A NUMERICAL ANALYSIS OF THE TRANSIENT RESPONSE
OF AN ABLATION SYSTEM INCLUDING EFFECTS OF
THERMAL NON-EQUILIBRIUM, MASS TRANSFER AND CHEMICAL KINETICS

by

Ronald Keith Clark

(ABSTRACT)

The differential equations governing the transient response of a one-dimensional ablative thermal protection system undergoing stagnation ablation are derived for the general case of thermal non-equilibrium between the pyrolysis gases and the char layer and kinetically controlled chemical reactions and mass transfer between the pyrolysis gases and the char layer. The boundary conditions are written for the particular case of stagnation heating with surface removal by oxidation or sublimation and pyrolysis of the uncharred layer occurring in a plane.

The governing equations and boundary conditions are solved numerically using the modified implicit method (Crank-Nicolson method). Numerical results are compared with exact solutions for a number of simplified cases. The comparison is favorable in each instance.

Numerical results are presented for a typical ablation system subjected to a square heat pulse. The effects of chemical reactions and mass transfer are pronounced.
ACKNOWLEDGEMENTS

The author is grateful to Dr. Felix J. Pierce, Advisory Committee Chairman, for his suggestions and criticisms throughout this effort and to the entire committee for their review of this thesis.

The author is also indebted to the National Aeronautics and Space Administration for permission to use material obtained from research at the Langley Research Center in this thesis. Thanks are due many people at the Langley Research Center who made this effort possible. In particular the support of Mr. Robert T. Swann throughout the program is appreciated as is the encouragement received from Mr. Marvin B. Dow. The assistance of Mr. Claud M. Pittman and Mrs. Kay L. Brinkley was invaluable in completing the programming of the finite difference equations. And last but not least, the author appreciates the patience of his wife who must have heard the phrase "I think I've found the problem" 200 times.

LIST OF SYMBOLS

A
specific reaction rate constant for chemical reaction (various units) or radiant energy absorption of char layer (W/m^3)

A'
radiant energy absorption of pyrolysis gases (W/m^3) or specific reaction rate constant for pyrolysis of uncharred material (kg/m^2-sec)

A_i
chemical species i

[A_i]
mole density of chemical species i (mole/m^3)

A_s
specific surface area (area per unit volume) of char layer (1/m) or specific reaction rate constant for surface removal by oxidation (various units)

B
activation energy for chemical reaction (°K)

B'
activation energy for pyrolysis of uncharred layer (°K)

B_s
activation energy for surface removal by oxidation (°K)

C
mass fraction of oxygen in boundary layer

C
normalized mass fraction of oxygen in boundary layer

C_p
heat capacity of pyrolysis gases at constant pressure (J/mole-°K)

C_p
heat capacity of pyrolysis gases at constant pressure, per unit mass (J/kg-°K)

C_{p,HS}
heat capacity per unit mass of heat sink at interface of uncharred material and insulation layer (J/kg-°K)

C_{p,HSP}
heat capacity per unit mass of heat sink at back of insulation layer (J/kg-°K)

C_{p,i}
heat capacity of chemical species i at constant pressure (J/mole-°K)

C_{p,s}
heat capacity of solid at constant pressure (J/mole-°K)

CHAPTER I

INTRODUCTION

Space vehicles reentering the earth's atmosphere or entering other planetary environments are subjected to severe aerodynamic heating. Several methods of protecting the interior of the spacecraft have been proposed. Conditions resulting in high aerodynamic heating rates require use of ablation materials for thermal protection. The charring ablator thermal protection material (see schematic diagram, Fig. 1) has been found most effective as a thermal shielding material for a wide range of heating conditions. In Ref. 1 Swann discusses weights and efficiencies of various thermal protection systems for a range of heating conditions.

The favorable performance of the charring ablator is largely attributable to the tough char layer which forms on the surface of the material as it is heated. This char layer is capable of withstanding very high temperatures, and during reentry a significant amount of the total heat input at the surface is radiated to the environment by the high temperature char surface. Gases generated in the pyrolysis zone of the charring ablator percolate through the high temperature porous char layer to the surface. As these pyrolysis gases flow through the char layer, they absorb energy by increasing in temperature and undergoing chemical reactions.

The performance of ablative thermal protection systems has been the subject of extensive research over the past decade. Refs. 2, 3,
Figure 1. - Schematic diagram of charring ablator.
and 4 by Chapman, Dow and Tompkins, and Chapman and Dow are typical of the many reports presenting results of experimental evaluation of the ablative performance of thermal protection materials. The experimental programs whose results are reported in Refs. 2, 3 and 4 involved testing candidate thermal protection materials in arc-heated tunnels to compare their performance as thermal protection systems for reentry applications.

Many analytical reports have been devoted to developing theories of ablation. In Refs. 5, 6 and 7 Roberts considers the effects of mass transfer processes near the stagnation point on heat transfer to two-dimensional or axisymmetric bodies. Ref. 5 presents a simplified analysis of mass transfer cooling near the stagnation point for two dimensional or axisymmetric bodies, showing the reduction in heat transfer in terms of the properties of the cooling fluid. Ref. 6 presents a simplified analysis of the shielding mechanism which reduces the stagnation point heat transfer when ablation takes place at the surface. Ref. 7 presents a theoretical study of the shielding mechanism whereby the rates of heat transfer are reduced near the stagnation point of two-dimensional and three dimensional bodies when melting and vaporization occur simultaneously.

A large body of literature exists which describes the experimental and analytical effort directed toward studying the performance of ablative thermal protection systems including the interaction of the ablator with the boundary layer. In Ref. 8 Scala and Gilbert present
a theoretical analysis of the overall response of a char-forming plastic during hypersonic flight. The rate of pyrolysis of the plastic is calculated by means of a chemical kinetic equation. A mathematical description of the gas flow through the char is included. Hypersonic boundary layer mass transfer effects are also considered in the overall energy balance. Results are presented for the forward stagnation line of an unyawed cylinder in hypersonic flow undergoing quasi-steady ablation.

An analysis of the effects of environmental conditions on the performance of charring ablators is presented in Ref. 9 by Swann, Dow and Tompkins. Equations relating different environments which produce the same material response are derived for the case of surface removal by oxidation. The effects of environmental parameters on the thermal performance of ablators are examined.

In Ref. 10 Swann presents an analysis of the performance of char-forming ablators. It includes a derivation of the equations governing the response of charring ablators subject to char removal by diffusion controlled oxidation. Results are presented for the case of a constant enthalpy level and the effects of various material properties and environmental parameters are discussed.

A study of the effects of oxidation on the performance of charring ablators is presented in Ref. 11 by Dow and Swann. Char-forming ablation specimens were exposed to high energy gas streams of nitrogen and different oxygen concentrations. Surface removal data from these
tests were correlated in terms of a diffusion limited oxidation mechanism. An energy balance calculated for specimens exposed to 11.5 percent oxygen concentration showed that the heat input from combustion is a significant part of the total heat input.

Further attempts at defining the effects of environment and material properties on the performance of ablators are discussed by Clark in Ref. 12 and Swann, Brewer and Clark in Ref. 13.

Because of the many complex factors involved, the usefulness of developing computer simulation programs as a practical tool for solving ablation problems was obvious early in the previous decade. Early analyses of ablative thermal protection systems neglected or greatly simplified the complex processes and rate controlling mechanisms that occur in charring ablation systems. Ref. 14 by Swann and Pittman represents an early numerical treatment of an ablative thermal protection system. It presents a derivation in finite difference form of the energy transfer equations for a charring ablator system in which thermal equilibrium exists between the char layer and the pyrolysis gases. Removal of material at the surface by chemical and/or mechanical processes is achieved by modelling any of the following mechanisms:

1) ablation at a given temperature
2) material erosion as a given function of time
3) material erosion such that the char thickness is a given function of time.

Pyrolysis of the uncharred material occurs at a single given temperature, so that a well-defined interface exists between the char layer
and the uncharred layer. Reduction of aerodynamic heating at the surface resulting from injection of pyrolysis gases into the boundary layer is accounted for by using a second-degree approximation to the boundary layer solutions for air-to-air injection. The effect of chemical reactions involving the pyrolysis gases as they flow through the char layer is included by using an effective specific heat for the pyrolysis gases which is adjusted to account for endothermic and exothermic chemical processes. Ref. 14 presents some typical results from computer calculations and some comparisons with experimental results.

In Ref. 15 Kratsch, Hearne and McChesney present a sound effort at developing and experimentally verifying a theoretical model of a charring ablation thermal protection system. They present the coupled energy and mass transfer equations for a two-component resin-fabric composite with a complete description of the chemical processes involved. However, it invokes the assumption of thermal equilibrium between the char layer and pyrolysis gases. It also assumes steady state conditions exist. Experimental and computed results are presented for comparison.

Ref. 16 by Swann, Pittman and Smith presents what is perhaps the most widely employed numerical ablation analysis. Basically it represents a greatly improved version of the earlier analysis by Swann and Pittman (Ref. 14). The improvements include the following: (1) treatment of surface removal by chemical oxidation with consideration of rate controlled and diffusion controlled regimes; (2) pyrolysis
of the uncharred layer as an exponential function of temperature, and (3) transformation of governing equations to a moving coordinate system to accommodate changes in location of the surfaces of the ablator. However, their analysis also invokes the assumption of thermal equilibrium between the char layer and pyrolysis gases. Ref. 16 presents a comparison of computed results with exact solutions for simplified cases. The agreement between the numerical and exact solutions is good.

More recently strong interest has been directed toward the chemical processes occurring within the char layer of an ablation system. The experimental work by Clark which is reported in Refs. 17 and 18 demonstrates the intensity of these processes. This work also shows that the pyrolysis gases and char layer are not always in thermal equilibrium. Ref. 19 by Brewer, Stroud and Clark shows a thirty percent variation in thermal protection requirements for a typical reentry vehicle depending on whether the pyrolysis gases in the char are in chemical equilibrium or frozen as they flow from the pyrolysis zone to the surface.

This report presents an analysis of the transient response of a one-dimensional ablative thermal protection system undergoing stagnation ablation. The differential equations governing heat and mass transfer are derived out for both the char layer and the pyrolysis gases flowing through the char layer. These equations are coupled through a convective heat transfer term which represents energy transferred from the char layer to the pyrolysis gases. The
differential equation governing the pressure distribution in the char
layer is formulated. Chemical rate equations describing the chemical
reactions occurring in the char layer are formulated.

The boundary conditions are written for the particular case of
stagnation heating with surface removal by oxidation and/or sublimation,
and temperature dependent pyrolysis of the uncharred material occurring
in a plane.

The governing equations and boundary conditions are solved
numerically using a digital computer. Numerical solutions are obtained
for a number of simple problems where exact solutions are available
to test the integrity of various parts of the total program. Results
are presented for a body subjected to stagnation heating with surface
removal by oxidation and finite-rate chemistry occurring in the char
layer to illustrate the form of results obtained using this tool.
A discussion of the use of this program in design of thermal protection
systems is included.
CHAPTER II

GOVERNING EQUATIONS

A charring ablator system can be described by three distinct layers as shown in Fig. 1. These layers are the char layer and the uncharred material, which make up the ablator, and the heat sink and substrate insulation which are behind the ablator. The char layer is exposed to aerodynamic and/or radiant heating at the front surface. The surface of the char layer may also interact with the external boundary layer resulting in erosion of the char layer by chemical reactions and/or mechanical means. The region separating the char layer and the uncharred material is labeled the pyrolysis zone and is assumed to be a plane. The uncharred material undergoes pyrolysis at this interface at a rate given by an empirical Arrhenius type relation producing gaseous pyrolysis products and a porous char layer. The gaseous products absorb energy and undergo chemical reactions as they flow through the porous char layer to the front surface where they are injected into the boundary layer. From this discussion it is seen to be necessary to consider the three layers separately in deriving the differential equations which govern the behavior of an ablative system.

The char layer consists of two phases - the porous solid residue or char and the gaseous pyrolysis products, or pyrolysis gases, flowing through the porous residue. The porous residue experiences heat conduction and mass and heat transfer from interaction with the flow of
pyrolysis products. The pyrolysis products flowing through the porous residue undergo chemical reactions in addition to interacting with the solid. The uncharred layer and the substrate insulation experience heat conduction only.

Char Layer Equations

The char layer requires two differential equations for conservation of energy - one for the char and one for the pyrolysis gases. Mass transfer processes affecting the char must be considered to obtain an equation for variation of the char porosity. The pyrolysis gases also require differential equations for conservation of chemical species, total mass and momentum, and chemical reaction rate equations.

Char temperature differential equation.-The energy conservation equation for the char is obtained by considering a control volume $V$ within the char layer. The char occupies a fraction of this volume equal to $(1 - \eta)$ where $\eta$ is the char layer porosity. The energy conservation equation applied to the solid phase of the char layer states that the rate of change of energy contained in the solid phase of the char within the control volume $V$ equals the sum of the net ratio of energy transfer into the solid phase by conduction heat transfer, convection to the pyrolysis gases, mass transfer from the pyrolysis gases to the solid resulting from homogeneous chemical reactions and heterogeneous chemical reactions (reactions occurring on the solid surface), heats of reaction given up by the solid in heterogeneous chemical reactions involving the pyrolysis gases and
the solid, radiation of energy to the solid and energy produced within the solid by any internal source.

The total energy contained in the solid phase of the char within a unit volume of the char layer is equal to the product of the theoretical solid density, enthalpy and solid phase volume fraction which is \((1 - \eta)\). The terms of the char energy equation may be written as follows:

Non-stationary volume term

\[
\int_V \frac{\partial}{\partial t} [(1 - \eta) \rho_s H_s] \, dV
\]

Conduction heat transfer term

\[- \int_S \mathbf{q}_s \cdot \mathbf{n} \, dS\]

Convection to the pyrolysis gases

\[- \int_V H_A (T_s - T) \, dV\]

where the volumetric heat transfer coefficient for convective energy transfer from the char to the pyrolysis gases is given by Bland in Ref. 20 as

\[
H_A = \frac{K \nu}{N_{Pr}} \sum_{i} \frac{\rho_i C_i}{M_i}
\]
Mass transfer from the pyrolysis gases to the solid resulting from homogeneous chemical reactions

\[ \int_V \eta \, r_s \, \hat{H}(T)_s \, dV \]

Mass transfer from the pyrolysis gases to the solid resulting from heterogeneous chemical reactions

\[ \int_V \eta \, r_{hs} \, \hat{H}_s \, dV \]

Heats of reaction given up by the solid in heterogeneous chemical reactions

\[ - \int_V \eta \, \sum_r \, r_h (r) \, \Delta H (r) \, dV \]

Radiation of energy to the solid

\[ \int_V (1 - \eta) (A - \varepsilon) \, dV \]

Energy produced within the solid by any internal source

\[ \int_V (1 - \eta) \, q'''_s \, dV \]

Combining these terms in equation form gives
\[ \int_V \frac{\partial}{\partial t} [(1 - \eta) \rho_s \hat{H}_s] \, dV = - \int_S \hat{q}_s \cdot \hat{n} \, dS - \int_V H_A (T_s - T) \, dV \]

\[ + \int_V \eta r_s \hat{H}(T_s) \, dV + \int_V \eta r_{hs} \hat{H}_s \, dV - \int_V \eta \sum_{r}^{(r)} \Delta H^{(r)} \, dV \]

\[ + \int_V (1 - \eta)(A - \varepsilon) \, dV + \int_V (1 - \eta) q''' \, dV \]  \hspace{1cm} (2-2)

which is a statement of conservation of thermal and chemical energy for the portion of a control volume in the char layer occupied by solid. The energy term associated with stresses has not been included since that term is negligible with respect to other terms. The use of enthalpy in this equation is consistent with its nearly universal usage as a measure of the energy content of solids; however, implicit with its use is the assumption that enthalpy and internal energy are equal. This assumption is valid for incompressible solids.

The term associated with the heats of reaction for heterogeneous chemical reactions is obtained by assuming that the heat of reaction for each reaction is supplied by the char. As an example, consider the \( r \)-th heterogeneous chemical reaction which is the oxidation of solid carbon to form carbon monoxide. The stoichiometric equation representing this reaction is

\[ O_2 + 2C_s \rightarrow 2CO \]  \hspace{1cm} (2-3)

and the heat supplied to the reaction is just the difference in enthalpy of the products and the reactants, or in equation form
\[ \Delta H(r) = 2H(T_s)C_0 - H(T)O_2 - H(T_s)C_s \]  

(2-4)

Applying Gauss's Theorem to the surface integral to obtain a volume integral results in the following equation

\[ \int_V \left\{ \frac{\partial}{\partial t} \left[ (1 - \eta) \rho_s \hat{H}_s \right] + \hat{V} \cdot \hat{q}_s + H_A (T_s - T) - \eta r_s \hat{H}(T) - \eta r_{hs} \hat{H}_s 
+ \eta \sum_r r_h^{(r)} \Delta H^{(r)} - (1 - \eta)(A - \varepsilon) - (1 - \eta) q'''ight\} dV = 0. \]  

(2-5)

This equation is true for any volume \( V \); therefore, the integral can vanish only if the integrand vanishes everywhere. Thus, the differential form of the char energy equation is

\[ \frac{\partial}{\partial t} \left[ (1 - \eta) \rho_s \hat{H}_s \right] + \hat{V} \cdot \hat{q}_s + H_A (T_s - T) - \eta r_s \hat{H}(T) - \eta r_{hs} \hat{H}_s 
+ \eta \sum_r r_h^{(r)} \Delta H^{(r)} - (1 - \eta)(A - \varepsilon) - (1 - \eta) q''' = 0. \]  

(2-6)

The non-stationary term is expanded to obtain

\[ \frac{\partial}{\partial t} \left[ (1 - \eta) \rho_s \hat{H}_s \right] = (1 - \eta) \rho_s \frac{\partial \hat{H}_s}{\partial t} + (1 - \eta) \hat{H}_s \frac{\partial \rho_s}{\partial t} \]  

(2-7)

But the theoretical density of the char is constant; therefore,

\[ \frac{\partial}{\partial t} \left[ (1 - \eta) \rho_s \hat{H}_s \right] = (1 - \eta) \rho_s \frac{\partial \hat{H}_s}{\partial t} - \rho_s \hat{H}_s \frac{\partial \eta}{\partial t}. \]  

(2-8)
The char layer energy equation now takes the form

\[(1 - \eta)\rho_s \frac{\partial \hat{H}_s}{\partial t} = - \nabla \cdot \dot{q}_s - H_A (T_s - T) + \eta r_s \dot{H}(T) + \eta r_{hs} \hat{H}_s \]

\[- \eta \sum_r r(t) \Delta H(4) + (1 - \eta)(A - \varepsilon) + (1 - \eta)q'''' + \rho_s \hat{H}_s \frac{\partial \eta}{\partial t}. \quad (2-9)\]

It is more convenient to work with temperature than enthalpy. The char enthalpy may be written as

\[\hat{H}_s = \int_0^T C_p (T_s - dT) + \hat{H}_{s0} \cdot \quad (2-10)\]

The time rate of change of char enthalpy is obtained by differentiating Eq. 2-10,

\[\frac{\partial \hat{H}_s}{\partial t} = \frac{2}{\partial t} \int_0^T C_p (T_s - dT) + \hat{H}_{s0} \cdot \quad (2-11)\]

The derivative of the integral appearing here is obtained by applying the Leibnitz Rule for differentiation under the integral sign as in Hildebrand (Ref. 21). Thus Eq. 2-11 becomes

\[\frac{\partial \hat{H}_s}{\partial t} = \int_0^T \frac{2}{\partial t} C_p (T_s - dT) + \hat{H}_{s0} \cdot \quad (2-12)\]
but \( \hat{C}_{ps} \) is not a function of time and \( \hat{H}_{so} \) is constant so

\[
\frac{\partial \hat{H}}{\partial t} = \frac{\partial H}{\partial t} = \frac{C_p}{\rho_s} \frac{\partial T}{\partial t} .
\]  

(2-13)

Combining Eq. 2-13 and Fourier's conduction equation,

\[
q_s = -k_s \frac{\partial T_s}{\partial s} ,
\]  

(2-14)

with Eq. 2-9 gives the differential equation for conservation of energy in the char layer as

\[
(1 - \eta) \rho_s \frac{\partial T}{\partial t} = \nabla \cdot (k_s \nabla T_s) - H_A (T_s - T) + \eta r_s \hat{H}(T) s
\]

\[
+ \eta r_{hs} \hat{H}_s - \eta \sum_r r^{(r)}_h \Delta H^{(r)} + (1 - \eta)(A - \epsilon)
\]

\[
+ (1 - \eta) q''' + \rho_s \frac{\partial H}{\partial t} .
\]  

(2-15)

The specific quantities \( \hat{C}_{ps} \), \( \hat{H}_s(T) \), \( \Delta H_j \) and \( \hat{H}_s \) and the chemical production terms \( r_s \) and \( r_{hs} \) may be expressed in terms of the respective mole quantities and Eq. 2-15 becomes

\[
(1 - \eta) \frac{\rho_s C_p}{M_s} \frac{\partial T}{\partial t} = \nabla \cdot (k_s \nabla T_s) - H_A (T_s - T) + \eta r_s \hat{H}(T) s
\]

\[
+ \eta r_{hs} \hat{H}_s - \eta \sum_r r^{(r)}_h \Delta H^{(r)} + (1 - \eta)(A - \epsilon)
\]

\[
+ (1 - \eta) q''' + \frac{\rho_s H}{M_s} \frac{\partial \eta}{\partial t} .
\]  

(2-16)
Char porosity differential equation.- The porosity differential equation results from consideration of mass transfer between the char and the pyrolysis gases. Mass transfer between these two phases results from two sources. One source is the solid material formed by homogeneous chemical reactions in the pyrolysis gases. This solid material is deposited from the gas phase to the solid phase. The other source is the solid material formed or consumed by heterogeneous chemical reactions which occur at the char-gas interface.

The rate of formation of solid material by homogeneous chemical reactions in the pyrolysis gases is determined from the appropriate chemical reaction rate equations to be $R_s$ (moles solid per unit volume of gas per unit time). The product of the char porosity (void fraction of the char layer), the molecular weight of the solid, and the rate of formation of solid gives the rate of material deposited in mass units per unit volume of char layer. Or, in equation form

$$\text{Mass Rate of Deposition} = \eta \frac{M_s}{\rho_s} R_s.$$  \hspace{1cm} (2-17)

This deposit occupies a volume equal to $\frac{1}{\rho_s}$ volume units per unit mass and this volume represents a decrease in the porosity of the char layer. Thus the time rate of change of char porosity due to homogeneous chemical reactions is

$$\left(\frac{\partial \eta}{\partial t}\right)_\text{hom} = - \eta \frac{M_s R_s}{\rho_s}.$$ \hspace{1cm} (2-18)
Similarly, the rate of formation of solid by heterogeneous chemical reactions, $R_{hs}$, is determined from the appropriate chemical reaction rate equations. Thus the time rate of change of char porosity due to heterogeneous chemical reactions is

\[
\frac{\partial \eta}{\partial t} = -\eta \frac{M_s}{\rho_s} R_{hs}.
\] (2-19)

Summing Eqs. 2-18 and 2-19 gives the time rate of change of char layer porosity as

\[
\frac{\partial \eta}{\partial t} = -\eta \frac{M_s}{\rho_s} (R_{hs} + R_s).
\] (2-20)

**Pyrolysis gas energy differential equation.**—The energy conservation equation applied to the fluid phase of the char layer states that the time rate of change of internal and kinetic energy contained in the pyrolysis gases within the control volume $V$ equals the sum of the net rates of convection of internal and kinetic energy transferred into the pyrolysis gases due to the mass average velocity, conduction of energy in the pyrolysis gases, radiation of energy to the pyrolysis gases, work done on the pyrolysis gases by external forces, work done on the pyrolysis gases by pressure forces, work done on the pyrolysis gases by viscous forces, energy transfer to the pyrolysis gases by convection from the char, energy loss by the pyrolysis gases due to mass transfer and energy gained by the pyrolysis gases due to
heterogeneous chemical reactions. The terms of the pyrolysis gas energy equation may be written as follows:

Non-stationary volume term

\[ \int_V \frac{\partial}{\partial t} \left[ \eta \rho \left( \hat{u} + \frac{1}{2} v^2 \right) \right] \, dV \]

Convection by mass average velocity

\[ -\int_S (\hat{u} + \frac{1}{2} v^2) \rho \mathbf{v}_o \cdot \mathbf{n} \, dS \]

where \( v \) is the velocity of the pyrolysis gases in the char layer and \( v_o \) is the superficial velocity (volume rate of flow through a unit cross-sectional area of the char plus pyrolysis gases).

