Toronto, University, Toronto, Canada). *Journal of Aircraft*, vol. 8, June 1971, p. 395-400. 19 refs. National Research Council of Canada Grant No. A-2003; Grant No. AF AFOSR 67-0672A.

The fundamental aerodynamic problem associated with flight through atmospheric turbulence is calculation of the response of a wing flying through a single sinusoidal wave of upwash with lines of constant phase arbitrarily inclined to the flight path. Approximate closed form expressions for the 'gust transfer functions' relating the lift and moments to the upwash in such a wave are derived for large aspect ratio rectangular wings in incompressible flow. The lift transfer function is expressed as the usual two-dimensional Sears function multiplied by a factor to correct for finite span and a further factor to account for the spanwise gust wave number. Multiplying this expression by the chordwise (or spanwise) center of pressure leads to the pitching (or rolling) moment transfer function. Some simple scaling laws, based on these results, are then suggested for flight through large-scale turbulence. (Author)

A71-30605 # **Designing jet aircraft wind-tunnel test programs with propulsion system simulation.** James L. Grunnet (Fluidyne Engineering Corp., Minneapolis, Minn.). *Journal of Aircraft*, vol. 8, June 1971, p. 421-427. 8 refs.

This paper discusses the design of wind-tunnel force test programs for jet aircraft configurations where propulsion system aerodynamic effects must be evaluated in the testing. The simulation requirements of present day jet aircraft are discussed, as are the

simulation problems. The potential tradeoff between individual model engine simulator complexity and test program complexity that will provide the required simulation is introduced. Various model support techniques and engine simulation techniques that might be used are described. Test program designs that could yield aircraft force coefficient data are presented, and finally, the choice of an engine simulator and test program design is considered for three specific aircraft configurations. (Author)

A71-30606 # **Combined inertial - ILS aircraft navigation systems.** James W. Burrows (Boeing Co., Seattle, Wash.). *Journal of Aircraft*, vol. 8, June 1971, p. 439-443. 7 refs.

Error models for the Instrument Landing System (ILS) and Inertial Navigation System (INS) are discussed. A method for combining the two systems using the theory of optimal linear estimation is given. Results of tests of the combined navigation system using a ground vehicle operating on runways and instrumented with an inertial navigator, radio receivers, and a computer are given with emphasis on the effects of initialization and unmodeled errors. The results indicate that use of the combined system during landing approach would simultaneously reduce the cross-runway position and velocity (track angle) errors. The combined system is relatively insensitive to the choice of initial values of certain parameters. Results are still good when the initial parameter values are chosen to approximate a real-time least square fit of INS position and velocity to the ILS localizer signal. The effects of the principal unmodeled error, platform tilt, are such that the tilt would have to be precorrected or included in the error model during approach if a poorer INS were to be employed. (Author)

A71-30607 # **Flutter of clamped skew panels in supersonic flow.** Somayajulu Durvasula (Indian Institute of Science, Bangalore, India). *Journal of Aircraft*, vol. 8, June 1971, p. 461-466. 28 refs.

The supersonic panel flutter problem of clamped skew panels with in-plane forces is formulated on the basis of the classical, small deflection, thin plate theory using oblique coordinates. The two-dimensional, static approximation is made use of for the aerodynamic loading. Galerkin method with the flutter mode represented in terms of a double series of beam characteristic functions is employed. Results of numerical calculations made for unstressed panels for different combinations of side ratio, angle of skew, and angle of yaw are presented here. The majority of the calculations were made using 16 terms in the series. Convergence is examined in a few typical cases. The dynamic pressure parameter for flutter is found to increase monotonically with the angle of skew for side ratio 1 and to decrease initially before beginning to increase for side ratio 0.5. The results are also compared with those obtained earlier for simply supported panels. (Author)

A71-30609 # **Energy state approximation and minimum-fuel fixed-range trajectories.** Nelson R. Zagalsky, Robert P. Irons, Jr., and Robert L. Schultz (Honeywell Systems and Research Center, Minneapolis, Minn.). *Journal of Aircraft*, vol. 8, June 1971, p. 488-490. 5 refs. Contract No. N 00014-69-C-0101.

Search for remedies to the limitations of the energy-state approximation in its performance optimization capability for supersonic aircraft. It is shown that for supersonic aircraft the velocity set is not convex and relaxed controllers are allowed that attain fuel economies superior to any control satisfying the principle of the maximum. This results in the failure of this principle to yield any solutions to the problem of maximum range cruise. It is also shown that, in default of an optimal control, there are suboptimal trajectories that contain a minimum fuel cruise segment, and achieve fuel economies very close to those of the optimum relaxed controller. An appropriate treatment of the minimum fuel problem with range constraints is derived therefrom. M.V.E.

A71-30610 * # Sonic boom reflection factors for flight near the threshold Mach number. Charles L. Thomas (NASA, Ames Research Center, Aerodynamics Branch, Moffett Field, Calif.). *Journal of Aircraft*, vol. 8, June 1971, p. 490.

Study of the reflection of a very weak shock wave off a smooth surface for the condition in which the incident shock wave is nearly perpendicular to the surface. It is found that in this situation the pressure rise across the reflected shock can be up to twice the pressure rise across the incident shock, indicating that sonic boom reflection factors as large as three are possible for aircraft traveling near the threshold Mach number. M.V.E.

A71-30681 * # Installation and testing of strain gages for high-temperature aircraft applications. Earl J. Wilson (NASA, Flight Research Center, Edwards, Calif.). In: Strain gages and extreme environments; Society for Experimental Stress Analysis, Technical Session, Huntsville, Ala., May 19, 1970, Proceedings. Edited by O. L. Gillette. Westport, Conn., Society for Experimental Stress Analysis, 1970, p. 1-7; Discussion, p. 7-10. 5 refs.

Survey of a research program conducted to define the optimal selection, installation, and calibration criteria for strain gages used in aircraft flight-load measurements in a high-temperature environment caused by aerodynamic heating. Tests have been made to determine apparent strain, hysteresis, gage factor, insulation resistance, and attachment methods. Most of the tests involved apparent strain for the purpose of matching the thermal expansion coefficients of the gage and structure materials. A setup for simulating the flight heating of an X-15 horizontal stabilizer is described, and measured temperature vs apparent strain curves are shown for two different free-filament types of gages and one weldable type of gage. As a result of the evaluation program, the weldable platinum-alloy strain gage was chosen for measurements in areas where the temperature was not expected to exceed 900 F. Some fatigue problems associated with using weldable gages are examined, and recommendations are given for strain gage installation. T.M.

A71-30710 Guidance is forever. C. S. Draper (Charles Stark Draper Laboratory, Cambridge, Mass.). *Navigation*, vol. 18, Spring 1971, p. 26-50.

Review of the fundamentals that are alike for all control, navigation and guidance problems, showing how the laws of nature lead to patterns of mechanization that may be generalized for equipment to satisfy the requirements of all missions. Similarities of function are stressed rather than differences in design details. Guidance translates deviations into correction commands and applies these as input to the control subsystem which changes vehicle velocity toward conditions for mission requirement. Application of earth reference coordinates for aircraft, missiles and spacecraft is described from the standpoint of initial orientation to earth coordinates. F.R.L.

A71-30711 The development of long-range hyperbolic navigation in the United States. J. A. Pierce (Harvard University, Cambridge, Mass.) and R. H. Woodward. *Navigation*, vol. 18, Spring 1971, p. 51-62. 19 refs.

Review of the development of navigation by the timing of radio signals, which must be accomplished with an accuracy of a very few microsec if positional accuracy comparable to other methods of navigation is to be achieved. Some details of the British Gee systems and the early developments which led to Loran are discussed. As Loran was perfected, many stations and many thousands of receivers were placed in operation. The major advantage of Loran is the long baseline possible. Several improved versions of Loran are described. Other systems discussed are Radux and Omega. F.R.L.

A71-30712 Air navigation techniques. E. W. Anderson (Smiths Industries, Ltd., Cheltenham, Glos., England). *Navigation*, vol. 18, Spring 1971, p. 77-92.

General discussion of navigation techniques as they have been developed since the earliest days of flying. Before WW II the radio range had become practical, and during the war radar and hyperbolic systems were developed which are briefly described. International agreements formulated after the war are discussed, as well as short-range aids, long-range navigation, and air traffic control. Position finding, automatic dead reckoning, automatic landing, the functions of computers and displays, and area navigation are reviewed. The future roles of Doppler and inertial navigation, and astronavigation by means of satellites are considered. F.R.L.

A71-30725 # Evaluation of American Airlines' B747 prototype AIDS Engine Monitoring Program. H. D. Kruckenberg (American Airlines, Inc., Tulsa, Okla.). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-648*. 11 p. Members, \$1.50; nonmembers, \$2.00.

American is currently entering the evaluation phase of its B747 AIDS (Aircraft Integrated Data System) Program. Attention has been focused on expansion of the number of engine parameters to be monitored including parameter accuracy and repeatability. Depending upon the parameter, the sampling rate for a 4 second data frame varies from a minimum of 4 to a maximum of 32. The experience gained to date from this program is portrayed including the status of the B747 AIDS program objectives. Data utilization is briefly discussed. (Author)

A71-30726 # Automatic inspection, diagnostic and prognostic systems for Army aircraft. Joseph P. Poynton (U.S. Army, Aviation Systems Command, St. Louis, Mo.). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-649*. 7 p. Members, \$1.50; nonmembers, \$2.00.

The U.S. Army Aviation Systems Command has been conducting two major pre-engineering development efforts into automated maintenance monitoring systems. Feasibility, technical approach, and effectiveness studies are now in progress. State-of-the-art test bed hardware has been applied to four UH-1 helicopters. The approach was premised on being able to establish a signature norm and discern detectable differences between this norm and discrepant component signatures. Degraded parts were implanted in the helicopter engines/power-trains and operated in test cells and in flight. Results will be discussed based on available data to date. (Author)

A71-30727 # On-board checkout approach to engine diagnostics - It can work. William Brenner (Grumman Aerospace Corp., Bethpage, N.Y.). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-651*. 7 p. Members, \$1.50; nonmembers, \$2.00.

Description of the techniques required to use an on-board computer to provide coordinated testing, monitoring, data reduction, and analysis. Emphasis is placed upon the need and techniques for automatic in-flight recording (periodically and when limits are exceeded); individual baseline engine performance and vibration signatures; fault isolation; and trend analysis. The purpose is to provide post-flight displays in the aircraft for use by maintenance personnel. The results of implementing this design approach should culminate in an operational airborne engine diagnostic system that will provide the necessary information to determine a scheduled engine maintenance program. F.R.L.

A71-30728 # A systems approach to engine condition monitoring. K. B. Kochanski and D. W. Leiby (General Electric Co., Cincinnati, Ohio). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint*

Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-652. 10 p. Members, \$1.50; nonmembers, \$2.00.

A condition monitoring maintenance concept is being considered or proposed for almost all new commercial or military aircraft. The complexity of jet engines, the engine/aircraft interfaces, and the marriage of airborne instrumentation and electronic equipment with ground based electronic/computer hardware requires the use of a systems approach for the development and implementation of a condition monitoring system. This paper describes how a systems approach has been used in developing condition monitoring techniques for the CF6 engine as a means of having a workable and effective condition monitoring capability available early in its service operation. (Author)

A71-30731 * # Shuttle airbreathing propulsion. Warner L. Stewart, Arthur J. Glassman, and Stanley M. Nosek (NASA, Lewis Research Center, Cleveland, Ohio). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-662.* 11 p. Members, \$1.50; nonmembers, \$2.00.

Airbreathing gas turbine engines to provide cruise, landing, go-around, and ferry capability for the shuttle vehicles face new requirements such as launch, space residence, and reentry. Also, hydrogen is being considered as an alternate fuel for the engines. It becomes necessary to determine which engines are most suitable and to examine them for modifications and technology required to meet the new requirements. This paper reviews the requirements imposed on the engine, the effect of fuel selection, and the design studies currently being conducted to assess candidate engine designs in light of the mission requirements. (Author)

A71-30733 * # Instantaneous and dynamic analysis of supersonic inlet-engine compatibility. James E. Calogeras, Paul L. Burstadt, and Robert E. Coltrin (NASA, Lewis Research Center, Cleveland, Ohio). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-667.* 11 p. 9 refs. Members, \$1.50; nonmembers, \$2.00.

An experimental wind-tunnel investigation was made to determine the effects of time-variant distortions produced in a supersonic inlet on a J85-GE-13 turbojet engine. Results are presented principally in terms of 'instantaneous' distortion amplitudes and contours measured through compressor stall. They indicate that although a time-averaged distortion may be far from a stall-inducing value, corresponding instantaneous distortion amplitudes can approach or exceed this value. A film made by combining instantaneous distortion contours demonstrates that severe total pressure fluctuations at the compressor face can result in an instantaneous distortion of a type completely different from the time-averaged distortion. (Author)

A71-30734 # Compressor sensitivity to transient and distorted transient flows. Willem Jansen, Michael C. Swarden, and Albert W. Carlson (Northern Research and Engineering Corp., Cambridge, Mass.). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-670.* 18 p. 14 refs. Members, \$1.50; nonmembers, \$2.00.

The problem is treated with an analytical model which considers the inlet duct, compressor stages, and combustor up to the turbine nozzles. Results include compressor stalling sensitivity as a function of pressure and temperature amplitude, rotor-speed excursions, pulse duration, circumferential distortion extent, and pulse frequency, as well as blade geometry (such as blade chord length and solidity), and inlet duct geometry. Comparisons with some experimental results are

included. The key conclusion is that delays in blade separation are too short to play a direct role but that delays in stage rotating stall development influence the transient compressor response. (Author)

A71-30735 # Simulation and measurement of pressure transients in a mixed-compression supersonic intake during engine surge. C. R. Dawson (Boeing Co., Seattle, Wash.). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-671.* 12 p. 9 refs. Members, \$1.50; nonmembers, \$2.00.

The flow reduction associated with engine surge was simulated using a high speed mass-flow control coupled to an 1/18-scale wind tunnel model of the SST intake. The valve design and the experimental technique are discussed. Intake/airplane interference resulting from the transient was studied using a twin-intake/wing configuration. Test data indicated lower levels of internal overpressure than predicted by a theoretical analysis which used inviscid conservation equations. Transient pressure differences across internal doors were experimentally determined and used to establish full-scale SST intake load levels. Studies of external interference effects enabled a suitable fence to be defined to prevent mutual intake interference. (Author)

A71-30744 * # Use of the gas generator method to calculate the thrust of an afterburning turbofan engine. Frank W. Burcham, Jr. (NASA, Flight Research Center, Edwards, Calif.). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-680.* 11 p. 11 refs. Members, \$1.50; nonmembers, \$2.00.

The feasibility of using the gas generator method to calculate the thrust of an afterburning turbofan engine was investigated. The NASA Flight Research Center's F-111A airplane, powered by TF30 afterburning turbofan engines, was used. Two variations of the gas generator method were utilized, one based primarily on the exhaust nozzle pressure and area and the other on the nozzle total temperature and weight flow. An influence coefficient study was performed for static and flight conditions. Results showed that the accuracy of the two calculation methods was about equal at static conditions, but for flight conditions the total temperature and weight flow calculation was superior. Two ground thrust stand tests were also performed, and the thrust calculated by using both methods was compared to the measured thrust; results using either method were generally within plus or minus 3 percent except at low power settings. High inlet flow distortion caused an additional scatter of as much as plus or minus 2 percent. (Author)

A71-30745 * # Nozzle performance measurement on underwing nacelles on an F-106 utilizing calibrated engines and load cells. Harold W. Groth (NASA, Lewis Research Center, Cleveland, Ohio). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-681.* 13 p. 6 refs. Members, \$1.50; nonmembers, \$2.00.

A flight research program is underway at the Lewis Research Center to study installation effects on turbojet engine exhaust nozzles over a range of flight Mach number from 0.60 to 1.30. Two J85-13 afterburning turbojet engines were mounted in underwing nacelles. Exhaust nozzle propulsion efficiency is being measured using load cells, calibrated engines, and flight calibrated nacelle tare forces. Reference nozzles of known performance were used to determine nacelle tare forces. Analysis of flight calibration data shows that the system is capable of determining nozzle efficiency to a one-sigma random error of plus or minus 1.5 percent. (Author)

A71-30756 # Systems aspects of augmentor combustion instability. Kervyn D. Mach (USAF, Aero Propulsion Laboratory,

Wright-Patterson AFB, Ohio). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-697*. 4 p. 7 refs. Members, \$1.50; nonmembers, \$2.00.

The improved performance capability demanded of future turbopropulsion systems requires that the major engine components operate at increased levels of performance. Problems, hitherto easily overcome during engineering development, can now become major obstacles. Nearly all augmentor development programs have experienced combustion instability problems (for example, screech), often of destructive magnitude. Because combustion instability is an extremely complex phenomenon and not at all well understood, its elimination often entails performance compromises or expensive schedule slippages. Extensive research into its causes and behavior is necessary to reduce the element of uncertainty in augmentor development programs. (Author)

A71-30757 # Combustion instability in turbojet and turbofan augmentors. John M. Bonnell, Richard L. Marshall, and George T. Riecke (United Aircraft Corp., Pratt and Whitney Aircraft Div., East Hartford, Conn.). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-698*. 9 p. 9 refs. Members, \$1.50; nonmembers, \$2.00.

The state-of-the-art knowledge of high frequency transverse modes (screech) and low frequency longitudinal modes of combustion instability encountered in the development of modern turbofan and turbojet augmentors is presented. The operating conditions and design parameters conducive to combustion instability in turbojet afterburners, turbofan mixed-flow afterburners, and turbofan duct burners are discussed. The nature of screech and low frequency pressure oscillations, as well as possible mechanisms for sustaining the waves, are described. Methods of eliminating high frequency oscillations, either by utilizing wide bandwidth screech liners or by altering the flameholder design are described. Low frequency oscillations are attenuated primarily by tailoring the fuel-air ratio distribution and altering the flameholder design. (Author)

A71-30766 # A mathematical model for jet engine combustor pollutant emissions. Raymond Edelman and Constantino Economos (General Applied Science Laboratories, Inc., Westbury, N.Y.). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-714*. 21 p. 24 refs. Members, \$1.50; nonmembers, \$2.00.

This paper presents a mathematical model based on a modular concept which describes the combustion and pollution formation processes in a jet engine combustor. The model includes turbulent mixing, and reaction kinetics appropriate to the coupled fuel oxidation and pollutant species formation process as well as the effects of two phase flow, recirculation and swirl. The modular concept is unique and permits each relevant process to be studied individually or coupled as a function of operating and geometric parameters. The importance of 'primary' zone parameters upon CO, NO_x, C_xH_y, and soot formation are delineated. (Author)

A71-30770 # Analytical and experimental evaluation of performance prediction methods applicable to exhaust nozzles. E. R. Glasgow, J. S. Divita (Lockheed-California Co., Burbank, Calif.), P. C. Everling, and J. A. Laughrey (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, Ohio). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-719*. 13 p. 29 refs. Members, \$1.50; nonmembers, \$2.00. Contract No. AF 33(657)-70-C-0511.

An evaluation was made of analytical and empirical methods suitable for predicting the performance of isolated jet engine exhaust nozzles operating in the subsonic, transonic and supersonic flight regimes. Among the methods examined were those for predicting internal thrust, ejector pumping, exhaust plumes, surface pressure distribution, boattail and base drags, and flow separation. The most promising methods were evaluated by comparison with data obtained from the testing of variations of convergent, convergent-divergent, and plug nozzles at Mach numbers ranging from 0.6 to 3.0 in the AEDC 16-Foot Propulsion Wind Tunnels. It was concluded that theoretical methods predict pressure distributions, thrust, supersonic boattail drag, and plume shapes, whereas, the empirical correlation methods provide good predictions of base drag, subsonic and transonic boattail drags, and flow separation. (Author)

A71-30771 # Predicting airframe/exhaust nozzle interactions at transonic Mach numbers. E. Grund, W. Presz, Jr., and M. Konarski (United Aircraft Corp., Pratt and Whitney Aircraft Div., East Hartford, Conn.). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-720*. 10 p. 10 refs. Members, \$1.50; nonmembers, \$2.00. Contract No. AF 33(657)-70-C-0511.

An analysis is presented which predicts pressure distributions and drags over arbitrary slender axisymmetric fuselages and afterbodies at transonic Mach numbers. Spreiter and Alksne's method of local linearization has been modified to obtain a more accurate and numerically stable flow field solution at all transonic Mach numbers. This inviscid solution is iteratively coupled with turbulent boundary layer and method of characteristic calculations thereby accounting for viscous effects and variations in jet plume shape. Analytical results are compared with experimental data for a variety of applications. After first showing the validity of the theoretical predictions for basic fuselage and afterbody shapes at approach velocities below and above the speed of sound, the effects of varying nozzle pressure ratio on boattail pressure distributions and drags are presented. Plume shapes for static conditions as well as those influenced by external transonic flow are defined. The analytic method is also used to predict the effects of different boundary layer characteristics and different forebody shapes on afterbody pressure drags. Finally, an example is provided that demonstrates how the analysis can be applied to point up the performance differences between a propulsion system in an isolated or airplane installed flow field. (Author)

A71-30775 # Flowfields produced by multiple jets in a supersonic stream. James M. Kallis (McDonnell Douglas Astronautics Co., Huntington Beach, Calif.). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-728*. 7 p. 20 refs. Members, \$1.50; nonmembers, \$2.00. Research supported by the McDonnell Douglas Astronautics Independent Research and Development Program.

The situation investigated occurs with jet control of a supersonic vehicle, with supersonic-combustion ramjets, and with fluid injection for thrust-vector control of solid-propellant rockets. The ultimate objective of the research is to develop a method or methods for predicting the effect on the control force of the interaction between flowfields produced by adjacent jets. The approach taken is to conceptually replace the jets by equivalent solid obstacles and to neglect boundary-layer effects. This makes it possible to reduce the problem to that of calculating the inviscid flowfield between multiple solid blunt bodies in a supersonic stream. The results of a three-part study of this problem are described. A method is developed for calculating the interference flowfield between bodies spaced far enough apart that the shock-wave pattern is regular reflection. This calculation is based on the method of characteristics. An evaluation is made of the suitability of available blunt-body methods for computing the input lines for the characteristics' calculations. M.M.

A71-30776 # Aviation and environmental quality (A survey of the SAE/DOT Conference on Aircraft and the Environment). Robert L. Paullin (U.S. Department of Transportation, Regulatory Policy and Standards Div., Washington, D.C.). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-729.* 7 p. Members, \$1.50; nonmembers, \$2.00.

The SAE/DOT Conference on Aircraft and the Environment, held in Washington, D.C., Feb. 8-10, 1971, brought together for the first time those parties interested in problems associated with the environment, generated by aircraft and airports. This paper summarizes the results of that Conference, delineates conclusions and recommendations, and highlights future courses of action laid out by the Conference. The questions of noise pollution and the question of air and other types of pollution were directly reviewed during the course of the Conference. Technical papers were presented and workshop sessions were held on the source, distribution and receipt, as well as legal and economic aspects of broad problem areas. These subjects are surveyed in this paper. (Author)

A71-30777 # The prediction of the spectral content of combination tone noise. Gordon F. Pickett (United Aircraft Corp., Pratt and Whitney Aircraft Div., East Hartford, Conn.). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-730.* 7 p. 6 refs. Members, \$1.50; nonmembers, \$2.00. Contract No. FA-69-WA-2045.

The essential features of combination tone noise which is generated from turbofan engines when the relative tip speed of the fan blades is supersonic are examined. A method for determining the expected distribution of sound power among the harmonics of engine rotation frequency is presented. The distribution is found to depend on two statistical parameters representing the variations in shock strength and the intervals between successive shock waves. The spectral dependence is shown to be more critical on interval variations. Estimates for typical blade geometries are obtained. O.H.

A71-30778 * # Theoretical and experimental analysis of acoustic linings for ducts with flow. Walter Eversman (Boeing Co.; Wichita State University, Wichita, Kan.), M. Dean Nelsen, Denis Armstrong, and Orville J. Hall, Jr. (Boeing Co., Wichita, Kan.). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-731.* 14 p. 26 refs. Members, \$1.50; nonmembers, \$2.00. NASA-supported research.

A theoretical and experimental program for the design of acoustic linings for the attenuation of fan generated noise in turbo fan engines is described. This program is based on an interaction between an extensive analytical lining performance prediction capability and flow duct testing. The theoretical basis for lining analysis in rectangular, circular, and annular ducts with either uniform or sheared flow is formulated and the results of the development of a lining mathematical model are presented. The predictive capability is employed in conjunction with a least attenuated mode lining optimization scheme to determine the lining impedance which will provide the required attenuation spectrum. A flow duct test facility is described and results of the testing of lining designs and the comparison with theoretical predictions is presented. Current developments for the improvement of the design capability are discussed. (Author)

A71-30780 # On combustion generated noise. Warren C. Strahle (Georgia Institute of Technology, Atlanta, Ga.). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-735.* 11 p. 23 refs. Members, \$1.50; nonmembers, \$2.00.

A theory of combustion noise is developed in order to overcome the apparent lack of understanding of the mechanism by which this type of noise is generated. The theory follows rigorously from the principles of fluid mechanics. Lighthill's approach (1952), used in his studies of aerodynamic noise, is closely followed. The sound radiated from open, turbulent flames is found to depend strongly upon the structure of such flames; presently their structure is not well known. However, meaningful bounds and scaling rules for the sound power output and spectral content are derived, based upon the present limited knowledge. A framework is developed which explains past experimental work and the origin of combustion noise. O.H.

A71-30784 * # Some experimental results on lift fan noise reduction. M. J. Benzakein and S. B. Kazin (General Electric Co., Cincinnati, Ohio). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-743.* 8 p. Members, \$1.50; nonmembers, \$2.00. Contract No. NAS 2-5462.

The results of an extensive experimental program on lift fan noise suppression are presented. The program was carried out on a tip turbine driven 36-in. lift fan research vehicle propelled by a J85 engine. The fan has a design pressure ratio of 1.3 and a design tip speed of 950 ft/sec. The comparative results on the relative benefits of vane/blade ratio, vane lean, rotor stator spacing, fan frame treatment and acoustically treated splitters on fan radiated noise are discussed. (Author)

A71-30785 * # Blown flap noise research. R. G. Dorsch, E. A. Krejsa, and W. A. Olsen (NASA, Lewis Research Center, Cleveland, Ohio). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-745.* 19 p. 6 refs. Members, \$1.50; nonmembers, \$2.00.

Noise data were obtained with models of both internally and externally blown jet-flaps of the type currently being developed for STOL aircraft. The principal tests were conducted with an augmentor-wing model and with an externally-blown double-slotted-flap model. Secondary tests were conducted with a jet flap model. The interaction between the jet and the flap assembly caused both redirection and generation of noise. The data were extrapolated to representative full scale STOL airplane flap systems. It is shown that with a quiet engine the blown flap noise can be the major contribution to the total aircraft noise. Suppression techniques will therefore be required. (Author)

A71-30791 * # Acoustic liner design from a fluid mechanics approach. T. S. Tonon, W. A. Sirignano, D. T. Harje (Princeton University, Princeton, N.J.), and P. K. Tang. *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-757.* 15 p. 13 refs. Members, \$1.50; nonmembers, \$2.00. NASA-supported research.

Design procedures and recommendations are presented for the construction of acoustic liners in the suppression of combustion instability in liquid and solid propellant combustors and of high intensity noise in air-breathing jet aircraft. The liner geometry may consist of Helmholtz resonators or quarter-wave tubes. Liner cross-flow effects as well as oscillatory pressure effects are considered in the methods presented. (Author)

A71-30792 # Experimental correlation of installation effects for inlet/airplane integration. W. H. Ball and P. A. Ross (Boeing Co., Seattle, Wash.). *American Institute of Aeronautics and Astronautics and Society of Automotive Engineers, Propulsion Joint Specialist Conference, 7th, Salt Lake City, Utah, June 14-18, 1971, AIAA Paper 71-759.* 10 p. 5 refs. Members, \$1.50; nonmembers, \$2.00.

Results of a test of a closely related series of propulsion and aerodynamic wind tunnel models to investigate installation effects for a multimission strategic aircraft configuration. The tests were designed to yield, in a related fashion, flowfield definition; inlet internal performance; and inlet/aircraft drag as a function of inlet position, forebody shape, and orientation. A semiempirical analysis procedure was derived from the results to predict installed inlet performance. The cases examined with this approach show excellent correlation with measured installed performance. F.R.L.

A71-30799 Optimal and suboptimal control synthesis for minimum time VTOL transition. Louis R. Nardizzi, Ming Y. Tarn (Southern Methodist University, Dallas, Tex.), and Robert J. Parker (LTV Aerospace Corp., Dallas, Tex.). *IEEE Transactions on Aerospace and Electronic Systems*, vol. AES-7, May 1971, p. 506-520. 7 refs. NSF Grant No. GK-5608; Contract No. AF 44(620)-68-C-0023.

Optimal open-loop and suboptimal closed-loop controls for a VTOL aircraft in a minimum climb-to-cruise time transition are presented in this paper. The optimal open-loop controls are synthesized by a proposed gradient technique which provides for the selection of desired changes in physically meaningful parameters during each iteration step. The suboptimal closed-loop controls are synthesized as integral mean-square approximations to the optimal open-loop controls over the minimum time-to-climb interval. Piecewise-constant feedback gains and switching times are synthesized for multidimensional control vectors which are linear combinations of observable states. Several computational results are presented for optimal and suboptimal minimum time controls with constrained and unconstrained terminal flight-path angles. (Author)

A71-30820 * Practical aspects of sonic boom problems (Aspetti pratici dei problemi del boom sonico). Antonio Ferri (New York University, New York, N.Y.). *L'Aerotecnica - Missili e Spazio*, vol. 50, Feb. 1971, p. 37-45. 15 refs. In Italian. Grant No. NGL-33-016-119.

Investigation of SST configurations selected from the standpoint of minimizing sonic boom. It is shown that, for an overall aircraft length of 300 ft and a total weight comparable to that of current U.S. SST designs, sonic booms having shock overpressures of the order of 0.6 lb/sq ft can be obtained. Values as low as 0.3 lb/sq ft are possible for aircraft designed for cross-country flights. M.M.

A71-30821 Shape of the fuselage of modern passenger transports (Sulla forma delle fusoliere dei moderni velivoli da trasporto passeggeri). Giuseppe Gabrielli (Torino, Politecnico, Turin, Italy). *L'Aerotecnica - Missili e Spazio*, vol. 50, Feb. 1971, p. 46-52. 6 refs. In Italian.

Due to the increased efficiency of modern wing flaps and the need for larger cargo and passenger spaces, the influence of wings on total aircraft drag has been reduced, while fuselage influence has increased in modern fast subsonic airliners. Some geometric characteristics of present fuselages are analyzed, and the reasons for new prospects regarding the fuselage shape of large airlines are outlined. The expediency of proceeding with the present philosophy of cylindrical fuselages with high aspect ratio, as compared with fuselages with a much lower aspect ratio, is discussed. The paucity of experimental data from individual fuselage models, primarily in the range of Reynolds numbers close to the real numbers, and the lack of experimental facilities are stressed. A proposal for a wind tunnel to be built as a European cooperative effort is advanced. M.M.

A71-30822 Aeronautical Institute of the University of Pisa - Activities of the 1960-70 decade: Projects currently under way (L'Istituto di Aeronautica dell'Università di Pisa - Attività nel decennio 1960-70: Programmi in atto). Lucio Lazzarino (Pisa, Università, Pisa, Italy). *L'Aerotecnica - Missili e Spazio*, vol. 50, Feb. 1971, p. 53-62. 63 refs. In Italian.

Brief description of the research projects concluded and initiated by the Institute in the 1960s. The results obtained so far are summarized, and a bibliography is provided for details. The projects deal with the interaction of supersonic and subsonic fluid streams, even at the boundaries of different surfaces, the fatigue strength of thin stiffened shells subjected to compressive or tensile loads, as well as preliminary, methodologic, theoretical, and experimental investigations on V/STOL aircraft and their use. The experimental equipment, partly original, which was designed and built to carry out the investigations, is briefly described. M.M.

A71-30824 Conceptual lines for the definition of an aeronautical project (Linee concettuali per la definizione di un progetto aeronautico). Gian Battista Nicolò (Napoli, Università, Naples, Italy) and Licio Giorgieri (Trieste, Università, Trieste, Italy). *L'Aerotecnica - Missili e Spazio*, vol. 50, Feb. 1971, p. 73-84. In Italian.

The criteria to be followed in order to convert operational targets into actual requirements and technical specifications are outlined, attaching the utmost importance to the achievement of optimal cost effectiveness. A rational scheme of research, which has been applied successfully to the definition of the multinational, multirole combat aircraft MRCA, is described in its general lines and complexities. The setting up of a parametric analysis, which constitutes the central phase of the research, through which requirements and specifications are correlated in the most feasible solution, is described in detail. M.M.

A71-30825 Influence of structural nonlinearities on panel flutter (Influenza delle nonlinearià strutturali sulle vibrazioni aeroelastiche dei pannelli). Paolo Santini (Roma, Università, Rome, Italy). *L'Aerotecnica - Missili e Spazio*, vol. 50, Feb. 1971, p. 85-90. 19 refs. In Italian.

Investigation of the problem of the flutter of a flat or curved panel, with emphasis on the effect upon it of structural and inertial nonlinearities. Geometrical nonlinearities, which can be treated with sufficient confidence, are discussed, and the lack of information existing in the area of physical nonlinearities is pointed out. Some methods of solution are briefly discussed. M.M.

A71-30855 # A solution for an axisymmetrical three-component flow of incompressible viscous fluid (Ob odnom reshenii trekhkomponentnogo osesimmetrichnogo techeniia viazkoï neszhimaemoï zhidkosti). G. I. Nazarov and A. K. Ianko (Kievskii Institut Inzhenerov Grazhdanskoi Aviatsii, Kiev, Ukrainian SSR). *Prikladnaia Mekhanika*, vol. 7, Apr. 1971, p. 123-126. In Russian.

Derivation of an exact solution to a system of equations describing the axisymmetrical motion of the components of an incompressible viscous fluid flow in a cylinder with a rotating disk of paddles and a mesh preventing the circular motion of the flow. The equations contain an arbitrary function which depends only on the axial coordinate of the mass forces. The solution can be used in calculating the parameters of an air flow in the cylindrical compressor cascade of a turbofan engine. V.Z.

A71-30874 # Hypersonic flow past a delta wing. A. L. Gonor. (*Prikladnaia Matematika i Mekhanika*, vol. 34, May-June 1970, p. 481-490.) *PMM - Journal of Applied Mathematics and Mechanics*, vol. 34, no. 3, 1970, p. 452-461. 6 refs. Translation.

Analysis of the flow pattern at the windward side of a wing with supersonic leading edges, with particular reference to the difficulties associated with obtaining a correct solution to the problem. These difficulties arise due to the fact that in the flow field behind a strong shock wave, there exist simultaneously uniform potential regions and vortex regions which must be smoothly joined. An analytical theory of hypersonic flow past a wing with an attached shock wave is

proposed which makes it possible to join the potential and vortex regions behind the shock wave. V.P.

A71-30888 Calculation of three-dimensional structures. Number 13 (Raschet prostranstvennykh konstruksii. Number 13). Edited by S. A. Alekseev, V. V. Novozhilov, and A. A. Umanskii. Moscow, Izdatel'stvo Literatur po Stroitel'stvu, 1970. 295 p. In Russian.

Survey of the strength and stability of compound-curvature shells, bodies of revolution, and multilayer plates. Topics treated include (1) the use of analytic functions for solving three-dimensional problems in the theory of elasticity, (2) stability of plates, rods, and shells during creep, (3) new applications of photoelastic coatings for studying large and small deformations, and (4) determination of aerodynamic loads acting on spherical shells.

A71-30896 NTC '71; institute of Electrical and Electronics Engineers, National Telemetry Conference, Washington, D.C., April 12-15, 1971, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1971. 346 p. Members, \$17.50; nonmembers, \$20.

Theoretical and experimental research on transmission codes, data processing techniques, sensors, transmitters, receivers, and system design procedures for telemetry applications in medicine, industry, law enforcement, transportation, earth resources, and environmental monitoring. Detailed descriptions are given of systems used for satellite data collection, seismic data acquisition, weather observations, petroleum surveys, air traffic control, urban traffic measurement, image processing, emergency medical communications, and biological observations. FM threshold extension, random multiple access, asynchronous TDM, and color TV transmission systems are outlined. Some studies are directly concerned with increasing the efficiency of electromagnetic spectrum utilization in areas of high message traffic density.

A71-30898 * Results of an experiment to locate and read data from unmanned transponders using satellites. Roy E. Anderson (General Electric Co., Schenectady, N.Y.). In: NTC '71; Institute of Electrical and Electronics Engineers, National Telemetry Conference, Washington, D.C., April 12-15, 1971, Record.

New York, Institute of Electrical and Electronics Engineers, Inc., 1971, p. 15-28. Contract No. NAS 5-11634.

The vhf transponders of NASA's ATS-1 and ATS-3 satellites have been used to locate and communicate with ships and aircraft and to locate and read sensor data from a buoy moored at sea. The remote platforms have included a buoy moored in deep water near Bermuda, Coast Guard cutters in the Gulf of Mexico and Pacific Ocean, aircraft in flight over the continental United States and the North Atlantic, and a network of ground-based transponders at Ireland, Greenland, Iceland; Newfoundland, the state of Washington, and Argentina. Position fix accuracies were approximately 1 n mi, 1 sigma, using ordinary vhf band mobile communications equipment with simple, inexpensive tone-code responders connected between the receivers and transmitters. Much better accuracy would be obtained using wider bandwidth at higher radio frequencies. The tests confirmed that a network of remote, unmanned platforms can be interrogated at any time, in any sequence with the location of each platform and its sensor data immediately available at the ground station. A71-30900 Design tradeoffs for HF and synchronous satellite data collection systems. Bernard A. Mitchell and Francis P. Cullen (Sanders Associates, Inc., Nashua, N.H.). In: NTC '71; Institute of Electrical and Electronics Engineers, National Telemetry Conference, Washington, D.C., April 12-15, 1971, Record.

New York, Institute of Electrical and Electronics Engineers, Inc., 1971, p. 37-45.

The results of a performance and cost tradeoff study between

High Frequency (HF) and Synchronous Satellite Readout of remote data collection platforms is presented. The HF link analysis is concerned with surface wave transmission for path lengths less than 200 n mi and for ionospheric mode transmission for path lengths between 200 and 2000 n mi. The satellite link analyzed is the Synchronous Meteorological Satellite (SMS) currently being built by NASA/NOAA. Based on this analysis, platform transmitter power requirements are defined and required SNR margins delineated to combat the combined effects of high sea state variations and low elevation angle operation. Cost considerations based on the difference in platform requirements for each type of link are presented.

A71-31021 Wake induced flutter of circular cylinders - Mechanical aspects. Alan Simpson (Bristol, University, Bristol, England). *Aeronautical Quarterly*, vol. 22, May 1971, p. 101-118.

The class of cases wherein the mechanical support system for the leeward cylinder exhibits static coupling is studied using undamped flutter theory. It is demonstrated that the appearance of static coupling terms can lead to quite dramatic changes in the flutter characteristics and that considerable care must be exercised in the design and operation of wind-tunnel dynamic models if meaningful results are to be obtained. An Appendix deals with the general problem of mechanical coupling, using the normal coordinates approach, and aspects of the problem which bear on the sub-conductor oscillations phenomenon experienced on bundled overhead power transmission lines are highlighted.

A71-31022 Experimental study of the thermal wake interference between closely spaced wires of an X-type hot-wire probe. F. E. Jerome (British Columbia, University, Vancouver, Canada), D. E. Guitton (McGill University, Montreal, Canada), and R. P. Patel. *Aeronautical Quarterly*, vol. 22, May 1971, p. 119-126. 5 refs. Research supported by the Department of Transport of Canada; Defence Research Board of Canada Grant No. 9551-12.

A Disa X-type probe, with the wires 0.15 mm apart, is tested and found to have a static sensitivity to small angles of pitch, which is very significant for Reynolds numbers under 5 but becomes small for Reynolds numbers greater than 10. The experiments with the Disa X-wire probe were performed in the McGill 0.91 m x 0.61 suction wind tunnel. Two simple modifications were used in order to avoid the thermal wake effects of the X-wire probe in its original form. A modified probe, having the wires one wire length apart, is suggested. This probe was found to have no pitch sensitivity. G.R.

A71-31024 The strongly controlled aircraft. R. D. Milne and G. D. Padfield (Queen Mary College, London, England). *Aeronautical Quarterly*, vol. 22, May 1971, p. 146-168. 7 refs.

The analysis described shows how the motion of a strongly controlled aircraft can be described in terms of simpler subsystems. The sum of the dimensions of the subsystems is equal to the total dimension of the aircraft/control system. The technique, under suitable conditions, yields an approximation to all the modes of motion of the system. In the limit of infinitely strong control the results agree with Newmark's theory (1957). The theory of kinematic constraint serves as a useful indicator for the application of the approximation described. The role of the pilot in applying strong control is placed in the context of the general theory. G.R.

A71-31026 The dynamical behaviour of a flexible cable in a uniform flow field. R. R. Huffman (Whirlpool Corp., Benton Harbor, Mich.) and Joseph Genin (Purdue University, Lafayette, Ind.). *Aeronautical Quarterly*, vol. 22, May 1971, p. 183-195. 12 refs.

A nonlinear mathematical model for the study of the dynamics of an extensible cable subjected to aerodynamic forces generated by a uniform flow field is formulated. Solutions are found considering large displacement caused by suddenly applied loads (i.e., gusts, shock waves, turbulence) for a range of flow speeds and cable

A71-31034

lengths. Transition from overdamped to oscillatory motion is observed when flow speed and cable length are increased and decreased, respectively. The stability of the system is discussed.

A71-31034 **Institution of Electrical Engineers, Conference on Aerospace Antennas, London, England, June 8-10, 1971, Proceedings.** London, Institution of Electrical Engineers (IEE Conference Publication, No. 77), 1971, 286 p.

Details of satellite, aircraft, and rocket antenna systems intended for navigational, communications, and telemetry applications. Structural design features, materials specifications, and electrical characteristics are outlined for end-fed slotted waveguide arrays, blade antennas, omnidirectional cylindrical arrays of slot radiators, Luneberg lenses, conical spiral antennas, and various antennas developed to meet specific environmental and electrical requirements. Extensive theoretical and experimental research is described on the effects of radomes, polarization requirements, mechanical and electrical scanning procedures, numerical prediction of radiation patterns, and stabilization mechanisms.

A71-31036 **A high speed airborne scanning aerial with matched patterns.** R. H. J. Cary and A. M. Munro (Royal Radar Establishment, Malvern, Worcs., England). In: Institution of Electrical Engineers, Conference on Aerospace Antennas, London, England, June 8-10, 1971, Proceedings. London, Institution of Electrical Engineers (IEE Conference Publication, No. 77), 1971, p. 7-12.

Description of a navigational radar antenna consisting of an offset horn fed reflector and featuring choice of polarization and faster scanning for improved visual display. Right-hand and left-hand circular, vertical, and horizontal polarization modes are available, and the reception of cross-polarized components is possible in each case. The horn is so positioned as to reduce aperture blocking and to be of long focal length, enabling a minimum reflector curvature for minimum cross polarization.

T.M.

A71-31038 **An airborne electronically scanned X band narrow beam circular antenna array.** R. H. J. Cary (Royal Radar Establishment, Malvern, Worcs., England). In: Institution of Electrical Engineers, Conference on Aerospace Antennas, London, England, June 8-10, 1971, Proceedings. London, Institution of Electrical Engineers (IEE Conference Publication, No. 77), 1971, p. 19-24.

Three different electronically scanned, X-band, antenna array configurations which provide all-round coverage when mounted beneath the nose or fuselage of an aircraft are compared in order to evaluate the advisability of replacing a conventional, mechanically scanned 5-ft diam antenna. The configurations include (1) three separate planar arrays arranged in a triangular form, (2) a near-hemispherical sectional Luneberg lens antenna, and (3) a circular array of 240 radiators switched in a 120-deg arc of 80 radiating elements. The Luneberg lens antenna is the most suitable of the three configurations, but the overall conclusion is that none of the three offer enough advantages over the mechanically scanned system to be cost effective at present.

T.M.

A71-31041 **Antennas for sideways looking airborne radar.** R. H. J. Cary (Royal Radar Establishment, Malvern, Worcs., England) and J. Thraves (EMI Electronics, Ltd., Feltham, Middx., England). In: Institution of Electrical Engineers, Conference on Aerospace Antennas, London, England, June 8-10, 1971, Proceedings. London, Institution of Electrical Engineers (IEE Conference Publication, No. 77), 1971, p. 37-42.

Structural design concepts, mechanical stability requirements, and aircraft compatibility considerations are explained for airborne side-looking radar antennas consisting of end-fed slotted waveguide arrays. Control of the azimuth and vertical patterns is described in terms of slot positioning and spacing effects, the use of dielectric lenses and broadside horns, and the stacking of linear arrays. Methods used for indication of moving targets are outlined, together with mechanical solutions to the problem of compensating for aircraft roll, yaw, and other instabilities.

T.M.

A71-31043 **Flush mounted aeronautical antenna.** G. A. Hockham (Standard Telecommunication Laboratories, Ltd., Harlow, Essex, England). In: Institution of Electrical Engineers, Conference on Aerospace Antennas, London, England, June 8-10, 1971, Proceedings. London, Institution of Electrical Engineers (IEE Conference Publication, No. 77), 1971, p. 49-53.

An experimental investigation has demonstrated that waveguide antennas are feasible at much lower frequencies than usual by using electrically small elements and without the necessity of completely loading the waveguide with high-permittivity material. A flush-mounted airborne antenna was designed which consists of a short length of waveguide with a thin dielectric plug in the aperture. The use of the plug results in a purely real input impedance which gives rise to complete energy transfer through the structure when matched to the feed. The plug also provides protection from the environment and provides continuity of the flange. Measured characteristics are given for operation at 5 GHz.

T.M.

A71-31044 **An airborne blade antenna for 26-100 MHz.** C. E. Cooper (Chelton /Electrostatics/, Ltd., Marlow, Bucks., England). In: Institution of Electrical Engineers, Conference on Aerospace Antennas, London, England, June 8-10, 1971, Proceedings. London, Institution of Electrical Engineers (IEE Conference Publication, No. 77), 1971, p. 54-59.

Description of a tunable antenna covering either 30-100 or 26-76 MHz by 35 or 45 individual bands, respectively. Individual bandwidth varies from less than 0.5 MHz up to 5 MHz at the low and high frequency extremes, respectively. Radiation is from an elevated plane whose capacitance is series-resonated by a combination of from one to six binary-related inductors, switched by miniature high-vacuum relays. The entire radiation-tuning-switching mechanism is contained within an aerodynamically shaped fiberglass shell.

T.M.

A71-31046 **An aerial module for the uhf band.** G. Bagley (Royal Aircraft Establishment, Farnborough, Hants., England). In: Institution of Electrical Engineers, Conference on Aerospace Antennas, London, England, June 8-10, 1971, Proceedings. London, Institution of Electrical Engineers (IEE Conference Publication, No. 77), 1971, p. 66-70.

Preliminary test results are given for an airborne communications system being developed in an attempt to determine the efficiency of a relatively low rf carrier power which is applied directly to the aerial. A composite aerial was mounted on the underside of a Hastings aircraft during the tests while rf drive, power supply and modulation were furnished by a modified 12 channel uhf equipment. Some field strength measurement data obtained on the ground for the communications system are given.

V.Z.

A71-31047 **Fincap communication aerials.** J. Mahoney (Standard Telephones and Cables, Ltd., London, England). In: Institution of Electrical Engineers, Conference on Aerospace Antennas, London, England, June 8-10, 1971, Proceedings. London, Institution of Electrical Engineers (IEE Conference Publication, No. 77), 1971, p. 71-76.

An empirical approach to designing vhf/uhf fincap aerials is set forth and practical environmental tests of fincap aerials for vibration,

acceleration, waterproofness, salt corrosion, ice formation and compass safe distance are indicated. Radiation patterns and structural and impedance problems are covered. Simulation and scale models are essential in this fincap design technique. V.Z.

A71-31048 **A review of helicopter aerial problems.** W. A. Kelly (Ministry of Aviation Supply, London, England) and R. A. Burberry (Standard Telephones and Cables, Ltd., London, England). In: Institution of Electrical Engineers, Conference on Aerospace Antennas, London, England, June 8-10, 1971, Proceedings. London, Institution of Electrical Engineers (IEE Conference Publication, No. 77), 1971, p. 77-82.

Difficulties to be overcome for proper accommodation of all the required aerials on modern helicopters are discussed. The multiplicity of the aerials, their multiband designs, the extensive use of nonmetallic structures, and the increased complexity of airborne radio systems are noted as sources of aerial-siting problems. It is suggested that designers bear in mind the limitations of aerials and treat their siting problems not in isolation but as ingredients of helicopter designs as units. V.Z.

A71-31049 **On the uncertainty limit of high speed electronic scanning.** S. Cornbleet (Surrey, University, Guildford, Surrey, England). In: Institution of Electrical Engineers, Conference on Aerospace Antennas, London, England, June 8-10, 1971, Proceedings. London, Institution of Electrical Engineers (IEE Conference Publication, No. 77), 1971, p. 83-88. 5 refs.

Element error and angular error analysis for phase and frequency scanned arrays, covering linear arrays and static matrix-fed and monopulse arrays. An equation is given to show that an array element frequency discrepancy and thus an uncertainty in the beam position arise when the array pattern is scanned through an angle of 2 psi in T seconds. The nonexistence limit of angular uncertainty in the static case is shown to correspond to the classical time-frequency uncertainty relation $T \Delta f = 1$. V.Z.

A71-31053 **Hf notch aerials for small aircraft.** C. G. Fitzpatrick and R. A. Burberry (Standard Telephones and Cables, Ltd., London, England). In: Institution of Electrical Engineers, Conference on Aerospace Antennas, London, England, June 8-10, 1971, Proceedings. London, Institution of Electrical Engineers (IEE Conference Publication, No. 77), 1971, p. 112-117.

Investigation of notch antennas, which provide one solution to the problem of inefficient radiation at the lower end of the hf band. The notch antenna has the additional merit of minimal interference with primary aircraft structure. Work on a number of small (less than 50-ft length) high performance aircraft is described. F.R.L.

A71-31054 **An airborne phased array for use in an ATC satellite system in L-band.** W. M. Fraser and N. C. Williams (British Aircraft Corp., Ltd., Bristol, England). In: Institution of Electrical Engineers, Conference on Aerospace Antennas, London, England, June 8-10, 1971, Proceedings. London, Institution of Electrical Engineers (IEE Conference Publication, No. 77), 1971, p. 118-126.

Use of a phased array on board the aircraft to alleviate problems of power budget and vulnerability to multipath and interference. A phased array provides the required hemispherical coverage in a number of manually steered, high gain, narrow bandwidth steps. Major design constraints are aircraft mounting, airframe visibility, and pattern interference in addition to airline operator considerations. F.R.L.

A71-31055 **A microstrip p.i.n. diode controlled L-band digital phase shifter.** P. A. Matthews and D. Markopoulos (University

College, London, England). In: Institution of Electrical Engineers, Conference on Aerospace Antennas, London, England, June 8-10, 1971, Proceedings. London, Institution of Electrical Engineers (IEE Conference Publication, No. 77), 1971, p. 127-129.

Consideration of 3-bit phase shifters giving relative phase shifts of 180, 90, and 45 deg. Their purpose is to steer the beam from the phased array as the orientation of the aircraft relative to the satellite changes. Each phase shift bit uses a 3-dB coupler with two arms terminated by switching circuits. The 3-dB couplers considered are the two-branch line coupler and the hybrid ring coupler. Both these couplers may be fabricated by using thin or thick film techniques. F.R.L.

A71-31056 **A high efficiency Cassegrain aerial design.** C. Dawson (Elliott-Automation Radar Systems, Ltd., Borehamwood, Herts., England). In: Institution of Electrical Engineers, Conference on Aerospace Antennas, London, England, June 8-10, 1971, Proceedings. London, Institution of Electrical Engineers (IEE Conference Publication, No. 77), 1971, p. 130-135.

Description of a compact Cassegrain antenna which has a high efficiency/narrow beam characteristic which illuminates the horizon without excessive ground illumination. It has an oval-shaped aperture; only the central circular section has a uniform amplitude distribution. This configuration was chosen in order to make optimum use of radome space. F.R.L.

A71-31060 **The antenna performance of the L-1011 Tristar.** F. R. Zboril (Lockheed-California Co., Burbank, Calif.). In: Institution of Electrical Engineers, Conference on Aerospace Antennas, London, England, June 8-10, 1971, Proceedings. London, Institution of Electrical Engineers (IEE Conference Publication, No. 77), 1971, p. 157-163.

One-year test results are discussed for the antenna arrangement developed for the aircraft. The arrangement was found to be well consistent with weight, aerodynamic and structural design requirements. It is anticipated that the antenna arrangement will provide adequate radiation patterns in the complexity of the aircraft structure in compliance with the required performance of the L-1011 communication and navigation systems. V.Z.

A71-31062 **Design of a linear array of blade antennas for aircraft-satellite communication.** J. P. B. Vreeburg, O. B. M. Pietersen, and F. Klinker (National Luchtvaartlaboratorium, Amsterdam, Netherlands). In: Institution of Electrical Engineers, Conference on Aerospace Antennas, London, England, June 8-10, 1971, Proceedings. London, Institution of Electrical Engineers (IEE Conference Publication, No. 77), 1971, p. 176-185.

The power gain of an antenna system can be expressed in wave parameters by assuming that the system can be considered as a linear microwave network. Various simplifications are made resulting in an expression for the array factor which takes into account mutual effects of the elements. These mutual influences are determined by a small number of measurements on the array in its simulated electrical environment. Comparison with measured values shows that the side lobe levels of the radiation pattern of the array are predicted better than when mutual effects are neglected. It is expected that the information from an array consisting of a few elements is sufficient to predict the performance of a similar array with more elements. (Author)

A71-31074 **The L band aircraft antenna of the 'Dioscures System' (Electronic scanning for satellite-aided navigation system).** B. Dorier (SNECMA, Suresnes, Hauts-de-Seine, France). In: Institution of Electrical Engineers, Conference on Aerospace Antennas, London, England, June 8-10, 1971, Proceedings. London, Institution of Electrical Engineers (IEE Conference Publication, No. 77), 1971, p. 259-264.

Discussion of an L band antenna which is based on the use of a convex array consisting of left- and right-hand circularly polarized radiating elements and of static electronic steering circuits. This makes it possible to scan two antenna beams independently in two directions. Such an aircraft-integrated equipment permits simultaneous L band radio links with two synchronous satellites. A ground station can then ensure accurate aircraft location by electronic methods. Practically worldwide coverage is possible with 6 synchronous satellites. F.R.L.

A71-31075 **A circular slot aperture with arbitrary polarization for aerospace applications.** Richard E. Herskind (Avco Corp., Systems Div., Wilmington, Mass.). In: Institution of Electrical Engineers, Conference on Aerospace Antennas, London, England, June 8-10, 1971, Proceedings. London, Institution of Electrical Engineers (IEE Conference Publication, No. 77), 1971, p. 265-275.

Description of a one-wavelength circular slot aperture radiation from the surface of a circular cylinder. It is shown that the single circular slot has radiation characteristics which offer a lower ellipticity ratio than that of a crossed linear slot radiating under similar conditions. It is suggested that a circular slot aperture can be used to approximate the pattern characteristics of an Archimedean or log spiral on a cylinder over a wide range of frequencies. F.R.L.

A71-31076 **Army helicopter performance trends.** Richard B. Lewis, II (U.S. Army, Edwards AFB, Calif.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 500.* 10 p. 15 refs. Members, \$1.25; nonmembers, \$2.00.

Performance data of seven different types of current Army rotorcraft, based on U.S. Army Aviation Systems Test Activity test experience, are summarized. Nondimensional presentations are employed to generalize the data. Several aspects of both hovering and forward flight performance are first discussed. Out-of-ground effect hover power required, compressibility effects on hovering performance, and the influence of ground proximity are examined. Level flight power required, drag effects, and compressibility trends in forward flight are shown. Finally, a discussion of autorotational descent performance is presented. O.H.

A71-31077 **Full-scale proprotor development.** Kenneth G. Wernicke and H. Kipling Edenborough (Bell Helicopter Co., Fort Worth, Tex.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 501.* 16 p. 27 refs. Members, \$1.25; nonmembers, \$2.00.

An advanced-design, 25-foot-diameter, flightworthy proprotor was tested in the NASA-Ames Large-Scale Tunnel, and reached a simulated speed of 408 knots. The tests were part of an Army/NASA Proprotor Technology Program, the objective of which is to develop technology for an aircraft which will meet the civil and military need for VTOL transportation. The proprotor, suitable for a demonstrator aircraft, displayed good stability and performance. Measured damping of the major coupled modes agreed with theoretical predictions and one-fifth-scale model tests. Propulsing efficiencies exceeding 90% were measured and agreed closely with theory. Operation of the proprotor, satisfactory in each flight mode, met or exceeded all design requirements. The proprotor is ready for flight test. O.H.

A71-31078 * **Horizontal stoppable rotor conversion.** George A. Watts (Lockheed-California Co., Burbank, Calif.) and James C. Biggers (NASA, Ames Research Center, Moffett Field, Calif.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 502.* 12 p. 6 refs. Members, \$1.25; nonmembers, \$2.00. Army-supported research; Contract No. NAS 2-5168.

The behavior of a specially stiffened hingeless rotor operating at discrete rpm, over a wide range of rpm, at airspeeds sufficiently high for conversion from helicopter to airplane flight to take place has been studied analytically and experimentally. The rotor shaft was fixed against pitching and rolling motion in both studies. Aeroelastic derivatives of the 33-foot, 3-bladed rotor with irreversible swashplate control were predicted analytically and verified by tests over an airspeed range of 50 to 120 knots in the Ames 40 x 80 foot wind tunnel. A constant speed gyroscope was introduced into the cyclic feathering system and the swashplate position control released so that the swashplate became free to take up positions dictated by rotor and gyroscope moment equilibrium. The system automatically trimmed hub moments to near zero. Rotor control was then introduced in the form of moments applied to the free swashplate, and the control effectiveness was measured. The control system is shown to be stable, to provide almost zero phase shift and to exhibit nearly constant hub moment to control moment gain over wide ranges of rpm and advance ratio. (Author)

A71-31079 **HLH primary flight control system design.** Richard W. Sanford, Peter R. Venuti, and Derek Wood (Boeing Co., Vertol Div., Philadelphia, Pa.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 503.* 15 p. Members, \$1.25; nonmembers, \$2.00.

Demonstration that the most attractive primary flight control system for the Heavy Lift Helicopter (HLH) is a fly-by-wire electrical analog of the conventional mechanical control linkage. This type of system can be mechanized using known techniques, and in many cases identifiable components. It is pointed out that the only remaining step required for acceptance of this fly-by-wire system is construction and flight demonstration of a complete operational prototype. M.M.

A71-31080 **Development of the ABC rotor.** Robert K. Burgess (United Aircraft Corp., Sikorsky Aircraft Div., Stratford, Conn.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 504.* 17 p. 6 refs. Members, \$1.25; nonmembers, \$2.00.

Description of the development of the ABC rotor from conception through small-scale model wind-tunnel testing, full-scale analysis, design, fabrication, and ultimate wind-tunnel testing of a 40-ft-diam rotor in a 40 x 80 ft wind tunnel. The principal design tradeoffs resulting from the early analyses and testing are discussed, along with their expected impact on the full-scale rotor characteristics. Materials and manufacturing methods employed are covered, including the more important difficulties surmounted during the development. The major test programs are outlined, including blade balancing, turbine test bed operation and full-scale wind-tunnel testing in the wind tunnel at speeds up to 180 knots and at advance ratios up to .91. A.B.K.

A71-31081 * **Application of a lifting-surface theory to the calculation of helicopter airloads.** Wayne Johnson (MIT, Cambridge, Mass.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 510.* 10 p. 14 refs. Members, \$1.25; nonmembers, \$2.00. Grant No. NGR-22-009-303; Contract No. N 00019-69-C-0219.

A method is described for the application of a lifting-surface solution of a model problem for vortex-induced airloads to the calculation of the airloading on a helicopter rotor blade. A comparison of the loads calculated for a simplified vortex and rotor blade configuration, using the lifting-surface solution and the usual lifting-line theory, indicates that the former should be used for vortices closer than about five chord lengths to the blade. A comparison of the lifting-surface-theory results with experimental data shows good agreement. Some results of the calculation of helicopter airloads using the lifting-surface-theory solution are presented. These results indicate that a very accurate wake geometry model will be required to make full use of the accuracy of the

lifting-surface-theory solution. They also show that there is yet much more to learn about the phenomenon of vortex/blade interaction.

A71-31082 # **A study of the effects of nonuniform swash-plate stiffness and out-of-blade track on rotor dynamics and stability.** Vincent J. Piarulli (Rochester Applied Science Associates, Inc., Rochester, N.Y.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 511.* 12 p. Members, \$1.25; nonmembers, \$2.00.

This paper presents the results of a study directed at investigating the effects of an anisotropically mounted flexible swash-plate, including blade out-of-track, on the vibratory and mechanical stability characteristics of helicopter rotor systems. The analysis which has been developed is based on a combined Laplace transform and associated matrix approach. The program yields complex eigenvalues which indicate frequency and rate of growth or decay of a natural mode of the complex system. Blade modal response and swash-plate motion corresponding to a given eigenvalue are predicted.

(Author)

A71-31083 * # **The method of multiblade coordinates in the linear analysis of lifting rotor dynamic stability and gust response at high advance ratio.** Sheng-Kuang Yin and Kurt H. Hohenemser (Washington University, St. Louis, Mo.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 512.* 14 p. 7 refs. Members, \$1.25; nonmembers, \$2.00. Contract No. NAS 2-4151.

The dynamic linearized or perturbation problem of a lifting rotor with rigid flapping blades having elastic restraints, with rigid hub and with four types of control feedback is solved for high rotor advance ratio with the method of multiblade generalized coordinates, using the Floquet state transition matrix. Numerical examples assuming three and four blades per rotor show considerable differences in the modal function columns and in the gain factors at the stability limits depending on the number of blades. A rotor representation with constant coefficients in the differential equations for the multiblade coordinates gives for a rotor advance ratio of .8 a good approximation for some modes but does not account for the substantial effects of blade number and is in some cases unconservative. The method of multiblade coordinates is applied to the analysis of random blade flapping from continuous atmospheric turbulence to obtain the effectiveness of the various feedback systems in reducing the root mean square flapping amplitudes.

