TO: KSI/Scientific & Technical Information Division
      Attn: Miss Winnie M. Morgan

FROM: GP/Office of Assistant General
      Counsel for Patent Matters

SUBJECT: Announcement of NASA-Owned U.S. Patents in STAR

In accordance with the procedures agreed upon by Code GP and Code KSI, the attached NASA-owned U.S. Patent is being forwarded for abstracting and announcement in NASA STAR.

The following information is provided:

U.S. Patent No. : 3,647,529
Government or Corporate Employee : TRW, Inc.
Rancho, CA
Supplementary Corporate Source (if applicable) :
NASA Patent Case No. : LEW-10,199-1

NOTE - If this patent covers an invention made by a corporate employee of a NASA Contractor, the following is applicable:

YES ☐ NO ☐

Pursuant to Section 305(a) of the National Aeronautics and Space Act, the name of the Administrator of NASA appears on the first page of the patent; however, the name of the actual inventor (author) appears at the heading of column No. 1 of the Specification, following the words "...with respect to an invention of..."

Bonnie L. Woerner
Enclosure
This invention relates to reinforced polyimide structures. Reinforcing materials are impregnated with a suspension of polyimide prepolymer and bonded together by heat and pressure to form a cured, hard-reinforced, polyimide structure.
REINFORCED STRUCTURAL PLASTICS

The invention described herein was made in the performance of work under a NASA contract and is subject to the provisions of Section 305 of the National Aeronautics and Space Act of 1958, Public Law 85-568 (72 state 435; 42 U.S.C. 2457).

Reinforced polyimide structures exhibit outstanding physical properties in the presence of high temperatures. Where high strength is necessary at elevated temperatures, for example as in leading edges for aircraft or nose cones for space vehicles, reinforced polyimide structures provide excellent construction materials. Limitations as to their use, however, arise from problems resulting from difficult processing techniques.

Reinforced polyimide articles are currently produced by impregnating sheets of fibrous material with a polyimide acid produced by a condensation reaction of an anhydride and a polyfunctional amine. Materials impregnated with this polyimide acid must be hermetically sealed, refrigerated, and kept in solution, if final cure is not effected within a short time. When the final product has been formed, a cure of between 5 and 10 hours is necessary to produce a polyimide from the polyimide acid. During the cure, special processing is necessary to allow for the escape of appreciable volatile matter, mainly water. Failure to allow for these volatiles will produce an inferior structure containing interstitial bubbles and pockets.

It has now been discovered that reinforced polyimide articles can be produced using rapid-cure polyimide prepolymer. Preparation of the polyimide prepolymer and the polyimide polymers produced therefrom, are discussed in more detail in copending application Ser. No. 650,625, filed July 3, 1967, now U.S. Pat. No. 3,528,950. It is to be understood that the polymers employed in this invention may be produced from the amines and anhydrides enumerated therein.

The amines which may be utilized for purposes of this invention to prepare the polyimides include the following:

- Paraphenylene diamine
- Meta-phenylene diamine
- 4,4′-diamino-diphenyl propane
- 4,4′-diaminodiphenyl methane
- 4,4′-diamino-diphenyl sulfide
- 4,4′-diamino-diphenyl sulfone
- 4,4′-diamino-diphenyl ether
- 1,5-diamino-naphthalene
- 3,3′-dimethoxy benzidine
- 2,4-bis (beta-amino-t-butyl)toluene
- bis-(para-beta-amino-t-butyl-phen) ether
- bis-(penta-methyl-delta-amine-pentyl)benzene
- bis-(1,1-dimethyl-5-amine-pentyl)benzene
- 1-isopropyl-2,4-metaphenylene diamine
- m-xylene diamine
- hexamethylenediamine
- heptamethylenediamine
- octamethylenediamine
- nonamethylenediamine
- decamethylenediamine
- diamino-propyl tetramethylenediamine
- 3-methylheptamethylenediamine
- 4,4′-dimethylheptamethylenediamine
- 1,1′-diamino-dodecane
- 1,2-bis-(3-amino-propoxy)ethane
- 2,2-dimethyl propylene diamine
- 3-methoxy-hexamethylenediamine
- 3,3′-dimethylbenzidine
- 2,5-dimethylhexamethylenediamine
- 2,5-dimethylheptamethylenediamine
- 5-methyl-nonamethylenediamine
- 2,17-diamino-eicosadecane
- 1,4-diamino-cyclohexane
- 1,10-diamino-1,10-dimethyldodecane