Conduction term

\[ -\int_S q \cdot \mathbf{n} \, dS \]

Radiation term

\[ \int_V \eta (A' - \varepsilon') \, dV \]

Work by external forces

\[ \int_V \eta \sum_i \mathbf{n}_i \cdot \mathbf{g}_i \, dV \]
where \( \vec{n}_1 \) is a mass flux vector equal to the sum of the mass flux due to mass average velocity and the mass flux due to diffusion, or in equation form

\[
\vec{n}_1 = \rho_1 \vec{v} + \vec{j}_1.
\] (2-21)

Work by pressure forces

\[
- \int_S p \vec{v}_o \cdot \vec{n} \, dS
\]

Work by viscous forces

\[
\int_S [\vec{\tau} \cdot \vec{v}_o] \cdot \vec{n} \, dS
\]

Convection from the char

\[
\int_V H_A (T_s - T) \, dV
\]

Energy loss by mass transfer resulting from homogeneous chemical reactions

\[
- \int_V \eta \, r_s \, H(T)_s \, dV
\]

Energy loss by mass transfer resulting from heterogeneous chemical reactions
Energy gain resulting from heterogeneous chemical reactions

\[ f_V \eta \sum_{r} n_r (A^{(r)} - \mathcal{H}^{(r)}) dV \]

Combining these terms in equation form gives

\[ \frac{\partial}{\partial t} \left[ \eta \rho (U + \frac{1}{2} v^2) \right] dV = \]

\[ - \int_S (\hat{U} + \frac{1}{2} v^2) \rho \hat{v}_o \cdot \hat{n} dS - \int_S q \cdot \hat{n} dS \]

\[ + \int_V \eta (A' - \epsilon') dV + \int_V \eta \sum_{i} \hat{n_i} \cdot \hat{g}_i dV \]

\[ - \int_S p \hat{v}_o \cdot \hat{n} dS + \int_S [\hat{\tau} \cdot \hat{v}_o] \cdot \hat{n} dS \]

\[ + \int_V H_A (T_s - T) dV - \int_V \eta r_{hs} \mathcal{H}^{(T_s)} dV \]

\[ - \int_V \eta r_{hs} \mathcal{H}^{(s)} dV + \int_V \eta \sum_{r} n_r (A^{(r)} - \mathcal{H}^{(r)}) dV. \]  \hspace{1cm} (2-22)

Applying Gauss' Theorem to convert the surface integrals to volume integrals gives
\[
\int_V \left\{ \frac{\partial}{\partial t} [\eta \rho (\dot{U} + \frac{1}{2} \dot{V}^2)] + \nabla \cdot [(\dot{U} + \frac{1}{2} \dot{V}^2) \rho \dot{V}_o] + \nabla \cdot \dot{q} - \eta (A' - \varepsilon') - \eta \sum_i \dot{q}_i \cdot \dot{g}_i + \dot{v} \cdot p \dot{V}_o \right. \\
- \nabla \cdot [\tau \cdot \dot{V}_o] - H_A(T_s - T) + \eta r_s H(T)_s + \eta r_{hs} \hat{H}_s \\
- \eta \sum_r \Delta H(r) \right\} dV = 0 . \quad (2-23)
\]

This equation is true for any volume \( V \); therefore, the integral can vanish only if the integrand vanishes everywhere. Thus the differential form of the pyrolysis gas internal and kinetic energy equation is

\[
\frac{\partial}{\partial t} [\eta \rho (\dot{U} + \frac{1}{2} \dot{V}^2)] + \nabla \cdot [(\dot{U} + \frac{1}{2} \dot{V}^2) \rho \dot{V}_o] + \nabla \cdot \dot{q} \\
- \eta (A' - \varepsilon') - \eta \sum_i \dot{q}_i \cdot \dot{g}_i + \dot{v} \cdot p \dot{V}_o \\
- \nabla \cdot [\tau \cdot \dot{V}_o] - H_A(T_s - T) + \eta r_s H(T)_s + \eta r_{hs} \hat{H}_s \\
- \eta \sum_r \Delta H(r) = 0 , \quad (2-24)
\]

This equation can be simplified by subtracting from it the equation of mechanical energy. The equation of mechanical energy for
a fluid flowing through porous media results from taking the scalar product of the fluid velocity with the equation of motion. The equation of motion for a fluid flowing through porous media states that the time rate of change of momentum contained in the pyrolysis gas within the control volume \( V \) equals the sum of the net rates of momentum increase resulting from momentum convection by mass average velocity, pressure force per unit volume of pyrolysis gases, viscous transfer per unit volume of pyrolysis gases and gravitational force per unit volume of pyrolysis gases. In equation form

\[
\int_V \frac{\partial}{\partial t} (\eta \rho \hat{v}) \, dV = - \int_S (\rho \hat{v}) \hat{v}_o \cdot \hat{n} \, dS - \int_S \eta \rho \hat{\tau} \cdot \hat{n} \, dS + \int_S \eta \rho \hat{g} \cdot \hat{n} \, dS \\
+ \int_S \eta \hat{\tau} \cdot \hat{n} \, dS + \int_V \eta \rho \hat{g} \, dV \cdot (2-25)
\]

Gauss's theorem may be applied to Eq. 2-25 to convert the surface integrals to volume integrals giving

\[
\int_V \left\{ \frac{\partial}{\partial t} (\eta \rho \hat{v}) + \hat{v} \cdot \rho \hat{v} \hat{v}_o + \hat{v} \eta \rho \right\} \\
- \hat{\tau} \cdot \eta \hat{\tau} - \eta \rho \hat{g} \, dV = 0 \cdot (2-26)
\]

This equation is true for any volume \( V \); therefore, the integral can vanish only if the quantity in brackets vanishes everywhere. Thus the
differential form of the equation of motion for flow through porous media is

\[
\frac{\partial}{\partial t} (\eta \rho \vec{v}) + \vec{\nabla} \cdot (\rho \vec{v} \vec{v}_o) + \vec{\nabla} \cdot \eta \vec{p} = 0. \quad (2-27)
\]

Forming the scalar product of the pyrolysis gas velocity with Eq. 2-27 gives the equation of mechanical energy for the pyrolysis gases as

\[
\frac{1}{2} \frac{\partial}{\partial t} (\eta \rho \vec{v}^2) + \frac{1}{2} \eta \vec{v}^2 \frac{\partial \rho}{\partial t} + \frac{1}{2} \rho \vec{v}^2 \frac{\partial \eta}{\partial t} + \frac{1}{2} \vec{v} \cdot \rho \vec{v}^2 + \vec{v}_o
\]

\[
+ \frac{1}{2} \rho \vec{v}^2 \vec{v}_o \cdot \vec{\nabla} \rho + \frac{1}{2} \rho \vec{v}^2 \vec{v} \cdot \vec{\nabla} \vec{v}_o + \vec{\nabla} \cdot \rho \vec{v}^2 + \vec{\nabla}_o
\]

\[
- \eta \vec{p} \vec{\nabla} \cdot \vec{\nabla} - \vec{\nabla} \cdot [\vec{\nabla}_o \vec{\nabla}] + \eta \vec{\nabla} \cdot \vec{\nabla} \cdot \vec{\nabla}
\]

\[
- \eta \rho \vec{v} \vec{g} = 0. \quad (2-28)
\]

Equation 2-28 is subtracted from Eq. 2-24 to obtain the thermal energy equation of the pyrolysis gases as
Equation 2-29 can be simplified somewhat by expressing the internal energy in terms of the enthalpy and the state variables pressure and density and by making use of the mass conservation equation. The internal energy-enthalpy relation

\[ U = H - P/\rho \]  

yields

\[ \frac{DU}{Dt} = \frac{DH}{Dt} - \frac{1}{\rho} \frac{DP}{Dt} + \frac{P}{\rho^2} \frac{DP}{Dt}, \]  

(2-31)

**Chemical species continuity equation.** The chemical species continuity equation applied to the pyrolysis gases flowing through the char layer states that the time rate of change of mass of some species within the control volume \( V \) equals the sum of the net rate of mass of that chemical species transferred into the control volume.
by the mass average velocity and mass diffusion and the net rate of formation of that chemical species by chemical processes. Writing this equation in integral form gives

\[ f \cdot \frac{\partial}{\partial t} (\eta \rho_i) \, dV = - f \rho_i \cdot \vec{v}_o \cdot \hat{n} \, dS + f \cdot \eta \cdot \vec{r}_{T_i} \, dV - f \cdot \eta \cdot \hat{j}_i \cdot \hat{n} \, dS. \]  
\[ (2-32) \]

Applying Gauss's Theorem to convert the surface integrals to volume integrals gives

\[ f \cdot \left[ \frac{\partial}{\partial t} (\eta \rho_i) + \vec{v} \cdot (\rho_i \vec{v}_o) - \eta \cdot \vec{r}_{T_i} + \vec{v} \cdot \eta \cdot \hat{j}_i \right] \, dV = 0 \]  
\[ (2-33) \]

which yields the chemical species conservation equation

\[ \frac{\partial}{\partial t} (\eta \rho_i) + \vec{v} \cdot (\rho_i \vec{v}_o) + \vec{v} \cdot \eta \cdot \hat{j}_i - \eta \cdot \vec{r}_{T_i} = 0. \]  
\[ (2-34) \]

**Total mass conservation equation.**—The total mass conservation equation is obtained by summing the chemical species conservation equation over all species. Thus

\[ \frac{\partial}{\partial t} (\eta \rho) + \vec{v} \cdot (\rho \vec{v}_o) - \eta \sum_{i} \vec{r}_{T_i} = 0. \]  
\[ (2-35) \]
Equations 2-29, 2-31 and 2-35 are combined to give the pyrolysis gas energy equation in terms of enthalpy as

\[ \eta \rho \frac{DH}{Dt} = \eta \frac{DP}{Dt} + P \frac{DH}{Dt} - \eta \left( H - \frac{1}{2} v^2 \right) \sum r_{T1} \]

\[ + \eta \tau : \hat{\nabla} \cdot \nabla + \eta \sum j_i \cdot \hat{g}_i - \hat{v} \cdot \hat{q} + \eta (A' - \varepsilon') \]

\[ + H_A (T_s - T) - \eta r_s \hat{H}(T_s) - \eta r_{hs} \hat{H}_s \]

\[ + \eta \sum r_h (r) \Delta H(r) \text{.} \quad (2-36) \]

It is more convenient to work with the pyrolysis gas energy equation written in terms of \( \hat{C}_p \) rather than \( \hat{H} \). The desired form of the pyrolysis gas energy equation is obtained by combining Eq. 2-36 with the Gibbs equation written in terms of \( \hat{H} \) and the First Law of Thermodynamics.

The Gibbs equation for a system in equilibrium as written by Hatsopoulos and Keenan (Ref. 22) is

\[ dH = T dS + V dP + \sum \mu_i d(\rho_i / \rho) \text{.} \quad (2-37) \]

It will now be assumed that, although the pyrolysis gases are not in true equilibrium, there exists within small mass elements a state of local equilibrium for which a bulk gas temperature can be defined and for which the local entropy \( \hat{S} \) is a well-defined function of the
various parameters which are necessary to define the macroscopic state of the system completely. With this assumption Eq. 2-37 becomes valid for a mass element followed along its center of motion, thus

\[
\frac{DH}{Dt} = T \frac{DS}{Dt} + \hat{V} \frac{DP}{Dt} + \Sigma \mu_i \frac{D}{Dt} \left( \rho_i / \rho \right).
\]  

Equation 2-38 can be made more useful by expressing entropy in terms of \( P, \nabla, \) and \( T. \) Assuming the system is composed of a mixture of thermally perfect gases the entropy may be expressed as a function of \( P, T, \) and \( \frac{\rho_i}{\rho}, \) or

\[
\hat{S} = \hat{S} \left( P, T, \frac{\rho_i}{\rho} \right) \quad (2-39)
\]

which yields

\[
d\hat{S} = \left( \frac{\partial \hat{S}}{\partial P} \right)_T \rho_i / \rho \ dP + \left( \frac{\partial \hat{S}}{\partial T} \right)_P \rho_i / \rho \ dT \]

\[
+ \Sigma \left( \frac{\partial \hat{S}}{\partial \rho_i / \rho} \right)_P,T \ d(\rho_i / \rho). \quad (2-40)
\]

Writing Eq. 2-37 in terms of specific heat

\[
d\hat{S} = \hat{C} \frac{dT}{T} - \frac{V}{T} dP - \frac{1}{T} \Sigma \mu_i d(\rho_i / \rho). \quad (2-41)
\]
Equating the coefficients for \( dT \) in Eqs. 2-40 and 2-41 gives

\[
\left( \frac{\partial S}{\partial T} \right)_{P, \rho_1/\rho} = \frac{C_p}{T}.
\]  

(2-42)

The coefficient of \( dP \) in Eq. 2-40 is replaced by its equivalent from the Maxwell relation

\[
\left( \frac{\partial S}{\partial P} \right)_{T, \rho_1/\rho} = -\left( \frac{\partial V}{\partial T} \right)_{P, \rho_1/\rho}.
\]  

(2-43)

Equations 2-40, 2-42 and 2-43 are combined to give a differential entropy expression in terms of \( P, V \) and \( T \).

\[
dS = \frac{C_p}{T} dT - \left( \frac{\partial V}{\partial T} \right)_{P, \rho_1/\rho} dT + \sum_i \left( \frac{\partial S}{\partial \rho_1/\rho} \right)_{P,T} \frac{dP}{dT} (\rho_1/\rho).
\]  

(2-44)

This equation may be written for a mass element followed along its center of motion as

\[
\frac{dS}{d_t} = \frac{C_p}{T} \frac{dT}{d_t} - \left( \frac{\partial V}{\partial T} \right)_{P, \rho_1/\rho} \frac{dP}{d_t} + \sum_i \left( \frac{\partial S}{\partial \rho_1/\rho} \right)_{P,T} \frac{dP}{d_t} (\rho_1/\rho).
\]  

(2-45)

Equation 2-45 may be combined with Eq. 2-38 to give

\[
\frac{dH}{d_t} = \frac{C_p}{T} \frac{dT}{d_t} + V \frac{dP}{d_t} - T \left( \frac{\partial V}{\partial T} \right)_{P, \rho_1/\rho} \frac{dP}{d_t} + \sum_i [\hat{u}_i + T \left( \frac{\partial S}{\partial \rho_1/\rho} \right)_{P,T}] \frac{dP}{d_t} (\rho_1/\rho).
\]  

(2-46)
The summation term in this equation can be reduced by considering the relation between partial properties. The entropy of a system is written as

\[ \hat{S} = \sum_i (\rho_i / \rho) \hat{S}_i \]  

(2-47)

From Eq. 2-47 we have that

\[ d\hat{S} = \sum_i \frac{\rho_i}{\rho} d\hat{S}_i + \sum_i \hat{S}_i d\left( \frac{\rho_i}{\rho} \right) . \]  

(2-48)

Since entropy of a pure substance may be expressed as a function of \( P \) and \( T \), Eq. 2-48 written for a constant pressure and temperature process is

\[ d\hat{S} = \sum_i \hat{S}_i d\left( \frac{\rho_i}{\rho} \right) . \]  

(2-49)

Thus

\[ \left( \frac{\partial \hat{S}}{\partial \rho_i / \rho} \right)_{P,T} = \hat{S}_i \]  

(2-50)

The partial specific Gibbs function is defined as

\[ \hat{\mu}_i = \left( \frac{\partial G}{\partial M_i} \right)_{P,T} \]  

(2-51)
But

\[ G = H - TS \quad (2-52) \]

or

\[ G = \sum M_i \left( \hat{H}_i - \hat{T}_S \right) \quad (2-53) \]

Equation 2-53 is combined with Eq. 2-51 to give the partial specific Gibbs function as

\[ \mu_i = \hat{H}_i - T \hat{S}_i \quad (2-54) \]

Equations 2-50 and 2-54 are combined with Eq. 2-46 to satisfy the First Law of Thermodynamics applied to an element of mass near equilibrium followed along its center of motion. In equation form

\[ \frac{DH}{dt} = C_p \frac{DT}{dt} + V \frac{DP}{dt} - T \left( \frac{\partial V}{\partial T} \right)_P \rho_i / \rho \frac{DP}{dt} \]

\[ + \sum_i H_i \frac{D}{dt} (\rho_i / \rho) \quad (2-55) \]

Equation 2-55 is combined with Eq. 2-36 to give the pyrolysis gas energy equation in terms of \( C_p \) as
\[
\eta \rho \frac{\partial C_p}{\partial \rho \partial C_p} \frac{\partial T}{\partial t} = -\eta \left( \frac{\partial}{\partial x} \left( \frac{\rho C_p}{\partial x} \right) \right) \frac{\partial \rho}{\partial t} - \eta \rho \sum_i \left( \frac{\partial H_i}{\partial t} \right) \frac{\partial \rho_i}{\partial t} - \eta \rho \sum_i \left( \rho_i \frac{\partial}{\partial t} \right) \frac{\partial \rho_i}{\partial t} \\
+ \rho \frac{\partial}{\partial t} \left( \eta \left( \frac{1}{2} \rho v^2 \right) \sum_i \frac{\partial r_i}{\partial T} \right) + \eta \rho \left( \hat{\nabla} \cdot \hat{\nabla} \right) + \eta \rho \sum_i \left( \hat{\nabla} \cdot \hat{\nabla} \right) \\
- \hat{\nabla} \cdot \hat{\nabla} + \eta \left( \frac{1}{2} \rho \left( A' - \epsilon' \right) \right) + H_A \left( T_s - T \right) - \eta \rho \frac{\partial}{\partial T} \sum_i \left( r_i \right) H(T_s) - \eta \rho \frac{\partial}{\partial T} \sum_i \left( r_i \right) H_s \\
+ \eta \sum_i \left( r_i \Delta H \right). 
\]

Equation 2-56 can be expanded and combined with the chemical species and total mass continuity equations (Eqs. 2-34 and 2-35) to give

\[
\frac{\partial}{\partial t} \left( \frac{\rho_i}{\rho} \right) = \frac{1}{\rho} \frac{\partial}{\partial T} \left( r_i \right) - \frac{1}{\eta \rho} \hat{\nabla} \cdot \hat{\nabla} \left( r_i \right) - \frac{\rho_i}{\rho} \frac{\partial}{\partial T} \sum_i \left( r_i \right) 
\]

Equation 2-57 is combined with Eq. 2-56 and the specific quantities \( \hat{\nabla} \), \( \hat{\nabla} H \), \( \hat{\nabla} H_i \), and \( \hat{\nabla} H_s(T) \) and the chemical production terms \( r_i \), \( r_{hs} \) and \( r_s \) are written in terms of their respective mole quantities to give the pyrolysis gas energy equation in terms of mole quantities as
Pyrolysis gas pressure differential equation. - The basic law governing the velocity of fluids flowing through porous media is the phenomenological law of Darcy which states that the rate of flow through porous media is directly proportional to the pressure gradient causing flow. Darcy's law written in equation form as in Scheidegger (Ref. 23) is

\[ \frac{\dot{v}}{v_o} = -\frac{K}{\mu} \nabla p \]  

(2-59)

or

\[ \nabla \mathbf{v} = -\frac{K}{\mu} \nabla p \]  

(2-60)
Equation 2-59 may be combined with the total mass conservation equation to give

\[
\frac{\partial}{\partial t} (\eta \rho) - \nabla \cdot (\frac{\rho K}{\mu} \nabla P) - \eta \sum_i R_{T_i} M_i = 0 . \tag{2-61}
\]

The equation of state for the pyrolysis gases,

\[
P = \rho \frac{R_u T}{\bar{M}} \tag{2-62}
\]

and the identity

\[
P \nabla P = \frac{1}{2} \nabla P^2 \tag{2-63}
\]

are used in Eq. 2-61 to give the differential equation for pyrolysis gas pressure as

\[
\nabla \cdot \nabla P + \frac{\mu T}{K_M} (\frac{K_M}{\mu T}) \cdot \nabla P^2 - \frac{2 \mu R_u T}{K_M} \left[ \frac{\partial}{\partial t} (\eta \rho) - \eta \sum_i R_{T_i} M_i \right] = 0 . \tag{2-64}
\]

Chemical reaction rate equations. - The rate of chemical reactions occurring within the char layer must be computed using an appropriate chemistry model. The model considered here treats homogeneous and heterogeneous reactions. The rate of removal of chemical species by
homogeneous reactions is governed by the Law of Mass Action which states that the rate of removal of a chemical species is proportional to the product of the concentrations of the reacting species where each and every chemical species concentration is raised to a power equal to its stoichiometric coefficient. In equation form, the Law of Mass Action as written by Clarke and McChesney (Ref. 24) for a one-step chemical reaction described by the following stoichiometric relation

\[ \sum v_i' A_i + \sum v_i'' A_i \]

is

\[ \text{reaction rate} = k \prod_i [A_i]^{v_i'} \]  \hspace{1cm} (2-66)

where the reaction rate constant \( k \) is considered to be independent of the concentration of chemical species and dependent on temperature. The reaction rate constant is given by

\[ k = A T^S \exp \left( -\frac{B}{T} \right) \]  \hspace{1cm} (2-67)

where \( A \) and \( B \) are the frequency factor and activation energy for the reaction.

Simultaneous forward and reverse chemical reactions are represented by
where

\[ r = 1, 2, \ldots, m \text{ independent reactions.} \]

The rate of forward reaction for the chemical reaction represented by the \( r^{th} \) equation is

\[
\text{rate of forward reaction} = k_f^{(r)} \prod_i \left[ A_i \right]^{v_i^{(r)}}
\]

and the rate of reverse reaction is

\[
\text{rate of reverse reaction} = k_r^{(r)} \prod_i \left[ A_i \right]^{-v_i^{(r)'}}
\]

Thus the net rate of progress of the \( r^{th} \) reaction in the forward direction is given by

\[
r^{(r)} = k_f^{(r)} \prod_i \left[ A_i \right]^{v_i^{(r)'}} - k_r^{(r)} \prod_i \left[ A_i \right]^{-v_i^{(r)'}}.
\]

Now this reaction yields a predetermined number of moles of chemical species \( i \) as indicated by the coefficients in the stoichiometric
representation of the chemical reaction. Therefore, the molar rate of production of chemical species \( i \) is given by

\[
R_i = \sum_r \{ v_i^{(r)''} - v_i^{(r)'} \} \{ k_f^{(r)} \Pi [A_i^j] v_i^{(r)'} 
\]

\[
- k_r^{(r)} \Pi [A_i] v_i \}
\].

Equations 2-69 and 2-70 are based on the Law of Mass Action and are general expressions for the forward and reverse reaction rates of some chemical reaction occurring in a gaseous system. Most frequently the chemical kinetics data for a particular reaction are based on empirical curve fits to experimental data. Such chemical kinetics data are usually presented with a rate law which best describes the particular chemical process.

The theory describing heterogeneous chemical reactions or reactions occurring at the gas-solid interface is somewhat more complicated than for homogeneous chemical reactions. It was assumed by Laidler (Ref. 25) that there are four steps involved in the interaction of the gas molecules with the solid phase. These steps are: (1) The reacting molecules diffuse to the solid surface. (2) The molecules are adsorbed on the surface. (3) The molecules undergo chemical reactions giving gaseous and/or solid products. (4) The gaseous product molecules diffuse from the surface. The usual treatment of surface reactions is based on a concept due to Langmuir and Hinshelwood
which is discussed in Emmett (Ref. 26). The Langmuir-Hinshelwood mechanism assumes that the reactants are in adsorptive equilibrium with the solid surface. The reaction then involves the adsorbed molecules. Quantitative treatment of the reactions by this mechanism, therefore, involves obtaining an expression, using the adsorption isotherm, for the concentration of the reactant molecules on the surface. Thus, expressing the rate of reaction in terms of these surface concentrations, the rate of reaction can be expressed in terms of the concentrations of the gaseous reactants.

Following the development of Alekseyev (Ref. 27), the Law of Surface Action for the heterogeneous reaction

\[ \sum_j v'_j A_j \rightarrow \sum_j v''_j A_j \]  

(2-73)

states that the rate of the process is proportional to the product of the portions of the surface occupied by reacting species raised to powers equal to the corresponding stoichiometric coefficients. In equation form

\[ \text{reaction rate} = k \prod_j [\theta_j]^{v'_j} \theta_o^n \]  

(2-74)

where the reaction rate constant is given by an equation of the form

\[ k = A \exp (-B/T) \]  

(2-75)
Simultaneous forward and reverse heterogeneous chemical reactions are represented by

\[ \sum_{j} v_j^{(r)'} A_j + \sum_{j} v_j^{(r)''} A_j \]

(2-77)

where \( r = 1, 2, \ldots, m \) independent reactions. The rate of the forward reaction for the chemical reaction represented by the \( r^{th} \) equation is

\[ \text{rate of forward reaction} = k_f^{(r)} \prod_{j} [\theta_j]^{v_j^{(r)'}} o^n(r) \]

(2-78)

and the rate of the reverse reaction is

\[ \text{rate of reverse reaction} = k_r^{(r)} \prod_{j} [\theta_j]^{v_j^{(r)''}} o^n(r) \]

(2-79)

Thus the net rate of the \( r^{th} \) reaction is given by

\[ r_h^{(r)} = \left\{ k_f^{(r)} \prod_{j} [\theta_j]^{v_j^{(r)'}} - k_r^{(r)} \prod_{j} [\theta_j]^{v_j^{(r)''}} \right\} o^n(r) A_s \]

(2-80)

and the molar rate of production of chemical species \( j \) resulting from the set of reactions (Eq. 2-77) is
\[ R_{h_j} = \sum_r \left( v_j (r)'' - v_j (r)' \right) \left\{ k_f (r) \prod_j [\theta_j] v_j (r)' \right\} - k_r (r) \prod_j v_j (r)'' \right\} A_s \theta_o (r) \] (2-81)

where the factor \( A_s \) is the surface area per volume and is included to give rate of production per volume for heterogeneous chemical reactions occurring in porous media.

There is very little chemical kinetics data available for reactions and conditions of interest in the field of ablation. When data are available it is presented with a rate law which best describes the particular chemical reaction.

Uncharred Material and Substrate Insulation Equations

The single energy transfer mechanism occurring in the uncharred material and substrate insulation is heat transfer by conduction. Thus the differential equation governing the thermal behavior of these regions is the conduction equation given by

\[ \nabla \cdot k' \nabla T' = \rho_s' \frac{\hat{c}}{p_s} \frac{\partial T'}{\partial t} \] (2-82)

and

\[ \nabla \cdot k'' \nabla T'' = \rho_s'' \frac{\hat{c}}{p_s} \frac{\partial T''}{\partial t} \] (2-83)

respectively.
CHAPTER III

BOUNDARY CONDITIONS AND INITIAL CONDITIONS

This analysis refers to the stagnation point of a body, hence the governing equations derived in Chapter II are reduced to one dimension in space. The equations to be solved are:

Char Layer Equations.