A71-31084 **Prediction of control loads due to blade stall.** F. J. Tarzanin, Jr. (Boeing Co., Vertol Div., Philadelphia, Pa.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 513.* 14 p. 12 refs. Members, \$1.25; nonmembers, \$2.00.

Description of a semiempirical aerodynamic theory for eliminating the prime limitation to the operational boundaries of helicopters represented by the sharp growth of control loads due to retreating-blade stall. The theory includes unsteady aerodynamics with linear shed wake, stall hysteresis for lift, drag, and pitching moment, and three-dimensional flow. This theory was incorporated into an aeroelastic rotor analysis program that can now predict the high pitch link loads associated with blade stall. This aeroelastic rotor analysis was then used to study how the aerodynamic and structural characteristics of the rotor system influence the stall-induced high control loads. This investigation led to suggestions that may significantly reduce or eliminate stall flutter loads.

A71-31085 **Preliminary development of an active transmission isolation system.** Paul W. von Hardenberg and Paul B. Saltanis (United Aircraft Corp., Sikorsky Aircraft Div., Stratford, Conn.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 514.* 11 p. Members, \$1.25; nonmembers, \$2.00.

An analytical/ground test program has succeeded in isolating vertical and in-plane main rotor-head vibratory forces from a helicopter fuselage without introducing static deflection. This was achieved by using a hydropneumatic, servo-centered isolation system installed at the transmission/airframe interface. Shake tests showed overall reductions of approximately 70% in fuselage response to main rotor 6p force excitations using a CH-53A test vehicle. These tests showed that significant reductions can be achieved over the complete range of excitation frequency above the isolator resonances. Step load and shake tests demonstrated that the isolated aircraft had near-rigid characteristics for transient and 1p excitations. The aircraft isolator modes were stable, and analysis established that aircraft mechanical stability characteristics remain unchanged.

A71-31086 **Analytical investigation of the effects of blade flexibility, unsteady aerodynamics, and variable inflow on helicopter rotor stall characteristics.** E. D. Bellinger (United Aircraft Research Laboratories, East Hartford, Conn.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 520.* 14 p. 21 refs. Members, \$1.25; nonmembers, \$2.00.

An analytical study was conducted to investigate systematically the relative importance of blade flexibility, unsteady aerodynamics, and variable inflow (with and without wake distortions) in determining predicted helicopter rotor stall characteristics. The theoretical results of this study were compared with corresponding full scale wind tunnel results for the H-34 rotor system. Various levels of rotor stall were investigated at forward speeds of 117 knots and 194 knots. The classical theory (rigid blades, steady aerodynamics, and constant inflow) produced good correlation at nominally unstalled operating conditions. However, rotor lifts significantly lower than the test values were predicted at high blade angles of attack. The use of unsteady airfoil data provided the most significant improvement in correlation by allowing higher section lift coefficients to be reached due to the 'stall delay' phenomenon associated with unsteady operating conditions. The primary effect of blade flexibility was due to blade torsional deflections, which, as with blade pitch changes, had a direct effect on performance. It was found that the deflections, and therefore performance, were sensitive to the chordwise location of the mass axis, indicating the need for accurately defining this parameter. Variable inflow, although producing significant changes in the angle of attack distribution over the disk, did not appreciably affect rotor performance.

A71-31087 * **Detailed aerodynamic measurements on a model rotor in the blade stall regime.** Richard K. Fisher, Jr. (Boeing Co., Philadelphia, Pa.) and W. J. McCroskey (U.S. Army, Mobility Research and Development Laboratory, Moffett Field, Calif.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 521.* 14 p. 13 refs. Members, \$1.25; nonmembers, \$2.00. Army-supported research; Contract No. NAS 2-5473.

An investigation of retreating blade stall on a model helicopter rotor has shown that a series of separate pressure distribution and boundary layer events lead up to complete blade stall. This experimental picture of the local flow field was gleaned from measurements of blade element pressure and skin friction distributions, surface streamline directions, and local angle of attack. The results of the experiment also demonstrate the limitations of contemporary empirical corrections in accounting for three-dimensional and unsteady effects on classical airfoil data after complete stall occurs. The measurements further indicate that some of the most significant unknowns in the problem are the local blade-element velocities and angles of attack. From the results of this test, it is postulated that the basic retreating blade stall mechanisms become increasingly dominated by dynamic vortex-shedding from the leading edge as advance ratio increases.

A71-31088 * **Tip vortices - Velocity distributions.** N. A. Chigier and V. R. Corsiglia (NASA, Ames Research Center, Moffett Field, Calif.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 522.* 14 p. 9 refs. Members, \$1.25; nonmembers, \$2.00.

Detailed measurements of velocity distributions have been made in vortices generated at the tip of a square-tip, 18-in.-chord, 48-in. semispan blade mounted in the NASA-Ames 7- by 10-foot wind tunnel. Time-mean-average velocity components were measured using a triple-sensor hot wire probe operated by three separate anemometers. With the blade at an angle of attack of 12 deg, traverses were made through the vortex centers at six axial stations, corresponding to x/c ratios of -0.75, -0.50, -0.25, 0.0, 2.0, and 4.0, where x/c equal to 0 is the trailing edge. The dimensions of the vortex increase with distance downstream over the blade surface, and at x/c equal to 4 the vortex core radius is 0.7% of the span. Maximum circumferential velocity of 42% of mainstream velocity was measured at x/c equal to -0.50, over the wing surface, followed by decay to 24.0% of mainstream velocity at x/c equal to 4. Axial velocity in excess of free-stream velocity was measured in the vortex core with maximum axial velocity of 140% of free-stream velocity at x/c equal to -0.25. The vortex center moved inboard from the tip at x/c equal to -0.75 to 2.9% of span at x/c equal to 4. A secondary vortex was located outboard of the main tip vortex. (Author)

A71-31089 * # **A method for predicting helicopter wake geometry, wake-induced flow and wake effects on blade airloads.** S. G. Sadler (Rochester Applied Science Associates, Inc., Rochester, N.Y.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 523.* 11 p. 16 refs. Members, \$1.25; nonmembers, \$2.00. Contract No. NAS 1-8448.

Rotor wake geometries are predicted by a process similar to the start-up of a rotor in a free stream. An array of discrete trailing and shed vortices is generated. Vortex strengths correspond to stepwise radial and azimuthal blade circulations, and this array is limited to an arbitrary number of azimuthal steps behind each blade. The remainder of the wake model for each blade is an arbitrary number of trailed vortices. Vortex element end points are allowed to be transported by the free stream and vortex-induced velocities. Wake geometries, wake flows, and wake-induced velocity influence coefficients for use in blade loads calculations were determined and measured. Computed and measured average wake velocities are compared and indicate that the wake model is satisfactory for nonuniform inflow calculations. These velocities and the corresponding computed wake geometries are discussed. Wake geometries are presented and discussed for various rotor configurations, including rotor systems having shaftwise separations, nonuniform azimuthal spacing, counter rotating blades with different rotor lengths and other physical differences. (Author)

A71-31090 **Forward flight performance of a coaxial rigid rotor.** Vincent M. Paglino (United Aircraft Corp., Sikorsky Aircraft Div., Stratford, Conn.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 524.* 16 p. 7 refs. Members, \$1.25; nonmembers, \$2.00.

A brief review is presented of basic aerodynamic principles differentiating conventional rotors and coaxial rigid rotors. Performance data obtained from a recent test of a full-scale coaxial rigid rotor (ABC) system in the NASA/Ames wind tunnel are given and discussed. These data, ranging to advance ratios of .91, are compared with conventional rotor data and with blade element rotor theory at various stages of refinement. A parametric study is presented to illustrate the influence of a number of blade geometric properties on ABC propulsive efficiency. At all advance ratios tested, the ABC system was aeromechanically stable; it had superior loading capability and more favorable stall characteristics when compared to an H-34 rotor. Of the geometric changes investigated, blade twist was found to have largest influence on predicted performance. O.H.

A71-31091 **Day and night fire power of the Cheyenne.** Bernard J. Merritt (U.S. Army, St. Louis, Mo.) and John C. Kirby (Lockheed-California Co., Burbank, Calif.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 530.* 13 p. Members, \$1.25; nonmembers, \$2.00.

The Army/Lockheed Cheyenne attack helicopter, with its integrated complement of armament, fire control, and navigation equipment, has been designed to obtain high first round hit probabilities at long ranges. The fire control system has been developed to include a night capability with approximately the same accuracy as in daylight. The details of the Cheyenne weapon system and the system engineering tools used during the design/development process are discussed. O.H.

A71-31092 **An attack helicopter weapons delivery computer.** John A. Simpson (United Aircraft Corp., Radar Research Group, Norwalk, Conn.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 531.* 7 p. Members, \$1.25; nonmembers, \$2.00.

A system of computation suitable for both bombing and gun laying is described. It is based upon the use of the planar distributed function generator, and gives a general, closed-form, virtually instantaneous solution capability. It can provide an automatic or manual release for bombs, or laying cues for guns, in milliseconds. It is shown that by using the low-cost analog system described, mission tactics will not be constrained and the helicopter's guns and bombs can be deployed with full flexibility. The computer is essentially made of solid-state components and photoetched metal film resistors. It is thus inherently reliable, and the projected mean time between failure is 4,070 hr. G.R.

A71-31094 # **AN/ASN-86 Inertial Navigation Set.** J. B. Hughes (Litton Industries, Inc., Guidance and Control Systems Div., Woodland Hills, Calif.) and R. W. Creed (U.S. Army, Avionics Laboratory, Fort Monmouth, N.J.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 533.* 14 p. Members, \$1.25; nonmembers, \$2.00.

Description of a purely inertial navigation system consisting of an inertial platform, a digital computer, and a control-indicator unit. The computer has the necessary interface circuitry for interconnection to 11 other systems. The control-indicator unit provides capability to enter or read out position information in lat/long or UTM (universal transverse mercator) coordinates. It also contains controls for performing all navigation operations. The system has a built-in self test which is capable of isolating malfunctions to the unit level. Technical details of the system and a description of the system's operational application to both fixed-wing aircraft and helicopters are presented. It is considered that there should be many commercial applications of this equipment. F.R.L.

A71-31095 **The night rescue terminal navigation problem.** Cecil S. Richardson (United Aircraft Corp., Sikorsky Aircraft Div., Stratford, Conn.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 534.* 11 p. 10 refs. Members, \$1.25; nonmembers, \$2.00.

In night rescue, visual contact has to be replaced by instrumented techniques that enable precise destination definition, approach, and hover. Initial efforts culminated in design, development, and test of the Limited Night Recovery System (LNRS), for the HH-53 aircraft. The functional requirements of improved sensors for homing and approach have been presented along with functional requirements for a positional hover sensor system. A currently available set of sensor systems has been described and a LORAN retransmission concept for solving some of

the remaining problem areas has been presented. Sufficient information has been provided to enable prospective manufacturers of terminal navigation sensor aids to initiate development of solutions to the night rescue terminal navigation problem as it applies to the current rescue helicopter system. G.R.

flapwise bending modes to predict hub moments. Third is the question of blade/fuselage dynamic coupling, which arises owing to the more powerful hub moments which are generated by a hingeless rotor. Blade/fuselage coupling can be of considerable importance. (Author)

A71-31096 **Synthesis of an electromechanical control system for a compound hingeless rotor helicopter.** R. L. Heimbold (Lockheed-California Co., Burbank, Calif.) and C. D. Griffith (Sperry Rand Corp., Flight Systems Div., Phoenix, Ariz.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 536.* 13 p. Members, \$1.25; nonmembers, \$2.00.

A study was conducted to configure an electromechanical control system for a hingeless rotor compound helicopter. Emphasis was placed on control system synthesis using the root locus method with transfer functions derived from a linear model of the six airframe degrees of freedom and the fundamental rotor flapping modes. An attitude or quasi-attitude feedback is required to counteract the strong divergent tendency of hingeless rotor about the pitch axis. Feedback from both pitch rate and pitch hub moment were evaluated and the latter was chosen for use in the pitch axis because of its ability to relieve high airframe moments when in ground contact as well as to provide damping for the attitude feedback. The roll axis is stabilized with rate feedback alone. Effects of the control system feedbacks on loads and rotor stability are briefly covered. An analogue computer program was employed to refine control system parameters. (Author)

A71-31099 **Feel augmentation and sensitivity control in high speed helicopters.** Sean J. O'Connor (United Aircraft Corp., Sikorsky Aircraft Div., Stratford, Conn.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 542.* 8 p. Members, \$1.25; nonmembers, \$2.00.

Handling qualities problems associated with changing control sensitivity accompany the increased speed capabilities of high performance helicopters. Two approaches to the problems have been presented. In the case of the pitch control, a constant pitch stick force per resultant load factor characteristics has been implemented. This feel augmentation approach masks the sensitivity problem effectively. In the case of the collective control, the collective blade pitch vs stick displacement transient has been modified. This approach compensates for the increased sensitivity to changes in collective setting at high speeds. A number of conclusions are presented which have been gathered from extensive flight testing. G.R.

A71-31097 **IFR hover for heavy lift helicopters with slung load.** William P. Keane and R. Joseph Milelli (U.S. Army, Avionics Laboratory, Fort Monmouth, N.J.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 540.* 11 p. Members, \$1.25; nonmembers, \$2.00.

A man-machine simulation program has been completed which indicates the feasibility of developing an IFR hover capability with properly chosen sensors, controls and displays. Display alternatives included a simple hover indicator, a flight director and a fully integrated multicolored CRT display. IFR hover was shown to be a reasonable task from a pilot workload standpoint. A wide range of performance was achieved with the best systems providing a helicopter hover accuracy from 1 to 2 feet. All tests were performed under simulated gust conditions. The results obtained indicate the feasibility of accomplishing more precise construction and logistic tasks by the helicopter in the near future through the use of instrument hover. The unloading of containerized ships by the helicopter is a possible application with both commercial and military advantage. G.R.

A71-31100 **Rotor stability derivatives determined from wind tunnel tests of an instrumented helicopter.** Robert E. Rohrt and Sally V. LaForge (Hughes Tool Co., Culver City, Calif.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 543.* 10 p. Members, \$1.25; nonmembers, \$2.00. Contract No. NOW-66-0657-f.

Tests of an operational prototype OH-6A helicopter were conducted in the Ames 40- by 80-foot wind tunnel. From these tests, experimental stability derivatives were obtained. Analytical studies were conducted using a simplified digital computing technique for comparison with these wind tunnel experimental data. The results of this investigation indicated that the simplified computer program can be used to predict rotor stability derivatives. The agreement between theory and test was excellent at advance ratios from 0.25 to 0.35, even though the theory used an assumed uniform induced velocity rather than a variable induced velocity. A limited amount of data was obtained at an advance ratio equal to 0.4, and the results are inconclusive. The numerical program, which also was simplified in not accounting for blade flexibility, predicted the blade flapping for unstalled conditions but did not predict the large increase in blade flapping due to retreating tip stall. However, comparison of data and theory indicated that retreating tip stall did not significantly change the rotor pitching moment about the aircraft center of gravity. Pitching moment derivatives, horizontal stabilizer on and off, were used to estimate the stabilizer effectiveness and downwash. (Author)

A71-31098 **A stability and control theory for hingeless rotors.** H. C. Curtiss, Jr. (Princeton University, Princeton, N.J.) and N. K. Shupe (U.S. Army, Avionics Laboratory, Fort Monmouth, N.J.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 541.* 12 p. 10 refs. Members, \$1.25; nonmembers, \$2.00.

Some fundamental aspects relating to the prediction of the stability and control characteristics of hingeless rotor helicopters are discussed. In particular, areas are examined which require a different analytical treatment from the articulated rotor. Three areas are examined as having potential importance. First, the induced flow field of the rotor is considered. It is shown that the hingeless rotor will give rise to a first harmonic variation in the induced flow field which can be included in the analysis through an effective Lock Number. The second area involves consideration of the number of flapwise bending modes required to represent the hingeless rotor for stability and control studies. It is desirable to include at least two

A71-31101 * **Factors affecting handling qualities of a lift-fan aircraft during steep terminal area approaches.** Ronald M. Gerdes and Charles S. Hynes (NASA, Ames Research Center, Moffett Field, Calif.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 544.* 9 p. Members, \$1.25; nonmembers, \$2.00.

The XV-5B lift-fan aircraft was one of four NASA V/STOL research vehicles recently used to explore the factors affecting handling qualities in the terminal area. The objectives of the program were to define the limitations of powered-lift VTOL aircraft that prevent full exploitation of their low-speed capabilities, and to develop operationally feasible techniques for performing simulated precision instrument landing approaches. A 10 deg ILS approach task was selected as representing a typical steep-angle approach with which to explore these problems. Three major phases of the approach were considered: (1) interception of the glide slope at 1500

ft, (2) glide-slope tracking, (3) deceleration along the glide slope to a spot hover. Variations in airplane deck angle, deceleration schedule, and powered-lift management were studied to assess their effects on handling qualities. The overall descent performance envelope was identified on the basis of such operational limitations as fan stall, maximum comfortable descent rate, and controllability restrictions. The 'collective-lift' stick provided precise glide-slope tracking capability (to within plus or minus 20 ft) through direct control of fan lift, but the pilot tended to 'chase' glide slope if engine power (throttle) was modulated. The pilot preferred a deck-parallel (to glide slope) attitude, for which he used powered lift (collective) to control glide slope and pitch attitude (stick) to keep the angle of attack near zero, which minimized his workload. This technique also provided a greater angle-of-attack margin from fan stall. Workload was reduced when the deceleration schedule was delayed until the aircraft was well established on the glide slope, since thrust vector changes induced flight path disturbances. (Author)

A71-31102 Evaluation of rotor controls designed for increased safety. Lawrence D. Barrett and John C. Mack (Boeing Co., Vertol Div., Philadelphia, Pa.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 550.* 10 p. Members, \$1.25; nonmembers, \$2.00.

Experience gained during analysis, design, and testing of failsafe helicopter rotor controls is reviewed. Analysis of field experience and accident and discrepancy reports emphasized the need for damage-tolerant mechanical components with special features that make maintenance errors less likely to occur. Flight control experience in transport aircraft and design requirements of current helicopter specifications also helped formulate design guidelines. A mechanically redundant rotor control system with inherent component failure warning is shown and discussed. From this design, four major components were selected. These components were designed, fabricated and fatigue-tested. Test results were measured against the criteria that secondary load paths should have fatigue lives many times that of the normal reinspection interval, and that load path condition should be determinable without special diagnostic equipment. The test specimens met these criteria. It is concluded that the designs represent practical approaches to failsafe and damage-tolerant rotor control components. (Author)

A71-31103 Fail-safety for the H-46 rotor blade. George H. Thompson and William L. Weiss (Boeing Co., Vertol Div., Philadelphia, Pa.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 551.* 8 p. Members, \$1.25; nonmembers, \$2.00.

Description of a system to make the H-46 rotor blade fail safe which has been designed, fabricated, qualified, and placed in service. This system, designated ISIS (Integral Spar Inspection System), is a continuously functioning inspection system, integral to the rotor blade, which will detect spar cracks in the early stages. A ground inspection at each rotor shutdown will provide ample warning of impending blade fracture. This system has provided fail-safety for an existing structure with little modification. The developmental testing and analytical techniques resulting from this program have broad application to the achievement of structural fail-safety in existing as well as new helicopter component designs. F.R.L.

A71-31104 Size effects on the design of large rotor systems. Henry G. Smith (Hughes Tool Co., Culver City, Calif.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 552.* 12 p. 11 refs. Members, \$1.25; nonmembers, \$2.00.

Review of the fundamental effects of size upon the relationship of the rotor system structural and dynamic parameters to weight. Of particular concern are the significant deviations from structural and dynamic scaling similarity that occur as a result of the degree to which cube-square law weight growth is avoided. The effects of blade

loading, disk loading, tip speed, number of blades, blade width/sq ft, etc., are discussed. Trends toward new types of rotor retention and component design configurations to avoid size-effect weight penalties, such as sandwich construction, multicell structures, advanced composites, and articulated hub/retention systems are reviewed. It is concluded that the changes in the structural and dynamic parameters of rotor systems due to large size increases are fundamental in nature and will require thorough investigation and understanding before it is possible to arrive at the optimum design. F.R.L.

A71-31106 Preliminary design methods of V/STOL prop/rotors. Warren K. Stratton and Richard B. Freeman (Boeing Co., Vertol Div., Philadelphia, Pa.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 554.* 7 p. Members, \$1.25; nonmembers, \$2.00.

A method is presented for the rapid evaluation of the potential for composite materials applied to V/STOL prop/rotors. The results are displayed in a form suitable for easy comparison with criteria and for selection of those material options with the best potential. The parametric effect that material properties have on frequencies and weight is determined using Southwell coefficients. Blades which meet the frequency requirements are then evaluated in terms of strength requirements. O.H.

A71-31107 Factors affecting fuel control stability of a turbine engine/helicopter rotor drive system. C. Fredrickson (Boeing Co., Vertol Div., Philadelphia, Pa.), K. Rumford (Avco Corp., Lycoming Div., Stratford, Conn.), and C. Stephenson (AVSCOM, St. Louis, Mo.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 560.* 10 p. Members, \$1.25; nonmembers, \$2.00.

Despite positive results from all normal stability criteria, the interaction of rotor, engine and control on the Boeing/Vertol CH-47C helicopter resulted in unacceptable torque and fuel flow oscillation in early flight test aircraft. A flight test program was undertaken and analytical capability at Lycoming and Vertol was upgraded to determine the cause of the oscillations. To analytically reproduce the phenomenon, inclusion of the hydraulic spring effect of the rotor blade lag damper, in addition to its normal damping representation, was found to be necessary. Based on this analysis, fuel control gain and time constant changes were suggested, evaluated in flight test, and a solution found. (Author)

A71-31108 Turbofan engine considerations for reaction drive rotors. R. J. Sullivan (Hughes Tool Co., Aircraft Div., Culver City, Calif.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 561.* 7 p. 8 refs. Members, \$1.25; nonmembers, \$2.00.

Optimum combinations of major turbofan engine and rotor variables necessary to obtain a good helicopter design are examined. It is found that blade duct area must be large enough to permit flow at a reasonable duct Mach number. The resultant rotor solidity must not be so high as to cause excessive blade profile power, and rotor weight. In addition, fuel consumption must be considered. An arbitrary family of turbofan engines is studied in a simplified manner to illustrate the relationship of the variables. It is shown that a value of rotor solidity that is a good compromise of aerodynamic, thermodynamic, and mission considerations can be obtained with the newer, high-compression turbofan engines of low (0.7 to 0.8) bypass ratio. O.H.

A71-31109 VTOL propulsion system development. Paul C. Setze, Jacob L. Browne, and Robert C. Turnbull (General Electric Co., Aircraft Engine Group, Lynn, Mass.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C.,*

May 19-21, 1971, Preprint 562. 11 p. Members, \$1.25; nonmembers, \$2.00.

Several major aspects that have to be taken into account in designing VTOL propulsion systems powered by turboshaft engines are discussed. General features of these systems and their operation are outlined. Problems involved in the system development - i.e., design requirements, development program planning, component development, system integration development and qualification - are examined in detail. Detailed attention is also given to system vibration, in particular, to vibration analyses using a computer model, and to vibration testing. O.H.

A71-31110 Strain gauge torquemeters for use in helicopter transmission systems. Dennis P. Hames (British Hovercraft Corp., Ltd., Experimental and Electronic Laboratories, East Cowes, Isle of Wight, England). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 563.* 11 p. Members, \$1.25; nonmembers, \$2.00.

The use of a strain gauge torquemeter as the primary power indicating instrument in a helicopter gives the pilot a direct and accurate indication of the torque in the transmission system, and provides several advantages for the helicopter designer and operator. An accuracy of indication of plus or minus 1-1/2% of full load torque, under all operating conditions, has been achieved with production equipment. Resistance foil strain gauges are attached to the shaft transmitting torque. The electrical supply to the rotating shaft and the output signal from it are inductively coupled to an electronic amplifier unit through a rotating transformer assembly. The pilot is given an immediate audible warning of overtorque. Torquemeters operating at shaft speeds to 30,000 rpm are described. G.R.

A71-31111 Results of high-speed flight research with the high performance UH-1 compound helicopter. Walter C. O. Sonneborn and Louis W. Hartwig (Bell Helicopter Co., Fort Worth, Tex.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 570.* 18 p. 6 refs. Members, \$1.25; nonmembers, \$2.00. Contract No. DA-44-177-AMC-364(T).

This paper discusses a high-speed compound-helicopter flight research program. This program was conducted to determine the behavior of rotors at combinations of advance ratios and advancing-blade tip Mach numbers beyond those attainable in existing full-scale wind tunnels. A level flight speed of 274 knots was achieved with a two-bladed semirigid rotor. A four-bladed flexbeam rotor was also evaluated at speeds up to 220 knots. An integrated control system allowed in-flight changeover from helicopter to airplane-type controls - i.e., from tail rotor and longitudinal cyclic control to a rudder and a stabilator with the longitudinal swashplate fixed. Results in the areas of structural loads, vibrations, performance, control and stability, and correlation of flight and wind-tunnel data are discussed. (Author)

A71-31112 The Boeing Model 347 advanced technology helicopter program. Frank H. Duke and W. Euan Hooper (Boeing Co., Vertol Div., Philadelphia, Pa.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 571.* 10 p. Members, \$1.25; nonmembers, \$2.00.

This program consists of an integrated effort covering analysis, simulation, wind tunnel, whirl tower and bench test, plus the modification of a CH-47 airframe to permit flight verification and demonstration of advanced technology. The program consists of two phases. The first phase will explore the capability of the pure helicopter configuration, and the second phase will investigate the potentials of the winged helicopter. The prime objective of the 347 program is to integrate recent transport helicopter experience with the latest technology and demonstrate a helicopter with improved

stability and control, reduced noise and vibration levels, and a flight path control system incorporating extended navigation and IFR (instrument flight rules) capability, resulting in a reduced pilot workload. M.M.

A71-31113 United States Coast Guard evaluates hovercraft. Thomas C. Lutton (U.S. Coast Guard, Air Cushion Vehicle Evaluation Unit, San Francisco, Calif.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 572.* 7 p. Members, \$1.25; nonmembers, \$2.00.

When three Navy SK-5 air cushion vehicles became available in late 1969, the Coast Guard commenced an expanded ACV evaluation program. The first two hovercraft were scheduled for operational evaluation in the San Francisco Bay area and the third for Arctic trials at Point Barrow, Alaska. Tentative results of the evaluation in a number of fields are discussed including search and rescue, aids to navigation, law enforcement/oil pollution, marine safety, and logistics. An analysis of the relative effectiveness of the ACV compared to helicopters and boats is also presented. The greater speed advantage of the ACV over the Coast Guard's patrol boats makes it particularly attractive in response time and search area covered in responding to search and rescue. G.R.

A71-31114 Army/Navy operational evaluation of offshore discharge of containerships. L. J. McConnell (U.S. Army, Washington, D.C.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 573.* 5 p. Members, \$1.25; nonmembers, \$2.00.

A detailed discussion of the offshore discharge of containerships by helicopter is presented. It is shown that while helicopters demonstrated a virtually all weather, day and night capability to transport the containers, the capability of the current helicopter is limited to containers of ten tons gross weight. Z.W.

A71-31115 AH-56A vehicle development. J. F. Johnston and J. R. Cook (Lockheed-California Co., Burbank, Calif.). *American Helicopter Society, Annual National V/STOL Forum, 27th, Washington, D.C., May 19-21, 1971, Preprint 574.* 11 p. Members, \$1.25; nonmembers, \$2.00.

The rotor stability and handling qualities of the AH-56A compound helicopter are discussed. Four different development areas are considered. The first two involve the dynamics of rigid or hingeless rotors: the 1P x 2P phenomenon of produced blade flapping and in-plane motions which compromised the blade feathering feedback at reduced rpm, and the 'hop' phenomenon at near one-half cycle per revolution which involves both the cyclic and the collective modes of rotor and body motion. The remaining two areas, in which new data were added, concern antitorque rotor effectiveness and pilot/vehicle matching for maximum roll rates in nap-of-the-earth flight. O.H.

PARACHUTE [PARASHYUT]

A. Khorobrykh 24 Sep. 1970 14 p Transl. into ENGLISH from Starshina-Serzhant (USSR), no. 8, 1969 p 20-22

(AD-719480; FSTC-HT-23-400-70) Avail: NTIS CSCL 1/3

Brief historical remarks concerning parachute development in the Soviet Union are followed by a functional description of the basic components of standard personnel parachutes. Devices and methods employed to open parachutes, including manual and automatic methods are discussed and illustrated. Specific attention is devoted to a device which is pressure-controlled, with automatic timing for canopy deployment. The application and role of the parachute in areas other than aviation are discussed briefly.

AVIONICS INTERFERENCE PREDICTION MODEL

G. Morgan Annapolis, Md. Electromagnetic Compatibility Analysis Center Nov. 1970 140 p refs

(Contract F19628-70-C-0291)

(AD-718997; ESD-TR-70-286) Avail: NTIS CSCL 20/14

An interference prediction model developed for use in evaluating expected interactions between avionics equipments on an airplane is described. The model is substantially automated and includes subroutines which calculate expected path losses between aircraft antennas and the rejection offered by the receivers to the undesired emissions from transmitters on the aircraft. An analysis of the interactions between the equipments installed on an FAA Sabreliner has been made using the prediction model and the results of the analysis are described. Requirements for expansion of the prediction model are established.

The author gives a description of present-day ways of determining visibility through the atmosphere. He explains how atmospheric transmissivity, the visibility of actual objects, and the range of visibility on landing an aircraft are measured. He emphasizes particularly the methods for determining the level of visibility. In a number of cases he concludes that problems which he regards as being important have not yet been satisfactorily solved.

USE OF WEATHER RADAR FOR AVIATION

H. Treussart, W. B. Beckwith, S. G. Bigler, K. Otani, V. V. Kostarev et al 1970 92 p refs Its Tech. Note 110

(WMO-264-TP-148) Copyright. Avail: Issuing Activity

The existing aviation requirements for weather radar, either ground-based or airborne, in connexion with performance criteria, range and accuracy, are reviewed. The detection and identification of regions of hail and turbulence associated with thunderstorms, these being considered dangerous phenomena for aviation are discussed. It is shown through intensive surveys on hail detection that echo intensity, as an indicator of hail, observed using 10 cm wavelength radar exhibited a similar trend to that observed using 3 cm radar, but very little change in intensity with height. Several case studies of the probability of hail as a function of height are also illustrated for assessment of hail. Brief mention is made of the use of airborne radar for detection of hail and the avoidance of turbulence by aircraft in flight. The question of measuring the height of echoes observed by radar, which represents an index of storm activity is considered and the interpretation of echoes for different types of radar is discussed. The processing and transmission of radar information is discussed in detail and transmission of radar information to aircraft in flight is also considered. New techniques developed for radar observations are also presented. Author (ESRO)

A GENERAL THEORY OF PARACHUTE OPENING

Edward W. Ross, Jr. Jan. 1971 42 p refs

(AD-719698; USA-NLABS-TR-71-32-OSD) Avail: NTIS CSCL 1/3

A simple mathematical model of the opening behavior of parachutes is presented. The model predicts the drag and velocity as functions of time and also gives an estimate of opening time. The model is very general and applicable to almost any parachute. The characteristics of a specific parachute enter the model by means of certain constants that have to be chosen. Values of these constants are found for flat, circular parachutes, partly by estimation and partly by numerical experimentation. The resulting model of the opening behavior of flat, circular canopies gives reasonable agreement with experiments for several parachutes of different sizes. Insofar as generality and flexibility are concerned, this model seems to be superior to present methods of predicting opening behavior of parachutes. Author (GRA)

THE ROLE OF HEAT CONDUCTION IN LEADING EDGE HEATING THEORY AND EXPERIMENT

T. R. F. Nonweiler, H. Y. Wong, and S. R. Aggarwal London Aeron. Res. Council 1970 52 p refs Supersedes ARC-31445

(Contract PD/48/09/ADM)

(ARC-CP-1126; ARC-31445) Copyright. Avail: NTIS; HMSO: 75p; BIS: \$3.00

The effect of heat conduction of material on the temperature distribution in the vicinity of a wing leading edge in hypersonic flight is investigated. The theory is based on a conducting plate subjected to aerodynamic heating. It is found that the role played by the conductivity of the material and the leading edge thickness in moderating the nose temperature is very significant. Detailed discussions of the numerical solutions for various shapes of leading edge are given. An experimental technique has been developed by which a number of models representing a wing leading edge can be tested and the results thus obtained are compared with those predicted by the theory. EVALUATION OF FUEL FLOWMETER

INSTRUMENTATION Final Report. 5 Aug. - 20 Oct. 1970

Albert L. Winn and Robert P. Jefferis Jan. 1971 30 p refs

(AD-719280; USAAST-70-33) Avail: NTIS CSCL 14/2

Flight tests on the Flow Technology Inc. standard line turbine flow transducer were conducted between 5 August and 20 October 1970 to determine its acceptability as a test instrument. The evaluation was conducted at Edwards Air Force Base, California, by the US Army Aviation Systems Test Activity. Ground calibrations showed that the sensor can be used with precision equal to present flow measurement methods. The testing consisted of 2.9 flight hours with the measurement systems mounted in a UH-1C helicopter. The Flow Technology sensor performance was compared to that obtained with standard Potter and Revere flight test systems. Results show that the sensor is acceptable as a flight test instrument. The indicator sensitivity is excellent and there was no degradation of meter performance with variations in engine power or flight conditions. Although the indicator scale range was suitable for this test, the range is not large enough to be operable on all Army aircraft. Author (GRA)

THE BEHAVIOUR OF THE LEADING-EDGE VORTICES OVER A DELTA WING FOLLOWING A SUDDEN CHANGE OF INCIDENCE

N. C. Lambourne, D. W. Bryer, and J. F. M. Maybrey London Aeron. Res. Council 1970 47 p refs Supersedes NPL-AERO-1294; ARC-31056

(ARC-R/M-3645; NPL-AERO-1294; ARC-31056) Copyright. Avail: NTIS; HMSO: £ 1.25; BIS: \$4.50

The transient behavior of leading-edge vortices over a delta wing subject to a sudden change of incidence is of importance in understanding the wing loadings that can occur in unsteady conditions of flight. In the experiments reported changes of incidence have been imposed on delta-shaped plates by application of a constant-velocity plunging motion for a limited time; other related unsteady motions are discussed in the appendix. Cine records of particle tracks and of dye filaments in a water tunnel have been analyzed to trace the time history of vortex centres in cross-flow planes following the application of step-changes of incidence. The flows for various combinations of initial incidence, planform, plunging velocity, and chordwise position have been examined. Results indicate that after the start of the plunge an effectively steady vortex system is established over the plate in a time approximately equal to that required for one chord length of relative forward travel. Where comparisons can be made, Dore's theoretical calculations of the manner in which the vortices move show fair agreement with the experiment. Effects of the transient movements of the vortices on lift distribution are discussed and the inference is drawn that the changes in the distribution of wing loading occurring for an increase of incidence are not simply reversed when the incidence is decreased. NUMERICAL EVALUATION OF THE DOWNWASH INTEGRAL FOR A LIFTING RECTANGULAR PLANFORM

N71-24488

Valerie A. Ray and G. F. Miller Dec. 1970 24 p refs
(NPL-Ma-90) Copyright. Avail: NTIS

A method is described for the accurate evaluation of the downwash integral of Multhopp's lifting surface theory for wings of rectangular planform subjected to very general loadings. In the form in which it was originally derived the integral defining the downwash $\alpha(x,y)$ at points on the wing surface is unsuitable for numerical calculation because of the presence of a strong singularity of the integrand at the point (x,y) . The basis of the present method is to transform the integral by removing certain terms which (subject to natural assumptions regarding the form of the loading function alternate $\theta(x,y)$) can be evaluated in closed form, while the remaining integral is only weakly singular and is amenable to numerical evaluation. The method has been embodied in a KDF 9 program which computes the downwash, for arbitrary values of the aspect ratio, to high precision. Tables and digrams are appended, giving values of the downwash at a representative set of points on the wing for several aspect ratios and loadings. A basic aim has been to provide a definitive set of results of substantial precision against which results obtained by other methods (possibly applicable to more general shapes) may be tested.

THE TWO-DIMENSIONAL CHARACTERISTICS OF A 12.2 PERCENT THICK RAE 100 AEROFOIL SECTION

D. S. Woodward London Aeron. Res. Council, 1971 71 p refs Supersedes RAE-TR-68303; ARC-31374
(ARC-R/M-3648; RAE-TR-68303; ARC-31374) Copyright. Avail: NTIS; HMSO: £1.75; BIS: \$6.30

The 12.2% thick RAE 100 airfoil section was chosen as being likely to fulfil the requirements for the basic airfoil section of a series of sweptback wings designed to provide fundamental information on the high lift and stalling behavior of swept wing aircraft. The choice was based upon previously published work on the stall characteristics of twodimensional airfoils, and the results presented show that the desired behavior at high lift has been obtained. The measurements of the airfoil characteristics were obtained by surface pressure plotting. Not only were the overall forces and moments obtained from these measurements, but also the pressure distributions were analyzed in three ways intended to provide information on the changes from the potential flow pressure distribution which are produced by the displacement thickness of the boundary layer.

A NEW SERIES OF LOW-DRAG AEROFOILS

T. R. F. Nonweiler London Aeron. Res. Council 1971 107 p refs Supersedes ARC-30528

(ARC-R/M-3618; ARC-30528) Copyright. Avail: NTIS; HMSO: £2.70; BIS: \$10

A series of low drag airfoils, modelled roughly on the NACA 6-series, is described. It appears to offer theoretical advantages over its progenitor, and allows flexibility in the choice of leading-edge thickness and trailing-edge angle. Airfoils of this series are specified by five parameters, and the aerodynamic and geometrical characteristics of about 1000 of the sections are listed. The mathematical derivation of their shape (by the Lighthill method) is described in detail, and an ALGOL 60 procedure for the computation of their ordinates is included: care has been taken to construct this procedure so that it may be of general use in other applications of the Lighthill method of design.

NEW DEVELOPMENTS IN SCANNING BEAM LANDING GUIDANCE SYSTEMS, PART 2 Final Annual Report
George B. Litchford Wright-Patterson AFB, Ohio AFFDL Dec. 1970 255 p refs
(Contract F33615-69-C-1110)
(AD-718972; L-AF-04-Pt-2; AFFDL-TR-69-107-Pt-2; AR-2) Avail: NTIS CSCL 17/7

Design details are given of a CW microwave scanning-beam system operating at C and Ku bands. Many of the available design options are noted that apply to the solution of certain engineering problems. One of the virtues of the plan is that several options exist for rapid validation of all critical matters. Consequently the total risks, both economically and technically, now appear much lower than previously. Possible designs of angle-data modulation, dual-band receivers, angle-data processors, etc., are reviewed as are several validation tests and experiments now needed to tie down engineering parameters before a firm national signals-in-space standard can be approved. The important advances in the last year toward planning a national system for aircraft landing in all environments suited to all physical types and operations of aircraft are identified.

LOW-SPEED WIND-TUNNEL TESTS ON A SWEPTBACK WING MODEL (BUCCANEER MARK 1) WITH BLOWING AT THE WING LEADING EDGE AND BLOWING OVER THE FLAPS AND DROOPED AILERONS
S. F. J. Butler London Aeron. Res. Council 1971 54 p refs
Supersedes RAE-TR-67223; ARC-29976
(ARC-R/M-3655; RAE-TR-67223; ARC-29976)

Low-speed longitudinal stability measurements are described on a fifth-scale half-model including some comparisons with complete-model tests and the measured aircraft performance. Shroud blowing over the trailing-edge flap, and drooped aileron nearly doubled the $C_{sub L}$ (lift coefficient) increment, to as much as 1.0, with adequate aileron roll control effectiveness at a mean aileron angle of up to 30 deg. Trimming reduced the lift increments by about 20 per cent. Despite considerable aerodynamic objections associated with the thin wing and small nose radii, and integral (nondeflecting) leading-edge blowing arrangement was specified for aircraft structural reasons. Although an acceptable arrangement was developed, this necessitated the selection of a safe compromise position for the blowing nozzle to avoid adverse compressibility effects at aircraft takeoff and landing speeds. Typically, a stalling incidence of 20 deg [$C_{sub L}$ max (maximum lift coefficient) = 1.8] was achieved for the proposed takeoff configuration 30 deg flap; 20 deg mean ail was achieved for the proposed takeoff configuration (30 deg flap; 20 deg mean aileron droop). With the prescribed integral leading edge, wing pitch-up at the stall was not avoided, although initial wing flow separations were confined to the inboard wing. In general, the aircraft high-lift performance confirms the results of the tests on this half-model.

PART 1: MEASUREMENTS OF THE OSCILLATORY PITCHING-MOMENT DERIVATIVES ON A DELTA WING WITH ROUND LEADING EDGES IN INCOMPRESSIBLE FLOW

L. Woodgate *In its* Meas. of the Oscillatory Pitching-Moment Derivatives on a Series of Three Delta Wings in Incompressible Flow 1971 p 3-21 refs
Copyright. Avail: NTIS; HMSO: £2; BIS: \$7.20

Oscillatory pitching-moment derivatives have been measured on a round-leading-edged delta wing of aspect ratio 1.484 and of thickness to chord ratio 0.06. Mean incidence was varied from 0 to 15 deg, and frequency parameter and Reynolds number, based on the mean chord, were varied from 0.2 to 0.1 and from 1.28 million to 2.56 million respectively. Comparisons are made with similar measurements on a sharp-edged delta wing of the same aspect ratio. Differences between the results for the two models are found for both pitching axes used in the tests. From the results for $h = 1.5$ mean chord and from surface flow patterns, it appeared that for low angles of incidence the round leading edge suppressed the development of vortex flow sufficiently for it to have no effect on either derivative. Above $\alpha = 5$ deg, vortex flow was gradually established, giving a change in each derivative with incidence similar to that found on the sharp-edged model.

PART 2: MEASUREMENTS OF THE OSCILLATORY PITCHING-MOMENT DERIVATIVES ON A SLENDER SHARP-EDGED DELTA WING IN INCOMPRESSIBLE FLOW

L. Woodgate *In its* Meas. of the Oscillatory Pitching-Moment Derivatives on a Series of Three Delta Wings in Incompressible Flow 1971 p 22-38 refs

Copyright. Avail: NTIS; HMSO: £2; BIS: \$7.20

Oscillatory pitching-moment derivatives have been measured by an inexorable forcing method on a delta wing of aspect ratio

0.654 in pitching motion. Mean incidence has been varied from 0 to 15 deg, frequency parameter from 0.2 to 1.0, and Reynolds number from 1.28 million to 2.30 million. The derivatives showed large and approximately linear variations with incidence. Comparisons are made with previous measurements on a delta wing of higher aspect ratio also with sharp edges. In general, the numerical values of the derivatives and the variation in the derivatives due to changes in the mean incidence, frequency of oscillation, and Reynolds number are smaller for the more slender wing.
Author (ESRO)

N71-24572# National Physical Lab., Teddington (England). Aerodynamics Div.

PART 3: MEASUREMENTS OF THE OSCILLATORY PITCHING-MOMENT DERIVATIVES ON A SHARP-EDGED DELTA WING AT ANGLES OF INCIDENCE FOR WHICH VORTEX BREAKDOWN OCCURS

L. Woodgate *In its Meas. of the Oscillatory Pitching-Moment Derivatives on a Series of Three Delta Wings in Incompressible Flow* 1971 p 39-57 refs

Copyright. Avail: NTIS; HMSO: £ 2; BIS: \$7.20

Pitching-moment derivatives have been measured on a sharp-edged delta wing of aspect ratio 1.484 for a range of incidence from $\alpha = 20$ to 35 deg. For $\alpha = 30$ and 35 deg, vortex breakdown occurred above the wing surface. Some numerically-low values of both the stiffness and damping derivatives were obtained for $\alpha = 30$ deg at low frequency parameters and these are attributed to vortex breakdown. Corresponding measurements at higher frequency parameters were practically unaffected. Flow visualization showed that the pitching oscillation led to an oscillation of the streamwise position of the vortex breakdown but, for the small amplitude of oscillation used, had no effect on the mean position of the breakdown. Author (ESRO)

N71-24573# National Physical Lab., Teddington (England). Aerodynamics Div.

PART 4: MEASUREMENTS OF LIFT, DRAG, AND PITCHING MOMENT ON A SERIES OF THREE DELTA WINGS

L. Woodgate and A. S. Halliday *In its Meas. of the Oscillatory Pitching-Moment Derivatives on a Series of Three Delta Wings in Incompressible Flow* p 58-75 refs

Copyright. Avail: NTIS; HMSO: £ 2; BIS: \$7.20

The measurements were made on three 6 percent thick delta wings; wing (1) had an aspect ratio of 1.484 and all its edges were sharp, wing (2) also had an aspect ratio of 1.484 and the leading edges were rounded, and wing (3) had an aspect ratio of 0.654 with all edges sharp. The values of $C_{sub\ l}$ (lift coefficient), $C_{sub\ m}$ (pitching moment coefficient), and the derivative $\delta C_{sub\ m}/\delta \alpha$ obtained are compared with values predicted by a theory of Garner and Lehrian which takes into account the effects of leading-edge flow separation. The values obtained for wing (1) were in good agreement with similar measurements from other sources, $C_{sub\ l}$ being slightly larger than theory and $C_{sub\ m}$ in reasonable agreement with theory. The round leading edge of wing (2) had the predictable effect of slightly reducing the value of $C_{sub\ l}$ and numerically increasing the value of $C_{sub\ m}$ for the mid-root-chord axis, as compared with the sharp-edged wing. Wing (3) produced values much lower than both theory and reported values for flat-plate deltas of similar aspect ratio. Author (ESRO)

VERTICAL-FIN LOADS AND RUDDER HINGE-MOMENT MEASUREMENTS ON A 1/8 SCALE MODEL OF THE M2F3 LIFTING BODY VEHICLE AT MACH NUMBERS FROM 0.50 TO 1.30

Ming H. Tang Washington May 1971 43 p refs
(NASA-TM-X-2286; H-650) Avail: NTIS CSCL 01A

Outboard fin loads and rudder hinge moment measurements were obtained from a 1/8 scale model of the M2-F3 lifting body vehicle tested in the 11 foot transonic wind tunnel. The tests were conducted at Mach 0.50 to 1.30. The effects of variations in rudder deflection, upper flap deflection, lower flap deflection, and angles of attack and sideslip were studied. The left outboard fin loads increased with increase in angle of attack, Mach number, rudder deflection, lower flap deflection, and negative sideslip and decreased with increasing upper flap deflection. The rudder hinge moment increased with increase in rudder deflection and, generally, with Mach number.

NOISE MEASUREMENTS FOR A THREE ENGINE TURBOFAN TRANSPORT AIRPLANE DURING CLIMBOUT AND LANDING APPROACH OPERATIONS

W. Latham Copeland and Lorenzo R. Clark Washington May 1971 54 p refs

(NASA-TN-D-6137; L-5994) Avail: NTIS CSCL 01B

Noise measurements have been made for a three engine turbofan transport airplane during climbout and landing approach operations in which the airplane operating procedures were carefully controlled. These controlled procedures included an orderly scheduling of operating variables such as engine power, speed, altitude, and flap settings. The results of these studies are presented for seven climbout operations involving various climb speeds, flap settings, and engine power settings and for three landing approach operations involving various glide-slope angles. In general, the results from the climbout studies indicated that the lower noise levels (6 dB to 14 dB) were associated with profiles employing lower engine powers during second-segment climb. It was also found that, for a given climb profile and climb rate, slightly higher noise levels are associated with operations employing fixed flaps than with a specified flap retraction schedule. The results from landing approach studies indicated that generally lower noise levels were associated with the steeper glide slopes. For these steeper glide slopes, noise reductions attained (4 dB to 9 dB) resulted from both the increased altitude and the lower engine powers. Author

THICK HIGH ASPECT RATIO WING, PART 2

Larry L. Erickson, Bruno J. Gambucci and Phillip R. Wilcox *In its* NASA Space Shuttle Technol. Conf., Vol. 3 Apr. 1971 p 201-229 refs

Avail: NTIS HC \$6.00/MF \$0.95 CSCL 20K

Transonic flutter and buffet results are presented for two elastic models of a proposed space-shuttle straight wing. The models were tested at Mach numbers from 0.6 to 1.1 at various dynamic pressures and at angles of attack up to 18 deg. Zero degree angle of attack flutter occurred in a narrow Mach number range centered at about Mach 0.85. Stall flutter was not observed although several instances of low torsional damping were noted. At conditions of maximum buffet intensity, model peak dynamic bending moments ranged up to 80% of the corresponding static bending moments.

APPLICATION OF RECENT PANEL FLUTTER RESEARCH TO THE SPACE SHUTTLE. PART 2: INFLUENCE OF EDGE CLIPS AND FLOW ANGULARITY

Herman L. Bohon and Charles P. Shore *In its* NASA Space Shuttle Technol. Conf., Vol. 3 Apr. 1971 p 247-264 refs

Avail: NTIS HC \$6.00/MF \$0.95 CSCL 20K

The parameters that are known contributors to aeroelastic problems in light of current TPS designs are examined. In particular, the nature of boundary conditions and flow angularity as they affect panel flutter are discussed. The data are not restricted to metallic panels but, in fact, may also apply to panels with external insulation. Emphasis, however, is placed on the orthotropy of the surface structure and the deflectional flexibility of the clips which connect it to the primary structure.

PRELIMINARY MEASUREMENTS AND FLOW VISUALIZATION STUDIES OF PRESSURE FLUCTUATIONS ON SPACE SHUTTLE CONFIGURATIONS

Charles F. Coe, Jules B. Dods, Jr., Robert C. Robinson, and William H. Mayes *In its* NASA Space Shuttle Technol. Conf., Vol. 3 Apr. 1971 p 293-314 ref

Avail: NTIS HC\$6.00/MF\$0.95 CSCL 20K

Results of research in flow characteristics and pressure fluctuations on space shuttle launch and reentry configurations are reported. The investigations to date have consisted of pressure fluctuation measurements at transonic speeds on 0.01- and 0.025-scale models of straight- and delta-wing launch configurations and fluorescent oil flow tests of 0.008-scale models of straight- and delta-wing launch configurations over a Mach number range of 0.8 to 2.0. The Bolt, Beranek and Newman tests have been directed to the definition of unsteady pressures for reentry conditions. They consisted of flow visualization studies and measurements of pressure fluctuations on both 0.004-scale and 0.0077-scale models of a low-cross-range orbiter configuration at $\alpha = 60$ deg for Mach numbers of 2.5 and 4.0. THE EFFECTS OF PARAMETER VARIATION ON INFLIGHT WIND LOADING

Alden C. Mackey *In its* NASA Space Shuttle Technol. Conf., Vol. 3 Apr. 1971 p 315-332

Avail: NTIS HC\$6.00/MF\$0.95 CSCL 20/4

Performance, controllability, and structural loads were investigated to maximize the payload in space shuttle operation. The parameters: wing incidence angle, control system gains, commanded attitude history, and winds are considered to affect boost loads and performance. Their effects are presented in graphs. It is concluded that the means for reducing structural loads are available, and structural loading must be considered in payload maximization analyses. F.O.S.

DESIGN POINT CHARACTERISTICS OF A 15-TO-80 kWe NUCLEAR-REACTOR BRAYTON-CYCLE POWER SYSTEM

Paul T. Kerwin [1971] 9 p refs Proposed for presentation at the 1971 Intersociety Energy Conversion Engineering Conf., Boston, 3-6 Aug. 1971

(NASA-TM-X-67811) Avail: NTIS CSCL 18L

A study of 15-80 kWe nuclear reactor powered Brayton cycle power system is presented. The system has a design turbine inlet temperature of 1150 F based on the use of a zirconium-hydride reactor but is also required to be capable of operation at turbine inlet temperatures up to 1600 F with an advanced reactor. Considerations involved in the selection of cycle parameters, working fluid, pressure level, and turbomachinery rotational speed are discussed. Size and weight estimates, predicted design-point performance, and required radiator area are presented. Author

PREDICTED PERFORMANCE OF A 15-80 kWe REACTOR BRAYTON POWER SYSTEM OVER A RANGE OF OPERATING CONDITIONS

D. C. Guentert and R. L. Johnsen [1971] 10 p refs To be presented at 1971 Intersoc. Energy Conversion Eng. Conf., Boston, 3-6 Aug. 1971; sponsored by SAE

(NASA-TM-X-67833) Avail: NTIS CSCL 18L

A computer simulation of a 15-80 kWe nuclear reactor Brayton cycle power system designed for a turbine inlet temperature of 1150 F was used to study the steady-state performance of the system at turbine inlet temperatures between 1050 and 1600 F. The low end of the temperature range is of interest in applications using a zirconium hydride reactor heat source, while the 1600 F temperature assumes the use of an advanced reactor. Cycle-parameter effects and predicted system efficiency and required radiator area are presented over a range of compressor inlet temperatures and turbine inlet temperatures. The performance over a range of power levels is also presented. Author

MOTOR STARTING TECHNIQUES FOR THE 2-TO-15 kW BRAYTON SPACE POWER SYSTEM

L. J. Gilbert, J. S. Curreri, and D. A. Cantoni [1971] 12 p refs Proposed for presentation at the 1971 Intersociety Energy Conversion Engineering Conf., Boston, 3-6 Aug. 1971

(NASA-TM-X-67819) Avail: NTIS CSCL 18L

The 2-15 kilowatt Brayton space power system has been effectively started by motoring the rotating unit. This Brayton power system generates 120/208 volts, 1200 hertz electrical power at a rated speed of 36,000 rpm. The system is designed for a turbine inlet temperature of 1600 F (1145 K) and can be operated with a variety of heat sources such as a nuclear reactor or radioisotope. By applying 20 volts line-to-neutral, 400 hertz electrical power to the alternator terminals at standstill, the rotating unit can be motored to a speed of 12,000 rpm in about 20 seconds. Upon removal of the input electrical power, the system self-accelerates to its rated speed, provided that the turbine inlet temperature is 875 F (741 K) or higher. Author

TRAVERSING PROBE Patent

Edwin J. Saltzman, Meryl D. De Geer, Stanley C. Plamowski, and Robert Grant Green, inventors (to NASA) Issued 20 Sep. 1966 (Filed 25 Jun. 1964) 9 p Cl. 73-389

(NASA-Case-XFR-02007; US-Patent-3,273,399;

US-Patent-Appl-SN-378080) Avail: US Patent Office CSCL 20D

An instrument which makes it possible to obtain an accurate boundary layer profile using only a limited number of probes, usually one or two, is described. The instrumentation required for recording and measuring is (1) an instrument for measuring and recording the pressure conditions encountered by each probe, and (2) an instrument for determining and recording the position of the probe with respect to the vehicle surface. Inasmuch as the probes are mounted in a fixed position to a single mast only one instrument is required for probe position even though two probes are employed. Two embodiments of a traversing mechanism for extending and retracting the probe are disclosed.

DESIGN OF BODIES FOR LOW DRAG AND HIGH PERFORMANCE IN PRACTICAL HYPERSONIC FLIGHT

E. S. Love *In its* Performance and Dyn. of Aerospace Vehicles 1971 p 103-174 refs

Avail: NTIS HC \$9.00/MF \$0.95 CSCL 20D

Some topics related to body shaping for minimum drag and improved performance at hypersonic speed are presented. Implications of the most frequently assumed pressure laws are reviewed from the view of practical flight regimes, and solutions expressed in exponential residuals are presented for inviscid minimum drag power-law bodies (simple and complex) for a wide range of fineness ratio. Analytical results and comparisons with experiment are given for constraints of length and diameter and length and

volume. Experimental results from Mach numbers of 6 to 20 are presented for a series of trapezoidal bodies; the cross section of the body giving best lift drag ratio differs from that indicated in earlier work. A simple \sin^2 deficiency method is presented for predicting pressures on blunt shapes; the method appears to yield results comparable to more elaborate methods requiring machine computation.  Avail: NTIS HC\$9.00/MF\$0.95 CSCL 20D

A discussion is presented of the response of an airplane to turbulence, including techniques for the alleviation of lateral and longitudinal motions. A simplified theoretical treatment of the longitudinal response to vertical gusts, which allows calculation of the effects of various types of gust alleviation systems, is presented. Flight experiments on various gust alleviation systems are reviewed. A brief discussion is given of the application of these systems to different types of airplanes. Finally, methods of refinement of the simplified theory to include effects of horizontal gusts, unsteady lift effects, and isotropic turbulence are described. Author

AN AIRSPACE UTILIZATION MODEL FOR V/STOL TERMINAL OPERATIONS

Dorian Albert DeMaio (M.S. Thesis) Jan. 1971 95 p refs
 (Contract NAS12-2081; Grant NGR-22-009-010; Contract DOT-TSC-5)
 (NASA-CR-118315; TE-45) Avail: NTIS CSCL 01B

A computer graphics display program is developed for use in terminal area studies and V/STOL approach and departure path synthesis. The computer processes inputs describing the terminal area and accompanying constraints and displays on a cathode ray tube the airspace utilization model, a three dimensional image representation of the constraints at a given altitude. Extensive machine operator interaction is provided to select various constraint criteria, to plan approaches and departures and to check the results through viewing and teletype output. The program is general and may be applied to a number of terminal areas. The programs' applicability and usefulness is demonstrated in the analyses of several proposed VTOL port sites in the Northeast Corridor. Author

TECHNICAL EVALUATION OF DUAL INPUT TRANSPONDER Final Report, Jul. 1969 - May 1970
 Jules E. Blazej Apr. 1971 78 p refs
 (FAA-NA-71-39; FAA-RD-71-18) Avail: NTIS

The Dual Input Transponder (DIT) was evaluated to determine if it, in conjunction with upper and lower aircraft antennas, could resolve existing Air Traffic Control Radar Beacon System (ATCRBS) antenna coverage problems by minimizing aircraft antenna shielding phenomena. Flight tests of the DIT and other comparative transponder-antenna configurations were conducted and included several types of maneuvers intended to place the test aircraft in numerous shielding attitudes. Results of the test program indicated that the DIT effectively minimized the loss of transponder replies caused by shielding of the antennas and provided essentially uninterrupted antenna coverage. A limited number of tests with two independently operated transponders and two antennas indicated that this configuration resulted in less apparent shielding effects than the DIT system. Author

ABSORPTION EFFECT ON VHF PROPAGATION BETWEEN SYNCHRONOUS SATELLITE AND AIRCRAFT Summary Report

Edward J. Mueller (Westinghouse Elec. Corp., Baltimore, Md.) Dec. 1970 50 p refs
 (NASA-TM-X-65507; X-490-71-44) Avail: NTIS CSCL 17B

Ionospheric and tropospheric absorption, in terms of geographical contour, are discussed for the very high frequencies in an aeronautical satellite system. The North Atlantic region was chosen as the test area. The system comprises two geostationary satellites. Conclusions indicate no allowances need be made for tropospheric absorption, but that auroral and ionospheric absorption should be considered in North Atlantic design. Results also show that aeronautical routing, operational procedures, and telecommunications systems design must be considered. E.H.W.

SATELLITE AIDED VEHICLE AVOIDANCE SYSTEM Patent
 Ernest R. Steele, inventor (to NASA) Issued 22 Dec. 1970 (Filed 28 Mar. 1969) 19 p Cl. 343-112; Int. Cl. G01s5/02
 (NASA-Case-ERC-10090; US-Patent-3,550,129; US-Patent-App'l-SN-811542) Avail: US Patent Office CSCL 17G

A method and an apparatus for warning aircraft pilots of the proximity of another aircraft are detailed. The apparatus comprises a system including a satellite for transmitting a synchronizing signal and means onboard the aircraft for receiving said synchronizing

signal. Means are also included onboard said aircraft for generating a response signal in response to said synchronizing signal and for opening a gate upon the receipt of said synchronizing signal for receiving said response signal. The gate is maintained open for a predetermined period of time that establishes a threat detection zone so that a response signal from another aircraft passes through the gate only if the response signal is received during the predetermined period of time. The received response signal is applied to an indicator to indicate the proximity of the other aircraft or is used to compute the threat of collision and derive a display of a suitable avoidance maneuver.

THE THEORY OF DIGITAL PROCESSING OF STOCHASTIC SIGNALS FOR USE IN AVIONIC SYSTEMS ON-BOARD AIR FORCE AIRCRAFT Final Scientific Report, 1 Jan. 1967-31 Dec. 1970

N. Thomas Gaarder Mar. 1971 17 p refs
(Grant AF-AFOSR-1251-67)

(AD-719822; CER-PRE-70101; AFOSR-TR-71-0494) Avail: NTIS CSCL 9/4

The report contains a description of the University of Hawaii research program in the theory of digital processing of stochastic signals for use in avionics systems on-board Air Force aircraft. The majority of new signal processors in avionics communication and control systems are being realized digitally. They are realized digitally because the advent of the present integrated circuit technology has led to inexpensive, reliable, flexible, and light weight systems. The discrete nature of these digital processors coupled with the stochastic nature of their input signals imposes constraints upon such systems that should be considered in the design of such systems.

EMPELLAGE LOADS ON T-TAIL TRANSPORTS IN CONTINUOUS ATMOSPHERIC TURBULENCE

Henry Morgan Dodd, Jr. (Ph.D. Thesis) 1969 104 p
Avail: Univ. Microfilms Order No. 70-11014

Empennage loads on T-tail transports were investigated for the case of response to continuous atmospheric turbulence. A real-time analog-digital computer simulated the airplane dynamics and determined the importance of nonlinear aerodynamic loads caused by simultaneous vertical and lateral gusts. These nonlinear aerodynamic effects were determined from wind-tunnel tests in a transonic dynamics tunnel. The simulated model was assumed to be a rigid airplane with five degrees of freedom (2 longitudinal, 3 lateral), and results were obtained for both yaw damper on and damper off flight conditions. Bending moments on the stabilizer, fin tip, and fin root were chosen as typical loads, with emphasis on how loads might be altered by the nonlinear effects.