Triamines such as

1,3,5-triaminobenzene
2,4,6-triaminotriazine
1,2,3-triaminopropene
4,4′-triaminotriphenyl methane and
4,4′-triaminotriphenylcarbinol

Polyfunctional anhydrides employed in the production of the polyimide prepolymer according to this invention are generally dianhydrides although tri- and tetraanhydrides come within the scope of this invention. Polyfunctional anhydrides which have been found to be suitable in the practice of this invention are as follows:

- Pyromellitic dianhydride
- Benzophenone tetracarboxylic dianhydride
- 2,3,6,7-naphthalene tetracarboxylic dianhydride
- 3,3′,4,4′-diphenyl tetracarboxylic dianhydride
- 1,2,5,6-naphthalene tetracarboxylic dianhydride
- 2,2′,3,3′-diphenyl tetracarboxylic dianhydride
- 2,2-bis (3,4-dicarboxyphenoxy) propane dianhydride
- 3,4,9,10-pentane tetracarboxylic dianhydride
- bis(3,4-dicarboxyphenyl)ether dianhydride
- Ethylene tetracarboxylic dianhydride
- Naphthalene-1,2,4,5-tetracarboxylic dianhydride
- Naphthalene-1,4,5,8-tetracarboxylic dianhydride
- Decahydro-phenanthrene-1,4,5,8-tetracarboxylic dianhydride
- 4,6-dimethyl-1,2,3,5,6,7-hexahydro-naphthalene-1,2,5,6-tetracarboxylic dianhydride
- 2,6-dichloronaphthalene-1,4,5,8-tetracarboxylic dianhydride
- 2,7-dichloronaphthalene-1,4,5,8-tetracarboxylic dianhydride
- 2,3,6,7,8,9-tetrachloronaphthalene-1,4,5,8-tetracarboxylic dianhydride
- Phenanthrene-1,8,9,10-tetracarboxylic dianhydride
- Cyclopentane-1,2,3,4-tetracarboxylic dianhydride
- Pyrrolidine-2,3,4,5-tetracarboxylic dianhydride
- Pyridazine-2,3,4,5-tetracarboxylic dianhydride
- Pyrazine-2,3,4,5-tetracarboxylic dianhydride
- Pyridine-2,3,4,5-tetracarboxylic dianhydride
- 1,5-diamino-naphthalene
- 1,2-bis (3,4-dicarboxyphenyl) ethane dianhydride
- 1,1-bis (3,4-dicarboxyphenyl) ethane dianhydride
- Bis(2,3-dicarboxyphenyl) methane dianhydride
- Bis(3,4-dicarboxyphenyl) methane dianhydride
- Bis(3,4-dicarboxyphenyl)sulfone dianhydride
- Benzen-1,2,3,4-tetracarboxylic dianhydride
- 1,2,3,4-butane tetracarboxylic dianhydride
- Thiophene-2,3,4,5-tetracarboxylic dianhydride.

Reinforced articles of this invention employ polymeric bonding agents which may be reproduced from any polyimide which has an end-capping group produced by the reaction of a monoanhydride having the structure:

![Structure](attachment:structure.png)

where R represents hydrogen, or a lower alkyl group, e.g.,

- Ethyl, propyl, butyl, or amyl.

Preparation of the reinforced polyimide articles is effected by impregnating reinforcing material with the polyimide prepolymer resin. After the impregnation, items may be stored in air for a longer period of use without special precautions. Final cure or bonding simply consists of arranging the impregnated reinforcement into the desired shape and then applying heat and pressure, whereupon a hard, strong reinforced article is formed.