Char temperature

\[(1 - \eta) \frac{\rho_s C_p}{M_s} \frac{\partial T_s}{\partial t} = \frac{\partial}{\partial y} \left( k_s \frac{\partial T_s}{\partial y} \right) - H_A (T_s - T)\]

\[+ \eta \, R_s \, H(T)_s + \eta \, R_{hs} \, H_s - \eta \, \Sigma \, r_r^{(r)} \Delta H(r) + (1 - \eta) (A - \varepsilon)\]

\[+ (1 - \eta) \, q_s + \frac{\rho_s H_s}{M_s} \frac{\partial \eta}{\partial t}\]  

(3-1)

Char porosity

\[\frac{\partial \eta}{\partial t} = - \eta \, \frac{M_s}{\rho_s} (R_{hs} + R_s)\]  

(3-2)

Pyrolysis gas temperature

\[\eta \, \Sigma \, \frac{\rho_i C_{pi}}{M_i} \left( \frac{\partial T}{\partial t} + \mathbf{v} \frac{\partial T}{\partial y} \right) = -\eta \, \left( \frac{\partial}{\partial T} \frac{\partial \rho}{\partial \ln \rho} \right) \rho_i \mathbf{v} \frac{\partial P}{\partial t}\]

\[+ \mathbf{v} \frac{\partial P}{\partial y} - \eta \, \Sigma \, H_i \, R_i \mathbf{T_i} + \Sigma \, H_i \, \frac{\partial}{\partial y} J_i + P \frac{\partial \eta}{\partial t} + P \mathbf{v} \frac{\partial \eta}{\partial y}\]
\[ + \frac{1}{2} \eta v^2 \sum_i R_{Ti} M_i + \eta \frac{\partial}{\partial y} v \sum_i \frac{J_i g_i}{M_i} - \frac{\partial}{\partial y} q_y \]

\[ + \eta (A' - \varepsilon') + H_A (T_s - T) - \eta R_s H(T)_s - R_{hs} H_s \]

\[ + \eta \sum_r r_h^{(r)} \Delta H^{(r)} \]

(3-3)

Chemical species continuity equation

\[ \frac{\partial}{\partial t} (\eta \rho_i) + \frac{\partial}{\partial y} (\rho_i v_o) + \frac{\partial}{\partial y} \eta l_i - \eta r_{Ti} = 0 \]

(3-4)

Total mass conservation equation

\[ \frac{\partial}{\partial t} (\eta \rho) + \frac{\partial}{\partial y} (\rho v_o) - \eta \sum_i r_{Ti} = 0 \]

(3-5)

Pressure of pyrolysis gas

\[ \frac{\partial^2 p^2}{\partial y^2} + \frac{\mu T}{K_M} \frac{\partial}{\partial y} \left( \frac{K_M}{\mu T} \right) \frac{\partial p^2}{\partial y} - \frac{2 \mu R_T \frac{\partial}{\partial t} (\eta \rho)}{K_M} \]

\[ - \eta \sum_i R_{Ti} M_i = 0 \]

(3-6)

Uncharred Layer and Substrate Insulation Equations

Uncharred layer temperature

\[ \frac{\partial}{\partial y} \left( k' \frac{\partial T'}{\partial y} \right) = \rho_s \frac{\partial}{\partial t} \left( C'_s + \frac{\partial T'}{\partial t} \right) \]

(3-7)
Substrate insulation temperature

\[
\frac{\partial}{\partial y} \left( k^s \frac{\partial T^u_s}{\partial y} \right) = \rho_s \hat{c}_p^s \frac{\partial T^u_s}{\partial t}.
\] (3-8)

It is convenient to treat the equations for char temperature, uncharred layer temperature and substrate insulation temperature as a set of coupled equations. That is, the char temperature equations are related to the uncharred layer temperature equation through the boundary condition at the char-uncharred interface. The equations for the uncharred layer and the insulation layer are similarly related. From this point forward, reference to the solid temperature will mean the temperature of the particular layer of interest.

Solid Temperature Equations

Two conditions must be specified at the front surface of the char layer. The first condition is an expression for the rate of material removal or the surface temperature and the second is an energy balance.

Surface removal by oxidation.- There are two regimes of surface removal by oxidation. The first regime is the rate controlled regime. The rate of surface removal by oxidation is rate controlled when conditions of temperature and pressure are low enough that the rate of oxygen consumption in the chemical process does not exceed the rate of oxygen diffusion through the boundary layer to the surface. As the surface temperature and pressure increase, the rate of surface removal
goes through a transition from the rate controlled regime to a diffusion controlled regime. In the diffusion controlled regime, surface removal by oxidation depends on the rate of oxygen diffusion to the surface. Nolan and Scala (Ref. 28) express the rate of surface removal by oxidation in the rate controlled regime in terms of chemical kinetics, writing the mass loss rate as

$$\dot{m}_s = k (P_{02})^n$$

where the exponent $n$ is the order of the reaction. The specific reaction rate is obtained from

$$k = A_s \exp(-B_s / T_s).$$

The oxygen partial pressure at the wall may be written in terms of the mass fraction of oxygen as follows:

$$P_{02}^w = (x_{02}^w) P_e$$

$$P_w = P_e$$

$$x_{02}^w = C_w \bar{M}_w / M_{02}.$$
Equations 3-9, 3-10, and 3-14 are combined to give the rate of surface removal by rate controlled oxidation as

$$\dot{m}_s = A_s \exp\left(-\frac{8}{s_s} T_s\right) \left(\frac{C_w \bar{M}_w}{M_{O_2}} P_e\right)^n. \quad (3-15)$$

In subsonic and supersonic flow, the stagnation pressure is given by the solution of the inviscid flow problem. The stagnation pressure in hypersonic flow is approximated in Truitt (Ref. 29) by

$$p_{w,s} = \frac{11}{12} \rho_e v_e^2. \quad (3-16)$$

In Ref. 30 Chapman relates the heating rate and enthalpy to the free stream conditions by

$$q_c \propto \sqrt{\rho_e / \text{Rad}} v_e^3 \quad (3-17)$$

and

$$\hat{H}_e \propto v_e^2. \quad (3-18)$$

Thus the wall pressure is approximated by
In the current problem,

\[ P_w, s = 5.693 \times 10^6 \text{ Rad} \left( q_c / H_e \right)^2. \] (3-19)

thus

\[ P_w = P_{w, s} \] (3-20)

In the diffusion controlled regime, surface removal by oxidation depends on the rate of oxygen diffusion to the surface as expressed in the following equation

\[ \dot{m}_s = \lambda \dot{m}_{O_2} \] (3-22)

where \( \lambda \) is the ratio of the mass of char layer removed by oxidation to the mass of oxygen diffusing to the surface.

In Ref. 10 Swann presents an analysis of oxidation of carbon surfaces near the stagnation region of a body in a nonreacting mixture of two gases having the same specific heats. Following Swann's development, the boundary layer equation for conservation of oxygen is

\[
\tilde{\rho} u \frac{\partial C}{\partial z} + \tilde{\rho} v \frac{\partial C}{\partial y} = \frac{\partial}{\partial y} \left( \frac{\mu}{N_{Sc}} \frac{\partial C}{\partial y} \right)
\] (3-23)
and the boundary layer energy equation is

\[
\frac{\bar{\rho}}{\bar{\rho}} u \frac{\partial \hat{H}}{\partial z} + \frac{\bar{\rho}}{\bar{\rho}} v \frac{\partial \hat{H}}{\partial y} = \frac{\partial}{\partial y} \left[ \frac{\mu}{N_{Pr}} \frac{\partial \hat{H}}{\partial y} + \frac{\mu}{2} \left( 1 - \frac{1}{N_{Pr}} \right) \frac{\partial u^2}{\partial y} \right].
\]

Equations 3-21 and 3-22 are formally similar if \( N_{Pr} = 1 \) or if \( \frac{\partial u^2}{\partial y} \) is small relative to \( \frac{\partial \hat{H}}{\partial y} \), which is valid at stagnation regions. Also, the boundary conditions for these two equations are identical, that is

\[
\begin{align*}
C &= C_w \\
\hat{H} &= H_w
\end{align*}
\quad \text{at } y = 0 \tag{3-25}
\]

and

\[
\begin{align*}
C &= C_e \\
\hat{H} &= H_e
\end{align*}
\quad \text{at } y = \infty \tag{3-26}
\]

Nondimensionalizing Eqs. 3-23 and 3-24 with
\[
\begin{align*}
\bar{C} &= \frac{C - C_w}{C_e - C_w} \\
\bar{H} &= \frac{H - H_w}{H_e - H_w}
\end{align*}
\]

(3-27)

gives

\[
\begin{align*}
\bar{\rho} u \frac{\partial \bar{C}}{\partial z} + \bar{\rho} v \frac{\partial \bar{C}}{\partial y} &= \frac{\partial \bar{C}}{\partial y} \frac{\mu}{N_{sc}} \frac{\partial \bar{C}}{\partial y} \\
\bar{\rho} u \frac{\partial \bar{H}}{\partial z} + \bar{\rho} v \frac{\partial \bar{H}}{\partial y} &= \frac{\partial \bar{H}}{\partial y} \frac{\mu}{N_{Pr}} \frac{\partial \bar{H}}{\partial y}
\end{align*}
\]

(3-28)

\[
\begin{align*}
\bar{C} = \bar{H} = 0 \text{ at } y = 0 \\
\bar{C} = \bar{H} = 1 \text{ at } y = \infty.
\end{align*}
\]

Therefore, the solutions of the oxygen conservation equation and the energy conservation equation are formally similar. If the solution of the boundary layer energy equation is

\[
\bar{H} = F_1(z,y,N_{Pr})
\]

(3-29)

then the solution of the oxygen conservation equation is

\[
\bar{C} = F_1(z,y,N_{Sc})
\]

(3-30)
The rate of oxygen transfer to the surface by diffusion may be expressed as

$$\dot{m}(O_2) = (C_e - C_w) \left( \frac{\mu}{N_{Sc}} \frac{\partial C}{\partial y} \right)_w \quad (3-31)$$

and the rate of energy transfer to the surface may be expressed as

$$q = (H_e - H_w) \left( \frac{\mu}{N_{Pr}} \frac{\partial H}{\partial y} \right)_w \quad (3-32)$$

Fay and Riddell (Ref. 31) show that the rate of energy transfer to the surface may be expressed as

$$q_{c,\text{net}} = 0.76 \ N_{Pr}^{-0.6} (\rho_w \mu_w)^{0.1} (\rho_s \mu_s)^{0.4} (H_e - H_w) \frac{du_e}{dz} \quad (3-33)$$

Therefore, the rate of oxygen diffusion to the surface is

$$\dot{m}_{O_2} = 0.76 \ N_{Sc}^{-0.6} (\rho_w \mu_w)^{0.1} (\rho_s \mu_s)^{0.4} (C_e - C_w) \frac{du_e}{dz} \quad (3-34)$$

Equations 3-33 and 3-34 are combined to give the rate of oxygen diffusion to the surface in terms of the energy transfer rate as

$$\dot{m}_{O_2} = \frac{N_{Sc}^{-0.6} (C_e - C_w)}{N_{Pr}^{-0.6} (H_e - H_w)} q_{c,\text{net}} \quad (3-35)$$

or
The rate of surface removal by oxidation in terms of energy transfer rate is obtained upon combining Eqs. 3-22 and 3-36. Thus,

\[ \dot{h}_{O_2} = \frac{C - C_w}{H - H_w} \frac{0.6}{\text{Le}_{M} \text{q}_{c,\text{net}}} \]  \hspace{1cm} (3-36)

Equation 3-15 written for a reaction of order 1 is combined with Eq. 3-37 to give an equation for the rate of surface removal which does not contain the oxygen concentration at the wall. Thus,

\[ \dot{M}_s = \frac{C - C_w}{H - H_w} \lambda \frac{0.6}{\text{Le}_{M} \text{q}_{c,\text{net}}} \]  \hspace{1cm} (3-37)

where

\[ k = A_s \exp \left( - \frac{B_s}{T_s} \right) \]  \hspace{1cm} (3-39)

Front surface energy balance.- The second condition to be specified at the front surface is a surface energy balance. Energy transfer to the surface results from convective and radiative heating and combustion heating in the case of surface removal by oxidation. This energy is accommodated by blocking due to mass injection into the boundary layer, reradiation from the
surface, conduction to the interior, and sublimation of the char layer when the surface temperature reaches the sublimation temperature of the char material.

Figure 2 from Swann, Pittman and Smith (Ref. 16) shows the effect of mass injection into the boundary layer on energy transfer to the surface. The exact solution is from the boundary layer solution by Roberts (Ref. 6) for air-to-air injection. The linear approximation is

$$q_{c,\text{net}} = q_c (1 - \frac{H_w}{H_e}) [1 - \bar{\eta} \hat{m}_T \frac{H_e}{q_c}]$$  \hspace{1cm} (3-40)

where

$$\hat{m}_T = \alpha_c \hat{m}_s + \alpha_p \hat{m}_l$$  \hspace{1cm} (3-41)

and $\bar{\eta} = 0.6$. The second-order approximation, which was obtained by fitting a curve through points at $\hat{m}_T \frac{H_e}{q_c} = 0, 1.0, \text{ and } 2.5$ is

$$q_{c,\text{net}} = q_c (1 - \frac{H_w}{H_e}) \{1 - [0.724 \hat{m}_T \frac{H_e}{q_c} - 0.13 (\hat{m}_T \frac{H_e}{q_c})^2]\}.$$  \hspace{1cm} (3-42)

Figure 2 shows the linear approximation to be good for values of $\hat{m}_T \frac{H_e}{q_c} \leq 1$. The second-order approximation is good for $\hat{m}_T \frac{H_e}{q_c} < 2.25$. In Ref. 16 Swann, Pittman and Smith specify a minimum value of
Figure 2. - Blocking effectiveness for a laminar boundary layer with air-to-air injection.
\[
\frac{q_{c,\text{net}}}{q_c (1 - H_w/H_e)} \text{ of } 0.04 \text{ at } \frac{\dot{m}_T H_e}{q_c} = 2.25, \text{ where the second order curve departs the exact curve.}
\]

Writing the surface energy balance in equation form (Ref. 16)

\[
\begin{align*}
q_c \quad (1 - H_w/H_e) \quad (1 - (1 - \beta) [0.724 \frac{\dot{m}_T H_e}{q_c} \\
\text{Cold Wall Convectiv Heat-} \quad \text{Hot-wall correction \quad \text{---------------------Aerodynamic} Convective \quad \text{Rate}}
\end{align*}
\]

\[
\begin{align*}
-0.13 (\frac{\dot{m}_T H_e}{q_c})^2 \quad - \beta \quad \bar{\pi} \quad \frac{\dot{m}_T H_e}{q_c} + \alpha q_R
\end{align*}
\]

\[
\begin{align*}
\text{Blocking \quad \text{---------------------Radiative Heating Rate}}
\end{align*}
\]

\[
\begin{align*}
+ [1 - S(T_{sl} - \bar{T}_l)] \quad \dot{m}_s \quad \Delta H_c = \sigma \epsilon_s \quad T_{sl}^4
\end{align*}
\]

\[
\begin{align*}
\text{Combustion Heating Rate \quad \text{Reradiation}}
\end{align*}
\]

\[
\begin{align*}
- \frac{\partial T_s}{\partial y} \quad + S(T_{sl} - \bar{T}_l) \quad \dot{m}_s \quad H_c
\end{align*}
\]

\[
\begin{align*}
\text{Conduction \quad \text{Heat of Sublimation to Interior of Char}}
\end{align*}
\]

where
\[ \beta = 1 \text{ when } \frac{\hat{m}_T \hat{H}_e}{q_c} \leq 1.0 \]

\[ \beta = 0 \text{ when } \frac{\hat{m}_T \hat{H}_e}{q_c} > 1.0 \]

\[ S(T_{s_1} - \bar{T}_1) \text{ is a step function defined by} \]

\[ S(T_{s_1} - \bar{T}_1) = 1 \text{ when } T_{s_1} = \bar{T}_1 \]

\[ S(T_{s_1} - \bar{T}_1) = 0 \text{ when } T_{s_1} < \bar{T}_1. \]

When the surface temperature is less than the sublimation temperature, Eq. 3-43 is solved for the temperature gradient at the surface \( \frac{\partial T_s}{\partial y} \) which is used as a boundary condition for solving the char temperature equation.

When the temperature of the char layer surface equals the sublimation temperature of the char material, the specified sublimation temperature of the material is used as a boundary condition and Eq. 3-43 is used to compute the rate of surface removal by sublimation.

**Pyrolysis zone energy balance.** - The second boundary condition to be specified for the char temperature equation is at the interface of the char layer and the uncharred layer. This equation is just an expression of conservation of energy at the interface energy conducted from the char layer to the interface is accommodated by pyrolysis reactions and conduction into the uncharred layer. In equation form
- \left( k_s \frac{\partial T_s}{\partial y} \right) = \dot{m} g \Delta H - \left( k'_s \frac{\partial T'_s}{\partial y} \right) \quad (3-44)

Also, the temperature of the char layer equals the temperature of the uncharred layer at their interface.

\[ T_{sI} = T'_{sI} \quad (3-45) \]

**Rate of pyrolysis of uncharred material.** - The pyrolysis rate at the interface is given by an Arrhenius equation as follows:

\[ \dot{m} g = A' \exp \left( -B'/T_{sI} \right) \quad (3-46) \]

It is sometimes desirable to limit the temperature at the pyrolysis zone to some value \( \overline{T}_I \). When such a restriction is used, Eqs. 3-44 and 3-46 are employed as described until the pyrolysis zone temperature reaches \( \overline{T}_I \), then Eq. 3-44 is used to determine the rate of pyrolysis of the uncharred layer and the boundary condition for \( T_s \) at the pyrolysis zone becomes \( T_{sI} = \overline{T}_I \).

**Energy balance at the uncharred material-insulation interface.** - The boundary condition at the interface of the char layer and the uncharred layer also satisfies one of the requirements of the uncharred temperature equation for boundary conditions. The other boundary condition for the uncharred temperature equations results from an expression of conservation of energy at the interface of the uncharred
layer and the insulation layer—energy conducted from the uncharred layer to the surface is accommodated by energy conduction into the insulation and by increasing the temperature of the heat sink at the interface. In equation form

\[- \left( k_s' \frac{\partial T'}{\partial y} \right)_I + J = - \left( k_s'' \frac{\partial T''}{\partial y} \right)_I + J + \rho_{Hs} \hat{C}_{Hs} \lambda_{Hs} \left( \frac{\partial T'}{\partial t} \right)_I + J \]  

(3-47)

Also the temperatures of the two layers are equal at their interface.

Thus

\[ T'_s I + J = T''_s I + J \]  

(3-48)

**Back surface energy balance.**—Equation 3-47 satisfies one of the requirements of the insulation temperature equation for boundary conditions. The other boundary condition for the insulation temperature equation results from an energy balance at the back surface—energy transfer to the back surface (conduction through the insulation plus energy transfer to the surface from the surroundings) is accommodated by energy radiation to the surroundings and by increasing the temperature of the heat sink at the back surface. In equation form

\[- \left( k_s'' \frac{\partial T''}{\partial y} \right)_I + J + K + q_B = \sigma \varepsilon'' \bar{T}'' I + J + K \]

\[ + \rho_{HSP} \hat{C}_{HSP} \lambda_{HSP} \left( \frac{\partial T''}{\partial t} \right)_I + J + K \]  

(3-49)
The effect of an adiabatic surface is achieved by setting the rate of energy transfer to the surface from the surroundings equal to the rate of energy radiated by the surface to the surroundings. Thus, for an adiabatic back surface

\[ q_B = \sigma \varepsilon_s T_s^4 \quad \text{I + J + K.} \quad (3-50) \]

**Initial conditions.**—Initially, the complete system is at a specified temperature; thus the initial condition for the solid phase temperature is

\[ T_s (y, t) = T_{s_0} (y) \text{ at } t = 0 \quad (3-51) \]

where the superscript on \( T_s \) is neglected.

**Char Porosity Equation**

A single boundary condition is required for solution of the char layer porosity equation. The condition used in this analysis is a specified porosity of the char layer at the pyrolysis interface. The initial condition for the char layer porosity is

\[ \eta (y, t) = \eta_0 (y) \text{ at } t = 0. \quad (3-52) \]

**Pyrolysis Gas Temperature Equation**

The pyrolysis gas temperature equation requires a single boundary
condition. The condition employed is that the pyrolysis gas temperature is equal to the solid phase temperature at the pyrolysis zone. The initial condition for the pyrolysis gas temperature is

\[ T(y, t) = T_0(y) \text{ at } t = 0. \]  

(3-53)

Pyrolysis Gas Pressure Equation

The pyrolysis gas pressure distribution equation requires two boundary conditions.

**Specified pressure at the front surface.** The first boundary condition is that the pressure is specified at the surface,

\[ P_1 = P_w. \]  

(3-54)

**Specified pressure gradient at the pyrolysis zone.** The second is that the pressure gradient is specified at the interface. In developing the governing differential equation for pyrolysis gas pressure in Chapter II, Darcy's law was used to determine the superficial velocity of the pyrolysis gases in the char layer. In equation form, Darcy's law for a one-dimensional system is
\[v_o = - \frac{K}{\mu} \frac{\partial P}{\partial y} \quad (3-55)\]

Equation 3-55 is multiplied by \(\rho\) and the equation of state is used to give

\[\rho v_o = - \frac{KM}{\mu R_u T} P \frac{\partial P}{\partial y}. \quad (3-56)\]

Equation 3-56 is applied at the pyrolysis zone and use is made of the equation

\[(\rho v_o)_I = - \dot{m}_g \quad (3-57)\]

to obtain

\[\left(\frac{\partial P}{\partial y}\right)_I = R_u \left(\frac{\mu T}{KM}\right)_I \dot{m}_g. \quad (3-58)\]

But

\[\frac{\partial P}{\partial y} = \frac{1}{2P} \frac{\partial P^2}{\partial y} \quad (3-59)\]

therefore

\[\left(\frac{\partial P^2}{\partial y}\right)_I = 2 R_u \left(\frac{\mu T}{KM}\right)_I \dot{m}_g. \quad (3-60)\]
Initial conditions. - The initial condition for the pyrolysis gas pressure is

\[ P(y, t) = P_{w, o} \text{ at } t = 0. \]  

(3-61)

Total Mass Conservation Equation

The mass conservation equation is solved for the product \( \rho v_o \), or the local mass flow rate. It requires a single boundary condition. The boundary condition used is that the mass flow rate is known at the pyrolysis interface, or in equation form

\[ (\rho v_o)_I = -m_g. \]  

(3-62)

The initial condition for the mass flow rate is

\[ (\rho v_o)_y, t = \dot{m}_o (y) \text{ at } t = 0. \]  

(3-63)

Chemical Species Conservation Equation

The chemical species continuity equation is solved for the local mass flow rate of each chemical species. It requires a single boundary condition. The boundary condition is obtained from the molar composition of the pyrolysis gases which is specified at the pyrolysis interface and the total pyrolysis gas flow rate at that point. This
boundary condition is expressed in equation form as

\[(\rho_i v)_{I} = - \left( \frac{x_i}{\eta M} \right) M_i m_g \cdot \]  

(3-64)

The initial condition for the species continuity equation is

\[(\rho_i v)_{y,t} = (\rho_i v)_{y,o} \text{ at } t = 0. \]  

(3-65)
CHAPTER IV

TRANSFORMATION AND LINEARIZATION OF EQUATIONS

AND BOUNDARY CONDITIONS

The governing equations and boundary conditions presented to this point are for a physical system with boundaries which move relative to each other and relative to a fixed coordinate system. In maintaining a fixed number of stations in layers of varying thickness when obtaining a numerical solution to an equation it is necessary to interpolate after each iteration as the location of the stations change. Each such operation introduces a small error. This problem can be eliminated by transforming to a moving coordinate system in which the locations of the stations remain fixed and the coordinate system moves to accommodate changes in the location of the boundaries. The transformations presented by Swann, Pittman and Smith in Ref. 16 will be employed here. The location of the system boundaries with the new coordinate system is shown in Fig. 3. The finite char layer of thickness $\lambda_0$ at time $t = 0$ is required for obtaining a numerical solution to the governing equations.

The equations and boundary conditions for the char layer are transformed to a coordinate system with the origin attached to the front surface. The dimensional moving coordinate system with the origin attached to the front surface results from the following transformation
Figure 3.- Location of system boundaries and coordinates.
\[ x_d = y - \int_0^t \frac{\dot{m}_s}{\rho_s} \, dt \]  

(4-1)

where the integral represents the total surface recession at some time \( t \). Equation 4-1 is nondimensionalized by the char layer thickness \( \ell \) to give the transformed dimensionless coordinate for the char layer as

\[ x = \frac{y - \int_0^t \frac{\dot{m}_s}{\rho_s} \, dt}{\ell} \]  

(4-2)

Note that the new coordinate system for the char layer is attached to the char layer surface and extends to the pyrolysis zone. The coordinates of the front surface and pyrolysis zone are constant at \( x = 0 \) and \( x = 1 \) respectively.

Similarly, the governing equations and boundary conditions for the uncharred layer are transformed to a moving coordinate system with the origin attached to the pyrolysis zone. The dimensional moving coordinate system with the origin attached to the pyrolysis zone results from the following transformation

\[ x'_d = y - \ell_o - \int_0^t \frac{\dot{m}}{\Delta \rho} \, dt \]  

(4-3)

where \( \ell_o \) is the finite char thickness at time \( t = 0 \) and the integral represents the thickness of uncharred material which has been degraded at some time \( t \). Equation 4-3 is nondimensionalized by the uncharred material thickness \( \ell' \) to give the transformed dimensionless coordinate for the uncharred layer as
Note that the new coordinate system for the uncharred layer is attached to the pyrolysis zone and extends to the uncharred material—insulation layer interface. The coordinates of the uncharred layer boundaries are \( x' = 0 \) and \( x' = 1 \).

The boundaries of the insulation layer are fixed so the new coordinate system is stationary with the origin at the boundary between the uncharred layer and the insulation. The new coordinate system for the insulation layer results from transforming the initial system by an amount equal to the total initial thickness of the char layer and the uncharred layer and nondimensionalizing the result by the thickness of the insulation layer. In equation form

\[
\frac{y - (L_0 + L')}{\epsilon} = \frac{y - (L_0 + L')}{\epsilon}.
\]

The coordinates of the insulation boundaries are \( x'' = 0 \) and \( x'' = 1 \).