STABILITY AND CONTROLLABILITY OF SUPERSONIC AIRCRAFT, 1970

V. Lutskii et al 4 Dec. 1970 14 p Transl. into ENGLISH from *Aviatsiya i Kosmonavtika* (Moscow), no. 1, 1970 p 15-18
(AD-719804; FTD-HC-23-599-70) Avail: NTIS CSCL 1/3

To a great extent, the maneuverability of a supersonic fighter is determined by the value of the maximal available overloads which vary in relation to the flight speed and height. In its turn, the maximal available overload is affected by the maximally permissible value of lift coefficient and the reserve C(subscript y)--ranging from the balancing value in straight flight to the maximally permissible value. Satisfactory parameters of stability and controllability are retained in the delta-wing fighters under condition: of aerodynamic buffeting.

During the piloting of supersonic aircraft with swept wings, it is important to take into account a reduction in the overload stability margin in the transonic range of speeds at relatively small angles of attack. This is connected with the unfavorable development of flow separation on the wing and the horizontal empennage under conditions of the formation and development of supersonic zones of flow and shock waves; such a condition sometimes leads to a spontaneous abrupt rise in the overloading at these speeds.

FLIGHT TESTS TO INVESTIGATE THE PROBLEMS OF STEEP APPROACHES BY STOL AIRCRAFT

C. O. O'Leary and N. V. Slatter London Aeron. Res. Council 1970 43 p refs Supersedes RAE-TR-69277; ARC-31849 (ARC-CP-1138; RAE-TR-69277; ARC-31849) Copyright. Avail: NTIS; HMSO: 60p; BIS: \$2.40

Steep approach tests with a Varsity and an Andover aircraft are described. Using the Varsity aircraft, 243 visual approaches were flown in a statistical experiment which included variations of approach angle, speed, height of entry to the approach, glide path guidance and pilots. A statistical analysis of the effects of the variables on various approach performance parameters was carried out and the significant results are illustrated and discussed. Tests with the Andover aircraft were on a smaller scale and were primarily concerned with the final phase of the approach and

landing. The most important results of the tests are that steep approaches can be accurately and consistently made using a simple form of glide path guidance and landing distances can be decreased without any apparent increase in variability of performance.

MEASUREMENT AND ANALYSIS OF C-5A INTERIOR ACOUSTIC ENVIRONMENTS DURING FLIGHT OPERATIONS Final Report. Jul. - Aug. 1970
 Justus F. Rose, Jr. Oct. 1970 11 p refs
 (AD-719746; AMRL-TR-70-110) Avail: NTIS CSCL 20/1

Interior sound pressure levels produced by the C-5A aircraft were measured at sixty-six locations where crew/passenger personnel would typically be located during operational missions. Conditions ranged from aircraft preflight through maximum endurance cruise at an altitude of 31,000 feet. These data were used to compute A-weighted and C-weighted overall sound levels, permissible exposure times with and without ear protection and preferred speech interference levels. The measured data were grouped by location/condition and each major compartment in the aircraft evaluated for human exposure to the environment. The major problem area is in the cargo compartment where the high noise levels are such that for any appreciable exposure time, ear protection must be worn to prevent risk of permanent hearing impairment. The public address system in the cargo compartment is inadequate as presently configured and coupled with the high noise levels cannot be effectively used to brief passengers during missions.

A PILOTTED SIMULATOR STUDY OF A JET VTOL AIRCRAFT IN PARTIALLY JET-BORNE FLIGHT
 K. P. King and A. McPherson London Aeron. Res. Council 1971 67 p refs Supersedes RAE-TR-68301; ARC-31163
 (ARC-R/M-3647; RAE-TR-68301; ARC-31163) Copyright. Avail: NTIS; HMSO: £ 1.75; BIS: \$6.30

A simulation of a small jet VTOL aircraft has been used to examine the principles of controlling such aircraft in the partly jet-borne regime. An investigation of three alternative techniques for control at constant speed was made, from which the pilots were able to select a single control technique that was effective from the lowest speed simulated (40 kt) to the highest (150 kt). The preferred technique was to use thrust to control flight path and thrust vector angle to control airspeed while using attitude (controlled by the elevator) to make fine adjustments to both flight path and airspeed. A preliminary study of techniques for performing the transition between wing-borne and jet-borne flight was then made. Although computation limitations precluded transitions to speeds below 40 kt, some valuable information was gained. In particular, a number of transitions were performed successfully, and without great difficulty, while following an ILS beam. As a result of these tests, it is believed that jet VTOL aircraft with adequate stability may have a greater potential than had been anticipated for operating in poor weather, without the complicated flight-director systems and automatic controls that have generally been thought to be necessary. REPORT OF THE HIGH REYNOLDS NUMBER WIND TUNNEL STUDY GROUP OF THE FLUID DYNAMICS PANEL

Apr. 1971 24 p refs

(AGARD-AR-35-71) Avail: NTIS

The working group considered transonic wind tunnel performance and operating characteristics required to support evolution of military and civil, aeronautical and aerospace systems during the coming decade. These considerations, along with a review of experience on model testing at transonic speeds, led to the conclusion that the NATO nations should acquire, as soon as possible, two types of new wind tunnels. One tunnel should duplicate transonic flight Reynolds numbers and have a run time on the order of one second. The second should have a 16 ft test section and should provide Reynolds numbers that are 3 or 4 times the maximum presently available, with a run time on the order of 10 seconds. It was also concluded that AGARD should support current research and development in design, operation and test techniques in transonic tunnels of the continuous, conventional blowdown and Ludwieg tube type, and that AGARD should encourage expansion of these activities in the future. EXTREME VALUE ANALYSIS AND ITS APPLICATION TO c. g. VERTICAL ACCELERATIONS MEASURED ON TRANSPORT AIRPLANES OF TYPE C-130

Otto Buxbaum (Lab. fuer Betriebsfestigkeit) Mar. 1971 31 p refs Presented at 31st Meeting of the Panel on Environ. Statist. Data of AGARD, Tonsberg, Norway, 1-6 Nov. 1970

(AGARD-R-579-71) Avail: NTIS

The interpretation of cumulative frequency distributions of measured flight loads can be increased significantly by an additional extreme value analysis. This method not only leads to a higher reliability in fatigue design but may be used also for a prediction of extreme loading conditions and for a description of the effect of airplane and flight parameters on loads, as is demonstrated for c.g. vertical accelerations and gust velocities measured on airplanes of type C-130. THE ASSEMBLY OF GAS TURBINE AIRCRAFT ENGINES (SELECTED CHAPTERS)

V. I. Sokolov et al 10 Dec. 1970 102 p refs Transl. into ENGLISH from the publ. 'Sborka Aviatsionnykh Gazoturbinykh Dvigatelye' 1969 p 257-343

(AD-719823; FTD-HC-23-635-70) Avail: NTIS CSCL 21/5

While the units and subassemblies can be assembled both in an assembly shop and in the assembly sections of the combined and machine-assembly shops, the overall assembly of an engine is done only in an assembly shop. The overall assembly of engines, just as the assembly of units, consists of the preliminary intermediate and final assembly operations. In the process of conducting these operations, a check is made of the mutual arrangement of the parts and units; the axial, radial and diametral clearances and fits are established. These must comply with the technical specifications for the overall assembly of engines. The report discusses the overall assembly of three types of gas-turbine engines (GTE), differing significantly in design of basic units; therefore the preliminary intermediate and final assembly processes differ in respect to the methods used in these processes. PERTURBATION AND HARMONIC BALANCE METHODS FOR NONLINEAR PANEL FLUTTER Technical Report, 11 Dec. 1969-15 Mar. 1971

Luigi Morino, Ching-Chiang Kuo, and John Dugundji Mar. 1971 107 p refs

(Grant NGR-22-009-387)

(NASA-CR-111907; ASRL-TR-164-1) Avail: NTIS CSCL 20K

Nonlinear panel flutter is examined by using the multiple time scaling method and the harmonic balance method. The two methods are applied to the analysis of: (1) simply supported two dimensional plates; and (2) clamped-clamped three dimensional plates. The effect of mass ratio and inplane loadings are analyzed in both bases. The influence of the aspect ratio is considered also for the three dimensional plate. The two methods yield very similar results. A comparison with existing methods shows that the results are in very good agreement with those obtained by straightforward direct numerical integration method. Author

POTENTIAL OF METHANE FUELED SUPERSONIC TRANSPORTS OVER A RANGE OF CRUISE SPEEDS UP TO MACH 4

John B. Whitlow, Jr. and Gerald A. Kraft Washington May 1971 39 p refs

(NASA-TM-X-228) Avail: NTIS CSCL 01B

A major factor restricting currently proposed SST's to a maximum cruise speed of Mach 2.7 is the limited heat sink capacity of kerosene-type fuels. Higher speeds may be possible with cryogenic liquid methane, which has up to seven times the heat sink and can be economically obtained from natural gas. In the analysis presented, methane was considered as the fuel for airplanes designed to cruise at speeds up to Mach 4. When a comparison was made at Mach 2.7 with a conventionally fueled SST, the use of methane improved both range and direct operating cost (DOC) by about 11 percent. Little range improvement was obtained by cruising faster than Mach 2.7, although certain assumptions made in this study should produce somewhat optimistic results at the higher speeds. Range peaked near Mach 3 and decreased from 6 to 13 percent as cruise speed was increased to Mach 4. The block time reductions obtained with higher cruise speeds are beneficial to DOC. Most of the possible DOC improvement was obtained by a speed increase to Mach 3.2, where a 20-minute time saving produced 7 percent improvement in DOC. Author

A MODEL TEST ON THE HOVERING PERFORMANCE OF JET FLAPPED ROTOR

Masaki Komoda, Tohichi Oka, Kingo Takasawa, and Nobuhiro Toda 1970 18 p refs In JAPANESE; ENGLISH summary

(NAL-TR-211) Avail: NTIS

A model test was conducted to investigate the hovering performance of jet-flapped rotors with special attention to the comparison with that predicted theoretically. The jet-augmented thrusts and torques were measured for given sets of rotor rpm and mass flow rate. Except for the fact that considerably smaller rates of mass flow were measured than predicted, which is attributable to pressure loss within the nozzle area, the general dependence of measured thrust and torque coefficients upon mass flow and rotor rpm exhibits acceptable agreement with theoretical predictions

PRELIMINARY IMPACT SPEED AND ANGLE CRITERIA FOR DESIGN OF A NUCLEAR AIRPLANE FISSION PRODUCT CONTAINMENT VESSEL

Patrick M. Finnegan, Richard L. Puthoff, and James W. Turnbow (Dyn. Sci. Corp., Phoenix, Ariz.) Washington May 1971 37 p
(NASA-TM-X-2245; E-6025) Avail: NTIS CSCL 21F

Reports and photographs of 96 major accidents occurring before 1965 and involving multiengine jet aircraft were studied. Impact speed and angle are presented for landing and takeoff accidents, cruise accidents without in-flight structural failure, and in-flight structural failure accidents. The landing and takeoff accidents had an average impact velocity of 200 ft/sec from a,., direction and a maximum impact velocity of 300 ft/sec with a 10 deg solid angle about the roll axis. The cruise accident without structural failure had an average impact velocity of 400 ft/sec and a maximum possibly as high as 1000 ft/sec (305 m/sec), both within a 10 deg solid angle about the roll axis. The in-flight structural failure accident had an average impact velocity of 400 ft/sec (122 m/sec) from any direction and a maximum possibly as high as 1000 ft/sec (305 m/sec) within a 10 deg solid angle about the roll axis. The in-flight structural failure accident determines the most severe impact speed for all impact angles. Author

IMPROVED ALUMINIDE COATINGS FOR NICKEL BASE ALLOYS Final Report

M. A. Levinstein and J. R. Stanley 12 Mar. 1971 175 p refs
(Contract NAS3-11160)

(NASA-CR-72863) Avail: NTIS CSCL 11F

Improved aluminide coatings for the NASA 6A nickel-base superalloy, developed for high-temperature jet engine components, were investigated. Coatings involved modifications of a base system representative of three approaches to improve coating stability: 1) oxide particle embedment, 2) chromium enrichment, and 3) aluminum enrichment. Both single-step and duplex coating processes were used. Coatings were tested at 2000 F (1366 K) in dynamic oxidation using both high- and low-velocity cycle burner rigs and ballistic impact. Coating systems identified exceeded 660 hours life at Mach 0.5 and 2000 hours at low velocity. Tensile and stress-rupture properties of NASA 6A were not affected by the coatings. Author

(NASA-CR-82862; GE-R71-AEG-149-Vol-1) Avail: NTIS CSCL 20D

Two high-tip-speed compressor stages were tested with various rotor tip casing treatment configurations under conditions of undistorted inlet flow, tip-radial distortion and circumferential distortion. The first stage consisted of a 1400 ft/sec tip speed medium-aspect-ratio rotor plus a stator vane row; the second stage had a 1500 ft/sec tip speed medium-aspect-ratio rotor and a stator vane row. This second stage was tested both with and without zero-turning inlet guide vanes. Overall performance and stall margin were determined for each stage configuration and inlet condition at 70, 90, 100% of design speed. Extensive surveys of flow conditions were made for the case of circumferential distortion. In addition, blade element data were obtained when testing with undistorted and radial distortion inlet conditions. The techniques and procedure used to acquire the data are described and an analysis and discussion of the test results is included. Author

AIRBREATHING NUCLEAR PROPULSION, A NEW LOOK

Frank E. Rom [1971] 23 p refs Presented at 6th Symp. on Advanced Propulsion Concepts, Niagara, N.Y., 4-5 May 1971; sponsored by AFOSR

(NASA-TM-X-67837) Avail: NTIS CSCL 21F

Aircraft that could fly anywhere on the surface of the earth or remain aloft for weeks at a time without refueling is discussed. Such an aircraft or air cushion vehicle would be nuclear propelled with complete radiation shielding for crew and passenger safety, and have safety provisions designed to prevent the release of radioactive material in the event of serious aircraft accidents. Other safety features include reactors for long operation without refueling, long life high temperature oxidation resistant heat exchangers, and light weight long life valves and pumps. The economics and practicality of such vehicles are also discussed. E.H.W.

IN-FLIGHT EVALUATION OF THE LATERAL HANDLING OF A FOUR-ENGINE JET TRANSPORT DURING APPROACH AND LANDING

Euclid C. Holleman and Glenn B. Gilyard Washington May 1971 31 p refs

(NASA-TN-D-6339; H-642) Avail: NTIS CSCL 01B

The lateral handling of a typical jet transport was evaluated during up-and-away and approach flight in the landing configuration. Sidestep maneuvers to a landing were performed with several levels of lateral control power in smooth-air conditions. A roll control

power capability of about 15 degrees per second was required for satisfactory lateral control, 200-foot lateral offsets to the runway could be safely corrected with very low levels of lateral control power, approximately 2 to 5 degrees per second, using altered piloting techniques. The pilot evaluation results were in general agreement with results from other studies. Author

AIRFIELD PAVEMENT CONDITION SURVEY, USNS ADAK, ALASKA

David J. Lambiotte and Robert B. Brownie Jan. 1971 63 p refs
 (AD-719889; NCEL-TN-1138) Avail: NTIS CSCL 1/5

The results of a condition survey of the airfield pavements at the U. S. Naval Station, Adak, Alaska are presented. The survey established statistically-based condition numbers (weighted defect densities) which were direct indicators of the condition of the individual asphaltic concrete and portland cement concrete pavement facilities. Additional evaluation efforts included photographic coverage of defect types, preparation of the construction history of the station, compilation of data on current aircraft traffic and aircraft types using the station, performance of runway skid resistance tests, and a study of the requirements for future pavement evaluation efforts. GENERAL AVIATION, NAVAL AVIATION AND CONGESTION WITH AN EXAMPLE FROM SOUTHERN CALIFORNIA

Stuart G. Schmid Jan. 1971 32 p refs *Its* INS Res. Contrib. No. 154
 (Contract N00014-68-A-0091)
 (AD-719906) Avail: NTIS CSCL 1/2

Federal Aviation Authority projections of general aviation activity for 1980 show a 75 percent increase over 1969 levels. Such growth will cause a substantial increase in general aviation traffic in airspace over metropolitan areas, creating difficulties for present users of airspace including the Navy. This paper describes a simple computational model used to translate projected general aviation growth into implied densities and aircraft interaction frequencies. The model is applied to Southern California and a case study is made of Miramar NAS at San Diego. The study shows that Navy operations there will be seriously hampered by general aviation traffic within the decade unless stricter air traffic controls are imposed. Such controls are probably justifiable considering the costs of moving Navy operations out of Miramar in comparison to the costs to general aviation of staying clear of prescribed Navy airspace. AIRCRAFT ANTI-ICING SYSTEM: PRINCIPLES OF DESIGN AND TEST METHODS

V. S. Savin et al 26 Jan. 1971 380 p refs Transl. into ENGLISH of the book "Protivoobledenitelnye Sistemy Letalnnykh Apparatov: Osnovy Proektir. i Metody Ispytanii" Moscow, Mashinost., 1967 p 1-320
 (AD-719922; FSTC-HT-23-411-69) Avail: NTIS HC \$6.00/MF \$0.95 CSCL 1/3

Theoretical fundamentals and practical methods of calculating and testing anti-icing systems (AIS) of aircraft and helicopters are described. Based on generalizations of results of experimental research, the meteorological conditions under which icing of aircraft and power plant is possible are pointed out, and the conditions that must be taken as calculation basis in designing AIS are set forth. The unfavorable effect of various forms and types of icing

on stability and control of aircraft and engine performance is discussed. Approximation methods of calculating the dimensions of icing zones are presented. Present-day mechanical, physico-chemical, and thermal anti-icers are briefly examined and criteria for evaluating them when designing AIS are proposed. Principal attention is paid to electro-thermal and preheat-air systems, for which detailed methods of heat calculations are spelled out. Methods and techniques of testing AIS under full-scale and artificial icing conditions are described and tests with icing simulators are analyzed.

ON TRANSONIC FLOW PERTURBATIONS CAUSED BY VORTICITY

G. B. Iinskaya et al [1971] 4 p refs Transl. into ENGLISH from Izv. Akad. Nauk SSSR, Mekh. Zhidk. Gaza (USSR), no. 1, 1971 p 168-170

Avail: NTIS; National Translations Center, John Crerar Library, Chicago, Ill. 60616

Plane vortical gas flows in the neighborhood of a point of orthogonality of the sonic line to the velocity vector are studied. Such points originate in the transonic flow over a wing profile in the external boundary layer region, where there is a transverse velocity gradient. Flows in which the acceleration is negative ahead of the sonic point are investigated. They can originate in the flow around a wing profile with a peak pressure distribution, when intense compression waves starting from the sonic line retard the flow in the local supersonic zone. The gas motion is described by the continuity, vortex, and Bernoulli equations. Author

NUCLEAR POWERED AIR CUSHION VEHICLES FOR TRANSOCEANIC COMMERCE

Frank E. Rom and Charles C. Masser Washington May 1971 52 p refs

(NASA-TM-X-2293; E-6152) Avail: NTIS CSCL 21F

Large air-cushion vehicles (ACV's) greater than 3620 metric tons (4000 tons) gross weight, have the potential for hauling transoceanic cargo at rates in the range of \$0.006 to \$0.012 per metric ton-kilometer (\$0.010 to \$0.020/ton-n mi) at speeds of 185 kilometers per hour (100 knots). It theoretically would take a fleet of over 1000 10,000-metric-ton-gross-weight ACV's to handle 10 percent of the world transoceanic trade projected for 1985. ACV's using compact lightweight nuclear reactors show clearly superior performance for ranges of 3710 kilometers (2000 n mi) or greater. For a range of 7420 kilometers (4000 n mi) the total operating cost for chemical ACV's is three times that for nuclear ACV's. The nuclear ACV performance is less sensitive than the chemical ACV to the operating and cost assumptions used. Relatively large variations in any of the important assumptions had a relatively small effect on nuclear ACV performance. Author

RESULTS OF INITIAL PROP-FAN MODEL ACOUSTIC TESTING. VOLUME 1: DISCUSSION

F. B. Metzger and T. G. Ganger 4 Dec. 1970 58 p refs

(NASA Order L-60739)

(NASA-CR-111842-1; HSER-5787-Vol-1) Avail: NTIS CSCL 20A

Results are summarized of a test program conducted to explore the low noise potential of the prop-fan, a high bypass ratio, low pressure ratio, variable pitch propulsor. Far field noise data and directional character of a 21-inch diameter prop-fan model were determined for two shroud configurations, a bellmouth test shroud and a takeoff/cruise shroud. In addition, near field data were obtained for the bellmouth test shroud. Review of the data reinforce earlier conclusions that a large STOL aircraft powered by prop-fans has the potential to meet the objective of 95 PNdB at 500 feet with modest acoustic treatment. Author

SHORT TERM CREEP OF METALS AND ALLOYS UNDER CONDITIONS OF AERODYNAMIC HEATING [KRATKOVREMENNAYA POLZUCHEST METALLOV I SPLAVOV V USLOVIYAKH AERODINAMICHESKOGO MAGREVA]

I. N. Bogachev et al Washington NASA May 1971 10 p refs Transl. into ENGLISH from Izv. Vyssh. Ucheb. Zaved., Chern. Met. (USSR), no. 4, 1970 p 142-147

(Contract NASw-2038)

(NASA-TT-F-13633) Avail: NTIS CSCL 11F

A method of testing metals and alloys for short-term creep under conditions of aerodynamic heating (in dynamic contact with high velocity air flows in the test apparatus) is described. Tests on Ni, Co, Armco Fe, Ti alloys, and various types of C and alloy steel at 500-1000 C show that the nature of the creep process under aerodynamic conditions differ sharply from that characterizing static creep. The change is attributed to thermal, erosive, and corrosive effects, and in some cases to the alternating stresses arising from high-speed air flows. Author

A COMPARISON OF PILOT PERFORMANCE USING A CENTER STICK vs SIDE ARM CONTROL CONFIGURATION Technical Report, May - Oct. 1968

Richard Geiselhart, Paul Kemmerling, James E. Cronburg, and David E. Thornburn Wright-Patterson AFB, Ohio AFSC Nov. 1970 54 p refs

(Contract F33615-68-C-1097)

(AD-720846; ASD-TR-70-39) Avail: NTIS CSCL 1/3

Six Air Force pilots having current flying status flew a series of forty-minute missions to compare pilot performance with the conventional center stick, dual side stick, and single side stick configurations. An F-111 flight simulator with three degrees-of-motion was employed as the test-bed for the experiment. The missions, which included climbout, a terrain following portion, two banking turns, and five Instrument Landing System (ILS) approaches, were designed to test the feasibility of side stick controllers under low-altitude, high-speed conditions. Course steering deviation, airspeed deviation, pitch deviation, and ILS evaluation scores were obtained using the computer to compare pilot performance using the three stick configurations. From the evaluation of the performance data and opinion questionnaires filled out by the pilots, it was concluded that side stick controllers are feasible for use in a relatively high-speed aircraft flying a low-altitude, high-speed mission, and that dual side sticks are preferable to single side sticks. Recommendations were made for further studies in several areas. Author (GRA)

MACH 2.5 PERFORMANCE OF A BICONE INLET WITH INTERNAL FOCUSED COMPRESSION AND 40 PERCENT INTERNAL CONTRACTION

Joseph F. Wasserbauer and David A. Choby Washington May 1971 58 p refs

(NASA-TM-X-2294; E-6079) Avail: NTIS CSCL 20D

The inlet was designed to have the minimum internal contraction consistent with high total-pressure recovery and low cowl drag. Without a bypass system the inlet provided a critical pressure recovery of 0.880 and a steady-state distortion of 0.185 when the supercritical bleed flow was 0.032. With a bypass system in operation the critical pressure recovery increased to 0.903 and the steady-state distortion dropped to 0.10. Maximum angle of attack before an inlet unstart ranged as high as 9.4 deg.

INVESTIGATION TO DEVELOP A HIGH STRENGTH STRESS-CORROSION RESISTANT NAVAL AIRCRAFT ALUMINUM ALLOY Final Report, 16 Dec. 1969-16 Sep. 1970

J. T. Staley 20 Nov. 1970 114 p refs
(Contracts N00019-70-C-0118; N00019-69-C-0292)
(AD-720398) Avail: NTIS CSCL 11/6

The report presents the results of an evaluation of three tempers of commercially fabricated alloy MA15 plate in 1 in. to 6 in. thickness. Compared at equal strengths, MA15 developed higher resistance to stress-corrosion cracking, greater resistance to exfoliation corrosion, higher toughness, and better fatigue performance than established commercial aluminum alloys. Compared at equal resistance to stress-corrosion cracking, MA15 developed substantially higher strength than established commercial aluminum alloys. Field testing of this material is recommended.

RADIO FREQUENCY UTILIZATION IN THE BANDS OF PRINCIPAL INTEREST FOR AERONAUTICAL SATELLITES

John J. Bisaga, Earl J. Holliman, and Allan Schneider Dec. 1970 128 p refs

(NASA-TM-X-65527; X-490-70-447) Avail: NTIS CSCL 17B

Radio frequencies examined are those allocated and assigned in the frequency bands 118.0 to 136.0 MHz (VHF) and 1535 to 1660 MHz (UHF or L band). The frequency areas were considered as possible candidates for aeronautical communications using satellite techniques because of their current allocation to the aeronautical service. The present utilization, future trends which would affect frequency availability with projected growth, and pertinent factors influencing frequency assignment for the time frame to 1980 were studied. Since the ability to meet increased utilization also depends upon channelization and performance characteristics, the parametric relation of these factors for a range of values were included.

TECHNICAL MAINTENANCE OF AIRCRAFT [TEKHNICHESKAYA EKSPLOATATSIYA LETATELNYKH APPARATOV]

A. I. Pugachev et al 15 Jan. 1971 633 p refs Transl. into ENGLISH from the Russian
(AD-720366; FTD-MT-24-110-70) Avail: NTIS HC \$9.00/MF \$0.95 CSCL 1/3

Basic questions on the theory, practice and organization of technical maintenance of aircraft of civil aviation are stated. Application of methods of flow planning, the theory of mass servicing and the theory of reliability in solving problems of technical servicing are considered. Basic rules are started for the maintenance of aircraft and special features of their servicing under various climatic conditions. Questions regarding provision of operational technical facilities for aircraft and foreign experience in the

organization of technical servicing are elucidated. Data regarding methods and means of control and mechanization of processes of technical servicing are set forth. In the book questions of flight operations of aircraft are stated: the organization and provision of flights, maintenance of aircraft at various stages, under specific conditions and cases of flight, methods of determination of load, and centering, and of fuel consumption, and methods of analyzing flying accidents.

AIRCRAFT ACCIDENT REPORT: COMPANIA ECUATORIANA DE AVIACION DOUGLAS C-54D, REPUBLIC OF ECUADOR, HC-AON: MIAMI INTERNATIONAL AIRPORT, MIAMI, FLORIDA, 14 APRIL 1970

Dec. 1970 27 p ref

(NTSB-AAR-71-2) Avail: NTIS

A Douglas C-54D, of Ecuadorian registration, crashed at Miami International Airport, Miami, Florida, at approximately 0724 e.s.t., April 14, 1970. The aircraft was being operated as an international cargo flight by Compania Ecuatoriana de Aviacion. The accident occurred during the initial climb, following an instrument takeoff at Miami International Airport. The flight was en route from Miami to Panama City, Panama, the first leg of a flight which was to terminate at Quito, Ecuador. The two pilots, the only occupants of the aircraft, were killed, and the aircraft was demolished by impact and postimpact ground fire.

AN ANALYSIS OF PREDICTED SPACE SHUTTLE TEMPERATURES AND THEIR IMPACT ON THERMAL PROTECTION SYSTEMS

R. V. Masek and J. Alan Forney (NASA, Marshall Space Flight Center) *In* NASA, Washington NASA Space Shuttle Technol. Conf., Vol. 1 Apr. 1971 p 75-96

Avail: NTIS HC\$9.00/MF\$0.95 CSCL 20M

Aeroheating prediction methods for the space shuttle configuration are evaluated by comparing evolved time-temperature histories computed at five lower centerline locations for various combinations of flow field method, transition criterion, turbulent heating method and trajectory analysis. Considered are a metallic heat shield and a surface insulation concept, low and high cross-range missions, and a conical flow field with normal shock expansion to Newtonian pressure. The low cross-range mission peak temperature was found to be most sensitive to flow field assumption and the high cross-range mission was most affected by transition criteria. A conical flow assumption produces temperatures 166 C - 222 C higher than the normal shock assumption; the effects of transition criteria are noticeable about 111 C. For the low cross-range mission, the thermal protection system unit weight for one aeroheating methodology proved 32.1 N/sq m lighter than for another prediction method. G.G.

A NUMERICAL PROCEDURE TO CALCULATE THE INVISCID FLOW FIELD ABOUT A SPACE SHUTTLE ORBITER TRAVELING AT A SUPERSONIC/HYPERSONIC VELOCITY

B. Grossman, F. Marconi, Jr., and G. Moretti *In* NASA, Washington NASA Space Shuttle Technol. Conf., Vol. 1 Apr. 1971 p 157-184 refs

Avail: NTIS HC\$9.00/MF\$0.95

A technique for computing the complete inviscid, three dimensional flow field about a vehicle flying at supersonic speed at an angle of attack is reported. The flow field in the vicinity of the stagnation point at the nose of the body is determined using a three dimensional, time dependent blunt body program. The asymptotic steady state values of this flow field are then used as starting conditions for a supersonic, steady state numerical calculation. This computation utilizes a three dimensional, finite difference marching technique which determined the flow field downstream of the nose of the vehicle where the flow is supersonic. Within the physical model of an inviscid, perfect gas, the complete coupled calculation provides an approximation which uniformly converges to the exact solution. Agreement with experimental results is excellent and applications of the program are made for a typical shuttle orbiter delta lifting body configuration at angle of attack. Author

SHOCK INTERFERENCE HEATING AND DENSITY RATIO EFFECTS. PART 2: HYPERSONIC DENSITY RATIO EFFECTS

James L. Hunt and Theodore R. Creel, Jr. *In* NASA Space Shuttle Technol. Conf., Vol. 1 Apr. 1971 p 217-243

Avail: NTIS HC\$9.00/MF\$0.95 CSCL 20M

Ground test data obtained at hypersonic Mach numbers and at various values of specific heat-gas ratios are used to simulate the trends of equilibrium real gas effects expected for low cross-range shuttle flight. Applied are data on shock shape, surface oil flow patterns, and for the location of the body shock/wing shock intersection location obtained at various angles of attack and with normal shock density ratios of 3.9, 5.6, and 12, respectively. Primary conclusions show that significant shock-density-ratio effects are strongly configuration and angle-of-attack dependent and that a high cross-range shuttle configuration which reenters at lower angles of attack is essentially a best choice. G.G.

LEE SIDE HEATING INVESTIGATIONS. PART 2: LEE SIDE HEATING INVESTIGATIONS OF SIMPLE BODY LIKE CONFIGURATIONS

George Maise *In* NASA, Washington NASA Space Shuttle Technol. Conf., Vol. 1 Apr. 1971 p 289-309 refs

Avail: NTIS HC\$9.00/MF\$0.95 CSCL 20M

The leeside aerodynamic heating of various shapes flying hypersonically at an angle of attack was investigated. Intense heating resulting from reattachment of leading-edge vortices on the lee side of the bodies was analyzed by: (1) correlation and comparison of available leeside heating data, and (2) an experimental program to clarify some questions related to the vortical flow phenomenon. In the correlation of available data on circular cones, a strong Reynolds number dependence has been observed. In the wind tunnel study, the effect of increase in cross sectional area on vortical heating was examined, and an attempt was made to establish the angles of attack at which the flow about elongated bodies becomes two dimensional in the cross-flow plane, i.e., negligible axial components. Heat transfer and oil flow models were tested in a hypersonic wind tunnel. Author

STATIC AND DYNAMIC AERODYNAMICS OF SPACE SHUTTLE VEHICLES

Victor L. Peterson, Elliott D. Katzen, John A. Axelson, Jack J. Brownson, Donald L. Ciffone et al *In its* NASA Space Shuttle Technol. Conf., Vol. 1 Apr. 1971 p 311-373 refs

Avail: NTIS HC\$9.00/MF\$0.95 CSCL 22B

Effects of Mach number, as well as chine radius and Reynolds number, on the aerodynamics of space shuttle vehicles at high angles of attack are considered for delta wing configurations having single and twin vertical tails. Resulting aerodynamic criteria for a wide range of shuttle configurations and test conditions show that: (1) aerodynamic stability designs must consider the effects of varying dynamic pressure and Mach numbers. Computer simulations can be utilized to determine which of the many derivatives have the greatest influence on flight behavior of space shuttle configurations. G.G.

CONSIDERATION OF REYNOLDS NUMBER SIMULATION FOR SUBSONIC SHUTTLE TESTS

Thomas B. Sellers *In* NASA, Washington NASA Space Shuttle Technol. Conf., Vol. 1 Apr. 1971 p 423-453 refs

Avail: NTIS HC\$9.00/MF\$0.95 CSCL 20D

The Reynolds number simulation requirements for conducting subscale wind tunnel tests of space shuttle aerodynamic configurations are reviewed, and conclusions are reached that apply to the acquisition of data at angles of attack from zero to 90 degrees. Methods for qualitatively evaluating effects of simulation

deficiencies are presented. It is shown that uncertainties inherent in high angle of attack stability data may be greatly reduced by extending the existing two-dimensional cross-flow coefficient data base. At low angles of attack, requirements for developing methods for predicting the onset of discernible viscous components, and relating the strength of that component to Reynolds number, are cited. CORRELATION OF SPACE SHUTTLE APPLICABLE EXPERIMENTAL HYPERSONIC AERODYNAMIC CHARACTERISTICS WITH THEORY

Richard K. Hamilton *In* NASA, Washington NASA Space Shuttle Technol. Conf., Vol. 1 Apr. 1971 p 455-492 refs

Avail: NTIS HC\$9.00/MF\$0.95 CSCL 22B

Hypersonic theoretical-experimental correlations of aerodynamic characteristics pertinent to straight and blended delta wing shuttle designs are presented. The results substantiate the usefulness of the theoretical techniques in supporting the assessment of the hypersonic aerodynamic coefficients for delta wing shuttle designs. The use of the Hypersonic Arbitrary Body Program (HABP) also provides confidence in configurations as they are entered into the wind tunnel program. Emphasis is placed on those aerodynamic characteristics which are influential with respect to the shuttle design. Characteristics correlated are shown on the slide. Areas of exceptional agreement will be noted as well as instances where deviations exist. Oil flow visualization studies complement the analysis. Author

DIRECT LIFT CONTROL SYSTEM Patent

Joseph W. Stickle, inventor (to NASA) Issued 27 Apr. 1971 4 p Filed 20 Jun. 1969 Cl. 244-42; Int. Cl. B64c21/08 (NASA-Case-LAR-10249-1; US-Patent-3,576,301; US-Patent-Appl-SN-835060) Avail: US Patent Office CSCL 01C

A direct lift control system is proposed which is associated with existing control mechanism on most aircraft, and particularly applicable to light-weight aircraft. This is accomplished by forming a slot through to the flap associated with the wing. When the flap is deflected, air is forced through the slot opening in the lower surface of the flap and discharged at the slot opening at the upper surface of the flap, this spoils the airflow over the flap thus reducing lift. Tests have shown that this arrangement has little effect on drag, since the actual shape of the airfoil flap combination has not been changed to any degree. In addition, closure mechanisms are introduced for varying the size of the slots to regulate the degree of spoiling of the flap induced lift and the resultant direct lift control. Author

AERODYNAMIC FORCES ON AUTOCABS, APPENDIX M

K. T. Shaw *In its* Cabtrack Studies: Assessment of Autntaxi Urban Transport Systems Jan. 1969 p 123-128 refs

Copyright. Avail: NTIS

Autocabs may be subject to substantial aerodynamic forces when operating in windy conditions although the cab speed may be relatively low. These forces can have a considerable effect upon the power required to maintain particular acceleration profiles and upon the vehicle track required for lateral stability. The effect of the yawing moment on longitudinal stability could limit the types of guidance system which are acceptable. Some preliminary estimates of the aerodynamic forces and moments to which an Autocab may be subjected, over a range of cab and wind speeds within which a Cabtrack system in Central London may operate

N71-26150

are presented. The estimates refer to an idealized cab running on a flat road surface of unlimited width and do not take into account the effects of flow disturbances produced by particular track configurations. Author

TURBULENCE AND LATERAL-DIRECTIONAL FLYING QUALITIES

James A. Franklin Washington NASA Apr. 1971 344 p refs (Contract NSR-31-001-104)

(NASA-CR-1718; Rept-890) Avail: NTIS CSCL01B

Trends in pilot rating obtained in the test program for variations in turbulence disturbances and airplane dynamics are explained in terms of measures of precision of task performance, pilot control workload, and pilot compensatory behavior derived from time histories of the flight evaluations. Pilot-vehicle systems analyses substantiate the performance-workload data and provide a more fundamental understanding of the heading control task in turbulence. The significant influence of turbulence on the evaluation task was found to be the rms disturbance magnitude, with yaw disturbances having a more profound effect than roll disturbances. Spectral bandwidth had less bearing on flying qualities than disturbance magnitude. Reductions in either roll damping or directional stability adversely affected flying qualities. Additional roll damping and directional stability were desired when the level of turbulence was increased. Data obtained for variations in aileron yaw indicate that favorable yaw is detrimental to the heading tracking task, particularly for low directional stability and when roll disturbances due to turbulence are large. LOW SPEED AERODYNAMIC CHARACTERISTICS OF A LARGE SCALE STOL TRANSPORT MODEL WITH AN AUGMENTED JET FLAP

Anthony M. Cook and Thomas N. Aiken Mar. 1971 89 p refs (NASA-TM-X-62017) Avail: NTIS CSCL01A

An investigation was made to study the aerodynamic characteristics of a large scale model equipped with an augmented-jet flap and underwing cruise engines with deflectable thrust capability. The augmented-jet flap is a jet flap with the primary jet thrust increased by means of a spanwise ejector system installed in the wing trailing-edge flap. The flap installation was on the inboard part of the wing, with blown ailerons outboard. Primary configurations tested were those selected previously for landing approach and takeoff, for direct application of the data to a proposed flight research aircraft. Assessment was made of the effects of the underwing engines and nacelles with variations in thrust magnitude and direction. The effects of fuselage BLC were also measured. In addition, several methods of lateral control were investigated to obtain measurements of lateral derivatives and roll control power. The tests were made with and without the horizontal tail at a wind

tunnel dynamic pressure of 383 newtons per square meter (8 pounds per square foot), corresponding to a Reynolds number of 2.9 million. The range of jet momentum coefficients was 0 to 1.07. Author

GAS TURBINE COMBUSTORS

Kunio Suzuki, Takasi Tamaru, Shoji Horiuchi, and Takashi Saito Sep. 1970 82 p refs In JAPANESE; ENGLISH summary (NAL-TR-208) Avail: NTIS

A design method for lift engines is proposed for applying recent data and experience. Various flame holders and their characteristics, the admission of air and its distributions, and flow patterns in the combustion chambers are investigated. However, on account of lack of fundamental knowledge concerning the phenomena occurring in a combustion chamber, the design details still must be dependent on the practical data and model experiments. Therefore, design data which had been experienced in many practical engines, especially those of vaporizing types, are considered. Experimental techniques necessary for developing or improving combustion systems such as temperature measurement by thermocouples, and gas analysis by means of sampling probes, are also described. PRECIPITATION DETECTOR Patent
Harold R. Long, Martin J. Menges, and Samuel W. Mugler, inventors (to NASA) Issued 20 Apr. 1971 4 p Filed 5 Feb. 1969 Cl. 317-153; Cl. 317-DIG3; Cl. 340-235; Int. Cl. H01h47/36
(NASA-Case-XLA-2619; US-Patent-3,575,641;
US-Patent-Appl-SN-796691) Avail: US Patent Office CSCL 09C

A precipitation detector and mechanism used to shut down a load during precipitation and activate a load upon completion of precipitation is described. The detector has thermistors in a bridge circuit. One of the thermistors is exposed to the elements and cooled upon being contacted with precipitation. This causes an imbalance in the bridge circuit the output of which actuates a relay that shuts down the load. Termination of precipitation allows the thermistor to warm up balancing the bridge circuit and the relay closes activating the load.

APPLICATION OF PHOTOCHROMIC COATINGS FOR NONDESTRUCTIVE INSPECTION Final Technical Report, Jan. 1969-Jul. 1970

Sidney Allinikov Dec. 1970 61 p refs
(AD-720239; AFML-TR-70-246) Avail: NTIS CSCL 14/2

The application of a photochromic compound to provide a nondestructive inspection (NDI) technique for aerospace materials and structures is discussed. The photochromic compound, incorporated into a paint formulation, is converted from a white to a bright violet color upon a brief irradiation from an ultraviolet source. The colored paint surface is then heated by any suitable means, such as a hot air blower. Heat serves to bleach the paint to the original white color. Defects are disclosed because heat conductivity at the defect site is different from that of the rest of the area under inspection. The defect thus appears as a colored or white area dependent upon the nature of the defect and originating direction of the heat source. Some of the types of defects and kinds of structures to which the NDI paint has been applied are discussed, along with advantages and limitations of the paint. Author (GRA)

INSTRUMENT FOR MEASURING THE DYNAMIC BEHAVIOR OF LIQUIDS Patent

David G. Stephens and Clemans A. Powell, Jr., inventors (to NASA) Issued 21 Oct. 1969 5 p Filed 26 Jan. 1968 Cl. 73-301; Int. Cl. G01f23/00
(NASA-Case-XLA-05541; US-Patent-3,473,379;
US-Patent-Appl-SN-700986) Avail: US Patent Office CSCL 20D

An instrument to determine the dynamic behavior of liquid in a tank is described including a pipe fixed to the tank and

N71-26416

extending throughout its height. An inlet of the pipe allows liquid to enter the pipe. A tube placed inside the pipe carries a plurality of pressure transducers, one being exposed to the liquid in the tank, a second exposed to liquid within the pipe, and a third located at the end of the tube below the other transducers. Outputs from the transducers are computed, and indicate the simultaneous acceleration of the tank, the amplitude of liquid slosh in the tank, and the depth of liquid in the tank.

STATIC TESTS OF A 0.7 SCALE AUGMENTOR WING FLAP FOR THE MODIFIED C-8A AIRPLANE: TEST RESULTS AND ANALYSIS

D. L. Harkonen, C. F. Wintermeyer, and F. L. Wright May 1971 296 p refs

(Contract NAS2-6025)

(NASA-CR-114315; D6-24850) Avail: NTIS CSCL01C

A static test investigation was made of an augmentor-wing flap system for the modified C-8A jet STOL research airplane. Tests were conducted using a 0.7 scale model which had a wing span of 95 inches, a flap chord of 30 inches, and a full span double slot nozzle. Flap surface static pressures and total pressures within the augmentor were measured. The augmentor performance was found to be sensitive to the flap coanda surface position and flow blockage within the augmentor. Nozzle total pressure ratio was also an important parameter. The optimum flap pivot point for the aircraft was determined. The augmentation ratios with this pivot point location were near the maximum measured for flap angles from 30 to 65 degrees. The maximum augmentation ratio, based on isentropic thrust at the duct entrance, was 1.27 at 30 degrees flap angle. The corresponding augmentation ratio based on actual nozzle performance was 1.39. As the augmentor passage was blocked off by a moveable segment of the flap, the thrust of the augmentor decreased until slightly negative thrust occurred with the passage completely blocked. Author

PARAMETRIC STUDIES OF THE ACOUSTIC BEHAVIOR OF LINED DUCTS AND DUCT LINING MATERIALS FOR TURBOFAN ENGINE APPLICATIONS

J. Atvars Mar. 1971 216 p refs

(Contract NAS1-10272)

(NASA-CR-111887) Avail: NTIS CSCL01C

A flow-duct test facility was developed to simulate turbofan engine bypass duct geometry and noise environment in the laboratory. The facility was used to study the effects of various parameters of sound-absorbent wall liners. The liners consisted basically of a honeycomb sandwich and a porous face sheet. A description is given of the flow-duct test facility and the data reduction techniques, along with a listing of the reduced test results. Analyses of the test data showed that the significant design parameters are the face sheet impedance, treatment length, treatment depth, honeycomb cell dimensions, duct size, number of walls lined, number of layers in the linings, air velocity, and direction of flow with reference to sound propagation. The influence of these parameters is discussed. For simple single-layer linings, a design technology was developed by means of empirical equations. Experimental results show that this technology is valid for duct sizes (or lining separations) from 4 to 12 in., lining depths of 0.25 to 1 in., and duct airflow Mach numbers from -0.4 to +0.4. It is concluded that the flow-duct facility is a useful tool for investigating the basic properties of acoustically lined ducts. Author

ALPA: A SURVEY OF AIRPORT FIRE AND RESCUE FACILITIES, 1971, NORTH AMERICA

B. V. Hewes, P. R. Robinson, and A. L. Couch 1971 154 p

Avail: NTIS

A survey of airports in the United States in order to determine the status of the crash fire and rescue equipment available for use in case of an accident involving a scheduled trunk or local service air carrier aircraft is discussed. Only those airports receiving daily service are included and only fire and rescue equipment located within the airport boundaries is reported. Off airport equipment is not considered capable of meeting the response time requirement of 2 to 3 minutes considered a maximum by expert authorities and, therefore, can only be utilized for back up purposes. When this survey was first conducted 4 years ago, almost 50% of airports in the United States had no fire and rescue capability whatsoever. This number has now been reduced to 25 percent. Author

A MODEL FOR THE WAKE GEOMETRY OF THE LIFTING ROTOR IN FORWARD FLIGHT AND AN EVALUATION OF THE SENSITIVITY OF COMPUTED BLADE LOADS TO THE WAKE GEOMETRY

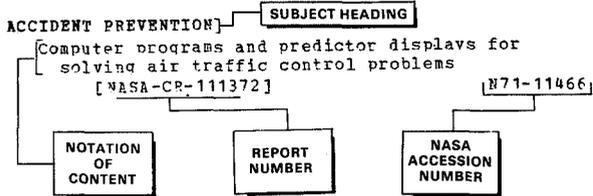

Mukund Madhav Joglekar (Ph.D. Thesis) 1969 241 p

Avail: Univ. Microfilms Order No. 70-2877

Assuming that a helicopter rotor in forward flight can be represented by a flat circular disk with an appropriate steady pressure discontinuity across it, expressions were developed for relating the pressure field to: (1) the total aerodynamic thrust and the total steady pitching and rolling moments experienced by the rotor; or, (2) the time dependent aerodynamic flapping moments at the roots of the blades as they rotate. The selected pressure field satisfies: (1) the requirement of a loss of lift at the center and periphery of the disk, (2) accounts for first and second azimuthal harmonic variations in the lift density, and (3) satisfies Laplace's equation. A digital computing program was written for calculating the velocity field from the selected pressure field and for calculating the streamlines emanating from points above the disk. Two sample cases were chosen, corresponding to the UH-1 two-bladed teetering rotor at advance ratios of 0.26 and 0.08 respectively. Dissert. Abstr.

[AD-719746]

Acoustic measurements on prop-fan model propulsion system - Vol. 2, appendices

N71-25784

[NASA-CR-111842-2]

Acoustic measurements on prop-fan model propulsion system

N71-25785

[NASA-CR-111842-1]

Familiarization of Federal Aviation Administration personnel in acoustic measurement techniques and procedures involved in noise certification of aircraft

N71-26304

[HRC-TR-300]

Techniques and procedures for measuring effective perceived noise level during aircraft noise type certifications

N71-26305

[HRC-TR-300-SUPPL-2]

ADJUSTING

Cam profile selection for adjustment in computing-resolving unit of aneroid sensors of altimeters

A71-28938

AERODYNAMIC CHARACTERISTICS

Aerodynamic characteristics similarity and variation in hypersonic flow transition region from free molecular flow to solid medium

A71-29172

Elevons as longitudinal and lateral control elements on low aspect ratio wings, calculating subsonic and supersonic aerodynamic characteristics

A71-29190

Elliptical cones at large angle of attack, calculating three-component real gas properties effects on aerodynamic characteristics

A71-29191

Wing-jet interference effects in cross wind on thrust and aerodynamic characteristics at large distance from and near ground

A71-29207

Wind tunnel simulation of viscous hypersonic flow-laminar boundary layer interactions, presenting similarity parameter effects on aerodynamic characteristics

A71-29224

Longitudinal stability of ground effect airplanes, discussing influence on aerodynamic characteristics of height, ground surface roughness and wing aspect ratio

A71-29228

Aerodynamic behavior of bodies in wake of two dimensional bluff bodies, discussing loads

A71-29265

Soviet book on helicopter design covering aerodynamic properties, power plants, control systems, fatigue minimization and strength analysis

A71-29944

Time dependent clearance changes effects on aerodynamic characteristics of sectorially grooved gas bearings, describing lift and drag

- coefficients calculation A71-30227
- Aerodynamic characteristics of low-aspect-ratio wing mounted on cylindrical body, simulating by system of horseshoe vortices A71-30264
- Multimission strategic aircraft installation effects testing in propulsion and aerodynamic wind tunnels, yielding flowfield definition, inlet internal performance, drag, forebody shape and orientation [AIAA PAPER 71-759] A71-30792
- L-1011 Tristar antenna arrangement test results, considering weight, aerodynamic and structural design requirements A71-31060
- Development of mathematical model for opening behavior of parachutes noting drag and velocity as functions of time [AD-719698] N71-24433
- Analysis of empennage loads and aeroelastic response of T-tail transport aircraft in continuous atmospheric turbulence N71-24996
- Flight evaluation of lateral handling, stability, control, and flying qualities of jet transport aircraft during up-and-away and approach flight in landing configuration [NASA-TN-D-6339] N71-25537
- Hypersonic theoretical/experimental correlations of aerodynamic characteristics for space shuttle design N71-26066
- Wind tunnel tests to determine low-speed aerodynamic characteristics of large-scale STOL transport model with augmented jet flap [NASA-TM-X-62017] N71-26183
- Analysis of aerodynamic forces on DL-4 lifting entry vehicle and comparison with theoretical methods [NASA-TM-X-1994] N71-26354
- AERODYNAMIC COEFFICIENTS**
- Air flow about low aspect ratio delta wing at large angles of attack, deriving lift coefficient A71-28282
- Supercavitating flow past straight cascade with arbitrary blade shapes, considering lift and drag coefficients, cavitation number, cavity shape and exit flow conditions [ASME PAPER 71-FE-6] A71-29448
- Measurements of aerodynamic drag, interference lift, and pitching moment on delta wings N71-24573
- AERODYNAMIC CONFIGURATIONS**
- Effects of aeroelasticity on static longitudinal aerodynamic derivatives N71-24707
- AERODYNAMIC DRAG**
- Isolated axisymmetric jet engine exhaust nozzles thrust and drag predictions in sub-, trans- and supersonic flight regimes [AIAA PAPER 71-719] A71-30770
- Fuselage influence on total aircraft drag in subsonic passenger aircraft, considering high aspect ratio cylindrical fuselages A71-30821
- Low aerodynamic drag airfoil designing by lighthill method [ARC-R/M-3618] N71-24498
- AERODYNAMIC FORCES**
- Photoelectric, bolometric and photographic recording assembly for measurement of light pressure and aerodynamic forces on complex shape body in free molecular flow A71-29155
- Nonlinear mathematical model for dynamical behavior of extensible towing cable subjected to aerodynamic forces generated by uniform flow field, discussing system stability A71-31026
- Aerodynamic forces produced in turbine stage by vane cascade of cascade series [NASA-TT-F-13631] N71-25998
- Investigation of aerodynamic forces imposed on vehicles proposed for operation in improved urban transportation system N71-26129
- AERODYNAMIC HEATING**
- Conductive heat transfer effect on temperature distribution in vicinity of wing leading edge in hypersonic flight [ARC-CP-1126] N71-24446
- Tests to determine short-term creep of metals and alloys under conditions of aerodynamic heating with high velocity air flow [NASA-TT-F-13633] N71-25822
- Comparison of space shuttle aerodynamic heating analyses for metallic heat shield and surface insulation concepts N71-26054
- Flow visualization, thermocouple measurements, and analyses of shock interference heating effects on straight wing space shuttle model N71-26057
- Hypersonic shock/density ratio effects in aerothermodynamic heating of space shuttle configuration N71-26058
- Lee surface flow and aerodynamic heating on delta wing orbiter N71-26060
- Leeside aerodynamic heating of lifting reentry vehicle configurations N71-26061
- AERODYNAMIC LOADS**
- Supersonic flutter analysis of clamped skew panels with in-plane forces by Galerkin method, using two dimensional static approximation for aerodynamic loading A71-30607
- Helicopter rotor blade airload by applying lifting surface solution [AHS PREPRINT 510] A71-31081
- Wake model and computer program to compute geometries, flows and velocity influence coefficients for helicopter blade load calculations [AHS PREPRINT 523] A71-31089
- Transonic wind tunnel tests of vertical fin loads and rudder hinge moments on M2-F3 lifting body scale model at Mach 0.50 to 1.30 [NASA-TM-X-2286] N71-24581
- Analysis of empennage loads and aeroelastic response of T-tail transport aircraft in continuous atmospheric turbulence N71-24996
- AERODYNAMIC NOISE**
- Aerodynamic noise produced by supercritical jets, using high speed flash photography for schlieren and shadowgraph studies A71-28767
- Combustion generated aerodynamic noise, considering sound radiation from open turbulent flames, spectral content, power output and origin [AIAA PAPER 71-735] A71-30780
- Noise measurement data on various types of blown flap configurations for STOL aircraft, discussing integration effects between jet and flap assembly [AIAA PAPER 71-745] A71-30785
- AERODYNAMIC STABILITY**
- Army rotorcraft performance data, discussing hovering and forward flight performance out of ground and level flight power requirements and drag and compressibility effects [AHS PREPRINT 500] A71-31076
- Forward flight performance of coaxial rigid rotor in NASA wind tunnel, comparing to aerodynamic stability with conventional rotors [AHS PREPRINT 524] A71-31090
- Least squares method and iteration technique for obtaining aerodynamic stability derivatives N71-24703
- Aerodynamic characteristics of delta wing space shuttle configurations N71-26062
- Pressure sensor network for measuring liquid dynamic response in flight including fuel tank acceleration, liquid slosh amplitude, and fuel depth monitoring [NASA-CASE-XLA-05541] N71-26387
- AERODYNAMIC STALLING**
- Rotor blade stall induced helicopter control loads, combining unsteady aerodynamics with aeroelastic rotor analysis

- [AHS PREPRINT 513] A71-31084
Helicopter rotor stall characteristics, investigating blade flexibility, unsteady aerodynamics and variable inflow effects
- [AHS PREPRINT 520] A71-31086
Retreating blade stall experiments on model helicopter rotor, considering series of pressure distribution and boundary layer events
- [AHS PREPRINT 521] A71-31087
- AERODYNAMICS**
Soviet book on experimental aerodynamics covering wind tunnels, shock tubes, liquid and gas physical properties, flow parameter measurement equipment, etc A71-29524
- Aircraft development facility with wind tunnel testing capability [AD-719802] N71-25048
- AEROELASTICITY**
Mechanical support system role in determination of aeroelastic stability of leeward cylinder immersed in wake using undamped flutter theory A71-31021
- Parameters contributing to aeroelastic problems in thermal protection of space shuttle N71-24661
- Aeroelasticity and unsteady flow problems of aircraft N71-24706
- Effects of aeroelasticity on static longitudinal aerodynamic derivatives N71-24707
- AERONAUTICAL ENGINEERING**
Criteria for converting aeronautical project operational targets into actual requirements and technical specifications, emphasizing cost effectiveness A71-30824
- Scientific results from ESRO satellites and from sounding rocket campaign including aeronautical fields, management planning, satellite development, and telecommunication - 1969 report N71-24447
- Tropospheric and ionospheric absorption at VHF for North Atlantic aeronautical satellite system [NASA-TM-X-65507] N71-24914
- AERONAUTICS**
History of development of aviation and astronautics in USSR [NASA-TT-F-13142] N71-25024
- Survey of very high and ultrahigh frequency utilization in US aeronautics for communication satellite frequency assignment [NASA-TM-X-65527] N71-25920
- AEROSPACE ENGINEERING**
Aerospace materials - Conference, Anaheim, California, April 1971 A71-29633
- AEROSPACE ENVIRONMENTS**
SAE/DOT conference on aircraft and environments covering noise pollution, airport noise, sonic booms, regulatory/legal aspects and air pollution [AIAA PAPER 71-729] A71-30776
- AEROSPACE INDUSTRY**
Instrumentation in aerospace industry - Conference, Las Vegas, May 1971 A71-30309
- AEROSPACE SYSTEMS**
Consideration by NATO of transonic wind tunnel requirements to support evolution of aeronautical and aerospace systems during next decade [AGARD-AR-35-71] N71-25073
- AEROTHERMODYNAMICS**
Wind tunnel simulations of flow fields and aerothermodynamics of space shuttle orbiters N71-26053
- AFTERBURNING**
Afterburning turbofan engine thrust calculation by gas generator method, using F-111A for comparison tests [AIAA PAPER 71-680] A71-30744
- AIR BREATHING ENGINES**
Air breathing nuclear propulsion, considering reactor safety in air cushion vehicles and aircraft A71-29930
- Space shuttle airbreathing propulsion systems requirements and design studies, considering cruise, landing, go-around and ferry capabilities [AIAA PAPER 71-662] A71-30731
- AIR CARGO**
Frankfurt terminal baggage conveyor system, describing passenger capacity and luggage handling equipment A71-29312
- AIR CONDITIONING EQUIPMENT**
Performance of aircraft environmental control systems under simulated tactical conditions [AD-719101] N71-24461
- AIR DUCTS**
Absorbent materials for sound attenuation in turboreactor ducts, examining flow velocity, absorbent structure and cladding effects A71-30518
- AIR FLOW**
Air flow about low aspect ratio delta wing at large angles of attack, deriving lift coefficient A71-28282
- Air bypass behind compressor into variable area exhaust nozzle, obtaining energy losses from gas turbine jet engine indices A71-28586
- Flow direction effect on combined forced and free convective heat transfer from cylinders to air A71-28985
- Air flow past small aspect ratio thick-section wing at small angles of attack, investigating vortex system effect on flow characteristics in absence of lift A71-29234
- Separation control of two dimensional air flow with turbulent boundary layer along circular cylindrical wall by jets or suction A71-29433
- Stratospheric air flow patterns and CAT measurements onboard aircraft over and downwind of Western U.S. mountain terrain A71-29755
- HF rake probes with high temperature integrated sensor for inflight aircraft engine intake air flow distortion measurements A71-30321
- AIR INTAKES**
Air inlet for simulation of shock wave separated flow in supersonic diffusers, deriving pressure variation profile along free boundary A71-29175
- AIR NAVIGATION**
Onboard area navigation systems in ATC environment, discussing route structure and flight instruments [SAE PAPER 710455] A71-28332
- Area navigation system based on radio aids by airborne receivers and sensors for aircraft movement improvement, noting advantages of pilot displays [SAE PAPER 710457] A71-30533
- Inertial navigation systems improvements for commercial air transportation, noting digital computer program revision and increased functional capability [SAE PAPER 710458] A71-30534
- Combined inertial and instrument landing aircraft navigation systems with reduced cross runway position and velocity errors, using optimal linear estimation A71-30606
- Air navigation techniques history, considering radio, radar, loran Doppler and inertial navigation A71-30712
- AIR POLLUTION**
Modular concept mathematical model for combustion and pollution formation processes in jet engine combustors, including turbulent mixing and reaction kinetics [AIAA PAPER 71-714] A71-30766
- SAE/DOT conference on aircraft and environments covering noise pollution, airport noise, sonic booms, regulatory/legal aspects and air pollution [AIAA PAPER 71-729] A71-30776

AIR TRAFFIC

SUBJECT INDEX

AIR TRAFFIC

Roissy-en-France airport, describing construction, passenger handling, terminal facilities, traffic volume and runway system

A71-29309

Book on air law and civil air policy covering international regulation, air traffic market, passenger and cargo services, etc

A71-29938

Long haul international air transport, analyzing traffic growth rates

A71-30161

Long term prospects of air traffic development in competition with other modes, estimating VTOL service demand

A71-30164

AIR TRAFFIC CONTROL

Onboard area navigation systems in ATC environment, discussing route structure and flight instruments

[SAE PAPER 710455]

A71-28332

Optimum functional integration and performance requirements of navigation aids and ATC in terminal area

[SAE PAPER 710456]

A71-28333

Feasibility of VHF aeronautical satellite system frequency sharing band used by ATC service, employing spatial separation, antenna directivity and frequency offset

A71-28873

En route turbojet aircraft flight speed control, assessing impact on ATC procedures

A71-28884

ATC radar display systems mapping techniques using vectors and optical projections

A71-30014

French ATC, discussing automatic coordinator systems, computer utilization and flight plan data processing

A71-30382

Maastricht Automatic Data Processing and Display ATC system with digital computers for aiding controllers in issuing instructions and making decisions

A71-30383

Aircraft phased arrays for L-band ATC satellite system application, alleviating problems of power budget and vulnerability to multipath and interference

A71-31054

Terminal air traffic control facility for approach systems tests

[AD-719104]

N71-24451

Evaluation of dual input transponder with upper and lower aircraft antennas as resolution for problems with air traffic control radar beacon system limitations

[FAA-NA-71-39]

N71-24882

General aviation traffic implied densities and interaction frequencies computed with model using southern California to judge difficulty for naval air traffic

[AD-719906]

N71-25621

AIR TRANSPORTATION

STOL aircraft/engine integrated systems for medium distance air transportation, discussing tradeoff factors involving performance, noise, weight and cost

[SAE PAPER 710469]

A71-28337

SST in relation to U.S. world leadership in air transportation, discussing federal funding needs for technological capability assurance

A71-29387

Integrated short-haul interurban transportation system, considering combination of conventional jet aircraft, STOL aircraft and high-speed ground transportation

[AIAA PAPER 71-508]

A71-29550

Aviation within total transport system - Conference, London, May 1971

A71-30158

Air transport and travel expansion rate, discussing motivations and cost

A71-30159

Circumstances inducing growth in different air transport sectors, discussing transportation cost, aviation capital requirement and business and leisure air travel

A71-30160

Aviation within total transport system, discussing decision making and management planning

A71-30165

Air transport development trends, considering increased speed and capacity, STOL aircraft, urban service, and European cooperation for manufacturing

A71-30302

STOL vehicle and systems air transportation expansion by reducing trip time, congestion, noise exposures and pollution for DOT, DOD and NASA roles

[SAE PAPER 710464]

A71-30535

Aviation and surface transportation safety for 1970 with related accident investigations and recommendations

[AR-4]

N71-24925

AIRBORNE EQUIPMENT

Airborne Doppler radar receiver transmitter failure testing by Versatile Avionics Shop Test computer controlled system