The process in more detail consists of forming a suspension of powdered high molecular weight polyimide prepolymer resins in a solution of a low molecular weight polyimide prepolymer dissolved in a solvent. If desired, the soluble portion and viscosity of this suspension may be varied by heating. Details of the polyimide prepolymer may be obtained from the above-mentioned copending application. When a
homogeneous suspension or dispersion of the polyimide prepolymer has been obtained, the mixture is applied to the reinforcing material. The mixture is generally applied by dipping and wiping or spraying however, other methods of application may be equally suitable under certain conditions. After the suspension has been applied to the reinforcement it is dried to remove some or all of the solvent, generally at elevated temperatures to reduce process time. Processing to the final form comprises bonding by heat and pressure. To accomplish this, the impregnated reinforcements are subjected to state-of-the-art processing procedures, such as press cure, vacuum bagging, autoclaving, hydroclaving, etc. An example of press cure laminates consists of subjecting stacked plies to elevated temperatures of around 450° to 600° F. and moderately high pressures of around 1,000 p.s.i. Because the low molecular weight polyimide prepolymer melts at a lower temperature to provide a fusible matrix for the high molecular weight polyimide prepolymer powder, a stepped pressure application is necessary. To prevent excessive resin flow, a 200 p.s.i. pressure is initially applied for 30 seconds or more, depending on the thickness of composite. This period of heat and moderate pressure is sufficient to advance the polyimide prepolymer so that it can withstand the final processing conditions.

The reinforcing materials may be selected from a wide variety of materials. The limiting factors on the reinforcing materials which can be used are defined by the strength of the material and its decomposition temperature. Thus materials which provide little physical strength or decompose at temperatures below the processing temperatures would not be preferable for reinforcing materials. Materials which are generally most suitable are carbon, such as carbon or graphite fibers, whiskers, or crystals; silicates, such as asbestos or fiber glass; or metals, such as metal turnings, wires, or whiskers. In addition refractory materials, such as fibers, whiskers, or crystals of borides, carbides, silicides, nitrides, or oxides are suitable.

In addition to the rapid processing characteristics of these polyimide reinforced structures they also exhibit outstanding physical properties. The following table shows the results of several tests using different polyimide compositions and different reinforcing materials.

* Specimens aged at 315° C. for 100 hours prior to test.

This invention has provided a means for producing reinforced articles which utilizes the outstanding mechanical and thermal properties of the polyimide resins, but which may be produced in a fraction of the time that was required previously. Processing conditions for making reinforced polyimides have been greatly simplified by the stability of the polyimide prepolymer described in this invention, the reduced processing time, and the substantial reduction in the amount of volatiles expelled.

We claim:

1. A process for preparing a reinforced article which comprises impregnating a reinforcing material with a polyimide prepolymer; said prepolymer obtained by reacting monoanhydride with a mixture of polyfunctional amines and dianhydrides; said monoanhydride having the structure

\[
\text{R} = \text{R} = \text{O} = \text{R} = \text{R} \]

where \( R \) represents a member selected from the group consisting of hydrogen and lower alkyl radicals, and curing by the application of heat and pressure to form a reinforced article.

2. A process according to claim 1 wherein the lower alkyl radical is selected from the group consisting of methyl, ethyl, propyl, butyl, and amyl.

3. A process according to claim 1 wherein the reinforcing material is selected from the group consisting of carbons, silicates, carbides, silicides, borides, nitrides, oxides and metals.

4. A reinforced article comprising a reinforcing material bonded together by a cured polyimide resin wherein said resin is formed from an end-capped polyimide prepolymer; said prepolymer having an end-capping group derived from a monoanhydride having the structure

\[
\text{R} = \text{R} = \text{O} = \text{R} = \text{R} \]

wherein \( R \) represents a member selected from the group consisting of hydrogen and lower alkyl radicals.

5. A reinforced article according to claim 4 wherein the fibrous reinforcing material is selected from the group consisting of carbon, silicates, carbides, borides, carbides, silicides, nitrides, oxides, and metals.

6. A reinforced article according to claim 4 wherein the lower alkyl radical is selected from the group consisting of methyl, ethyl, propyl, butyl, and amyl.