**Char Layer Equations**

Equation 4-2 is used to transform the governing equations for the char layer. The following derivative expressions are obtained:

\[
\left(\frac{\partial}{\partial t}\right)_{\text{Old}} = \left(\frac{\partial}{\partial t}\right)_{\text{New}} + \left[ \frac{\partial x}{\partial y} \frac{\partial y}{\partial t} + \frac{\partial x}{\partial \epsilon} \frac{\partial \epsilon}{\partial t} + \frac{\partial x}{\partial L} \frac{\partial L}{\partial t} \right] \frac{\partial}{\partial x}.
\]

but
\[
\begin{align*}
\frac{\partial x}{\partial y} &= \frac{1}{\lambda} \\
\frac{\partial x}{\partial t} &= -\frac{x}{\lambda} \\
\frac{\partial x}{\partial t} &= -\frac{1}{\lambda} \frac{\dot{m}_s}{\rho s_o} \\
\frac{\partial l}{\partial t} &= \frac{\dot{m}_g}{\Delta \rho} - \frac{\dot{m}_s}{\rho s_o}.
\end{align*}
\] (4-7)

Therefore

\[
\left(\frac{\partial}{\partial t}\right)_\text{Old} = \left(\frac{\partial}{\partial t}\right)_\text{New} - v_c \frac{\partial}{\partial x}
\] (4-8)

where

\[
v_c = \frac{1}{\lambda} \left[\frac{\dot{m}_s}{\rho s_o} + x(\dot{m}_g/\Delta \rho - \dot{m}_s/\rho s_o)\right].
\] (4-9)

Also

\[
\frac{\partial}{\partial y} = \frac{\partial x}{\partial y} \frac{\partial}{\partial x}
\] (4-10)

or
Char temperature equation.- Using these derivative expressions the char temperature equation becomes

\[
(1 - \eta) \frac{\rho_s C_s}{M_s} \left[ \frac{\partial T_s}{\partial t} - V_c \frac{\partial T_s}{\partial x} \right] = \frac{k_s}{\lambda^2} \frac{\partial^2 T_s}{\partial x^2} + \frac{1}{\lambda^2} \frac{\partial k_s}{\partial x} \frac{\partial T_s}{\partial x} \\
- H_A (T_s - T) + \eta R_s H(T)_s + \eta R_h H_s - \eta \sum_r r^{(r)}_h \Delta H^{(r)} + (1 - \eta)(A - \epsilon) \\
+ (1 - \eta) q'' + \frac{\rho_s H_s}{M_s} \left( \frac{\partial n}{\partial t} - V_c \frac{\partial n}{\partial x} \right). \tag{4-13}
\]

This equation can be written as

\[
\frac{\partial^2 T_s}{\partial x^2} + \alpha_1 \frac{\partial T_s}{\partial x} + \alpha_2 T_s + \alpha_3 + \alpha_4 \frac{\partial T_s}{\partial t} = 0 \tag{4-14}
\]

where
\[ \alpha_1 = \frac{1}{k_s} \left[ \frac{\partial k_s}{\partial x} + \rho_s \varepsilon^2 (1 - \eta) \frac{C_p_s}{M_s} \right] \]  
\[ \alpha_2 = -h_A \varepsilon^2 /k_s \]  
\[ \alpha_3 = \frac{\varepsilon^2}{k_s} \left[ H_A T + \eta R_s H(T)_s + \eta R_h H_s - \eta \sum_r^h H(r) + (1 - \eta)(A - \varepsilon) \right] 
+ (1 - \eta)q''' + \frac{\rho_s H_s}{M_s} \left( \frac{\partial H}{\partial t} - V_c \frac{\partial H}{\partial x} \right) - \eta \sum_j^h R_{hj} \frac{\partial H}{\partial j} \]  
\[ \alpha_4 = - (1 - \eta) \varepsilon^2 \rho_s C_p_s /M_s k_s \]  

The form of Eq. 4-12 is convenient for obtaining a solution by numerical methods. In obtaining a numerical solution to Eq. 4-12 the \( \alpha \)'s are considered to be independent of \( T_s \), thus Eq. 4-12 becomes linear.

**Char porosity equation.** - The transformed char layer porosity equation is

\[ \frac{\partial \eta}{\partial t} - V_c \frac{\partial \eta}{\partial x} + \eta \frac{M_s}{\rho_s} (R_{hs} + R_s) = 0 \]  
\[ (4-19) \]

or, writing it in the linear form,

\[ \frac{\partial \eta}{\partial x} + \varepsilon_1 \eta + \varepsilon_2 + \varepsilon_3 \frac{\partial \eta}{\partial t} = 0 \]  
\[ (4-20) \]
where

\[
\varepsilon_1 = -\frac{M_S}{P_S} \frac{(R_{hs} + R_s)}{V_c}
\]

(4-21)

\[
\varepsilon_2 = 0
\]

(4-22)

\[
\varepsilon_3 = \frac{1}{V_c}
\]

(4-23)

**Pyrolysis gas temperature equation.**—The transformed pyrolysis gas temperature equation is

\[
\eta \sum_{i} \frac{\rho_i C_{pi}}{M_i} \left[ \frac{\partial T}{\partial t} + (v/k \cdot \nabla) \frac{\partial T}{\partial x} \right] = - \eta \left( \frac{\partial \ln p}{\partial T} \right) \frac{\partial p}{\partial t} + \eta \sum_{i} \frac{H_i}{R_i T_i} + \eta \sum_{i} \frac{H_i}{T_i} \frac{1}{k} \frac{\partial n}{\partial x}
\]

\[
+ (v/k \cdot \nabla) \frac{\partial p}{\partial x} - \eta \sum_{i} \frac{H_i}{R_i T_i} \frac{1}{k} \frac{\partial n}{\partial x} \frac{J_i}{R_i}
\]

(4-24)

Since
\[ \rho = \frac{\rho}{R u T} \tag{4-25} \]

\[ \left( \frac{\partial \ln \rho}{\partial \ln T} \right)_{P, x_i} = -1 \tag{4-26} \]

Also,

\[ \frac{\partial P}{\partial t} = \sum_{i} \rho_i / M_i \left( R_u \frac{\partial T}{\partial t} + R_u T \frac{\partial}{\partial t} \frac{\partial P}{\partial x} \right) \frac{\partial}{\partial x} \frac{\partial P}{\partial x} \tag{4-27} \]

and

\[ \frac{\partial P}{\partial x} = \sum_{i} \rho_i / M_i \left( R_u \frac{\partial T}{\partial x} + R_u T \frac{\partial}{\partial x} \frac{\partial P}{\partial x} \right) \frac{\partial}{\partial x} \frac{\partial P}{\partial x} \tag{4-28} \]

Therefore Eq. 4-24 can be written as

\[ \eta \left( \frac{\nu}{\ell} - V_c \right) \left[ \sum_{i} \frac{\rho_i}{M_i} C_{p,i} \left( \frac{\partial \rho_i}{\partial T} - R_u \frac{\partial T}{\partial x} \right) + \frac{\partial}{\partial T} \left( \frac{\partial}{\partial x} \frac{\partial P}{\partial x} \right) \right] + \left( \frac{\nu}{\ell} - V_c \right) \frac{\partial}{\partial x} \left( \frac{\partial}{\partial x} \frac{\partial P}{\partial x} \right) + \left( \frac{\nu}{\ell} - V_c \right) \frac{\partial}{\partial x} \left( \frac{\partial}{\partial x} \frac{\partial P}{\partial x} \right) \right]_{T} + \eta \sum_{i} H_i R T_i

\[ - \frac{1}{\ell} \sum_{i} H_i \frac{\partial}{\partial x} J_i \right] - \left( \frac{\nu}{\ell} \frac{2}{2} \Sigma R T M_i - \frac{T x x}{g} \frac{\partial v}{\partial x} \right)

\[ - \eta \sum_{i} \frac{J_i}{M_i} \frac{g_i}{\ell} + \frac{1}{\ell} \frac{\partial}{\partial x} q_x - \eta \left( A' - e' \right) - H A T_s \]
\[ + \eta R_s H(T)_s + \eta R_{hs} H_s - \eta \sum r_h^{(r)} \Delta H(r) + \eta \left( \sum \frac{\rho_i C_{pi}}{M_i} \right) \]

\[- R_u \sum \frac{\rho_{i1}}{M_1} \frac{\partial T}{\partial t} = 0 \quad (4-29)\]

or, in the linear form,

\[ \frac{\partial T}{\partial x} + \beta_1 T + \beta_2 + \beta_3 \frac{\partial T}{\partial t} = 0 \quad (4-30)\]

where

\[ \beta_1 = \left( H_A - \eta R_u \left[ \frac{\rho}{M} \frac{\partial n}{\partial t} - V_c \frac{\partial n}{\partial x} \right] + \frac{\partial}{\partial t} \left( \sum \frac{\rho_{i1}}{M_1} \right) \right) / D_1 \quad (4-31)\]

\[ D_1 = \eta \left( V_c - V_c \right) \left[ \sum \frac{\rho_{i1} C_{pi}}{M_1} - R_u \sum \frac{\rho_{i1}}{M_1} \right] \quad (4-32)\]

\[ \beta_2 = \left[ \eta \sum \frac{H_i R_{Ti}}{M_i} - \frac{1}{2} \sum \frac{H_i}{M_i} \frac{\partial}{\partial x} J_1 - \eta \frac{v^2}{2} \sum \frac{R_{Ti} M_i}{M_i} \right] \]

\[ \frac{\tau_{xx}}{\epsilon^3} \frac{\partial v}{\partial x} - \eta \sum \frac{J_1 g_{i1}}{M_1} + \frac{1}{\epsilon^2} \frac{\partial}{\partial x} q_x \]

\[- \eta (A' - \epsilon') - H_A T_s + \eta R_s H(T)_s + \eta R_{hs} H_s \]

\[ - \eta \sum r_h^{(r)} \Delta H(r) \right) / D_1 \quad (4-33)\]
The transformed chemical species continuity equation is

\[
\frac{\partial}{\partial t} \left( \eta \rho_i \right) - \nabla \cdot \left( \eta \rho_i \mathbf{v} \right) + \frac{1}{\eta} \nabla \cdot \left( \rho_i \mathbf{v}_0 \right) + \frac{1}{\rho_i} \frac{\partial}{\partial t} \rho_i = 0 \quad (4-35)
\]

This equation is combined with the identities

\[
\dot{\eta}_i = - \rho_i \mathbf{v} \quad (4-36)
\]

and

\[
\mathbf{v}_0 = \eta \mathbf{v} \quad (4-37)
\]

to obtain

\[
\eta \left( \frac{v}{v} - \frac{1}{\eta} \right) \frac{\partial}{\partial x} \dot{\eta}_i + \left[ \left( \frac{v}{v} - \frac{1}{\eta} \right) \frac{\partial \eta}{\partial x} - \frac{\eta}{v^2} \frac{\partial v}{\partial x} \right] \dot{\eta}_i + \frac{1}{\rho_i} \frac{\partial}{\partial t} \rho_i = 0 \quad (4-38)
\]

or, in linear form,

\[
\frac{\partial \dot{\eta}_i}{\partial x} + \Delta_1 \dot{\eta}_i + \Delta_2 \dot{\eta}_i + \Delta_3 \frac{\partial \dot{\eta}_i}{\partial t} = 0 \quad (4-39)
\]
where

\[ \Delta_{i} = \frac{1}{\eta} \frac{\partial n}{\partial x} + \left[ \frac{\eta R_{i} M_{i}}{\rho_{i}} - \eta \frac{V_{c}}{n} \frac{\partial V}{\partial x} - \frac{\partial n}{\partial t} \right] / D_{2} \]  

(4-40)

\[ D_{2} = \eta \left( V_{c} - \frac{V}{k} \right) \]  

(4-41)

\[ \Delta_{2i} = V \left( \frac{1}{\eta} \frac{\partial}{\partial x} n_{i} + \eta \frac{\partial \rho_{i}}{\partial t} \right) / D_{2} \]  

(4-42)

\[ \Delta_{3i} = 0 \]  

(4-43)

**Total mass conservation equation.**—The transformed total mass conservation equation is

\[ \frac{\partial}{\partial t} (n \rho) - V_{c} \frac{\partial}{\partial x} (n \rho) + \frac{1}{\eta} \frac{\partial}{\partial x} (\rho V_{o}) - \eta \sum_{i} R_{i} M_{i} = 0 . \]  

(4-44)

This equation is combined with the identity

\[ \dot{m} = - \rho V_{o} \]  

(4-45)

to obtain

\[ \frac{\partial}{\partial x} \dot{m} = L \left[ \frac{\partial}{\partial t} (n \rho) - \eta \sum_{i} R_{i} M_{i} \right. \]

\[ - V_{c} \left( \eta \frac{\partial \rho}{\partial x} + \rho \frac{\partial n}{\partial x} \right) \]  

(4-46)
It is convenient to integrate this equation numerically rather than use finite difference methods, hence, it is not expressed in the linear form. The solution to this equation is used with the total density obtained from the equation of state to determine the mass average velocity of the pyrolysis gases.

**Pyrolysis gas pressure equation.** - The transformed pyrolysis gas pressure equation is

$$\frac{\partial^2 P^2}{\partial x^2} + \frac{\mu T}{\bar{M}} \frac{\partial}{\partial x} \left( \frac{\bar{M}}{\mu T} \frac{\partial P^2}{\partial x} \right) - 2 \frac{\mu R T}{\bar{M}} \left[ \frac{\partial}{\partial t} \left( \eta \rho \right) \right.

- V_c \frac{\partial}{\partial x} \left( \eta \rho \right) \left. - \eta \sum_{i=1}^{n} \frac{R_i}{T_i} M_i \right] = 0. \quad (4-47)

This equation is combined with the equation of state to give

$$\frac{\partial^2 P^2}{\partial x^2} + \frac{\mu}{K} \left[ \frac{T}{\bar{M}} \frac{\partial}{\partial x} \left( \frac{\bar{M}}{\mu T} \frac{\partial P^2}{\partial x} \right) + \frac{\eta V_c}{P} \right] \frac{\partial P^2}{\partial x} \left.ight.

- \frac{2 \mu}{\bar{M}K_P} \left[ \eta \left( \frac{\partial \bar{M}}{\partial t} - \frac{\bar{M}}{T} \frac{\partial T}{\partial t} \right) + \bar{M} \left( \frac{\partial \eta}{\partial t} \right) \right.

- V_c \frac{\partial \eta}{\partial t} \left. - \eta \frac{\bar{M} \partial T}{\partial x} - V_c \frac{\partial \bar{M}}{\partial x} \right] P^2

+ \frac{2 \eta \sum_{i=1}^{n} R_i}{K_P} M_i - \frac{\mu \eta}{K_P} \frac{\partial P^2}{\partial t} = 0 \quad (4-48)

or, in the linear form,
\[
\frac{\partial^2 p}{\partial x^2} + \gamma_1 \frac{\partial p}{\partial x} + \gamma_2 \frac{\partial p}{\partial x} + \gamma_3 + \gamma_4 \frac{\partial^2 p}{\partial t^2} = 0
\]  
\hspace{1cm} (4-49)

where

\[
\gamma_1 = \frac{\mu}{K} \left[ \frac{T}{M} \frac{\partial}{\partial x} \left( \frac{\kappa R}{\mu T} \right) + \frac{n_v}{\rho} \right] \]  
\hspace{1cm} (4-50)

\[
\gamma_2 = -\frac{2\mu}{MK_p} \left[ n \left( \frac{\partial \bar{M}}{\partial x} - \frac{\bar{M}}{T} \frac{\partial T}{\partial t} \right) \right. 
+ \bar{M} \left( \frac{\partial \bar{n}}{\partial x} - \frac{\bar{n}}{c} \frac{\partial c}{\partial x} \right) + n \left( \frac{\bar{M}}{T} \frac{\partial T}{\partial x} - \frac{\bar{n}}{c} \frac{\partial c}{\partial x} \right) \right] \]  
\hspace{1cm} (4-51)

\[
\gamma_3 = \frac{2\mu n}{K_p} \sum_{i=1}^{R_T} R_T M_i \]  
\hspace{1cm} (4-52)

\[
\gamma_4 = -\frac{\mu n}{K_p} \]  
\hspace{1cm} (4-53)

Uncharred Layer Equation

Equation 4-4 is used to transform the governing energy equation for the uncharred layer. The following derivative expressions are obtained:

\[
\frac{\partial}{\partial t} \left[ \frac{\partial}{\partial t} \right] \text{Old} = \frac{\partial}{\partial t} \left[ \frac{\partial}{\partial t} \right] \text{New} + \left[ \frac{\partial x}{\partial y} \frac{\partial y}{\partial t} + \frac{\partial x}{\partial \bar{L}} \frac{\partial \bar{L}}{\partial t} + \frac{\partial x}{\partial t} \right] \frac{\partial}{\partial x} \]  
\hspace{1cm} (4-54)

but
\[
\frac{\partial x'}{\partial y} = \frac{1}{\lambda'} \\
\frac{\partial x'}{\partial \lambda'} = -\frac{x'}{\lambda'} \\
(4-55)
\]

\[
\frac{\partial x'}{\partial t} = -\frac{1}{\lambda'} \frac{\dot{m}}{\Delta \rho} \\
\lambda' = \lambda'_0 - \int_{t_0}^{t} \frac{\dot{m}}{\Delta \rho} \, dt \\
\frac{\partial \lambda'}{\partial t} = -\frac{\dot{m}}{\Delta \rho}. \\
\]

Therefore

\[
\left(\frac{\partial}{\partial t}\right)_{\text{old}} = \left(\frac{\partial}{\partial t}\right)_{\text{New}} + \frac{\dot{m}}{\Delta \rho} \left(\frac{x'}{\lambda'} - 1\right) \frac{\partial}{\partial x'}. \\
(4-56)
\]

Also

\[
\frac{\partial}{\partial y} = \frac{\partial x'}{\partial y} \frac{\partial}{\partial x'} \\
(4-57)
\]

or

\[
\frac{\partial}{\partial y} = \frac{1}{\lambda'} \frac{\partial}{\partial x'}. \\
(4-58)
\]
and

$$\frac{\partial^2}{\partial y^2} = \frac{1}{\lambda' x'^2} \frac{\partial^2}{\partial x'^2}. \tag{4-59}$$

These equations are employed to obtain the transformed energy equation for the uncharred layer as

$$\frac{k'}{s} \frac{\partial^2 T_s}{\partial x'^2} + \left[ \frac{1}{\lambda' x'^2} \frac{\partial k'}{s} + \frac{\rho' C_s}{p_s} \frac{\dot{m}}{\Delta \rho} (1 - x') \right] \frac{\partial T_s}{\partial x'}$$

$$- \frac{\rho_s' C_p}{\Delta t} \frac{\partial T_s}{\partial t} = 0 \tag{4-60}$$

where the superscript on $T_s$ is omitted. The linear form of this equation is

$$\frac{\partial^2 T_s}{\partial x'^2} + \alpha'_1 \frac{\partial T_s}{\partial x'} + \alpha'_2 T_s + \alpha'_3 + \alpha'_4 \frac{\partial T_s}{\partial t} = 0 \tag{4-61}$$

where

$$\alpha'_1 = \frac{1}{k'} \left[ \frac{\partial k'}{s} \frac{\dot{m}}{\Delta \rho} + \frac{\rho' C_s}{p_s} \frac{\dot{m}}{\Delta \rho} (1 - x') \right] \tag{4-62}$$

$$\alpha'_2 = 0 \tag{4-63}$$

$$\alpha'_3 = 0 \tag{4-64}$$
\[ \alpha_4' = -\rho_s' C_p' \frac{l''^2}{k_s'} . \] (4-65)

**Insulation Layer Equation**

Equation 4-5 is used to transform the governing energy equation for the insulation layer. The following derivative expressions are obtained:

\[ \left( \frac{\partial}{\partial t} \right)_{\text{Old}} = \left( \frac{\partial}{\partial t} \right)_{\text{New}} \] (4-66)

\[ \frac{\partial}{\partial y} = \frac{\partial x''}{\partial y} \frac{\partial}{\partial x''} = \frac{1}{l''} \frac{\partial}{\partial x''} \]

\[ \frac{\partial^2}{\partial y^2} = \frac{1}{l''^2} \frac{\partial^2}{\partial x''^2} . \]

The insulation layer temperature equation becomes

\[ \frac{k''}{l''^2} \frac{\partial^2 T_s}{\partial x''^2} + \frac{1}{l''} \frac{\partial k''}{\partial x''} \frac{\partial T_s}{\partial x''} - \rho_s'' C_p'' \frac{\partial T_s}{\partial t} = 0 \] (4-67)

or

\[ \frac{\partial^2 T_s}{\partial x''^2} + \alpha_1'' \frac{\partial T_s}{\partial x''} + \alpha_2'' T_s + \alpha_3'' + \alpha_4'' \frac{\partial T_s}{\partial t} = 0 \] (4-68)
where

\[ \alpha''_1 = \frac{1}{k''_s} \frac{\partial k''_s}{\partial x''} \]  \hspace{1cm} (4-69)

\[ \alpha''_2 = 0 \]  \hspace{1cm} (4-70)

\[ \alpha''_3 = 0 \]  \hspace{1cm} (4-71)

\[ \alpha''_4 = -\frac{\rho''_s c'' e'(x''^2)}{k''_s} . \]  \hspace{1cm} (4-72)

Boundary Conditions

The transformed boundary conditions are as follows:

Rate of surface removal by oxidation

\[ \dot{m}_s = \frac{k P e C e \bar{M}_T}{M_0 + \frac{k P e (H_e - H_w)}{\lambda N_{le} q_{c,net}}} \]  \hspace{1cm} (4-73)

Energy balance at the front surface

\[ q_c \left(1 - \frac{H_w}{H_e}\right) \left\{ 1 - (1 - \beta) \left[ 0.724 \frac{\dot{m}_T^e}{q_c} - 0.13 \left(\frac{H_e \dot{m}_T^e}{q_c}\right)^2 \right] \right\} \]

\[ - \beta \dot{m}_T^e \frac{\dot{H}_e}{q_c} + \alpha q_R + \left[ 1 - S(T_{s_1} - \bar{T}_{s_1}) \right] \dot{m}_s \Delta H_c \]

\[ = c \varepsilon_s \frac{T_{s_1}}{T_{s_1}} - \frac{k_s}{\ell} \frac{\partial T_e}{\partial x} + S(T_{s_1} - \bar{T}_{s_1}) \dot{m}_s H_c \]  \hspace{1cm} (4-74)
Energy balance at the pyrolysis zone

\[- \left( \frac{k_s}{\ell_s} \frac{\partial T_s}{\partial x} \right) x = 1 = \dot{m}_g \Delta H_p - \left( \frac{k'_s}{\ell'_s} \frac{\partial T_s}{\partial x'} \right) x' = 0 \]  \hspace{1cm} (4-75)

Rate of pyrolysis of uncharred material

\[\dot{m}_g = A' \exp \left( -B'/T_s \right) x = 1 \]  \hspace{1cm} (4-76)

Energy balance at the interface of the uncharred layer and the insulation layer

\[- \left( \frac{k'_s}{\ell'_s} \frac{\partial T_s}{\partial x'} \right) x' = 1 = - \left( \frac{k''_s}{\ell''_s} \frac{\partial T_s}{\partial x''} \right) x'' = 0 \]

\[+ \rho_{HS} \hat{C}_{p_{HS}} \hat{\rho}_{HS} \left( \frac{\partial T_s}{\partial t} \right) x' = 1 \]  \hspace{1cm} (4-77)

Energy balance at the back surface of the insulation layer

\[- \left( \frac{k''_s}{\ell''_s} \frac{\partial T_s}{\partial x''} \right) x'' = 1 = \sigma \varepsilon'' \tau_s T_s^{-4} x'' = 1 - q_B \]

\[+ \rho_{HSP} \hat{C}_{p_{HSP}} \hat{\rho}_{HSP} \left( \frac{\partial T_s}{\partial t} \right) x'' = 1 \]  \hspace{1cm} (4-78)

Specified char porosity at the pyrolysis zone

\[\eta_x = 1 = \eta_0 \]  \hspace{1cm} (4-79)

Specified temperature of pyrolysis gas at the pyrolysis interface

\[T_x = 1 = T_{s_x} = 1 \]  \hspace{1cm} (4-80)
Specified pressure at the front surface

\[ P_x = 0 = P_w \quad (4-81) \]

Specified pressure gradient at the pyrolysis interface

\[ \left( \frac{\partial}{\partial x} P^2 \right)_x = 1 = 2\ell \frac{R}{u} \left( \frac{\mu T}{KN} \right)_x = 1 \hat{m}_g \quad (4-82) \]

Specified mass flow rate at the pyrolysis interface

\[ (\hat{m})_x = 1 = \hat{m}_g \quad (4-83) \]

Specified chemical species mass flow rate at the pyrolysis interface

\[ (\rho v)_x = 1 = -\left( \frac{x_1}{\eta M_i} \right)_x = 1 \hat{m}_i g \quad , \quad (4-84) \]
CHAPTER V

FINITE DIFFERENCE EQUATIONS

The system of equations derived in Chapter II of this paper includes six partial differential equations with variable coefficients thus it is necessary to solve them numerically. The procedure employed to solve all equations except the total mass conservation equation involves deriving the governing differential equations in finite difference form and solving the resulting sets of algebraic equations by iteration. The total mass conservation equation is solved by numerical integration from the char layer - uncharred layer interface.

Figure 4 shows the locations of the finite-difference stations and the boundary conditions at each boundary. The distances between stations in the char layer, the uncharred layer, and the insulation layer are

\[
\begin{align*}
\Delta x &= \frac{1}{I} - 1 \\
\Delta x' &= \frac{1}{J} \\
\Delta x'' &= \frac{1}{K}
\end{align*}
\]

(5-1)

The station coordinates are
Figure 4.— Location of finite difference stations.
for the char layer,

$$x' = (N - 1)\Delta x'$$

(5-3)

for the uncharred layer, and

$$x'' = (N - I - J) \Delta x''$$

(5-4)

for the insulation layer.

**Solid Phase Temperature Equations**

The differential equation for the char temperature is

$$\frac{\partial^2 T_s}{\partial x^2} + \alpha_1 \frac{\partial T_s}{\partial x} + \alpha_2 T_s + \alpha_3 + \alpha_4 \frac{\partial T_s}{\partial t} = 0 .$$

(5-5)

**Interior stations of the char layer.** - At interior stations the partial derivatives are replaced by central difference approximations. The central difference approximations of the partial derivative are obtained from Taylor series expansions at the station N evaluated at N + 1 and N - 1. Thus

$$T_s(N + 1) = T_s(N) + \left(\frac{\partial T_s}{\partial x}\right)_N \Delta x + \left(\frac{\partial^2 T_s}{\partial x^2}\right)_N \frac{\Delta x^2}{2!}$$
Subtracting Eq. 5-7 from Eq. 5-6 gives

\[
\left( \frac{\partial^3 T_s}{\partial x^3} \right)_N \frac{\Delta x^3}{3!} + \cdots
\]

\[
T_s(N - 1) = T_s(N) - \left( \frac{\partial T_s}{\partial x} \right)_N \Delta x + \left( \frac{\partial^2 T_s}{\partial x^2} \right)_N \frac{\Delta x^2}{2!}
\]

\[- \left( \frac{\partial^3 T_s}{\partial x^3} \right)_N \frac{\Delta x^3}{3!} + \cdots.
\]

Therefore the equation

\[
\left( \frac{\partial T_s}{\partial x} \right)_N = \frac{T_s(N + 1) - T_s(N - 1)}{2\Delta x} + \left( \frac{\partial^3 T_s}{\partial x^3} \right)_N \frac{\Delta x^2}{12} . \tag{5-8}
\]

is accurate to terms of the order \( \Delta x^2 \). Similarly, adding Eqs. 5-6 and 5-7 gives

\[
\left( \frac{\partial^2 T_s}{\partial x^2} \right)_N = \frac{T_s(N + 1) - 2T_s(N) + T_s(N - 1)}{\Delta x^2} \tag{5-10}
\]

which is accurate to terms of the order \( \Delta x^2 \).

Equations 5-9 and 5-10 are used in Eq. 5-5 to obtain
\[
\frac{1}{2} \Delta x^2 \left[ T_s(N+1) - 2 T_s(N) + T_s(N-1) \right] + \frac{\alpha_1(N)}{2\Delta x} [T_s(N+1) - T_s(N-1)] + \alpha_2(N) T_s(N) + \alpha_3(N) + \alpha_4(N) \left( \frac{\partial T_s}{\partial t} \right)_N = 0 \tag{5-11}
\]

The finite difference approximation of the last term to the left in Eq. 5-11 is obtained from Taylor series expansions at time \( P + \Delta t/2 \) evaluated at time \( P \) and \( P + \Delta t \). Thus

\[
\left( \alpha_4 \frac{\partial T_s}{\partial t} \right)_P = \left( \alpha_4 \frac{\partial T_s}{\partial t} \right)^P + \frac{\Delta t}{2} \left[ \frac{\partial}{\partial t} \left( \alpha_4 \frac{\partial T_s}{\partial t} \right) \right]^P + \frac{\Delta t}{4} \left[ \frac{\partial^2}{\partial t^2} \left( \alpha_4 \frac{\partial T_s}{\partial t} \right) \right]^P + \cdots \tag{5-12}
\]

\[
\left( \alpha_4 \frac{\partial T_s}{\partial t} \right)^P + \Delta t = \left( \alpha_4 \frac{\partial T_s}{\partial t} \right)^P + \frac{\Delta t}{2} \left[ \frac{\partial}{\partial t} \left( \alpha_4 \frac{\partial T_s}{\partial t} \right) \right]^P + \frac{\Delta t}{4} \left[ \frac{\partial^2}{\partial t^2} \left( \alpha_4 \frac{\partial T_s}{\partial t} \right) \right]^P + \cdots \tag{5-13}
\]

Solving these two equations for \( \left( \alpha_4 \frac{\partial T_s}{\partial t} \right)^P + \Delta t/2 \),

\[
\left( \alpha_4 \frac{\partial T_s}{\partial t} \right)^P + \Delta t/2 = \frac{1}{2} \left[ \alpha_4^P \frac{\partial T_s}{\partial t}^P + \alpha_4^P + \Delta t \frac{\partial T_s}{\partial t}^P + \Delta t \right] \tag{5-14}
\]

which is accurate to terms of the order \( \Delta t^2 \). Now
\[ \alpha_4 = \frac{1}{2} (\alpha_4 + \alpha_4') \]  
\[ \frac{\partial T_s}{\partial t} = \frac{T_s^{P + \Delta t} - T_s^P}{\Delta t} \]  

and \( \alpha_4^P \frac{\partial T_s^P}{\partial t} \) and \( \alpha_4^P + \Delta t \) \( \frac{\partial T_s^P + \Delta t}{\partial t} \) are obtained from the explicit and implicit formulations of Eq. 5-11, that is

\[
\left( \alpha_4 \frac{\partial T_s}{\partial t} \right)_N^{P} = - \frac{1}{\Delta x} \left[ T_s(N + 1)^P - 2 T_s(N)^P + T_s(N - 1)^P \right] - \frac{\alpha_1(N)^P}{2\Delta x} \left[ T_s(N + 1)^P - T_s(N - 1)^P \right] - \alpha_2(N)^P T_s(N)^P - \alpha_3(N)^P \]  

(5-17)

\[
\left( \alpha_4 \frac{\partial T_s}{\partial t} \right)_N^{P + \Delta t} = - \frac{1}{\Delta x} \left[ T_s(N + 1)^P + \Delta t - 2 T_s(N)^P + \Delta t + T_s(N - 1)^P + \Delta t \right] - \frac{\alpha_1(N)^P + \Delta t}{2\Delta x} \left[ T_s(N + 1)^P + \Delta t - T_s(N - 1)^P + \Delta t \right] - \alpha_2(N)^P + \Delta t T_s(N)^P + \Delta t - \alpha_3(N)^P + \Delta t \].

(5-18)

Therefore, the modified implicit finite difference equation for \( T_s \) at interior stations is
\[ [\alpha_4(N)^P + \alpha_4(N)^P + \Delta t] \left( \frac{T_s(N)^P + \Delta t - T_s(N)^P}{\Delta t} \right) + \frac{1}{\Delta x^2} [T_s(N + 1)^P \]

\[- 2 T_s(N)^P + T_s(N - 1)^P] + \alpha_1(N)^P \frac{1}{2\Delta x} [T_s(N + 1)^P - T_s(N - 1)^P] \]

\[+ \alpha_2(N)^P T_s(N)^P + \alpha_3(N)^P + \frac{1}{\Delta x^2} [T_s(N + 1)^P + \Delta t - 2 T_s(N)^P + \Delta t \]

\[+ T_s(N - 1)^P + \Delta t] + \frac{\alpha_1(N)^P + \Delta t}{2\Delta x} [T_s(N + 1)^P + \Delta t - T_s(N - 1)^P + \Delta t] \]

\[+ \alpha_2(N)^P + \Delta t T_s(N)^P + \Delta t + \alpha_3(N)^P + \Delta t = 0 \quad (5-19) \]

or

\[A_s(N) T_s(N - 1)^P + \Delta t + B_s(N) T_s(N)^P + \Delta t + C_s(N) T_s(N + 1)^P + \Delta t \]

\[= D_s(N) \quad (5-20) \]

where

\[A_s(N) = \frac{1}{\Delta x^2} - \alpha_4(N)^P + \frac{\Delta t}{2\Delta x} \quad (5-21) \]

\[B_s(N) = \alpha_2(N)^P + \Delta t - 2/\Delta x^2 + \frac{1}{\Delta t} [\alpha_4(N)^P + \alpha_4(N)^P + \Delta t] \quad (5-22) \]

\[C_s(N) = \frac{1}{\Delta x^2} + \alpha_1(N)^P + \frac{\Delta t}{2\Delta x} \quad (5-23) \]
\[
D_s(N) = - \alpha_3(N)^P - \alpha_3(N)^P + \Delta t \left[ \frac{1}{\Delta x^2} - \frac{\alpha_1(N)^P}{2\Delta x} \right] T_s(N - 1) \\
- \left\{ \alpha_2(N)^P - 2/\Delta x^2 - \frac{1}{\Delta t} \left[ \alpha_4(N)^P + \alpha_4(N)^P + \Delta t \right] \right\} T_s(N)^P \\
- \left[ \frac{1}{\Delta x^2} + \frac{\alpha_1(N)^P}{2\Delta x} \right] T_s(N + 1)^P.
\] (5-24)

**Interior stations of the uncharred layer.** - The modified implicit finite difference equation at interior stations of the uncharred layer is obtained by analogy from Eq. 5-19. The resulting equation is

\[
A_s'(N) T_s(N - 1)^P + \Delta t + B_s'(N) T_s(N)^P + \Delta t + C_s' T_s(N + 1)^P + \Delta t \\
= D_s'(N)
\] (5-25)

where

\[
A_s'(N) = 1/\Delta x'^2 - \frac{\alpha_1(N)^P + \Delta t}{2\Delta x'}
\] (5-26)

\[
B_s'(N) = \alpha_2'(N)^P + \Delta t - \frac{2}{\Delta x'^2} + \frac{1}{\Delta t} \left[ \alpha_4'(N)^P + \alpha_4'(N)^P + \Delta t \right]
\] (5-27)

\[
C_s'(N) = 1/\Delta x'^2 + \frac{\alpha_1(N)^P + \Delta t}{2\Delta x'}
\] (5-28)
\( d_s'(N) = - \alpha_3'(N) P - \alpha_3'(N) P + \Delta t - \left[ \frac{1}{\Delta x'^2} - \frac{\alpha_1'(N) P}{2\Delta x'} \right] T_s(N - 1) P \)

\[-\{\alpha_2'(N) P - \frac{2}{\Delta x'^2} - \frac{1}{\Delta t} [\alpha_4'(N) P + \alpha_4'(N) P + \Delta t] \} T_s(N) P \]

\[-\left[ \frac{1}{\Delta x'^2} + \frac{\alpha_1'(N) P}{2\Delta x'} \right] T_s(N + 1) P \] (5-29)

**Interior stations of the insulation.**—The modified implicit finite difference equation at interior stations of the insulation layer is similarly obtained as

\[ A''(N) T_s(N - 1) P + \Delta t + B''(N) T_s(N) P + \Delta t + C''(N) T_s(N + 1) P + \Delta t \]

\[ = D''(N) \] (5-30)

where

\[ A''(N) = 1/\Delta x''^2 - \frac{\alpha_1''(N) P + \Delta t}{2\Delta x''} \] (5-31)

\[ B''(N) = \alpha_2''(N) P + \Delta t - \frac{2}{\Delta x''^2} + \frac{1}{\Delta t} [\alpha_4''(N) P + \alpha_4''(N) P + \Delta t] \] (5-32)

\[ C''(N) = 1/\Delta x''^2 + \frac{\alpha_1''(N) P + \Delta t}{2\Delta x''} \] (5-33)

\[ D''(N) = - \alpha_3''(N) P - \alpha_3''(N) P + \Delta t - \left[ \frac{1}{\Delta x''^2} - \frac{\alpha_1''(N) P}{2\Delta x''} \right] T_s(N - 1) P \]
\[- \left\{ \alpha''_{2}^{P}(N) \right\} \frac{2}{\Delta x'^{2}} - \frac{1}{\Delta t} \left\{ \alpha''_{4}^{P}(N) + \alpha''_{4}^{P} + \Delta t \right\} T_{s}^{P}(N) \]
\[- \left[ \frac{1}{\Delta x'^{2}} + \frac{\alpha''_{1}^{P}}{2\Delta x''} \right] T_{s}^{P}(N + 1) \]  
(5-34)

**Boundary stations.**—Boundary conditions other than a parameter being specified at a point are employed by combining the governing differential equation and the equation expressing the boundary condition to obtain a differential equation which is valid only at the boundary. The solution of this equation satisfies both the boundary condition and the governing differential equation.

At the front surface \((N = 1)\).—The front surface boundary condition is

\[- \frac{1}{\delta} \left( k \frac{\partial T_{s}}{\partial x} \right)_{N = 1} = q_{c, \text{net}} - \sigma \varepsilon_{s} T_{s}^{4} \]  
(5-35)

The second order derivative term in Eq. 5-5 is written as

\[ \frac{\partial^{2} T_{s}}{\partial x^{2}} = \frac{\partial}{\partial x} \left( \frac{\partial T_{s}}{\partial x} \right) \]  
(5-36)

The derivative of the temperature gradient is obtained from Taylor series expansions at the station \(N = 1\) evaluated at \(N = 2, N = 3,\) and \(N = 4.\) Thus
\[
\left( \frac{\partial T_s}{\partial x} \right)_{N=2} = \left( \frac{\partial T_s}{\partial x} \right)_{N=1} + \Delta x \left[ \frac{\partial}{\partial x} \left( \frac{\partial T_s}{\partial x} \right) \right]_{N=1} + \frac{\Delta x^2}{2} \left[ \frac{\partial^2}{\partial x^2} \left( \frac{\partial T_s}{\partial x} \right) \right]_{N=1} + \cdots \tag{5-37}
\]

\[
\left( \frac{\partial T_s}{\partial x} \right)_{N=3} = \left( \frac{\partial T_s}{\partial x} \right)_{N=1} + 2\Delta x \left[ \frac{\partial}{\partial x} \left( \frac{\partial T_s}{\partial x} \right) \right]_{N=1} + 2\Delta x^2 \left[ \frac{\partial^2}{\partial x^2} \left( \frac{\partial T_s}{\partial x} \right) \right]_{N=1} + \cdots \tag{5-38}
\]

\[
\left( \frac{\partial T_s}{\partial x} \right)_{N=4} = \left( \frac{\partial T_s}{\partial x} \right)_{N=1} + 3\Delta x \left[ \frac{\partial}{\partial x} \left( \frac{\partial T_s}{\partial x} \right) \right]_{N=1} + \frac{9\Delta x^2}{2} \left[ \frac{\partial^2}{\partial x^2} \left( \frac{\partial T_s}{\partial x} \right) \right]_{N=1} + \cdots \tag{5-39}
\]

Solving for \( \left[ \frac{\partial}{\partial x} \left( \frac{\partial T_s}{\partial x} \right) \right]_{N=1} \)

\[
\left[ \frac{\partial}{\partial x} \left( \frac{\partial T_s}{\partial x} \right) \right]_{N=1} = \frac{1}{6\Delta x} \left[ -11 \left( \frac{\partial T_s}{\partial x} \right)_{N=1} + 18 \left( \frac{\partial T_s}{\partial x} \right)_{N=2} - 9 \left( \frac{\partial T_s}{\partial x} \right)_{N=3} + 2 \left( \frac{\partial T_s}{\partial x} \right)_{N=4} \right] \tag{5-40}
\]

which is accurate to terms of the order \( \Delta x^3 \). Therefore,
\[
\left( \frac{\partial^2 T_s}{\partial x^2} \right)_{N = 1} = \frac{1}{6 \Delta x} \left[ \frac{\partial T_s}{\partial x} \right]_{N = 1} + 18 \left( \frac{\partial T_s}{\partial x} \right)_{N = 2} - 9 \left( \frac{\partial T_s}{\partial x} \right)_{N = 3} + 2 \left( \frac{\partial T_s}{\partial x} \right)_{N = 4} \right], \quad (5-41)
\]

Combining Eq. 5-41 with Eq. 5-5 written for station \( N = 1 \) gives

\[
[a_1(N) - \frac{11}{6 \Delta x}] \left( \frac{\partial T_s}{\partial x} \right)_{N = 1} + \frac{3}{\Delta x} \left( \frac{\partial T_s}{\partial x} \right)_{N = 2} - \frac{3}{2 \Delta x} \left( \frac{\partial T_s}{\partial x} \right)_{N = 3} + \frac{1}{3 \Delta x} \left( \frac{\partial T_s}{\partial x} \right)_{N = 4} + a_2(1) T_s(1) + a_3(1)
+a_4(1) \left( \frac{\partial T_s}{\partial t} \right)_{N = 1} = 0. \quad (5-42)
\]

The temperature gradient at station \( N = 1 \) is given by Eq. 5-35. The temperature gradients of neighboring stations are approximated by central difference expressions. The resulting finite difference equation is

\[
\{[a_1(1) - \frac{11}{6 \Delta x}] \frac{2}{k_s(1)} \sigma \varepsilon_s T_s(1)^3 - \frac{3}{2 \Delta x} + a_2(1) \} T_s(1)
+ \frac{3}{4 \Delta x} T_s(2) + \left( \frac{3}{2 \Delta x} - \frac{1}{6 \Delta x} \right) T_s(3) - \frac{3}{4 \Delta x} T_s(4)
+ \frac{1}{6 \Delta x} T_s(5) + a_3(1) - \frac{q_{c,net}}{k_s(1)} [a_1(1) - \frac{11}{6 \Delta x}]
+a_4(1) \left( \frac{\partial T_s}{\partial t} \right)_{N = 1} = 0. \quad (5-43)
\]
Following the procedure used to obtain the modified implicit finite difference equation for interior stations, the analogous equation for the station at the front surface becomes

\[
\left\{ \left[ \alpha_1(1)^P + \Delta t - \frac{11}{6\Delta x} \right] \frac{\partial P + \Delta t}{k_s(1)^P + \Delta t} \sigma \varepsilon_s [T_s(1)^P + \Delta t]^3 - \frac{3}{2\Delta x^2} \right. \\
+ \alpha_2(1)^P + \Delta t + \frac{1}{\Delta t} \left[ \alpha_4(1)^P + \alpha_4(1)^P + \Delta t \right] T_s(1)^P + \Delta t \\
+ \frac{3}{4\Delta x^2} T_s(2)^P + \Delta t + \left( \frac{3}{2\Delta x^2} - \frac{1}{6\Delta x^2} \right) T_s(3)^P + \Delta t - \frac{3}{4\Delta x^2} T_s(4)^P + \Delta t \\
+ \frac{1}{6\Delta x^2} T_s(5)^P + \Delta t = - \alpha_3(1)^P - \alpha_3(1)^P + \Delta t + \left[ \alpha_1(1)^P + \Delta t \right] \\
- \frac{11}{6\Delta x} q_{c,\text{net}}^P + \Delta t + \frac{\partial P + \Delta t}{k_s(1)^P + \Delta t} + \left[ \alpha_1(1)^P - \frac{11}{6\Delta x} q_{c,\text{net}}^P \right] \\
- \left\{ \left[ \alpha_1(1)^P - \frac{11}{6\Delta x} \right] \frac{\partial P}{k_s(1)^P + \Delta t} \sigma \varepsilon_s [T_s(1)^P]^3 - \frac{3}{2\Delta x^2} \right. \\
+ \frac{3}{4\Delta x^2} T_s(2)^P - \left( \frac{3}{2\Delta x^2} - \frac{1}{6\Delta x^2} \right) T_s(3)^P + 3/4\Delta x^2 T_s(4)^P \\
- \frac{1}{6\Delta x^2} T_s(5)^P \\
\] \hspace{1cm} (5-44)

or
\[ B_{1s} T_s(1)P + \Delta t + C_{1s} T_s(2)P + \Delta t + G_{1s} T_s(3)P + \Delta t + H_{1s} T_s(4)P + \Delta t + I_{1s} T_s(5)P + \Delta t = D_{1s} \]  

(5-45)

where

\[ B_{1s} = \left[ \alpha_1(1)P + \Delta t - \frac{11}{6\Delta x} \right] \frac{\varepsilon_{P} + \Delta t}{k_s(1)P + \Delta t} \sigma_{s} [T_s(1)P + \Delta t]^3 \]

\[ = \frac{3}{2\Delta x^2} + \alpha_2(1)P + \Delta t + \frac{1}{\Delta t} [\alpha_4(1)P + \alpha_4(1)P + \Delta t] \]  

(5-46)

\[ C_{1s} = \frac{3}{8\Delta x^2} \]

(5-47)

\[ G_{1s} = \frac{3}{4\Delta x^2} - \frac{1}{12\Delta x^2} \]

(5-48)

\[ H_{1s} = -\frac{3}{8\Delta x^2} \]

(5-49)

\[ I_{1s} = \frac{1}{12\Delta x^2} \]

(5-50)

\[ D_{1s} = -\alpha_3(1)P - \alpha_3(1)P + \Delta t + [\alpha_1(1)P + \Delta t - \frac{11}{6\Delta x}] \frac{q_{c, net} P + \Delta t}{k_s(1)P + \Delta t} \]

\[ + [\alpha_1(1)P - \frac{11}{6\Delta x}] \frac{q_{c, net} P}{k_s(1)P} - [\alpha_1(1)P \]

\[ - \frac{11}{6\Delta x} \] \frac{\varepsilon_{P} + \Delta t}{k_s(1)P} \sigma_{s} [T_s(1)P]^3 - \frac{3}{2\Delta x^2} + \alpha_2(1)P \]
\[- \frac{1}{\Delta t} \left[ \alpha_4(1)^P + \alpha_4(1)^P + \Delta t \right] T_s(1)^P - \frac{3}{4\Delta x} T_s(2)^P \]
\[- \left( \frac{3}{2\Delta x^2} - \frac{1}{6\Delta x^2} \right) T_s(3)^P + \frac{3}{4\Delta x^2} T_s(4)^P \]
\[- \frac{1}{6\Delta x^2} T_s(5)^P. \]  
(5-51)

At the pyrolysis zone \((N = I)\). - The boundary condition at the pyrolysis zone is

\[- \frac{1}{\xi} \left( k_s \frac{\partial T_s}{\partial x} \right)_N = I = \frac{\dot{m}}{g} \Delta H_p - \frac{1}{\xi} \left( k'_s \frac{\partial T_s}{\partial t} \right)_N = I^* \]  
(5-52)

The second order derivative in the governing equation for char layer temperature is approximated by a four-point backward difference expression analogous to Eq. 5-41. Thus

\[
\left( \frac{\partial^2 T_s}{\partial x^2} \right)_N = I = \frac{1}{6\Delta x} \left[ 11 \left( \frac{\partial T_s}{\partial x} \right)_N = I - 18 \left( \frac{\partial T_s}{\partial x} \right)_N = I - 1 \right. \\
+ 9 \left( \frac{\partial T_s}{\partial x} \right)_N = I - 2 - 2 \left( \frac{\partial T_s}{\partial x} \right)_N = I - 3 \right]. \]  
(5-53)

Using this equation in the governing equation for char layer temperature and solving for the char layer temperature gradient at the pyrolysis zone gives
The analogous expression for the uncharred layer temperature gradient is

\[
\left( \frac{\partial T_s}{\partial x} \right)_N = \frac{6}{1} \left [ 3 \left( \frac{\partial T_s}{\partial x} \right)_{N = I - 1} - \frac{3}{2} \left( \frac{\partial T_s}{\partial x} \right)_{N = I - 2} + \frac{1}{3} \left( \frac{\partial T_s}{\partial x} \right)_{N = 1} - \alpha_1'(I) \Delta x \left( \frac{\partial T_s}{\partial x} \right)_{N = I} - \alpha_2(I) \Delta x \left( \frac{\partial T_s}{\partial x} \right)_{N = I} - \alpha_3(I) \Delta x \left( \frac{\partial T_s}{\partial x} \right)_{N = I} - \alpha_4(I) \Delta x \left( \frac{\partial T_s}{\partial x} \right)_{N = I} \right].
\]

(5-54)

Combining Eqs. 5-52, 5-54, and 5-55 gives

\[
\left( \frac{\partial T_s}{\partial t} \right)_N = \frac{\Delta x}{\lambda} \frac{k_s(\alpha_4(I))}{\alpha_4(I)} \left[ \frac{k_s(\alpha_4(I))}{\lambda} + \frac{\Delta x' k_s'(\alpha_4(I))}{\lambda'} \right] \left( \frac{\partial T_s}{\partial x} \right)_{N = I - 1}
- \frac{3}{2} \left( \frac{\partial T_s}{\partial x} \right)_{N = I - 2} + \frac{1}{3} \left( \frac{\partial T_s}{\partial x} \right)_{N = I - 3} - \alpha_1(I) \Delta x \left( \frac{\partial T_s}{\partial x} \right)_{N = I} - \alpha_2(I) \Delta x T_s(\Delta x)
\]

(5-55)
\[
\begin{align*}
- \alpha_3(I) \Delta x' &+ \frac{11}{6} m \Delta H \rho - \frac{k'(I)}{\ell'} \left[ 3 \left( \frac{\partial T}{\partial x} \right)_{N = I + 1} - \frac{3}{2} \left( \frac{\partial T}{\partial x} \right)_{N = I + 2} \right] \\
+ \frac{1}{3} \left( \frac{\partial T}{\partial x} \right)_{N = I + 3} &+ \alpha_1'(I) \Delta x' \left( \frac{\partial T}{\partial x'} \right)_I + \alpha_2'(I) \Delta x' T_s(I) \\
+ \alpha_3'(I) \Delta x' \right)
\end{align*}
\] (5-56)

which is valid at the pyrolysis zone.

Approximating the temperature gradient of the char layer and the uncharred layer by four-point backward difference and forward difference expressions, respectively, and using central difference approximations for the temperature gradients at interior stations gives

\[
\left( \frac{\partial T_s}{\partial t} \right)_{N = I} = \frac{k_s(I) \alpha_4(I) \Delta x}{\ell} + \frac{k'(I) \alpha_4'(I) \Delta x'}{\ell'} \left\{ \frac{k_s(I)}{\ell} \left[ -\frac{1}{6 \Delta x} T_s(I - 4) \right. \right.
\]
\[
+ \left( \frac{3}{4 \Delta x} + \frac{\alpha_1(I)}{3} \right) T_s(I - 3) - \left( \frac{3}{4 \Delta x} + \frac{\alpha_1(I)}{2} \right) T_s(I - 2)
\]
\[
- \left( \frac{3}{4 \Delta x} - 3 \alpha_1(I) \right) T_s(I - 1) + \left[ \frac{k_s(I)}{\ell} \left( \frac{3}{2 \Delta x} - \frac{11}{6} \alpha_1(I) \right.ight.
\]
\[
- \alpha_2(I) \Delta x + \frac{k'(I)}{\ell'} \left( \frac{3}{2 \Delta x} + \frac{11}{6} \alpha_1(I) - \alpha_2'(I) \Delta x' \right) \left) T_s(I) \right. \right.
\]
\[
+ \frac{11}{6} m \Delta H \rho - \frac{k_s(I) \alpha_3(I) \Delta x}{\ell} - \frac{k'(I) \alpha_3'(I) \Delta x'}{\ell'} \\
\left. - \frac{k_s(I)}{\ell} \left[ \left( \frac{3}{4 \Delta x} + 3 \alpha_1'(I) \right) T_s(I + 1) + \left( \frac{4}{3 \Delta x} - \frac{3 \alpha_1(I)}{2} \right) T_s(I + 2) \right. \right.
\]
\[
- \left( \frac{3}{4 \Delta x} - \frac{\alpha_1(I)}{3} \right) T_s(I + 3) + \frac{1}{6 \Delta x^2} T_s(I + 4) \right) \right\}. \quad (5-57)
\]
The modified implicit finite difference equation results from taking an average of Eq. 5-57 written in explicit form and in implicit form. The result is

\[
Z_I T_s (I - 4)^P + \Delta t + Y_I T_s (I - 3)^P + \Delta t + X_I T_s (I - 2)^P + \Delta t
\]

\[+ A_I T_s (I - 1)^P + \Delta t + B_I T_s (I)^P + \Delta t\]

\[+ C_I T_s (I + 1)^P + \Delta t + E_I T_s (I + 2)^P + \Delta t\]

\[+ F_I T_s (I + 3)^P + \Delta t + G_I T_s (I + 4)^P + \Delta t\]

\[= D_I S\] (5-58)

where

\[
Z_I S = \frac{-k_s(I)^P + \Delta t}{(12 \Delta x \varepsilon^P + \Delta t)}
\]

(5-59)

\[
Y_I S = \frac{k_s(I)^P + \Delta t \alpha_4(I)^P + \Delta t \Delta x}{2 \varepsilon^P + \Delta t} + \frac{k_s'(I)^P + \Delta t \alpha_4'(I)^P + \Delta t \Delta x'}{\varepsilon^P + \Delta t}
\]

(5-60)
\[ X_{s} = \frac{-k_{s}(I)^{P} + \Delta t}{2} \left[ \frac{4}{3\Delta x} + \frac{3\alpha_{1}(x)}{2} \right] /l^{P} + \Delta t \] (5-61)

\[ A_{s} = \frac{k_{s}(I)^{P} + \Delta t}{2} \left[ \frac{3}{4\Delta x} - 3\alpha_{1}(I)^{P} + \Delta t \right] /l^{P} + \Delta t \] (5-62)

\[ B_{s} = -\frac{1}{\Delta t} + \frac{k_{s}(I)^{P} + \Delta t}{2} \left[ \frac{3}{2\Delta x} - \frac{11}{6} \alpha_{1}(I)^{P} + \Delta t - \alpha_{2}(I)^{P} + \Delta t \Delta x \right] + \frac{k_{s}(I)^{P} + \Delta t}{l^{P} + \Delta t} \left[ \frac{3}{2\Delta x'} - \frac{11}{6} \alpha_{1}'(I)^{P} + \Delta t - \alpha_{2}'(I)^{P} + \Delta t \right] \] (5-63)

\[ C_{s} = \frac{-k_{s}'(I)^{P} + \Delta t}{2} \left[ \frac{4}{3\Delta x'} + 3\alpha_{1}'(I)^{P} + \Delta t \right] /l^{P} + \Delta t \] (5-64)

\[ E_{s} = \frac{-k_{s}'(I)^{P} + \Delta t}{2} \left[ \frac{4}{3\Delta x'} + 3\alpha_{1}'(I)^{P} + \Delta t \right] /l^{P} + \Delta t \] (5-65)
\[ \begin{align*}
\text{FI}_s &= \frac{k_s'(I)^P + \Delta t \left[ \frac{3}{4\Delta x} - \frac{1}{3} \alpha_1'(I)^P + \Delta t \right]}{\frac{\Delta t}{4\Delta x}} \frac{\Delta t}{\Delta t} + \frac{k_s'(I)^P + \Delta t \alpha_1'(I)^P + \Delta t \Delta x}{\frac{\Delta t}{4\Delta x}} \\
\text{GI}_s &= \frac{-k_s'(I)^P + \Delta t}{12 \Delta x' \frac{\Delta t}{4\Delta x}} \\
\text{DI}_s &= \frac{1}{2} \left[ \frac{k_s'(I)^P + \Delta t \alpha_4'(I)^P + \Delta t \Delta x'}{\frac{\Delta t}{4\Delta x}} + \frac{k_s'(I)^P + \Delta t \alpha_4'(I)^P + \Delta t \Delta x'}{\frac{\Delta t}{4\Delta x}} \right] \\
&+ \frac{k_s'(I)^P + \Delta t \alpha_3'(I)^P + \Delta t \Delta x}{\frac{\Delta t}{4\Delta x}} \frac{\Delta t}{\Delta t} - \frac{11}{6} \frac{\Delta t}{6} \\
&+ \frac{k_s'(I)^P \alpha_4'(I)^P \Delta x}{\frac{\Delta t}{4\Delta x}} + \frac{k_s'(I)^P \alpha_4'(I)^P \Delta x'}{\frac{\Delta t}{4\Delta x}} \left( \frac{\Delta t}{\Delta t} \right) \\
&+ \frac{k_s'(I)^P \alpha_3'(I)^P \Delta x}{\frac{\Delta t}{4\Delta x}} - \frac{11}{6} \frac{\Delta t}{6} \Delta H \\
&- \frac{k_s'(I)^P}{\frac{\Delta t}{4\Delta x}} + \frac{k_s'(I)^P \alpha_4'(I)^P \Delta x'}{\frac{\Delta t}{4\Delta x}} \left( \frac{\Delta t}{\Delta t} \right) \left( \frac{\Delta t}{\Delta t} \right) \\
&- \frac{1}{6\Delta x} T_s(I - 4)^P
\end{align*} \]
At the uncharred material – insulation interface (N = I + J).

The boundary condition at the interface of the uncharred material and the insulation is
This equation is combined with the uncharred material temperature equation and the insulation temperature equation following the procedure used for the pyrolysis zone equations. The resulting modified implicit finite difference equation is

\[
ZP_s T_s (I + J - 4)^P + \Delta t + YP_s T_s (I + J - 3)^P + \Delta t
\]

\[
+ XP_s T_s (I + J - 2)^P + \Delta t + AP_s T_s (I + J - 1)^P + \Delta t
\]

\[
+ BP_s T_s (I + J)^P + \Delta t + CP_s T_s (I + J + 1)^P + \Delta t
\]

\[
+ EP_s T_s (I + J + 2)^P + \Delta t + FP_s T_s (I + J + 3)^P + \Delta t
\]

\[
+ GP_s T_s (I + J + 4)^P + \Delta t = DP_s
\]

where

\[
ZP_s = \frac{k_s'(I+J)^{P+\Delta t}/(12 \Delta^\prime)}{\left[ \frac{k_s'(I+J)^{P+\Delta t} \alpha'_4(I+J)^{P+\Delta t} \Delta x'}{\Delta^\prime P+\Delta t} + \frac{k_s''(I+J)^{P+\Delta t} \alpha'_4''(I+J)^{P+\Delta t} \Delta x''}{\Delta^\prime P+\Delta t} - \rho_{HS} \frac{C_p}{\rho_{HS}} \right]}
\]

(5-71)
\[
\begin{align*}
\text{YP}_s &= \frac{k'_s (I+J)^{P+\Delta t}}{2} \frac{\alpha_4 (I+J)^{P+\Delta t}}{\Delta x'} + \frac{k''_s (I+J)^{P+\Delta t}}{2} \frac{\alpha_4 (I+J)^{P+\Delta t}}{\Delta x''} - \rho_{\text{HS}} \frac{C_{\text{P}}}{C_{\text{P}}} \frac{\rho_{\text{HS}}}{C_{\text{HS}}},
\end{align*}
\]

\[(5-72)\]

\[
\begin{align*}

&\quad + \frac{k''(I+J)P+\Delta t}{2\Delta_t} \left[ \frac{\alpha_4(I+J)P+\Delta t}{\Delta x''} \right] - \rho_{HS} \hat{C}_{p_{HS}} \left[ \frac{\rho_{HS}}{\Delta_t} \right] \\
&= \left(5-78\right)
\end{align*}
\]

\[
\begin{align*}
GP_s &= \frac{k''(I+J)P+\Delta t}{(12 \Delta x''\Delta_t)} \\
&\quad + \frac{k''(I+J)P+\Delta t}{\Delta_t} \left[ \frac{\alpha_4(I+J)P+\Delta t}{\Delta x''} \right] - \rho_{HE} \hat{C}_{p_{HS}} \left[ \frac{\rho_{HS}}{\Delta_t} \right] \\
&= \left(5-79\right)
\end{align*}
\]

\[
\begin{align*}
DP_s &= \left[ \frac{k''(I+J)P+\Delta t}{\Delta_t} + \frac{k''(I+J)P+\Delta t}{\Delta_t} \right] \\
&\quad + \frac{k''(I+J)P+\Delta t}{\Delta_t} \left[ \frac{\alpha_4(I+J)P+\Delta t}{\Delta x''} \right] - \rho_{HS} \hat{C}_{p_{HS}} \left[ \frac{\rho_{HS}}{\Delta_t} \right] \\
&= \frac{k''(I+J)P}{\Delta_t} \\
&\quad + \frac{k''(I+J)P+\Delta t}{\Delta_t} \left[ \frac{\alpha_4(I+J)P+\Delta t}{\Delta x''} \right] - \rho_{HS} \hat{C}_{p_{HS}} \left[ \frac{\rho_{HS}}{\Delta_t} \right]
\end{align*}
\]
\[
\left\{ -\frac{1}{6\Delta x'} T_s (I + J - 4)^P + \left[ \frac{3}{4\Delta x'} + \frac{1}{3} \alpha_1' (I + J)^P \right] T_s (I + J - 3)^P 
\right.
\]
\[
- \left[ \frac{4}{3\Delta x'} + \frac{3}{2} \alpha_1' (I + J)^P \right] T_s (I + J - 2)^P - \left[ \frac{3}{4\Delta x'} - 3 \alpha_1' (I + J)^P \right] T_s (I + J - 1)^P \right\}
\]
\[
- \left[ \frac{1}{2} \left\{ \frac{k_s''(I+J)^P}{\xi''P} - \frac{k_s'(I+J)^P}{\xi'P} \right\} \right. 
\]
\[
= \left[ \frac{3}{2\Delta x''} - \frac{11}{6} \alpha_1''(I+J)^P - \alpha_2''(I+J)^P \Delta x'' \right] + \left[ \frac{3}{2\Delta x''} 
\right]
\]
\[
= \frac{1}{\Delta t} \left[ \frac{k_s''(I+J)^P / \xi''P}{2} \right. 
\]
\[
= \left[ \frac{3}{4\Delta x''} + 3 \alpha_1''(I+J)^P \right] T_s (I+J+1)^P + \left[ \frac{4}{3\Delta x''} - \frac{3}{2} \alpha_1''(I+J)^P \right] T_s (I+J+2)^P 
\]
\[
- \left[ \frac{3}{4\Delta x''} - \frac{1}{3} \alpha_1''(I+J)^P \right] T_s (I+J+3)^P + \frac{1}{6\Delta x''} T_s (I+J+4)^P \right\} .
\]
\]
\[
(5-80)
\]

At the back surface \((N = I + J + K)\). – The back surface boundary condition is

\[
- \frac{1}{\xi''} \left( k_s'' \frac{\partial T_s}{\partial x''} \right)_{N = I + J + K} = \frac{\partial T_s}{\partial \xi''} \left( I + J + K \right)
\]
\[
- q_B + \rho^\text{HSP} C^\text{HSP} \ell^\text{HSP} \left( \frac{\partial T_s}{\partial t} \right)_{N = I + J + K}.
\]
\[
(5-81)
\]
This equation is combined with the insulation temperature equation following the procedure used for the front surface boundary condition and char layer temperature equation. The resulting modified implicit finite difference equation is

\[ ZZ_s T_s (I + J + K - 4)^P + \Delta t + YZ_s T_s (I + J + K - 3)^P + \Delta t \]
\[ + XZ_s T_s (I + J + K - 2)^P + \Delta t + AZ_s T_s (I + J + K - 1)^P + \Delta t \]
\[ + BZ_s T_s (I + J + K)^P + \Delta t = DZ_s \]  \hspace{1cm} (5-82)

where

\[ ZZ_s = \frac{k''(I+J+K)^P + \Delta t}{(12 \Delta x''^2 \lambda'')^2} \]
\[ \left[ \hat{C}_{P_{HSP}} \hat{\lambda}_{HSP} \left[ \alpha''_{H}(I+J+K)^P + \Delta t + \frac{11}{6\Delta x''} \right] - \alpha''_{I4} \frac{\alpha''_{H}(I+J+K)^P + \Delta t}{\lambda''} \right] \]  \hspace{1cm} (5-83)

\[ YZ_s = -4.5 ZZ_s \]  \hspace{1cm} (5-84)

\[ XZ_s = 8 ZZ_s \]  \hspace{1cm} (5-85)

\[ AZ_s = - YZ_s \]  \hspace{1cm} (5-86)

\[ BZ_s = [6\alpha''_{2}(I+J+K)^P + \Delta t \Delta x''^2 - 9] ZZ_s - \frac{1}{\Delta t} \]
\[
\begin{align*}
\sigma & \varepsilon'' [T_s (I+J+K)^{P+\Delta t}]^3 \left[ \alpha''_1 (I+J+K)^{P+\Delta t} + \frac{11}{6\Delta x''} \right] \\
\frac{1}{2} & \left\{ \rho_{HSP} \frac{C_p}{HSP} \lambda_{HSP} \left[ \alpha''_1 (I+J+K)^{P+\Delta t} + \frac{11}{6\Delta x''} \right] - \frac{\alpha''_4 (I+J+K)^{P+\Delta t} k''_s (I+J+K)^{P+\Delta t}}{\lambda''} \right\} \\
\frac{DZ_s}{6} &= - \frac{\alpha''_1 (I+J+K)^{P+\Delta t} + \frac{11}{6\Delta x''}}{2} \\
\frac{1}{2} & \left\{ \rho_{HSP} \frac{C_p}{HSP} \lambda_{HSP} \left[ \alpha''_1 (I+J+K)^{P+\Delta t} + \frac{11}{6\Delta x''} \right] - \frac{\alpha''_4 (I+J+K)^{P+\Delta t} k''_s (I+J+K)^{P+\Delta t}}{\lambda''} \right\} \\
\frac{1}{2} & \left\{ \rho_{HSP} \frac{C_p}{HSP} \lambda_{HSP} \left[ \alpha''_1 (I+J+K)^{P+\Delta t} + \frac{11}{6\Delta x''} \right] - \frac{\alpha''_4 (I+J+K)^{P+\Delta t} k''_s (I+J+K)^{P+\Delta t}}{\lambda''} \right\} \\
&= \left\{ \frac{1}{6\Delta x''^2} T_s (I+J+K)^{P} - \frac{3}{4\Delta x''^2} T_s (I+J+K-3)^{P} + \frac{4}{3\Delta x''^2} T_s (I+J+K-2)^{P} \\
&\quad + \frac{3}{4\Delta x''^2} T_s (I+J+K-1)^{P} - \left[ \frac{3}{2\Delta x''^2} - \alpha''_2 (I+J+K)^{P} \right] T_s (I+J+K)^{P} \right\} \\
&- \sigma \varepsilon'' [T_s (I+J+K)^{P}]^4 \frac{1}{\Delta t} T_s (I+J+K)^{P}.
\end{align*}
\]
The differential equation for the char layer porosity is

\[ \frac{\partial n}{\partial x} + \varepsilon_1 \eta + \varepsilon_2 + \varepsilon_3 \frac{\partial n}{\partial t} = 0. \]  

(5-89)

The second term in this equation may be much less than 1. Therefore, to assure that the finite difference form of this equation is suitable for obtaining a numerical solution, the first order partial derivative is replaced by a forward difference approximation.

The forward difference approximation of the derivative is obtained from Taylor series expansions at the station \( N \) evaluated at \( N + 1 \) and \( N + 2 \). Thus

\[ \eta(N+1) = \eta(N) + \left( \frac{\partial n}{\partial x} \right)_N \Delta x + \left( \frac{\partial^2 n}{\partial x^2} \right)_N \frac{\Delta x^2}{2} + \left( \frac{\partial^3 n}{\partial x^3} \right)_N \frac{\Delta x^3}{6} + \ldots \]  

(5-90)

\[ \eta(N+2) = \eta(N) + 2 \left( \frac{\partial n}{\partial x} \right)_N \Delta x + 2 \left( \frac{\partial^2 n}{\partial x^2} \right)_N \Delta x^2 + \frac{4}{3} \left( \frac{\partial^3 n}{\partial x^3} \right)_N \Delta x^3 + \ldots \]  

(5-91)

Eliminating the second order derivative from this pair of equations and solving for the first order derivative gives:

\[ \left( \frac{\partial n}{\partial x} \right)_N = \frac{[-3\eta(N) + 4\eta(N+1) - \eta(N+2)]/2\Delta x}{\Delta x^2} \]  

(5-92)

which is accurate to terms of the order \( \Delta x^2 \).
Combining Eqs. 5-89 and 5-92 gives

\[ [\varepsilon_1(N) - \frac{\partial}{\partial x}] \eta(N) + \frac{2}{\Delta x} \eta(N+1) - \frac{1}{2\Delta x} \eta(N+2) \]

\[ + \varepsilon_2(N) + \varepsilon_3(N) \left( \frac{\partial \eta}{\partial t} \right)_N = 0 \quad (5-93) \]

which yields the following modified implicit finite difference equation.

\[ B(N) \eta(N)P + \Delta t + C(N) \eta(N+1)P + \Delta t + E(N) \eta(N+2)P + \Delta t = D(N) \quad (5-94) \]

where

\[ B(N) = \frac{1}{2\Delta t} [\varepsilon_3(N)^P + \varepsilon_3(N)^P + \Delta t ] \]

\[ + \frac{1}{2} [\varepsilon_1(N)^P + \Delta t - \frac{3}{2\Delta x} ] \quad (5-95) \]

\[ C(N) = \frac{1}{\Delta x} \quad (5-96) \]

\[ E(N) = -\frac{1}{4\Delta x} \quad (5-97) \]
\[ D(N) = - \frac{1}{2} \left[ \varepsilon_2(N)^P + \varepsilon_2(N)^P + \Delta t \right] \]

\[ -\frac{1}{2} \left[ \varepsilon_1(N)^P - \frac{3}{2\Delta x} - \frac{1}{\Delta t} \left[ \varepsilon_3(N)^P + \varepsilon_3(N)^P + \Delta t \right] \right] \eta(N)^P \]

\[ - \frac{1}{\Delta x} \eta(N+1)^P + \frac{1}{4\Delta x} \eta(N+2)^P. \] (5-98)

Equation 5-93 is valid at all stations from \( N = 1 \) to \( N = I - 2 \). At \( N = I - 1 \) the third term in Eq. 5-93 would contain \( \eta(I + 1) \) which is not defined. The finite difference equation for station \( I - 1 \) is obtained in a manner identical to that used to obtain Eq. 5-93 except that the first order derivative is approximated by a two-point forward difference equation. Thus:

\[ \left( \frac{\partial \eta}{\partial x} \right)_{N = I - 1} = \frac{\eta(I) - \eta(I - 1)}{\Delta x} \] (5-99)

which is accurate to terms of the order \( \Delta x \). The resulting modified implicit finite difference equation for station \( I - 1 \) is

\[ B(I - 1)\eta(I - 1)^P + \Delta t + C(I - 1)\eta(I)^P + \Delta t = D(I - 1) \] (5-100)
\[ B(I - 1) = \frac{1}{\Delta t} \left[ \epsilon_3(I - 1)^P + \epsilon_3(I - 1)^{P+\Delta t} \right] + \epsilon_1(I - 1)^{P+\Delta t} - \frac{1}{\Delta x} \]  
\hspace{1cm} \text{(5-101)}

\[ C(I - 1) = \frac{1}{\Delta x} \]  
\hspace{1cm} \text{(5-102)}

\[ D(I - 1) = - \left[ \epsilon_2(I - 1)^P + \epsilon_2(I - 1)^P \right] - \left\{ \epsilon_1(I - 1)^P - \frac{1}{\Delta x} \right. 
\hspace{1cm} \left. - \frac{1}{\Delta t} \left[ \epsilon_3(I - 1)^P + \epsilon_3(I - 1)^P + \Delta t \right] \epsilon(I - 1)^P \right\} - \frac{1}{\Delta x} \epsilon(I - 1)^P . \]  
\hspace{1cm} \text{(5-103)}

The single boundary condition for char layer porosity equation is

\[ \eta(I) = \eta_1 . \]  
\hspace{1cm} \text{(5-104)}

This identity is used instead of a finite difference equation at station I.

**Pyrolysis Gas Temperature Equation**

The differential equation for the pyrolysis gas temperature is

\[ \frac{\partial T}{\partial x} + \beta_1 T + \beta_2 + \beta_3 \frac{\partial T}{\partial t} = 0 . \]  
\hspace{1cm} \text{(5-105)}

The single boundary condition for this equation is
The forms of the pyrolysis gas temperature equation and its boundary conditions are identical to the char layer porosity equation and boundary condition; therefore, the modified implicit finite difference equation for pyrolysis gas temperature is of the same form as the equations for char layer porosity. Thus for $1 \leq N \leq I - 2$

$$B(N) T(N)^{P} + \Delta t + C(N) T(N + 1)^{P} + \Delta t + E(N) T(N + 2)^{P} + \Delta t$$

$$= D(N)$$

(5-107)

where

$$B(N) = \frac{1}{2\Delta t} \left[ \beta_{3}(N)^{P} + \beta_{3}(N)^{P} + \Delta t \right] + \frac{1}{2} \left[ \beta_{1}(N)^{P} + \Delta t - \frac{3}{2\Delta x} \right]$$

(5-108)

$$C(N) = \frac{1}{\Delta x}$$

(5-109)

$$E(N) = -\frac{1}{4\Delta x}$$

(5-110)

$$D(N) = -\frac{1}{2} \left[ \beta_{2}(N)^{P} + \beta_{2}(N)^{P} + \Delta t \right] - \frac{1}{2} \left( \beta_{1}(N)^{P} - \frac{3}{2\Delta x} \right)$$

$$- \frac{1}{\Delta t} \left[ \beta_{3}(N)^{P} + \beta_{3}(N)^{P} + \Delta t \right] T(N)^{P} - \frac{1}{\Delta x} T(N + 1)^{P} + \frac{1}{4\Delta x} T(N + 2)^{P}$$

(5-111)
and, for \( N = I - 1 \),

\[
B(I - 1) T(I - 1)^P + \Delta t + C(I - 1) T(I)^P + \Delta t = D(I - 1)
\]

(5-112)

where

\[
B(I - 1) = \frac{1}{\Delta t} \left[ \beta_3(I - 1)^P + \beta_3(I - 1)^P + \Delta t \right] + \beta_1(I - 1)^P + \Delta t - \frac{1}{\Delta x}
\]

(5-113)

\[
C(I - 1) = \frac{1}{\Delta x}
\]

(5-114)

\[
D(I - 1) = - \left[ \beta_2(I - 1)^P + \beta_2(I - 1)^P + \Delta t \right] - \beta_1(I - 1)^P
\]

\[
- \frac{1}{\Delta x} - \frac{1}{\Delta t} \left[ \beta_3(I - 1)^P + \beta_3(I - 1)^P + \Delta t \right] T(I - 1)^P
\]

\[
- \frac{1}{\Delta x} T(I)^P.
\]

(5-115)

The equation applied at \( N = I \) is

\[
T(I) = T_s(I).
\]

(5-116)
Pyrolysis Gas Pressure Equation

The differential equation for the pyrolysis gas pressure is

\[
\frac{\partial^2 P^2}{\partial x^2} + \gamma_1 \frac{\partial P^2}{\partial x} + \gamma_2 P^2 + \gamma_3 + \gamma_4 \frac{\partial P^2}{\partial t} = 0. \quad (5-117)
\]

**Interior stations.** The form of this equation is identical to that of the solid phase temperature equation; hence at interior stations the modified implicit finite difference equations for the pyrolysis gas pressure are written from the finite difference equations for the solid phase temperature as

\[
A_p(N) P^2(N - 1) + \Delta t + B_p(N) P^2(N) + \Delta t
\]

\[
+ C_p(N) P^2(N + 1) + \Delta t = D_p(N) \quad (5-118)
\]

where

\[
A_p(N) = \frac{1}{\Delta x^2} - \frac{\gamma_1(N) P + \Delta t}{2\Delta x} \quad (5-119)
\]

\[
B_p(N) = \gamma_2(N) P + \Delta t - \frac{2}{\Delta x^2} + \frac{1}{\Delta t} \left[ \gamma_4(N) P + \gamma_4(N) P + \Delta t \right] \quad (5-120)
\]

\[
C_p(N) = \frac{1}{\Delta x^2} + \frac{\gamma_1(N) P + \Delta t}{2\Delta x} \quad (5-121)
\]
\[ D_p(N) = -\gamma_3(N)^P - \gamma_3(N)^P + \Delta t - \left[ \frac{1}{\Delta x^2} - \frac{\gamma_1(N)^P}{2\Delta x} \right] p^2(N - 1)^P \]

\[ - \left( \gamma_2(N)^P - \frac{2}{\Delta x^2} - \frac{1}{\Delta t} \left[ \gamma_4(N)^P + \gamma_4(N)^P + \Delta t \right] \right) p^2(N)^P \]

\[ - \left[ \frac{1}{\Delta x^2} + \frac{\gamma_1(N)^P}{2\Delta x} \right] p^2(N + 1)^P . \] 

(5-122)

Front surface boundary condition \((N = 1)\).- The boundary condition for pressure at the front surface is

\[ P(1) = P_w \] 

(5-123)

or

\[ p^2(1) = p_w^2 \] 

(5-124)

which is used instead of a finite difference equation at station 1.

Pyrolysis zone boundary condition \((N = I)\).- The second boundary condition for the pressure equation is the specified pressure gradient at the pyrolysis zone -

\[ \left( \frac{3p^2}{\partial x} \right)_N = I = 2 R_u \left( \frac{\Delta T}{kM} \right)_N = I \] 

(5-125)

The second order derivative of Eq. 5-117 is written as the first derivative of the gradient of \( p^2 \).
The derivative of the gradient of $P^2$ is then approximated by a four-point backward difference expression obtained from Taylor series expansions at the station $N = I$ evaluated at $N = I - 1$, $N = I - 2$, and $N = I - 3$. Thus

\[
\left( \frac{\partial^2 P^2}{\partial x^2} \right)_{N = I} = \frac{1}{6\Delta x} \left[ 11 \left( \frac{\partial P^2}{\partial x} \right)_{N = I} - 18 \left( \frac{\partial P^2}{\partial x} \right)_{N = I - 1} 
+ 9 \left( \frac{\partial P^2}{\partial x} \right)_{N = I - 2} - 2 \left( \frac{\partial P^2}{\partial x} \right)_{N = I - 3} \right].
\] (5-127)

Combining Eq. 5-127 with Eq. 5-117 written for station $N = I$ gives

\[
\left[ \frac{11}{6\Delta x} + \gamma_1(I) \right] \left( \frac{\partial P^2}{\partial x} \right)_{N = I} - \frac{3}{\Delta x} \left( \frac{\partial P^2}{\partial x} \right)_{N = I - 1} + \frac{3}{2\Delta x} \left( \frac{\partial P^2}{\partial x} \right)_{N = I - 2} 
- \frac{1}{3\Delta x} \left( \frac{\partial P^2}{\partial x} \right)_{N = I - 3}
+ \gamma_2(I) P^2(I) + \gamma_3(I)
+ \gamma_4(I) \left( \frac{\partial P^2}{\partial t} \right)_{N = I} = 0.
\] (5-128)

In Eq. 5-128 the gradient of $P^2$ at the pyrolysis zone is replaced with Eq. 5-125 and the gradients at neighboring stations are approximated by central difference expressions yielding
The modified implicit finite difference equation for pressure at the pyrolysis zone is obtained from Eq. 5-129 using the procedure previously outlined. Writing the equation,

\[
\frac{1}{6\Delta x^2} p^2(I - 4) - \frac{3}{4\Delta x^2} p^2(I - 3) + \frac{4}{3\Delta x^2} p^2(I - 2)
\]

\[
+ \frac{3}{4\Delta x^2} p^2(I - 1) + [\gamma_2(I) - \frac{3}{2\Delta x^2}] p^2(I) + \gamma_3(I)
\]

\[
+ \left[ \frac{11}{6\Delta x} + \gamma_1(I) \right] 2 \& R \frac{\mu T}{K_M} N = I
\]

\[
+ \gamma_4(I) \left( \frac{\partial p^2}{\partial t} \right)_{N = I} = 0 .
\] (5-129)

The modified implicit finite difference equation for pressure at the pyrolysis zone is obtained from Eq. 5-129 using the procedure previously outlined. Writing the equation,

\[
PX p^2(I - 4) + \Delta t + PY p^2(I - 3) + \Delta t + PZ p^2(I - 2) + \Delta t
\]

\[
+ AP p^2(I - 1) + \Delta t + BP p^2(I) + \Delta t
\]

\[
= DP
\] (5-130)

where

\[
PX = \frac{1}{12\Delta x^2}
\] (5-131)

\[
PY = - \frac{3}{8\Delta x^2}
\] (5-132)
$PZ = \frac{3}{3\Delta x^2}$ \hspace{1cm} (5-133)

$AP = - PY$ \hspace{1cm} (5-134)

$BP = \frac{1}{2\Delta t} \left[ \gamma_4(I)^P + \gamma_3(I)^P + \Delta t \right] + \frac{1}{2} \left[ \gamma_2(I)^P + \Delta t \right] - \frac{3}{2\Delta x^2}$ \hspace{1cm} (5-135)

$DP = - \frac{1}{2} \left[ \gamma_3(I)^P + \gamma_3(I)^P + \Delta t \right] - \left[ \frac{11}{6\Delta x} \right.$

$+ \gamma_1(I)^P \right] R_u \frac{\kappa^P}{\rho^P} \left( \frac{\mu T}{\kappa N} \right) \hspace{1cm} N = I$

$- \left[ \frac{11}{6\Delta x} + \gamma_1(I)^P + \Delta t \right] R_u \frac{\kappa^P + \Delta t}{\rho^P} \left( \frac{\mu T}{\kappa N} \right) \hspace{1cm} N = I$

$- \frac{1}{12\Delta x^2} P^2(I - 4)^P + \frac{3}{8\Delta x^2} P^2(I - 3)^P - \frac{3}{8\Delta x^2} P^2(I - 2)^P$

$- \frac{3}{8\Delta x^2} P^2(I - 1)^P - \frac{1}{2} \left( \gamma_2(I)^P - \frac{3}{2\Delta x^2} - \frac{1}{\Delta t} \left[ \gamma_4(I)^P \right.$

$+ \gamma_4(I)^P + \Delta t \right) \hspace{1cm} \left. P^2(I)^P \right).$ \hspace{1cm} (5-136)

**Chemical Species Conservation Equation**

The differential equation for conservation of chemical species is

$$\frac{\partial}{\partial x} \hat{m}_i + \Delta_{i1} \hat{m}_1 + \Delta_{i2} \hat{m}_2 + \Delta_{i3} \frac{\partial \hat{m}_i}{\partial t} = 0.$$ \hspace{1cm} (5-137)
The single boundary condition for this equation is

\[ \left( \dot{m}_i \right)_{N = I} = -M_i \left( \frac{x_i}{\eta M} \right)_{N = I} \dot{m}_g \]  

(5-138)

This equation and its boundary condition are of the same form as the first order equations and boundary conditions handled previously. Therefore the modified implicit finite difference equation for conservation of chemical species is written directly as

\[ B_i(N) \dot{m}_i(N)^P + \Delta t + C_i(N) \dot{m}_i(N + 1)^P + \Delta t \]

\[ + E_i(N) \dot{m}_i(N + 2)^P + \Delta t = D_i(N) \]  

(5-139)

for \(1 \leq N \leq I - 2\)

where

\[ B_i(N) = \frac{1}{2\Delta t} \left[ \Delta_{11}^i(N)^P + \Delta_{11}^i(N)^P + \Delta t \right] \]

\[ + \frac{1}{2} \left[ \Delta_{11}^i(N)^P + \Delta t \frac{3}{2\Delta x} \right] \]  

(5-140)

\[ C_i(N) = \frac{1}{\Delta x} \]  

(5-141)

\[ E_i(N) = -\frac{1}{4\Delta x} \]  

(5-142)
\[ D_1(N) = - \frac{1}{2} [\Delta_{2_1}(N)^P + \Delta_{2_1}(N)^P + \Delta t ] \]

\[ - \frac{1}{2} \{\Delta_{1_1}(N)^P - \frac{3}{2\Delta x} - \frac{1}{\Delta t} [\Delta_{3_1}(N)^P + \Delta_3(N)^P + \Delta t]\} \hat{m}_1(N)^P - \frac{1}{\Delta x} \hat{m}_1(n + 1)^P \]

\[ + \frac{1}{4\Delta x} \hat{m}_1(n + 2)^P \]  \hspace{1cm} (5-143)

and, for \( N = I - 1 \),

\[ B_1(I - 1)\hat{m}_1(I - 1)^P + \Delta t + C_1(I - 1)\hat{m}_1(I)^P + \Delta t = D_1(I - 1) \]  \hspace{1cm} (5-144)

where

\[ B_1(I - 1) = \frac{1}{\Delta t} [\Delta_{3_1}(I - 1)^P + \Delta_{3_1}(I - 1)^P + \Delta t] \]

\[ + \Delta_{1_1}(I - 1)^P + \Delta t - \frac{1}{\Delta x} \]  \hspace{1cm} (5-145)

\[ C_1(I - 1) = \frac{1}{\Delta x} \]  \hspace{1cm} (5-146)

\[ D_1(I - 1) = - \Delta_{2_1}(I - 1)^P - \Delta_{2_1}(I - 1)^P + \Delta t - \Delta_{1_1}(I - 1)^P \]

\[ - \frac{1}{\Delta x} - \frac{1}{\Delta t} [\Delta_{3_1}(I - 1)^P + \Delta_{3_1}(I - 1)^P] m_1(I - 1)^P - \frac{1}{\Delta x} m_1(I)^P \]  \hspace{1cm} (5-147)
and, for $N = I$,

CHAPTER VI

SOLUTION OF EQUATIONS

The equations formulated to this point are solved on a digital computer. The linearized finite difference equations for solid temperature and pyrolysis gas pressure are solved using the method suggested by L. H. Thomas of the Watson Scientific Computing Laboratory. Thomas' method is presented in Bruce, Peaceman and Rachford (Ref. 32).

Consider the finite difference equations for the solid temperature -

At the front surface of the char layer \((N = 1)\):

\[
Bl_s T_s(1)^P + \Delta t + Cl_s T_s(2)^P + \Delta t + Cl_s T_s(3)^P + \Delta t + Hl_s T_s(4)^P + \Delta t + Il_s T_s(5)^P + \Delta t = Dl_s
\]  

\[\text{(6-1)}\]

Within the char layer \((1 < N < I)\):

\[
A_s(N) T_s(N - 1)^P + \Delta t + B_s(N) T_s(N)^P + \Delta t + C_s(N) T_s(N + 1)^P + \Delta t = D_s(N)
\]

\[\text{(6-2)}\]

At the pyrolysis zone \((N = I)\):
\[ Z_1 T_s(I - 4) + \Delta t + Y_1 T_s(I - 3) + \Delta t + X_1 T_s(I - 2) + \Delta t \]
\[ + A_s(I) T_s(I - 1) + \Delta t + B_s(I) T_s(I) + \Delta t + C_s(I) T_s(I + 1) + \Delta t \]
\[ + E_1 T_s(I + 2) + \Delta t + F_1 T_s(I + 3) + \Delta t + G_1 T_s(I + 4) + \Delta t \]
\[ = D_s(I) \]  \hspace{1cm} (6-3) 

Within the uncharred material \((I < N < I + J)\):

\[ A_s(N) T_s(N - 1) + \Delta t + B_s(N) T_s(N) + \Delta t + C_s(N) T_s(N + 1) + \Delta t = D_s(N) \]  \hspace{1cm} (6-4) 

At the uncharred layer-insulation layer interface \((N = I + J)\):

\[ Z_p T_s(I + J - 4) + \Delta t + Y_p T_s(I + J - 3) + \Delta t + X_p T_s(I + J - 2) + \Delta t \]
\[ + A_p T_s(I + J - 1) + \Delta t + B_p T_s(I + J) + \Delta t \]
\[ + C_p T_s(I + J + 1) + \Delta t + E_p T_s(I + J + 2) + \Delta t \]
\[ + F_p T_s(I + J + 3) + \Delta t + G_p T_s(I + J + 4) + \Delta t \]
\[ = D_s(I + J) \]  \hspace{1cm} (6-5)
Within the insulation layer \((I + J < N < I + J + K)\):

\[
A_s(N) T_s(N - 1)^P + \Delta t + B_s(N) T_s(N)^P + \Delta t + C_s(N) T_s(N + 1)^P + \Delta t = D_s(N)
\]  

(6-6)

At the back surface of the insulation \((N = I + J + K)\):

\[
Z Z_s T_s(I + J + K - 4)^P + \Delta t + Y Z_s T_s(I + J + K - 3)^P + \Delta t
\]

\[
+ X Z_s T_s(I + J + K - 2)^P + \Delta t + A z_s T_s(I + J + K - 1)^P + \Delta t
\]

\[
+ B z_s T_s(I + J + K)^P + \Delta t = D z_s .
\]  

(6-7)

Equation 6-1 is combined with Eq. 6-2 written for stations 2, 3, and 4 to obtain an equation relating \(T_s(1)\) and \(T_s(2)\) which is valid at station 1. Also Eq. 6-7 is combined with Eq. 6-6 written for stations \((I + J + K - 4), (I + J + K - 3),\) and \((I + J + K - 2)\) to obtain an equation relating \(T_s(I + J + K - 1)\) and \(T_s(I + J + K)\) which is valid at station \((I + J + K)\). Similarly, the interface equations are combined with equations for neighboring stations to obtain equations relating the interface temperature to the temperature at the two adjacent stations. The resulting set of equations is tri-diagonal and may be written as
Thomas' method for solving Eq. 6-8 is equivalent to Gaussian elimination, but it avoids the error growth associated with the back solution of the elimination method and it minimizes the storage requirements for machine calculations. Ref. 30 summarizes the method as follows: For the set of Eqs. 6-8

let

\begin{align*}
W(1) &= B_s(1) \\
W(N) &= B_s(N) - A_s(N) B(N-1) & 2 \leq N \leq I + J + K \\
B(N) &= C_s(N)/W(N) & 1 \leq N \leq I + J + K - 1
\end{align*}

and
\[ G(1) = \frac{D_s(1)}{W(1)} \]
\[ G(N) = \frac{D_s(N) - A_s(N) G(N-1)}{W(N)} \quad 2 \leq N \leq I + J + K. \] 

The solution is
\[ T_s(I + J + K)^P + \Delta t = G(I + J + K) \]
\[ T_s(N)^P + \Delta t = G(N) - B(N) T_s(N + 1)^P + \Delta t \quad 1 \leq N \leq I + J + K - 1. \] 

The finite difference equations for the pyrolysis gas pressure within the char layer are of the same form as those for the solid temperature, hence they are solved in the same manner.

The finite difference equations for the pyrolysis gas temperature, conservation of chemical species, and char layer porosity differ from the solid temperature and gas pressure equations in that the equations at internal stations are not symmetric with respect to the diagonal elements. Treatment of the set of equations for the pyrolysis gas temperature is shown as an example.

The set of finite difference equations for the pyrolysis gas temperature is
\[ B(N) T(N)^P + \Delta t + C(N) T(N + 1)^P + \Delta t + E(N) T(N + 2)^P + \Delta t = D(N) \quad 1 \leq N \leq I - 2 \]
\[ B(I - 1) T(I - 1)^P + \Delta t + C(I - 1) T(I)^P + \Delta t = D(I - 1) \]
\[ T(I)^P + \Delta t = T_s(I)^P + \Delta t. \]
Since each equation relates the temperature at a station to the temperature at forward stations the solution to this set of equations is obtained directly by working from the pyrolysis zone toward the front surface. Thus

\[
T(I)^{P + \Delta t} = T_s(I)^{P + \Delta t} \\
T(I - 1)^{P + \Delta t} = \frac{[D(I - 1) - C(I - 1) T(I)^{P + \Delta t}] / B(I - 1)}{B(I - 1)} \quad (6-13)
\]

\[
T(N)^{P + \Delta t} = \frac{[D(N) - C(N) T(N + 1)^{P + \Delta t}] / B(N)}{B(N)} \quad 1 \leq N \leq I - 2.
\]

The differential equation for conservation of mass is solved by numerical integration from the pyrolysis zone, where the mass flow rate of pyrolysis gases is known, to the front surface of the char layer. The transformed mass conservation equation is written in integral form as

\[
\int_a^b \frac{\partial}{\partial x} (m) \, dx = \ell \int_a^b \left[ \frac{\partial}{\partial t} (\eta \rho) - \eta \sum_i R_i T_i M_i - V_c \frac{\partial}{\partial x} (\eta \rho) \right] dx. \quad (6-14)
\]

The term on the left side of this equation is integrated immediately to obtain

\[
\hat{n}_b = \hat{n}_a + \ell \int_a^b \left[ \frac{\partial}{\partial t} (\eta \rho) - \eta \sum_i R_i T_i M_i - V_c \frac{\partial}{\partial x} (\eta \rho) \right] dx. \quad (6-15)
\]
If the lower limit of integration is station $N$ and the upper limit is the pyrolysis zone ($N = I$), Eq. 6-14 becomes

$$\dot{m}(N) = \dot{m}(I) - \ell \int_{x(N)}^{I} \left[ \frac{\partial}{\partial t} (\eta \rho) - \eta \sum_{i} R_i \frac{M_i}{T_i} \right] dx$$

$$+ \int_{x(N)}^{I} V_c \frac{\partial}{\partial x} (\eta \rho) \, dx.$$  \hspace{1cm} (6-16)

Equation (4-9) for $V_c$ is used in the second integral in Eq. 6-16 and the result is integrated by parts to obtain

$$\dot{m}(N) = \dot{m}(I) - \ell \int_{x(N)}^{I} \left[ \frac{\partial}{\partial t} (\eta \rho) - \eta \sum_{i} R_i \frac{M_i}{T_i} \right] dx$$

$$+ V_c(I) \eta(I) \rho(I) - V_c(N) \eta(N) \rho(N)$$

$$- \left( \frac{\dot{m}_g}{\Delta \rho} - \frac{\dot{m}_s}{\rho_s} \right) \int_{x(N)}^{I} \eta \rho \, dx.$$  \hspace{1cm} (6-17)

These sets of equations were programmed for solution by a digital computer. As these equations are quasi-linear it is necessary to iterate to obtain a solution. A total of nine homogeneous and heterogeneous chemical reactions involving 12 gaseous species plus solid carbon were considered.

Table 1 shows the chemical reactions, kinetics data, and rate laws included in the program. Table 2 gives a set of thermophysical properties data for a typical ablation material (low density phenolic-
nylon) which was input to this program. Data for viscosity and thermal conductivity of the gaseous species were obtained from Svehla (Ref. 33). The viscosity and thermal conductivity of the pyrolysis gas mixture are computed using the method presented by Brokaw in Ref. 34. Specific heat and enthalpy data for the gaseous species and enthalpy data for the char layer (solid carbon) were obtained from McBride and Bauer (Refs. 35 and 36).

Appendix A presents a general flow chart of the program. Appendix B gives program usage instructions including definitions of the input terminology. The program Fortran 600 statements are presented in Appendix C. Appendix D defines the program terminology.

CHAPTER VII

ANALYSIS VERIFICATION

The developments presented in Chapters IV and V represent the usual approach to obtaining numerical solutions to differential equations of engineering and physics. However, the system of algebraic equations resulting from that procedure were found to be unstable for certain conditions. This problem was overcome by including a graded finite difference spacing in the char layer and the uncharred layer and by rewriting the char layer equation (Eq. 4-12) to include the complete term, $H_A(T_s - T)$, in the "$a_3$" term. The graded finite difference spacing was used to reduce the spacing in regions of large gradients (near the front surface of the char layer and in the uncharred layer, near the pyrolysis zone). Numerical solutions have been compared with exact solutions for a number of simplified cases. The results of these comparisons are presented in the following sections.

Comparison of Numerical Results With Exact Solutions

The set of equations whose solution is presented here is too complex to obtain an exact solution for a general case to check the accuracy of the numerical analysis. However, exact solutions have been obtained for a number of simplified problems to serve as a check of results obtained using the finite difference equations.
The exact solutions employed here are for the following problems

(1) The Laplace equation for \( P^2 \).

(2) Flow of a constant property, incompressible fluid through an isothermal slab.

(3) Heat sink case (flat plate subjected to surface heating).

(4) Quasi-steady ablation case.

**Laplace equation for \( P^2 \).** - The differential equation governing the pyrolysis gas pressure in the char layer is given by Eq. 4-47

\[
\frac{\partial^2 P^2}{\partial x^2} + \gamma_1 \frac{\partial P^2}{\partial x} + \gamma_2 P^2 + \gamma_3 + \gamma_4 \frac{\partial P^2}{\partial t} = 0.
\]  

(7-1)

where the coefficients are not constant. The boundary and initial conditions imposed on \( P^2 \) are

\[
\begin{align*}
P^2_{x=0} &= P^2_w \\
\left( \frac{\partial P^2}{\partial x} \right)_{x=1} &= 2 \ell R \left( \frac{UT}{KM} \right)_{x=1} \\
P^2(x,0) &= P^2_{w,0}.
\end{align*}
\]

(7-2)

Equation 7-1 written for the idealized case of flow of a constant property, incompressible fluid through an isothermal slab with the fluid and slab in thermal equilibrium reduces to the Laplace equation,

\[ \nabla^2 P^2 = 0. \]
The solution of the Laplace equation subject to Eq. 7-2 is

\[ P = \left[ \frac{2\mu L R T \dot{m}}{K M} x + \frac{P_w^2}{2} \right]^{1/2} \]  

(7-3)

Results obtained from Eq. 7-3 were compared with the results from the numerical analysis for this idealized case. These results are shown in Fig. 5a and 5b for \( P_w = 0.01 \) and \( P_w = 0.1 \) Atm, respectively. Note that the error is less than 0.02% for each set of results.

Flow of a constant property incompressible fluid through an isothermal slab.—The differential equation governing the pyrolysis gas temperature is given by Eq. 4-30

\[ \frac{\partial T}{\partial x} + \beta_1 T + \beta_2 + \beta_3 \frac{\partial T}{\partial t} = 0 \]  

(7-4)

where the coefficients are not constant. The boundary and initial conditions imposed on \( T \) are

\[
\begin{align*}
T(1,t) &= T_s & \text{for } t > 0 \\
T(x,0) &= T_s \\
T(x,0) &= T_s
\end{align*}
\]

(7-5)

The governing energy equation for the idealized case of a constant property incompressible fluid flowing from a reservoir of specified temperature through an isothermal slab (Fig. 6) is
Figure 5a.— Comparison of results for numerical and exact solutions to the Laplace equation for $P^2$ with $P_w = 0.01$ ATM.
Figure 5b.- Comparison of results for numerical and exact solutions to the Laplace equation for $P^2$ with $P_w = 0.1$ ATM.

- $m_g = 0.05 \text{ kg/m}^2\text{-sec}$
- $\mu = 2.75 \times 10^{-5} \text{ N-sec/m}^2$
- $T = 750^\circ \text{K}$
- $K = 2.0 \times 10^{-10} \text{ m}^2$
- $\ell = 0.01 \text{ m}$
Reservoir of Incompressible Fluid

Porous Solid of Constant Temperature $T_s$

$T = T_0$

$m$

Figure 6. - Flow of constant property incompressible fluid through an isothermal slab.
\[
\frac{\partial T'}{\partial x'} + AT' + \frac{\partial T'}{\partial t} = 0 \quad (7-6)
\]

where

\[
T' = \frac{T - T_s}{T_0 - T_s}
\]

\[
x' = \frac{x}{L/v}
\]

\[
A = \frac{H_A}{\eta \rho C_p}
\]

and the boundary and initial conditions for \( T' \) are

\[
T'(0,t) = 1.0 \text{ for } t > 0
\]

\[
T'(x',0) = 0.
\]  

\[
T'(x',0) = 0. \quad (7-8)
\]

To solve this set of equations the Laplace transform of \( T \)
defined by

\[
P = \int_0^\infty e^{-St} T'(x',t) \, dt \quad (7-9)
\]
is introduced. Equations 7-6 and 7-8 become
The solution to Eq. 7-10 is

\begin{align}
P &= \exp(-Ax') \frac{1}{S} \exp(-Sx'). \\
T'(x',t) &= \exp(-Ax') S(t - x') \\
S(t - x') &= \begin{cases} 
0 & \text{when } 0 < t < x' \\
1 & \text{when } t > x'.
\end{cases}
\end{align}

Performing the reverse transformation of Eq. 7-11 gives the solution to Eq. 7-6 and 7-8 as

This is just the mathematical expression for a traveling wave of diminishing strength.

This idealized case was solved with \( A = 1.0 \) and \( \lambda/v = 1.0 \) using the finite difference equations. These numerical results are compared with the exact solution obtained from Eqs. 7-12 and 7-13 in
Figs. 7a and 7b for dimensionless finite difference spacings of 0.001 and 0.01. The comparison with the transient results is favorable for the fine spacing, but, as expected, the ability to indicate a step change decreases with increased grid spacing. The steady profile solutions differ by less than 0.02% for each case.

Heat sink case. - The exact solution for the temperature response of a flat plate subjected to a constant surface heating is (Carslaw and Jaeger, Ref. 39)

\[
T_s = T_{s0} + \frac{q(\ell + \ell')}{k_s} \left\{ \frac{k_s t}{\rho_s C_p (\ell + \ell')^2} + \frac{1}{2} (1 - x)^2 - \frac{1}{6} \right. \\
- \frac{2}{\pi^2} \sum_{n=1}^{\infty} \frac{(-1)^n}{n} \cos[n\pi(1 - x)] \exp \left[ \frac{n^2 \pi^2}{\rho_s C_p (\ell + \ell')^2} \frac{k_s t}{\rho_s C_p (\ell + \ell')^2} \right].
\]  

(7-14)

This equation was used to determine the transient response of a flat plate using the heating rate and material properties listed in Table 3. Solutions were obtained for the same problem using the finite-difference equations.

Figure 8 shows a comparison between the numerical results and the exact solution for time steps of 0.01 and 0.1 second. It can be seen that the error at \( t = 2.0 \) second is less than 2.0% for the large time step of 0.1 second.
Figure 7a.— Comparison of numerical results with the exact solution for flow of a constant property incompressible fluid through an isothermal slab with $\Delta x = .001$. 
Figure 7b.- Comparison of numerical results with the exact solution for flow of a constant property incompressible fluid through an isothermal slab with \( \Delta X = .01 \).

Figure 8.- Comparison of numerical results with the exact solution for the heat sink problem.
Quasi-steady ablation case. - A quasi-steady-state ablating system is one in which the pyrolysis interface and the front surface recede at the same rate, that is it maintains a constant char thickness. If in addition the pyrolysis gases are inert, incompressible, and in local thermal equilibrium with the char layer, material properties of the system are uniform and independent of temperature, there are no energy sources, viscous dissipation or diffusion and conditions exist such that no energy is transferred into the uncharred layer, an exact solution to the governing mathematical equations can be obtained.

The equation governing the char layer temperature is (Eq. 4-11)

\[
(1 - \eta) \frac{\rho_s C_p}{M_s} \left[ \frac{\partial T_s}{\partial t} - \frac{\partial T_s}{\partial x} \right] = k_s \frac{\partial^2 T_s}{\partial x^2}
\]

\[
+ \frac{1}{\xi^2} \frac{\partial k_s}{\partial x} \frac{\partial T_s}{\partial x} - H_A(T_s - T) + \eta R_s H(T_s)
\]

\[
+ \eta R_s H_s - \eta \sum_r (r) H_A^{(r)} + (1 - \eta)(A - \varepsilon)
\]

\[
+ (1 - \eta) q'''' + \frac{\rho_s H_s}{M_s} \left( \frac{\partial T_s}{\partial x} - \frac{\partial T_s}{\partial x} \right).
\]  

(7-15)

The equation governing the pyrolysis gas temperature is (Eq. 4-27)

\[
\eta (v/\ell - v_c) \left[ \frac{\rho_s C_p}{M_s} \sum_i \frac{M_i}{M_1} - R_u \sum_i \frac{\rho_s}{M_1} \right] \frac{\partial T_s}{\partial x} - H_A(T_s - T)
\]

\[
- \eta R_u \left[ \frac{\rho}{\eta M} \left( \frac{\partial T_s}{\partial t} - \frac{\partial T_s}{\partial x} \right) + \frac{\partial}{\partial t} \left( \frac{\rho_s}{M_1} \right) \right] + (v/\ell)
\]
With quasi-steady-state ablation, $\lambda$, $\dot{m}_g$, and $\dot{m}_s$ are constant and

$$\frac{\dot{m}_g}{\rho_g} = \frac{\dot{m}_s}{\rho_{s_0}}$$

$$\frac{\partial T_s}{\partial t} = 0$$

$$\frac{\partial T}{\partial t} = 0 \quad \text{ (7-17)}$$

Using Eq. 7-17 with the assumptions of no chemical reactions, incompressible pyrolysis gases, constant material properties, and no energy sources, viscous dissipation, or diffusion, Eq. 7-15 and 7-16 reduce to

$$\frac{\partial^2 T_s}{\partial x^2} + \frac{\dot{\lambda}}{k_s C_{P_s_0}} \dot{m}_s \frac{\partial T_s}{\partial x} - \frac{\dot{\lambda}^2}{k_s H_s (T_s - T)} = 0 \quad \text{ (7-18)}$$
\( \eta (v/\ell - \dot{m}_s/\rho_{s_0}) \left[ \rho C_p - R_u \sum \rho_i/M_i \right] \frac{\partial T}{\partial x} - H_A(t_s - T) = 0 \). \hspace{1cm} (7-19)

Equations 7-18 and 7-19 are combined to eliminate the term, \( H_A(t_s - T) \), thus

\[ \frac{\partial^2 t_s}{\partial x^2} + \frac{\dot{q}}{k_s} \left[ C_p \dot{m}_s \frac{\partial t_s}{\partial x} - \eta (v - \dot{m}_s/\rho_{s_0})(\rho C_p - R_u \sum \rho_i/M_i) \right] = 0. \hspace{1cm} (7-20) \]

Invoking the assumption of local thermal equilibrium between the pyrolysis gases and char layer \( (T = t_s \text{ and } \frac{\partial T}{\partial x} = \frac{\partial t_s}{\partial x}) \) gives

\[ \frac{\partial^2 t_s}{\partial x^2} + D \frac{\partial t_s}{\partial x} = 0 \hspace{1cm} (7-21) \]

where

\[ D = \frac{\dot{q}}{k_s} \left[ \dot{m}_s C_p + (\dot{m}_g + \eta \frac{\dot{m}_s}{\rho_{s_0}}) \left( C_p - \frac{R_u}{M} \right) \right]. \hspace{1cm} (7-22) \]

The solution of Eq. 7-21 is

\[ t_s = C_1 + C_2 \exp (-Dx). \hspace{1cm} (7-23) \]

The integration constants are determined from the boundary conditions:
The mass loss rates $\dot{m}_s$ and $\dot{m}_g$ and the char layer thickness $l$ are obtained from this equation with the following equations

$$
\dot{m}_g / \Delta \rho = \dot{m}_s / \rho_s \tag{7-26}
$$

$$
\left( \frac{\partial T_s}{\partial x} \right)_{x=0} = \frac{\dot{q}}{k_s} \left( \dot{m}_s \frac{H_C - q_{aero}}{k_s} \right) \tag{7-26}
$$

$$
\left( \frac{\partial T_s}{\partial x} \right)_{x=1} = - \dot{m}_g \frac{\Delta H_p \dot{q}}{k_s} \tag{7-26}
$$

where energy transfer into the uncharred layer is neglected. Thus

$$
\dot{m}_s = \frac{\rho_s \dot{q}_{aero}}{H_C + \Delta H_p + D' \left( \bar{T}_1 - \bar{T}_I \right)} \tag{7-27}
$$

$$
\dot{m}_g = \frac{\dot{q}_{aero}}{H_C + \Delta H_p + D' \left( \bar{T}_1 - \bar{T}_I \right)} \tag{7-27}
$$

$$
l = \frac{k_s}{q_{aero} D'} \left[ H_C + \Delta H_p + D' \left( \bar{T}_1 - \bar{T}_I \right) \right] \ln \left[ \frac{\Delta H_p + D' \left( \bar{T}_1 - \bar{T}_I \right)}{\Delta H_p} \right] \tag{7-27}
$$
where

\[ D' = \hat{C}_p \rho_s + \left( \hat{C}_p - \frac{R_u}{M} \right) \left( \frac{\Delta \rho + \eta \rho}{\rho_s} \right) \]  

(7-28)

The inputs used to obtain an exact solution to a quasi-steady-state ablation problem are listed in Table 4.

Numerical solutions were obtained using the finite difference equations. The assumption of incompressibility was satisfied by specifying the pyrolysis gas density to be constant. In an attempt to satisfy the assumption of local thermal equilibrium between the pyrolysis gases and the char layer a very large value was used for the proportionality constant appearing in the equation for \( H_A \), the convective heat transfer coefficient,

\[ H_A = \sum_{i} \left( \frac{\rho_i C_p}{M_i} \right) \]  

(7-29)

Calculations were made using a value for \( K_h \) of \( 5 \times 10^5 \) \( \text{m}^{-1} \) yet a temperature difference of \( 1.5^\circ \text{K} \) exists between the char layer and the pyrolysis gases at the front surface. These results are compared with the exact solution in Table 5. Note that the char thickness and mass loss rates are within 2% of the exact solution.

An additional set of calculations was made in which the pyrolysis gas temperature was set equal to the char layer temperature and the term, \( H_A(T_s - T) \), appearing in the char layer equation was replaced using the following equation.

Thus the assumption of local thermal equilibrium between the pyrolysis gases and the char layer was satisfied. Results from this set of calculations shown in Fig. 9 are within 1% of the exact solution. Note that the system reached a quasi-steady-state condition after only 30 sec. The near discontinuity in the surface removal rate curve illustrates the three regimes of mass removal at the surface. The initial segment of the curve represents that portion of time when oxidation of the char layer was governed by the exponential rate equation. The second portion of lesser slope represents the time period when the rate of oxidation of the char was governed by the rate of diffusion of oxygen through the boundary layer. The final portion of the curve represents the time during which the char layer was subliming.

CHAPTER VIII

RESULTS AND DISCUSSION

The analysis of heat transfer and ablation mechanisms present in ablative thermal protection systems during entry is of major importance in the design of heat shields for aerospace applications. The role that ablation analysis plays in the total program of heat shield design is shown in Fig. 10. The first stage of the program involves defining the entry environment. This definition is obtained from trajectory analysis experts. Once the environment is defined a heat shield material can be selected - the material may be one of a family of existing materials or it may be necessary to develop a new material which possesses characteristics required for a particular trajectory. Thermo-physical property data are then obtained. The definition of the environment and the material characterization are then used in a computer program to determine the response of the material to entry conditions. Because of uncertainties in the material characterization and simplifying assumptions made in the analysis, it is necessary to have checks on the results. Initially, the material is subjected to simulated entry conditions in our ground test facilities. Later the material may be flight-tested. There frequently is feedback from the analysis and ground test phases to the materials development phase to obtain improved materials. It is sometimes necessary to adjust the property data which typically contains many uncertainties to obtain good agreement between numerical and experimental data. Once the
Figure 10.- The role of ablation analysis in the design of thermal protection systems for aerospace applications.
computed results are found to be satisfactory the analysis is used to determine the amount of ablation material required for the mission.

Results from a typical computer calculation for an ablation system subjected to a square heat pulse are presented in Figs. 11-13 as an illustration of the type of data available from this analysis. The heating rate, enthalpy, and pressure histories for this calculation are given in Table 6. The ablation system properties considered in this calculation are those given in Table 2. Figure 11 shows time histories of surface removal rate, pyrolysis rate, char thickness, char surface temperature, and pyrolysis gas temperature at the surface for this calculation. Of particular interest in Fig. 11 is the short time during which the mode of performance is highly transient. After 100 seconds the temperature and mass transfer rates are changing much slower than initially. The spike in $\dot{m}_g$ occurring at 10 sec corresponds to the rapid increase in system temperature at initiation of heating. The sharp drop in $\dot{m}_g$ results from the growth of the char layer which insulates the pyrolysis zone and the blocking effect of the pyrolysis gases which reduces the rate of heat transfer to the char surface. The substantial difference in temperature of the char and pyrolysis gases at times less than 50 sec results from two factors — 1) Because of the thin char layer at early times, the fluid mechanical time is very small as is the energy transfer per mass of pyrolysis gas; and 2) For very low surface pressures, the reduction in gas temperature

Figure 11.- Typical time histories of $\dot{m}_s$, $\dot{m}_g$, $l$, surface temperature, and pyrolysis gas temperature at the surface for an ablation system subjected to a square heat pulse.
associated with expansion of the pyrolysis gas flowing through the char layer is appreciable. The rate controlled and diffusion controlled regimes of surface oxidation are obvious in Fig. 11. The initial steep slope (highly temperature dependent) is associated with the rate controlled oxidation regime. The \( \dot{\mathbf{m}} \) curve undergoes an orderly transition on the much flatter region which corresponds to the diffusion controlled oxidation regime.

Figures 12 and 13 show profiles of pyrolysis gas temperature, molecular weight, mass flow rate, and pressure and char layer temperature and porosity at times of 50 and 500 sec, respectively, for the case whose data are presented in Fig. 11. Note that \( x = 0 \) is the char layer surface and \( x = 1 \) is the pyrolysis zone. Of particular interest in Fig. 12 is the greater temperature difference between the char layer and pyrolysis gas near the pyrolysis zone. The difference in temperature is greater in this region because of the larger gradient in char layer temperature. As the pyrolysis gas temperature increases to about 1200° K the chemical reactions and mass transfer processes within the system become significant. The decrease in molecular weight results from a breaking down of larger molecular weight species and loss of carbon through deposition of solid carbon in the porous char layer. The rate of carbon deposition is reflected in the reduced local mass flow rate (\( \dot{\mathbf{m}} \)). The net carbon deposited is indicated by the porosity profile.

The profiles in Fig. 13 are of the same form as those in Fig. 12. Because of the larger char layer thickness at 500 sec the pyrolysis gas temperature is nearer the char layer temperature in the region near the surface.
Char thickness = $5.46 \times 10^{-3}$ m

$P_w = 1.013 \times 10^4$ N/m$^2$

$m_g = 3.54 \times 10^{-2}$ kg/m$^2$-sec

$\bar{M} = 2.573 \times 10^{-2}$ kg/g-mole

$T_{S1} - T_{SI} = 1102\degree K$

Figure 12.- Profiles of pyrolysis gas temperature, char layer temperature, pyrolysis gas molecular weight, char porosity, local mass flow rate, and pyrolysis gas pressure at a time of 50 sec for the case represented in Fig. 11.
Char thickness = 1.646 x 10^{-2} m
P_w = 1.013 x 10^4 N/m^2
\rho_g = 1.52 x 10^{-2} kg/m^2\cdot sec
\dot{M}_I = 2.573 x 10^{-2} kg/g-mole
T_{s1} - T_{sI} = 1312^\circ K

Figure 13.- Profiles of pyrolysis gas temperature, char layer temperature, pyrolysis gas molecular weight, char porosity, local mass flow rate, and pyrolysis gas pressure at a time of 500 sec for the case represented in Fig. 11.
CHAPTER IX

SUMMARY

The differential equations governing the transient response of a one-dimensional ablative thermal protection system undergoing stagnation ablation have been derived for the general case of thermal non-equilibrium between the pyrolysis gases and the char layer and kinetically controlled chemical reactions and mass transfer between the pyrolysis gases and the char layer. The boundary conditions have been written for the particular case of stagnation heating with surface removal by oxidation or sublimation and pyrolysis of the uncharred layer occurring in a plane.

The governing equations and boundary conditions have been solved numerically using the modified implicit method (Crank-Nicolson method). Exact solutions were obtained for a number of simplified problems. Numerical results compared favorably with exact results in every instance.

Numerical results were presented for a typical ablation system subjected to a square heat pulse. The effects of chemical reactions and mass transfer are pronounced.

APPENDIX B

PROGRAM USAGE INSTRUCTIONS

This program calculates the transient response of a one-dimensional ablative thermal protection system subjected to stagnation heating. It treats thermal non-equilibrium between the pyrolysis gases and the char layer, mass transfer between the fluid and solid phases, and a total of nine chemical reactions involving twelve gaseous species plus solid carbon. Surface removal by oxidation or sublimation and pyrolysis of the uncharred material occurring in a plane are considered. It considers a single layer of ablation material backed up by a single layer of insulation material with heat sinks between the ablation material and the insulation and behind the insulation. A maximum of 50 stations each may be considered for the char layer and the uncharred layer of the ablation material and a maximum of 10 stations may be considered for the insulation.

INPUT

FORTRAN IV NAMELIST with the names PERM, PIKUP, and LIST is used to load the input data. PERM contains physical constants, program constants and tables of thermodynamic and chemical kinetics data which are considered to be permanent inputs. PIKUP contains initial solutions plus selected program constants and material properties. These data are changed when beginning a computer calculation at some time other
than 0. seconds. LIST contains those data and system parameters which are most frequently changed from one calculation to another. The following list contains the input variables with the dimensions used in the program. The NAMELIST name containing each variable is indicated in its description. The size of an array is limited to the dimensions stated.

HTSKP—VALUE OF THERMAL CAPACITY OF HEAT SINK AT BACK OF INSULATION LAYER  

IOPT1—TRIGGER FOR SELECTING METHOD OF COMPUTING PYROLYSIS RATE. (IOPT1=0 NO RESTRICTION ON TEMPERATURE OF PYROLYSIS ZONE, PYROLYSIS RATE COMPUTED USING ARRHENIUS TYPE RATE EQUATION, IOPT1=1 TEMPERATURE OF PYROLYSIS ZONE LIMITED TO TIBAR, PYROLYSIS RATE COMPUTED USING ENERGY BALANCE WHEN TS(I)=TIBAR)  

IOPT1—TRIGGER FOR SELECTING MODE OF BEHAVIOR OF SURFACE TEMPERATURE DURING SUBLIMATION. (IOPT1=0 NO RESTRICTION ON SURFACE TEMPERATURE, IOPT1=1 SURFACE TEMPERATURE LIMITED TO TIBAR)
IUPTP  TRIGGER FOR SELECTING METHOD OF COMPUTING WALL PRESSURE. (IUPTP=1 USE TABLE LOOKUP, IUPTP=0 COMPUTE WALL PRESSURE FROM HYPERSONIC FLOW THEORY) A 37
KT  NUMBER OF GASEOUS SPECIES CONSIDERED A 40
LCT  INITIAL THICKNESS OF UNCHARRED LAYER A 41
LOPC  NUMBER OF CHEMICAL REACTIONS CONSIDERED A 42
OCTAB  TABLE OF COLD WALL CONVECTIVE HEATING RATE VS TIME A 43
QRS  RADIANT HEATING RATE A 44
RAD  RADIUS OF BODY A 45
RHOC  THEORETICAL DENSITY OF CHAR MATERIAL A 46
SPT  TABLE OF WALL PRESSURE VS TIME A 47
TIBAR  MAXIMUM TEMPERATURE OF PYROLYSIS ZONE USED WITH A 48
TIBAR SUBLIMATION TEMPERATURE OF CHAR LAYER A 49

CHEMICAL SPECIES IDENTIFICATION-
1. CH4  2. H2  3. C2H4
10. HCN  11. C2H6  12. COH6
13. C (SOLID)

FOR DOUBLE SUBSCRIPTED QUANTITIES- FIRST SUBSCRIPT REFERS TO REACTION, STATION, OR TEMPERATURE AND SECOND SUBSCRIPT REFERS TO CHEMICAL SPECIES.

HSA11 \text{ Dummy parameters defined in computing HK}
HSA12
HSCNST \text{ Coefficient in solid temperature finite difference equation evaluated at the front surface of the char layer}
HST \text{ Enthalpy of char layer evaluated at the pyrolysis gas temperature, single subscript}
HSTT \text{ Table of char layer enthalpy versus temperature, single subscript}
HTSK \text{ Value of } \rho C_p l \text{ for heat sink at uncharred layer-insulation layer interface}
HTSKP \text{ Value of } \rho C_p l \text{ for heat sink behind insulation layer}
HW \text{ Enthalpy of air at char surface temperature}
I \text{ Number of finite difference stations in the char layer}
IL \text{ Thickness of insulation layer}
IM IN \text{ Indices}
IN^2 \text{ }
IO IO_1 \text{ }
IP \text{ Total number of finite difference stations in char layer and uncharred material}
IPP IP_1 \text{ Indices}
IZ \text{ Total number of finite difference stations in char layer, uncharred material, and insulation layer}
IZ_1 J \text{ Dummy indices}
JK \text{ Number of finite difference stations in uncharred material}
K \text{ Dummy index}
KA \text{ Parameter defined in computing rate of char layer removal by first order oxidation}
KAP''PP1) Value of ALPHAl, etc. for the insulation layer at the uncharred layer-insulation layer interface evaluated at the start of the time step
KAPIPP2)
KAPIPP3)
KAPIPP4)

KAPIP1) Value of ALPHAl, etc. for the insulation layer at the uncharred layer-insulation layer interface evaluated at the end of the time step
KAPIP2)
KAPIP3)
KAPIP4)

KG Conductivity of the pyrolysis gas
KGK Conductivity of gaseous species, single subscript

KI, KM, KON}

KP Conductivity of uncharred material at end of time step, single subscript
KPP Conductivity of insulation layer, single subscript

KPI Conductivity of uncharred material at pyrolysis zone evaluated at start of time step
KPPPI Conductivity of uncharred material at uncharred layer - insulation layer interface evaluated at start of time step

KPPPIP Conductivity of insulation layer at uncharred layer - insulation layer interface evaluated at start of time step
KPPPIZ Conductivity of insulation layer at back of insulation evaluated at start of time step

KPPV Data input for insulation layer conductivity
KPT Table of uncharred material conductivity versus temperature, single subscript

KS Conductivity of char layer at end of time step, single subscript
KSPI Conductivity of char layer at pyrolysis zone evaluated at start of time step
KSPI Conductivity of char layer at front surface evaluated at start of time step
KST  Table of char layer conductivity versus temperature, single subscript
KT  Indices
KTT  Table of gaseous species conductivity versus temperature, double subscript
KUPT  Dummy array defined for use in table-look-up routine for KGK, single subscript
KUPTV  Char layer thickness at end of time step
LAM  Ratio of mass char layer removed to free stream oxygen consumed in first order oxidation of char
LP  Uncharred material thickness at end of time step
LPMIN  Minimum thickness of uncharred layer
LPP  Char layer thickness at start of time step
LPPP  Uncharred material thickness at start of time step
M  Molecular weight of chemical species, single subscript
MCPP  Order of interpolation in obtaining CPP
MFK  Mole fraction of gaseous species, double subscript
MFKI  Mole fraction of gaseous species at pyrolysis zone, single subscript
MGDOT  Rate of pyrolysis of uncharred material at end of time step
MGDOTP  Rate of pyrolysis of uncharred material at start of time step
MKP  Order of interpolation in obtaining KP
MKS  Order of interpolation in obtaining KS
MNO  Order of interpolation in obtaining HS, HST, HK, CPK, HBRKN2, HBRNK02, MUK, and KGK
MPDOT  Effective mass injection rate at char surface
MQC Order of interpolation in obtaining QC
MS Molecular weight of carbon
MSDOT Rate of char layer removal by first order oxidation at end of time step
MSDOTP Rate of char layer removal by first order oxidation at start of time step
MSQPT Order of interpolation in obtaining SQPT
MU Viscosity of pyrolysis gas mixture, single subscript
MUK Viscosity of gaseous species, single subscript
MUKT Table of gaseous species viscosity versus temperature, double subscript
MUKTV Dummy array defined in computing pyrolysis gas viscosity, single subscript
N Dummy index
NCPP Number of entries in CPPT table
NIT Iteration count
NITA Trigger, set to 1 after first iteration following $\dot{\mu}_g = 1.0 \times 10^{-3} \, \text{kg/m}^2\text{-sec}$
NITC Trigger, set to 1 after first iteration
NITG Trigger, set to 1 if surface temperature changes more than .2% with respect to previous times
NITP Trigger, set to 1 when $\dot{\mu}_g = 1.0 \times 10^{-3} \, \text{kg/m}^2\text{-sec}$
NITS Trigger used in computing CPK and HK
NKP Number of entries in KPT
NKS Number of entries in KST
NNO Number of entries in HSTT, HKT, CPKT, MUKT, and KUPT
NQC Number of entries in QCTAB
NRCT  Number of homogeneous chemical reactions treated
NRHOK  Trigger used in solving species continuity equation, single subscript
NSQPT  Number of entries in SQPT
NSSTEP  Dummy index
P  Pyrolysis gas pressure at end of time step, single subscript
PA  "PA" coefficient in finite difference equation for pyrolysis gas pressure evaluated at the pyrolysis zone
PAB3  Coefficients in finite difference equation for pyrolysis gas pressure evaluated at mid-point of time step, single subscript
PAB4  
PAL1  Coefficients in linearized differential for pyrolysis gas pressure evaluated at end of time step, single subscript
PAL2  
PAL3  
PAL4  
PAMGDOT  Product of chemical species density and velocity at start of time step, double subscript
PAP1  Value of PAL1, etc. evaluated at the start of the time step, single subscript
PAP2  
PAP3  
PAP4  
PART  Parameter defined by |TS(1)−TSP(1)|
PB  "PB" coefficient in finite difference equation for pyrolysis gas pressure evaluated at the pyrolysis zone
PD  "PD" coefficient in finite difference equation for pyrolysis gas pressure evaluated at the pyrolysis zone
PHBRKN2  Enthalpy of \(N_2\) at char surface temperature evaluated at start of time step
PHBRKO2  Enthalpy of \(O_2\) at char surface temperature evaluated at start of time step
PHI  Parameter defined in computing viscosity of pyrolysis gas, double subscript
PM Permeability of char layer at end of time step, single subscript
PMU Pyrolysis gas viscosity at pyrolysis zone, evaluated at start of time step
PMV Data input for permeability of char layer
PP Pyrolysis gas pressure at start of time step, single subscript
PPM Permeability of char layer at pyrolysis zone, evaluated at start of time step
PR Prandt number of pyrolysis gas
PRHO Pyrolysis gas density at start of time step, single subscript
PRINTFQ Time interval at which output is printed
PROM Sum of mole density of all chemical species, single subscript
PROC Proportionality constant appearing in equation for HA
PSI Parameter defined in computing conductivity of pyrolysis gas, double subscript
PT Pyrolysis gas temperature at last table look up of data, single subscript
PTIME Print time
PTS Solid temperature at last table-look-up data, single subscript
PW Dimensionless pressure at surface of char layer
PWP Dimensional pressure at surface of char layer
PX } "PX", etc. coefficients in finite difference equation for pyrolysis gas pressure evaluated the pyrolysis zone
PY PZ
Q Net heat transfer at char surface by conduction at end of time step

VITA

The author was born [REDACTED] in [REDACTED]. After graduating from Lafayette High School in Mayo, Florida in 1955, he served three years on active duty with the U. S. Army before enrolling in the University of Florida. In 1962 he received the Bachelor of Mechanical Engineering Degree with Honors from the University of Florida and has been employed by the National Aeronautics and Space Administration at the Langley Research Center since that time. He has earned the Master of Aerospace Engineering Degree from the University of Virginia since being employed by NASA.

The author currently resides in Hampton, Virginia, with his wife, the former Edwina Ann [REDACTED], and their children, Erica, Anthony, Douglas, and Monica.