A71-28778

Self contained lightweight airborne data acquisition system for atmospheric and meteorological research, using analog recorder and telemetry system

A71-30311

Integrated flight test data system combining digital airborne data acquisition/recording system with telemetry/microwave link to computerized ground station

A71-30318

Onboard weighing system for gross weight determination and center of gravity location of Alouette helicopter, using load sensors, electrical circuits and visual indicators

A71-30320

High speed airborne scanning navigational radar antenna with matched patterns, using offset horn fed reflector and polarization modes for improved visual display

A71-31036

Helicopter aerial design problems, considering antenna multiplicity use of nonmetallic structures and complexity of airborne radio systems

A71-31048

Interference prediction model for evaluating expected interactions between avionics equipment on aircraft

[AD-718997]

N71-24357

Test procedures to evaluate aircraft borne equipment for use in crash rescue operations

[AD-720563]

N71-26195

AIRBORNE/SPACEBORNE COMPUTERS

Airborne integrated data system capabilities based on flight tests with commercial aircraft

A71-30319

Onboard computer for aircraft engine testing, monitoring and data reduction, emphasizing automatic in-flight recording for post-flight displays

[AIAA PAPER 71-651]

A71-30727

Weapons delivery computer for attack helicopters, using planar distributed function generator for general closed form instantaneous solution capability

[AHS PREPRINT 531]

A71-31092

AIRCRAFT

Aeroelasticity and unsteady flow problems of aircraft

N71-24706

Random process theory method for estimating response of flexible airplanes to atmospheric turbulence

N71-24708

Potential feasibility of safe, practical, and economical air breathing nuclear propulsion system for aircraft and air cushion vehicles

[NASA-TM-X-67837]

N71-25524

Calculating and testing antiicing systems of aircraft and helicopters

[AD-719922]

N71-25622

AIRCRAFT ACCIDENT INVESTIGATION

Computerized simulation techniques for investigating aircraft accidents due to atmospheric turbulence

A71-29779

AIRCRAFT ACCIDENTS

- Turbulence-related accidents frequency and severity during past few years from worldwide synopsis
A71-28885
- U.S. air carrier accidents due to atmospheric turbulence, considering in-flight weather problems, airborne meteorological radar, CAT detection systems, etc
A71-29770
- Satellite aided aircraft collision avoidance system effective for large number of aircraft [NASA-CASE-ERC-10090]
N71-24948
- Studying aircraft accidents to determine impact angle and speed criteria for designing nuclear airplane fission product containment vessel [NASA-TM-X-2245]
N71-25411
- Aircraft accident at Miami, Florida involving Republic of Ecuador C-54D during climb following instrument takeoff [NTSB-AAR-71-2]
N71-26032
- Test procedures to evaluate aircraft borne equipment for use in crash rescue operations [AD-720563]
N71-26195
- Survey of civil airports to determine status of crash fire and rescue equipment available for use following accidents involving scheduled or local service air carrier aircraft
N71-26466
- AIRCRAFT ANTENNAS**
- Multiple planar Luneberg lens circular array for airborne electronically scanned X band narrow beam antenna mounted under aircraft nose or fuselage
A71-31038
- Structural design, mechanical stability and aircraft compatibility for airborne side-looking radar antennas, using end fed slotted waveguide arrays
A71-31041
- Flush mounted aeronautical waveguide antennas with dielectric plug for 5GHz operation
A71-31043
- Airborne blade antenna tunable for 26-100 MHz by individual bands, using binary related inductors switched by miniature high vacuum relays
A71-31044
- Low carrier power aircraft antenna module for airborne UHF communications system, considering range/field strength measurements
A71-31046
- Fincap communication antennas design and environmental tests for vibration, acceleration, waterproofing, salt corrosion, ice formation and compass safe distance
A71-31047
- Helicopter aerial design problems, considering antenna multiplicity use of nonmetallic structures and complexity of airborne radio systems
A71-31048
- Light aircraft notch antenna for efficient radiation at HF band lower end and minimal interference with aircraft structure
A71-31053
- Aircraft phased arrays for L-band ATC satellite system application, alleviating problems of power budget and vulnerability to multipath and interference
A71-31054
- High efficiency narrow beam aircraft Cassegrain antenna design for horizon without excessive ground illumination
A71-31056
- L band aircraft antenna array consisting of circularly polarized elements and static electronic steering circuits for synchronous satellites radio links
A71-31074
- Aerospace antenna design, calculating one-wavelength circular slot aperture radiation from circular cylindrical surface
A71-31075
- Evaluation of dual input transponder with upper and lower aircraft antennas as resolution for problems with air traffic control radar beacon system limitations [FAA-NA-71-39]
N71-24882
- Impedance measurements on modified broadband metal antenna for speech communication [FOA-3-C-3602-61]
N71-26150
- AIRCRAFT BRAKES**
- C-5A airplane Be brakes, considering critical design weight environment for optimum load carrying capacity [SAE PAPER 710427]
A71-28313
- AIRCRAFT COMMUNICATION**
- Blade antenna linear array design for aircraft-satellite communication, determining mutual influences by array measurements in simulated electrical environment
A71-31062
- Viability of L band communication system between geostationary satellites and aircraft terminals [NASA-TM-X-65508]
N71-24913
- AIRCRAFT COMPARTMENTS**
- Fluidic cabin pressure automatic control systems for military and civil aircraft, discussing design, operation and performance
A71-30308
- AIRCRAFT CONFIGURATIONS**
- Aircraft with T tail configuration, examining dynamic response to lateral gusts
A71-29786
- Wind tunnel force test program design for jet aircraft configurations, including propulsion system simulation
A71-30605
- AIRCRAFT CONTROL**
- V/STOL aircraft instruments, deck display and automatic flight controls for takeoff and landing operation
A71-29132
- Quasi-stationary gliding trajectories of aircraft in planetary atmosphere during constant control of attack and bank angles
A71-29185
- Elevons as longitudinal and lateral control elements on low aspect ratio wings, calculating subsonic and supersonic aerodynamic characteristics
A71-29190
- Jet-supported VTOL aircraft fuel-time-optimal landing control, using mathematical model, Pontryagin maximum principle and analog computer solution
A71-29281
- Third Chance flight control system, discussing aircraft control capability with backup hydraulic system after loss of dual main hydraulic systems due to combat damage
A71-29382
- Air turbulence primary and secondary effects on aircraft flight and avoidance criteria considerations
A71-29768
- V/STOL aircraft flight path and attitude controls in turbulence, discussing design based on state variable methods of control theory
A71-29776
- Aircraft gust alleviation, considering movement correction based real time atmospheric turbulence measurement
A71-29785
- Soviet book on helicopter design covering aerodynamic properties, power plants, control systems, fatigue minimization and strength analysis
A71-29944
- Control, navigation and guidance review, considering application of earth reference coordinates for aircraft, missiles and spacecraft
A71-30710
- VTOL aircraft minimum climb-to-cruise time transition optimal open loop and suboptimal closed loop control synthesis
A71-30799
- Controlled aircraft motion under strict kinematic constraints in terms of simple subsystems, noting pilots role in Newmark theory
A71-31024
- Handling qualities of V/STOL research vehicles during steep terminal area approaches, discussing powered lift fan VTOL aircraft limitations and instrument landing approach [AHS PREPRINT 544]
A71-31101

AIRCRAFT DESIGN

Stability, control, and handling quality characteristics of STOL and V/STOL airplanes N71-24702

En route aircraft flap control during descent and holding [ARB-TN-99] N71-24920

Comparison of pilot performance using center stick, dual side stick, and single side stick configuration [AD-720846] N71-25846

Direct lift control system having flaps with slots adjacent to their leading edge and particularly adapted for lightweight aircraft [NASA-CASE-LAR-10249-1] N71-26110

AIRCRAFT DESIGN

Landing load estimation methods for preliminary design weight prediction for military aircraft A71-28211

Economic analysis of subsonic transport airplane design, evaluation and operation [SAE PAPER 710423] A71-28310

FAA aircraft design appraisal for maintainability, considering maintenance concepts and adverse airworthiness situations [SAE PAPER 710431] A71-28316

Military/commercial STOL transport design, discussing performance, payload and equipment requirements with emphasis on production cost benefits [SAE PAPER 710468] A71-28336

STOL aircraft/engine integrated systems for medium distance air transportation, discussing tradeoff factors involving performance, noise, weight and cost [SAE PAPER 710469] A71-28337

Structural fatigue in aircraft design, discussing twin engine transport tests, crack propagation rate, residual strength, etc A71-29434

Aircraft capabilities in intraurban transportation for Detroit metropolitan area, considering vehicle design, fleet size, cost and terminal location [AIAA PAPER 71-504] A71-29548

Materials and structural design development by high velocity impact testing due to transport and subsonic military aircraft susceptibility to bird collision damage A71-29642

Atmospheric turbulence statistical models assessment for aircraft design and operation, considering CAT and thunderstorm turbulence data A71-29751

V/STOL aircraft flight path and attitude controls in turbulence, discussing design based on state variable methods of control theory A71-29776

Jet transport aircraft design for safety under air turbulence conditions, considering cruise altitude limitations and pitch and g excursion reduction by special autopilot mode A71-29777

Aircraft structural design requirements based on statistical analysis of air turbulence intensity and gust loads records from large number of research flights A71-29784

Aircraft design and fatigue life monitoring, investigating effects of gust velocity frequency distribution in patches of atmospheric turbulence A71-29789

Air transport development trends, considering increased speed and capacity, STOL aircraft, urban service, and European cooperation for manufacturing A71-30302

Computer aided design program for civil transport aircraft configuration, performance, propulsion, weight and costs to meet given specifications A71-30398

Aircraft quantitative maintenance cost requirements translation into design criteria, considering airline operations influence on manufacturer [SAE PAPER 710437] A71-30529

Commercial vs military design criteria for STOL transport aircraft, noting landing and takeoff distances and noise levels

SUBJECT INDEX

[SAE PAPER 710465] A71-30536

Aircraft development facility with wind tunnel testing capability [AD-719802] N71-25048

AIRCRAFT ENGINES

VTOL propulsion, discussing gas turbine pressure ratio inlet temperature and lifting and high bypass fans A71-27838

Visible exhaust smoke trails from aircraft jet engines, measuring optical density by photographic photometry [SAE PAPER 710428] A71-28314

Reduction gearbox reliability problems from development and service experience with PT6A turboprop engine [SAE PAPER 710433] A71-28318

Commercial aircraft powerplant development, discussing engine and components test programs and techniques [SAE PAPER 710449] A71-28327

Aircraft propulsion system testing, stressing noise reduction and inlet-engine exhaust system compatibility [SAE PAPER 710450] A71-28328

Airline engine performance testing from operator perspective, using automated test cell data acquisition system [SAE PAPER 710451] A71-28329

High temperature aircraft gas turbine engine design, discussing developments in manufacturing processes, materials, cooling techniques, aerodynamic and mechanical design improvements [SAE PAPER 710462] A71-28335

Gas temperature measurement in aircraft combustion chambers, using calorimetric probe A71-28757

Aircraft engine production components and alloys mechanical properties evaluation for improved reliability of mass produced products A71-28944

Subsonic and supersonic turbojet aircraft engines development, discussing design, operation, reliability, weight, fuel consumption and cost A71-29811

Thrust measurement of aircraft propulsion systems, considering hydraulic piston device, edge clearance, oil quantity and calibration A71-29860

Concorde power plant fire protection system, describing prototype engine bay overheat detection system and additional UV optical fire detection system A71-30300

Aircraft jet engines technological progress review over past 25 years, emphasizing industry economics considerations A71-30303

HF rake probes with high temperature integrated sensor for inflight aircraft engine intake air flow distortion measurements A71-30321

Low cost go/no-go portable aircraft engine tester connected to engine mounted sensors A71-30327

Sound fields of flying aircraft from noise measurements, discussing engine operating conditions, speed and attitude A71-30521

Transport aircraft JT9D high bypass ratio engine development, noting maintainability and stability improvements [SAE PAPER 710419] A71-30527

Aircraft JT9D engine development for airline operation, discussing construction, condition monitoring, maintenance, noise and smoke reduction [SAE PAPER 710434] A71-30528

Design interface requirements for optimal aircraft engine condition monitoring system, using parameter, vibration, oil, borescope and radiography analysis [SAE PAPER 710447] A71-30531

V/STOL propulsion units lift ratings based on aircraft system requirements [SAE PAPER 710471] A71-30537

Onboard computer for aircraft engine testing, monitoring and data reduction, emphasizing automatic in-flight recording for post-flight

- displays
[AIAA PAPER 71-651] A71-30727
- Engine condition monitoring systems, discussing engineering design requirements with respect to accessibility, accuracy, economics, effectiveness, reliability and maintainability [AIAA PAPER 71-652] A71-30728
- VTOL turboshaft engine powered propulsion system development, detailing design requirements, program planning, component research and system integration [AHS PREPRINT 562] A71-31109
- Evaluation of fuel flowmeter instrumentation conducted during flight tests [AD-719280] N71-24479
- Assembly methods for three types of aircraft gas turbine engines [AD-719823] N71-25209
- Fundamentals of aircraft gas turbine engines [AD-719913] N71-25808
- Aircraft gas turbine combustion chamber design [NAL-TR-208] N71-26298
- AIRCRAFT EQUIPMENT**
- Soviet book on airplane and helicopter electrical power supply systems covering storage batteries, DC generators, alternators, voltage regulators, current and frequency control, etc A71-29525
- Soviet handbook of aircraft electrical equipment covering DC and turbine powered generators, lubrication materials, electromagnetic interference countermeasures, etc A71-29530
- Airborne equipment for CAT detection ahead of aircraft, considering pulsed Doppler laser and IR detectors A71-29765
- Test procedures for aircraft defogger/defroster equipment [AD-719109] N71-24452
- Procedures for evaluating compatibility of aviation material with related equipment [AD-719107] N71-24457
- Performance of aircraft environmental control systems under simulated tactical conditions [AD-719101] N71-24461
- Design, development, and test of ground support equipment for analyzing aircraft equipment condition and performance [AD-719675] N71-24603
- Evaluation of dual input transponder with upper and lower aircraft antennas as resolution for problems with air traffic control radar beacon system limitations [FAA-WA-71-39] N71-24882
- Test procedures to determine ability of aircraft equipment and armament to withstand storage and operate effectively in tropic environment [AD-720570] N71-26194
- AIRCRAFT FUEL SYSTEMS**
- Airport jet fuel delivery system salt driers for reducing water content below saturation, lengthening filter life and improving downstream system components performance [SAE PAPER 710440] A71-28322
- AIRCRAFT FUELS**
- Kerosene type fuels for aircraft gas turbine engines, discussing combustion problems, smoke emission reduction and bacterial or fungal contamination A71-28754
- Energy state approximation and supersonic aircraft minimum fuel fixed range trajectory optimization, noting not convex velocity set A71-30609
- AIRCRAFT HAZARDS**
- Aircraft hazards due to frequent low cloud occurrences at Kenya airport, forecasting weather with statistical analysis and radiosounding A71-29106
- AIRCRAFT HYDRAULIC SYSTEMS**
- Optimization of military VTOL aircraft secondary power systems, considering alternate power source for aircraft hydraulics, pneumatic drives, etc [SAE PAPER 710445] A71-28326
- AIRCRAFT INDUSTRY**
- Aircraft jet engines technological progress review over past 25 years, emphasizing industry economics considerations A71-30303
- AIRCRAFT INSTRUMENTS**
- Onboard aircraft refractometer design, operation and effectiveness A71-28250
- Electrical and physical nature of microbial membranes implicated in aircraft fuel quantity probe malfunction [SAE PAPER 710439] A71-28321
- V/STOL aircraft instruments, deck display and automatic flight controls for takeoff and landing operation A71-29132
- Aircraft instrumentation and data analysis for clear air turbulence, including orthogonal components and temperature and wind distributions A71-29753
- Instrumentation in aerospace industry - Conference, Las Vegas, May 1971 A71-30309
- Aircraft barometric altimeter errors caused by atmospheric temperature deviations from International Standard Atmosphere A71-30323
- Holographic techniques, optical data processing and laser properties for aerospace instrumentation A71-30329
- Heavy lift helicopters IFR hover capability with slung load, discussing sensors controls and displays [AHS PREPRINT 540] A71-31097
- AIRCRAFT LANDING**
- Transport aircraft all weather automatic landing operation, examining guidance system and independent monitors [SAE PAPER 710441] A71-28323
- Jet-supported VTOL aircraft fuel-time-optimal landing control, using mathematical model, Pontryagin maximum principle and analog computer solution A71-29281
- Automatic aircraft landing system modification for improvement of response to air turbulence effects A71-29773
- Anemometer measurement optimum averaging time of wind speed for conventional aircraft landings A71-30394
- Single anemometer wind measurement required for aircraft landing, comparing data from different sampling periods A71-30395
- Combined inertial and instrument landing aircraft navigation systems with reduced cross runway position and velocity errors, using optimal linear estimation A71-30606
- Design and characteristics of continuous wave, microwave scanning-beam aircraft landing system operating at C band and superhigh frequencies [AD-718972] N71-24555
- Climbout and landing approach noise measurements for three engine turbofan transport aircraft [NASA-TN-D-6137] N71-24582
- AIRCRAFT MAINTENANCE**
- Methods for engine condition monitoring application to airline operation A71-28177
- MAC malfunction detection, analysis and recording system applications in commercial airlines, emphasizing real time response for maintenance function [SAE PAPER 710425] A71-28311
- FAA aircraft design appraisal for maintainability, considering maintenance concepts and adverse airworthiness situations [SAE PAPER 710431] A71-28316
- Airline operator evaluation of maintainability, considering costs and investment return [SAE PAPER 710432] A71-28317
- Microbiological contamination of jet aircraft fuel tanks in tropical regions, considering maintenance [SAE PAPER 710438] A71-28320

AIRCRAFT NOISE

SUBJECT INDEX

- Transport aircraft JT9D high bypass ratio engine development, noting maintainability and stability improvements
[SAE PAPER 710419] A71-30527
- Aircraft quantitative maintenance cost requirements translation into design criteria, considering airline operations influence on manufacturer
[SAE PAPER 710437] A71-30529
- Boeing 747 aircraft integrated data system program for reducing engine maintenance and operating costs
[AIAA PAPER 71-648] A71-30725
- Army aircraft automatic inspection and maintenance monitoring system, considering feasibility, technology approach and effectiveness
[AIAA PAPER 71-649] A71-30726
- Onboard computer for aircraft engine testing, monitoring and data reduction, emphasizing automatic in-flight recording for post-flight displays
[AIAA PAPER 71-651] A71-30727
- Evaluating adequacy of tool sets for aircraft maintenance
[AD-719103] N71-24379
- Aircraft maintenance for civil aviation
[AD-720366] N71-25955
- AIRCRAFT NOISE**
- Aircraft noise on and near airports and factors affecting its intensity A71-29304
- Operations research minimum cost model of aircraft noise abatement in airport communities
[AIAA PAPER 71-525] A71-29551
- Sound fields of flying aircraft from noise measurements, discussing engine operating conditions, speed and attitude A71-30521
- STOL vehicle and systems air transportation expansion by reducing trip time, congestion, noise exposures and pollution for DOT, DOD and NASA roles
[SAE PAPER 710464] A71-30535
- Commercial vs military design criteria for STOL transport aircraft, noting landing and takeoff distances and noise levels
[SAE PAPER 710465] A71-30536
- SAE/DOT conference on aircraft and environments covering noise pollution, airport noise, sonic booms, regulatory/legal aspects and air pollution
[AIAA PAPER 71-729] A71-30776
- Interior sound pressure measurements in C-5A aircraft
[AD-719746] N71-25060
- Proceedings of conference to train personnel in conducting aircraft noise certification tests
[HRC-TR-300-SUPPL-1] N71-26303
- Familiarization of Federal Aviation Administration personnel in acoustic measurement techniques and procedures involved in noise certification of aircraft
[HRC-TR-300] N71-26304
- Techniques and procedures for measuring effective perceived noise level during aircraft noise type certifications
[HRC-TR-300-SUPPL-2] N71-26305
- AIRCRAFT PARTS**
- Advanced composite vs conventional material components in cost comparison for aircraft parts A71-29656
- Complex structural aircraft components manufacture, using group technology principle based on subdivision of parts classes A71-30267
- AIRCRAFT PERFORMANCE**
- Supersonic staggered gutter colander combustion system for plenum chamber burning on high bypass Pegasus turbofan engine of Harrier VTOL aircraft, noting performance improvement A71-28743
- German monograph on game theory and planning techniques for aircraft evaluation A71-28880
- Aircraft flight characteristics dependence on angle of attack, roll and pitch A71-29043
- Ejection system performance in relation to aircraft performance dependent extreme flight conditions, examining ejection seat design features and trajectories A71-29385
- Atmospheric turbulence effects on handling qualities and structural loads on aircraft A71-29787
- Low wing loading STOL transport ride smoothing using Boeing aircraft
[NASA-CR-111819] N71-24586
- Alleviation of lateral and longitudinal gust effects on aircraft N71-24709
- Jet vertical takeoff aircraft piloted cockpit simulator for controlling aircraft flight performance
[ARC-R/M-3647] N71-25065
- AIRCRAFT PRODUCTION**
- Aircraft engine production components and alloys mechanical properties evaluation for improved reliability of mass produced products A71-28944
- Complex structural aircraft components manufacture, using group technology principle based on subdivision of parts classes A71-30267
- Air transport development trends, considering increased speed and capacity, STOL aircraft, urban service, and European cooperation for manufacturing A71-30302
- AIRCRAFT RELIABILITY**
- Costs-reliability relationships in helicopter development testing and demonstration, emphasizing decision making in program management
[SAE PAPER 710452] A71-28330
- Yak 40 aircraft flight test program, discussing airworthiness requirements, static structural, vibration and wind tunnel tests A71-29911
- Fail-safe helicopter rotor control design, discussing damage tolerant components, redundant system, failure warning and maintenance
[AHS PREPRINT 550] A71-31102
- AIRCRAFT SAFETY**
- Airport certification and safety inspection procedures and minimum safety standards
[SAE PAPER 710413] A71-28305
- Plug-in relay hazards and minimization for aircraft flight safety applications A71-28841
- Jet transport aircraft design for safety under air turbulence conditions, considering cruise altitude limitations and pitch and g excursion reduction by special autopilot mode A71-29777
- High intensity xenon flashtube lights for increasing conspicuity of trainer helicopters during daytime and nighttime flights
[AD-718639] N71-24669
- Potential feasibility of safe, practical, and economical air breathing nuclear propulsion system for aircraft and air cushion vehicles
[NASA-TM-X-67837] N71-25524
- Calculating and testing antiicing systems of aircraft and helicopters
[AD-719922] N71-25622
- AIRCRAFT SPECIFICATIONS**
- DC 10 specifications for airport planning, including ground clearances, payload-range characteristics and jet engine exhaust velocities A71-30239
- Computer aided design program for civil transport aircraft configuration, performance, propulsion, weight and costs to meet given specifications A71-30398
- AIRCRAFT STABILITY**
- Longitudinal stability of ground effect airplane, discussing influence on aerodynamic characteristics of height, ground surface roughness and wing aspect ratio A71-29228
- Jet transport aircraft stability and controllability under atmospheric turbulence conditions, discussing longitudinal and lateral-directional characteristics with particular attention to unstable spiral mode A71-29772

- Pilot subjective evaluation of XB-70 aircraft response to atmospheric turbulence in comparison with measured accelerations
A71-29774
- Helicopter rotor system vibratory and mechanical stability characteristics, investigating anisotropically mounted flexible swash plate and blade out of track effects
[AHS PREPRINT 511] A71-31082
- Hingeless rotor helicopter stability and control characteristics, considering induced flow field, flapwise bending modes and blade-fuselage dynamic coupling
[AHS PREPRINT 541] A71-31098
- Stability, control, and handling quality characteristics of STOL and V/STOL airplanes
N71-24702
- Investigation of stability and controllability parameters for supersonic aircraft under varying aerodynamic load conditions
[AD-719804] N71-25032
- Stability and controllability of supersonic swept wing aircraft
[AD-719803] N71-25049
- AIRCRAFT STRUCTURES**
- Artificial corrosion pits effect on fatigue durability of smooth samples and aircraft duraluminum skin elements
A71-27819
- Filamentary composite reinforced metal aircraft structures, considering boron/epoxy in combination with aluminum
A71-28168
- Locating neutral layer and critical curvature radius in aircraft components waffle panels under elastoplastic bending
A71-28940
- Structural fatigue in aircraft design, discussing twin engine transport tests, crack propagation rate, residual strength, etc
A71-29434
- Soviet book on aircraft materials science and treatment covering steel/cast iron processing, metallography, heat/thermochemical conditioning, surface protection and corrosion prevention
A71-29529
- Atmospheric turbulence effects on handling qualities and structural loads on aircraft
A71-29787
- Nondestructive testing of aircraft structures using thulium and iridium gamma sources
[JAERI-MEMO-4163] N71-24849
- Development and characteristics of high strength, stress corrosion resistant aluminum alloys for aircraft structures
[AD-720398] N71-25876
- AIRCRAFT WAKES**
- Vortex wakes behind STOL operations high lift wings, discussing height above ground and various wind tunnel dimensions effects
A71-28033
- Trailing vortices shed by aircraft lifting surfaces, noting wake effects importance at low speeds
A71-28176
- AIRFOIL PROFILES**
- Aerofoil cascades with axial velocity change in incompressible flow, determining turbine blade force dependence on circulation
A71-28467
- Wind tunnel tests of geometrically compatible airfoils for variable chord sailplane
A71-29257
- Two dimensional flow research on high lift airfoils for STOL aircraft, using vorticity distribution and wind tunnel wall blowing techniques
A71-29910
- High lift and boundary layer separation behavior of sweptback wing airfoil profile noting trailing and leading edge stall pattern
[ARC-R/M-3648] N71-24488
- AIRFOILS**
- Low aerodynamic drag airfoil designing by Lighthill method
[ARC-R/M-3618] N71-24498
- AIRFRAME MATERIALS**
- Fatigue and fracture mechanics of airframes and materials including structural design and stress analysis techniques
[AD-719756] N71-25092
- Application of photochromic coatings to provide nondestructive inspection for aerospace materials and structures
[AD-720239] N71-26383
- AIRFRAMES**
- Fatigue and fracture mechanics of airframes and materials including structural design and stress analysis techniques
[AD-719756] N71-25092
- AIRLINE OPERATIONS**
- Methods for engine condition monitoring, application to airline operation
A71-28177
- Airline operator evaluation of maintainability, considering costs and investment return
[SAE PAPER 710432] A71-28317
- Airline engine performance testing from operator perspective, using automated test cell data acquisition system
[SAE PAPER 710451] A71-28329
- Commercial airlines flight training program, using simulation and improved techniques for safety and economy
[SAE PAPER 710475] A71-28340
- Aircraft noise on and near airports and factors affecting its intensity
A71-29304
- Helicopter systems operations in, around and between major metropolitan areas, considering performance of New York Airways
[AIAA PAPER 71-507] A71-29549
- Air turbulence primary and secondary effects on aircraft flight and avoidance criteria considerations
A71-29768
- U.S. air carrier accidents due to atmospheric turbulence, considering in-flight weather problems, airborne meteorological radar, CAT detection systems, etc
A71-29770
- Book on air law and civil air policy covering international regulation, air traffic market, passenger and cargo services, etc
A71-29938
- Long haul international air transport, analyzing traffic growth rates
A71-30161
- VTOL and STOL aircraft comparative study covering site area, cost and noise and toxic gas production
A71-30163
- Aircraft JT9D engine development for airline operation, discussing construction, condition monitoring, maintenance, noise and smoke reduction
[SAE PAPER 710434] A71-30528
- Aircraft quantitative maintenance cost requirements translation into design criteria, considering airline operations influence on manufacturer
[SAE PAPER 710437] A71-30529
- Analysis of magnitude, growth, and carrier participation of passenger traffic in major short-haul markets
N71-26528
- AIRPORT PLANNING**
- Airport certification and safety inspection procedures and minimum safety standards
[SAE PAPER 710413] A71-28305
- National Airport Plan changes since 1946, discussing airport management involvement increase
[SAE PAPER 710414] A71-28306
- Airport terminal building design and construction, noting economy and expansibility corequirements
[SAE PAPER 710418] A71-28307
- Aircraft noise on and near airports and factors affecting its intensity
A71-29304
- Airport pavement design principles, considering imposed stresses at flight operation areas, runways, taxiways, apron and waiting position overrun areas, shoulders and strips
A71-29311
- Ultra Compact Airport Terminal, describing landside, terminal and airside elements
A71-29313

AIRPORTS

Aircraft capabilities in intraurban transportation for Detroit metropolitan area, considering vehicle design, fleet size, cost and terminal location
[AIAA PAPER 71-504] A71-29548

Operations research minimum cost model of aircraft noise abatement in airport communities
[AIAA PAPER 71-525] A71-29551

DC 10 specifications for airport planning, including ground clearances, payload-range characteristics and jet engine exhaust velocities A71-30239

SAE/DOT conference on aircraft and environments covering noise pollution, airport noise, sonic booms, regulatory/legal aspects and air pollution
[AIAA PAPER 71-729] A71-30776

Analysis of adequacy of access routes to Dulles International Airport and need for additional facilities to accommodate future expansion
[PB-194094] N71-26301

Analysis of road traffic problems at Washington National Airport and recommendations to improve airport access
[REPT-3] N71-26526

AIRPORTS

Roissy-en-France airport, describing construction, passenger handling, terminal facilities, traffic volume and runway system A71-29309

Melbourne/Tullawarine airport, describing facilities, capacity, road system, cargo and passenger handling areas and runway layout A71-29310

Survey of civil airports to determine status of crash fire and rescue equipment available for use following accidents involving scheduled or local service air carrier aircraft N71-26466

AIRSPEED

Altimeter-air speed and Mach number pressure transducer with diaphragm free of temperature and vibration effects A71-30322

ALL-WEATHER AIR NAVIGATION

Transport aircraft all weather automatic landing operation, examining guidance system and independent monitors
[SAE PAPER 710441] A71-28323

ALLOYS

Aircraft engine production components and alloys mechanical properties evaluation for improved reliability of mass produced products A71-28944

Tests to determine short-term creep of metals and alloys under conditions of aerodynamic heating with high velocity air flow
[NASA-TT-P-13633] N71-25822

ALOUETTE HELICOPTERS

Onboard weighing system for gross weight determination and center of gravity location of Alouette helicopter, using load sensors, electrical circuits and visual indicators A71-30320

ALTIMETERS

Cam profile selection for adjustment in computing-resolving unit of aneroid sensors of altimeters A71-28938

High altitude balloons pressure-altitude transducer assembly, discussing electronic circuitry, calibration and temperature and vibration effects A71-30070

Altimeter-air speed and Mach number pressure transducer with diaphragm free of temperature and vibration effects A71-30322

Aircraft barometric altimeter errors caused by atmospheric temperature deviations from International Standard Atmosphere A71-30323

ALTITUDE

Radarscope net for target azimuth and distance and for direct altitude readout through beacon numerics A71-28886

ALUMINUM ALLOYS

Artificial corrosion pits effect on fatigue

SUBJECT INDEX

durability of smooth samples and aircraft duraluminum skin elements A71-27819

Development and characteristics of high strength, stress corrosion resistant aluminum alloys for aircraft structures
[AD-720398] N71-25876

ALUMINUM COATINGS

Aluminide coatings for nickel-base superalloy developed for high temperature jet engine components
[NASA-CR-72863] N71-25454

ANEMOMETERS

Anemometer measurement optimum averaging time of wind speed for conventional aircraft landings A71-30394

Single anemometer wind measurement required for aircraft landing, comparing data from different sampling periods A71-30395

Fan-produced sound pressure fluctuation in very low speed subsonic wind tunnel test stream, noting resulting anemometer calibration errors A71-30526

ANGLE OF ATTACK

Air flow about low aspect ratio delta wing at large angles of attack, deriving lift coefficient A71-28282

Aircraft flight characteristics dependence on angle of attack, roll and pitch A71-29043

Quasi-stationary gliding trajectories of aircraft in planetary atmosphere during constant control of attack and bank angles A71-29185

Hypersonic flow around delta wing at small angles of attack, using pressure sources method and Fredholm integral equation A71-29189

Elliptical cones at large angle of attack, calculating three-component real gas properties effects on aerodynamic characteristics A71-29191

Spacecraft optimal atmospheric reentry trajectory for minimum flight distance, investigating angle of attack control with allowance for load constraints A71-29229

Air flow past small aspect ratio thick-section wing at small angles of attack, investigating vortex system effect on flow characteristics in absence of lift A71-29234

Slender cone boundary layer transition under angle of attack at Mach 21 with promoted leeward and fixed windward ray A71-29887

Supersonic mass flux probe description, discussing inlet geometry, angle of attack and Reynolds and Mach numbers effects on performance A71-29925

Measurement of oscillatory pitching moment derivatives on sharp-edged delta wing at vortex breakdown angle of attack N71-24572

ANGULAR ACCELERATION

Helicopter gyro displacement measurements at differing flying conditions
[FOA-2-C-2356-49-72/] N71-26567

ANISOTROPIC PLATES

Helicopter rotor system vibratory and mechanical stability characteristics, investigating anisotropically mounted flexible swash plate and blade out of track effects
[AHS PREPRINT 511] A71-31082

ANNUAL VARIATIONS

Normal accelerations experienced by transport aircraft fleet from fatigue load meter data analysis, discussing counting rates seasonal variations A71-29788

ANTENNA ARRAYS

Multiple planar Luneberg lens circular array for airborne electronically scanned X band narrow beam antenna mounted under aircraft nose or fuselage A71-31038

- Blade antenna linear array design for aircraft-satellite communication, determining mutual influences by array measurements in simulated electrical environment
A71-31062
- L band aircraft antenna array consisting of circularly polarized elements and static electronic steering circuits for synchronous satellites radio links
A71-31074
- ANTENNA DESIGN**
- Structural design, mechanical stability and aircraft compatibility for airborne side-looking radar antennas, using end fed slotted waveguide arrays
A71-31041
- Flush mounted aeronautical waveguide antennas with dielectric plug for 5GHz operation
A71-31043
- Airborne blade antenna tunable for 26-100 MHz by individual bands, using binary related inductors switched by miniature high vacuum relays
A71-31044
- Fincap communication antennas design and environmental tests for vibration, acceleration, waterproofing, salt corrosion, ice formation and compass safe distance
A71-31047
- Helicopter aerial design problems, considering antenna multiplicity use of nonmetallic structures and complexity of airborne radio systems
A71-31048
- Light aircraft notch antenna for efficient radiation at HF band lower end and minimal interference with aircraft structure
A71-31053
- Aircraft phased arrays for L-band ATC satellite system application, alleviating problems of power budget and vulnerability to multipath and interference
A71-31054
- High efficiency narrow beam aircraft Cassegrain antenna design for horizon without excessive ground illumination
A71-31056
- L-1011 Tristar antenna arrangement test results, considering weight, aerodynamic and structural design requirements
A71-31060
- Blade antenna linear array design for aircraft-satellite communication, determining mutual influences by array measurements in simulated electrical environment
A71-31062
- Aerospace antenna design, calculating one-wavelength circular slot aperture radiation from circular cylindrical surface
A71-31075
- ANTENNA FEEDS**
- High speed airborne scanning navigational radar antenna with matched patterns, using offset horn fed reflector and polarization modes for improved visual display
A71-31036
- ANTENNA RADIATION PATTERNS**
- Feasibility of VHF aeronautical satellite system frequency sharing band used by ATC service, employing spatial separation, antenna directivity and frequency offset
A71-28873
- Light aircraft notch antenna for efficient radiation at HF band lower end and minimal interference with aircraft structure
A71-31053
- High efficiency narrow beam aircraft Cassegrain antenna design for horizon without excessive ground illumination
A71-31056
- Aerospace antenna design, calculating one-wavelength circular slot aperture radiation from circular cylindrical surface
A71-31075
- ANTENNAS**
- Aerospace antennas - IEE Conference, London, June 1971
A71-31034
- ANTIICING ADDITIVES**
- Calculating and testing antiicing systems of aircraft and helicopters
[AD-719922] N71-25622
- ANTISUBMARINE WARFARE**
- Helicopter handling under ASW flight conditions, discussing sea state effect on low altitude hover stability
A71-29384
- APPLICATIONS TECHNOLOGY SATELLITES**
- ATS 1 and 3 satellite VHF transponders for ships and aircraft location, communication and remote sensing, discussing performance test results
A71-30898
- APPROACH**
- Computerized simulation of V/STOL terminal approach and departure paths at landing sites
[NASA-CR-118315] N71-24869
- APPROACH CONTROL**
- Design and characteristics of continuous wave, microwave scanning-beam aircraft landing system operating at C band and superhigh frequencies
[AD-718972] N71-24555
- Flight tests for controlling slope approach of short takeoff aircraft
[ARC-CP-1138] N71-25050
- APPROACH INDICATORS**
- Terminal air traffic control facility for approach systems tests
[AD-719104] N71-24451
- Design and characteristics of continuous wave, microwave scanning-beam aircraft landing system operating at C band and superhigh frequencies
[AD-718972] N71-24555
- APPROPRIATIONS**
- Authorization hearings on NASA space flight program - Part 4, 1972
N71-25196
- ARMED FORCES (UNITED STATES)**
- General aviation traffic implied densities and interaction frequencies computed with model using southern California to judge difficulty for naval air traffic
[AD-719906] N71-25621
- ASCENT**
- Aerothermodynamic shock heating of space shuttle booster surface during atmospheric ascent
N71-26059
- ASPECT RATIO**
- Aspect ratio effect on oscillatory pitching moment derivatives of slender sharp-edged delta wing in incompressible flow
N71-24571
- ASSEMBLING**
- Assembly methods for three types of aircraft gas turbine engines
[AD-719823] N71-25209
- ASTRONAUTICS**
- History of development of aviation and astronautics in USSR
[NASA-TT-F-13142] N71-25024
- ATMOSPHERIC ENTRY**
- Conical body lift/drag ratio increase by wedge shaped nose, noting applications to space vehicles entering atmosphere above escape velocity
A71-29183
- ATMOSPHERIC MODELS**
- Atmospheric models of partially trapped waves propagation in layer above tropopause with large stratospheric Scorer parameter
A71-29763
- ATMOSPHERIC PHYSICS**
- Self contained lightweight airborne data acquisition system for atmospheric and meteorological research, using analog recorder and telemetry system
A71-30311
- Clear air turbulence in stratosphere and effects on weather formation, atmospheric physics, and supersonic flights
[JPRS-53133] N71-25746
- ATMOSPHERIC TEMPERATURE**
- Aircraft instrumentation and data analysis for clear air turbulence, including orthogonal components and temperature and wind distributions
A71-29753
- Aircraft barometric altimeter errors caused by atmospheric temperature deviations from International Standard Atmosphere

ATMOSPHERIC TURBULENCE

SUBJECT INDEX

	A71-30323	[WMO-264-TP-148]	N71-24394
ATMOSPHERIC TURBULENCE		Random process theory method for estimating response of flexible airplanes to atmospheric turbulence	
Turbulence-related accidents frequency and severity during past few years from worldwide synopsis			N71-24708
Atmospheric turbulence - Conference, London, May 1971	A71-28885	Alleviation of lateral and longitudinal gust effects on aircraft	
Atmospheric turbulence effect on turbine powered transport aircraft, discussing gust accelerations, avoidance, detection, forecasting and pilot control	A71-29749	Analysis of empennage loads and aeroelastic response of T-tail transport aircraft in continuous atmospheric turbulence	N71-24709
Atmospheric turbulence statistical models assessment for aircraft design and operation, considering CAT and thunderstorm turbulence data	A71-29750	Flight evaluations using variable stability aircraft to determine effects of turbulence induced aerodynamic disturbances and lateral directional dynamics on pilot performance [NASA-CR-1718]	N71-24996
Oklahoma and Malaysia thunderstorms comparison based on weather reconnaissance aircraft measurements, considering turbulence patches	A71-29751	ATOMIZERS	
Stratospheric turbulence correlation to mesoscale horizontal temperature gradient at altitudes flown by SST from Coldscan program	A71-29752	Optical measurement of sprays mean droplet size, assessing operating variables effect on air-blast atomizer characteristics	A71-28756
Air turbulence primary and secondary effects on aircraft flight and avoidance criteria considerations	A71-29767	Gas turbine engine startup igniter with modified propellant atomizer enhanced by air injection	A71-28969
U.S. air carrier accidents due to atmospheric turbulence, considering in-flight weather problems, airborne meteorological radar, CAT detection systems, etc	A71-29768	ATOMIZING	
Flight characteristics under atmospheric turbulence conditions, analyzing analog trace records of airspeed, normal acceleration, altitude, air temperature, control surface and flight attitude parameters	A71-29770	Gas turbine engine combustion chamber start-up and burning performance, considering air injection and propellant atomization	A71-28968
Jet transport aircraft stability and controllability under atmospheric turbulence conditions, discussing longitudinal and lateral-directional characteristics with particular attention to unstable spiral mode	A71-29771	ATTACK AIRCRAFT	
Automatic aircraft landing system modification for improvement of response to air turbulence effects	A71-29772	Cheyenne attack helicopter weapons system, discussing night vision capability, armament, fire control and navigation equipment integration [AHS PREPRINT 530]	A71-31091
Pilot subjective evaluation of XB-70 aircraft response to atmospheric turbulence in comparison with measured accelerations	A71-29773	Weapons delivery computer for attack helicopters, using planar distributed function generator for general closed form instantaneous solution capability [AHS PREPRINT 531]	A71-31092
V/STOL aircraft flight path and attitude controls in turbulence, discussing design based on state variable methods of control theory	A71-29774	AUTOMATIC CONTROL	
Jet transport aircraft design for safety under air turbulence conditions, considering cruise altitude limitations and pitch and g excursion reduction by special autopilot mode	A71-29776	Fluidic cabin pressure automatic control systems for military and civil aircraft, discussing design, operation and performance	A71-30308
Computerized simulation techniques for investigating aircraft accidents due to atmospheric turbulence	A71-29777	French ATC, discussing automatic coordinator systems, computer utilization and flight plan data processing	A71-30382
Commercial aircraft piloting in atmospheric turbulence, discussing aircraft characteristics, instrumentation, flying procedures, pilot training and kinesthetic cues	A71-29779	Maastricht Automatic Data Processing and Display ATC system with digital computers for aiding controllers in issuing instructions and making decisions	A71-30383
Aircraft structural design requirements based on statistical analysis of air turbulence intensity and gust loads records from large number of research flights	A71-29782	AUTOMATIC FLIGHT CONTROL	
Aircraft gust alleviation, considering movement correction based real time atmospheric turbulence measurement	A71-29784	V/STOL aircraft instruments, deck display and automatic flight controls for takeoff and landing operation	A71-29132
Atmospheric turbulence effects on handling qualities and structural loads on aircraft	A71-29785	Controlled aircraft motion under strict kinematic constraints in terms of simple subsystems, noting pilots role in Newark theory	A71-31024
Meteorological radar for detection of thunderstorms, hail, and turbulence hazardous to aviation noting echo interpretation and radar transmission	A71-29787	Helicopter gyro displacement measurements at differing flying conditions [FOA-2-C-2356-49-72/]	N71-26567
		AUTOMATIC LANDING CONTROL	
		Transport aircraft all weather automatic landing operation, examining guidance system and independent monitors [SAE PAPER 710441]	A71-28323
		Automatic landing systems independent monitor for L-1011 aircraft, providing pilot confidence under reduced visibilities [SAE PAPER 710443]	A71-28324
		Trident aircraft autopilot for automatic landings in blind conditions, discussing operational problems	A71-29261
		Automatic aircraft landing system modification for improvement of response to air turbulence effects	A71-29773
		AUTOMATIC PILOTS	
		Trident aircraft autopilot for automatic landings in blind conditions, discussing operational problems	A71-29261

- AUTOMATIC TEST EQUIPMENT** A71-29774
 Airborne Doppler radar receiver transmitter failure testing by Versatile Avionics Shop Test computer controlled system A71-28778
 Gas turbine engine condition analysis by digital computer and fault isolation techniques [SAE PAPER 710448] A71-30532
 Army aircraft automatic inspection and maintenance monitoring system, considering feasibility, technology approach and effectiveness [AIAA PAPER 71-649] A71-30726
 Onboard computer for aircraft engine testing, monitoring and data reduction, emphasizing automatic in-flight recording for post-flight displays [AIAA PAPER 71-651] A71-30727
- AUTOMATION**
 Automated orifice drilling optimal treatment routines, including proper timing and adequate total depth allowance A71-28941
- AUTOMOBILE ENGINES**
 Chemical kinetic calculation of nitric oxide formation in spark ignition automobile engines and gas turbine combustors A71-30454
- AUXILIARY POWER SOURCES**
 Optimization of military VTOL aircraft secondary power systems, considering alternate power source for aircraft hydraulics, pneumatic drives, etc [SAE PAPER 710445] A71-28326
 Gas turbine auxiliary power unit accessories, discussing high energy igniters, cables and connectors, thermocouples and speed and temperature monitoring equipment A71-29262
- AVIONICS**
 Airborne Doppler radar receiver transmitter failure testing by Versatile Avionics Shop Test computer controlled system A71-28778
 Interface IC circuits for driving high voltage transistor switches from low level logic inputs, noting avionics application A71-28910
 Interference prediction model for evaluating expected interactions between avionics equipment on aircraft [AD-718997] N71-24357
 Development and characteristics of electronic equipment for digital processing of stochastic signals for military aircraft avionics systems [AD-719822] N71-24954
- AXIAL FLOW**
 Aerofoil cascades with axial velocity change in incompressible flow, determining turbine blade force dependence on circulation A71-28467
 Multistage axial flow compressors on digital computer, testing gas dynamic design in final adjustment phase A71-28584
 Monograph on potential flow interaction between blade rows in axial flow compressors covering mathematical model, numerical analysis and experiment A71-28883
- AXIAL FLOW TURBINES**
 Measurement errors in testing single stage air driven axial flow compressors and turbines A71-28582
 Axial flow turbines comparative performance tests under steady and pulse flow conditions for turbocharger application A71-29819
- AXISYMMETRIC FLOW**
 Axisymmetrical three component flow equations for incompressible viscous fluid in cylinder with rotating disk A71-30855
- B**
- B-70 AIRCRAFT**
 Pilot subjective evaluation of XB-70 aircraft response to atmospheric turbulence in comparison with measured accelerations
- BACKUPS**
 Third Chance flight control system, discussing aircraft control capability with backup hydraulic system after loss of dual main hydraulic systems due to combat damage A71-29382
- BAGGAGE**
 Frankfurt terminal baggage conveyor system, describing passenger capacity and luggage handling equipment A71-29312
- BALLISTIC TRAJECTORIES**
 Roll moment of inertia to static margin ratio effect on yaw of repose angle magnitude in ballistic match of projectiles A71-29890
- BASE PRESSURE**
 Low thrust jet effect on base pressures on boat-tailed afterbodies in Mach number 0.8-1.2 flow A71-29889
- BERYLLIUM**
 C-5A airplane Be brakes, considering critical design weight environment for optimum load carrying capacity [SAE PAPER 710427] A71-28313
- BIBLIOGRAPHIES**
 Aeroelasticity and unsteady flow problems of aircraft N71-24706
- BIRDS**
 Materials and structural design development by high velocity impact testing due to transport and subsonic military aircraft susceptibility to bird collision damage A71-29642
- BLADE TIPS**
 Combination tone noise generation from turbofans with supersonic fan blade tip speed, determining sound power distribution among engine rotation frequency harmonics [AIAA PAPER 71-730] A71-30777
- BLADES**
 Helicopter rotor stall characteristics, investigating blade flexibility, unsteady aerodynamics and variable inflow effects [AHS PREPRINT 520] A71-31086
- BLIND LANDING**
 Trident aircraft autopilot for automatic landings in blind conditions, discussing operational problems A71-29261
- BLOWDOWN WIND TUNNELS**
 Hypervelocity blowdown nitrogen wind tunnel with graphite resistance heater noting nozzles, diffuser, and calibration [IC-AERO-71-01] N71-24675
- BLOWING**
 Low-speed wind tunnel longitudinal stability tests on sweptback wing model with blowing at leading edge slats and trailing edge flaps for Buccaneer aircraft performance [ARC-R/M-3655] N71-24565
- BLUFF BODIES**
 Aerodynamic behavior of bodies in wake of two dimensional bluff bodies, discussing loads A71-29265
- BOATTAILS**
 Low thrust jet effect on base pressures on boat-tailed afterbodies in Mach number 0.8-1.2 flow A71-29889
- BODIES OF REVOLUTION**
 Soviet papers on three dimensional structures covering strength and stability of compound curvature shells, bodies of revolution and multilayer plates A71-30888
- BODY-WING AND TAIL CONFIGURATIONS**
 Minimum drag wing-fuselage combination for supersonic speeds and prescribed lifting force, longitudinal moment and volume, using method of successive approximations A71-29182
- BOEING AIRCRAFT**
 Low wing loading STOL transport ride smoothing using Boeing aircraft [NASA-CR-111819] N71-24586

BOEING 747 AIRCRAFT

Boeing 747 crew members training program, describing ground training, classrooms, inertial navigation system and cockpit trainers [SAE PAPER 710473] A71-28339

Boeing 747 aircraft integrated data system program for reducing engine maintenance and operating costs [AIAA PAPER 71-648] A71-30725

BOOSTER ROCKETS
Aerothermodynamic shock heating of space shuttle booster surface during atmospheric ascent N71-26059

BOUNDARY LAYER CONTROL
Separation control of two dimensional air flow with turbulent boundary layer along circular cylindrical wall by jets or suction A71-29433

High entrainment constant area multiple nozzle ejectors with two mixing tube lengths for boundary layer control, estimating performance with analytical model [ASME PAPER 71-FE-34] A71-29469

BOUNDARY LAYER SEPARATION
High lift and boundary layer separation behavior of sweptback wing airfoil profile noting trailing and leading edge stall pattern [ARC-R/M-3648] N71-24488

BOUNDARY LAYER TRANSITION
Slender cone boundary layer transition under angle of attack at Mach 21 with promoted leeward and fixed windward ray A71-29887

BOUNDARY LAYERS
Data correlation and effectiveness prediction from film cooling injection geometries, considering finitely thick slot lip and boundary layers A71-28751

Retreating blade stall experiments on model helicopter rotor, considering series of pressure distribution and boundary layer events [AHS PREPRINT 521] A71-31087

Application of research in panel flutter and boundary layer thickness to space shuttle N71-24660

Flow meter for measuring stagnation pressure in boundary layer around high speed flight vehicle [NASA-CASE-XFR-02007] N71-24692

BRAYTON CYCLE
Design point characteristics of 15-80 kWe nuclear reactor Brayton cycle power system [NASA-TM-X-67811] N71-24689

Predicted performance of 15-80 kWe reactor Brayton power system over range of operating conditions [NASA-TM-X-67833] N71-24690

Motor starting techniques for 2-15 kW Brayton space power system [NASA-TM-X-67819] N71-24691

BRISTOL-SIDDELEY OLYMPUS 593 ENGINE
Olympus 593 Concorde engine combustion system, discussing operating conditions, combustion performance criticality and altitude relighting A71-28740

Olympus 593 supersonic engine lubricants tests, defining requirements in terms of bulk thermal stability, resistance to hot bearing breakdown, oil mist coking, etc A71-29826

BUCCANEER AIRCRAFT
Low-speed wind tunnel longitudinal stability tests on sweptback wing model with blowing at leading edge slats and trailing edge flaps for Buccaneer aircraft performance [ARC-R/M-3655] N71-24565

BUFFETING
Transonic flutter and buffeting for elastic wind tunnel models of straight wing proposed for space shuttles N71-24659

Buffet response of straight wing and delta wing model of space shuttle launch configuration N71-24662

BURNING RATE
Gas turbine engine combustion chamber start-up and burning performance, considering air injection and propellant atomization A71-28968

C

C-5 AIRCRAFT

C-5A airplane Be brakes, considering critical design weight environment for optimum load carrying capacity [SAE PAPER 710427] A71-28313

Interior sound pressure measurements in C-5A aircraft [AD-719746] N71-25060

C-54 AIRCRAFT
Aircraft accident at Miami, Florida involving Republic of Ecuador C-54D during climb following instrument takeoff [NTSB-AAR-71-2] N71-26032

CABLES

Nonlinear mathematical model for dynamical behavior of extensible towing cable subjected to aerodynamic forces generated by uniform flow field, discussing system stability A71-31026

CALIBRATING

Fluctuating pressure measurements in jet engine testing, using miniature transducers with calibration and data acquisition equipment A71-30325

Aircraft flight load measurements in high temperature environment, determining optimal strain gage installation and calibration A71-30681

CALIFORNIA

General aviation traffic implied densities and interaction frequencies computed with model using southern California to judge difficulty for naval air traffic [AD-719906] N71-25621

CAMS

Cam profile selection for adjustment in computing-resolving unit of aneroid sensors of altimeters A71-28938

CARBON

Carbon deposition rates in gas turbine engine combustion chambers with airstream-mechanical propellant atomization A71-28970

CARGO AIRCRAFT

Soviet Mil V-12 heavy lift helicopter for civil and military missions, noting turbine engines, rotor configuration, cargo hold and navigation system A71-30420

CARGO SHIPS

Army/Navy operational evaluation of offshore containerships discharge by CH-54 helicopters [AHS PREPRINT 573] A71-31114

CASCADE FLOW

Aerofoil cascades with axial velocity change in incompressible flow, determining turbine blade force dependence on circulation A71-28467

Supercavitating flow past straight cascade with arbitrary blade shapes, considering lift and drag coefficients, cavitation number, cavity shape and exit flow conditions [ASME PAPER 71-FE-6] A71-29448

Two dimensional jet flap cascades, presenting stream deflection angles as function of jet to mainstream momentum flux [ASME PAPER 71-FE-14] A71-29453

CASCADES

Aerodynamic forces produced in turbine stage by vane cascade of cascade series [NASA-TT-F-13631] N71-25998

CASSEGRAIN ANTENNAS

High efficiency narrow beam aircraft Cassegrain antenna design for horizon without excessive ground illumination A71-31056

CAVITATION FLOW

Structure and shape of vortex wake associated with oblique flow past multiblade hinged rotor, using cavitation method A71-29217

CAVITY RESONATORS

Heat transfer within resonant cavities at subsonic and supersonic flow, discussing wind tunnels, test procedures and data reduction [ASME PAPER 71-FE-9] A71-29450

CENTER OF GRAVITY

Onboard weighing system for gross weight determination and center of gravity location of Alouette helicopter, using load sensors, electrical circuits and visual indicators
A71-30320

CERTIFICATION

Airport certification and safety inspection procedures and minimum safety standards
[SAE PAPER 710413] A71-28305
Proceedings of conference to train personnel in conducting aircraft noise certification tests
[HRC-TR-300-SUPPL-1] N71-26303

CH-46 HELICOPTER

Integral spar inspection system for making CH-46 rotor blade fail-safe
[AHS PREPRINT 551] A71-31103

CH-47 HELICOPTER

Turbine engine fuel control stability on CH-47C helicopter, using flight tests and lag damper simulation
[AHS PREPRINT 560] A71-31107
Boeing 347 helicopter program consisting of analysis, vibration simulation, wind tunnel, whirl tower and bench tests
[AHS PREPRINT 571] A71-31112

CH-54 HELICOPTER

Army/Navy operational evaluation of offshore containerships discharge by CH-54 helicopters
[AHS PREPRINT 573] A71-31114

CIRCULAR CONES

Unsteady hypersonic self similar gas flow and drag on circular cone accelerated according to power law, using small perturbation theory
A71-29205

CIRCULAR CYLINDERS

Mechanical support system role in determination of aeroelastic stability of leeward cylinder immersed in wake using undamped flutter theory
A71-31021

CIVIL AVIATION

MAC malfunction detection, analysis and recording system applications in commercial airlines, emphasizing real time response for maintenance function
[SAE PAPER 710425] A71-28311
Commercial airlines flight training program, using simulation and improved techniques for safety and economy
[SAE PAPER 710475] A71-28340
Commercial V/STOL and jet VTOL transport, discussing Do-31 test results, landing approach, air traffic control automation and electronic control
A71-29131

Book on air law and civil air policy covering international regulation, air traffic market, passenger and cargo services, etc
A71-29938

Air transport and travel expansion rate, discussing motivations and cost
A71-30159

Circumstances inducing growth in different air transport sectors, discussing transportation cost, aviation capital requirement and business and leisure air travel
A71-30160

Long haul international air transport, analyzing traffic growth rates
A71-30161

Civil aviation customer/operator, passenger and community/ needs, describing STOL and V/STOL aircrafts
A71-30162

Computer aided design program for civil transport aircraft configuration, performance, propulsion, weight and costs to meet given specifications
A71-30398

Soviet Mil V-12 heavy lift helicopter for civil and military missions, noting turbine engines, rotor configuration, cargo hold and navigation system
A71-30420

Inertial navigation systems improvements for commercial air transportation, noting digital computer program revision and increased functional capability
[SAE PAPER 710458] A71-30534

Flightworthy 25-foot diameter prop rotor wind tunnel test, considering civil and military need for VTOL transportation
[AHS PREPRINT 501] A71-31077
General aviation traffic implied densities and interaction frequencies computed with model using southern California to judge difficulty for naval air traffic
[AD-719906] N71-25621
Aircraft maintenance for civil aviation
[AD-720366] N71-25955
Analysis of magnitude, growth, and carrier participation of passenger traffic in major short-haul markets
N71-26528

CLEAR AIR TURBULENCE

Aircraft instrumentation and data analysis for clear air turbulence, including orthogonal components and temperature and wind distributions
A71-29753
Stratospheric air flow patterns and CAT measurements onboard aircraft over and downwind of Western U.S. mountain terrain
A71-29755
Thunderstorm, CAT, weather and mountain wave induced turbulence forecasting and analysis for transport aircraft
A71-29764

Airborne equipment for CAT detection ahead of aircraft, considering pulsed Doppler laser and IR detectors
A71-29765

Clear air turbulence in stratosphere and effects on weather formation, atmospheric physics, and supersonic flights
[JPRS-53133] N71-25746

CLEARANCES

Time dependent clearance changes effects on aerodynamic characteristics of sectorially grooved gas bearings, describing lift and drag coefficients calculation
A71-30227

CLIMBING FLIGHT

Climbout and landing approach noise measurements for three engine turbofan transport aircraft
[NASA-TN-D-6137] N71-24582
Computerized simulation of V/STOL terminal approach and departure paths at landing sites
[NASA-CR-118315] N71-24869
Aircraft accident at Miami, Florida involving Republic of Ecuador C-54D during climb following instrument takeoff
[NTSB-AAR-71-2] N71-26032

CLOUD COVER

Aircraft hazards due to frequent low cloud occurrences at Kenya airport, forecasting weather with statistical analysis and radiosounding
A71-29106

CLOUDS

Aircraft mounted infrared detectors for remote measurements of optical cloud properties
N71-25260

COANDA EFFECT

Propulsion, guidance and stability of ground effect vehicle with perimetric Coanda fluid boundary
A71-29308

COCKPIT SIMULATORS

Boeing 747 crew members training program, describing ground training, classrooms, inertial navigation system and cockpit trainers
[SAE PAPER 710473] A71-28339
Jet vertical takeoff aircraft piloted cockpit simulator for controlling aircraft flight performance
[ARC-R/M-3647] N71-25065

COLLISION AVOIDANCE

Satellite aided aircraft collision avoidance system effective for large number of aircraft
[NASA-CASE-ERC-10090] N71-24948

COMBUSTIBLE FLOW

Soviet papers on combustion processes in turbulent and laminar flows of kerosene and gasoline mixtures, stressing gas turbine engines problems
A71-28954

COMBUSTION

Combustion and heat transfer in gas turbine

COMBUSTION CHAMBERS

systems - Conference, Cranfield, England, April 1969
A71-28739

COMBUSTION CHAMBERS

Olympus 593 Concorde engine combustion system, discussing operating conditions, combustion performance criticality and altitude relighting
A71-28740

RB 162 turbojet engine combustors for VTOL aircraft, achieving ignition by two pressure jet atomizers operative during starting cycle
A71-28742

Diffusion and thermal mechanism ignition theories, applying to altitude relighting of gas turbine engine combustors
A71-28745

Annular vaporizing combustion chamber with film cooling, determining flame temperature under supersonic flight conditions
A71-28749

Gas turbine engine combustion chamber start-up and burning performance, considering air injection and propellant atomization
A71-28968

Carbon deposition rates in gas turbine engine combustion chambers with airstream-mechanical propellant atomization
A71-28970

Gas turbine engine combustion chamber outlet, noting gas flow temperature field peripheral nonuniformity
A71-28972

Analytical model of compressor sensitivity to transient and distorted transient flows, considering inlet duct, compressor stages and combustor up to turbine nozzles
[AIAA PAPER 71-670] A71-30734

Modular concept mathematical model for combustion and pollution formation processes in jet engine combustors, including turbulent mixing and reaction kinetics
[AIAA PAPER 71-714] A71-30766

Aircraft gas turbine combustion chamber design
[NAL-TR-208] N71-26298

COMBUSTION EFFICIENCY

Continuous combustion gas turbine with stepwise heat release, investigating ideal thermal efficiency cycle of gas overexpansion, cooling and compression
A71-28583

Olympus 593 Concorde engine combustion system, discussing operating conditions, combustion performance criticality and altitude relighting
A71-28740

Gas-air mixture requirements for turbine and injection burner combustion efficiencies
[AD-719834] N71-25359

COMBUSTION PHYSICS

Combustion generated aerodynamic noise, considering sound radiation from open turbulent flames, spectral content, power output and origin
[AIAA PAPER 71-735] A71-30780

COMBUSTION PRODUCTS

Chemical kinetic calculation of nitric oxide formation in spark ignition automobile engines and gas turbine combustors
A71-30454

COMBUSTION STABILITY

Turbopropulsion systems thrust augmentor combustion instability, discussing physical causes due to various pressure oscillation modes
[AIAA PAPER 71-697] A71-30756

Turbojet and turbofan augmentors combustion instability, discussing pressure oscillations elimination by screech liner and flameholder design
[AIAA PAPER 71-698] A71-30757

Acoustic liner design for propellant combustion instability and jet aircraft noise suppression, discussing cross flow and oscillatory pressure effects
[AIAA PAPER 71-757] A71-30791

COMMERCE

Characteristics and cost analysis of nuclear powered air cushion vehicles for oceanic commercial operations
[NASA-TM-X-2293] N71-25783

SUBJECT INDEX

COMMERCIAL AIRCRAFT

Military/commercial STOL transport design, discussing performance, payload and equipment requirements with emphasis on production cost benefits
[SAE PAPER 710468] A71-28336

Cost efficient sound limit expenditures per parameter unit in commercial transport aircraft design
A71-28945

Commercial aircraft piloting in atmospheric turbulence, discussing aircraft characteristics, instrumentation, flying procedures, pilot training and kinesthetic cues
A71-29782

Airborne integrated data system capabilities based on flight tests with commercial aircraft
A71-30319

Commercial vs military design criteria for STOL transport aircraft, noting landing and takeoff distances and noise levels
[SAE PAPER 710465] A71-30536

Analysis of magnitude, growth, and carrier participation of passenger traffic in major short-haul markets
N71-26528

COMMUNICATION SATELLITES

Feasibility of VHF aeronautical satellite system frequency sharing band used by ATC service, employing spatial separation, antenna directivity and frequency offset
A71-28873

Survey of very high and ultrahigh frequency utilization in US aeronautics for communication satellite frequency assignment
[NASA-TM-X-65527] N71-25920

COMPATIBILITY

Procedures for evaluating compatibility of aviation materiel with related equipment
[AD-719107] N71-24457

COMPONENT RELIABILITY

Reduction gearbox reliability problems from development and service experience with PT6A turboprop engine
[SAE PAPER 710433] A71-28318

Fail-safe helicopter rotor control design, discussing damage tolerant components, redundant system, failure warning and maintenance
[AHS PREPRINT 550] A71-31102

Conference on fatigue life in helicopter components
[DLR-MITT-70-01] N71-24385

Dynamic tests of helicopter components
N71-24388

Structural stability tests of helicopter components
N71-24390

Aluminide coatings for nickel-base superalloy developed for high temperature jet engine components
[NASA-CR-72863] N71-25454

COMPOSITE MATERIALS

Filamentary composite reinforced metal aircraft structures, considering boron/epoxy in combination with aluminum
A71-28168

Advanced composite vs conventional material components in cost comparison for aircraft parts
A71-29656

Composite materials application to V/STOL prop/rotors, determining material properties parametric effect on frequencies and weight by Southwell coefficients
[AHS PREPRINT 554] A71-31106

COMPOUND HELICOPTERS

Electromechanical control system synthesis for compound hingeless rotor helicopter, using root locus method with transfer functions from airframe motion linear model
[AHS PREPRINT 536] A71-31096

High performance UH-1 compound helicopter high speed flight research, considering rotor loads, stability, control and flying qualities
[AHS PREPRINT 570] A71-31111

AH-56A compound helicopter rigid rotor stability and handling qualities, using flight, whirl tower and wind tunnel tests
[AHS PREPRINT 574] A71-31115

- COMPRESSIBILITY EFFECTS** A71-29610
 Army rotorcraft performance data, discussing hovering and forward flight performance out of ground and level flight power requirements and drag and compressibility effects [AHS PREPRINT 500] A71-31076
- COMPRESSION LOADS**
 Pisa University Aeronautical Institute activities /1960-1970/, considering supersonic and subsonic flow research, thin stiffened shells fatigue under compressive or tensile loads, etc A71-30822
- COMPRESSOR BLADES**
 Monograph on potential flow interaction between blade rows in axial flow compressors covering mathematical model, numerical analysis and experiment A71-28883
- COMPRESSORS**
 Air bypass behind compressor into variable area exhaust nozzle, obtaining energy losses from gas turbine jet engine indices A71-28586
- COMPUTER PROGRAMS**
 French ATC, discussing automatic coordinator systems, computer utilization and flight plan data processing A71-30382
 Computer aided design program for civil transport aircraft configuration, performance, propulsion, weight and costs to meet given specifications A71-30398
 Inertial navigation systems improvements for commercial air transportation, noting digital computer program revision and increased functional capability [SAE PAPER 710458] A71-30534
 Low aerodynamic drag airfoil designing by Lighthill method [ARC-R/H-3618] N71-24498
- COMPUTER TECHNIQUES**
 Gas turbine engine condition analysis by digital computer and fault isolation techniques [SAE PAPER 710448] A71-30532
 Onboard computer for aircraft engine testing, monitoring and data reduction, emphasizing automatic in-flight recording for post-flight displays [AIAA PAPER 71-651] A71-30727
- COMPUTERIZED DESIGN**
 Computer aided design program for civil transport aircraft configuration, performance, propulsion, weight and costs to meet given specifications A71-30398
 Hypersonic theoretical/experimental correlations of aerodynamic characteristics for space shuttle design N71-26066
- COMPUTERIZED SIMULATION**
 Computerized simulation techniques for investigating aircraft accidents due to atmospheric turbulence A71-29779
 Computerized simulation of V/STOL terminal approach and departure paths at landing sites [NASA-CR-118315] N71-24869
- CONCORDE AIRCRAFT**
 Olympus 593 pure jet twin shaft engine development program for Concorde, discussing engine evolution, design considerations and flight development [SAE PAPER 710422] A71-28309
 Olympus 593 Concorde engine combustion system, discussing operating conditions, combustion performance criticality and altitude relighting A71-28740
 Concorde SST flight test equipment installation with PCM recording and visual instruments A71-30055
 Concorde power plant fire protection system, describing prototype engine bay overheat detection system and additional UV optical fire detection system A71-30300
- CONDUCTING FLUIDS**
 Incompressible conducting fluid plane jet expansion in homogeneous slipstream, deriving partial differential equations for nonconduction approximation
- CONDUCTIVE HEAT TRANSFER** A71-29610
 Static strain measurements on Ti specimen subjected to different conductive heating rates, testing various gages A71-29833
 Conductive heat transfer effect on temperature distribution in vicinity of wing leading edge in hypersonic flight [ARC-CP-1126] N71-24446
- CONFERENCES**
 Technical, sales/marketing and management Conference, Coronado, California, May 1971 A71-28164
 Combustion and heat transfer in gas turbine systems - Conference, Cranfield, England, April 1969 A71-28739
 Aerospace materials - Conference, Anaheim, California, April 1971 A71-29633
 Atmospheric turbulence - Conference, London, May 1971 A71-29749
 Dynamic testing - Conference, London, January 1971 A71-30053
 Aviation within total transport system - Conference, London, May 1971 A71-30158
 Instrumentation in aerospace industry - Conference, Las Vegas, May 1971 A71-30309
 Telemetry - IEEE Conference, Washington, D.C., April 1971 A71-30896
 Aerospace antennas - IEE Conference, London, June 1971 A71-31034
 Conference on fatigue life in helicopter components [DLR-MIT-70-01] N71-24385
 Conference on dynamics and aeroelasticity of space shuttle [NASA-TM-X-2274] N71-24651
 Proceedings of conference to train personnel in conducting aircraft noise certification tests [HRC-TR-300-SUPPL-1] N71-26303
- CONGRESS**
 Authorization hearings on NASA space flight program - Part 4, 1972 N71-25196
- CONICAL BODIES**
 Conical body lift/drag ratio increase by wedge shaped nose, noting applications to space vehicles entering atmosphere above escape velocity A71-29183
- CONICAL FLOW**
 Elliptical cones at large angle of attack, calculating three-component real gas properties effects on aerodynamic characteristics A71-29191
- CONTROL EQUIPMENT**
 Fluidic cabin pressure automatic control systems for military and civil aircraft, discussing design, operation and performance A71-30308
 Supersonic aircraft lateral control equipment [AD-720740] N71-26538
- CONTROL STABILITY**
 Turbine engine fuel control stability on CH-47C helicopter, using flight tests and lag damper simulation [AHS PREPRINT 560] A71-31107
- CONTROL SURFACES**
 Hypersonic flight load bearing refractory alloy control surface protective coatings, emphasizing oxidation screening tests A71-29646
- CONTROL THEORY**
 Controlled aircraft motion under strict kinematic constraints in terms of simple subsystems, noting pilots role in Newmark theory A71-31024
 Hingeless rotor helicopter stability and control characteristics, considering induced flow field, flapwise bending modes and blade-fuselage dynamic coupling [AHS PREPRINT 541] A71-31098

CONTROLLABILITY

SUBJECT INDEX

CONTROLLABILITY

- Helicopter handling under ASW flight conditions, discussing sea state effect on low altitude hover stability
A71-29384
- Commercial aircraft piloting in atmospheric turbulence, discussing aircraft characteristics, instrumentation, flying procedures, pilot training and kinesthetic cues
A71-29782
- Atmospheric turbulence effects on handling qualities and structural loads on aircraft
A71-29787
- Handling qualities and control sensitivity of high performance helicopters, considering pitch and collective control
[AHS PREPRINT 542] A71-31099
- Handling qualities of V/STOL research vehicles during steep terminal area approaches, discussing powered lift fan VTOL aircraft limitations and instrument landing approach
[AHS PREPRINT 544] A71-31101
- AH-56A compound helicopter rigid rotor stability and handling qualities, using flight, whirl tower and wind tunnel tests
[AHS PREPRINT 574] A71-31115
- Stability and controllability of supersonic swept wing aircraft
[AD-719803] N71-25049
- CONVECTIVE HEAT TRANSFER**
Flow direction effect on combined forced and free convective heat transfer from cylinders to air
A71-28985
- CONVEYORS**
Frankfurt terminal baggage conveyor system, describing passenger capacity and luggage handling equipment
A71-29312
- COOLING SYSTEMS**
Analysis of first stage turbine stator vane and rotor blade cooling designs for application in highspeed aircraft
[NASA-TM-X-1782] N71-26355
- CORRELATION**
Data correlation and effectiveness prediction from film cooling injection geometries, considering finitely thick slot lip and boundary layers
A71-28751
- CORRELATION COEFFICIENTS**
Hypersonic theoretical/experimental correlations of aerodynamic characteristics for space shuttle design
N71-26066
- CORROSION PREVENTION**
Soviet book on aircraft materials science and treatment covering steel/cast iron processing, metallography, heat/thermochemical conditioning, surface protection and corrosion prevention
A71-29529
- Development and characteristics of high strength, stress corrosion resistant aluminum alloys for aircraft structures
[AD-720398] N71-25876
- CORROSION RESISTANCE**
Mechanical properties of composites consisting of Al matrix reinforced by boron fibers, considering high temperature creep, corrosion and thermal shock resistivity
A71-30473
- CORROSION TESTS**
Artificial corrosion pits effect on fatigue durability of smooth samples and aircraft duraluminum skin elements
A71-27819
- Metal coated superalloys evaluation for gas turbine engine components, including corrosion, impact and fatigue tests
A71-29635
- Fincap communication antennas design and environmental tests for vibration, acceleration, waterproofing, salt corrosion, ice formation and compass safe distance
A71-31047
- COST ANALYSIS**
Airline operator evaluation of maintainability, considering costs and investment return
[SAE PAPER 710432] A71-28317
- Costs-reliability relationships in helicopter development testing and demonstration, emphasizing decision making in program management
[SAE PAPER 710452] A71-28330
- Aircraft capabilities in intraurban transportation for Detroit metropolitan area, considering vehicle design, fleet size, cost and terminal location
[AIAA PAPER 71-504] A71-29548
- Advanced composite vs conventional material components in cost comparison for aircraft parts
A71-29656
- Air transport and travel expansion rate, discussing motivations and cost
A71-30159
- Circumstances inducing growth in different air transport sectors, discussing transportation cost, aviation capital requirement and business and leisure air travel
A71-30160
- Aircraft quantitative maintenance cost requirements translation into design criteria, considering airline operations influence on manufacturer
[SAE PAPER 710437] A71-30529
- COST EFFECTIVENESS**
Cost efficient sound limit expenditures per parameter unit in commercial transport aircraft design
A71-28945
- Helicopters as cranes and external load carriers, considering operational costs and investment return
A71-29144
- Operations research minimum cost model of aircraft noise abatement in airport communities
[AIAA PAPER 71-525] A71-29551
- Criteria for converting aeronautical project operational targets into actual requirements and technical specifications, emphasizing cost effectiveness
A71-30824
- COST REDUCTION**
Boeing 747 aircraft integrated data system program for reducing engine maintenance and operating costs
[AIAA PAPER 71-648] A71-30725
- Potential feasibility of safe, practical, and economical air breathing nuclear propulsion system for aircraft and air cushion vehicles
[NASA-TM-X-67837] N71-25524
- CRACK PROPAGATION**
Structural fatigue in aircraft design, discussing twin engine transport tests, crack propagation rate, residual strength, etc
A71-29434
- CRANES**
Helicopter design for use as crane and for carrying external loads
A71-28489
- Helicopters as cranes and external load carriers, considering operational costs and investment return
A71-29144
- CREEP TESTS**
Tests to determine short-term creep of metals and alloys under conditions of aerodynamic heating with high velocity air flow
[NASA-TT-F-13633] N71-25822
- CRITICAL LOADING**
C-5A airplane Be brakes, considering critical design weight environment for optimum load carrying capacity
[SAE PAPER 710427] A71-28313
- CROSS FLOW**
Wing-jet interference effects in cross wind on thrust and aerodynamic characteristics at large distance from and near ground
A71-29207
- Flowfield production by fluid injection into supersonic crossflow, occurring with liquid/gas jet control of vehicle with combustion ramjets
[AIAA PAPER 71-728] A71-30775
- Wind tunnel investigation of jet exhausting into cross flow - data for three jet configuration
[AD-718123] N71-24491
- Wind tunnel investigation of jets exhausting into cross flow - description and data analysis
[AD-718122] N71-24492

- CURVED PANELS**
 Locating neutral layer and critical curvature radius in aircraft components waffle panels under elastoplastic bending A71-28940
 Structural and inertial nonlinearities influence on flat or curved panel flutter A71-30825
- CYCLIC LOADS**
 Evaluation of helicopter flight loading and structural stability N71-24389
- CYLINDRICAL ANTENNAS**
 Aerospace antenna design, calculating one-wavelength circular slot aperture radiation from circular cylindrical surface A71-31075
- CYLINDRICAL BODIES**
 Flow direction effect on combined forced and free convective heat transfer from cylinders to air A71-28985
 Aerodynamic characteristics of low-aspect-ratio wing mounted on cylindrical body, simulating by system of horseshoe vortices A71-30264
- D**
- DASSAULT AIRCRAFT**
 Dassault Mercure short range twin jet aircraft capable of using powerful engine A71-29276
- DATA ACQUISITION**
 Self contained lightweight airborne data acquisition system for atmospheric and meteorological research, using analog recorder and telemetry system A71-30311
 Fluctuating pressure measurements in jet engine testing, using miniature transducers with calibration and data acquisition equipment A71-30325
 Automated modal data acquisition and processing system /MODAPS/ for real-time modal vibration testing of complex aerospace vehicle structures, describing features, capabilities and utilization A71-30341
 Performance and cost design tradeoff between HF and synchronous meteorological satellite data collection systems, considering platform transmitting power and SNR A71-30900
- DATA LINKS**
 L band aircraft antenna array consisting of circularly polarized elements and static electronic steering circuits for synchronous satellites radio links A71-31074
- DATA PROCESSING**
 Normal accelerations experienced by transport aircraft fleet from fatigue load meter data analysis, discussing counting rates seasonal variations A71-29788
 Automated modal data acquisition and processing system /MODAPS/ for real-time modal vibration testing of complex aerospace vehicle structures, describing features, capabilities and utilization A71-30341
 French ATC, discussing automatic coordinator systems, computer utilization and flight plan data processing A71-30382
 Maastricht Automatic Data Processing and Display ATC system with digital computers for aiding controllers in issuing instructions and making decisions A71-30383
- DATA PROCESSING EQUIPMENT**
 Development and characteristics of electronic equipment for digital processing of stochastic signals for military aircraft avionics systems [AD-719822] N71-24954
- DATA REDUCTION**
 Heat transfer within resonant cavities at subsonic and supersonic flow, discussing wind tunnels, test procedures and data reduction [ASME PAPER 71-FE-9] A71-29450
 Circumferential traversing probe technique for intrastage analysis of axial flow compressors, considering mass flow averaging data reduction technique [ASME PAPER 71-FE-33] A71-29468
 Aircraft instrumentation and data analysis for clear air turbulence, including orthogonal components and temperature and wind distributions A71-29753
 Wind tunnel investigation of jets exhausting into cross flow - description and data analysis [AD-718122] N71-24492
- DATA SYSTEMS**
 Integrated flight test data system combining digital airborne data acquisition/recording system with telemetry/microwave link to computerized ground station A71-30318
 Airborne integrated data system capabilities based on flight tests with commercial aircraft A71-30319
 Boeing 747 aircraft integrated data system program for reducing engine maintenance and operating costs [AIAA PAPER 71-648] A71-30725
- DATA TRANSMISSION**
 Sensing and communications technologies for short wayside headways, considering applicable equipment for personal rapid transit systems, modulation, coding and data transmission techniques A71-30337
- DC 10 AIRCRAFT**
 DC 10 specifications for airport planning, including ground clearances, payload-range characteristics and jet engine exhaust velocities A71-30239
 DC 10 flight crew individualized ground training program, emphasizing hands-on equipment and instruction hardware [SAE PAPER 710472] A71-30538
- DECISION MAKING**
 Costs-reliability relationships in helicopter development testing and demonstration, emphasizing decision making in program management [SAE PAPER 710452] A71-28330
 Aviation within total transport system, discussing decision making and management planning A71-30165
- DEFROSTING**
 Test procedures for aircraft defogger/defroster equipment [AD-719109] N71-24452
- DEICING**
 Calculating and testing antiicing systems of aircraft and helicopters [AD-719922] N71-25622
- DELTA WINGS**
 Air flow about low aspect ratio delta wing at large angles of attack, deriving lift coefficient A71-28282
 Hypersonic flow around delta wing at small angles of attack, using pressure sources method and Fredholm integral equation A71-29189
 Hypersonic flow pattern past windward side of delta wing with supersonic leading edges, joining potential and vortex regions behind shock wave A71-30874
 Angle of incidence effect on delta wing leading-edge vortices with cross flow visualization in hydraulic test tunnel [ARC-R/M-3645] N71-24482
 Flow measurement of Nonweiler delta wing in hypersonic slip flow [DIR-FB-70-46] N71-24500
 Oscillatory pitching moment derivatives measurement on delta wings in incompressible flow [ARC-R/M-3628-PT-1-4] N71-24569
 Measurements of oscillatory pitching moments on round leading edged delta wing in incompressible flow noting vortex flow development

DEMAND (ECONOMICS)

SUBJECT INDEX

Measurement of oscillatory pitching moment derivatives on sharp-edged delta wing at vortex breakdown angle of attack N71-24570

Buffet response of straight wing and delta wing model of space shuttle launch configuration N71-24572

Aerodynamic characteristics of delta wing space shuttle configurations N71-24662

DEMAND (ECONOMICS) N71-26062

Long term prospects of air traffic development in competition with other modes, estimating VTOL service demand A71-30164

DENSITY MEASUREMENT

Temperature and radical concentration measurements for high temperature flowing gas streams in rig simulating conditions in ramjet combustion chamber and nozzle A71-28758

DEPOSITION

Carbon deposition rates in gas turbine engine combustion chambers with airstream-mechanical propellant atomization A71-28970

DERIVATION

Least squares method and iteration technique for obtaining aerodynamic stability derivatives N71-24703

DESCENT

En route aircraft flap control during descent and holding [ARB-TN-99] N71-24920

DETECTORS

Precipitation detector and mechanism for stopping and restarting machinery at initiation and cessation of rain [NASA-CASE-XLA-2619] N71-26334

DH 121 AIRCRAFT

Trident aircraft autopilot for automatic landings in blind conditions, discussing operational problems A71-29261

DIAPHRAGMS (MECHANICS)

Altimeter-airspeed and Mach number pressure transducer with diaphragm free of temperature and vibration effects A71-30322

DIFFUSION THEORY

Diffusion and thermal mechanism ignition theories, applying to altitude relighting of gas turbine engine combustors A71-28745

DIGITAL COMPUTERS

Multistage axial flow compressors on digital computer, testing gas dynamic design in final adjustment phase A71-28584

Wind tunnel model trajectory simulation system with closed loop control by digital computer, describing instrumentation, system servoamplifiers and testing procedures A71-30334

Maastricht Automatic Data Processing and Display ATC system with digital computers for aiding controllers in issuing instructions and making decisions A71-30383

Inertial navigation systems improvements for commercial air transportation, noting digital computer program revision and increased functional capability [SAE PAPER 710458] A71-30534

AN/ASN-86 inertial navigation system consisting of inertial platform, digital computer and control indicator [AHS PREPRINT 533] A71-31094

DIGITAL SYSTEMS

Integrated flight test data system combining digital airborne data acquisition/recording system with telemetry/microwave link to computerized ground station A71-30318

Microstrip p-i-n diode controlled I band digital phase shifter for aircraft-satellite communication A71-31055

DIODES

Microstrip p-i-n diode controlled I band digital phase shifter for aircraft-satellite communication A71-31055

DIRECTIONAL CONTROL

Flight evaluations using variable stability aircraft to determine effects of turbulence induced aerodynamic disturbances and lateral directional dynamics on pilot performance [NASA-CR-1718] N71-26170

DISPLAY DEVICES

V/STOL aircraft instruments, deck display and automatic flight controls for takeoff and landing operation A71-29132

ATC radar display systems mapping techniques using vectors and optical projections A71-30014

Concorde SST flight test equipment installation with PCM recording and visual instruments A71-30055

Maastricht Automatic Data Processing and Display ATC system with digital computers for aiding controllers in issuing instructions and making decisions A71-30383

Area navigation system based on radio aids by airborne receivers and sensors for aircraft movement improvement, noting advantages of pilot displays [SAE PAPER 710457] A71-30533

DO-31 AIRCRAFT

Commercial V/STOL and jet VTOL transport, discussing Do-31 test results, landing approach, air traffic control automation and electronic control A71-29131

DOPPLER NAVIGATION

Air navigation techniques history, considering radio, radar, loran Doppler and inertial navigation A71-30712

DOPPLER RADAR

Airborne Doppler radar receiver transmitter failure testing by Versatile Avionics Shop Test computer controlled system A71-28778

DORNIER AIRCRAFT

Rotary wing structural stability of Dornier high temperature gas jet helicopter N71-24387

DOWNWASH

Numerical evaluation of downwash integral for wing loading of lifting rectangular planform [NPL-MA-90] N71-24483

DRAG

Unsteady hypersonic self similar gas flow and drag on circular cone accelerated according to power law, using small perturbation theory A71-29205

Supercavitating flow past straight cascade with arbitrary blade shapes, considering lift and drag coefficients, cavitation number, cavity shape and exit flow conditions [ASME PAPER 71-FE-6] A71-29448

Pressure distribution and drag prediction over slender axisymmetric fuselages and afterbodies and exhaust nozzles at transonic Mach numbers [AIAA PAPER 71-720] A71-30771

DRAG MEASUREMENT

Ballistic wind tunnel for drag measurement on models during free flight at supersonic speeds A71-29201

DRAG REDUCTION

Minimizing drag and increasing performance of optimum shapes at hypersonic flight N71-24704

DRILLING

Automated orifice drilling optimal treatment routines, including proper timing and adequate total depth allowance A71-28941

DROP SIZE

Optical measurement of sprays mean droplet size, assessing operating variables effect on air-blast atomizer characteristics A71-28756

DUCTED FANS

Acoustic linings for attenuation of fan generated noise in turbofan engines, considering interaction between analytical lining performance prediction and flow duct testing
[AIAA PAPER 71-731] A71-30778

DUCTED FLOW

Friction factor for low Reynolds number turbulent flow in large aspect ratio rectangular ducts, comparing Blasius and Prandtl relations
[ASME PAPER 71-FE-A] A71-29378

Acoustic linings for attenuation of fan generated noise in turbofan engines, considering interaction between analytical lining performance prediction and flow duct testing
[AIAA PAPER 71-731] A71-30778

DYNAMIC CHARACTERISTICS

Nonlinear mathematical model for dynamical behavior of extensible towing cable subjected to aerodynamic forces generated by uniform flow field, discussing system stability
A71-31026

DYNAMIC MODELS

Analytical model of compressor sensitivity to transient and distorted transient flows, considering inlet duct, compressor stages and combustor up to turbine nozzles
[AIAA PAPER 71-670] A71-30734

DYNAMIC RESPONSE

Aircraft with T tail configuration, examining dynamic response to lateral gusts
A71-29786

Alleviation of lateral and longitudinal gust effects on aircraft
N71-24709

Pressure sensor network for measuring liquid dynamic response in flight including fuel tank acceleration, liquid slosh amplitude, and fuel depth monitoring
[NASA-CASE-XLA-05541] N71-26387

DYNAMIC STABILITY

Propulsion, guidance and stability of ground effect vehicle with perimetric Coanda fluid boundary
A71-29308

High rotor advance ratio from multiblade general coordinates method in linear analysis of lifting rotor dynamic stability and gust ratio
[AHS PREPRINT 512] A71-31083

DYNAMIC TESTS

Dynamic testing - Conference, London, January 1971
A71-30053

Conference on fatigue life in helicopter components
[DLR-MITT-70-01] N71-24385

Dynamic tests of helicopter components
N71-24388

Structural stability tests of helicopter components
N71-24390

E**EARTH ATMOSPHERE**

Description of method for determining visibility in earth atmosphere
[AD-719502] N71-24375

EARTH SURFACE

Jet aircraft sound spectrum on ground and in air, comparing calculation with experiment
A71-30524

ECONOMIC ANALYSIS

Airport terminal building design and construction, noting economy and expansibility corequirements
[SAE PAPER 710418] A71-28307

Economic analysis of subsonic transport airplane design, evaluation and operation
[SAE PAPER 710423] A71-28310

ECONOMICS

Aircraft jet engines technological progress review over past 25 years, emphasizing industry economics considerations
A71-30303

EJECTION SEATS

Tractor rocket actuated Yankee escape system, discussing advantages of pulling action over conventional pushed ejection seat under low speed low altitude conditions
A71-29383

Ejection system performance in relation to aircraft performance dependent extreme flight conditions, examining ejection seat design features and trajectories
A71-29385

EJECTORS

High entrainment constant area multiple nozzle ejectors with two mixing tube lengths for boundary layer control, estimating performance with analytical model
[ASME PAPER 71-FE-34] A71-29469

ELECTRIC EQUIPMENT

Soviet handbook of aircraft electrical equipment covering DC and turbine powered generators, lubrication materials, electromagnetic interference countermeasures, etc
A71-29530

ELECTRIC GENERATORS

STOL aircraft electric power variable frequency generation and high voltage DC distribution with secondary square wave AC distribution
[SAE PAPER 710444] A71-28325

Soviet book on airplane and helicopter electrical power supply systems covering storage batteries, DC generators, alternators, voltage regulators, current and frequency control, etc
A71-29525

ELECTRIC POWER

STOL aircraft electric power variable frequency generation and high voltage DC distribution with secondary square wave AC distribution
[SAE PAPER 710444] A71-28325

ELECTRIC POWER TRANSMISSION

Soviet book on airplane and helicopter electrical power supply systems covering storage batteries, DC generators, alternators, voltage regulators, current and frequency control, etc
A71-29525

ELECTRIC RELAYS

Plug-in relay hazards and minimization for aircraft flight safety applications
A71-28841

ELECTRICAL PROPERTIES

Electrical and physical nature of microbial membranes implicated in aircraft fuel quantity probe malfunction
[SAE PAPER 710439] A71-28321

ELECTROMAGNETIC ABSORPTION

Tropospheric and ionospheric absorption at VHF for North Atlantic aeronautical satellite system
[NASA-TM-X-65507] N71-24914

ELECTROMAGNETIC INTERFERENCE

Soviet handbook of aircraft electrical equipment covering DC and turbine powered generators, lubrication materials, electromagnetic interference countermeasures, etc
A71-29530

ELECTROMAGNETIC RADIATION

Hot jet aerodynamic parameters from emissions of electromagnetic and acoustic energies by crossed beam IR probing
A71-30520

ELECTRONIC CONTROL

Multiple planar Luneberg lens circular array for airborne electronically scanned X band narrow beam antenna mounted under aircraft nose or fuselage
A71-31038

High speed electronic phase and frequency scanned linear, static fed and monopulse arrays element and angular error analysis
A71-31049

ELECTRONIC EQUIPMENT

Interference prediction model for evaluating expected interactions between avionics equipment on aircraft
[AD-718997] N71-24357

ELECTRONIC EQUIPMENT TESTS

Airborne Doppler radar receiver transmitter failure testing by Versatile Avionics Shop Test computer controlled system
A71-28778

ELECTRONIC MODULES

Low carrier power aircraft antenna module for airborne UHF communications system, considering range/field strength measurements
A71-31046

ELEVATORS (CONTROL SURFACES)

Sailplane elevator induced maneuvering and

- horizontal tail surface loads, discussing
airworthiness requirements A71-29256
- ELEVONS**
Elevons as longitudinal and lateral control
elements on low aspect ratio wings, calculating
subsonic and supersonic aerodynamic
characteristics A71-29190
- ELLIPTICITY**
Elliptical cones at large angle of attack,
calculating three-component real gas properties
effects on aerodynamic characteristics A71-29191
- EMISSION SPECTRA**
Complex noise emission spectra from superposition
of continuous component and peaks, calculating
level separations due to perfectly reflecting
plane A71-30523
- ENERGY DISSIPATION**
Air bypass behind compressor into variable area
exhaust nozzle, obtaining energy losses from gas
turbine jet engine indices A71-28586
- ENERGY DISTRIBUTION**
Energy state approximation and supersonic aircraft
minimum fuel fixed range trajectory
optimization, noting not convex velocity set
A71-30609
- ENERGY SOURCES**
Hot jet aerodynamic parameters from emissions of
electromagnetic and acoustic energies by crossed
beam IR probing A71-30520
- ENGINE DESIGN**
VTOL propulsion, discussing gas turbine pressure
ratio inlet temperature and lifting and high
bypass fans A71-27838
- Olympus 593 pure jet twin shaft engine development
program for Concorde, discussing engine
evolution, design considerations and flight
development [SAE PAPER 710422] A71-28309
- High temperature aircraft gas turbine engine
design, discussing developments in manufacturing
processes, materials, cooling techniques,
aerodynamic and mechanical design improvements
[SAE PAPER 710462] A71-28335
- STOL aircraft/engine integrated systems for medium
distance air transportation, discussing tradeoff
factors involving performance, noise, weight and
cost [SAE PAPER 710469] A71-28337
- Subsonic and supersonic turbojet aircraft engines
development, discussing design, operation,
reliability, weight, fuel consumption and cost
A71-29811
- Aircraft jet engines technological progress review
over past 25 years, emphasizing industry
economics considerations A71-30303
- Transport aircraft JT9D high bypass ratio engine
development, noting maintainability and
stability improvements [SAE PAPER 710419] A71-30527
- Aircraft JT9D engine development for airline
operation, discussing construction, condition
monitoring, maintenance, noise and smoke
reduction [SAE PAPER 710434] A71-30528
- Design interface requirements for optimal aircraft
engine condition monitoring system, using
parameter, vibration, oil, borescope and
radiography analysis [SAE PAPER 710447] A71-30531
- Space shuttle airbreathing propulsion systems
requirements and design studies, considering
cruise, landing, go-around and ferry
capabilities [AIAA PAPER 71-662] A71-30731
- Fundamentals of aircraft gas turbine engines
[AD-719913] N71-25808
- Aircraft gas turbine combustion chamber design
[NAL-TR-208] N71-26298
- Analysis of first stage turbine stator vane and
rotor blade cooling designs for application in
highspeed aircraft
- [NASA-TM-X-1782] N71-26355
- ENGINE INLETS**
Aircraft propulsion system testing, stressing
noise reduction and inlet-engine exhaust system
compatibility [SAE PAPER 710450] A71-28328
- HF rake probes with high temperature integrated
sensor for inflight aircraft engine intake air
flow distortion measurements A71-30321
- Engine surge pressure transients in mixed-
compression supersonic inlet, describing scale
wind tunnel model simulation and measurement
techniques [AIAA PAPER 71-671] A71-30735
- ENGINE MONITORING INSTRUMENTS**
Gas turbine auxiliary power unit accessories,
discussing high energy igniters, cables and
connectors, thermocouples and speed and
temperature monitoring equipment A71-29262
- Design interface requirements for optimal aircraft
engine condition monitoring system, using
parameter, vibration, oil, borescope and
radiography analysis [SAE PAPER 710447] A71-30531
- Boeing 747 aircraft integrated data system program
for reducing engine maintenance and operating
costs [AIAA PAPER 71-648] A71-30725
- Engine condition monitoring systems, discussing
engineering design requirements with respect to
accessibility, accuracy, economics,
effectiveness, reliability and maintainability
[AIAA PAPER 71-652] A71-30728
- ENGINE NOISE**
Absorbent materials for sound attenuation in
turboreactor ducts, examining flow velocity,
absorbent structure and cladding effects A71-30518
- ENGINE PARTS**
Vacuum heat treatment of brazed and diffusion
bonded jet engine components near melting
temperature A71-28145
- Silicide coated Nb alloys for gas turbine engine
components operating at temperatures above 2000
F [SAE PAPER 710460] A71-28334
- Metal coated superalloys evaluation for gas
turbine engine components, including corrosion,
impact and fatigue tests A71-29635
- ENGINE STARTERS**
Gas turbine engine startup igniter with modified
propellant atomizer enhanced by air injection
A71-28969
- Motor starting techniques for 2-15 kW Brayton
space power system [NASA-TM-X-67819] N71-24691
- ENGINE TESTS**
Supersonic inlet turbojet engine compatibility
tests in wind tunnels, using light panels and
Summation Device analysis A71-28032
- CF6 turbofan engine development, discussing
performance and endurance tests and design
changes for reliable low cost operation
[SAE PAPER 710421] A71-28308
- Commercial aircraft powerplant development,
discussing engine and components test programs
and techniques [SAE PAPER 710449] A71-28327
- Aircraft propulsion system testing, stressing
noise reduction and inlet-engine exhaust system
compatibility [SAE PAPER 710450] A71-28328
- Airline engine performance testing from operator
perspective, using automated test cell data
acquisition system [SAE PAPER 710451] A71-28329
- Miniature transducers design and fabrication for
fluctuating pressure measurements in jet engine
testing, noting frequency response and power
dissipation A71-30324
- Fluctuating pressure measurements in jet engine
testing, using miniature transducers with
calibration and data acquisition equipment

- Low cost go/no-go portable aircraft engine tester connected to engine mounted sensors A71-30325
- Gas turbine engine condition analysis by digital computer and fault isolation techniques [SAE PAPER 710448] A71-30327
- Wind tunnel force test program design for jet aircraft configurations, including propulsion system simulation A71-30532
- ENVIRONMENTAL CONTROL
Performance of aircraft environmental control systems under simulated tactical conditions [AD-719101] A71-30605 N71-24461
- ENVIRONMENTAL TESTS
Fincap communication antennas design and environmental tests for vibration, acceleration, waterproofing, salt corrosion, ice formation and compass safe distance A71-31047
- Test procedures for aircraft defogger/defroster equipment [AD-719109] N71-24452
- EQUILIBRIUM METHODS
Nonlinear panel flutter analyses by perturbation and harmonic balance methods [NASA-CR-111907] N71-25362
- EQUIPMENT SPECIFICATIONS
Development and characteristics of scanning systems for thermal viewers and infrared detectors for airborne operation [AD-719854] N71-25053
- ERROR ANALYSIS
Measurement errors in testing single stage air driven axial flow compressors and turbines A71-28582
- High speed electronic phase and frequency scanned linear, static fed and monopulse arrays element and angular error analysis A71-31049
- ESCAPE ROCKETS
Tractor rocket actuated Yankee escape system, discussing advantages of pulling action over conventional pushed ejection seat under low speed low altitude conditions A71-29383
- ESCAPE SYSTEMS
Tractor rocket actuated Yankee escape system, discussing advantages of pulling action over conventional pushed ejection seat under low speed low altitude conditions A71-29383
- Ejection system performance in relation to aircraft performance dependent extreme flight conditions, examining ejection seat design features and trajectories A71-29385
- ESRO SATELLITES
Scientific results from ESRO satellites and from sounding rocket campaign including aeronautical fields, management planning, satellite development, and telecommunication - 1969 report N71-24447
- EVALUATION
Procedures for evaluating compatibility of aviation materiel with related equipment [AD-719107] N71-24457
- EVASIVE ACTIONS
Performance of aircraft environmental control systems under simulated tactical conditions [AD-719101] N71-24461
- EXHAUST GASES
Visible exhaust smoke trails from aircraft jet engines, measuring optical density by photographic photometry [SAE PAPER 710428] A71-28314
- Chemical kinetic calculation of nitric oxide formation in spark ignition automobile engines and gas turbine combustors A71-30454
- Wind tunnel investigation of jets exhausting into cross flow - description and data analysis [AD-718122] N71-24492
- EXHAUST NOZZLES
Air bypass behind compressor into variable area exhaust nozzle, obtaining energy losses from gas turbine jet engine indices A71-28586
- Optimal penetration effect on peripheral gas flow temperature field at outlet of turbine combustion chamber with circular flame tubes A71-28971
- High entrainment constant area multiple nozzle ejectors with two mixing tube lengths for boundary layer control, estimating performance with analytical model [ASME PAPER 71-FE-34] A71-29469
- Airframe installation effects on underwing nacelle nozzle performance, using calibrated engines and load cells on F-106 for measurements [AIAA PAPER 71-681] A71-30745
- Isolated axisymmetric jet engine exhaust nozzles thrust and drag predictions in sub-, trans- and supersonic flight regimes [AIAA PAPER 71-719] A71-30770
- Pressure distribution and drag prediction over slender axisymmetric fuselages and afterbodies and exhaust nozzles at transonic Mach numbers [AIAA PAPER 71-720] A71-30771
- EXHAUST SYSTEMS
Aircraft propulsion system testing, stressing noise reduction and inlet-engine exhaust system compatibility [SAE PAPER 710450] A71-28328
- EXPERIMENTAL DESIGN
Wind tunnel force test program design for jet aircraft configurations, including propulsion system simulation A71-30605
- EXTREMUM VALUES
Cumulative frequency distributions determined by extreme value analysis used for fatigue analysis and interpretation of c.g. vertical acceleration and gust velocity measured on transport aircraft [AGARD-R-579-71] N71-25080

F

F-104 AIRCRAFT

Minimum time profiles for F-104 aircraft by Balakrishnan epsilon technique, comparing solutions with energy method A71-28831

FABRICATION

Materials and processing methods for rain erosion resistant ceramic coated plastic structures for supersonic aircraft, considering fiberglass reinforced polyimide radomes with alumina coating A71-29645

Miniature transducers design and fabrication for fluctuating pressure measurements in jet engine testing, noting frequency response and power dissipation A71-30324

FAIL-SAFE SYSTEMS

Fail-safe helicopter rotor control design, discussing damage tolerant components, redundant system, failure warning and maintenance [AHS PREPRINT 550] A71-31102

Integral spar inspection system for making CH-46 rotor blade fail-safe [AHS PREPRINT 551] A71-31103

FAILURE ANALYSIS

Airborne Doppler radar receiver transmitter failure testing by Versatile Avionics Shop Test computer controlled system A71-28778

Structure service life and storage failure probability calculation with current load measurements and laboratory fatigue testing A71-29231

Gas turbine engine condition analysis by digital computer and fault isolation techniques [SAE PAPER 710448] A71-30532

FAILURE MODES

Helicopter power transmission failure modes, presenting field experiences correlation with conventional design stress analysis and bench test data [SAE PAPER 710454] A71-28331

FATIGUE (MATERIALS)

Cumulative frequency distributions determined by extreme value analysis used for fatigue analysis and interpretation of c.g. vertical acceleration and gust velocity measured on transport aircraft [AGARD-R-579-71] N71-25080

- Fatigue and fracture mechanics of airframes and materials including structural design and stress analysis techniques
[AD-719756] N71-25092
- FATIGUE LIFE**
- Artificial corrosion pits effect on fatigue durability of smooth samples and aircraft duraluminum skin elements A71-27819
- Aircraft design and fatigue life monitoring, investigating effects of gust velocity frequency distribution in patches of atmospheric turbulence A71-29789
- Conference on fatigue life in helicopter components [DLR-MITT-70-01] N71-24385
- Fatigue life of helicopter rotary wings under vibrational stresses N71-24386
- FATIGUE TESTS**
- Structure service life and storage failure probability calculation with current load measurements and laboratory fatigue testing A71-29231
- Structural fatigue in aircraft design, discussing twin engine transport tests, crack propagation rate, residual strength, etc A71-29434
- Metal coated superalloys evaluation for gas turbine engine components, including corrosion, impact and fatigue tests A71-29635
- Pisa University Aeronautical Institute activities /1960-1970/, considering supersonic and subsonic flow research, thin stiffened shells fatigue under compressive or tensile loads, etc A71-30822
- FEEDBACK CONTROL**
- Wind tunnel model trajectory simulation system with closed loop control by digital computer, describing instrumentation, system servoamplifiers and testing procedures A71-30334
- VTOL aircraft minimum climb-to-cruise time transition optimal open loop and suboptimal closed loop control synthesis A71-30799
- FILM COOLING**
- Annular vaporizing combustion chamber with film cooling, determining flame temperature under supersonic flight conditions A71-28749
- Data correlation and effectiveness prediction from film cooling injection geometries, considering finitely thick slot lip and boundary layers A71-28751
- FINITE DIFFERENCE THEORY**
- Finite difference method for calculating inviscid flow field around supersonic/hypersonic space shuttle N71-26056
- FIRE CONTROL**
- Cheyenne attack helicopter weapons system, discussing night vision capability, armament, fire control and navigation equipment integration [AHS PREPRINT 530] A71-31091
- Weapons delivery computer for attack helicopters, using planar distributed function generator for general closed form instantaneous solution capability [AHS PREPRINT 531] A71-31092
- FIRE PREVENTION**
- Concorde power plant fire protection system, describing prototype engine bay overheat detection system and additional UV optical fire detection system A71-30300
- FISSION PRODUCTS**
- Studying aircraft accidents to determine impact angle and speed criteria for designing nuclear airplane fission product containment vessel [NASA-TN-X-2245] N71-25411
- FLAME TEMPERATURE**
- Annular vaporizing combustion chamber with film cooling, determining flame temperature under supersonic flight conditions A71-28749
- FLAPS (CONTROL SURFACES)**
- Direct lift control system having flaps with slots adjacent to their leading edge and particularly adapted for lightweight aircraft [NASA-CASE-LAR-10249-1] N71-26110
- FLAT PLATES**
- Asymptotic limiting viscous flow pattern and drag on flat plate with stationary separation zones at large Reynolds numbers A71-29204
- Skin friction drag and velocity profile measurements on flat plate in two phase circular pipe flow in subsonic wind tunnel for gas-solid media, using photographic technique [ASME PAPER 71-FE-32] A71-29467
- Turbulent skin friction and heat transfer prediction on flat plates and wind tunnel walls at supersonic and hypersonic Mach numbers, using Van Driest theory A71-29868
- Low speed wind tunnel test of four ft diameter circular plate model to determine surface static pressure distributions for jet decay characteristics of cross flow [AD-720232] N71-26516
- Low speed wind tunnel test of four ft diameter circular plate model with three exhausting jets [AD-720233] N71-26517
- FLEXIBILITY**
- Helicopter rotor stall characteristics, investigating blade flexibility, unsteady aerodynamics and variable inflow effects [AHS PREPRINT 520] A71-31086
- FLEXIBLE BODIES**
- Random process theory method for estimating response of flexible airplanes to atmospheric turbulence N71-24708
- FLIGHT**
- Flow meter for measuring stagnation pressure in boundary layer around high speed flight vehicle [NASA-CASE-XFR-02007] N71-24692
- FLIGHT ALTITUDE**
- Jet transport aircraft design for safety under air turbulence conditions, considering cruise altitude limitations and pitch and g excursion reduction by special autopilot mode A71-29777
- FLIGHT CHARACTERISTICS**
- Aircraft flight characteristics dependence on angle of attack, roll and pitch A71-29043
- Flight characteristics under atmospheric turbulence conditions, analyzing analog trace records of airspeed, normal acceleration, altitude, air temperature, control surface and flight attitude parameters A71-29771
- Forward flight performance of coaxial rigid rotor in NASA wind tunnel, comparing to aerodynamic stability with conventional rotors [AHS PREPRINT 524] A71-31090
- FLIGHT CONDITIONS**
- Flight characteristics under atmospheric turbulence conditions, analyzing analog trace records of airspeed, normal acceleration, altitude, air temperature, control surface and flight attitude parameters A71-29771
- FLIGHT CONTROL**
- L-1011 aircraft flying stabilizer, discussing choice of longitudinal flight control systems [SAE PAPER 710426] A71-28312
- VTOL aircraft minimum climb-to-cruise time transition optimal open loop and suboptimal closed loop control synthesis A71-30799
- Heavy lift helicopter flight control system design, emphasizing fly by wire electrical analog [AHS PREPRINT 503] A71-31079
- Jet vertical takeoff aircraft piloted cockpit simulator for controlling aircraft flight performance [ARC-R/M-3647] N71-25065
- FLIGHT CREWS**
- DC 10 flight crew individualized ground training program, emphasizing hands-on equipment and instruction hardware

SUBJECT INDEX

FLOW EQUATIONS

- [SAE PAPER 710472] A71-30538
FLIGHT HAZARDS
 Materials and structural design development by high velocity impact testing due to transport and subsonic military aircraft susceptibility to bird collision damage
- A71-29642
FLIGHT INSTRUMENTS
 Onboard area navigation systems in ATC environment, discussing route structure and flight instruments
 [SAE PAPER 710455] A71-28332
- FLIGHT LOAD RECORDERS**
 Aircraft flight load measurements in high temperature environment, determining optimal strain gage installation and calibration
 A71-30681
- FLIGHT PATHS**
 V/STOL aircraft flight path and attitude controls in turbulence, discussing design based on state variable methods of control theory
 A71-29776
- High intensity neon flashtube lights for increasing conspicuity of trainer helicopters during daytime and nighttime flights
 [AD-718639] N71-24669
- FLIGHT PLANS**
 French ATC, discussing automatic coordinator systems, computer utilization and flight plan data processing
 A71-30382
- FLIGHT SIMULATION**
 V/STOL aircraft gust effects prediction with mathematical models based on nonlinear hybrid simulation at takeoff and landing altitudes
 A71-29775
- Computerized simulation techniques for investigating aircraft accidents due to atmospheric turbulence
 A71-29779
- FLIGHT SIMULATORS**
 Visual flight simulation devices, considering high resolution photographic films and digital memories
 A71-29483
- FLIGHT STABILITY TESTS**
 Evaluation of helicopter flight loading and structural stability
 N71-24389
- Flight evaluations using variable stability aircraft to determine effects of turbulence induced aerodynamic disturbances and lateral directional dynamics on pilot performance
 [NASA-CR-1718] N71-26170
- FLIGHT TESTS**
 Yak 40 aircraft flight test program, discussing airworthiness requirements, static structural, vibration and wind tunnel tests
 A71-29911
- Concorde SST flight test equipment installation with PCM recording and visual instruments
 A71-30055
- Integrated flight test data system combining digital airborne data acquisition/recording system with telemetry/microwave link to computerized ground station
 A71-30318
- Airborne integrated data system capabilities based on flight tests with commercial aircraft
 A71-30319
- High performance UH-1 compound helicopter high speed flight research, considering rotor loads, stability, control and flying qualities
 [AHS PREPRINT 570] A71-31111
- Evaluation of fuel flowmeter instrumentation conducted during flight tests
 [AD-719280] N71-24479
- Flight tests for controlling slope approach of short takeoff aircraft
 [ARC-CP-1138] N71-25050
- Comparison of pilot performance using center stick, dual side stick, and single side stick configuration
 [AD-720846] N71-25846
- FLIGHT TIME**
 Minimum time profiles for F-104 aircraft by Balakrishnan epsilon technique, comparing solutions with energy method
 A71-28831
- STOL vehicle and systems air transportation expansion by reducing trip time, congestion, noise exposures and pollution for DOT, DOD and NASA roles
 [SAE PAPER 710464] A71-30535
- FLIGHT TRAINING**
 Boeing 747 crew members training program, describing ground training, classrooms, inertial navigation system and cockpit trainers
 [SAE PAPER 710473] A71-28339
- Commercial airlines flight training program, using simulation and improved techniques for safety and economy
 [SAE PAPER 710475] A71-28340
- DC 10 flight crew individualized ground training program, emphasizing hands-on equipment and instruction hardware
 [SAE PAPER 710472] A71-30538
- FLOW CHARACTERISTICS**
 Air flow past small aspect ratio thick-section wing at small angles of attack, investigating vortex system effect on flow characteristics in absence of lift
 A71-29234
- Helicopter rotor stall characteristics, investigating blade flexibility, unsteady aerodynamics and variable inflow effects
 [AHS PREPRINT 520] A71-31086
- Transonic wind tunnel investigation of flow characteristics and pressure fluctuation of space shuttle launch and reentry configurations
 N71-24663
- FLOW DEFLECTION**
 Two dimensional jet flap cascades, presenting stream deflection angles as function of jet to mainstream momentum flux
 [ASME PAPER 71-FE-14] A71-29453
- FLOW DISTORTION**
 HF rake probes with high temperature integrated sensor for inflight aircraft engine intake air flow distortion measurements
 A71-30321
- Time variant distortions in supersonic inlet on J-85-GE-13 turbojet engine from wind tunnel test, considering instantaneous distortion amplitudes and contours
 [AIAA PAPER 71-667] A71-30733
- FLOW DISTRIBUTION**
 Asymptotic limiting viscous flow pattern and drag on flat plate with stationary separation zones at large Reynolds numbers
 A71-29204
- Stratospheric air flow patterns and CAT measurements onboard aircraft over and downwind of Western U.S. mountain terrain
 A71-29755
- Flowfield production by fluid injection into supersonic crossflow, occurring with liquid/gas jet control of vehicle with combustion ramjets
 [AIAA PAPER 71-728] A71-30775
- Hypersonic flow pattern past windward side of delta wing with supersonic leading edges, joining potential and vortex regions behind shock wave
 A71-30874
- Nonlinear mathematical model for dynamical behavior of extensible towing cable subjected to aerodynamic forces generated by uniform flow field, discussing system stability
 A71-31026
- Flow field velocity distribution at rotating wing devices tip vortices
 [AHS PREPRINT 522] A71-31088
- Wind tunnel simulations of flow fields and aerothermodynamics of space shuttle orbiters
 N71-26053
- Finite difference method for calculating inviscid flow field around supersonic/hypersonic space shuttle
 N71-26056
- Flow visualization, thermocouple measurements, and analyses of shock interference heating effects on straight wing space shuttle model
 N71-26057
- FLOW EQUATIONS**
 Axisymmetrical three component flow equations for incompressible viscous fluid in cylinder with rotating disk
 A71-30855

FLOW MEASUREMENT

SUBJECT INDEX

- FLOW MEASUREMENT** A71-31021
 Monograph on hypersonic shock tunnel supersonic combustion research techniques covering test facilities, optical and electromagnetic flow measurement methods, etc A71-29578
- Supersonic mass flux probe description, discussing inlet geometry, angle of attack and Reynolds and Mach numbers effects on performance A71-29925
- Flow measurement of Nonweiler delta wing in hypersonic slip flow [DLR-FB-70-46] N71-24500
- FLOW THEORY**
 Monograph on potential flow interaction between blade rows in axial flow compressors covering mathematical model, numerical analysis and experiment A71-28883
- Unsteady curvilinear motion of lifting surface, calculating induced gas flow velocities in terms of vortex densities A71-29188
- Propeller vortex theory, calculating vortex streets pitch distributions and wake configuration A71-30443
- FLOW VELOCITY**
 Aerofoil cascades with axial velocity change in incompressible flow, determining turbine blade force dependence on circulation A71-28467
- Unsteady curvilinear motion of lifting surface, calculating induced gas flow velocities in terms of vortex densities A71-29188
- Skin friction drag and velocity profile measurements on flat plate in two phase circular pipe flow in subsonic wind tunnel for gas-solid media, using photographic technique [ASME PAPER 71-FE-32] A71-29467
- Flow field velocity distribution at rotating wing devices tip vortices [AHS PREPRINT 522] A71-31088
- FLOW VISUALIZATION**
 Turbulence level effects on mixing of three plane parallel slipstreams with equal velocities and temperature from smoke visualization A71-28962
- Helicopter rotor vortex system and induced velocity field for various angles of attack, flight conditions and unit loads, using smoke visualization technique A71-29235
- Angle of incidence effect on delta wing leading-edge vortices with cross flow visualization in hydraulic test tunnel [ARC-R/M-3645] N71-24482
- FLOWMETERS**
 Evaluation of fuel flowmeter instrumentation conducted during flight tests [AD-719280] N71-24479
- Flow meter for measuring stagnation pressure in boundary layer around high speed flight vehicle [NASA-CASE-XFR-02007] N71-24692
- FLUID BOUNDARIES**
 Propulsion, guidance and stability of ground effect vehicle with perimeteric Coanda fluid boundary A71-29308
- FLUID INJECTION**
 Flowfield production by fluid injection into supersonic crossflow, occurring with liquid/gas jet control of vehicle with combustion ramjets [AIAA PAPER 71-728] A71-30775
- FLUIDICS**
 Fluidic cabin pressure automatic control systems for military and civil aircraft, discussing design, operation and performance A71-30308
- FLUTTER ANALYSIS**
 Supersonic flutter analysis of clamped skew panels with in-plane forces by Galerkin method. using two dimensional static approximation for aerodynamic loading A71-30607
- Mechanical support system role in determination of aeroelastic stability of leeward cylinder immersed in wake using undamped flutter theory
- FLY BY WIRE CONTROL**
 Heavy lift helicopter flight control system design, emphasizing fly by wire electrical analog [AHS PREPRINT 503] A71-31079
- FLYING PLATFORMS**
 Geomagnetic components measurement from moving platforms, discussing coordinate system stabilization methods for errorless time averaging of measurements A71-28249
- FORCED CONVECTION**
 Flow direction effect on combined forced and free convective heat transfer from cylinders to air A71-28985
- FRACTURE MECHANICS**
 Fatigue and fracture mechanics of airframes and materials including structural design and stress analysis techniques [AD-719756] N71-25092
- FREDHOLM EQUATIONS**
 Hypersonic flow around delta wing at small angles of attack, using pressure sources method and Fredholm integral equation A71-29189
- FREE BOUNDARIES**
 Air inlet for simulation of shock wave separated flow in supersonic diffusers, deriving pressure variation profile along free boundary A71-29175
- FREE CONVECTION**
 Flow direction effect on combined forced and free convective heat transfer from cylinders to air A71-28985
- FREE FLIGHT**
 Ballistic wind tunnel for drag measurement on models during free flight at supersonic speeds A71-29201
- FREE MOLECULAR FLOW**
 Photoelectric, bolometric and photographic recording assembly for measurement of light pressure and aerodynamic forces on complex shape body in free molecular flow A71-29155
- Aerodynamic characteristics similarity and variation in hypersonic flow transition region from free molecular flow to solid medium A71-29172
- FREE RADICALS**
 Temperature and radical concentration measurements for high temperature flowing gas streams in rig simulating conditions in ramjet combustion chamber and nozzle A71-28758
- FREQUENCY ASSIGNMENT**
 Survey of very high and ultrahigh frequency utilization in US aeronautics for communication satellite frequency assignment [NASA-TM-X-65527] N71-25920
- FREQUENCY DISTRIBUTION**
 Aircraft design and fatigue life monitoring, investigating effects of gust velocity frequency distribution in patches of atmospheric turbulence A71-29789
- Cumulative frequency distributions determined by extreme value analysis used for fatigue analysis and interpretation of c.g. vertical acceleration and gust velocity measured on transport aircraft [AGARD-R-579-71] N71-25080
- FREQUENCY RESPONSE**
 Frequency response of five component strain gage oscillating balance for dynamic wind tunnel stability testing A71-30333
- FREQUENCY SCANNING**
 High speed electronic phase and frequency scanned linear, static fed and monopulse arrays element and angular error analysis A71-31049
- FRICTION DRAG**
 Skin friction drag and velocity profile measurements on flat plate in two phase circular pipe flow in subsonic wind tunnel for gas-solid media, using photographic technique [ASME PAPER 71-FE-32] A71-29467
- FRICTION FACTOR**
 Friction factor for low Reynolds number turbulent

- flow in large aspect ratio rectangular ducts, comparing Blasius and Prandtl relations
[ASME PAPER 71-FE-A] A71-29378
- FUEL COMBUSTION**
Kerosene type fuels for aircraft gas turbine engines, discussing combustion problems, smoke emission reduction and bacterial or fungal contamination A71-28754
- FUEL CONSUMPTION**
Jet-supported VTOL aircraft fuel-time-optimal landing control, using mathematical model, Pontryagin maximum principle and analog computer solution A71-29281
Subsonic and supersonic turbojet aircraft engines development, discussing design, operation, reliability, weight, fuel consumption and cost A71-29811
- FUEL CONTAMINATION**
Microbiological contamination of jet aircraft fuel tanks in tropical regions, considering maintenance [SAE PAPER 710438] A71-28320
Kerosene type fuels for aircraft gas turbine engines, discussing combustion problems, smoke emission reduction and bacterial or fungal contamination A71-28754
- FUEL CONTROL**
Energy state approximation and supersonic aircraft minimum fuel fixed range trajectory optimization, noting not convex velocity set A71-30609
Turbine engine fuel control stability on CH-47C helicopter, using flight tests and lag damper simulation [AHS PREPRINT 560] A71-31107
- FUEL GAGES**
Electrical and physical nature of microbial membranes implicated in aircraft fuel quantity probe malfunction [SAE PAPER 710439] A71-28321
- FUEL INJECTION**
Gas-air mixture requirements for turbine and injection burner combustion efficiencies [AD-719834] N71-25359
- FUEL SYSTEMS**
Procedures for evaluating effectiveness of self propelled and portable ground servicing units for Army aircraft [AD-719102] N71-24459
Evaluation of fuel flowmeter instrumentation conducted during flight tests [AD-719280] N71-24479
- FUEL TANKS**
Microbiological contamination of jet aircraft fuel tanks in tropical regions, considering maintenance [SAE PAPER 710438] A71-28320
Pressure sensor network for measuring liquid dynamic response in flight including fuel tank acceleration, liquid slosh amplitude, and fuel depth monitoring [NASA-CASE-XLA-05541] N71-26387
- FUEL TESTS**
Fuel tests to determine feasibility of gelled methane for use in jet engine [NASA-CR-72876] N71-25772
- FUEL-AIR RATIO**
Gas-air mixture requirements for turbine and injection burner combustion efficiencies [AD-719834] N71-25359
- FUSELAGES**
Fuselage influence on total aircraft drag in subsonic passenger aircraft, considering high aspect ratio cylindrical fuselages A71-30821
- G**
- GAME THEORY**
German monograph on game theory and planning techniques for aircraft evaluation A71-28880
- GAMMA RAYS**
Nondestructive testing of aircraft structures using thulium and iridium gamma sources [JAERI-MEMO-4163] N71-24849
- GAS BEARINGS**
Time dependent clearance changes effects on aerodynamic characteristics of sectorially grooved gas bearings, describing lift and drag coefficients calculation A71-30227
- GAS COOLING**
Metal temperatures in rotating cooled gas turbine blades, discussing coolant flow aerodynamics A71-28748
- GAS DENSITY**
Hypersonic shock/density ratio effects in aerothermodynamic heating of space shuttle configuration N71-26058
- GAS FLOW**
Heat shield ablation under high enthalpy chemically active turbulent gas flow in hydrojet engine manifolds A71-28589
Gas turbine engine combustion chamber outlet, noting gas flow temperature field peripheral nonuniformity A71-28972
Three dimensional steady separated liquid and gas flows past low aspect ratio bodies, deriving similarity laws for reduction to two dimensional problem A71-29169
Heat transfer on spheres and sharp cones in rarefied hypersonic gas flow at zero angles of attack in wind tunnel vacuum A71-29176
Unsteady curvilinear motion of lifting surface, calculating induced gas flow velocities in terms of vortex densities A71-29188
Unsteady hypersonic self similar gas flow and drag on circular cone accelerated according to power law, using small perturbation theory A71-29205
Soviet book on experimental aerodynamics covering wind tunnels, shock tubes, liquid and gas physical properties, flow parameter measurement equipment, etc A71-29524
Vortical transonic gas flow over wing profile N71-25714
- GAS GENERATORS**
Afterburning turbofan engine thrust calculation by gas generator method, using F-111A for comparison tests [AIAA PAPER 71-680] A71-30744
- GAS INJECTION**
Gas turbine engine combustion chamber start-up and burning performance, considering air injection and propellant atomization A71-28968
Gas turbine engine startup igniter with modified propellant atomizer enhanced by air injection A71-28969
- GAS PRESSURE**
Fluidic cabin pressure automatic control systems for military and civil aircraft, discussing design, operation and performance A71-30308
- GAS STREAMS**
Temperature and radical concentration measurements for high temperature flowing gas streams in rig simulating conditions in ramjet combustion chamber and nozzle A71-28758
- GAS TEMPERATURE**
Gas temperature measurement in aircraft combustion chambers, using calorimetric probe A71-28757
- GAS TURBINE ENGINES**
VTOL propulsion, discussing gas turbine pressure ratio inlet temperature and lifting and high bypass fans A71-27838
Commercial aircraft powerplant development, discussing engine and components test programs and techniques [SAE PAPER 710449] A71-28327
Silicide coated Nb alloys for gas turbine engine components operating at temperatures above 2000 F [SAE PAPER 710460] A71-28334

- High temperature aircraft gas turbine engine design, discussing developments in manufacturing processes, materials, cooling techniques, aerodynamic and mechanical design improvements [SAE PAPER 710462] A71-28335
- Air bypass behind compressor into variable area exhaust nozzle, obtaining energy losses from gas turbine jet engine indices A71-28586
- Diffusion and thermal mechanism ignition theories, applying to altitude relighting of gas turbine engine combustors A71-28745
- Kerosene type fuels for aircraft gas turbine engines, discussing combustion problems, smoke emission reduction and bacterial or fungal contamination A71-28754
- Soviet papers on combustion processes in turbulent and laminar flows of kerosene and gasoline mixtures, stressing gas turbine engines problems A71-28954
- Gas turbine engine combustion chamber start-up and burning performance, considering air injection and propellant atomization A71-28968
- Gas turbine engine startup igniter with modified propellant atomizer enhanced by air injection A71-28969
- Carbon deposition rates in gas turbine engine combustion chambers with airstream-mechanical propellant atomization A71-28970
- Optimal penetration effect on peripheral gas flow temperature field at outlet of turbine combustion chamber with circular flame tubes A71-28971
- Gas turbine engine combustion chamber outlet, noting gas flow temperature field peripheral nonuniformity A71-28972
- Gas turbine auxiliary power unit accessories, discussing high energy igniters, cables and connectors, thermocouples and speed and temperature monitoring equipment A71-29262
- Metal coated superalloys evaluation for gas turbine engine components, including corrosion, impact and fatigue tests A71-29635
- Chemical kinetic calculation of nitric oxide formation in spark ignition automobile engines and gas turbine combustors A71-30454
- Aircraft JT9D engine development for airline operation, discussing construction, condition monitoring, maintenance, noise and smoke reduction [SAE PAPER 710434] A71-30528
- Gas turbine engine condition analysis by digital computer and fault isolation techniques [SAE PAPER 710448] A71-30532
- Turbopropulsion systems thrust augmentor combustion instability, discussing physical causes due to various pressure oscillation modes [AIAA PAPER 71-697] A71-30756
- Design point characteristics of 15-80 kWe nuclear reactor Brayton cycle power system [NASA-TM-X-67811] N71-24689
- Predicted performance of 15-80 kWe reactor Brayton power system over range of operating conditions [NASA-TM-X-67833] N71-24690
- Motor starting techniques for 2-15 kW Brayton space power system [NASA-TM-X-67819] N71-24691
- Assembly methods for three types of aircraft gas turbine engines [AD-719823] N71-25209
- Fundamentals of aircraft gas turbine engines [AD-719913] N71-25808
- Aircraft gas turbine combustion chamber design [NAL-TR-208] N71-26298
- GAS TURBINES**
- Continuous combustion gas turbine with stepwise heat release, investigating ideal thermal efficiency cycle of gas overexpansion, cooling and compression A71-28583
- Combustion and heat transfer in gas turbine systems - Conference, Cranfield, England, April 1969 A71-28739
- Metal temperatures in rotating cooled gas turbine blades, discussing coolant flow aerodynamics A71-28748
- GEARS**
- Reduction gearbox reliability problems from development and service experience with PT6A turboprop engine [SAE PAPER 710433] A71-28318
- GELLED PROPELLANTS**
- Fuel tests to determine feasibility of gelled methane for use in jet engine [NASA-CR-72876] N71-25772
- GEOCENTRIC COORDINATES**
- Control, navigation and guidance review, considering application of earth reference coordinates for aircraft, missiles and spacecraft A71-30710
- GEOMAGNETISM**
- Geomagnetic components measurement from moving platforms, discussing coordinate system stabilization methods for errorless time averaging of measurements A71-28249
- GLIDE PATHS**
- Quasi-stationary gliding trajectories of aircraft in planetary atmosphere during constant control of attack and bank angles A71-29185
- GLIDERS**
- Sailplane elevator induced maneuvering and horizontal tail surface loads, discussing airworthiness requirements A71-29256
- Wind tunnel tests of geometrically compatible airfoils for variable chord sailplane A71-29257
- GREASES**
- Military aviation greases for subsonic commercial airplane lubricants, discussing economic and technical benefits based on service experience and testing [SAE PAPER 710411] A71-28304
- GRINDING MACHINES**
- Helicopter component surface finish smoothness and residual stress requirements, using abrasive grinding belt machines with gear link mechanisms A71-28943
- GROUND EFFECT**
- Longitudinal stability of ground effect airplane, discussing influence on aerodynamic characteristics of height, ground surface roughness and wing aspect ratio A71-29228
- GROUND EFFECT MACHINES**
- Propulsion, guidance and stability of ground effect vehicle with perimetric Coanda fluid boundary A71-29308
- Air breathing nuclear propulsion, considering reactor safety in air cushion vehicles and aircraft A71-29930
- SK-5 air cushion vehicles evaluation including search/rescue, aids to navigation, law enforcement, safety logistics and oil pollution [AHS PREPRINT 572] A71-31113
- Potential feasibility of safe, practical, and economical air breathing nuclear propulsion system for aircraft and air cushion vehicles [NASA-TM-X-67837] N71-25524
- Characteristics and cost analysis of nuclear powered air cushion vehicles for oceanic commercial operations [NASA-TM-X-2293] N71-25783
- GROUND HANDLING**
- Frankfurt terminal baggage conveyor system, describing passenger capacity and luggage handling equipment A71-29312
- GROUND SUPPORT EQUIPMENT**
- Design, development, and test of ground support equipment for analyzing aircraft equipment condition and performance [AD-719675] N71-24603

GROUND-AIR-GROUND COMMUNICATIONS

Low carrier power aircraft antenna module for airborne UHF communications system, considering range/field strength measurements A71-31046

GUIDANCE (NOTION)

Control, navigation and guidance review, considering application of earth reference coordinates for aircraft, missiles and spacecraft A71-30710

GUIDANCE SENSORS

Sensing and communications technologies for short wayside headways, considering applicable equipment for personal rapid transit systems, modulation, coding and data transmission techniques A71-30337

GUNS (ORDNANCE)

Cheyenne attack helicopter weapons system, discussing night vision capability, armament, fire control and navigation equipment integration [AHS PREPRINT 530] A71-31091

GUST ALLEVIATORS

Aircraft gust alleviation, considering movement correction based real time atmospheric turbulence measurement A71-29785
Alleviation of lateral and longitudinal gust effects on aircraft N71-24709

GUST LOADS

Atmospheric turbulence effect on turbine powered transport aircraft, discussing gust accelerations, avoidance, detection, forecasting and pilot control A71-29750
Aircraft structural design requirements based on statistical analysis of air turbulence intensity and gust loads records from large number of research flights A71-29784

Gust transfer functions relating lift and moments to upwash in single sinusoidal wave for large aspect ratio rectangular wings in turbulent incompressible flow A71-30604

Cumulative frequency distributions determined by extreme value analysis used for fatigue analysis and interpretation of c.g. vertical acceleration and gust velocity measured on transport aircraft [AGARD-R-579-71] N71-25080

GUSTS

Extreme turbulence measurement during low level flights of Mirage A3-76 fighter aircraft, determining true gust velocities and power spectral energy distributions A71-29756
V/STOL aircraft gust effects prediction with mathematical models based on nonlinear hybrid simulation at takeoff and landing altitudes A71-29775

Aircraft with T tail configuration, examining dynamic response to lateral gusts A71-29786

Aircraft design and fatigue life monitoring, investigating effects of gust velocity frequency distribution in patches of atmospheric turbulence A71-29789

High rotor advance ratio from multiblade general coordinates method in linear analysis of lifting rotor dynamic stability and gust ratio [AHS PREPRINT 512] A71-31083

H

H-53 HELICOPTER

Night rescue terminal navigation, considering design, development and tests of Limited Night Recovery System for HH-53 helicopter [AHS PREPRINT 534] A71-31095

H-56 HELICOPTER

Cheyenne attack helicopter weapons system, discussing night vision capability, armament, fire control and navigation equipment integration [AHS PREPRINT 530] A71-31091

AH-56A compound helicopter rigid rotor stability and handling qualities, using flight, whirl tower and wind tunnel tests [AHS PREPRINT 574] A71-31115

HAIL

Meteorological radar for detection of thunderstorms, hail, and turbulence hazardous to aviation noting echo interpretation and radar transmission [WMO-264-TP-148] N71-24394

HANDLING EQUIPMENT

Melbourne/Tullamarine airport, describing facilities, capacity, road system, cargo and passenger handling areas and runway layout A71-29310
Frankfurt terminal baggage conveyor system, describing passenger capacity and luggage handling equipment A71-29312

HARRIER AIRCRAFT

Supersonic staggered gutter colander combustion system for plenum chamber burning on high bypass Pegasus turbofan engine of Harrier VTOL aircraft, noting performance improvement A71-28743

HAZARDS

Plug-in relay hazards and minimization for aircraft flight safety applications A71-28841

HEAT RESISTANT ALLOYS

Metal coated superalloys evaluation for gas turbine engine components, including corrosion, impact and fatigue tests A71-29635
Aluminide coatings for nickel-base superalloy developed for high temperature jet engine components [NASA-CR-72863] N71-25454

HEAT SHIELDING

Heat shield ablation under high enthalpy chemically active turbulent gas flow in hydrojet engine manifolds A71-28589
Parameters contributing to aeroelastic problems in thermal protection of space shuttle N71-24661
Comparison of space shuttle aerodynamic heating analyses for metallic heat shield and surface insulation concepts N71-26054

HEAT TRANSFER

Combustion and heat transfer in gas turbine systems - Conference, Cranfield, England, April 1969 A71-28739
Heat transfer on spheres and sharp cones in rarefied hypersonic gas flow at zero angles of attack in wind tunnel vacuum A71-29176
Heat transfer within resonant cavities at subsonic and supersonic flow, discussing wind tunnels, test procedures and data reduction [ASME PAPER 71-FE-9] A71-29450

HEAT TREATMENT

Vacuum heat treatment of brazed and diffusion bonded jet engine components near melting temperature A71-28145
Soviet book on aircraft materials science and treatment covering steel/cast iron processing, metallography, heat/thermochemical conditioning, surface protection and corrosion prevention A71-29529

HEATING EQUIPMENT

Procedures for evaluating effectiveness of self propelled and portable ground servicing units for Army aircraft [AD-719102] N71-24459

HELICOPTER CONTROL

Helicopter handling under ASW flight conditions, discussing sea state effect on low altitude hover stability A71-29384
Rotor blade stall induced helicopter control loads, combining unsteady aerodynamics with aeroelastic rotor analysis [AHS PREPRINT 513] A71-31084
AH/ASW-86 inertial navigation system consisting of inertial platform, digital computer and control

HELICOPTER DESIGN

SUBJECT INDEX

- indicator
[AHS PREPRINT 533] A71-31094
- Electromechanical control system synthesis for compound hingeless rotor helicopter, using root locus method with transfer functions from airframe motion linear model
[AHS PREPRINT 536] A71-31096
- Heavy lift helicopters IFR hover capability with slung load, discussing sensors controls and displays
[AHS PREPRINT 540] A71-31097
- Hingeless rotor helicopter stability and control characteristics, considering induced flow field, flapwise bending modes and blade-fuselage dynamic coupling
[AHS PREPRINT 541] A71-31098
- Handling qualities and control sensitivity of high performance helicopters, considering pitch and collective control
[AHS PREPRINT 542] A71-31099
- Fail-safe helicopter rotor control design, discussing damage tolerant components, redundant system, failure warning and maintenance
[AHS PREPRINT 550] A71-31102
- High performance UH-1 compound helicopter high speed flight research, considering rotor loads, stability, control and flying qualities
[AHS PREPRINT 570] A71-31111
- AH-56A compound helicopter rigid rotor stability and handling qualities, using flight, whirl tower and wind tunnel tests
[AHS PREPRINT 574] A71-31115
- Helicopter gyro displacement measurements at differing flying conditions
[FOA-2-C-2356-49-/72/] N71-26567
- HELICOPTER DESIGN**
- Costs-reliability relationships in helicopter development testing and demonstration, emphasizing decision making in program management
[SAE PAPER 710452] A71-28330
- Helicopter design for use as crane and for carrying external loads
A71-28489
- Helicopter component surface finish smoothness and residual stress requirements, using abrasive grinding belt machines with gear link mechanisms
A71-28943
- Soviet book on helicopter design covering aerodynamic properties, power plants, control systems, fatigue minimization and strength analysis
A71-29944
- Westland WG 13 Lynx helicopter, discussing design features, performance characteristics and civil and military applications
A71-30301
- Soviet Mil V-12 heavy lift helicopter for civil and military missions, noting turbine engines, rotor configuration, cargo hold and navigation system
A71-30420
- Advancing Blade Concept helicopter lifting rotor development, discussing full scale analysis, design, fabrication and wind tunnel tests
[AHS PREPRINT 504] A71-31080
- High rotor advance ratio from multiblade general coordinates method in linear analysis of lifting rotor dynamic stability and gust ratio
[AHS PREPRINT 512] A71-31083
- Optimal turbofan engine and reaction drive rotor combinations for helicopter design
[AHS PREPRINT 561] A71-31108
- Strain gage torque meter as primary power indicating instrument in helicopter transmission systems, providing advantages for helicopter designer and operator
[AHS PREPRINT 563] A71-31110
- Fatigue life of helicopter rotary wings under vibrational stresses
N71-24386
- Dynamic tests of helicopter components
N71-24388
- HELICOPTER ENGINES**
- Helicopter power transmission failure modes, presenting field experiences correlation with conventional design stress analysis and bench test data
[SAE PAPER 710454] A71-28331
- Soviet book on helicopter design covering aerodynamic properties, power plants, control systems, fatigue minimization and strength analysis
A71-29944
- HELICOPTER PERFORMANCE**
- Westland WG 13 Lynx helicopter, discussing design features, performance characteristics and civil and military applications
A71-30301
- Soviet Mil V-12 heavy lift helicopter for civil and military missions, noting turbine engines, rotor configuration, cargo hold and navigation system
A71-30420
- Noise production during aerodynamic tests on helicopter rotor in wind tunnel
A71-30519
- Army rotorcraft performance data, discussing hovering and forward flight performance out of ground and level flight power requirements and drag and compressibility effects
[AHS PREPRINT 500] A71-31076
- Helicopter fuselage vertical and in-plane main rotor head vibratory forces isolation with hydropneumatic servocentered system at transmission/airframe interface
[AHS PREPRINT 514] A71-31085
- Helicopter rotor stall characteristics, investigating blade flexibility, unsteady aerodynamics and variable inflow effects
[AHS PREPRINT 520] A71-31086
- High performance UH-1 compound helicopter high speed flight research, considering rotor loads, stability, control and flying qualities
[AHS PREPRINT 570] A71-31111
- Evaluation of helicopter flight loading and structural stability
N71-24389
- Aerodynamic configurations and characteristics of USSR military helicopters
[AD-719585] N71-25133
- HELICOPTER PROPELLER DRIVE**
- Helicopter rotor system vibratory and mechanical stability characteristics, investigating anisotropically mounted flexible swash plate and blade out of track effects
[AHS PREPRINT 511] A71-31082
- Optimal turbofan engine and reaction drive rotor combinations for helicopter design
[AHS PREPRINT 561] A71-31108
- HELICOPTER WAKES**
- Wake model and computer program to compute geometries, flows and velocity influence coefficients for helicopter blade load calculations
[AHS PREPRINT 523] A71-31089
- Mathematical models for lifting rotor aerodynamic calculations, noting wake configurations
[DLR-MITT-70-19] N71-24489
- HELICOPTERS**
- Helicopters as cranes and external load carriers, considering operational costs and investment return
A71-29144
- Soviet book on airplane and helicopter electrical power supply systems covering storage batteries, DC generators, alternators, voltage regulators, current and frequency control, etc
A71-29525
- Helicopter systems operations in, around and between major metropolitan areas, considering performance of New York Airways
[AIAA PAPER 71-507] A71-29549
- Helicopter aerial design problems, considering antenna multiplicity use of nonmetallic structures and complexity of airborne radio systems
A71-31048
- Heavy lift helicopter flight control system design, emphasizing fly by wire electrical analog
[AHS PREPRINT 503] A71-31079
- Helicopter rotor blade airload by applying lifting surface solution
[AHS PREPRINT 510] A71-31081
- Conference on fatigue life in helicopter components
[DLR-MITT-70-01] N71-24385

SUBJECT INDEX

HYPERSONIC FLOW

- Rotary wing structural stability of Dornier high temperature gas jet helicopter
N71-24387
- Dynamic tests of helicopter components
N71-24388
- Structural stability tests of helicopter components
N71-24390
- High intensity xenon flashtube lights for increasing conspicuity of trainer helicopters during daytime and nighttime flights
[AD-718639] N71-24669
- Calculating and testing antiicing systems of aircraft and helicopters
[AD-719922] N71-25622
- HIGH ALTITUDE BALLOONS**
- High altitude balloons pressure-altitude transducer assembly, discussing electronic circuitry, calibration and temperature and vibration effects
A71-30070
- HIGH ASPECT RATIO**
- Friction factor for low Reynolds number turbulent flow in large aspect ratio rectangular ducts, comparing Blasius and Prandtl relations
[ASME PAPER 71-FE-A] A71-29378
- Gust transfer functions relating lift and moments to upwash in single sinusoidal wave for large aspect ratio rectangular wings in turbulent incompressible flow
A71-30604
- Fuselage influence on total aircraft drag in subsonic passenger aircraft, considering high aspect ratio cylindrical fuselages
A71-30821
- HIGH FREQUENCIES**
- Performance and cost design tradeoff between HF and synchronous meteorological satellite data collection systems, considering platform transmitting power and SNR
A71-30900
- HIGH RESOLUTION**
- Visual flight simulation devices, considering high resolution photographic films and digital memories
A71-29483
- HIGH SPEED**
- Flow meter for measuring stagnation pressure in boundary layer around high speed flight vehicle
[NASA-CASE-XFR-02007] N71-24692
- HIGH TEMPERATURE ENVIRONMENTS**
- Aircraft flight load measurements in high temperature environment, determining optimal strain gage installation and calibration
A71-30681
- HIGH TEMPERATURE GASES**
- Gas temperature measurement in aircraft combustion chambers, using calorimetric probe
A71-28757
- Temperature and radical concentration measurements for high temperature flowing gas streams in rig simulating conditions in ramjet combustion chamber and nozzle
A71-28758
- HIGHWAYS**
- Aviation and surface transportation safety for 1970 with related accident investigations and recommendations
[AR-4] N71-24925
- HOLOGRAPHY**
- Holographic techniques, optical data processing and laser properties for aerospace instrumentation
A71-30329
- HORIZONTAL TAIL SURFACES**
- Sailplane elevator induced maneuvering and horizontal tail surface loads, discussing airworthiness requirements
A71-29256
- HORN ANTENNAS**
- High speed airborne scanning navigational radar antenna with matched patterns, using offset horn feed reflector and polarization modes for improved visual display
A71-31036
- HOT-WIRE FLOWMETERS**
- X-type hot-wire probe thermal turbulent wake interference, discussing wind tunnel investigation of wire distance effect on pitch angle sensitivity
A71-31022
- HOVERING**
- Army rotorcraft performance data, discussing hovering and forward flight performance out of ground and level flight power requirements and drag and compressibility effects
[AHS PREPRINT 500] A71-31076
- Heavy lift helicopters IFR hover capability with slung load, discussing sensors controls and displays
[AHS PREPRINT 540] A71-31097
- Hovering performance tests of jet-flapped rotors and comparison of predicted and actual results
[NAL-TR-211] N71-25396
- HOVERING STABILITY**
- Helicopter handling under ASW flight conditions, discussing sea state effect on low altitude hover stability
A71-29384
- HUMAN REACTIONS**
- Pilot subjective evaluation of XB-70 aircraft response to atmospheric turbulence in comparison with measured accelerations
A71-29774
- HYDRAULIC EQUIPMENT**
- Third Chance flight control system, discussing aircraft control capability with backup hydraulic system after loss of dual main hydraulic systems due to combat damage
A71-29382
- Thrust measurement of aircraft propulsion systems, considering hydraulic piston device, edge clearance, oil quantity and calibration
A71-29860
- HYDROCARBON COMBUSTION**
- Soviet papers on combustion processes in turbulent and laminar flows of kerosene and gasoline mixtures, stressing gas turbine engine problems
A71-28954
- HYPERBOLIC NAVIGATION**
- Long range hyperbolic navigation in U.S., discussing loran and Omega systems
A71-30711
- HYPERSONIC BOUNDARY LAYER**
- Slender cone boundary layer transition under angle of attack at Mach 21 with promoted leeward and fixed windward ray
A71-29887
- HYPERSONIC FLIGHT**
- Hypersonic flight load bearing refractory alloy control surface protective coatings, emphasizing oxidation screening tests
A71-29646
- Conductive heat transfer effect on temperature distribution in vicinity of wing leading edge in hypersonic flight
[ARC-CP-1126] N71-24446
- Minimizing drag and increasing performance of optimum shapes at hypersonic flight
N71-24704
- HYPERSONIC FLOW**
- Aerodynamic characteristics similarity and variation in hypersonic flow transition region from free molecular flow to solid medium
A71-29172
- Heat transfer on spheres and sharp cones in rarefied hypersonic gas flow at zero angles of attack in wind tunnel vacuum
A71-29176
- Hypersonic flow around delta wing at small angles of attack, using pressure sources method and Fredholm integral equation
A71-29189
- Unsteady hypersonic self similar gas flow and drag on circular cone accelerated according to power law, using small perturbation theory
A71-29205
- Wind tunnel simulation of viscous hypersonic flow-laminar boundary layer interactions, presenting similarity parameter effects on aerodynamic characteristics
A71-29224
- Monograph on hypersonic shock tunnel supersonic combustion research techniques covering test facilities, optical and electromagnetic flow measurement methods, etc
A71-29578

- Turbulent skin friction and heat transfer prediction on flat plates and wind tunnel walls at supersonic and hypersonic Mach numbers, using Van Driest theory
A71-29868
- Hypersonic flow pattern past windward side of delta wing with supersonic leading edges, joining potential and vortex regions behind shock wave
A71-30874
- Flow measurement of Nonweiler delta wing in hypersonic slip flow [DLR-FB-70-46]
N71-24500
- HYPERSONIC REENTRY**
Hypersonic shock/density ratio effects in aerothermodynamic heating of space shuttle configuration
N71-26058
- HYPERVELOCITY FLOW**
Tests to determine short-term creep of metals and alloys under conditions of aerodynamic heating with high velocity air flow [NASA-TT-F-13633]
N71-25822
- Finite difference method for calculating inviscid flow field around supersonic/hypersonic space shuttle
N71-26056
- HYPERVELOCITY WIND TUNNELS**
Wind tunnel simulation of viscous hypersonic flow-laminar boundary layer interactions, presenting similarity parameter effects on aerodynamic characteristics
A71-29224
- Hypervelocity blowdown nitrogen wind tunnel with graphite resistance heater noting nozzles, diffuser, and calibration [IC-AERO-71-01]
N71-24675
- ICE FORMATION**
Fincap communication antennas design and environmental tests for vibration, acceleration, waterproofing, salt corrosion, ice formation and compass safe distance
A71-31047
- IGNITERS**
Gas turbine engine startup igniter with modified propellant atomizer enhanced by air injection
A71-28969
- Gas turbine auxiliary power unit accessories, discussing high energy igniters, cables and connectors, thermocouples and speed and temperature monitoring equipment
A71-29262
- IGNITION SYSTEMS**
Diffusion and thermal mechanism ignition theories, applying to altitude relighting of gas turbine engine combustors
A71-28745
- IMPACT ACCELERATION**
Studying aircraft accidents to determine impact angle and speed criteria for designing nuclear airplane fission product containment vessel [NASA-TM-X-2245]
N71-25411
- IMPACT DAMAGE**
Materials and structural design development by high velocity impact testing due to transport and subsonic military aircraft susceptibility to bird collision damage
A71-29642
- IMPEDANCE MEASUREMENTS**
Impedance measurements on modified broadband metal antenna for speech communication [POA-3-C-3602-61]
N71-26150
- IN-FLIGHT MONITORING**
Onboard computer for aircraft engine testing, monitoring and data reduction, emphasizing automatic in-flight recording for post-flight displays [AIAA PAPER 71-651]
A71-30727
- Engine condition monitoring systems, discussing engineering design requirements with respect to accessibility, accuracy, economics, effectiveness, reliability and maintainability [AIAA PAPER 71-652]
A71-30728
- INCIDENT RADIATION**
Simply supported normal mode plate time response to traveling wave at oblique incidence, using numerical analysis
A71-30068
- Incident sonic boom shock wave reflection factors off smooth surface, discussing pressure rise and flight near threshold Mach number
A71-30610
- INCOMPRESSIBLE FLOW**
Aerofoil cascades with axial velocity change in incompressible flow, determining turbine blade force dependence on circulation
A71-28467
- Incompressible fluid motion in laminar boundary layer on blade rotating uniformly about axis perpendicular to wing span
A71-30218
- Oscillatory pitching moment derivatives measurement on delta wings in incompressible flow [ARC-R/M-3628-PT-1-4]
N71-24569
- Measurements of oscillatory pitching moments on round leading edged delta wing in incompressible flow noting vortex flow development
N71-24570
- INCOMPRESSIBLE FLUIDS**
Incompressible conducting fluid plane jet expansion in homogeneous slipstream, deriving partial differential equations for nonconduction approximation
A71-29610
- Axisymmetrical three component flow equations for incompressible viscous fluid in cylinder with rotating disk
A71-30855
- INERTIAL NAVIGATION**
Boeing 747 crew members training program, describing ground training, classrooms, inertial navigation system and cockpit trainers [SAE PAPER 710473]
A71-28339
- Inertial navigation systems improvements for commercial air transportation, noting digital computer program revision and increased functional capability [SAE PAPER 710458]
A71-30534
- Combined inertial and instrument landing aircraft navigation systems with reduced cross runway position and velocity errors, using optimal linear estimation
A71-30660
- Air navigation techniques history, considering radio, radar, loran Doppler and inertial navigation
A71-30712
- AN/ASN-86 inertial navigation system consisting of inertial platform, digital computer and control indicator [AHS PREPRINT 533]
A71-31094
- INERTIAL PLATFORMS**
AN/ASN-86 inertial navigation system consisting of inertial platform, digital computer and control indicator [AHS PREPRINT 533]
A71-31094
- INFLUENCE COEFFICIENT**
Wake model and computer program to compute geometries, flows and velocity influence coefficients for helicopter blade load calculations [AHS PREPRINT 523]
A71-31089
- INFRARED DETECTORS**
Airborne equipment for CAT detection ahead of aircraft, considering pulsed Doppler laser and IR detectors
A71-29765
- Development and characteristics of scanning systems for thermal viewers and infrared detectors for airborne operation [AD-719854]
N71-25053
- Aircraft mounted infrared detectors for remote measurements of optical cloud properties
N71-25260
- INFRARED INSTRUMENTS**
Development and characteristics of scanning systems for thermal viewers and infrared detectors for airborne operation [AD-719854]
N71-25053
- INGESTION (ENGINES)**
Exhaust gas ingestion and recirculating flow field characteristics of small scale vertical take off engine pod [NASA-CR-1774]
N71-25397

- INLET FLOW**
 Test description and results for high Mach number transonic fan stages to determine range and distortion tolerance for various rotor tip casing treatment configurations [NASA-CR-82862] N71-25460
 Tabulations of blade element and circumferential distortion flow data in tests of high Mach number transonic fan stages with various rotor tip casing treatment configurations [NASA-CR-82867] N71-25461
- INLET PRESSURE**
 Engine surge pressure transients in mixed-compression supersonic inlet, describing scale wind tunnel model simulation and measurement techniques [AIAA PAPER 71-671] A71-30735
- INSPECTION**
 Airport certification and safety inspection procedures and minimum safety standards [SAE PAPER 710413] A71-28305
- INSTALLING**
 Aircraft flight load measurements in high temperature environment, determining optimal strain gage installation and calibration A71-30681
- INSTRUMENT ERRORS**
 Aircraft barometric altimeter errors caused by atmospheric temperature deviations from International Standard Atmosphere A71-30323
 Fan-produced sound pressure fluctuation in very low speed subsonic wind tunnel test stream, noting resulting anemometer calibration errors A71-30526
- INSTRUMENT FLIGHT RULES**
 Heavy lift helicopters IFR hover capability with slung load, discussing sensors controls and displays [AHS PREPRINT 540] A71-31097
- INSTRUMENT LANDING SYSTEMS**
 Combined inertial and instrument landing aircraft navigation systems with reduced cross runway position and velocity errors, using optimal linear estimation A71-30606
 Handling qualities of V/STOL research vehicles during steep terminal area approaches, discussing powered lift fan VTOL aircraft limitations and instrument landing approach [AHS PREPRINT 544] A71-31101
- INTEGRAL TRANSFORMATIONS**
 Numerical evaluation of downwash integral for wing loading of lifting rectangular planform [NPL-MA-90] N71-24483
- INTEGRATED CIRCUITS**
 Interface IC circuits for driving high voltage transistor switches from low level logic inputs, noting avionics application A71-28910
- INTERFERENCE LIFT**
 Wing-jet interference effects in cross wind on thrust and aerodynamic characteristics at large distance from and near ground A71-29207
- INTERNAL COMPRESSION INLETS**
 Analytical model of compressor sensitivity to transient and distorted transient flows, considering inlet duct, compressor stages and combustor up to turbine nozzles [AIAA PAPER 71-670] A71-30734
 Wind tunnel tests to determine Mach 2.5 performance of bicone inlet with internal focused compression and 40-percent internal contraction [NASA-TM-X-2294] N71-25872
- INTERNATIONAL COOPERATION**
 Air transport development trends, considering increased speed and capacity, STOL aircraft, urban service, and European cooperation for manufacturing A71-30302
- INTERNATIONAL LAW**
 Book on air law and civil air policy covering international regulation, air traffic market, passenger and cargo services, etc A71-29938
- INTERNATIONAL TRADE**
 Long haul international air transport, analyzing traffic growth rates A71-30161
- IRIDIUM ISOTOPES**
 Nondestructive testing of aircraft structures using thulium and iridium gamma sources [JAERI-MEMO-4163] N71-24849
- ITERATIVE SOLUTION**
 Least squares method and iteration technique for obtaining aerodynamic stability derivatives N71-24703
- J**
- J-85 ENGINE**
 Time variant distortions in supersonic inlet on J-85-GE-13 turbojet engine from wind tunnel test, considering instantaneous distortion amplitudes and contours [AIAA PAPER 71-667] A71-30733
- JET AIRCRAFT**
 Microbiological contamination of jet aircraft fuel tanks in tropical regions, considering maintenance [SAE PAPER 710438] A71-28320
 En route turbojet aircraft flight speed control, assessing impact on ATC procedures A71-28884
 Dassault Mercure short range twin jet aircraft capable of using powerful engine A71-29276
 Jet-supported VTOL aircraft fuel-time-optimal landing control, using mathematical model, Pontryagin maximum principle and analog computer solution A71-29281
 Integrated short-haul interurban transportation system, considering combination of conventional jet aircraft, STOL aircraft and high-speed ground transportation [AIAA PAPER 71-508] A71-29550
 Atmospheric turbulence effect on turbine powered transport aircraft, discussing gust accelerations, avoidance, detection, forecasting and pilot control A71-29750
 Jet transport aircraft stability and controllability under atmospheric turbulence conditions, discussing longitudinal and lateral-directional characteristics with particular attention to unstable spiral mode A71-29772
 Jet transport aircraft design for safety under air turbulence conditions, considering cruise altitude limitations and pitch and g excursion reduction by special autopilot mode A71-29777
 Wind tunnel force test program design for jet aircraft configurations, including propulsion system simulation A71-30605
 Jet vertical takeoff aircraft piloted cockpit simulator for controlling aircraft flight performance [ARC-R/M-3647] N71-25065
 Flight evaluation of lateral handling, stability, control, and flying qualities of jet transport aircraft during up-and-away and approach flight in landing configuration [NASA-TN-D-6339] N71-25537
- JET AIRCRAFT NOISE**
 Noise attenuation prediction in absorbing ducts adaptable to bypass jet engines, using Morse theory A71-30522
 Jet aircraft sound spectrum on ground and in air, comparing calculation with experiment A71-30524
 Acoustic liner design for propellant combustion instability and jet aircraft noise suppression, discussing cross flow and oscillatory pressure effects [AIAA PAPER 71-757] A71-30791
- JET CONTROL**
 Flowfield production by fluid injection into supersonic crossflow, occurring with liquid/gas jet control of vehicle with combustion ramjets [AIAA PAPER 71-728] A71-30775
- JET ENGINE FUELS**
 Airport jet fuel delivery system salt driers for

JET ENGINES

SUBJECT INDEX

- reducing water content below saturation, lengthening filter life and improving downstream system components performance
[SAE PAPER 710440] A71-28322
- JET ENGINES**
Vacuum heat treatment of brazed and diffusion bonded jet engine components near melting temperature A71-28145
- Olympus 593 pure jet twin shaft engine development program for Concorde, discussing engine evolution, design considerations and flight development
[SAE PAPER 710422] A71-28309
- Air bypass behind compressor into variable area exhaust nozzle, obtaining energy losses from gas turbine jet engine indices A71-28586
- Heat shield ablation under high enthalpy chemically active turbulent gas flow in hydrojet engine manifolds A71-28589
- Aircraft jet engines technological progress review over past 25 years, emphasizing industry economics considerations A71-30303
- Miniature transducers design and fabrication for fluctuating pressure measurements in jet engine testing, noting frequency response and power dissipation A71-30324
- Fluctuating pressure measurements in jet engine testing, using miniature transducers with calibration and data acquisition equipment A71-30325
- Modular concept mathematical model for combustion and pollution formation processes in jet engine combustors, including turbulent mixing and reaction kinetics
[AIAA PAPER 71-714] A71-30766
- Isolated axisymmetric jet engine exhaust nozzles thrust and drag predictions in sub-, trans- and supersonic flight regimes
[AIAA PAPER 71-719] A71-30770
- Exhaust gas ingestion and recirculating flow field characteristics of small scale vertical take off engine pod
[NASA-CR-1774] N71-25397
- Aluminate coatings for nickel-base superalloy developed for high temperature jet engine components
[NASA-CR-72863] N71-25454
- Fuel tests to determine feasibility of gelled methane for use in jet engine
[NASA-CR-72876] N71-25772
- JET EXHAUST**
Visible exhaust smoke trails from aircraft jet engines, measuring optical density by photographic photometry
[SAE PAPER 710428] A71-28314
- Isolated axisymmetric jet engine exhaust nozzles thrust and drag predictions in sub-, trans- and supersonic flight regimes
[AIAA PAPER 71-719] A71-30770
- Wind tunnel investigation of jet exhausting into cross flow - data for three jet configuration
[AD-718123] N71-24491
- Low speed wind tunnel test of four ft diameter circular plate model with three exhausting jets
[AD-720233] N71-26517
- JET FLAPS**
Two dimensional jet flap cascades, presenting stream deflection angles as function of jet to mainstream momentum flux
[ASME PAPER 71-FE-14] A71-29453
- Hovering performance tests of jet-flapped rotors and comparison of predicted and actual results
[NAL-TR-211] N71-25396
- Wind tunnel tests to determine low-speed aerodynamic characteristics of large-scale STOL transport model with augmented jet flap
[NASA-TM-X-62017] N71-26183
- JET FLOW**
Aerodynamic noise produced by supercritical jets, using high speed flash photography for schlieren and shadowgraph studies A71-28767
- Incompressible conducting fluid plane jet expansion in homogeneous slipstream, deriving partial differential equations for nonconduction approximation A71-29610
- Low thrust jet effect on base pressures on boat-tailed afterbodies in Mach number 0.8-1.2 flow A71-29889
- Hot jet aerodynamic parameters from emissions of electromagnetic and acoustic energies by crossed beam IR probing A71-30520
- JET IMPINGEMENT**
Wing-jet interference effects in cross wind on thrust and aerodynamic characteristics at large distance from and near ground A71-29207
- JET MIXING FLOW**
Optimal penetration effect on peripheral gas flow temperature field at outlet of turbine combustion chamber with circular flame tubes A71-28971
- Wind tunnel investigation of jet exhausting into cross flow - data for three jet configuration
[AD-718123] N71-24491
- Wind tunnel investigation of jets exhausting into cross flow - description and data analysis
[AD-718122] N71-24492
- JET THRUST**
Wing-jet interference effects in cross wind on thrust and aerodynamic characteristics at large distance from and near ground A71-29207
- Afterburning turbofan engine thrust calculation by gas generator method, using F-111A for comparison tests
[AIAA PAPER 71-680] A71-30744
- Rotary wing structural stability of Dornier high temperature gas jet helicopter N71-24387
- K**
- KEROSENE**
Kerosene type fuels for aircraft gas turbine engines, discussing combustion problems, smoke emission reduction and bacterial or fungal contamination A71-28754
- KINEMATIC EQUATIONS**
Controlled aircraft motion under strict kinematic constraints in terms of simple subsystems, noting pilots role in Newmark theory A71-31024
- L**
- L-1011 AIRCRAFT**
L-1011 aircraft flying stabilizer, discussing choice of longitudinal flight control systems
[SAE PAPER 710426] A71-28312
- Automatic landing systems independent monitor for L-1011 aircraft, providing pilot confidence under reduced visibilities
[SAE PAPER 710443] A71-28324
- L-1011 Tristar antenna arrangement test results, considering weight, aerodynamic and structural design requirements A71-31060
- LAMINAR BOUNDARY LAYER**
Wind tunnel simulation of viscous hypersonic flow-laminar boundary layer interactions, presenting similarity parameter effects on aerodynamic characteristics A71-29224
- Incompressible fluid motion in laminar boundary layer on blade rotating uniformly about axis perpendicular to wing span A71-30218
- LAMINAR FLOW**
Soviet papers on combustion processes in turbulent and laminar flows of kerosene and gasoline mixtures, stressing gas turbine engines problems A71-28954
- LANDING GEAR**
Powered landing gear wheel system requirements for parking and taxiing of commercial jet transport airplanes
[SAE PAPER 710446] A71-30530

- LANDING LOADS**
Landing load estimation methods for preliminary design weight prediction for military aircraft
A71-28211
- LASERS**
Holographic techniques, optical data processing and laser properties for aerospace instrumentation
A71-30329
- LATERAL CONTROL**
Elevons as longitudinal and lateral control elements on low aspect ratio wings, calculating subsonic and supersonic aerodynamic characteristics
A71-29190
Supersonic aircraft lateral control equipment [AD-720740]
N71-26538
- LATERAL STABILITY**
Flight evaluations using variable stability aircraft to determine effects of turbulence induced aerodynamic disturbances and lateral directional dynamics on pilot performance [NASA-CR-1718]
N71-26170
- LAUNCH VEHICLE CONFIGURATIONS**
Buffet response of straight wing and delta wing model of space shuttle launch configuration
N71-24662
Transonic wind tunnel investigation of flow characteristics and pressure fluctuation of space shuttle launch and reentry configurations
N71-24663
- LEADING EDGES**
Hypersonic flow pattern past windward side of delta wing with supersonic leading edges, joining potential and vortex regions behind shock wave
A71-30874
Conductive heat transfer effect on temperature distribution in vicinity of wing leading edge in hypersonic flight [ARC-CP-1126]
N71-24446
Angle of incidence effect on delta wing leading-edge vortices with cross flow visualization in hydraulic test tunnel [ARC-R/M-3645]
N71-24482
- LEAST SQUARES METHOD**
Least squares method and iteration technique for obtaining aerodynamic stability derivatives
N71-24703
- LEE WAVES**
Lee surface flow and aerodynamic heating on delta wing orbiter
N71-26060
Leeside aerodynamic heating of lifting reentry vehicle configurations
N71-26061
- LIIFT**
Air flow about low aspect ratio delta wing at large angles of attack, deriving lift coefficient
A71-28282
Minimum drag wing-fuselage combination for supersonic speeds and prescribed lifting force, longitudinal moment and volume, using method of successive approximations
A71-29182
Supercavitating flow past straight cascade with arbitrary blade shapes, considering lift and drag coefficients, cavitation number, cavity shape and exit flow conditions [ASME PAPER 71-FE-6]
A71-29448
V/STOL propulsion units lift ratings based on aircraft system requirements [SAE PAPER 710471]
A71-30537
High lift and boundary layer separation behavior of sweptback wing airfoil profile noting trailing and leading edge stall pattern [ARC-R/M-3648]
N71-24488
- LIIFT DEVICES**
Vortex wakes behind STOL operations high lift wings, discussing height above ground and various wind tunnel dimensions effects
A71-28033
Two dimensional flow research on high lift airfoils for STOL aircraft, using vorticity distribution and wind tunnel wall blowing techniques
A71-29910
- Numerical evaluation of downwash integral for wing loading of lifting rectangular planform [NPL-MA-90]
N71-24483
Direct lift control system having flaps with slots adjacent to their leading edge and particularly adapted for lightweight aircraft [NASA-CASE-LAR-10249-1]
N71-26110
- LIIFT DRAG RATIO**
Conical body lift/drag ratio increase by wedge shaped nose, noting applications to space vehicles entering atmosphere above escape velocity
A71-29183
- LIIFT FANS**
VTOL propulsion, discussing gas turbine pressure ratio inlet temperature and lifting and high bypass fans
A71-27838
Tip turbine driven lift fan noise reduction tests, considering design parameters effects [AIAA PAPER 71-743]
A71-30784
Handling qualities of V/STOL research vehicles during steep terminal area approaches, discussing powered lift fan VTOL aircraft limitations and instrument landing approach [AHS PREPRINT 544]
A71-31101
- LIIFTING BODIES**
Miniature aerodynamic turbulence gage using axisymmetric lifting body sensor
A71-28158
Trailing vortices shed by aircraft lifting surfaces, noting wake effects importance at low speeds
A71-28176
Unsteady curvilinear motion of lifting surface, calculating induced gas flow velocities in terms of vortex densities
A71-29188
- LIIFTING REENTRY VEHICLES**
Leeside aerodynamic heating of lifting reentry vehicle configurations
N71-26061
Analysis of aerodynamic forces on DL-4 lifting entry vehicle and comparison with theoretical methods [NASA-TM-X-1994]
N71-26354
- LIIFTING ROTORS**
Advancing Blade Concept helicopter lifting rotor development, discussing full scale analysis, design, fabrication and wind tunnel tests [AHS PREPRINT 504]
A71-31080
Helicopter rotor blade airload by applying lifting surface solution [AHS PREPRINT 510]
A71-31081
High rotor advance ratio from multiblade general coordinates method in linear analysis of lifting rotor dynamic stability and gust ratio [AHS PREPRINT 512]
A71-31083
Hingeless rotor helicopter stability and control characteristics, considering induced flow field, flapwise bending modes and blade-fuselage dynamic coupling [AHS PREPRINT 541]
A71-31098
Composite materials application to V/STOL prop/rotors, determining material properties parametric effect on frequencies and weight by Southwell coefficients [AHS PREPRINT 554]
A71-31106
Mathematical models for lifting rotor aerodynamic calculations, noting wake configurations [DLR-MITT-70-19]
N71-24489
- LIGHT AIRCRAFT**
Direct lift control system having flaps with slots adjacent to their leading edge and particularly adapted for lightweight aircraft [NASA-CASE-LAR-10249-1]
N71-26110
- LIGHTHILL METHOD**
Low aerodynamic drag airfoil designing by Lighthill method [ARC-R/M-3618]
N71-24498
- LINE SPECTRA**
Complex noise emission spectra from superposition of continuous component and peaks, calculating level separations due to perfectly reflecting plane
A71-30523
- LINEAR ARRAYS**
High speed electronic phase and frequency scanned linear, static fed and monopulse arrays element

LINING PROCESSES

SUBJECT INDEX

- and angular error analysis A71-31049
- Blade antenna linear array design for aircraft-satellite communication, determining mutual influences by array measurements in simulated electrical environment A71-31062
- LINING PROCESSES**
- Acoustic linings for attenuation of fan generated noise in turbofan engines, considering interaction between analytical lining performance prediction and flow duct testing [AIAA PAPER 71-731] A71-30778
- Flow-duct test facility data on acoustic behavior of lined ducts and duct-lining materials for turbojet engine applications [NASA-CR-111887] N71-26417
- LININGS**
- Acoustic liner design for propellant combustion instability and jet aircraft noise suppression, discussing cross flow and oscillatory pressure effects [AIAA PAPER 71-757] A71-30791
- LIQUID ATOMIZATION**
- Carbon deposition rates in gas turbine engine combustion chambers with airstream-mechanical propellant atomization A71-28970
- LIQUID FLOW**
- Three dimensional steady separated liquid and gas flows past low aspect ratio bodies, deriving similarity laws for reduction to two dimensional problem A71-29169
- LIQUID SLOSHING**
- Pressure sensor network for measuring liquid dynamic response in flight including fuel tank acceleration, liquid slosh amplitude, and fuel depth monitoring [NASA-CASE-XLA-05541] N71-26387
- LOAD DISTRIBUTION (FORCES)**
- Sailplane elevator induced maneuvering and horizontal tail surface loads, discussing airworthiness requirements A71-29256
- LOADING OPERATIONS**
- Helicopters as cranes and external load carriers, considering operational costs and investment return A71-29144
- LOADS (FORCES)**
- Aerodynamic behavior of bodies in wake of two dimensional bluff bodies, discussing loads A71-29265
- Atmospheric turbulence effects on handling qualities and structural loads on aircraft A71-29787
- LOGIC CIRCUITS**
- Interface IC circuits for driving high voltage transistor switches from low level logic inputs, noting avionics application A71-28910
- LONGITUDINAL CONTROL**
- L-1011 aircraft flying stabilizer, discussing choice of longitudinal flight control systems [SAE PAPER 710426] A71-28312
- Elevons as longitudinal and lateral control elements on low aspect ratio wings, calculating subsonic and supersonic aerodynamic characteristics A71-29190
- LONGITUDINAL STABILITY**
- Longitudinal stability of ground effect airplane, discussing influence on aerodynamic characteristics of height, ground surface roughness and wing aspect ratio A71-29228
- Low-speed wind tunnel longitudinal stability tests on sweptback wing model with blowing at leading edge slats and trailing edge flaps for Buccaneer aircraft performance [ARC-R/M-3655] N71-24565
- LORAN**
- Long range hyperbolic navigation in U.S., discussing loran and Omega systems A71-30711
- Air navigation techniques history, considering radio, radar, loran Doppler and inertial navigation A71-30712
- LOW ASPECT RATIO**
- Three dimensional steady separated liquid and gas flows past low aspect ratio bodies, deriving similarity laws for reduction to two dimensional problem A71-29169
- LOW ASPECT RATIO WINGS**
- Air flow about low aspect ratio delta wing at large angles of attack, deriving lift coefficient A71-28282
- Elevons as longitudinal and lateral control elements on low aspect ratio wings, calculating subsonic and supersonic aerodynamic characteristics A71-29190
- Air flow past small aspect ratio thick-section wing at small angles of attack, investigating vortex system effect on flow characteristics in absence of lift A71-29234
- Aerodynamic characteristics of low-aspect-ratio wing mounted on cylindrical body, simulating by system of horseshoe vortices A71-30264
- LOW LEVEL TURBULENCE**
- Extreme turbulence measurement during low level flights of Mirage A3-76 fighter aircraft, determining true gust velocities and power spectral energy distributions A71-29756
- LOW SPEED WIND TUNNELS**
- Wind tunnel investigation of jets exhausting into cross flow - description and data analysis [AD-718122] N71-24492
- Wind tunnel tests to determine low-speed aerodynamic characteristics of large-scale STOL transport model with augmented jet flap [NASA-TM-X-62017] N71-26183
- Low speed wind tunnel test of four ft diameter circular plate model to determine surface static pressure distributions for jet decay characteristics of cross flow [AD-720232] N71-26516
- Low speed wind tunnel test of four ft diameter circular plate model with three exhausting jets [AD-720233] N71-26517
- LOW THRUST**
- Low thrust jet effect on base pressures on boat-tailed afterbodies in Mach number 0.8-1.2 flow A71-29889
- LOW VISIBILITY**
- Automatic landing systems independent monitor for L-1011 aircraft, providing pilot confidence under reduced visibilities [SAE PAPER 710443] A71-28324
- LUBRICANT TESTS**
- Olympus 593 supersonic engine lubricants tests, defining requirements in terms of bulk thermal stability, resistance to hot bearing breakdown, oil mist coking, etc A71-29826
- LUBRICATING OILS**
- Military aviation greases for subsonic commercial airplane lubricants, discussing economic and technical benefits based on service experience and testing [SAE PAPER 710411] A71-28304
- Olympus 593 supersonic engine lubricants tests, defining requirements in terms of bulk thermal stability, resistance to hot bearing breakdown, oil mist coking, etc A71-29826
- M**
- M-2 LIFTING BODY**
- Transonic wind tunnel tests of vertical fin loads and rudder hinge moments on M2-F3 lifting body scale model at Mach 0.50 to 1.30 [NASA-TM-X-2286] N71-24581
- MACH NUMBER**
- Altitude-air speed and Mach number pressure transducer with diaphragm free of temperature and vibration effects A71-30322

MACHINERY

Precipitation detector and mechanism for stopping and restarting machinery at initiation and cessation of rain
[NASA-CASE-XLA-2619] A71-26334

MAGNETIC MEASUREMENT

Geomagnetic components measurement from moving platforms, discussing coordinate system stabilization methods for errorless time averaging of measurements A71-28249

MAINTAINABILITY

FAA aircraft design appraisal for maintainability, considering maintenance concepts and adverse airworthiness situations
[SAE PAPER 710431] A71-28316

Airline operator evaluation of maintainability, considering costs and investment return
[SAE PAPER 710432] A71-28317

MALAYA

Oklahoma and Malaysia thunderstorms comparison based on weather reconnaissance aircraft measurements, considering turbulence patches A71-29752

MALFUNCTIONS

MAC malfunction detection, analysis and recording system applications in commercial airlines, emphasizing real time response for maintenance function
[SAE PAPER 710425] A71-28311

Electrical and physical nature of microbial membranes implicated in aircraft fuel quantity probe malfunction
[SAE PAPER 710439] A71-28321

MAN MACHINE SYSTEMS

Controlled aircraft motion under strict kinematic constraints in terms of simple subsystems, noting pilots role in Newmark theory A71-31024

MANAGEMENT PLANNING

Technical, sales/marketing and management - Conference, Coronado, California, May 1971 A71-28164

German monograph on game theory and planning, techniques for aircraft evaluation A71-28880

Aviation within total transport system, discussing decision making and management planning A71-30165

Criteria for converting aeronautical project operational targets into actual requirements and technical specifications, emphasizing cost effectiveness A71-30824

Scientific results from ESRO satellites and from sounding rocket campaign including aeronautical fields, management planning, satellite development, and telecommunication - 1969 report N71-24447

MANUFACTURING

Complex structural aircraft components manufacture, using group technology principle based on subdivision of parts classes A71-30267

MAPPING

ATC radar display systems mapping techniques using vectors and optical projections A71-30014

MARINE PROPULSION

SK-5 air cushion vehicles evaluation including search/rescue, aids to navigation, law enforcement, safety logistics and oil pollution [AHS PREPRINT 572] A71-31113

MARKETING

Technical, sales/marketing and management - Conference, Coronado, California, May 1971 A71-28164

MASS FLOW

Circumferential traversing probe technique for intrastage analysis of axial flow compressors, considering mass flow averaging data reduction technique [ASME PAPER 71-FE-33] A71-29468

MASS FLOW RATE

Supersonic mass flux probe description, discussing inlet geometry, angle of attack and Reynolds and Mach numbers effects on performance A71-29925

MATERIALS HANDLING

Melbourne/Tullamarine airport, describing facilities, capacity, road system, cargo and passenger handling areas and runway layout A71-29310

MATERIALS SCIENCE

Soviet book on aircraft materials science and treatment covering steel/cast iron processing, metallography, heat/thermochemical conditioning, surface protection and corrosion prevention A71-29529

Aerospace materials - Conference, Anaheim, California, April 1971 A71-29633

Advanced composite vs conventional material components in cost comparison for aircraft parts A71-29656

MATERIALS TESTS

Materials and structural design development by high velocity impact testing due to transport and subsonic military aircraft susceptibility to bird collision damage A71-29642

MATHEMATICAL MODELS

Monograph on potential flow interaction between blade rows in axial flow compressors covering mathematical model, numerical analysis and experiment A71-28883

High entrainment constant area multiple nozzle ejectors with two mixing tube lengths for boundary layer control, estimating performance with analytical model A71-29469

[ASME PAPER 71-FE-34] V/STOL aircraft gust effects prediction with mathematical models based on nonlinear hybrid simulation at takeoff and landing altitudes A71-29775

Modular concept mathematical model for combustion and pollution formation processes in jet engine combustors, including turbulent mixing and reaction kinetics [AIAA PAPER 71-714] A71-30766

Nonlinear mathematical model for dynamical behavior of extensible towing cable subjected to aerodynamic forces generated by uniform flow field, discussing system stability A71-31026

Wake model and computer program to compute geometries, flows and velocity influence coefficients for helicopter blade load calculations A71-31089

[AHS PREPRINT 523] Mathematical models for lifting rotor aerodynamic calculations, noting wake configurations [DLR-MIT-70-19] N71-24489

General aviation traffic implied densities and interaction frequencies computed with model using southern California to judge difficulty for naval air traffic [AD-719906] N71-25621

MEASURING INSTRUMENTS

Circumferential traversing probe technique for intrastage analysis of axial flow compressors, considering mass flow averaging data reduction technique [ASME PAPER 71-FE-33] A71-29468

Soviet book on experimental aerodynamics covering wind tunnels, shock tubes, liquid and gas physical properties, flow parameter measurement equipment, etc A71-29524

Supersonic mass flux probe description, discussing inlet geometry, angle of attack and Reynolds and Mach numbers effects on performance A71-29925

MECHANICAL DRIVES

Reduction gearbox reliability problems from development and service experience with PT6A turboprop engine [SAE PAPER 710433] A71-28318

MECHANICAL MEASUREMENT

Oscillatory pitching moment derivatives measurement on delta wings in incompressible flow [ARC-R/M-3628-PT-1-4] N71-24569

Measurements of oscillatory pitching moments on round leading edged delta wing in incompressible flow noting vortex flow development

MECHANICAL PROPERTIES

SUBJECT INDEX

Measurements of aerodynamic drag, interference lift, and pitching moment on delta wings
N71-24570

MECHANICAL PROPERTIES
Aircraft engine production components and alloys mechanical properties evaluation for improved reliability of mass produced products
A71-28944

Composite materials application to V/STOL prop/rotors, determining material properties parametric effect on frequencies and weight by Southwell coefficients
[AHS PREPRINT 554] A71-31106

METAL COATINGS
Metal coated superalloys evaluation for gas turbine engine components, including corrosion, impact and fatigue tests
A71-29635

METAL MATRIX COMPOSITES
Mechanical properties of composites consisting of Al matrix reinforced by boron fibers, considering high temperature creep, corrosion and thermal shock resistivity
A71-30473

METALS
Tests to determine short-term creep of metals and alloys under conditions of aerodynamic heating with high velocity air flow
[NASA-TT-F-13633] N71-25822
Impedance measurements on modified broadband metal antenna for speech communication
[FOA-3-C-3602-61] N71-26150

METEOROLOGICAL INSTRUMENTS
Self contained lightweight airborne data acquisition system for atmospheric and meteorological research, using analog recorder and telemetry system
A71-30311

METEOROLOGICAL PARAMETERS
Description of method for determining visibility in earth atmosphere
[AD-719502] N71-24375

METEOROLOGICAL RADAR
Meteorological radar for detection of thunderstorms, hail, and turbulence hazardous to aviation noting echo interpretation and radar transmission
[WMO-264-TP-148] N71-24394

METEOROLOGY
Single anemometer wind measurement required for aircraft landing, comparing data from different sampling periods
A71-30395

METHANE
Performance prediction of methane-fueled supersonic transports over range of cruise speeds up to Mach 4
[NASA-TM-X-2281] N71-25384
Fuel tests to determine feasibility of gelled methane for use in jet engine
[NASA-CR-72876] N71-25772

MICROBIOLOGY
Microbiological contamination of jet aircraft fuel tanks in tropical regions, considering maintenance
[SAE PAPER 710438] A71-28320

MICROORGANISMS
Electrical and physical nature of microbial membranes implicated in aircraft fuel quantity probe malfunction
[SAE PAPER 710439] A71-28321

MICROWAVE ANTENNAS
Flush mounted aeronautical waveguide antennas with dielectric plug for 5GHz operation
A71-31043
Low carrier power aircraft antenna module for airborne UHF communications system, considering range/field strength measurements
A71-31046
Aircraft phased arrays for L-band ATC satellite system application, alleviating problems of power budget and vulnerability to multipath and interference
A71-31054
L band aircraft antenna array consisting of circularly polarized elements and static electronic steering circuits for synchronous satellites radio links

MICROWAVE EQUIPMENT
Microstrip p-i-n diode controlled L band digital phase shifter for aircraft-satellite communication
A71-31074
Design and characteristics of continuous wave, microwave scanning-beam aircraft landing system operating at C band and superhigh frequencies
[AD-718972] N71-24555

MICROWAVE TRANSMISSION
Integrated flight test data system combining digital airborne data acquisition/recording system with telemetry/microwave link to computerized ground station
A71-30318

MILITARY AIR FACILITIES
Runway concrete pavement condition at Naval Station, Adak, Alaska
[AD-719889] N71-25604

MILITARY AIRCRAFT
Landing load estimation methods for preliminary design weight prediction for military aircraft
A71-28211
Optimization of military VTOL aircraft secondary power systems, considering alternate power source for aircraft hydraulics, pneumatic drives, etc
[SAE PAPER 710445] A71-28326
Military/commercial STOL transport design, discussing performance, payload and equipment requirements with emphasis on production cost benefits
[SAE PAPER 710468] A71-28336
Commercial vs military design criteria for STOL transport aircraft, noting landing and takeoff distances and noise levels
[SAE PAPER 710465] A71-30536
Army aircraft automatic inspection and maintenance monitoring system, considering feasibility, technology approach and effectiveness
[ATAA PAPER 71-649] A71-30726
Multimission strategic aircraft installation effects testing in propulsion and aerodynamic wind tunnels, yielding flowfield definition, inlet internal performance, drag, forebody shape and orientation
[ATAA PAPER 71-759] A71-30792
Flightworthy 25-foot diameter prop rotor wind tunnel test, considering civil and military need for VTOL transportation
[AHS PREPRINT 501] A71-31077
Procedures for evaluating effectiveness of self propelled and portable ground servicing units for Army aircraft
[AD-719102] N71-24459

MILITARY AVIATION
Military aviation greases for subsonic commercial airplane lubricants, discussing economic and technical benefits based on service experience and testing
[SAE PAPER 710411] A71-28304
Army rotorcraft performance data, discussing hovering and forward flight performance out of ground and level flight power requirements and drag and compressibility effects
[AHS PREPRINT 500] A71-31076

MILITARY HELICOPTERS
Soviet Mil V-12 heavy lift helicopter for civil and military missions, noting turbine engines, rotor configuration, cargo hold and navigation system
A71-30420
Weapons delivery computer for attack helicopters, using planar distributed function generator for general closed form instantaneous solution capability
[AHS PREPRINT 5311] A71-31092
Aerodynamic configurations and characteristics of USSR military helicopters
[AD-719585] N71-25133

MILITARY TECHNOLOGY
MAC malfunction detection, analysis and recording system applications in commercial airlines, emphasizing real time response for maintenance function
[SAE PAPER 710425] A71-28311
Procedures for service test evaluations of Army aircraft automatic navigation systems

SUBJECT INDEX

NOSES (FOREBODIES)

[AD-719096] N71-24369
MINIATURE ELECTRONIC EQUIPMENT
 Miniature transducers design and fabrication for fluctuating pressure measurements in jet engine testing, noting frequency response and power dissipation A71-30324

MINIATURIZATION
 Miniature aerodynamic turbulence gage using axisymmetric lifting body sensor A71-28158

MINIMUM DRAG
 Minimum drag wing-fuselage combination for supersonic speeds and prescribed lifting force, longitudinal moment and volume, using method of successive approximations A71-29182

MIRAGE 3 AIRCRAFT
 Extreme turbulence measurement during low level flights of Mirage A3-76 fighter aircraft, determining true gust velocities and power spectral energy distributions A71-29756

MISSILE CONTROL
 Control, navigation and guidance review, considering application of earth reference coordinates for aircraft, missiles and spacecraft A71-30710

MIXING LENGTH FLOW THEORY
 High entrainment constant area multiple nozzle ejectors with two mixing tube lengths for boundary layer control, estimating performance with analytical model [ASME PAPER 71-FE-34] A71-29469

MODULATION
 Sensing and communications technologies for short wayside headways, considering applicable equipment for personal rapid transit systems, modulation, coding and data transmission techniques A71-30337

MOMENTS OF INERTIA
 Roll moment of inertia to static margin ratio effect on yaw of repose angle magnitude - ballistic match of projectiles A71-29890

MOTIVATION
 Air transport and travel expansion rate, discussing motivations and cost A71-30159

MULTIPHASE FLOW
 Turbulence level effects on mixing of three plane parallel slipstreams with equal velocities and temperature from smoke visualization A71-28962

N

NACELLES
 Airframe installation effects on underwing nacelle nozzle performance, using calibrated engines and load cells on F-106 for measurements [AIAA PAPER 71-681] A71-30745

NASA PROGRAMS
 Authorization hearings on NASA space flight program - Part 4, 1972 N71-25196

NAVIGATION AIDS
 Optimum functional integration and performance requirements of navigation aids and ATC in terminal area [SAE PAPER 710456] A71-28333
 Area navigation system based on radio aids by airborne receivers and sensors for aircraft movement improvement, noting advantages of pilot displays [SAE PAPER 710457] A71-30533
 Control, navigation and guidance review, considering application of earth reference coordinates for aircraft, missiles and spacecraft A71-30710
 SK-5 air cushion vehicles evaluation including search/rescue, aids to navigation, law enforcement, safety logistics and oil pollution [AHS PREPRINT 572] A71-31113
 Procedures for service test evaluations of Army aircraft automatic navigation systems

[AD-719096] N71-24369
NAVIGATION INSTRUMENTS
 High speed airborne scanning navigational radar antenna with matched patterns, using offset horn fed reflector and polarization modes for improved visual display A71-31036

NICKEL ALLOYS
 Aluminate coatings for nickel-base superalloy developed for high temperature jet engine components [NASA-CR-72863] N71-25454

NIGHT
 Night rescue terminal navigation, considering design, development and tests of Limited Night Recovery System for HH-53 helicopter [AHS PREPRINT 534] A71-31095

NIGHT VISION
 Cheyenne attack helicopter weapons system, discussing night vision capability, armament, fire control and navigation equipment integration [AHS PREPRINT 530] A71-31091

NIOBIUM ALLOYS
 Silicide coated Nb alloys for gas turbine engine components operating at temperatures above 2000 F [SAE PAPER 710460] A71-28334

NITRIC OXIDE
 Chemical kinetic calculation of nitric oxide formation in spark ignition automobile engines and gas turbine combustors A71-30454

NOISE INTENSITY
 Aircraft noise on and near airports and factors affecting its intensity A71-29304

NOISE PROPAGATION
 Combustion generated aerodynamic noise, considering sound radiation from open turbulent flames, spectral content, power output and origin [AIAA PAPER 71-735] A71-30780

NOISE REDUCTION
 Aircraft propulsion system testing, stressing noise reduction and inlet-engine exhaust system compatibility [SAE PAPER 710450] A71-28328
 Operations research minimum cost model of aircraft noise abatement in airport communities [AIAA PAPER 71-525] A71-29551
 Noise attenuation prediction in absorbing ducts adaptable to bypass jet engines, using Morse theory A71-30522
 Tip turbine driven lift fan noise reduction tests, considering design parameters effects [AIAA PAPER 71-743] A71-30784
 Acoustic liner design for propellant combustion instability and jet aircraft noise suppression, discussing cross flow and oscillatory pressure effects [AIAA PAPER 71-757] A71-30791
 SST sonic boom minimization, discussing cross-country flight A71-30820

NOISE SPECTRA
 Complex noise emission spectra from superposition of continuous component and peaks, calculating level separations due to perfectly reflecting plane A71-30523

NONDESTRUCTIVE TESTS
 Nondestructive testing of aircraft structures using thulium and iridium gamma sources [JAERI-MEMO-4163] N71-24849
 Application of photochromic coatings to provide nondestructive inspection for aerospace materials and structures [AD-720239] N71-26383

NORTH ATLANTIC TREATY ORGANIZATION (NATO)
 Consideration by NATO of transonic wind tunnel requirements to support evolution of aeronautical and aerospace systems during next decade [AGARD-AR-35-71] N71-25073

NOSES (FOREBODIES)
 Conical body lift/drag ratio increase by wedge shaped nose, noting applications to space

- vehicles entering atmosphere above escape velocity
A71-29183
- NOZZLE FLOW**
Pressure distribution and drag prediction over slender axisymmetric fuselages and afterbodies and exhaust nozzles at transonic Mach numbers
[AIAA PAPER 71-720] A71-30771
- NOZZLE THRUST COEFFICIENTS**
Isolated axisymmetric jet engine exhaust nozzles thrust and drag predictions in sub-, trans- and supersonic flight regimes
[AIAA PAPER 71-719] A71-30770
- NUCLEAR PROPELLED AIRCRAFT**
Air breathing nuclear propulsion, considering reactor safety in air cushion vehicles and aircraft
A71-29930
- Studying aircraft accidents to determine impact angle and speed criteria for designing nuclear airplane fission product containment vessel
[NASA-TM-X-2245] N71-25411
- NUCLEAR PROPULSION**
Air breathing nuclear propulsion, considering reactor safety in air cushion vehicles and aircraft
A71-29930
- Potential feasibility of safe, practical, and economical air breathing nuclear propulsion system for aircraft and air cushion vehicles
[NASA-TM-X-67837] N71-25524
- Characteristics and cost analysis of nuclear powered air cushion vehicles for oceanic commercial operations
[NASA-TM-X-2293] N71-25783
- NUCLEAR REACTORS**
Design point characteristics of 15-80 kWe nuclear reactor Brayton cycle power system
[NASA-TM-X-67811] N71-24689
- Predicted performance of 15-80 kWe reactor Brayton power system over range of operating conditions
[NASA-TM-X-67833] N71-24690
-
- OH-6 HELICOPTER**
Rotor stability derivatives determination from instrumented OH-6A prototype helicopter wind tunnel tests, comparing data with analytical results obtained by digital computing technique
[AHS PREPRINT 543] A71-31100
- OKLAHOMA**
Oklahoma and Malaysia thunderstorms comparison based on weather reconnaissance aircraft measurements, considering turbulence patches
A71-29752
- OMEGA NAVIGATION SYSTEM**
Long range hyperbolic navigation in U.S., discussing loran and Omega systems
A71-30711
- ONBOARD EQUIPMENT**
Onboard aircraft refractometer design, operation and effectiveness
A71-28250
- Onboard area navigation systems in ATC environment, discussing route structure and flight instruments
[SAE PAPER 710455] A71-28332
- Satellite aided aircraft collision avoidance system effective for large number of aircraft
[NASA-CASE-ERC-10090] N71-24948
- OPERATIONS RESEARCH**
Operations research minimum cost model of aircraft noise abatement in airport communities
[AIAA PAPER 71-525] A71-29551
- OPTICAL DATA PROCESSING**
Holographic techniques, optical data processing and laser properties for aerospace instrumentation
A71-30329
- OPTICAL DENSITY**
Visible exhaust smoke trails from aircraft jet engines, measuring optical density by photographic photometry
[SAE PAPER 710428] A71-28314
- OPTICAL EQUIPMENT**
Development and characteristics of scanning systems for thermal viewers and infrared detectors for airborne operation
[AD-719854] N71-25053
- OPTICAL MEASUREMENT**
Optical measurement of sprays mean droplet size, assessing operating variables effect on air-blast atomizer characteristics
A71-28756
- Photoelectric, bolometric and photographic recording assembly for measurement of light pressure and aerodynamic forces on complex shape body in free molecular flow
A71-29155
- OPTICAL PROPERTIES**
Aircraft mounted infrared detectors for remote measurements of optical cloud properties
N71-25260
- OPTIMIZATION**
Optimization of military VTOL aircraft secondary power systems, considering alternate power source for aircraft hydraulics, pneumatic drives, etc
[SAE PAPER 710445] A71-28326
- Optimal penetration effect on peripheral gas flow temperature field at outlet of turbine combustion chamber with circular flame tubes
A71-28971
- Wing thickness optimal distribution for minimum wave drag in supersonic flow at zero angle of attack for given planform, using Ritz method at lower Mach numbers
A71-29222
- Design interface requirements for optimal aircraft engine condition monitoring system, using parameter, vibration, oil, borescope and radiography analysis
[SAE PAPER 710447] A71-30531
- ORIFICES**
Automated orifice drilling optimal treatment routines, including proper timing and adequate total depth allowance
A71-28941
- OXIDATION**
Hypersonic flight load bearing refractory alloy control surface protective coatings, emphasizing oxidation screening tests
A71-29646
- P
- P-I-N JUNCTIONS**
Microstrip p-i-n diode controlled L band digital phase shifter for aircraft-satellite communication
A71-31055
- PANEL FLUTTER**
Supersonic flutter analysis of clamped skew panels with in-plane forces by Galerkin method, using two dimensional static approximation for aerodynamic loading
A71-30607
- Structural and inertial nonlinearities influence on flat or curved panel flutter
A71-30825
- Application of research in panel flutter and boundary layer thickness to space shuttle
N71-24660
- Nonlinear panel flutter analyses by perturbation and harmonic balance methods
[NASA-CR-111907] N71-25362
- PARACHUTE DESCENT**
Development of mathematical model for opening behavior of parachutes noting drag and velocity as functions of time
[AD-719698] N71-24433
- PARACHUTES**
Brief history of parachute development including devices and methods for canopy deployment
[AD-719480] N71-24351
- Development of mathematical model for opening behavior of parachutes noting drag and velocity as functions of time
[AD-719698] N71-24433
- PASSENGER AIRCRAFT**
Fuselage influence on total aircraft drag in subsonic passenger aircraft, considering high aspect ratio cylindrical fuselages
A71-30821
- PAVEMENTS**
Airport pavement design principles, considering imposed stresses at flight operation areas,

SUBJECT INDEX

PITCH (INCLINATION)

- runways, taxiways, apron and waiting position
overrun areas, shoulders and strips
A71-29311
- Runway concrete pavement condition at Naval
Station, Adak, Alaska
[AD-719889] N71-25604
- PAYLOADS**
Optimization of payload for space shuttle by
reducing structural loading and weight
N71-24664
- PERFORMANCE**
Minimizing drag and increasing performance of
optimum shapes at hypersonic flight
N71-24704
- PERFORMANCE PREDICTION**
Data correlation and effectiveness prediction from
film cooling injection geometries, considering
finitely thick slot lip and boundary layers
A71-28751
German monograph on game theory and planning
techniques for aircraft evaluation
A71-28880
Acoustic linings for attenuation of fan generated
noise in turbofan engines, considering
interaction between analytical lining
performance prediction and flow duct testing
[AIAA PAPER 71-731] A71-30778
Development of mathematical model for opening
behavior of parachutes noting drag and velocity
as functions of time
[AD-719698] N71-24433
Predicted performance of 15-80 kWe reactor Brayton
power system over range of operating conditions
[NASA-TM-X-67833] N71-24690
Performance prediction of methane-fueled
supersonic transports over range of cruise
speeds up to Mach 4
[NASA-TM-X-2281] N71-25384
- PERFORMANCE TESTS**
CF6 turbofan engine development, discussing
performance and endurance tests and design
changes for reliable low cost operation
[SAE PAPER 710421] A71-28308
Airline engine performance testing from operator
perspective, using automated test cell data
acquisition system
[SAE PAPER 710451] A71-28329
Measurement errors in testing single stage air
driven axial flow compressors and turbines
A71-28582
Wind tunnel tests of geometrically compatible
airfoils for variable chord sailplane
A71-29257
High entrainment constant area multiple nozzle
ejectors with two mixing tube lengths for
boundary layer control, estimating performance
with analytical model
[ASME PAPER 71-FE-34] A71-29469
Axial flow turbines comparative performance tests
under steady and pulse flow conditions for
turbocharger application
A71-29819
Airframe installation effects on underwing nacelle
nozzle performance, using calibrated engines and
load cells on F-106 for measurements
[AIAA PAPER 71-681] A71-30745
Multimission strategic aircraft installation
effects testing in propulsion and aerodynamic
wind tunnels, yielding flowfield definition,
inlet internal performance, drag, forebody shape
and orientation
[AIAA PAPER 71-759] A71-30792
SK-5 air cushion vehicles evaluation including
search/rescue, aids to navigation, law
enforcement, safety logistics and oil pollution
[AHS PREPRINT 572] A71-31113
Procedures for service test evaluations of Army
aircraft automatic navigation systems
[AD-719096] N71-24369
Dynamic tests of helicopter components
N71-24388
Hovering performance tests of jet-flapped rotors
and comparison of predicted and actual results
[NAL-TR-211] N71-25396
- PERIPHERAL JET FLOW**
Optimal penetration effect on peripheral gas flow
temperature field at outlet of turbine
combustion chamber with circular flame tubes
A71-28971
- PERSONNEL DEVELOPMENT**
Proceedings of conference to train personnel in
conducting aircraft noise certification tests
[HRC-TR-300-SUPPL-1] N71-26303
Familiarization of Federal Aviation Administration
personnel in acoustic measurement techniques and
procedures involved in noise certification of
aircraft
[HRC-TR-300] N71-26304
- PERTURBATION THEORY**
Nonlinear panel flutter analyses by perturbation
and harmonic balance methods
[NASA-CR-111907] N71-25362
- PHASE SHIFT CIRCUITS**
Microstrip p-i-n diode controlled L band digital
phase shifter for aircraft-satellite
communication
A71-31055
- PHASED ARRAYS**
High speed electronic phase and frequency scanned
linear, static fed and monopulse arrays element
and angular error analysis
A71-31049
Aircraft phased arrays for L-band ATC satellite
system application, alleviating problems of
power budget and vulnerability to multipath and
interference
A71-31054
- PHOTOCHROMISM**
Application of photochromic coatings to provide
nondestructive inspection for aerospace
materials and structures
[AD-720239] N71-26383
- PHOTOGRAPHIC FILM**
Visual flight simulation devices, considering high
resolution photographic films and digital
memories
A71-29483
- PHYSICAL PROPERTIES**
Electrical and physical nature of microbial
membranes implicated in aircraft fuel quantity
probe malfunction
[SAE PAPER 710439] A71-28321
Soviet book on experimental aerodynamics covering
wind tunnels, shock tubes, liquid and gas
physical properties, flow parameter measurement
equipment, etc
A71-29524
- PILOT PERFORMANCE**
Automatic landing systems independent monitor for
L-1011 aircraft, providing pilot confidence
under reduced visibilities
[SAE PAPER 710443] A71-28324
Commercial aircraft piloting in atmospheric
turbulence, discussing aircraft characteristics,
instrumentation, flying procedures, pilot
training and kinesthetic cues
A71-29782
Controlled aircraft motion under strict kinematic
constraints in terms of simple subsystems,
noting pilots role in Newmark theory
A71-31024
Comparison of pilot performance using center
stick, dual side stick, and single side stick
configuration
[AD-720846] N71-25846
Flight evaluations using variable stability
aircraft to determine effects of turbulence
induced aerodynamic disturbances and lateral
directional dynamics on pilot performance
[NASA-CR-1718] N71-26170
- PILOT TRAINING**
DC 10 flight crew individualized ground training
program, emphasizing hands-on equipment and
instruction hardware
[SAE PAPER 710472] A71-30538
- PITCH (INCLINATION)**
Aircraft flight characteristics dependence on
angle of attack, roll and pitch
A71-29043
Propeller vortex theory, calculating vortex
strengths pitch distributions and wake
configuration
A71-30443
Handling qualities and control sensitivity of high
performance helicopters, considering pitch and
collective control
[AHS PREPRINT 542] A71-31099

PITCHING MOMENTS

SUBJECT INDEX

PITCHING MOMENTS

Oscillatory pitching moment derivatives
 measurement on delta wings in incompressible
 flow
 [ARC-R/N-3628-PT-1-4] N71-24569
 Measurements of oscillatory pitching moments on
 round leading edged delta wing in incompressible
 flow noting vortex flow development N71-24570
 Measurement of oscillatory pitching moment
 derivatives on sharp-edged delta wing at vortex
 breakdown angle of attack N71-24572
 Expressions for relating pressure field to total
 aerodynamic thrust and steady pitching and
 rolling moments experienced by helicopter rotor
 N71-26583

PITTING

Artificial corrosion pits effect on fatigue
 durability of smooth samples and aircraft
 duraluminum skin elements A71-27819

PLATE THEORY

Soviet papers on three dimensional structures
 covering strength and stability of compound
 curvature shells, bodies of revolution and
 multilayer plates A71-30888

PLATES (STRUCTURAL MEMBERS)

Simply supported normal mode plate time response
 to traveling wave at oblique incidence, using
 numerical analysis A71-30068

PLENUM CHAMBERS

Supersonic staggered gutter colander combustion
 system for plenum chamber burning on high bypass
 Pegasus turbofan engine of Harrier VTOL
 aircraft, noting performance improvement A71-28743

PLUGGING

Plug-in relay hazards and minimization for
 aircraft flight safety applications A71-28841

PORTABLE EQUIPMENT

Low cost go/no-go portable aircraft engine tester
 connected to engine mounted sensors A71-30327
 Procedures for evaluating effectiveness of self
 propelled and portable ground servicing units
 for Army aircraft
 [AD-719102] N71-24459

POSITION (LOCATION)

Locating neutral layer and critical curvature
 radius in aircraft components waffle panels
 under elastoplastic bending A71-28940

POSITION ERRORS

Combined inertial and instrument landing aircraft
 navigation systems with reduced cross runway
 position and velocity errors, using optimal
 linear estimation A71-30606

POWER SPECTRA

Extreme turbulence measurement during low level
 flights of Mirage A3-76 fighter aircraft,
 determining true gust velocities and power
 spectral energy distributions A71-29756

POWER TRANSMISSION

Helicopter power transmission failure modes,
 presenting field experiences correlation with
 conventional design stress analysis and bench
 test data
 [SAE PAPER 710454] A71-28331
 Powered landing gear wheel system requirements for
 parking and taxiing of commercial jet transport
 airplanes
 [SAE PAPER 710446] A71-30530
 Strain gage torqueometer as primary power
 indicating instrument in helicopter transmission
 systems, providing advantages for helicopter
 designer and operator
 [AHS PREPRINT 563] A71-31110

PRESSURE DISTRIBUTION

Air inlet for simulation of shock wave separated
 flow in supersonic diffusers, deriving pressure
 variation profile along free boundary A71-29175

Sound radiation and pressure fields inside
 vibrating turbomachine blades, using
 miniaturized microphones and compact capacitive
 detectors A71-30517

Pressure distribution and drag prediction over
 slender axisymmetric fuselages and afterbodies
 and exhaust nozzles at transonic Mach numbers
 [AIAA PAPER 71-720] A71-30771

Retreating blade stall experiments on model
 helicopter rotor, considering series of pressure
 distribution and boundary layer events
 [AHS PREPRINT 521] A71-31087

Low speed wind tunnel test of four ft diameter
 circular plate model to determine surface static
 pressure distributions for jet decay
 characteristics of cross flow
 [AD-720232] N71-26516

Expressions for relating pressure field to total
 aerodynamic thrust and steady pitching and
 rolling moments experienced by helicopter rotor
 N71-26583

PRESSURE EFFECTS

Incident sonic boom shock wave reflection factors
 off smooth surface, discussing pressure rise and
 flight near threshold Mach number A71-30610

PRESSURE MEASUREMENTS

Miniature transducers design and fabrication for
 fluctuating pressure measurements in jet engine
 testing, noting frequency response and power
 dissipation A71-30324
 Fluctuating pressure measurements in jet engine
 testing, using miniature transducers with
 calibration and data acquisition equipment A71-30325

PRESSURE OSCILLATIONS

Fan-produced sound pressure fluctuation in very
 low speed subsonic wind tunnel test stream,
 noting resulting anemometer calibration errors
 A71-30526

Turbopropulsion systems thrust augmentor
 combustion instability, discussing physical
 causes due to various pressure oscillation modes
 [AIAA PAPER 71-697] A71-30756

Turbojet and turbofan augmentors combustion
 instability, discussing pressure oscillations
 elimination by screech liner and flameholder
 design
 [AIAA PAPER 71-698] A71-30757

Transonic wind tunnel investigation of flow
 characteristics and pressure fluctuation of
 space shuttle launch and reentry configurations
 N71-24663

PRESSURE SENSORS

Cam profile selection for adjustment in computing-
 resolving unit of aneroid sensors of altimeters
 A71-28938

High altitude balloons pressure-altitude
 transducer assembly, discussing electronic
 circuitry, calibration and temperature and
 vibration effects A71-30070

Altitude-air speed and Mach number pressure
 transducer with diaphragm free of temperature
 and vibration effects A71-30322

Miniature transducers design and fabrication for
 fluctuating pressure measurements in jet engine
 testing, noting frequency response and power
 dissipation A71-30324

Fluctuating pressure measurements in jet engine
 testing, using miniature transducers with
 calibration and data acquisition equipment
 A71-30325

Pressure sensor network for measuring liquid
 dynamic response in flight including fuel tank
 acceleration, liquid slosh amplitude, and fuel
 depth monitoring
 [NASA-CASE-XLA-05541] N71-26387

PRESSURIZED CABINS

Fluidic cabin pressure automatic control systems
 for military and civil aircraft, discussing
 design, operation and performance A71-30308

PROBES

HF rake probes with high temperature integrated

SUBJECT INDEX

RADAR CORNER REFLECTORS

sensor for inflight aircraft engine intake air flow distortion measurements A71-30321

PRODUCT DEVELOPMENT
 Olympus 593 pure jet twin shaft engine development program for Concorde, discussing engine evolution, design considerations and flight development [SAE PAPER 710422] A71-28309
 Commercial aircraft powerplant development, discussing engine and components test programs and techniques [SAE PAPER 710449] A71-28327

PRODUCTION ENGINEERING
 Complex structural aircraft components manufacture, using group technology principle based on subdivision of parts classes A71-30267

PROJECT MANAGEMENT
 Costs-reliability relationships in helicopter development testing and demonstration, emphasizing decision making in program management [SAE PAPER 710452] A71-28330
 Criteria for converting aeronautical project operational targets into actual requirements and technical specifications, emphasizing cost effectiveness A71-30824

PROJECTILES
 Roll moment of inertia to static margin ratio effect on yaw of repose angle magnitude in ballistic match of projectiles A71-29890

PROPAGATION MODES
 Simply supported normal mode plate time response to traveling wave at oblique incidence, using numerical analysis A71-30068

PROPELLANT COMBUSTION
 Acoustic liner design for propellant combustion instability and jet aircraft noise suppression, discussing cross flow and oscillatory pressure effects [AIAA PAPER 71-757] A71-30791

PROPELLANT SPRAYS
 Gas turbine engine combustion chamber start-up and burning performance, considering air injection and propellant atomization A71-28968
 Gas turbine engine startup igniter with modified propellant atomizer enhanced by air injection A71-28969

PROPELLER FANS
 Prop-fan propulsion system for V/STOL short haul transport aircraft, discussing performance, noise and weight characteristics [SAE PAPER 710470] A71-28338
 Acoustic measurements on prop-fan model propulsion system - Vol. 2, appendices [NASA-CR-111842-2] N71-25784
 Acoustic measurements on prop-fan model propulsion system [NASA-CR-111842-1] N71-25785

PROPELLER SLIPSTREAMS
 Propeller vortex theory, calculating vortex streets pitch distributions and wake configuration A71-30443

PROPULSION SYSTEM CONFIGURATIONS
 Prop-fan propulsion system for V/STOL short haul transport aircraft, discussing performance, noise and weight characteristics [SAE PAPER 710470] A71-28338
 Propulsion, guidance and stability of ground effect vehicle with perimetric Coanda fluid boundary A71-29308
 Wind tunnel force test program design for jet aircraft configurations, including propulsion system simulation A71-30605
 VTOL turboshaft engine powered propulsion system development, detailing design requirements, program planning, component research and system integration [AHS PREPRINT 562] A71-31109

PROPULSION SYSTEM PERFORMANCE
 CF6 turbofan engine development, discussing performance and endurance tests and design changes for reliable low cost operation [SAE PAPER 710421] A71-28308
 Aircraft propulsion system testing, stressing noise reduction and inlet-engine exhaust system compatibility [SAE PAPER 710450] A71-28328
 Thrust measurement of aircraft propulsion systems, considering hydraulic piston device, edge clearance, oil quantity and calibration A71-29860
 V/STOL propulsion units lift ratings based on aircraft system requirements [SAE PAPER 710471] A71-30537
 Airframe installation effects on underwing nacelle nozzle performance, using calibrated engines and load cells on F-106 for measurements [AIAA PAPER 71-681] A71-30745
 Multimission strategic aircraft installation effects testing in propulsion and aerodynamic wind tunnels, yielding flowfield definition, inlet internal performance, drag, forebody shape and orientation [AIAA PAPER 71-759] A71-30792
 Acoustic measurements on prop-fan model propulsion system - Vol. 2, appendices [NASA-CR-111842-2] N71-25784
 Acoustic measurements on prop-fan model propulsion system [NASA-CR-111842-1] N71-25785
 Wind tunnel tests to determine Mach 2.5 performance of bicone inlet with internal focused compression and 40-percent internal contraction [NASA-TM-X-2294] N71-25872

PROTECTIVE COATINGS
 Silicide coated Nb alloys for gas turbine engine components operating at temperatures above 2000 F [SAE PAPER 710460] A71-28334
 Materials and processing methods for rain erosion resistant ceramic coated plastic structures for supersonic aircraft, considering fiberglass reinforced polyimide radomes with alumina coating A71-29645
 Hypersonic flight load bearing refractory alloy control surface protective coatings, emphasizing oxidation screening tests A71-29646
 Application of photochromic coatings to provide nondestructive inspection for aerospace materials and structures [AD-720239] N71-26383

PULSE CODE MODULATION
 Concorde SST flight test equipment installation with PCM recording and visual instruments A71-30055

PULSED LASERS
 Airborne equipment for CAT detection ahead of aircraft, considering pulsed Doppler laser and IR detectors A71-29765

R

RADAR ANTENNAS
 High speed airborne scanning navigational radar antenna with matched patterns, using offset horn fed reflector and polarization modes for improved visual display A71-31036
 Structural design, mechanical stability and aircraft compatibility for airborne side-looking radar antennas, using end fed slotted waveguide arrays A71-31041

RADAR BEACONS
 Radarscope net for target azimuth and distance and for direct altitude readout through beacon numerics A71-28886

RADAR CORNER REFLECTORS
 Multiple planar Luneberg lens circular array for airborne electronically scanned X band narrow beam antenna mounted under aircraft nose or fuselage A71-31038

RADAR DETECTION

RADAR DETECTION

Meteorological radar for detection of thunderstorms, hail, and turbulence hazardous to aviation noting echo interpretation and radar transmission

[WMO-264-TP-148] N71-24394

RADAR NAVIGATION

Air navigation techniques history, considering radio, radar, loran Doppler and inertial navigation

A71-30712

RADARSCOPES

Radarscope net for target azimuth and distance and for direct altitude readout through beacon numerics

A71-28886

ATC radar display systems mapping techniques using vectors and optical projections

A71-30014

RADIATION DETECTORS

Sound radiation and pressure fields inside vibrating turbomachine blades, using miniaturized microphones and compact capacitive detectors

A71-30517

RADIATION DISTRIBUTION

Jet aircraft sound spectrum on ground and in air, comparing calculation with experiment

A71-30524

RADIATION PRESSURE

Photoelectric, bolometric and photographic recording assembly for measurement of light pressure and aerodynamic forces on complex shape body in free molecular flow

A71-29155

RADIO ANTENNAS

Airborne blade antenna tunable for 26-100 MHz by individual bands, using binary related inductors switched by miniature high vacuum relays

A71-31044

Light aircraft notch antenna for efficient radiation at HF band lower end and minimal interference with aircraft structure

A71-31053

RADIO COMMUNICATION

ATS 1 and 3 satellite VHF transponders for ships and aircraft location, communication and remote sensing, discussing performance test results

A71-30898

Helicopter aerial design problems, considering antenna multiplicity use of nonmetallic structures and complexity of airborne radio systems

A71-31048

RADIO FREQUENCY INTERFERENCE

Interference prediction model for evaluating expected interactions between avionics equipment on aircraft

[AD-718997] N71-24357

RADIO NAVIGATION

Area navigation system based on radio aids by airborne receivers and sensors for aircraft movement improvement, noting advantages of pilot displays

[SAE PAPER 710457] A71-30533

Air navigation techniques history, considering radio, radar, loran Doppler and inertial navigation

A71-30712

RADIO TRACKING

ATS 1 and 3 satellite VHF transponders for ships and aircraft location, communication and remote sensing, discussing performance test results

A71-30898

RADOME MATERIALS

Materials and processing methods for rain erosion resistant ceramic coated plastic structures for supersonic aircraft, considering fiberglass reinforced polyimide radomes with alumina coating

A71-29645

RADOMES

Materials and processing methods for rain erosion resistant ceramic coated plastic structures for supersonic aircraft, considering fiberglass reinforced polyimide radomes with alumina coating

A71-29645

SUBJECT INDEX

RAIL TRANSPORTATION

Integrated short-haul interurban transportation system, considering combination of conventional jet aircraft, STOL aircraft and high-speed ground transportation

[AIAA PAPER 71-508] A71-29550

Aviation and surface transportation safety for 1970 with related accident investigations and recommendations

[AR-4] N71-24925

Investigation of aerodynamic forces imposed on vehicles proposed for operation in improved urban transportation system

N71-26129

RAIN

Precipitation detector and mechanism for stopping and restarting machinery at initiation and cessation of rain

[NASA-CASE-XLA-2619] N71-26334

RANDOM PROCESSES

Random process theory method for estimating response of flexible airplanes to atmospheric turbulence

N71-24708

RAPID TRANSIT SYSTEMS

Sensing and communications technologies for short wayside headways, considering applicable equipment for personal rapid transit systems, modulation, coding and data transmission techniques

A71-30337

RAREFIED GAS DYNAMICS

Heat transfer on spheres and sharp cones in rarefied hypersonic gas flow at zero angles of attack in wind tunnel vacuum

A71-29176

REACTION KINETICS

Chemical kinetic calculation of nitric oxide formation in spark ignition automobile engines and gas turbine combustors

A71-30454

Modular concept mathematical model for combustion and pollution formation processes in jet engine combustors, including turbulent mixing and reaction kinetics

[AIAA PAPER 71-714] A71-30766

REACTOR CORES

Studying aircraft accidents to determine impact angle and speed criteria for designing nuclear airplane fission product containment vessel

[NASA-TM-X-2245] N71-25411

REACTOR SAFETY

Air breathing nuclear propulsion, considering reactor safety in air cushion vehicles and aircraft

A71-29930

REAL GASES

Elliptical cones at large angle of attack, calculating three-component real gas properties effects on aerodynamic characteristics

A71-29191

REAL TIME OPERATION

MAC malfunction detection, analysis and recording system applications in commercial airlines, emphasizing real time response for maintenance function

[SAE PAPER 710425] A71-28311

RECORDING INSTRUMENTS

Photoelectric, bolometric and photographic recording assembly for measurement of light pressure and aerodynamic forces on complex shape body in free molecular flow

A71-29155

Concorde SST flight test equipment installation with PCM recording and visual instruments

A71-30055

RECTANGULAR PLANFORMS

Numerical evaluation of downwash integral for wing loading of lifting rectangular planform

[NPL-MA-90] N71-24483

RECTANGULAR WINGS

Gust transfer functions relating lift and moments to upwash in single sinusoidal wave for large aspect ratio rectangular wings in turbulent incompressible flow

A71-30604

REDUNDANT COMPONENTS

Third Chance flight control system, discussing aircraft control capability with backup

SUBJECT INDEX

ROTARY WINGS

- hydraulic system after loss of dual main hydraulic systems due to combat damage A71-29382
- REENTRY TRAJECTORIES**
Spacecraft optimal atmospheric reentry trajectory for minimum flight distance, investigating angle of attack control with allowance for load constraints A71-29229
- REENTRY VEHICLES**
Transonic wind tunnel investigation of flow characteristics and pressure fluctuation of space shuttle launch and reentry configurations N71-24663
- REFERENCE ATMOSPHERES**
Aircraft barometric altimeter errors caused by atmospheric temperature deviations from International Standard Atmosphere A71-30323
- REFRACTOMETERS**
Onboard aircraft refractometer design, operation and effectiveness A71-28250
- REFRACTORY METAL ALLOYS**
Hypersonic flight load bearing refractory alloy control surface protective coatings, emphasizing oxidation screening tests A71-29646
- REGULATIONS**
Book on air law and civil air policy covering international regulation, air traffic market, passenger and cargo services, etc A71-29938
SAE/DOT conference on aircraft and environments covering noise pollution, airport noise, sonic booms, regulatory/legal aspects and air pollution [AIAA PAPER 71-729] A71-30776
- REINFORCED PLASTICS**
Materials and processing methods for rain erosion resistant ceramic coated plastic structures for supersonic aircraft, considering fiberglass reinforced polyimide radomes with alumina coating A71-29645
- REINFORCING FIBERS**
Filamentary composite reinforced metal aircraft structures, considering boron/epoxy in combination with aluminum A71-28168
Mechanical properties of composites consisting of Al matrix reinforced by boron fibers, considering high temperature creep, corrosion and thermal shock resistivity A71-30473
- REMOTE SENSORS**
Aircraft mounted infrared detectors for remote measurements of optical cloud properties N71-25260
- RESCUE OPERATIONS**
Night rescue terminal navigation, considering design, development and tests of Limited Night Recovery System for HH-53 helicopter [AHS PREPRINT 534] A71-31095
SK-5 air cushion vehicles evaluation including search/rescue, aids to navigation, law enforcement, safety logistics and oil pollution [AHS PREPRINT 572] A71-31113
Test procedures to evaluate aircraft borne equipment for use in crash rescue operations [AD-720563] N71-26195
- RESIDUAL STRESS**
Helicopter component surface finish smoothness and residual stress requirements, using abrasive grinding belt machines with gear link mechanisms A71-28943
- RESISTANCE HEATING**
Hypervelocity blowdown nitrogen wind tunnel with graphite resistance heater noting nozzles, diffuser, and calibration [IC-AERO-71-01] N71-24675
- RESONANT VIBRATION**
Mechanical support system role in determination of aeroelastic stability of leeward cylinder immersed in wake using undamped flutter theory A71-31021
- REYNOLDS NUMBER**
Asymptotic limiting viscous flow pattern and drag on flat plate with stationary separation zones at large Reynolds numbers A71-29204
- Friction factor for low Reynolds number turbulent flow in large aspect ratio rectangular ducts, comparing Blasius and Prandtl relations [ASME PAPER 71-PP-A] A71-29378
Supersonic mass flux probe description, discussing inlet geometry, angle of attack and Reynolds and Mach numbers effects on performance A71-29925
Reynolds number simulation requirements for subsonic wind tunnel tests of space shuttle configurations N71-26065
- RHEOELECTRICAL SIMULATION**
Sonic boom induced indoor acoustical waves, using electrical analog A71-30200
Heavy lift helicopter flight control system design, emphasizing fly by wire electrical analog [AHS PREPRINT 503] A71-31079
- RIGID ROTOR HELICOPTERS**
Retreating blade stall experiments on model helicopter rotor, considering series of pressure distribution and boundary layer events [AHS PREPRINT 521] A71-31087
Electromechanical control system synthesis for compound hingeless rotor helicopter, using root locus method with transfer functions from airframe motion linear model [AHS PREPRINT 536] A71-31096
AH-56A compound helicopter rigid rotor stability and handling qualities, using flight, whirl tower and wind tunnel tests [AHS PREPRINT 574] A71-31115
- RIGID ROTORS**
Stiffened horizontal stoppable hingeless rotor conversion from helicopter to airplane flight speeds [AHS PREPRINT 502] A71-31078
Forward flight performance of coaxial rigid rotor in NASA wind tunnel, comparing to aerodynamic stability with conventional rotors [AHS PREPRINT 524] A71-31090
- ROADS**
Analysis of adequacy of access routes to Dulles International Airport and need for additional facilities to accommodate future expansion [PB-194094] N71-26301
- ROLL**
Aircraft flight characteristics dependence on angle of attack, roll and pitch A71-29043
Roll moment of inertia to static margin ratio effect on yaw of repose angle magnitude in ballistic match of projectiles A71-29890
- ROLLING MOMENTS**
Expressions for relating pressure field to total aerodynamic thrust and steady pitching and rolling moments experienced by helicopter rotor N71-26583
- ROTARY GYROSCOPES**
Helicopter gyro displacement measurements at differing flying conditions [POA-2-C-2356-49-/72/] N71-26567
- ROTARY STABILITY**
Helicopter rotor system vibratory and mechanical stability characteristics, investigating anisotropically mounted flexible swash plate and blade out of track effects [AHS PREPRINT 511] A71-31082
AH-56A compound helicopter rigid rotor stability and handling qualities, using flight, whirl tower and wind tunnel tests [AHS PREPRINT 574] A71-31115
- ROTARY WING AIRCRAFT**
Army rotorcraft performance data, discussing hovering and forward flight performance out of ground and level flight power requirements and drag and compressibility effects [AHS PREPRINT 500] A71-31076
- ROTARY WINGS**
Structure and shape of vortex wake associated with oblique flow past multiblade hinged rotor, using cavitation method A71-29217

Helicopter rotor vortex system and induced velocity field for various angles of attack, flight conditions and unit loads, using smoke visualization technique
A71-29235

Noise production during aerodynamic tests on helicopter rotor in wind tunnel
A71-30519

Stiffened horizontal stoppable hingeless rotor conversion from helicopter to airplane flight speeds
[AHS PREPRINT 502] A71-31078

Helicopter rotor blade airload by applying lifting surface solution
[AHS PREPRINT 510] A71-31081

Helicopter rotor system vibratory and mechanical stability characteristics, investigating anisotropically mounted flexible swash plate and blade out of track effects
[AHS PREPRINT 511] A71-31082

Helicopter fuselage vertical and in-plane main rotor head vibratory forces isolation with hydropneumatic servo-centered system at transmission/airframe interface
[AHS PREPRINT 514] A71-31085

Helicopter rotor stall characteristics, investigating blade flexibility, unsteady aerodynamics and variable inflow effects
[AHS PREPRINT 520] A71-31086

Flow field velocity distribution at rotating wing devices tip vortices
[AHS PREPRINT 522] A71-31088

Wake model and computer program to compute geometries, flows and velocity influence coefficients for helicopter blade load calculations
[AHS PREPRINT 523] A71-31089

Rotor stability derivatives determination from instrumented OH-6A prototype helicopter wind tunnel tests, comparing data with analytical results obtained by digital computing technique
[AHS PREPRINT 543] A71-31100

Fail-safe helicopter rotor control design, discussing damage tolerant components, redundant system, failure warning and maintenance
[AHS PREPRINT 550] A71-31102

Size effects on large rotor systems design, considering weight, blade loading, tip speed, etc
[AHS PREPRINT 552] A71-31104

Optimal turbofan engine and reaction drive rotor combinations for helicopter design
[AHS PREPRINT 561] A71-31108

High performance UH-1 compound helicopter high speed flight research, considering rotor loads, stability, control and flying qualities
[AHS PREPRINT 570] A71-31111

Fatigue life of helicopter rotary wings under vibrational stresses
N71-24386

Rotary wing structural stability of Dornier high temperature gas jet helicopter
N71-24387

Hovering performance tests of jet-flapped rotors and comparison of predicted and actual results
[NAL-TR-211] N71-25396

Expressions for relating pressure field to total aerodynamic thrust and steady pitching and rolling moments experienced by helicopter rotor
N71-26583

ROTATING BODIES
Metal temperatures in rotating cooled gas turbine blades, discussing coolant flow aerodynamics
A71-28748

ROTATING DISKS
Axisymmetrical three component flow equations for incompressible viscous fluid in cylinder with rotating disk
A71-30855

ROTOR AERODYNAMICS
Mathematical models for lifting rotor aerodynamic calculations, noting wake configurations
[DLR-MITT-70-19] N71-24489

ROTOR BLADES
Incompressible fluid motion in laminar boundary layer on blade rotating uniformly about axis perpendicular to wing span
A71-30218

Advancing Blade Concept helicopter lifting rotor development, discussing full scale analysis, design, fabrication and wind tunnel tests
[AHS PREPRINT 504] A71-31080

Rotor blade stall induced helicopter control loads, combining unsteady aerodynamics with aeroelastic rotor analysis
[AHS PREPRINT 513] A71-31084

Retreating blade stall experiments on model helicopter rotor, considering series of pressure distribution and boundary layer events
[AHS PREPRINT 521] A71-31087

Integral spar inspection system for making CH-46 rotor blade fail-safe
[AHS PREPRINT 551] A71-31103

Size effects on large rotor systems design, considering weight, blade loading, tip speed, etc
[AHS PREPRINT 552] A71-31104

RUNWAY CONDITIONS
Airport pavement design principles, considering imposed stresses at flight operation areas, runways, taxiways, apron and waiting position overrun areas, shoulders and strips
A71-29311

Uneven runway taxiing vibration effects on supersonic transport aircraft, comparing calculation with measurement
A71-30305

Runway concrete pavement condition at Naval Station, Adak, Alaska
[AD-719889] N71-25604

RUNWAYS
Roissy-en-France airport, describing construction, passenger handling, terminal facilities, traffic volume and runway system
A71-29309

Melbourne/Tullamarine airport, describing facilities, capacity, road system, cargo and passenger handling areas and runway layout
A71-29310

S

SAFETY DEVICES
Concorde power plant fire protection system, describing prototype engine bay overheat detection system and additional UV optical fire detection system
A71-30300

SAFETY FACTORS
Plug-in relay hazards and minimization for aircraft flight safety applications
A71-28841

SALTS
Airport jet fuel delivery system salt driers for reducing water content below saturation, lengthening filter life and improving downstream system components performance
[SAE PAPER 710440] A71-28322

SATELLITE NETWORKS
Aircraft phased arrays for L-band ATC satellite system application, alleviating problems of power budget and vulnerability to multipath and interference
A71-31054

SATELLITE TRACKING
Satellite aided aircraft collision avoidance system effective for large number of aircraft
[NASA-CASE-ERC-10090] N71-24948

SATELLITE TRANSMISSION
ATS 1 and 3 satellite VHF transponders for ships and aircraft location, communication and remote sensing, discussing performance test results
A71-30898

Performance and cost design tradeoff between HF and synchronous meteorological satellite data collection systems, considering platform transmitting power and SNR
A71-30900

SCALE EFFECT
Size effects on large rotor systems design, considering weight, blade loading, tip speed, etc
[AHS PREPRINT 552] A71-31104

SCALE MODELS
Buffet response of straight wing and delta wing model of space shuttle launch configuration
N71-24662

- Acoustic measurements on prop-fan model propulsion system - Vol. 2, appendices
[NASA-CR-111842-2] N71-25784
- Acoustic measurements on prop-fan model propulsion system
[NASA-CR-111842-1] N71-25785
- Reynolds number simulation requirements for subsonic wind tunnel tests of space shuttle configurations
N71-26065
- Static tests of augmentor-wing flap system for modified C-8A jet STOL research airplane using 0.7 scale model
[NASA-CR-114315] N71-26416
- SELF MANEUVERING UNITS**
Procedures for evaluating effectiveness of self propelled and portable ground servicing units for Army aircraft
[AD-719102] N71-24459
- SENSORS**
Miniature aerodynamic turbulence gage using axisymmetric lifting body sensor
A71-28158
- SEPARATED FLOW**
Three dimensional steady separated liquid and gas flows past low aspect ratio bodies, deriving similarity laws for reduction to two dimensional problem
A71-29169
- Air inlet for simulation of shock wave separated flow in supersonic diffusers, deriving pressure variation profile along free boundary
A71-29175
- Asymptotic limiting viscous flow pattern and drag on flat plate with stationary separation zones at large Reynolds numbers
A71-29204
- Separation control of two dimensional air flow with turbulent boundary layer along circular cylindrical wall by jets or suction
A71-29433
- SERVICE LIFE**
Structure service life and storage failure probability calculation with current load measurements and laboratory fatigue testing
A71-29231
- SERVOAMPLIFIERS**
Wind tunnel model trajectory simulation system with closed loop control by digital computer, describing instrumentation, system servoamplifiers and testing procedures
A71-30334
- SERVOMECHANISMS**
Helicopter fuselage vertical and in-plane main rotor head vibratory forces isolation with hydropneumatic servocentered system at transmission/airframe interface
[AHS PREPRINT 514] A71-31085
- SHARP LEADING EDGES**
Aspect ratio effect on oscillatory pitching moment derivatives of slender sharp-edged delta wing in incompressible flow
N71-24571
- Measurement of oscillatory pitching moment derivatives on sharp-edged delta wing at vortex breakdown angle of attack
N71-24572
- SHELL STABILITY**
Soviet papers on three dimensional structures covering strength and stability of compound curvature shells, bodies of revolution and multilayer plates
A71-30888
- SHOCK HEATING**
Aerothermodynamic shock heating of space shuttle booster surface during atmospheric ascent
N71-26059
- SHOCK TUBES**
Soviet book on experimental aerodynamics covering wind tunnels, shock tubes, liquid and gas physical properties, flow parameter measurement equipment, etc
A71-29524
- SHOCK TUNNELS**
Monograph on hypersonic shock tunnel supersonic combustion research techniques covering test facilities, optical and electromagnetic flow measurement methods, etc
A71-29578
- SHOCK WAVES**
Air inlet for simulation of shock wave separated flow in supersonic diffusers, deriving pressure variation profile along free boundary
A71-29175
- Incident sonic boom shock wave reflection factors off smooth surface, discussing pressure rise and flight near threshold Mach number
A71-30610
- Hypersonic flow pattern past windward side of delta wing with supersonic leading edges, joining potential and vortex regions behind shock wave
A71-30874
- SHORT HAUL AIRCRAFT**
Prop-fan propulsion system for V/STOL short haul transport aircraft, discussing performance, noise and weight characteristics
[SAE PAPER 710470] A71-28338
- Dassault Mercure short range twin jet aircraft capable of using powerful engine
A71-29276
- Aircraft capabilities in intraurban transportation for Detroit metropolitan area, considering vehicle design, fleet size, cost and terminal location
[AIAA PAPER 71-504] A71-29548
- Integrated short-haul interurban transportation system, considering combination of conventional jet aircraft, STOL aircraft and high-speed ground transportation
[AIAA PAPER 71-508] A71-29550
- SHORT TAKEOFF AIRCRAFT**
Vortex wakes behind STOL operations high lift wings, discussing height above ground and various wind tunnel dimensions effects
A71-28033
- STOL aircraft electric power variable frequency generation and high voltage DC distribution with secondary square wave AC distribution
[SAE PAPER 710444] A71-28325
- Military/commercial STOL transport design, discussing performance, payload and equipment requirements with emphasis on production cost benefits
[SAE PAPER 710468] A71-28336
- STOL aircraft/engine integrated systems for medium distance air transportation, discussing tradeoff factors involving performance, noise, weight and cost
[SAE PAPER 710469] A71-28337
- Integrated short-haul interurban transportation system, considering combination of conventional jet aircraft, STOL aircraft and high-speed ground transportation
[AIAA PAPER 71-508] A71-29550
- Two dimensional flow research on high lift airfoils for STOL aircraft, using vorticity distribution and wind tunnel wall blowing techniques
A71-29910
- Civil aviation customer /operator, passenger and community/ needs, describing STOL and V/STOL aircrafts
A71-30162
- VTOL and STOL aircraft comparative study covering site area, cost and noise and toxic gas production
A71-30163
- Air transport development trends, considering increased speed and capacity, STOL aircraft, urban service, and European cooperation for manufacturing
A71-30302
- STOL vehicle and systems air transportation expansion by reducing trip time, congestion, noise exposures and pollution for DOT, DOD and NASA roles
[SAE PAPER 710464] A71-30535
- Commercial vs military design criteria for STOL transport aircraft, noting landing and takeoff distances and noise levels
[SAE PAPER 710465] A71-30536
- Low wing loading STOL transport ride smoothing using Boeing aircraft
[NASA-CR-111819] N71-24586
- Stability, control, and handling quality characteristics of STOL and V/STOL airplanes
N71-24702

- Flight tests for controlling slope approach of short takeoff aircraft
[ARC-CP-1138] N71-25050
- Wind tunnel tests to determine low-speed aerodynamic characteristics of large-scale STOL transport model with augmented jet flap
[NASA-TN-X-62017] N71-26183
- Static tests of augmentor-wing flap system for modified C-8A jet STOL research airplane using 0.7 scale model
[NASA-CR-114315] N71-26416
- SIDE-LOOKING RADAR**
Structural design, mechanical stability and aircraft compatibility for airborne side-looking radar antennas, using end fed slotted waveguide arrays
A71-31041
- SIGNAL ENCODING**
Sensing and communications technologies for short wayside headways, considering applicable equipment for personal rapid transit systems, modulation, coding and data transmission techniques
A71-30337
- SILICIDES**
Silicide coated Nb alloys for gas turbine engine components operating at temperatures above 2000 F
[SAE PAPER 710460] A71-28334
- SIMULATION**
Performance of aircraft environmental control systems under simulated tactical conditions
[AD-719101] N71-24461
- SKIN (STRUCTURAL MEMBER)**
Artificial corrosion pits effect on fatigue durability of smooth samples and aircraft duraluminum skin elements
A71-27819
- SKIN FRICTION**
Skin friction drag and velocity profile measurements on flat plate in two phase circular pipe flow in subsonic wind tunnel for gas-solid media, using photographic technique
[ASME PAPER 71-FE-32] A71-29467
- Turbulent skin friction and heat transfer prediction on flat plates and wind tunnel walls at supersonic and hypersonic Mach numbers, using Van Driest theory
A71-29868
- SLENDER BODIES**
Pressure distribution and drag prediction over slender axisymmetric fuselages and afterbodies and exhaust nozzles at transonic Mach numbers
[AIAA PAPER 71-720] A71-30771
- SLENDER CONES**
Slender cone boundary layer transition under angle of attack at Mach 21 with promoted leeward and fixed windward ray
A71-29887
- SLENDER WINGS**
Aspect ratio effect on oscillatory pitching moment derivatives of slender sharp-edged delta wing in incompressible flow
N71-24571
- SLIP FLOW**
Flow measurement of Nonweiler delta wing in hypersonic slip flow
[DLR-FB-70-46] N71-24500
- SLIPSTREAMS**
Turbulence level effects on mixing of three plane parallel slipstreams with equal velocities and temperature from smoke visualization
A71-28962
- Incompressible conducting fluid plane jet expansion in homogeneous slipstream, deriving partial differential equations for nonconduction approximation
A71-29610
- SLOT ANTENNAS**
Structural design, mechanical stability and aircraft compatibility for airborne side-looking radar antennas, using end fed slotted waveguide arrays
A71-31041
- Aerospace antenna design, calculating one-wavelength circular slot aperture radiation from circular cylindrical surface
A71-31075
- SLOTS**
Direct lift control system having flaps with slots adjacent to their leading edge and particularly adapted for lightweight aircraft
[NASA-CASE-LAR-10249-1] N71-26110
- SMOKE TRAILS**
Visible exhaust smoke trails from aircraft jet engines, measuring optical density by photographic photometry
[SAE PAPER 710428] A71-28314
- Kerosene type fuels for aircraft gas turbine engines, discussing combustion problems, smoke emission reduction and bacterial or fungal contamination
A71-28754
- SONIC BOOMS**
Sonic boom induced indoor acoustical waves, using electrical analog
A71-30200
- Incident sonic boom shock wave reflection factors off smooth surface, discussing pressure rise and flight near threshold Mach number
A71-30610
- SST sonic boom minimization, discussing cross-country flight
A71-30820
- SOUND FIELDS**
Cost efficient sound limit expenditures per parameter unit in commercial transport aircraft design
A71-28945
- Sound fields of flying aircraft from noise measurements, discussing engine operating conditions, speed and attitude
A71-30521
- Jet aircraft sound spectrum on ground and in air, comparing calculation with experiment
A71-30524
- SOUND GENERATORS**
Combination tone noise generation from turbofans with supersonic fan blade tip speed, determining sound power distribution among engine rotation frequency harmonics
[AIAA PAPER 71-730] A71-30777
- Combustion generated aerodynamic noise, considering sound radiation from open turbulent flames, spectral content, power output and origin
[AIAA PAPER 71-735] A71-30780
- SOUND INTENSITY**
Combination tone noise generation from turbofans with supersonic fan blade tip speed, determining sound power distribution among engine rotation frequency harmonics
[AIAA PAPER 71-730] A71-30777
- SOUND PRESSURE**
Fan-produced sound pressure fluctuation in very low speed subsonic wind tunnel test stream, noting resulting anemometer calibration errors
A71-30526
- Interior sound pressure measurements in C-5A aircraft
[AD-719746] N71-25060
- Techniques and procedures for measuring effective perceived noise level during aircraft noise type certifications
[HRC-TR-300-SUPPL-2] N71-26305
- SOUND WAVES**
Sonic boom induced indoor acoustical waves, using electrical analog
A71-30200
- Sound radiation and pressure fields inside vibrating turbomachine blades, using miniaturized microphones and compact capacitive detectors
A71-30517
- Hot jet aerodynamic parameters from emissions of electromagnetic and acoustic energies by crossed beam IR probing
A71-30520
- SOUNDING ROCKETS**
Scientific results from ESRO satellites and from sounding rocket campaign including aeronautical fields, management planning, satellite development, and telecommunication - 1969 report
N71-24447
- SPACE MISSIONS**
Authorization hearings on NASA space flight program - Part 4, 1972

- SPACE POWER UNIT REACTORS N71-25196
 Motor starting techniques for 2-15 kW Brayton
 space power system
 [NASA-TM-X-67819] N71-24691
- SPACE SHUTTLES
 Space shuttle airbreathing propulsion systems
 requirements and design studies, considering
 cruise, landing, go-around and ferry
 capabilities
 [AIAA PAPER 71-662] A71-30731
 Conference on dynamics and aeroelasticity of space
 shuttle
 [NASA-TM-X-2274] N71-24651
 Transonic flutter and buffeting for elastic wind
 tunnel models of straight wing proposed for
 space shuttles N71-24659
 Application of research in panel flutter and
 boundary layer thickness to space shuttle
 N71-24660
 Parameters contributing to aeroelastic problems in
 thermal protection of space shuttle
 N71-24661
 Buffet response of straight wing and delta wing
 model of space shuttle launch configuration
 N71-24662
 Transonic wind tunnel investigation of flow
 characteristics and pressure fluctuation of
 space shuttle launch and reentry configurations
 N71-24663
 Optimization of payload for space shuttle by
 reducing structural loading and weight
 N71-24664
 Cost estimates, performance prediction, technology
 assessment, and configurations for space shuttle
 N71-26052
 Wind tunnel simulations of flow fields and
 aerothermodynamics of space shuttle orbiters
 N71-26053
 Comparison of space shuttle aerodynamic heating
 analyses for metallic heat shield and surface
 insulation concepts N71-26054
 Finite difference method for calculating inviscid
 flow field around supersonic/hypersonic space
 shuttle N71-26056
 Flow visualization, thermocouple measurements, and
 analyses of shock interference heating effects
 on straight wing space shuttle model
 N71-26057
 Hypersonic shock/density ratio effects in
 aerothermodynamic heating of space shuttle
 configuration N71-26058
 Aerothermodynamic shock heating of space shuttle
 booster surface during atmospheric ascent
 N71-26059
 Lee surface flow and aerodynamic heating on delta
 wing orbiter N71-26060
 Aerodynamic characteristics of delta wing space
 shuttle configurations N71-26062
 Reynolds number simulation requirements for
 subsonic wind tunnel tests of space shuttle
 configurations N71-26065
 Hypersonic theoretical/experimental correlations
 of aerodynamic characteristics for space shuttle
 design N71-26066
- SPACECRAFT ANTENNAS A71-31075
 Aerospace antenna design, calculating one-
 wavelength circular slot aperture radiation from
 circular cylindrical surface
- SPACECRAFT COMMUNICATION
 Microstrip p-i-n diode controlled L band digital
 phase shifter for aircraft-satellite
 communication A71-31055
 Blade antenna linear array design for aircraft-
 satellite communication, determining mutual
 influences by array measurements in simulated
 electrical environment A71-31062
- Viability of L band communication system between
 geostationary satellites and aircraft terminals
 [NASA-TM-X-65508] N71-24913
- SPACECRAFT CONFIGURATIONS
 Transonic wind tunnel investigation of flow
 characteristics and pressure fluctuation of
 space shuttle launch and reentry configurations
 N71-24663
 Cost estimates, performance prediction, technology
 assessment, and configurations for space shuttle
 N71-26052
- SPACECRAFT CONSTRUCTION MATERIALS
 Application of photochromic coatings to provide
 nondestructive inspection for aerospace
 materials and structures
 [AD-720239] N71-26383
- SPACECRAFT CONTROL
 Spacecraft optimal atmospheric reentry trajectory
 for minimum flight distance, investigating angle
 of attack control with allowance for load
 constraints A71-29229
 Control, navigation and guidance review,
 considering application of earth reference
 coordinates for aircraft, missiles and
 spacecraft A71-30710
- SPACECRAFT INSTRUMENTS
 Instrumentation in aerospace industry -
 Conference, Las Vegas, May 1971 A71-30309
 Holographic techniques, optical data processing
 and laser properties for aerospace
 instrumentation A71-30329
- SPACECRAFT PERFORMANCE
 Analysis of aerodynamic forces on DL-4 lifting
 entry vehicle and comparison with theoretical
 methods
 [NASA-TM-X-1994] N71-26354
- SPACECRAFT PROPULSION
 Space shuttle airbreathing propulsion systems
 requirements and design studies, considering
 cruise, landing, go-around and ferry
 capabilities
 [AIAA PAPER 71-662] A71-30731
- SPACECRAFT REENTRY
 Spacecraft optimal atmospheric reentry trajectory
 for minimum flight distance, investigating angle
 of attack control with allowance for load
 constraints A71-29229
- SPECIFICATIONS
 Criteria for converting aeronautical project
 operational targets into actual requirements and
 technical specifications, emphasizing cost
 effectiveness A71-30824
- SPECTRAL ENERGY DISTRIBUTION
 Extreme turbulence measurement during low level
 flights of Mirage A3-76 fighter aircraft,
 determining true gust velocities and power
 spectral energy distributions A71-29756
- SPEED CONTROL
 En route turbojet aircraft flight speed control,
 assessing impact on ATC procedures A71-28884
- STABILITY DERIVATIVES
 Rotor stability derivatives determination from
 instrumented OH-6A prototype helicopter wind
 tunnel tests, comparing data with analytical
 results obtained by digital computing technique
 [AHS PREPRINT 543] A71-31100
 Effects of aeroelasticity on static longitudinal
 aerodynamic derivatives N71-24707
- STAGNATION PRESSURE
 Flow meter for measuring stagnation pressure in
 boundary layer around high speed flight vehicle
 [NASA-CASE-XPR-02007] N71-24692
- STANDARDS
 Airport certification and safety inspection
 procedures and minimum safety standards
 [SAE PAPER 710413] A71-28305
- STATE VECTORS
 V/STOL aircraft flight path and attitude controls
 in turbulence, discussing design based on state
 variable methods of control theory

STATIC PRESSURE

SUBJECT INDEX

A71-29776
STATIC PRESSURE
 Low speed wind tunnel test of four ft diameter circular plate model to determine surface static pressure distributions for jet decay characteristics of cross flow
 [AD-720232] N71-26516

STATIC TESTS
 Yak 40 aircraft flight test program, discussing airworthiness requirements, static structural, vibration and wind tunnel tests A71-29911
 Effects of aeroelasticity on static longitudinal aerodynamic derivatives N71-24707
 Static tests of augmentor-wing flap system for modified C-8A jet STOL research airplane using 0.7 scale model [NASA-CR-114315] N71-26416

STATISTICAL ANALYSIS
 Atmospheric turbulence statistical models assessment for aircraft design and operation, considering CAT and thunderstorm turbulence data A71-29751

STATOR BLADES
 Test description and results for high Mach number transonic fan stages to determine range and distortion tolerance for various rotor tip casing treatment configurations [NASA-CR-82862] N71-25460
 Tabulations of blade element and circumferential distortion flow data in tests of high Mach number transonic fan stages with various rotor tip casing treatment configurations [NASA-CR-82867] N71-25461

STEADY FLOW
 Three dimensional steady separated liquid and gas flows past low aspect ratio bodies, deriving similarity laws for reduction to two dimensional problem A71-29169

STEERABLE ANTENNAS
 L band aircraft antenna array consisting of circularly polarized elements and static electronic steering circuits for synchronous satellites radio links A71-31074

STOCHASTIC PROCESSES
 Development and characteristics of electronic equipment for digital processing of stochastic signals for military aircraft avionics systems [AD-719822] N71-24954

STORAGE BATTERIES
 Soviet book on airplanes and helicopter electrical power supply systems covering storage batteries, DC generators, alternators, voltage regulators, current and frequency control, etc A71-29525

STORAGE STABILITY
 Test procedures to determine ability of aircraft equipment and armament to withstand storage and operate effectively in tropic environment [AD-720570] N71-26194

STRAIN GAGE BALANCES
 Frequency response of five component strain gage oscillating balance for dynamic wind tunnel stability testing A71-30333

STRAIN GAGES
 Static strain measurements on Ti specimen subjected to different conductive heating rates, testing various gages A71-29833
 Aircraft flight load measurements in high temperature environment, determining optimal strain gage installation and calibration A71-30681
 Strain gage torque meter as primary power indicating instrument in helicopter transmission systems, providing advantages for helicopter designer and operator [AHS PREPRINT 563] A71-31110

STRATOSPHERE
 Stratospheric air flow patterns and CAT measurements onboard aircraft over and downwind of Western U.S. mountain terrain A71-29755
 Atmospheric models of partially trapped waves propagation in layer above tropopause with large stratospheric Scorer parameter A71-29763
 Stratospheric turbulence correlation to mesoscale horizontal temperature gradient at altitudes flown by SST from Coldscan program A71-29767
 Clear air turbulence in stratosphere and effects on weather formation, atmospheric physics, and supersonic flights [JPRS-53133] N71-25746

STRATUS CLOUDS
 Aircraft hazards due to frequent low cloud occurrences at Kenya airport, forecasting weather with statistical analysis and radiosounding A71-29106

STRESS ANALYSIS
 Helicopter power transmission failure modes, presenting field experiences correlation with conventional design stress analysis and bench test data [SAE PAPER 710454] A71-28331
 Fatigue and fracture mechanics of airframes and materials including structural design and stress analysis techniques [AD-719756] N71-25092

STRESS MEASUREMENT
 Static strain measurements on Ti specimen subjected to different conductive heating rates, testing various gages A71-29833

STRUCTURAL ANALYSIS
 Optimization of payload for space shuttle by reducing structural loading and weight N71-24664
 Nonlinear panel flutter analyses by perturbation and harmonic balance methods [NASA-CR-111907] N71-25362

STRUCTURAL DESIGN
 Materials and structural design development by high velocity impact testing due to transport and subsonic military aircraft susceptibility to bird collision damage A71-29642
 Aircraft structural design requirements based on statistical analysis of air turbulence intensity and gust loads records from large number of research flights A71-29784
 L-1011 Tristar antenna arrangement test results, considering weight, aerodynamic and structural design requirements A71-31060

STRUCTURAL FAILURE
 Fatigue and fracture mechanics of airframes and materials including structural design and stress analysis techniques [AD-719756] N71-25092
 Structure service life and storage failure probability calculation with current load measurements and laboratory fatigue testing A71-29231
 Structural fatigue in aircraft design, discussing twin engine transport tests, crack propagation rate, residual strength, etc A71-29434

STRUCTURAL STABILITY
 Conference on fatigue life in helicopter components [DLR-MIT-70-01] N71-24385
 Rotary wing structural stability of Dornier high temperature gas jet helicopter N71-24387
 Evaluation of helicopter flight loading and structural stability N71-24389
 Structural stability tests of helicopter components N71-24390

STRUCTURAL VIBRATION
 Automated modal data acquisition and processing system /MODAPS/ for real-time modal vibration testing of complex aerospace vehicle structures, describing features, capabilities and utilization A71-30341

SUBSONIC AIRCRAFT
 Military aviation greases for subsonic commercial airplane lubricants, discussing economic and

SUBJECT INDEX

SUPERSONIC WIND TUNNELS

- technical benefits based on service experience and testing
[SAE PAPER 710411] A71-28304
- Economic analysis of subsonic transport airplane design, evaluation and operation
[SAE PAPER 710423] A71-28310
- Fuselage influence on total aircraft drag in subsonic passenger aircraft, considering high aspect ratio cylindrical fuselages
A71-30821
- SUBSONIC FLOW**
- Heat transfer within resonant cavities at subsonic and supersonic flow, discussing wind tunnels, test procedures and data reduction
[ASME PAPER 71-FE-9] A71-29450
- Pisa University Aeronautical Institute activities /1960-1970/, considering supersonic and subsonic flow research, thin stiffened shells fatigue under compressive or tensile loads, etc
A71-30822
- SUBSONIC WIND TUNNELS**
- Skin friction drag and velocity profile measurements on flat plate in two phase circular pipe flow in subsonic wind tunnel for gas-solid media, using photographic technique
[ASME PAPER 71-FE-32] A71-29467
- Fan-produced sound pressure fluctuation in very low speed subsonic wind tunnel test stream, noting resulting anemometer calibration errors
A71-30526
- SUPERCAVITATING FLOW**
- Supercavitating flow past straight cascade with arbitrary blade shapes, considering lift and drag coefficients, cavitation number, cavity shape and exit flow conditions
[ASME PAPER 71-FE-6] A71-29448
- SURCHARGERS**
- Axial flow turbines comparative performance tests under steady and pulse flow conditions for turbocharger application
A71-29819
- SUPERCRITICAL FLOW**
- Aerodynamic noise produced by supercritical jets, using high speed flash photography for schlieren and shadowgraph studies
A71-28767
- SUPERHIGH FREQUENCIES**
- Multiple planar Luneberg lens circular array for airborne electronically scanned X band narrow beam antenna mounted under aircraft nose or fuselage
A71-31038
- SUPERSONIC AIRCRAFT**
- Minimum drag wing-fuselage combination for supersonic speeds and prescribed lifting force, longitudinal moment and volume, using method of successive approximations
A71-29182
- Energy state approximation and supersonic aircraft minimum fuel fixed range trajectory optimization, noting not convex velocity set
A71-30609
- Investigation of stability and controllability parameters for supersonic aircraft under varying aerodynamic load conditions
[AD-719804] N71-25032
- Stability and controllability of supersonic swept wing aircraft
[AD-719803] N71-25049
- Supersonic aircraft lateral control equipment
[AD-720740] N71-26538
- SUPERSONIC COMBUSTION**
- Supersonic staggered gutter colander combustion system for plenum chamber burning on high bypass Pegasus turbofan engine of Harrier VTOL aircraft, noting performance improvement
A71-28743
- Monograph on hypersonic shock tunnel supersonic combustion research techniques covering test facilities, optical and electromagnetic flow measurement methods, etc
A71-29578
- SUPERSONIC COMPRESSORS**
- Analytical model of compressor sensitivity to transient and distorted transient flows, considering inlet duct, compressor stages and combustor up to turbine nozzles
[AIAA PAPER 71-670] A71-30734
- SUPERSONIC DIFFUSERS**
- Air inlet for simulation of shock wave separated flow in supersonic diffusers, deriving pressure variation profile along free boundary
A71-29175
- SUPERSONIC FLIGHT**
- Annular vaporizing combustion chamber with film cooling, determining flame temperature under supersonic flight conditions
A71-28749
- Clear air turbulence in stratosphere and effects on weather formation, atmospheric physics, and supersonic flights
[JPRS-53133] N71-25746
- SUPERSONIC FLOW**
- Wing thickness optimal distribution for minimum wave drag in supersonic flow at zero angle of attack for given planform, using Ritz method at lower Mach numbers
A71-29222
- Heat transfer within resonant cavities at subsonic and supersonic flow, discussing wind tunnels, test procedures and data reduction
[ASME PAPER 71-FE-9] A71-29450
- Turbulent skin friction and heat transfer prediction on flat plates and wind tunnel walls at supersonic and hypersonic Mach numbers, using Van Driest theory
A71-29868
- Supersonic mass flux probe description, discussing inlet geometry, angle of attack and Reynolds and Mach numbers effects on performance
A71-29925
- Flowfield production by fluid injection into supersonic crossflow, occurring with liquid/gas jet control of vehicle with combustion ramjets
[AIAA PAPER 71-728] A71-30775
- Pisa University Aeronautical Institute activities /1960-1970/, considering supersonic and subsonic flow research, thin stiffened shells fatigue under compressive or tensile loads, etc
A71-30822
- Finite difference method for calculating inviscid flow field around supersonic/hypersonic space shuttle
N71-26056
- SUPERSONIC FLUTTER**
- Supersonic flutter analysis of clamped skew panels with in-plane forces by Galerkin method, using two dimensional static approximation for aerodynamic loading
A71-30607
- SUPERSONIC INLETS**
- Supersonic inlet turbojet engine compatibility tests in wind tunnels, using light panels and Summation Device analysis
A71-28032
- Engine surge pressure transients in mixed-compression supersonic inlet, describing scale wind tunnel model simulation and measurement techniques
[AIAA PAPER 71-671] A71-30735
- Wind tunnel tests to determine Mach 2.5 performance of bicorne inlet with internal focused compression and 40-percent internal contraction
[NASA-TM-X-2294] N71-25872
- SUPERSONIC TRANSPORTS**
- SST in relation to U.S. world leadership in air transportation, discussing federal funding needs for technological capability insurance
A71-29387
- Stratospheric turbulence correlation to mesoscale horizontal temperature gradient at altitudes flown by SST from Coldscan program
A71-29767
- Uneven runway taxiing vibration effects on supersonic transport aircraft, comparing calculation with measurement
A71-30305
- SST sonic boom minimization, discussing cross-country flight
A71-30820
- Performance prediction of methane-fueled supersonic transports over range of cruise speeds up to Mach 4
[NASA-TM-X-2281] N71-25384
- SUPERSONIC WIND TUNNELS**
- Ballistic wind tunnel for drag measurement on

SUPPORT INTERFERENCE

models during free flight at supersonic speeds
A71-29201

Time variant distortions in supersonic inlet on
J-85-GE-13 turbojet engine from wind tunnel
test, considering instantaneous distortion
amplitudes and contours
[AIAA PAPER 71-667] A71-30733

Wind tunnel tests to determine Mach 2.5
performance of bicone inlet with internal
focused compression and 40-percent internal
contraction
[NASA-TM-X-2294] N71-25872

SUPPORT INTERFERENCE
Mechanical support system role in determination of
aeroelastic stability of leeward cylinder
immersed in wake using undamped flutter theory
A71-31021

SURFACE FINISHING
Helicopter component surface finish smoothness and
residual stress requirements, using abrasive
grinding belt machines with gear link mechanisms
A71-28943

SURFACE GEOMETRY
Photoelectric, bolometric and photographic
recording assembly for measurement of light
pressure and aerodynamic forces on complex shape
body in free molecular flow
A71-29155

SURFACE ROUGHNESS EFFECTS
Uneven runway taxiing vibration effects on
supersonic transport aircraft, comparing
calculation with measurement
A71-30305

SURFACE TEMPERATURE
Lee surface flow and aerodynamic heating on delta
wing orbiter
N71-26060

Leeside aerodynamic heating of lifting reentry
vehicle configurations
N71-26061

SURFACE VEHICLES
Investigation of aerodynamic forces imposed on
vehicles proposed for operation in improved
urban transportation system
N71-26129

Analysis of road traffic problems at Washington
National Airport and recommendations to improve
airport access
[REPT-3] N71-26526

SURGES
Analytical model of compressor sensitivity to
transient and distorted transient flows,
considering inlet duct, compressor stages and
combustor up to turbine nozzles
[AIAA PAPER 71-670] A71-30734

SWEPT WINGS
Stability and controllability of supersonic swept
wing aircraft
[AD-719803] N71-25049

SWEPTBACK WINGS
High lift and boundary layer separation behavior
of sweptback wing airfoil profile noting
trailing and leading edge stall pattern
[ARC-R/M-3648] N71-24488

Low-speed wind tunnel longitudinal stability tests
on sweptback wing model with blowing at leading
edge slats and trailing edge flaps for Buccaneer
aircraft performance
[ARC-R/M-3655] N71-24565

SWITCHING CIRCUITS
Interface IC circuits for driving high voltage
transistor switches from low level logic inputs,
noting avionics application
A71-28910

SYMMETRICAL BODIES
Minimizing drag and increasing performance of
optimum shapes at hypersonic flight
N71-24704

SYNCHRONOUS METEOROLOGICAL SATELLITE
Performance and cost design tradeoff between HF
and synchronous meteorological satellite data
collection systems, considering platform
transmitting power and SNR
A71-30900

SYNCHRONOUS SATELLITES
L band aircraft antenna array consisting of
circularly polarized elements and static
electronic steering circuits for synchronous
satellites radio links
A71-30374

SUBJECT INDEX

SYSTEMS ANALYSIS
High rotor advance ratio from multiblade general
coordinates method in linear analysis of lifting
rotor dynamic stability and gust ratio
[AHS PREPRINT 512] A71-31083

SYSTEMS ENGINEERING
Onboard aircraft refractometer design, operation
and effectiveness
A71-28250

Engine condition monitoring systems, discussing
engineering design requirements with respect to
accessibility, accuracy, economics,
effectiveness, reliability and maintainability
[AIAA PAPER 71-652] A71-30728

Performance and cost design tradeoff between HF
and synchronous meteorological satellite data
collection systems, considering platform
transmitting power and SNR
A71-30900

Heavy lift helicopter flight control system
design, emphasizing fly by wire electrical
analog
[AHS PREPRINT 503] A71-31079

Electromechanical control system synthesis for
compound hingeless rotor helicopter, using root
locus method with transfer functions from
airframe motion linear model
[AHS PREPRINT 536] A71-31096

Calculating and testing antiicing systems of
aircraft and helicopters
[AD-719922] N71-25622

T

T TAIL SURFACES
Aircraft with T tail configuration, examining
dynamic response to lateral gusts
A71-29786

Analysis of empennage loads and aeroelastic
response of T-tail transport aircraft in
continuous atmospheric turbulence
N71-24996

TABLES (Data)
Tabulations of blade element and circumferential
distortion flow data in tests of high Mach
number transonic fan stages with various rotor
tip casing treatment configurations
[NASA-CR-82867] N71-25461

TAKEOFF
Aircraft accident at Miami, Florida involving
Republic of Ecuador C-54D during climb following
instrument takeoff
[NTSB-AAR-71-2] N71-26032

TARGET ACQUISITION
Radarscope net for target azimuth and distance and
for direct altitude readout through beacon
numerics
A71-28886

TAXIING
Uneven runway taxiing vibration effects on
supersonic transport aircraft, comparing
calculation with measurement
A71-30305

Powered landing gear wheel system requirements for
parking and taxiing of commercial jet transport
airplanes
[SAE PAPER 710446] A71-30530

TECHNOLOGY ASSESSMENT
Cost estimates, performance prediction, technology
assessment, and configurations for space shuttle
N71-26052

TECHNOLOGY UTILIZATION
Technical, sales/marketing and management -
Conference, Coronado, California, May 1971
A71-28164

MAC malfunction detection, analysis and recording
system applications in commercial airlines,
emphasizing real time response for maintenance
function
[SAE PAPER 710425] A71-28311

TELECOMMUNICATION
Sensing and communications technologies for short
wayside headways, considering applicable
equipment for personal rapid transit systems,
modulation, coding and data transmission
techniques
A71-30337

- Scientific results from ESRO satellites and from sounding rocket campaign including aeronautical fields, management planning, satellite development, and telecommunication - 1969 report
N71-24447
- Viability of I band communication system between geostationary satellites and aircraft terminals [NASA-TM-X-65508] N71-24913
- Tropospheric and ionospheric absorption at VHF for North Atlantic aeronautical satellite system [NASA-TM-X-65507] N71-24914
- TELEMETRY**
- Self contained lightweight airborne data acquisition system for atmospheric and meteorological research, using analog recorder and telemetry system
A71-30311
- Integrated flight test data system combining digital airborne data acquisition/recording system with telemetry/microwave link to computerized ground station
A71-30318
- Telemetering - IEEE Conference, Washington, D.C., April 1971
A71-30896
- TEMPERATURE DISTRIBUTION**
- Gas turbine engine combustion chamber outlet, noting gas flow temperature field peripheral nonuniformity
A71-28972
- Conductive heat transfer effect on temperature distribution in vicinity of wing leading edge in hypersonic flight [ARC-CP-1126] N71-24446
- TEMPERATURE EFFECTS**
- Static strain measurements on Ti specimen subjected to different conductive heating rates, testing various gages
A71-29833
- X-type hot-wire probe thermal turbulent wake interference, discussing wind tunnel investigation of wire distance effect on pitch angle sensitivity
A71-31022
- Design point characteristics of 15-80 kWe nuclear reactor Brayton cycle power system [NASA-TM-X-67811] N71-24689
- Predicted performance of 15-80 kWe reactor Brayton power system over range of operating conditions [NASA-TM-X-67833] N71-24690
- Motor starting techniques for 2-15 kW Brayton space power system [NASA-TM-X-67819] N71-24691
- TEMPERATURE GRADIENTS**
- Stratospheric turbulence correlation to mesoscale horizontal temperature gradient at altitudes flown by SST from Coldscan program
A71-29767
- TEMPERATURE MEASUREMENT**
- Metal temperatures in rotating cooled gas turbine blades, discussing coolant flow aerodynamics
A71-28748
- Gas temperature measurement in aircraft combustion chambers, using calorimetric probe
A71-28757
- Temperature and radical concentration measurements for high temperature flowing gas streams in rig simulating conditions in ramjet combustion chamber and nozzle
A71-28758
- Aircraft instrumentation and data analysis for clear air turbulence, including orthogonal components and temperature and wind distributions
A71-29753
- TENSILE TESTS**
- Pisa University Aeronautical Institute activities /1960-1970/, considering supersonic and subsonic flow research, thin stiffened shells fatigue under compressive or tensile loads, etc
A71-30822
- TERMINAL FACILITIES**
- Airport terminal building design and construction, noting economy and expansibility corequirements [SAE PAPER 710418] A71-28307
- Optimum functional integration and performance requirements of navigation aids and ATC in terminal area [SAE PAPER 710456] A71-28333
- Roiissy-en-France airport, describing construction, passenger handling, terminal facilities, traffic volume and runway system
A71-29309
- Melbourne/Tullamarine airport, describing facilities, capacity, road system, cargo and passenger handling areas and runway layout
A71-29310
- Frankfurt terminal baggage conveyor system, describing passenger capacity and luggage handling equipment
A71-29312
- Ultra Compact Airport Terminal, describing landside, terminal and airside elements
A71-29313
- Survey of civil airports to determine status of crash fire and rescue equipment available for use following accidents involving scheduled or local service air carrier aircraft
N71-26466
- Analysis of road traffic problems at Washington National Airport and recommendations to improve airport access [REPT-3] N71-26526
- TERMINAL GUIDANCE**
- Night rescue terminal navigation, considering design, development and tests of Limited Night Recovery System for HH-53 helicopter [AHS PREPRINT 534] A71-31095
- TEST EQUIPMENT**
- Concorde SST flight test equipment installation with PCM recording and visual instruments
A71-30055
- Low cost go/no-go portable aircraft engine tester connected to engine mounted sensors
A71-30327
- Automated modal data acquisition and processing system /MODAPS/ for real-time modal vibration testing of complex aerospace vehicle structures, describing features, capabilities and utilization
A71-30341
- Design, development, and test of ground support equipment for analyzing aircraft equipment condition and performance [AD-719675] N71-24603
- TEST FACILITIES**
- Airline engine performance testing from operator perspective, using automated test cell data acquisition system [SAE PAPER 710451] A71-28329
- Terminal air traffic control facility for approach systems tests [AD-719104] N71-24451
- Test description and results for high Mach number transonic fan stages to determine range and distortion tolerance for various rotor tip casing treatment configurations [NASA-CR-82862] N71-25460
- Tabulations of blade element and circumferential distortion flow data in tests of high Mach number transonic fan stages with various rotor tip casing treatment configurations [NASA-CR-82867] N71-25461
- Test procedures to determine ability of aircraft equipment and armament to withstand storage and operate effectively in tropic environment [AD-720570] N71-26194
- Test procedures to evaluate aircraft borne equipment for use in crash rescue operations [AD-720563] N71-26195
- Flow-duct test facility data on acoustic behavior of lined ducts and duct-lining materials for turbojet engine applications [NASA-CR-111887] N71-26417
- TESTS**
- Procedures for evaluating compatibility of aviation materiel with related equipment [AD-719107] N71-24457
- THERMAL DIFFUSION**
- Diffusion and thermal mechanism ignition theories, applying to altitude relighting of gas turbine engine combustors
A71-28745
- THERMAL INSULATION**
- Comparison of space shuttle aerodynamic heating analyses for metallic heat shield and surface insulation concepts
N71-26054

THERMAL PROTECTION

SUBJECT INDEX

THERMAL PROTECTION

Parameters contributing to aeroelastic problems in thermal protection of space shuttle

N71-24661

THERMAL SHOCK

Mechanical properties of composites consisting of Al matrix reinforced by boron fibers, considering high temperature creep, corrosion and thermal shock resistivity

A71-30473

THERMAL STABILITY

Olympus 593 supersonic engine lubricants tests, defining requirements in terms of bulk thermal stability, resistance to hot bearing breakdown, oil mist coking, etc

A71-29826

THERMOCHEMISTRY

Soviet book on aircraft materials science and treatment covering steel/cast iron processing, metallography, heat/thermochemical conditioning, surface protection and corrosion prevention

A71-29529

THERMODYNAMIC EFFICIENCY

Continuous combustion gas turbine with stepwise heat release, investigating ideal thermal efficiency cycle of gas overexpansion, cooling and compression

A71-28583

THICKNESS RATIO

Wing thickness optimal distribution for minimum wave drag in supersonic flow at zero angle of attack for given planform, using Ritz method at lower Mach numbers

A71-29222

THIN WALLED SHELLS

Pisa University Aeronautical Institute activities /1960-1970/, considering supersonic and subsonic flow research, thin stiffened shells fatigue under compressive or tensile loads, etc

A71-30822

THREE DIMENSIONAL FLOW

Three dimensional steady separated liquid and gas flows past low aspect ratio bodies, deriving similarity laws for reduction to two dimensional problem

A71-29169

THRUST

Expressions for relating pressure field to total aerodynamic thrust and steady pitching and rolling moments experienced by helicopter rotor

N71-26583

THRUST AUGMENTATION

Turbopropulsion systems thrust augmentor combustion instability, discussing physical causes due to various pressure oscillation modes [AIAA PAPER 71-697]

A71-30756

Turbojet and turbofan augmentors combustion instability, discussing pressure oscillations elimination by screech liner and flameholder design

[AIAA PAPER 71-698] A71-30757

Static tests of augmentor-wing flap system for modified C-8A jet STOL research airplane using 0.7 scale model

[NASA-CR-114315] N71-26416

THRUST MEASUREMENT

Thrust measurement of aircraft propulsion systems, considering hydraulic piston device, edge clearance, oil quantity and calibration

A71-29860

THULIUM ISOTOPES

Nondestructive testing of aircraft structures using thulium and iridium gamma sources [JABRI-MEMO-4163]

N71-24849

THUNDERSTORMS

Oklahoma and Malaysia thunderstorms comparison based on weather reconnaissance aircraft measurements, considering turbulence patches

A71-29752

Thunderstorm, CAT, weather and mountain wave induced turbulence forecasting and analysis for transport aircraft

A71-29764

Meteorological radar for detection of thunderstorms, hail, and turbulence hazardous to aviation noting echo interpretation and radar transmission

[WMO-264-TP-148] N71-24394

TILTED PROPELLERS

Flightworthy 25-foot diameter prop rotor wind tunnel test, considering civil and military need for VTOL transportation [AHS PREPRINT 501]

A71-31077

TILTING ROTORS

Flightworthy 25-foot diameter prop rotor wind tunnel test, considering civil and military need for VTOL transportation [AHS PREPRINT 501]

A71-31077

TIME DEPENDENCE

Time dependent clearance changes effects on aerodynamic characteristics of sectorially grooved gas bearings, describing lift and drag coefficients calculation

A71-30227

TIME OPTIMAL CONTROL

Minimum time profiles for F-104 aircraft by Balakrishnan epsilon technique, comparing solutions with energy method

A71-28831

Jet-supported VTOL aircraft fuel-time-optimal landing control, using mathematical model, Pontryagin maximum principle and analog computer solution

A71-29281

VTOL aircraft minimum climb-to-cruise time transition optimal open loop and suboptimal closed loop control synthesis

A71-30799

TIME RESPONSE

Simply supported normal mode plate time response to traveling wave at oblique incidence, using numerical analysis

A71-30068

TIMING DEVICES

Brief history of parachute development including devices and methods for canopy deployment [AD-719480]

N71-24351

TIP SPEED

Flow field velocity distribution at rotating wing devices tip vortices [AHS PREPRINT 522]

A71-31088

Size effects on large rotor systems design, considering weight, blade loading, tip speed, etc

[AHS PREPRINT 552] A71-31104

TITANIUM

Static strain measurements on Ti specimen subjected to different conductive heating rates, testing various gages

A71-29833

TOOLS

Evaluating adequacy of tool sets for aircraft maintenance [AD-719103]

N71-24379

TORQUEMETERS

Strain gage torque meter as primary power indicating instrument in helicopter transmission systems, providing advantages for helicopter designer and operator [AHS PREPRINT 563]

A71-31110

TOWING

Nonlinear mathematical model for dynamical behavior of extensible towing cable subjected to aerodynamic forces generated by uniform flow field, discussing system stability

A71-31026

TRADEOFFS

Performance and cost design tradeoff between HF and synchronous meteorological satellite data collection systems, considering platform transmitting power and SNR

A71-30900

TRAFFIC CONTROL

Analysis of road traffic problems at Washington National Airport and recommendations to improve airport access [REPT-3]

N71-26526

TRAINING DEVICES

DC 10 flight crew individualized ground training program, emphasizing hands-on equipment and instruction hardware [SAE PAPER 710472]

A71-30538

TRAJECTORY ANALYSIS

Quasi-stationary gliding trajectories of aircraft in planetary atmosphere during constant control of attack and bank angles

A71-29185

- Wind tunnel model trajectory simulation system with closed loop control by digital computer, describing instrumentation, system servoamplifiers and testing procedures A71-30334
- TRAJECTORY CONTROL**
Propulsion, guidance and stability of ground effect vehicle with perimetric Coanda fluid boundary A71-29308
- TRAJECTORY OPTIMIZATION**
Spacecraft optimal atmospheric reentry trajectory for minimum flight distance, investigating angle of attack control with allowance for load constraints A71-29229
Energy state approximation and supersonic aircraft minimum fuel fixed range trajectory optimization, noting not convex velocity set A71-30609
- TRANSFER FUNCTIONS**
Gust transfer functions relating lift and moments to upwash in single sinusoidal wave for large aspect ratio rectangular wings in turbulent incompressible flow A71-30604
- TRANSIENT PRESSURES**
Engine surge pressure transients in mixed-compression supersonic inlet, describing scale wind tunnel model simulation and measurement techniques [AIAA PAPER 71-671] A71-30735
- TRANSIENT RESPONSE**
Analytical model of compressor sensitivity to transient and distorted transient flows, considering inlet duct, compressor stages and combustor up to turbine nozzles [AIAA PAPER 71-670] A71-30734
- TRANSISTOR CIRCUITS**
Interface IC circuits for driving high voltage transistor switches from low level logic inputs, noting avionics application A71-28910
- TRANSITION FLOW**
Aerodynamic characteristics similarity and variation in hypersonic flow transition region from free molecular flow to solid medium A71-29172
- TRANSONIC COMPRESSORS**
Test description and results for high Mach number transonic fan stages to determine range and distortion tolerance for various rotor tip casing treatment configurations [NASA-CR-82862] N71-25460
Tabulations of blade element and circumferential distortion flow data in tests of high Mach number transonic fan stages with various rotor tip casing treatment configurations [NASA-CR-82867] N71-25461
- TRANSONIC FLOW**
Low thrust jet effect on base pressures on boat-tailed afterbodies in Mach number 0.8-1.2 flow A71-29889
Pressure distribution and drag prediction over slender axisymmetric fuselages and afterbodies and exhaust nozzles at transonic Mach numbers [AIAA PAPER 71-720] A71-30771
Vortical transonic gas flow over wing profile N71-25714
- TRANSONIC FLUTTER**
Transonic flutter and buffeting for elastic wind tunnel models of straight wing proposed for space shuttles N71-24659
- TRANSONIC WIND TUNNELS**
Transonic wind tunnel investigation of flow characteristics and pressure fluctuation of space shuttle launch and reentry configurations N71-24663
Consideration by NATO of transonic wind tunnel requirements to support evolution of aeronautical and aerospace systems during next decade [AGARD-AR-35-71] N71-25073
- TRANSPONDERS**
ATS 1 and 3 satellite VHF transponders for ships and aircraft location, communication and remote sensing, discussing performance test results A71-30898
- Evaluation of dual input transponder with upper and lower aircraft antennas as resolution for problems with air traffic control radar beacon system limitations [FAA-NA-71-39] N71-24882
- TRANSPORT AIRCRAFT**
Economic analysis of subsonic transport airplane design, evaluation and operation [SAE PAPER 710423] A71-28310
Transport aircraft all weather automatic landing operation, examining guidance system and independent monitors [SAE PAPER 710441] A71-28323
Military/commercial STOL transport design, discussing performance, payload and equipment requirements with emphasis on production cost benefits [SAE PAPER 710468] A71-28336
Cost efficient sound limit expenditures per parameter unit in commercial transport aircraft design A71-28945
Commercial V/STOL and jet VTOL transport, discussing Do-31 test results, landing approach, air traffic control automation and electronic control A71-29131
Structural fatigue in aircraft design, discussing twin engine transport tests, crack propagation rate, residual strength, etc A71-29434
Atmospheric turbulence effect on turbine powered transport aircraft, discussing gust accelerations, avoidance, detection, forecasting and pilot control A71-29750
Thunderstorm, CAT, weather and mountain wave induced turbulence forecasting and analysis for transport aircraft A71-29764
Jet transport aircraft stability and controllability under atmospheric turbulence conditions, discussing longitudinal and lateral-directional characteristics with particular attention to unstable spiral mode A71-29772
Jet transport aircraft design for safety under air turbulence conditions, considering cruise altitude limitations and pitch and g excursion reduction by special autopilot mode A71-29777
Normal accelerations experienced by transport aircraft fleet from fatigue load meter data analysis, discussing counting rates seasonal variations A71-29788
Computer aided design program for civil transport aircraft configuration, performance, propulsion, weight and costs to meet given specifications A71-30398
Transport aircraft JT9D high bypass ratio engine development, noting maintainability and stability improvements [SAE PAPER 710419] A71-30527
Powered landing gear wheel system requirements for parking and taxiing of commercial jet transport airplanes [SAE PAPER 710446] A71-30530
Commercial vs military design criteria for STOL transport aircraft, noting landing and takeoff distances and noise levels [SAE PAPER 710465] A71-30536
Analysis of empennage loads and aeroelastic response of T-tail transport aircraft in continuous atmospheric turbulence N71-24996
Cumulative frequency distributions determined by extreme value analysis used for fatigue analysis and interpretation of c.g. vertical acceleration and gust velocity measured on transport aircraft [AGARD-R-579-71] N71-25080
Flight evaluation of lateral handling, stability, control, and flying qualities of jet transport aircraft during up-and-away and approach flight in landing configuration [NASA-TN-D-6339] N71-25537
Wind tunnel tests to determine low-speed aerodynamic characteristics of large-scale STOL

TRANSPORTATION

transport model with augmented jet flap
[NASA-TM-X-62017] N71-26183

TRANSPORTATION
Analysis of adequacy of access routes to Dulles International Airport and need for additional facilities to accommodate future expansion
[PB-194094] N71-26301

TRAVELING WAVES
Simply supported normal mode plate time response to traveling wave at oblique incidence, using numerical analysis
A71-30068

TROPICAL REGIONS
Microbiological contamination of jet aircraft fuel tanks in tropical regions, considering maintenance
[SAE PAPER 710438] A71-28320
Test procedures to determine ability of aircraft equipment and armament to withstand storage and operate effectively in tropic environment
[AD-720570] N71-26194

TROPOPAUSE
Atmospheric models of partially trapped waves propagation in layer above tropopause with large stratospheric Scorer parameter
A71-29763

TROPOSPHERE
Tropospheric and ionospheric absorption at VHF for North Atlantic aeronautical satellite system
[NASA-TM-X-65507] N71-24914

TURBINE BLADES
Aerofoil cascades with axial velocity change in incompressible flow, determining turbine blade force dependence on circulation
A71-28467
Metal temperatures in rotating cooled gas turbine blades, discussing coolant flow aerodynamics
A71-28748
Aerodynamic forces produced in turbine stage by vane cascade of cascade series
[NASA-TT-F-13631] N71-25998
Analysis of first stage turbine stator vane and rotor blade cooling designs for application in highspeed aircraft
[NASA-TM-X-1782] N71-26355

TURBINE ENGINES
Turbine engine fuel control stability on CH-47C helicopter, using flight tests and lag damper simulation
[AHS PREPRINT 560] A71-31107
VTOL turboshaft engine powered propulsion system development, detailing design requirements, program planning, component research and system integration
[AHS PREPRINT 562] A71-31109
Analysis of first stage turbine stator vane and rotor blade cooling designs for application in highspeed aircraft
[NASA-TM-X-1782] N71-26355

TURBOCOMPRESSORS
Measurement errors in testing single stage air driven axial flow compressors and turbines
A71-28582
Multistage axial flow compressors on digital computer, testing gas dynamic design in final adjustment phase
A71-28584
Monograph on potential flow interaction between blade rows in axial flow compressors covering mathematical model, numerical analysis and experiment
A71-28883
Circumferential traversing probe technique for intrastage analysis of axial flow compressors, considering mass flow averaging data reduction technique
[ASME PAPER 71-FE-33] A71-29468
Axial flow turbines comparative performance tests under steady and pulse flow conditions for turbocharger application
A71-29819

TURBOFAN AIRCRAFT
Climbout and landing approach noise measurements for three engine turbofan transport aircraft
[NASA-TM-D-6137] N71-24582

TURBOFAN ENGINES
CF6 turbofan engine development, discussing performance and endurance tests and design changes for reliable low cost operation

SUBJECT INDEX

[SAE PAPER 710421] A71-28308
Supersonic staggered gutter colander combustion system for plenum chamber burning on high bypass Pegasus turbofan engine of Harrier VTOL aircraft, noting performance improvement
A71-28743
Afterburning turbofan engine thrust calculation by gas generator method, using F-111A for comparison tests
[AIAA PAPER 71-680] A71-30744
Turbojet and turbofan augmentors combustion instability, discussing pressure oscillations elimination by screech liner and flameholder design
[AIAA PAPER 71-698] A71-30757
Combination tone noise generation from turbofans with supersonic fan blade tip speed, determining sound power distribution among engine rotation frequency harmonics
[AIAA PAPER 71-730] A71-30777
Acoustic linings for attenuation of fan generated noise in turbofan engines, considering interaction between analytical lining performance prediction and flow duct testing
[AIAA PAPER 71-731] A71-30778
Optimal turbofan engine and reaction drive rotor combinations for helicopter design
[AHS PREPRINT 561] A71-31108

TURBOFANS
Tip turbine driven lift fan noise reduction tests, considering design parameters effects
[AIAA PAPER 71-743] A71-30784

TURBOGENERATORS
Soviet handbook of aircraft electrical equipment covering DC and turbine powered generators, lubrication materials, electromagnetic interference countermeasures, etc
A71-29530

TURBOJET ENGINES
Supersonic inlet turbojet engine compatibility tests in wind tunnels, using light panels and Summation Device analysis
A71-28032
RB 162 turbojet engine combustors for VTOL aircraft, achieving ignition by two pressure jet atomizers operative during starting cycle
A71-28742
Subsonic and supersonic turbojet aircraft engines development, discussing design, operation, reliability, weight, fuel consumption and cost
A71-29811
Absorbent materials for sound attenuation in turboreactor ducts, examining flow velocity, absorbent structure and cladding effects
A71-30518
Turbojet and turbofan augmentors combustion instability, discussing pressure oscillations elimination by screech liner and flameholder design
[AIAA PAPER 71-698] A71-30757
Gas-air mixture requirements for turbine and injection burner combustion efficiencies
[AD-719834] N71-25359
Flow-duct test facility data on acoustic behavior of lined ducts and duct-lining materials for turbojet engine applications
[NASA-CR-111887] N71-26417

TURBOMACHINE BLADES
Supercavitating flow past straight cascade with arbitrary blade shapes, considering lift and drag coefficients, cavitation number, cavity shape and exit flow conditions
[ASME PAPER 71-FE-6] A71-29448
Sound radiation and pressure fields inside vibrating turbomachine blades, using miniaturized microphones and compact capacitive detectors
A71-30517

TURBOPROP ENGINES
Reduction gearbox reliability problems from development and service experience with PT6A turboprop engine
[SAE PAPER 710433] A71-28318

TURBOSHAFTS
VTOL turboshaft engine powered propulsion system development, detailing design requirements, program planning, component research and system integration
[AHS PREPRINT 562] A71-31109

TURBULENCE EFFECTS

- Turbulence level effects on mixing of three plane parallel slipstreams with equal velocities and temperature from smoke visualization
A71-28962
- Atmospheric turbulence effect on turbine powered transport aircraft, discussing gust accelerations, avoidance, detection, forecasting and pilot control
A71-29750
- Air turbulence primary and secondary effects on aircraft flight and avoidance criteria considerations
A71-29768
- Flight characteristics under atmospheric turbulence conditions, analyzing analog trace records of airspeed, normal acceleration, altitude, air temperature, control surface and flight attitude parameters
A71-29771
- Automatic aircraft landing system modification for improvement of response to air turbulence effects
A71-29773

TURBULENCE METERS

- Miniature aerodynamic turbulence gage using axisymmetric lifting body sensor
A71-28158

TURBULENT BOUNDARY LAYER

- Separation control of two dimensional air flow with turbulent boundary layer along circular cylindrical wall by jets or suction
A71-29433

TURBULENT FLOW

- Heat shield ablation under high enthalpy chemically active turbulent gas flow in hydrojet engine manifolds
A71-28589
- Soviet papers on combustion processes in turbulent and laminar flows of kerosene and gasoline mixtures, stressing gas turbine engines problems
A71-28954

- Friction factor for low Reynolds number turbulent flow in large aspect ratio rectangular ducts, comparing Blasius and Prandtl relations
[ASME PAPER 71-FE-A] A71-29378

TURBULENT HEAT TRANSFER

- Turbulent skin friction and heat transfer prediction on flat plates and wind tunnel walls at supersonic and hypersonic Mach numbers, using Van Driest theory
A71-29868

TURBULENT MIXING

- Modular concept mathematical model for combustion and pollution formation processes in jet engine combustors, including turbulent mixing and reaction kinetics
[AIAA PAPER 71-714] A71-30766

TURBULENT WAKES

- Structure and shape of vortex wake associated with oblique flow past multiblade hinged rotor, using cavitation method
A71-29217
- X-type hot-wire probe thermal turbulent wake interference, discussing wind tunnel investigation of wire distance effect on pitch angle sensitivity
A71-31022

TWO DIMENSIONAL BODIES

- Aerodynamic behavior of bodies in wake of two dimensional bluff bodies, discussing loads
A71-29265
- High lift and boundary layer separation behavior of sweptback wing airfoil profile noting trailing and leading edge stall pattern
[ARC-R/M-3648] N71-24488

TWO DIMENSIONAL FLOW

- Separation control of two dimensional air flow with turbulent boundary layer along circular cylindrical wall by jets or suction
A71-29433
- Two dimensional jet flap cascades, presenting stream deflection angles as function of jet to mainstream momentum flux
[ASME PAPER 71-FE-14] A71-29453
- Incompressible conducting fluid plane jet expansion in homogeneous slipstream, deriving partial differential equations for nonconduction approximation
A71-29131

- Two dimensional flow research on high lift airfoils for STOL aircraft, using vorticity distribution and wind tunnel wall blowing techniques
A71-29610

TWO PHASE FLOW

- Skin friction drag and velocity profile measurements on flat plate in two phase circular pipe flow in subsonic wind tunnel for gas-solid media, using photographic technique
[ASME PAPER 71-FE-32] A71-29467

U**U.S.S.R.**

- Aerodynamic configurations and characteristics of USSR military helicopters
[AD-719585] N71-25133

UH-1 HELICOPTER

- High performance UH-1 compound helicopter high speed flight research, considering rotor loads, stability, control and flying qualities
[AHS PREPRINT 570] A71-31111

ULTRAHIGH FREQUENCIES

- Low carrier power aircraft antenna module for airborne UHF communications system, considering range/field strength measurements
A71-31046

- Viability of L band communication system between geostationary satellites and aircraft terminals
[NASA-TM-X-65508] N71-24913

- Survey of very high and ultrahigh frequency utilization in US aeronautics for communication satellite frequency assignment
[NASA-TM-X-65527] N71-25920

UNITED STATES OF AMERICA

- Survey of very high and ultrahigh frequency utilization in US aeronautics for communication satellite frequency assignment
[NASA-TM-X-65527] N71-25920

UNLOADING

- Army/Navy operational evaluation of offshore containerships discharge by CH-54 helicopters
[AHS PREPRINT 573] A71-31114

UNSTEADY FLOW

- Unsteady curvilinear motion of lifting surface, calculating induced gas flow velocities in terms of vortex densities
A71-29188

- Unsteady hypersonic self similar gas flow and drag on circular cone accelerated according to power law, using small perturbation theory
A71-29205

- Aeroelasticity and unsteady flow problems of aircraft
N71-24706

URBAN TRANSPORTATION

- Aircraft capabilities in intraurban transportation for Detroit metropolitan area, considering vehicle design, fleet size, cost and terminal location
[AIAA PAPER 71-504] A71-29548

- Helicopter systems operations in, around and between major metropolitan areas, considering performance of New York Airways
[AIAA PAPER 71-507] A71-29549

- Integrated short-haul interurban transportation system, considering combination of conventional jet aircraft, STOL aircraft and high-speed ground transportation
[AIAA PAPER 71-508] A71-29550

- Investigation of aerodynamic forces imposed on vehicles proposed for operation in improved urban transportation system
N71-26129

V**V/STOL AIRCRAFT**

- Prop-fan propulsion system for V/STOL short haul transport aircraft, discussing performance, noise and weight characteristics
[SAE PAPER 710470] A71-28338

- Commercial V/STOL and jet VTOL transport, discussing Do-31 test results, landing approach, air traffic control automation and electronic control
A71-29131

V/STOL aircraft instruments, deck display and automatic flight controls for takeoff and landing operation	A71-29132	Service demand	A71-30164
V/STOL aircraft gust effects prediction with mathematical models based on nonlinear hybrid simulation at takeoff and landing altitudes	A71-29775	VTOL turboshaft engine powered propulsion system development, detailing design requirements, program planning, component research and system integration [AHS PREPRINT 562]	A71-31109
V/STOL aircraft flight path and attitude controls in turbulence, discussing design based on state variable methods of control theory	A71-29776	VERTICAL TAKEOFF VTOL and STOL aircraft comparative study covering site area, cost and noise and toxic gas production	A71-30163
Civil aviation customer /operator, passenger and community/ needs, describing STOL and V/STOL aircrafts	A71-30162	Long term prospects of air traffic development in competition with other modes, estimating VTOL service demand	A71-30164
V/STOL propulsion units lift ratings based on aircraft system requirements [SAE PAPER 710471]	A71-30537	Exhaust gas ingestion and recirculating flow field characteristics of small scale vertical take off engine pod [NASA-CR-1774]	N71-25397
Handling qualities of V/STOL research vehicles during steep terminal area approaches, discussing powered lift fan VTOL aircraft limitations and instrument landing approach [AHS PREPRINT 544]	A71-31101	VERTICAL TAKEOFF AIRCRAFT VTOL propulsion, discussing gas turbine pressure ratio inlet temperature and lifting and high bypass fans	A71-27838
Composite materials application to V/STOL prop/rotors, determining material properties parametric effect on frequencies and weight by Southwell coefficients [AHS PREPRINT 554]	A71-31106	Optimization of military VTOL aircraft secondary power systems, considering alternate power source for aircraft hydraulics, pneumatic drives, etc [SAE PAPER 710445]	A71-28326
Stability, control, and handling quality characteristics of STOL and V/STOL airplanes	N71-24702	RB 162 turbojet engine combustors for VTOL aircraft, achieving ignition by two pressure jet atomizers operative during starting cycle	A71-28742
Computerized simulation of V/STOL terminal approach and departure paths at landing sites [NASA-CR-118315]	N71-24869	Supersonic staggered gutter colander combustion system for plenum chamber burning on high bypass Pegasus turbofan engine of Harrier VTOL aircraft, noting performance improvement	A71-28743
VACUUM FURNACES Vacuum heat treatment of brazed and diffusion bonded jet engine components near melting temperature	A71-28145	Commercial V/STOL and jet VTOL transport, discussing Do-31 test results, landing approach, air traffic control automation and electronic control	A71-29131
VANES Aerodynamic forces produced in turbine stage by vane cascade of cascade series [NASA-TT-F-13631]	N71-25998	Jet-supported VTOL aircraft fuel-time-optimal landing control, using mathematical model, Pontryagin maximum principle and analog computer solution	A71-29281
VARIABLE GEOMETRY STRUCTURES Wind tunnel tests of geometrically compatible airfoils for variable chord sailplane	A71-29257	Helicopter systems operations in, around and between major metropolitan areas, considering performance of New York Airways [AIAA PAPER 71-507]	A71-29549
VARIANCE Time variant distortions in supersonic inlet on J-85-GE-13 turbojet engine from wind tunnel test, considering instantaneous distortion amplitudes and contours [AIAA PAPER 71-667]	A71-30733	VTOL aircraft minimum climb-to-cruise time transition optimal open loop and suboptimal closed loop control synthesis	A71-30799
VEHICLE WHEELS Powered landing gear wheel system requirements for parking and taxiing of commercial jet transport airplanes [SAE PAPER 710446]	A71-30530	Flightworthy 25-foot diameter prop rotor wind tunnel test, considering civil and military need for VTOL transportation [AHS PREPRINT 501]	A71-31077
VELOCITY DISTRIBUTION Helicopter rotor vortex system and induced velocity field for various angles of attack, flight conditions and unit loads, using smoke visualization technique	A71-29235	Handling qualities of V/STOL research vehicles during steep terminal area approaches, discussing powered lift fan VTOL aircraft limitations and instrument landing approach [AHS PREPRINT 544]	A71-31101
Flow field velocity distribution at rotating wing devices tip vortices [AHS PREPRINT 522]	A71-31088	VTOL turboshaft engine powered propulsion system development, detailing design requirements, program planning, component research and system integration [AHS PREPRINT 562]	A71-31109
VELOCITY ERRORS Combined inertial and instrument landing aircraft navigation systems with reduced cross runway position and velocity errors, using optimal linear estimation	A71-30606	Wind tunnel investigation of jet exhausting into cross flow - data for three jet configuration [AD-718123]	N71-24491
VERBAL COMMUNICATION Impedance measurements on modified broadband metal antenna for speech communication [FOA-3-C-3602-61]	N71-26150	Jet vertical takeoff aircraft piloted cockpit simulator for controlling aircraft flight performance [ARC-R/M-3647]	N71-25065
VERTICAL LANDING V/STOL aircraft instruments, deck display and automatic flight controls for takeoff and landing operation	A71-29132	VERY HIGH FREQUENCIES Feasibility of VHF aeronautical satellite system frequency sharing band used by ATC service, employing spatial separation, antenna directivity and frequency offset	A71-28873
VTOL and STOL aircraft comparative study covering site area, cost and noise and toxic gas production	A71-30163	ATS 1 and 3 satellite VHF transponders for ships and aircraft location, communication and remote sensing, discussing performance test results	A71-30898
Long term prospects of air traffic development in competition with other modes, estimating VTOL	A71-30163		

- Tropospheric and ionospheric absorption at VHF for North Atlantic aeronautical satellite system [NASA-TM-X-65507] N71-24914
- Survey of very high and ultrahigh frequency utilization in US aeronautics for communication satellite frequency assignment [NASA-TM-X-65527] N71-25920
- VIBRATION EFFECTS**
Uneven runway taxiing vibration effects on supersonic transport aircraft, comparing calculation with measurement A71-30305
- VIBRATION ISOLATORS**
Helicopter fuselage vertical and in-plane main rotor head vibratory forces isolation with hydro pneumatic servocentered system at transmission/airframe interface [AHS PREPRINT 514] A71-31085
- VIBRATION MODE**
Automated modal data acquisition and processing system /MODAPS/ for real-time modal vibration testing of complex aerospace vehicle structures, describing features, capabilities and utilization A71-30341
- VIBRATION SIMULATORS**
Boeing 347 helicopter program consisting of analysis, vibration simulation, wind tunnel, whirl tower and bench tests [AHS PREPRINT 571] A71-31112
- VIBRATION TESTS**
Yak 40 aircraft flight test program, discussing airworthiness requirements, static structural, vibration and wind tunnel tests A71-29911
- Automated modal data acquisition and processing system /MODAPS/ for real-time modal vibration testing of complex aerospace vehicle structures, describing features, capabilities and utilization A71-30341
- Fincap communication antennas design and environmental tests for vibration, acceleration, waterproofing, salt corrosion, ice formation and compass safe distance A71-31047
- VIBRATIONAL STRESS**
Fatigue life of helicopter rotary wings under vibrational stresses N71-24386
- VISCOUS DRAG**
Asymptotic limiting viscous flow pattern and drag on flat plate with stationary separation zones at large Reynolds numbers A71-29204
- VISCOUS FLOW**
Asymptotic limiting viscous flow pattern and drag on flat plate with stationary separation zones at large Reynolds numbers A71-29204
- Wind tunnel simulation of viscous hypersonic flow-laminar boundary layer interactions, presenting similarity parameter effects on aerodynamic characteristics A71-2 224
- VISCOUS FLUIDS**
Axisymmetrical three component flow equations for incompressible viscous fluid in cylinder with rotating disk A71-30855
- VISIBILITY**
Description of method for determining visibility in earth atmosphere [AD-719502] N71-24375
- High intensity xenon flashtube lights for increasing conspicuity of trainer helicopters during daytime and nighttime flights [AD-718639] N71-24669
- VISUAL FLIGHT**
Visual flight simulation devices, considering high resolution photographic films and digital memories A71-29483
- VOLTAGE REGULATORS**
Soviet book on airplane and helicopter electrical power supply systems covering storage batteries, DC generators, alternators, voltage regulators, current and frequency control, etc A71-29525
- VORTEX BREAKDOWN**
Measurement of oscillatory pitching moment derivatives on sharp-edged delta wing at vortex breakdown angle of attack N71-24572
- VORTEX SHEETS**
Vortex wakes behind STOL operations high lift wings, discussing height above ground and various wind tunnel dimensions effects A71-28033
- VORTEX STREETS**
Propeller vortex theory, calculating vortex streets pitch distributions and wake configuration A71-30443
- VORTICES**
Trailing vortices shed by aircraft lifting surfaces, noting wake effects importance at low speeds A71-28176
- Structure and shape of vortex wake associated with oblique flow past multiblade hinged rotor, using cavitation method A71-29217
- Air flow past small aspect ratio thick-section wing at small angles of attack, investigating vortex system effect on flow characteristics in absence of lift A71-29234
- Helicopter rotor vortex system and induced velocity field for various angles of attack, flight conditions and unit loads, using smoke visualization technique A71-29235
- Flow field velocity distribution at rotating wing devices tip vortices [AHS PREPRINT 522] A71-31088
- Angle of incidence effect on delta wing leading-edge vortices with cross flow visualization in hydraulic test tunnel [ARC-R/M-3645] N71-24482
- Vertical transonic gas flow over wing profile N71-25714

W

- WAKES**
Aerodynamic behavior of bodies in wake of two dimensional bluff bodies, discussing loads A71-29265
- Mechanical support system role in determination of aeroelastic stability of leeward cylinder immersed in wake using undamped flutter theory A71-31021
- WALL FLOW**
Separation control of two dimensional air flow with turbulent boundary layer along circular cylindrical wall by jets or suction A71-29433
- WARNING SYSTEMS**
Concorde power plant fire protection system, describing prototype engine bay overheat detection system and additional UV optical fire detection system A71-30300
- WATER EROSION**
Materials and processing methods for rain erosion resistant ceramic coated plastic structures for supersonic aircraft, considering fiberglass reinforced polyimide radomes with alumina coating A71-29645
- WAVE DRAG**
Wing thickness optimal distribution for minimum wave drag in supersonic flow at zero angle of attack for given planform, using Ritz method at lower Mach numbers A71-29222
- WAVE PROPAGATION**
Atmospheric models of partially trapped waves propagation in layer above tropopause with large stratospheric Scorer parameter A71-29763
- WAVE REFLECTION**
Incident sonic boom shock wave reflection factors off smooth surface, discussing pressure rise and flight near threshold Mach number A71-30610

- WAVEGUIDE ANTENNAS
Flush mounted aeronautical waveguide antennas with dielectric plug for 5GHz operation
A71-31043
- WEAPON SYSTEMS
Cheyenne attack helicopter weapons system, discussing night vision capability, armament, fire control and navigation equipment integration
[AHS PREPRINT 530] A71-31091
Weapons delivery computer for attack helicopters, using planar distributed function generator for general closed form instantaneous solution capability
[AHS PREPRINT 531] A71-31092
- WEAPONS
Test procedures to determine ability of aircraft equipment and armament to withstand storage and operate effectively in tropic environment
[AD-720570] N71-26194
- WEATHER FORECASTING
Aircraft hazards due to frequent low cloud occurrences at Kenya airport, forecasting weather with statistical analysis and radiosounding
A71-29106
Thunderstorm, CAT, weather and mountain wave induced turbulence forecasting and analysis for transport aircraft
A71-29764
Clear air turbulence in stratosphere and effects on weather formation, atmospheric physics, and supersonic flights
[JPRS-53133] N71-25746
- WEATHER RECONNAISSANCE AIRCRAFT
Oklahoma and Malaysia thunderstorms comparison based on weather reconnaissance aircraft measurements, considering turbulence patches
A71-29752
- WEIGHT ANALYSIS
Landing load estimation methods for preliminary design weight prediction for military aircraft
A71-28211
L-1011 Tristar antenna arrangement test results, considering weight, aerodynamic and structural design requirements
A71-31060
Size effects on large rotor systems design, considering weight, blade loading, tip speed, etc
[AHS PREPRINT 552] A71-31104
Composite materials application to V/STOL prop/rotors, determining material properties parametric effect on frequencies and weight by Southwell coefficients
[AHS PREPRINT 554] A71-31106
- WEIGHT MEASUREMENT
Onboard weighing system for gross weight determination and center of gravity location of Alouette helicopter, using load sensors, electrical circuits and visual indicators
A71-30320
- WESTLAND AIRCRAFT
Westland WG 13 Lynx helicopter, discussing design features, performance characteristics and civil and military applications
A71-30301
- WIND EFFECTS
Extreme turbulence measurement during low level flights of Mirage A3-76 fighter aircraft, determining true gust velocities and power spectral energy distributions
A71-29756
Aircraft with T tail configuration, examining dynamic response to lateral gusts
A71-29786
Aircraft design and fatigue life monitoring, investigating effects of gust velocity frequency distribution in patches of atmospheric turbulence
A71-29789
- WIND MEASUREMENT
Aircraft instrumentation and data analysis for clear air turbulence, including orthogonal components and temperature and wind distributions
A71-29753
Single anemometer wind measurement required for aircraft landing, comparing data from different sampling periods
A71-30395
- WIND TUNNEL MODELS
Ballistic wind tunnel for drag measurement on models during free flight at supersonic speeds
A71-29201
Wind tunnel model trajectory simulation system with closed loop control by digital computer, describing instrumentation, system servoamplifiers and testing procedures
A71-30334
Wind tunnel investigation of jet exhausting into cross flow - data for three jet configuration
[AD-718123] N71-24491
Transonic flutter and buffeting for elastic wind tunnel models of straight wing proposed for space shuttles
N71-24659
Wind tunnel simulations of flow fields and aerothermodynamics of space shuttle orbiters
N71-26053
Aerodynamic characteristics of delta wing space shuttle configurations
N71-26062
- WIND TUNNEL STABILITY TESTS
Yak 40 aircraft flight test program, discussing airworthiness requirements, static structural, vibration and wind tunnel tests
A71-29911
Frequency response of five component strain gage oscillating balance for dynamic wind tunnel stability testing
A71-30333
Wind tunnel force test program design for jet aircraft configurations, including propulsion system simulation
A71-30605
Multimission strategic aircraft installation effects testing in propulsion and aerodynamic wind tunnels, yielding flowfield definition, inlet internal performance, drag, forebody shape and orientation
[AIAA PAPER 71-759] A71-30792
Flightworthy 25-foot diameter proprotor wind tunnel test, considering civil and military need for VTOL transportation
[AHS PREPRINT 501] A71-31077
Forward flight performance of coaxial rigid rotor in NASA wind tunnel, comparing to aerodynamic stability with conventional rotors
[AHS PREPRINT 524] A71-31090
Rotor stability derivatives determination from instrumented OH-6A prototype helicopter wind tunnel tests, comparing data with analytical results obtained by digital computing technique
[AHS PREPRINT 543] A71-31100
Boeing 347 helicopter program consisting of analysis, vibration simulation, wind tunnel, whirl tower and bench tests
[AHS PREPRINT 571] A71-31112
Low-speed wind tunnel longitudinal stability tests on sweptback wing model with blowing at leading edge slats and trailing edge flaps for Buccaneer aircraft performance
[ARC-R/M-3655] N71-24565
Transonic wind tunnel tests of vertical fin loads and rudder hinge moments on M2-F3 lifting body scale model at Mach 0.50 to 1.30
[NASA-TM-X-2286] N71-24581
Aircraft development facility with wind tunnel testing capability
[AD-719802] N71-25048
Reynolds number simulation requirements for, subsonic wind tunnel tests of space shuttle configurations
N71-26065
- WIND TUNNEL WALLS
Turbulent skin friction and heat transfer prediction on flat plates and wind tunnel walls at supersonic and hypersonic Mach numbers, using Van Driest theory
A71-29868
- WIND TUNNELS
Supersonic inlet turbojet engine compatibility tests in wind tunnels, using light panels and Summation Device analysis
A71-28032
Wind tunnel tests of geometrically compatible airfoils for variable chord sailplane

A71-29257

Heat transfer within resonant cavities at subsonic and supersonic flow, discussing wind tunnels, test procedures and data reduction
[ASME PAPER 71-FE-9] A71-29450

Noise production during aerodynamic tests on helicopter rotor in wind tunnel A71-30519

WIND VELOCITY

Anemometer measurement optimum averaging time of wind speed for conventional aircraft landings A71-30394

Single anemometer wind measurement required for aircraft landing, comparing data from different sampling periods A71-30395

WING FLAPS

Noise measurement data on various types of blown flap configurations for STOL aircraft, discussing integration effects between jet and flap assembly
[AIAA PAPER 71-745] A71-30785

En route aircraft flap control during descent and holding
[ARB-TW-99] N71-24920

Static tests of augmentor-wing flap system for modified C-8A jet STOL research airplane using 0.7 scale model
[NASA-CR-114315] N71-26416

WING LOADING

Wing-jet interference effects in cross wind on thrust and aerodynamic characteristics at large distance from and near ground A71-29207

Cost transfer functions relating lift and moments to upwash in single sinusoidal wave for large aspect ratio rectangular wings in turbulent incompressible flow A71-30604

Helicopter rotor blade airload by applying lifting surface solution
[AHS PREPRINT 510] A71-31081

Size effects on large rotor systems design, considering weight, blade loading, tip speed, etc
[AHS PREPRINT 552] A71-31104

Numerical evaluation of downwash integral for wing loading of lifting rectangular planform
[NPL-MA-90] N71-24483

Low wing loading STOL transport ride smoothing using Boeing aircraft
[NASA-CR-111819] N71-24586

WING OSCILLATIONS

Measurement of oscillatory pitching moment derivatives on sharp-edged delta wing at vortex breakdown angle of attack N71-24572

WING PANELS

Structural and inertial nonlinearities influence on flat or curved panel flutter A71-30825

WING PROFILES

Wing thickness optimal distribution for minimum wave drag in supersonic flow at zero angle of attack for given planform, using Ritz method at lower Mach numbers A71-29222

WING SPAN

Incompressible fluid motion in laminar boundary layer on blade rotating uniformly about axis perpendicular to wing span A71-30218

WINGS

Transonic flutter and buffeting for elastic wind tunnel models of straight wing proposed for space shuttles N71-24659

Vortical transonic gas flow over wing profile N71-25714

X

XENON LAMPS

High intensity xenon flashtube lights for increasing conspicuity of trainer helicopters during daytime and nighttime flights
[AD-718639] N71-24669

Y

YAK 40 AIRCRAFT

Yak 40 aircraft flight test program, discussing airworthiness requirements, static structural, vibration and wind tunnel tests A71-29911

YAW

Roll moment of inertia to static margin ratio effect on yaw of repose angle magnitude in ballistic match of projectiles A71-29890

Z

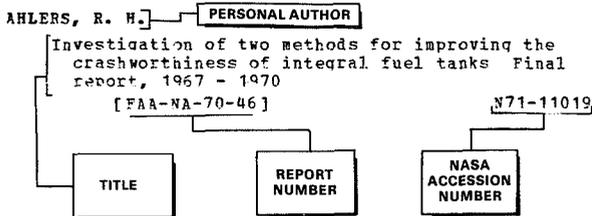

ZERO ANGLE OF ATTACK

Heat transfer on spheres and sharp cones in rarefied hypersonic gas flow at zero angles of attack in wind tunnel vacuum A71-29176

Wing thickness optimal distribution for minimum wave drag in supersonic flow at zero angle of attack for given planform, using Ritz method at lower Mach numbers A71-29222

PERSONAL AUTHOR INDEX

Typical Personal Author Index Listing

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The accession number is located beneath and to the right of the title, e.g., N71-11019. Under any one author's name the accession numbers are arranged in sequence with the /AA accession numbers appearing first.

CONTRACT NUMBER INDEX

Typical Contract Number Index Listing

Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the IAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the *IAA* or *STAR* section.

		8. Performing Organization Report No.	
7. Author(s)		10. Work Unit No.	
9. Performing Organization Name and Address National Aeronautics and Space Administration Washington, D. C. 20546		11. Contract or Grant No.	
		13. Type of Report and Period Covered	
12. Sponsoring Agency Name and Address		14. Sponsoring Agency Code	
		15. Supplementary Notes	
16. Abstract This special bibliography lists 540 reports, articles, and other documents introduced into the NASA scientific and technical information system in July 1971. Emphasis is placed on engineering and theoretical aspects for design, construction, evaluation, testing, operation and performance of aircraft (including aircraft engines) and associated components, equipment and systems. Also included are entries on research and development in aeronautics and aerodynamics and research and ground support for aeronautical vehicles.			
17. Key Words (Suggested by Author(s)) Aerodynamics Aeronautical Engineering Aeronautics Bibliographies		18. Distribution Statement Unclassified - Unlimited

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA deposits its technical documents and bibliographic tools in eleven Federal Regional Technical Report Centers located in the organizations listed below. Each center is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA

University of California, Berkeley

COLORADO

University of Colorado, Boulder

DISTRICT OF COLUMBIA

Library of Congress

GEORGIA

Georgia Institute of Technology, Atlanta

ILLINOIS

The John Crerar Library, Chicago

MASSACHUSETTS

Massachusetts Institute of Technology, Cambridge

MISSOURI

Linda Hall Library, Kansas City

NEW YORK

Columbia University, New York

PENNSYLVANIA

Carnegie Library of Pittsburgh

TEXAS

Southern Methodist University, Dallas

WASHINGTON

University of Washington, Seattle

NASA publications (those indicated by an "*" following the accession number) are also received by the following public and free libraries:

CALIFORNIA

Los Angeles Public Library

San Diego Public Library

COLORADO

Denver Public Library

CONNECTICUT

Hartford Public Library

DELAWARE

Wilmington Institute Free Library, Wilmington

MARYLAND

Enoch Pratt Free Library, Baltimore

MASSACHUSETTS

Boston Public Library

MICHIGAN

Detroit Public Library

MINNESOTA

Minneapolis Public Library

James Jerome Hill Reference Library, St. Paul

MISSOURI

Kansas City Public Library

St. Louis Public Library

NEW JERSEY

Trenton Public Library

NEW YORK

Brooklyn Public Library

Buffalo and Erie County Public Library

Rochester Public Library

New York Public Library

OHIO

Akron Public Library

Cincinnati Public Library

Cleveland Public Library

Dayton Public Library

Toledo Public Library

OKLAHOMA

Oklahoma County Libraries, Oklahoma City

TENNESSEE

Cossitt-Goodwin Libraries, Memphis

TEXAS

Dallas Public Library

Fort Worth Public Library

WASHINGTON

Seattle Public Library

WISCONSIN

Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 750 Third Avenue, New York, New York, 10017.

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the National Lending Library for Science and Technology, Boston Spa, Yorkshire, England. By virtue of arrangements other than with NASA, the National Lending Library also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "#" and "*", from: ESRO/ELDO Space Documentation Service, European Space Research Organization, 114, av de Neuilly, 92-Neuilly-sur-Seine, France.

"The aeronautical and space activities of the United States shall be conducted so as to contribute . . . to the expansion of human knowledge of phenomena in the atmosphere and space. The Administration shall provide for the widest practicable and appropriate dissemination of information concerning its activities and the results thereof."

—NATIONAL AERONAUTICS AND SPACE ACT OF 1958

NASA SCIENTIFIC AND TECHNICAL PUBLICATIONS

TECHNICAL REPORTS: Scientific and technical information considered important, complete, and a lasting contribution to existing knowledge.

TECHNICAL NOTES: Information less broad in scope but nevertheless of importance as a contribution to existing knowledge.

TECHNICAL MEMORANDUMS: Information receiving limited distribution because of preliminary data, security classification, or other reasons.

CONTRACTOR REPORTS: Scientific and technical information generated under a NASA contract or grant and considered an important contribution to existing knowledge.

TECHNICAL TRANSLATIONS: Information published in a foreign language considered to merit NASA distribution in English.

SPECIAL PUBLICATIONS: Information derived from or of value to NASA activities. Publications include conference proceedings, monographs, data compilations, handbooks, sourcebooks, and special bibliographies.

TECHNOLOGY UTILIZATION PUBLICATIONS: Information on technology used by NASA that may be of particular interest in commercial and other non-aerospace applications. Publications include Tech Briefs, Technology Utilization Reports and Technology Surveys.

Details on the availability of these publications may be obtained from:
