ACCESSION NUMBER RANGES

Accession numbers cited in this Supplement fall within the following ranges:

STAR (N-10000 Series) N75-25863 N75-28002

IAA (A-10000 Series) A75-35877 – A75-38853

This bibliography was prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by Informatics Information Systems Company.

AERONAUTICAL ENGINEERING

A Special Bibliography

Supplement 62

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in September 1975 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA)*

This Supplement is available from the National Technical Information Service (NTIS), Springfield, Virginia 22161, for \$4 00 For copies mailed to addresses outside the United States, add \$2 50 per copy for handling and postage

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering. The first issue of this bibliography was published in September 1970 and the first supplement in January 1971. Since that time, monthly supplements have been issued.

This supplement to *Aeronautical Engineering—A Special Bibliography* (NASA SP-7037) lists 306 reports, journal articles, and other documents originally announced in September 1975 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries*, in that order. The citations, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* or *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes—subject, personal author, and contract number—are included.

An annual cumulative index will be published.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A75-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics Inc (AIAA) as follows. Paper copies are available at \$5.00 per document up to a maximum of 20 pages. The charge for each additional page is 25 cents. Microfiche⁽¹⁾ are available at the rate of \$1.50 per microfiche for documents identified by the # symbol following the accession number. A number of publications because of their special characteristics are available only for reference in the AIAA Technical Information Service Library. Minimum airmail postage to foreign countries is \$1.00. Please refer to the accession number, e.g. (A75-10763) when requesting publications.

STAR ENTRIES (N75-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail NTIS. Sold by the National Technical Information Service to U.S. customers at the price shown in the citation following the letters HC (hard paper, or facsimile copy). Customers outside the U.S. should add \$2.50 per copy for handling and postage charges to the price shown. (Prices shown in earlier *STAR* volumes, 1962-1974 have been superseded but may be calculated from the number of pages shown in the citation. The price schedule by page count was given in the last *STAR* issue of 1974 or may be obtained from NTIS.)

Microfiche⁽¹⁾ are available at a standard price of \$2.25 (plus \$1.50 for non-U.S. customers) regardless of age for those accessions followed by a # symbol. Accession numbers followed by a "+" sign are not available as microfiche because of size or reproducibility.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Unit.

NOTE ON ORDERING DOCUMENTS. When ordering NASA publications (those followed by the * symbol) use the N accession number.

NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number.

Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other report number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests at the standard \$2.25 price for those documents identified by a # symbol.)

(1) A microfiche is a transparent sheet of film, 105 by 148mm in size containing as many as 60 to 98 pages of information reduced to micro images. (Not to exceed 26:1 reduction.)

- Avail NASA Public Document Rooms Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory
- Avail ERDA Depository Libraries Organizations in U.S. cities and abroad that maintain collections of Energy Research and Development Administration reports, usually in microfiche form, are listed in *Nuclear Science Abstracts*. Services available from the ERDA and its depositories are described in a booklet, *Science Information Available from the Energy Research and Development Administration* (TID-4550), which may be obtained without charge from the ERDA Technical Information Center
- Avail Univ Microfilms Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) at \$10.00 each and microfilm at \$4.00 each regardless of the length of the manuscript. Handling and shipping charges are additional. All requests should cite the author and the Order Number as they appear in the citation.
- Avail USGS Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.
- Avail HMSO Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.
- Avail BLL (formerly NLL) British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)
- Avail ZLDI Sold by the Zentralstelle für Luftfahrt-dokumentation und -Information, Munich, Federal Republic of Germany, at the price shown in deutschmarks (DM).
- Avail Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.
- Avail U.S. Patent Office Sold by Commissioner of Patents, U.S. Patent Office, at the standard price of 50 cents each, postage free.
- Other availabilities If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

SUBSCRIPTION AVAILABILITY

This publication is available on subscription from the National Technical Information Service (NTIS). The annual subscription rate for the monthly supplements, excluding the annual cumulative index, is \$18.00. All questions relating to subscriptions should be referred to the NTIS.

TYPICAL CITATION AND ABSTRACT FROM STAR

TYPICAL CITATION AND ABSTRACT FROM IAA

AERONAUTICAL ENGINEERING

A Special Bibliography (Suppl. 62) OCTOBER 1975

IAA ENTRIES

A75-35896 Application of finite element analysis to ceramic components C Visser, S Lien (Westinghouse Research Laboratories, Pittsburgh, Pa.), and R J. Schaller (Westinghouse Electric Corp., Lester, Pa.) (*American Ceramic Society, Joint Fall Meeting, Pittsburgh, Pa., Sept 23-26, 1973, Paper 30-BC-73F.*) *American Ceramic Society, Journal*, vol 58, Mar-Apr 1975, p. 131-135 10 refs. Grant No DAAC46-71-C-0162

A finite element analysis of a rotating ceramic gas turbine blade consisting of an airfoil and root is discussed Three-dimensional results were obtained for the blade using both isotropic and orthotropic material properties A two-dimensional study of the root considered the effects of friction, contact area, and root geometry (Author)

A75-35899 Kawasaki C-1 - Japan's mini-StarLifter E Sekigawa *Air International*, vol 9, July 1975, p 7-13

The article traces the development, design and production of Japan's Kawasaki C-1A aircraft from its inception to the present, as will be used by the Air Self-Defense Force (ASDF) Escalating costs of the military transport aircraft forcing a reduction in the total number to be purchased by the ASDF notwithstanding, its specifications (included in the article) meet the ASDF expectations M G

A75-35943 # Heat exchange in the hypersonic flow of a rarefied gas past a blunt wedge (Teploobmen pri obtekanii zatuplennogo klina giperzvukovym potokom razrezhennogo gaza) L L Vasil'ev, Iu A Lapshin, and A N Piskunov (Akademii Nauk Belorusskoi SSR, Institut Teplo- i Massoobmena, Minsk, Belorussian SSR) *Inzhenerno-Fizicheskii Zhurnal*, vol 28, May 1975, p 788-792 6 refs In Russian

An experiment is described which investigated the aerodynamic heating of a blunt wedge with heat pipes as the wedge is blown by the Mach-8 flow of a gas at 5.5 to 7.7 millitorr static pressure and 500 C stagnation temperature The temperature distribution along the surface of the wedge was studied The effect of cooling of the leading edge by the heat pipes was estimated by carrying out experiments with heat pipes filled with acetone and non-filled heat pipes, and with and without cooling of the heat pipe condensers by a liquid coolant It is shown that use of heat pipes leads to a lowering of the temperature of the leading edge, a leveling of the temperature distribution along the profile, and an increase in radiative heat exchange on account of the higher mean surface temperature P T H

A75-35967 # Hodograph method for axisymmetric transonic gas flows (O metode godografa dlia osesimmetrichnykh okolozvukovykh techenii gaza) Z N Dobrovolskaia *Prikladnaia Matematika i Mekhanika*, vol 39, Mar-Apr 1975, p 280-289 8 refs In Russian

The behavior of a perturbed uniform hypersonic gas flow at large distance from a thin body of revolution serving as obstacle is studied in the hodograph plane Analysis is carried out within the framework of an approximate Karman equation for the potential of perturbed velocity and is based on the method of Guderley and

Breiter (1966) An asymptotic expansion of the Legendre potential is obtained, having the necessary regularity properties in the hodograph plane The question of the preservation of regularity by the solution when it is mapped onto the physical flow plane is investigated

P T H

A75-35968 # The resistance of bodies of revolution at transonic flow velocities (O soprotivlenii tel vrascheniia pri transzvukovykh skorostiakh potoka) V N Diesperov and Iu B Lrfshits (*Prikladnaia Matematika i Mekhanika*, vol 39, Mar-Apr 1975, p 290-297 14 refs. In Russian

The present work investigates theoretically some aspects of the law of stabilization, which concerns the weak effect that the magnitude of the velocity of the main flow has on the deviation of the parameters at a body before the shock wave from their values at sonic velocity at infinity The present investigation also studies the flow behind the shock in order to clarify the nature of the dependence of the resistance of the body on the velocity of the main flow

P T H

A75-36040 Corrosion resistance of gas turbine blades tested in a high-temperature gas flow L P Lozitskii, E N Karpov, B Ia Kudriashov, and N N Motrii (Kievskii Institut Inzhenerov Grazhdanskoi Aviatsii, Kiev, Ukrainian SSR) (*Problemy Prochnosti*, vol 6, Sept 1974, p 87-90) *Strength of Materials*, vol 6, no 9, June 1975, p 1128-1131 Translation

A75-36099 # Flow about a conic wing and the optimal configuration of the wing at hypersonic velocities (Obtekanie i optimal'naiia forma konicheskogo kryla pri giperzvukovykh skorostiakh) A L Gonor, N A Ostapenko, and V I Lapygin *Moskovskii Gosudarstvennyi Universitet, Institut Mekhaniki, Otchet* no 981, 1969 21 p 21 refs In Russian

An analytical theory is formulated for the hypersonic flow about a triangular wing with a strong shock wave associated with the leading edge A closed solution is obtained which permits the regions of uniform, potential, and vortical flows to be joined smoothly, and the problem is reduced to solving an integro-differential equation for the form of the shock wave, which expresses all the characteristics of the flow field Flow about a rhomboid wing is analyzed together with the variational problem concerning the configuration of a conic wing having the maximum L/D ratio for a given volume The solution of this problem is shown to reduce to the Lagrange problem with one isoperimetric condition if the pressure distribution is assumed to be determined by Newton's law and the local friction coefficient is a constant The optimal contour is determined by the method of local variations and found to be V-shaped

F G M

A75-36100 # Investigation of a four-stage ejector for a hypersonic wind tunnel (Issledovanie chetyrekhstuppenchatogo ezhektora giperzvukovoi aerodinamicheskoi ustanovki). Iu P Aksekov, A I Glagolev, A I Zubkov, and A N Timoshin *Moskovskii Gosudarstvennyi Universitet, Institut Mekhaniki, Otchet* no 1274, 1971 28 p In Russian

The present work describes experimental results obtained in tests of a four stage ejector, in each stage of which the critical cross section of the ejecting gas nozzle has a variable area Ejector characteristics are determined for different combinations of the working stages Data are obtained on total pressure loss between

ejector stages Optimality conditions are determined for a multistage ejector The minimum total pressure in a hypersonic wind tunnel receiver operating in conjunction with a multistage ejector is obtained Calculations show the effect of air temperature in a hypersonic pump receiver on ejector parameters P T H

A75-36107 The dynamics of the civil aviation industry A P Ellison (Aviation Planning Services, Montreal, Canada) and E M Stafford (Southampton, University, Southampton, England) Farnborough, Hants, England, Saxon House, D C Heath, Ltd, Lexington, Mass, Lexington Books, D C Heath and Co, 1974 361 p 363 refs \$18

The structure of the civil aviation market is considered along with a model of the civil aviation industry, air passenger demand models, questions of capital stock measurement, and the world demand for civil aircraft Problems regarding the order-delivery lag in the world civil aviation industry are examined, taking into account distributed lag studies of engineering processes, aspects of exploratory model fitting, and an accurate distributed model derivation Attention is also given to the overall model, passenger demand forecasts, and aircraft forecasts for 1980 G R

A75-36163 # Analytic investigation of hypersonic flow around blunt bodies (Analiticheskoe issledovanie giperzvukovogo obtekanii zatuplennykh tel) A L Gonor and N A Ostapenko *Moskovskii Gosudarstvennyi Universitet, Institut Mekhaniki, Nauchnye Trudy*, no 32, 1974, p 109-121 14 refs In Russian

Theory is developed for the hypersonic flow around blunt bodies based on the method of two approximations A boundary value problem is set up for the shock layer region produced by symmetric flow, and an approximating system of differential equations of hyperbolic type is obtained, from which an integro-differential equation is derived for the shape of the shock wave The theory is applied to the analysis of hypersonic flow around a circular cylinder P T H

A75-36165 # Parabolic wing, resembling a wedge, in supersonic flow (Parabolicheskoe krylo, blizkoe k klinu, v sverkhzvukovom potoke) M I Folle *Moskovskii Gosudarstvennyi Universitet, Institut Mekhaniki, Nauchnye Trudy*, no 32, 1974, p 127-135 In Russian

A75-36166 # Optimization method for a generalized class of functional of several variables, and its application to problems involving the determination of the shape of three-dimensional bodies with optimal aerodynamic characteristics (Metod optimizatsii dlia obobshchennogo klassa funktsionalov neskol'kikh peremennykh i ego prilozhenie k zadacham ob opredelenii formy optimal'nykh po aerodinamicheskim kharakteristikam prostranstvennykh tel) A I Bunimovich and A V Dubinski *Moskovskii Gosudarstvennyi Universitet, Institut Mekhaniki, Nauchnye Trudy*, no 32, 1974, p 136 142 9 refs In Russian

A75-36194 # Flutter of a wing with nonlinear elastic characteristic (Flutter plata o nieliniowej charakterystyce sprzyzstaj) E Mzyk and J Matusiak *Archiwum Budowy Maszyn*, vol 22, no 2, 1975, p 213-222 7 refs In Polish

Flutter analysis of a simple, nonlinear wing model having two degrees of freedom is presented Unsteady, linear aerodynamic theory is applied to the wing, while a nonlinear elastic bending characteristic is assumed The methods of harmonic linearization and the Laplace transform were used in the stability analysis, and a

relation between the single frequency vibrations of the model at the limit cycle and steady flight speed was obtained along with flutter conditions P T H

A75-36236 * # Structure of turbulent jets and wakes. F C Wang (NASA, Marshall Space Flight Center, Systems Dynamics Laboratory, Huntsville, Ala) and T S Lundgren (Minnesota, University, Minneapolis, Minn) *AIAA Journal*, vol 13, May 1975, p 561-565 17 refs Contract No N00014-68-A-0141-0001 Project THEMIS

The structure of two-dimensional turbulent jets and wakes is studied using two eddy viscosity models The turbulent energy equation is used together with the mean momentum equations, and the system is closed by introducing eddy coefficients The fine structure turbulence is obtained by applying proper boundary conditions at the mean turbulent interface position The results, after a second averaging process, are compared with available experimental data (Author)

A75-36241 # Laminar boundary layer in symmetry plane of blunt-nosed body R A Smith (Catholic University of America, Washington, D C) and W T Moon (Korean Institute of Science and Technology, Seoul, South Korea) *AIAA Journal*, vol 13, May 1975, p 679, 680 7 refs

The present work investigates the laminar boundary layer in the plane of symmetry on the hemispherical nose of a blunt cylindrical body at angle of attack Computations based on experimental pressure distributions suggest the existence of an embedded vortex on the leeward side for angles of attack of 10 and 15 deg The size of the embedded vortex region indicates a vortex-induced separation at these angles of attack The qualitative behavior of the separation phenomena on the leeward side is in strong agreement with Wang's analysis and postulated behavior of three-dimensional separation on inclined bodies of revolution S J M

A75-36245 # Flutter of a panel supported on an elastic foundation I Chopra (National Aeronautical Laboratory, Bangalore, India) *AIAA Journal*, vol 13, May 1975, p 687, 688 6 refs

The flutter behavior of a thin panel resting on a linear elastic foundation is studied, using an analogy with the flutter of a panel of the same geometry without spring support With quasi-steady aerodynamic loading, it is observed that there is a change not only in the flutter frequency, but also in the total damping of the system, due to the elastic foundation Furthermore, it is found that for small values of aerodynamic damping and spring stiffness, the quasi-static approach is reasonable, whereas for high values of aerodynamic damping or of spring stiffness, quasi-static theory is inadequate For high values of spring stiffness, the flutter mode of the panel exhibits traveling wave motion S J M

A75-36288 Flow separation from yawed delta wings. I P Jones (East Anglia, University, Norwich, England) *Computers and Fluids*, vol 3, June 1975, p 155 177 10 refs Ministry of Defence Contract No AT/2162/05

The flow over a flat plate delta wing at incidence and yaw is studied using a vortex-sheet model The numerical method adopted allows solutions to be obtained in regions of parameter space, in particular at low incidence, where previous methods have failed to converge In the results which are presented attention is focused upon these new solutions Where comparable the agreement with the available experimental results is encouraging For large angles of yaw the leeward leading edge becomes a trailing edge and the associated vortex sheet assumes the characteristics of a trailing edge sheet A

simple analytical model for such a trailing vortex system is also studied. The results predicted by this linear model compare favorably with those from a further numerical study which indicates that the nonlinear behavior is similar to that of a flat wake and confirms the asymptotic nature of the linear model (Author)

A75-36291 Design estimate of cascade performance C L S Farn and D K Whirlow (Westinghouse Research Laboratories, Pittsburgh, Pa) *Computers and Fluids*, vol 3, June 1975, p 225-233 8 refs

A method, which utilizes existing computer programs for analyzing the performance of axial-flow cascades is outlined. The method is validated by comparing the analytical results for three low speed compressor, five low-speed turbine and two high-subsonic turbine cascades with the corresponding experimental data. The overall error bound for losses is 12 per cent. However, the error bound for low-speed cascades operating near the design condition is about 5 per cent. The effects of transition location on losses are very significant. The contribution to the loss by small trailing-edge separations in the compressor cascades could be as much as one-third of the total loss (Author)

A75-36366 Some system considerations for MLS airborne processors J Beneke and C Wightman (Calspan Corp., Buffalo, N Y) (*Institute of Navigation, Annual Meeting, 30th, San Diego, Calif, June 25-27, 1974*) *Navigation*, vol 22, Spring 1975, p 35-46 U.S. Department of Transportation Contract No. FA71WA 2592

Various aspects of the scanning beam and Doppler scan MLS systems are examined and compared, based on a previous techniques analysis. Means of rejecting multipath interference from other aircraft and airport structures are essential to precision guidance in a severe multipath environment. Additional experimental data are required before a final design is adopted, at present, both scanning beam and Doppler scan techniques appear to meet stipulated requirements S J M

A75-36368 Development of navigation systems for advanced commercial transports A F Norwood (Boeing Commercial Airplane Co., Seattle, Wash) (*Institute of Navigation, Annual Meeting, 30th, San Diego, Calif, June 25-27, 1974*) *Navigation*, vol 22, Spring 1975, p 68-75 9 refs

Attention is given to the design of a system which will best satisfy navigation functional and performance requirements for a new aircraft destined to operate for the next 20 to 25 years in an ATC environment subject to changes. Aspects of over ocean navigation are considered along with domestic requirements and airborne derived information requirements. Questions of airborne system design are discussed and cost factors are examined G R

A75-36401 The promise of air safety M Eleccion *IEEE Spectrum*, vol 12, July 1975, p 26, 27, 31-36

Problems presented to the air safety system in connection with the increasing air traffic are considered, taking into account the comparatively great number of air fatalities occurring in 1974. Ground-approach hazards are to be reduced by the installation of ground proximity warning systems on all U.S. commercial jet air carriers. The general introduction of collision-avoidance systems (CAS) is considered as a response to mid-air collision dangers. Questions regarding the controversy with respect to the type of CAS to be employed are discussed. Attention is given to aspects of ATC system development, taking into account the historical background, the present system, and the planning of the systems for the future G R

A75-36457 # Astrolabe, integrated navigation and landing aid device - Land-bound and airborne presentation of information (Astrolabe, dispositif intégré de navigation et d'aide à l'atterrissage -

Présentation au sol et à bord des informations) J Dorey and G Ringenbach (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France) (NATO, AGARD, Symposium on Electronic Airborne Displays, Edinburgh, Scotland, Apr 7-11, 1975) *ONERA, TP no 1975 17*, 1975 9 p In French

A microwave localization system is being developed, based on the properties of synthetic antennas, which permits the two-dimensional (azimuth and elevation) simultaneous analysis of a large number of targets constituted by low power beacons. The system ensures airspace surveillance while providing the pilot with a visualization of the surrounding terrain (e.g., runway boundaries) in proper perspective. It should thus permit the integration of various functions of ground control, such as landing aid and zone navigation, with those needed by the pilot in blind navigation (search for and precise identification of airport beacons). Two data processing and display devices associated with this system are described: an optronic device and an integrated digital device. Some results obtained at CEV flight test center at Bretigny are analyzed S J M

A75-36529 Microwave technology in the microwave landing system R M Kalafus (U.S. Department of Transportation, Transportation Systems Center, Cambridge, Mass) In *Microwaves in service to man, International Microwave Symposium, Palo Alto Calif, May 12-14, 1975, Digest of Technical Papers*

New York, Institute of Electrical and Electronics Engineers, Inc., 1975, p 343-345 FAA-supported research

The purpose, format, principles of operation, and equipment of the microwave landing system (MLS) are outlined. MLS is devised to provide lateral and vertical guidance to approaching aircraft from about 20 miles out through final approach, flare, touchdown, and roll-out, as well as through missed approach. The basic MLS outputs are the azimuth angle, elevation angle, and slant range. The angle and range measurement techniques are discussed along with the microwave components (phase shifters, solid-state sources, and voltage controlled attenuators). Opportunities for innovation in technology development are examined S D

A75-36530 Instrument Landing System performance prediction G. Chin, L. Jordan, D. Kahn, and S. Morin (U.S. Department of Transportation, Transportation Systems Center, Cambridge, Mass) In *Microwaves in service to man, International Microwave Symposium, Palo Alto, Calif, May 12-14, 1975, Digest of Technical Papers*. New York, Institute of Electrical and Electronics Engineers, Inc., 1975, p 346-348.

An electromagnetic scattering model has been developed for predicting Instrument Landing System (ILS) localizer and glide slope performance. The model is used to predict course structure degradation resulting from a change in the airport environment. Such changes include the addition of new hangars, terminal buildings and control towers as well as terrain modifications. In addition, the model is used to predict comparative ILS antenna array performance in order to help determine which ILS system is required for new runway instrumentation and for the upgrading of existing instrumented runways to a higher FAA category (Author)

A75-36651 Aircraft engine lube oil filtration study H C Mouwen (Purolator Products, Inc., Newbury Park, Calif) and P Duncan (Swift-Aire Lines, San Luis Obispo, Calif) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan, Apr 8-11, 1975, Paper 750505* 16 p

The aircraft engine lube oil filter maintenance practices of a small commercial airline were studied. Engines with known Times Since Overhaul (TSO) were selected and operating hours on the filters were controlled at 50 and 100 hours. The differences in filter pressure drops and particle contamination levels were recorded and a spectrometric analysis was performed on an oil sample from each oil change. The practices evaluated are satisfactory for both the 50 and 100 hours filter periods. The oil spectrometric analyses showed little oil degradation and no relationship between TSO and the recorded data could be obtained (Author)

A75-36652 Thrust reversers for the TFE-731 turbofan W K Greathouse and S F Martin (Grumman Aerospace Corp., Bethpage, N Y) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan, Apr 8-11, 1975, Paper 750506* 26 p

Improved design features have made the pivoted target thrust reverser concept most attractive for modern small turbofans with coaxial flow exhaust systems. These aerodynamic, mechanical and structural design improvements provide 40% or more reverse thrust effectiveness in a simple, light weight, low cost unit that has clean aerodynamic lines and minimum effect on engine performance. The pivoted target thrust reverser system, under development at Grumman for the AiResearch TFE-731 2 and -3 engines, is described. Applications include the IAI Westwind 1124, the Gates Learjet 35/36 and the Dassault Falcon 10 aircraft (Author)

A75-36655 Regional fatigue environment study for commuter airlines M G Nagati and M G Huff (Beech Aircraft Corp., Wichita, Kan) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan, Apr 8-11, 1975, Paper 750512* 7 p

An investigation involving the acquisition and the processing of pertinent data was conducted to determine a safe wing fatigue life for an aircraft operated in a localized area. The aircraft used in the investigation included Beechcraft Models 99, 99A, A99A, and B99 airliners. Readings from a counting accelerometer (fatigue meter) were collected over 12 months to cover all four seasons. It was found that, except for a few extreme cases, the normalized fatigue lives fell within a narrow scatter band for each regional area considered. G R

A75-36656 The B-1 structural integrity program G P Haviland (Rockwell International Corp., El Segundo, Calif) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan, Apr 8-11, 1975, Paper 750514* 10 p

The general characteristics of the B-1 structural integrity program for assuring airframe integrity are described. The program features design verification tests and a limit load, full-scale proof test instead of a full scale static test to ultimate. The combination of the large specimen tests to ultimate, and correlation of test results with the analyses will provide a good measure of how much growth is in the airframe. P T H

A75-36657 New directions in aircraft propulsor noise research F B Metzger and B Magliozzi (United Aircraft Corp., Hamilton Standard Div., Windsor Locks, Conn) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan, Apr 8-11, 1975, Paper 750515* 13 p 33 refs

Propellers and fans have in the past been tested under static conditions to provide test data for comparison with noise predicted using empirical or theoretically based procedures. This has resulted in noise prediction methodology adjusted to correlate with static test data. Recent tests have shown that the noise of propulsors in flight differs significantly from propulsors tested statically. This paper discusses the current knowledge of propulsor noise from an experimental and analytical standpoint in both static and forward flight operating regimes. Also, the advantages and disadvantages of various approaches to conducting definitive forward flight tests are presented. Emphasis is placed on evaluation of propellers and fans operating at subsonic tip speeds where experimental and theoretical developments can most easily be applied. (Author)

A75-36658 * Factors affecting the noise from small propeller driven aircraft D J Maglieri and H H Hubbard (NASA, Washington, D C) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan, Apr 8-11, 1975, Paper 750516* 9 p 21 refs

The factors affecting noise from small propeller driven airplanes are reviewed to quantify their effects where possible, and to indicate the potential for noise reduction. The main sources of external noise are noted to be the propellers and engines, the airframe being of less importance for both aural detection and community annoyance. Propeller noise is a strong function of tip speed and is affected adversely by nonuniform inflows. Reciprocating engine exhausts are noisier than those of comparably rated turboshaft engines, but their noise can be reduced by the use of flight certified exhaust mufflers. Presently, there are no generally accepted engineering methods for development of optimized propellers and exhaust muffler designs from weight and performance penalty standpoints. Flight demonstration results, however, suggest that required noise reductions for future certification should be possible with potentially small penalties. (Author)

A75-36660 Commercial developments in airborne VLF navigation A B Elliott (Global Navigation, Inc) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan, Apr 8-11, 1975, Paper 750518* 10 p 10 refs

Systems utilizing phase-stable transmissions of VLF communications stations and unique frequency transmissions available from some of the Omega network stations are discussed. Phase comparison techniques have been used to derive the navigational information. Advances in semiconductor and integrated circuit technology, coupled with a growing need for inexpensive long-range and remote area navigation capability, made commercial embodiment of VLF phase comparison systems possible. Emphasis in the current work is on airborne VLF systems. S J M

A75-36661 * Propeller modulation effects on a scanning-beam microwave landing system J M Pope (NASA, Ames Research Center, Moffett Field, Calif) and W N Staehle (NASA, Ames Research Center, Moffett Field, Calif, Raytheon Co., Equipment Div., Sudbury, Mass) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan, Apr 8-11, 1975, Paper 750521* 12 p 13 refs

The results of a systems study and ground test of the effects of propeller modulation on a time-multiplexed, scanning-beam microwave landing system (MLS) are presented. Propeller modulation effects are analyzed in terms of spacing between receiving antenna and propeller, propeller blade width, and propeller speed. Principal study conclusions: (1) scanning beam MLS is susceptible to errors due to synchronous propeller modulation, (2) the number of synchronous interference multiples increases as the number of propeller blades increases and as the data rate decreases, (3) the probability of synchronous interference decreases at higher data rates, and (4) MLS receiver susceptibility to propeller modulation depends upon the dynamic response of the receiver automatic gain control and the respective tracking loops. (Author)

A75-36663 * Wind tunnel and flight development of spoilers for general aviation aircraft W H Wentz, Jr, H C Seetharam (Wichita State University, Wichita, Kan), and J T Calhoun (Robertson Aircraft Corp., Renton, Wash) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan, Apr 8-11, 1975, Paper 750523* 12 p 6 refs. NASA-sponsored research

Wind tunnel tests have been carried out to develop a spoiler lateral control system for use with the GA(W)-1 airfoil with a 30% Fowler flap. Tests show that unfavorable aerodynamic interactions can occur between spoiler and flap for large flap deflections. Providing venting of lower surface air through the spoiler opening substantially improves performance. Results of tests with a number of spoiler and cavity shapes are presented and discussed. Applications of two-dimensional wind tunnel results to the design of satisfactory manual lateral control systems are discussed. (Author)

A75-36664 * Design of low-speed airfoils by numerical optimization R M Hicks and G N Vanderplaats (NASA, Ames Research Center, Moffett Field, Calif) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan , Apr 8-11, 1975, Paper 750524* 14 p 7 refs

A practical procedure for the optimum design of low-speed airfoils is demonstrated The procedure uses an optimization program based on a gradient algorithm coupled with an aerodynamic analysis program that uses a relaxation solution of the inviscid, full-potential equation The analysis program is valid for both incompressible and compressible flow, thereby making optimum design of high-speed, shock-free airfoils possible Results are presented for the following three constrained optimization problems at fixed angle of attack and Mach number (1) adverse pressure-gradient minimization, (2) pitching-moment minimization, and (3) lift maximization All three optimization problems were studied with various aerodynamic and geometric constraints (Author)

A75-36665 Drag analysis methods for light aircraft F O Smetana and D C Summey (North Carolina State University, Raleigh, N C) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan , Apr 8 11, 1975, Paper 750526* 11 p 10 refs

Questions regarding the analysis of two- and three-dimensional wing characteristics are considered, taking into account the vortex distribution procedure and aspects regarding a suitable location of the stagnation point Modifications required in an available computer program are discussed along with the study of fuselage characteristics, problems of wing-tail interference, and methods of flight verification It is concluded that the considered approach appears to offer a reliable means of determining both thrust horsepower and aircraft drag at the same time with a minimum of flight time G R

A75-36666 * An in-flight investigation of nonlinear roll control D R Ellis and N W Tilak (Princeton University, Princeton, N J) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan , Apr 8-11, 1975, Paper 750528* 6 p NASA-supported research

An in flight simulation was undertaken to study the piloting problems associated with a type of nonlinear control effectiveness which is characteristic of spoiler roll control systems Typically, the initial response is small or even zero, followed by a narrow region of highly effective control, and a final one of moderate effectiveness Results for the landing flare and touchdown, which turned out to be the critical flight phase, indicate that a substantial amount of dead zone and changing effectiveness can be tolerated, but the best level of handling is obtained with linear, aileron like control (Author)

A75-36667 Flight mechanics and pilot evaluation of conventional landings E Seckel and P H Whyte (Princeton University, Princeton, N J) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan , Apr 8 11, 1975, Paper 750529* 9 p

The results are given of an extensive investigation of conventional landing flares in general aviation type airplanes Experimental landings in a variable stability Navion have simulated a wide range of parameters influencing flare behavior The most important feature of the flare has turned out to be the airplane's deceleration in the flare, and it has been found to be possible to correlate various effects on this in terms of the average flare load factor Certain kinds of ground effects are found to be favorable, if they are small and in the right combination Piloting technique is extensively discussed Certain implications for design are presented (Author)

A75-36669 Damage resistance of high modulus aramid fiber composites in aircraft applications J C Norman (Du Pont de Nemours and Co , Inc , Wilmington, Del) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan , Apr 8-11, 1975, Paper 750532* 11 p 5 refs

Analyses of impact resistance are made for composites reinforced with fibers of high modulus aramid, glass, graphite, and graphite/high modulus aramid hybrids which indicate that the aramid fiber offers advantages over the other materials in thin laminate specimens when measured by Charpy, Izod, and ball drop impact tests while retaining some structural integrity Use of the high modulus aramid fiber as a hybrid with graphite resulted in higher impact energy resistance than the all-graphite fiber composite The fracture characteristics of notched quasi isotropic high modulus aramid, E-glass, and A-S graphite epoxy lamina and of notched fabric epoxy lamina of aramid and of glass are analyzed Aramid showed the highest fracture resistance, followed by glass and graphite

(Author)

A75-36670 Graphite composite materials applications in aircraft structures S L Cross (Hercules, Inc , Wilmington, Del) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan , Apr 8-11, 1975, Paper 750533* 12 p 13 refs

Aircraft components using graphite composite materials include spoilers, rudders, and ailerons Unlike homogeneous metals, the properties of fiber reinforced composites are directionally dependent on the fiber orientation A composite construction design can, therefore, be selected which will best suit the load-carrying requirements The material characteristics are considered, taking into account strength, stiffness, fatigue, environment, and impact and damage tolerance Questions of fabrication technology are discussed, giving attention to raw material and component fabrication Material cost trends are also briefly investigated G R

A75-36671 Ducted propulsors - Progress in the United Kingdom D G M Davis (Dowty Rotor, Ltd , Gloucester, Glos , England) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan , Apr 8-11, 1975, Paper 750534* 12 p

The relative merits of the ducted propulsor are examined, taking into account a general correlation of velocity and noise Propeller diameter must be increased as tip speed is reduced below a given value in order to avoid the imparting of excessive rotational energy to air It is found that the ducted propulsor provides a more cost effective approach for meeting noise regulations than the conventional propeller Experimental work related to ducted propulsors is discussed along with low speed fan rig tests, wind tunnel tests, and plans for further development work G R

A75-36672 Low emission, water-tolerant combustor for a small, all-weather turboshaft gas turbine engine R M Wood, J G Tomlinson, D L Troth, and J J Petraits (General Motors Corp , Detroit Diesel Allison Div , Detroit, Mich) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan , Apr 8-11, 1975, Paper 750535* 12 p

An experimental program has been conducted to select a combustion system design for the 500 shp Model 250-C28 turboshaft/turboprop engine A prototype prechamber combustor configuration developed from this program demonstrates compliance with the significantly reduced environmental pollution requirements defined by 1979 EPA standards and is capable of operating under environmental conditions exceeding natural, all weather flight operation S J M

A75-36673 A second generation turbo-prop power plant J B Houston and D F Black (de Havilland Aircraft of Canada, Ltd , Downsview, Ontario, Canada) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan , Apr 8 11, 1975, Paper 750536* 9 p

A survey of the design concepts and features of the powerplant installation in the de Havilland Aircraft of Canada Dash 7 is presented The Dash 7 is a 50 passenger, four-engined turboprop STOL aircraft The UACL PT6 A 50 engines, their mountings, intakes and control systems are described The construction and

A75-36675

control system of the Hamilton Standard 24 PF propellers are discussed. A brief description of the accessory systems concludes the paper (Author)

A75-36675 * Discussion of an aeromechanical gust alleviation system to improve the ride comfort of light airplanes E C Stewart (NASA, Langley Research Center, Hampton, Va.) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan., Apr 8-11, 1975, Paper 750544* 15 p 5 refs

A discussion of an on-going NASA research project of a gust alleviation system to improve the ride comfort of a light airplane is presented. The discussion includes a description of the proposed system which uses auxiliary aerodynamic surfaces to drive the trailing-edge flaps. The results of analytical work on the effects of the system on stability and effectiveness of the system are presented. Static wind tunnel tests of the system installed in a 1/6 scale model of a popular light airplane are also described. Problem areas which may need future investigation are discussed (Author)

A75-36676 Some ideas of vortex lift W A Kasper *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan., Apr 8-11, 1975, Paper 750547* 12 p

In tests on a glider designed for experimenting with vortex generated lift, the author experienced an unknown phenomenon which kept the glider afloat at half the usual sink rate and stalling speed. After study it was realized that a huge vortex had been forming after the stall which explained the presence of additional lift at high angles of attack and low speeds. The implications that this discovery has in terms of improving the slow speed characteristics of airplanes are explained in the paper in addition to a detailed study of the characteristics of this vortex (Author)

A75-36677 * Technology for reducing aircraft engine pollution R A Rudey and E E Kempke, Jr (NASA, Lewis Research Center, Cleveland, Ohio) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan., Apr 8-11, 1975, Paper 750550* 37 p 11 refs

Programs have been initiated by NASA to develop and demonstrate advanced technology for reducing aircraft gas turbine and piston engine pollutant emissions. These programs encompass engines currently in use for a wide variety of aircraft from widebody-jets to general aviation. Emission goals for these programs are consistent with the established EPA standards. Full-scale engine demonstrations of the most promising pollutant reduction techniques are planned within the next three years. Preliminary tests of advanced technology gas turbine engine combustors indicate that significant reductions in all major pollutant emissions should be attainable in present generation aircraft engines without adverse effects on fuel consumption. Fundamental-type programs are yielding results which indicate that future generation gas turbine aircraft engines may be able to utilize extremely low pollutant emission combustion systems (Author)

A75-36678 * NASA General Aviation Research overview - 1975 R L Winblade and J A Westfall (NASA, Washington, D C) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan., Apr 8-11, 1975, Paper 750500* 67 p 91 refs

An overview of the 1975 NASA Research and Technology efforts directly focused on general aviation is presented. Current status and accomplishments during the past year are described. An updated bibliography of technical reports generated by the NASA program, including seven recently declassified reports on airplane noise reduction, is included as an Appendix to this report (Author)

A75-36679 Handling and performance characteristics of swept-forward flying wing aircraft J J Marske (Marske Aircraft Propeller Driven Aircraft) D J Maglieri and H H Hubbard (NASA, Washington, D C) *Society of Automotive Engineers, Business Aircraft Meeting, Wichita, Kan., Apr 8-11, 1975, Paper 750516* 9 p 21 refs

The factors affecting noise from small propeller driven airplanes are reviewed to quantify their effects where possible, and to indicate the potential for noise reduction. The main sources of external noise are noted to be the propellers and engines, the airframe being of less importance for both aural detection and community annoyance. Propeller noise is a strong function of tip speed and is affected adversely by nonuniform inflows. Reciprocating engine exhausts are noisier than those of comparably rated turboshaft engines, but their noise can be reduced by the use of flight certified exhaust mufflers. Presently, there are no generally accepted engineering methods for development of optimized propellers and exhaust muffler designs from weight and performance penalty standpoints. Flight demonstration results, however, suggest that required noise reductions for future certification should be possible with potentially small penalties (Author)

A75-36718 European industry and civil air transport /28th Louis Blériot Lecture/ P Lecomte (Societe Nationale Industrielle Aerospatiale, Paris, France) *Aeronautical Journal*, vol 79, May 1975, p 189-197 5 refs

A historical overview of the Western European aircraft industry, the article characterizes the development, current problems and future objectives of public transport aircraft of moderate capacity (40 or more passengers). Europe has the necessary expertise and research establishment to meet the requirements and the needs of the 1980's aircraft. A cooperative, inter-European undertaking, charging a single organization (originating from all the constructors) with (1) the commercial and financial role for all products, namely sales and product support, (2) overall planning and distribution of work amongst the constructors to achieve the best possible workload continuity, and (3) progressive standardization of methods and products is suggested for the European aircraft industry M G

A75-36719 Alternative fuels for aviation E M Goodger (Cranfield Institute of Technology, Cranfield, Beds., England) *Aeronautical Journal*, vol 79, May 1975, p 212-224 17 refs

Overall characteristics of alternative fuels, proposed to meet the desired technological improvements are discussed, together with the feasibility of using these possible replacements for petroleum products in the aviation industry. Low and high density fuels, hydride fuels, carbon containing fuels, vaporising and/or endothermically reacting fuels, hydrocarbon fuels, aromatic mixtures, liquid methane, liquid hydrogen, nitrogen hydrides, alcohols, nuclear fuels, and various mixtures are analyzed for their performance, levels of volumetric and combined gravimetric energy densities, handling safety, pollution, thermal stability and capacity, and availability M G

A75-36720 Evaluation of the overall fuel mass penalty of an aircraft system R Le Claire (Hawker Siddeley Aviation, Ltd., Kingston-on-Thames, Surrey, England) *Aeronautical Journal*, vol 79, May 1975, p 225-228

A method for evaluating the fuel mass penalty incurred in flight after fitment of a system to an aircraft is discussed. The relative importance of the parameters involved in the method are shown, in particular, the relationship between fuel penalty due to system basic mass and that due to system drag. It is concluded that fuel penalty associated with drag is significantly more critical than that due to weight, therefore any drag reduction (without an increase in basic system mass) would result in substantial fuel savings and possibly increased payload M G

A75-36765 Awacs - Boeing's radar patroller S Broadbent *Flight International*, vol 107, June 26, 1975, p 993-1000

Moving targets can be detected and analyzed within a 200 mile radius and data can be relayed to the ground by the Boeing E-3A

aircraft, known as Awacs (Airborne Warning and Control System), using a planar array coupled to a digital computer in a Boeing 707 airframe. The historical development, aircraft structure, aerodynamics and radar operation of the Awacs are discussed. The surveillance radar equipment can operate in 7 modes including Pulse-Doppler Non-elevation Scan, Pulse-Doppler Elevation Scan, Beyond the Horizon, Passive and Maritime. The nine multi-purpose consoles which analyze the data collected by the radar antenna in the rotodome, are shown together with other operational equipment and the environmental system. M G

A75-36848 # Technical diagnostics in aircraft maintenance (*Technische Diagnostik in der Flugzeuginstandhaltung*) L Brehmer (Hochschule für Verkehrswesen, Dresden, East Germany) *Technisch-ökonomische Information der zivilen Luftfahrt*, vol 11, no 2, 1975, p 66-78. In German

The objectives of technical diagnostic procedures in aircraft maintenance operations are considered along with questions regarding the significance and the range of applications of such procedures. Modern technical inspection methods include approaches related to holography, thermography, acoustic emission, and spectrometric oil analyses. Details concerning an inspection method based on holography are discussed and a description of approaches based on thermography is given. G R

A75-36849 # Aviation in undulating flow - The Dolphin principle, its technical implementation, and its application in aviation (*Luftfahrt in gewellter Strömung. Das Delphin-Prinzip, seine technische Umsetzung und Anwendung in der Luftfahrt*) U Queck (Kammer der Technik, Berlin, East Germany) *Technisch-ökonomische Information der zivilen Luftfahrt*, vol 11, no 2, 1975, p 83-101. 28 refs. In German

It is pointed out that the principle of undulating propulsion has found general application in biology for movements of animals in water and in air. The operational procedures of aviation, on the other hand, are currently exclusively based on the principle of the reaction drive. It is claimed that the reasons for this development are related to the incomplete form of the present theory of flight mechanics which is restricted in its considerations to certain areas of aerodynamics. The possibility for the design of a vehicle based on novel operational principles is considered, giving attention to a vehicle which will optimally combine the advantages of an aircraft, an airship, and a helicopter. The principles utilized in the locomotion of a dolphin are discussed along with details concerning the flight of birds and insects. G R

A75-36850 # Specific properties of high-strength and heat-resistant wrought aluminum alloys and the consideration of these properties in the maintenance of aircraft II (*Spezifische Eigenschaften hoch- und warmfester Al-Knetlegierungen und deren Beachtung bei der Instandhaltung von Flugzeugen II*) L Ahnert (VEB Kombinat Spezialtechnik, Dresden, East Germany) *Technisch-ökonomische Information der zivilen Luftfahrt*, vol 11, no 2, 1975, p 107-116. 28 refs. In German

Approaches to be used in a description of material sensitivity against intercrystalline corrosion are examined, taking into account differences in the properties of alloys based on AlCuMg and AlZnMgCu and the effects of heat treatment and rate of cooling. Questions related to the material characteristics in the case of stress corrosion are also discussed along with the significance of internal stresses and their consideration. G R

A75-36888 # Performance of three vaned radial diffusers with swirling transonic flow. S Baghdadi (General Motors Corp., Detroit Diesel Allison Div., Indianapolis, Ind.) and A T McDonald (Purdue University, West Lafayette, Ind.) *American Society of Mechanical Engineers, Joint Fluids Engineering and Lubrication Conference, Minneapolis, Minn., May 5-7, 1975, Paper 75-FE-19*. 8 p. 12 refs. Members, \$1 00, nonmembers, \$3 00

A unique vortex nozzle facility has been conceived and developed to simulate the exit flow from a high pressure ratio centrifugal compressor impeller. Visual studies and performance measurements have been made for three vane sets representing common designs for vaned radial diffusers. Motion pictures show the progression from choke through operating to surge conditions as the back pressure on the diffuser is increased. The films, together with total and static pressure measurements, indicate that surge is an instability triggered by flow separation in the vaneless or quasi-vaneless space ahead of the diffuser throat. A geometrical criterion for the onset of surge is identified. The surge-to-choke operating range of the three diffusers appears to be a function of the number of diffuser vanes only. (Author)

A75-36890 # Transonic flow around rotor blade elements. J W Kurzrock and A S Novick (General Motors Corp., Detroit Diesel Allison Div., Indianapolis, Ind.) *American Society of Mechanical Engineers, Joint Fluids Engineering and Lubrication Conference, Minneapolis, Minn., May 5-7, 1975, Paper 75-FE-24*. 13 p. 23 refs. Members, \$1 00, nonmembers, \$3 00. Contract No. F33615-72-C 1098

An analytical/numerical method for calculating blade-to-blade transonic flow fields around blade elements of an axial compressor rotor of a turbomachine is presented. Radius variation and stream sheet convergence are included. The analysis considers the time-dependent Navier-Stokes equations in conservation law form which allows for viscous shock wave formation. A discretized method of characteristics is used to determine the boundary conditions along the blade surface and exit plane. An explicit, time-dependent, second-order, finite difference technique is utilized to numerically solve these partial differential equations in a transformed computational plane. Comparison of numerical results with cascade and rotor data indicate good agreement for blade surface pressure distributions and mixed-out exit conditions. (Author)

A75-36896 # Uniform shear flow within rectangular parallel-walled diffusers. S Masuda, I Ariga (Keio University, Tokyo, Japan), and I Watanabe (Aoyama Gakuin University, Tokyo, Japan) *American Society of Mechanical Engineers, Joint Fluids Engineering and Lubrication Conference, Minneapolis, Minn., May 5-7, 1975, Paper 75-FE-34*. 10 p. 14 refs. Members, \$1 00, nonmembers, \$3 00

In the present paper, the previous results concerning the effects of uniform shear flows within the rectangular parallel-walled diffusers were extended to the low inlet turbulence case and also the effect of viscosity was included. Low turbulence shear flows were generated and it was found that the coupled effects of the inlet mean velocity profile and the inlet turbulence intensity were so important that the former alone gave little information in predicting the diffuser performance. Furthermore, the effects of uniform shear flow upon the turbulent boundary layer growth on the diffuser walls were examined. It was revealed that the boundary layer grew more rapidly on the low velocity wall than on the high velocity wall and these effects became more remarkable with an increasing divergence angle. The predicted static pressure recovery and other boundary layer parameters agreed well with the experimental results except in the cases where the inlet velocity gradient and the divergence angle were large. (Author)

A75-36899 # A three-dimensional method for the calculation of flow in turbomachines using finite elements on a blade-to-blade surface of revolution. C Korving Delft, Technische Hogeschool, Doctor in de Technische Wetenschappen. Dissertation, 1974. 120 p. 12 refs.

A mathematical method is presented showing that complex fluid flows in turbomachines can be analyzed by a three-dimensional approach. The method is characterized by an approximation technique providing results whose accuracy is independent of the geometry of the impeller, the blade shape, and the number of blades. Moreover, it features a low computation time and a small amount of storage required to calculate the blade velocity distribution on a computer. S J M

A75-36951 **Omega Symposium, 2nd, Washington, D C, November 5-7, 1974, Proceedings** Symposium sponsored by the Institute of Navigation Washington, D C, Institute of Navigation, 1974 221 p Members, \$25, nonmembers, \$30

Aspects of Omega signal coverage prediction are considered along with accuracy specifications for automatic Omega navigators, Omega navigation systems specification and performance measurement, a computerized integrated Omega position fixing system, and a differential Omega in the air traffic control environment Attention is given to results concerning a parametric analysis of differential Omega error, an evaluation of differential Omega for general aviation area navigation, airborne Omega navigation system integration, the error characteristics of Omega-derived velocity, and digital phase processing for low cost Omega receivers

G R

A75-36952 # **Omega signal coverage prediction** J E Bortz, Sr., R R Gupta (Analytic Sciences Corp., Reading, Mass.), D C Scull, and P B Morris (U S Coast Guard, Washington, D C) In Omega Symposium, 2nd, Washington, D C, November 5-7, 1974, Proceedings Washington, D C, Institute of Navigation, 1974, p 1-8

A set of coverage prediction diagrams is presented for the 10 2 kHz signal from each OMEGA transmitter The diagrams show the -20 dB signal-to-noise ratio contours (in a 100 Hz noise bandwidth) for both local noon and local midnight Composite diagrams are also presented on which all individual -20 dB contours are plotted for the current transmitter network for local noon and for local midnight Similar diagrams are presented for the planned full OMEGA operational network A full-wave signal-propagation computer program was employed to generate signal strength profiles along radial paths from each transmitter Noise values from the CCIR noise map were applied to the profiles Sensitivity tables showing the shifts that result from small changes in transmitted power or from seasonal variations in the noise power are also included (Author)

A75-36953 # **Accuracy specifications for automatic Omega navigators** F C Sakran, Jr (U S Naval Air Test Center, Patuxent River, Md) In Omega Symposium, 2nd, Washington, D C, November 5 7, 1974, Proceedings Washington, D C, Institute of Navigation, 1974, p 9-20 13 refs

Fully automatic Omega navigation systems have been demonstrated and are beginning to be used operationally in aircraft and other vehicles A natural question is the accuracy achieved by such systems Concern over the probability of maintaining correct lane identification complicates this question Use of the root-mean square (rms) statistic is shown to be a misleading measure of operational performance Alternate methods of specifying the navigational errors of automatic Omega navigators are discussed Cumulative percentile plots are recommended for the specification of errors Use of Weibull probability paper to study radial error trends is demonstrated Illustrations of error analysis techniques are given, based on actual Omega flight test data (Author)

A75-36954 # **Experimental Omega four frequency format extends lane ambiguity** W E Rupp, Jr (U S Naval Air Test Center, Patuxent River, Md) In Omega Symposium, 2nd, Washington, D C, November 5-7, 1974, Proceedings Washington, D C, Institute of Navigation, 1974, p 21 29

A Global Rescue Alarm Net (GRAN) program has been conducted with the objective to develop a global universally acceptable search and rescue system A very serious limitation in the adaptation of the Omega Navigation System is the possibility of ambiguously provided position estimates inherent in the transmission format now committed for implementation Multiple position estimates are separated by only 72 nautical miles The part of the GRAN program which is directed at extending this distance between ambiguously indicated positions is discussed G R

A75-36955 * # **A comprehensive experimental program for investigation of various Omega operational modes with selected data analysis results** C D Lytle, E S Bradshaw (NASA, Langley Research Center, Hampton, Va), and L J Jowers (LTV Aerospace Corp., Hampton, Va) In Omega Symposium, 2nd, Washington, D C, November 5-7, 1974, Proceedings Washington, D C, Institute of Navigation, 1974, p 30-41 6 refs

The investigations considered are concerned with a better definition of the achievable accuracy and propagation characteristics of Omega and the provision of data which could be used for an analysis to study the potential application of Omega position determination to support other NASA projects The data collection program is considered along with the experimental equipment employed Attention is given to the design of the receiving station, aspects of data processing, position measurement errors, differential errors, problems of lane decision, and the definition of the update rate G R

A75-36956 # **Omega navigation systems specification and performance measurement** O J Baltzer and E C Fraser (Tracor, Inc., Austin, Tex) In Omega Symposium, 2nd, Washington, D C, November 5-7, 1974, Proceedings Washington, D C, Institute of Navigation, 1974, p 42 45

Attention is given to those areas in which the behavior of VLF systems differs markedly from that of more conventional radio systems The proposal is made to employ a standardized terminology and measurement procedures which will provide an accurate measure of a system's performance capability and permit valid comparisons between alternative systems It is pointed out that a performance specification for an Omega navigation system naturally divides into two parts, including an instrument accuracy specification and a navigational accuracy specification G R

A75-36957 # **Hand held calculator technology applied to an advanced Omega receiver** B N Gaon (Rockwell International Corp., Anaheim, Calif) In Omega Symposium, 2nd, Washington, D C, November 5 7, 1974, Proceedings Washington, D C, Institute of Navigation, 1974, p 62-67

An automatic Omega system which simplifies the standard Omega receiver/processor has been developed MOS/LSI micro processors are utilized to obtain a low cost, fully automatic composite airborne system The system functions are considered along with aspects of system mechanization and system performance The basic function of the Omega set is to determine the position by receiving and processing the Omega VLF transmissions The set has been designed to provide also steering information to preselected waypoints G R

A75-36958 # **Differential Omega in the air traffic control environment** H G Miller (Mitre Corp., McLean, Va) In Omega Symposium, 2nd, Washington, D C, November 5 7, 1974, Proceedings Washington, D C, Institute of Navigation, 1974, p 68-73 11 refs

Attention is given to the technical feasibility of implementing a differential Omega system which would provide complete coverage of the continental U S The monitor station configuration and location concepts are discussed along with the differential message format and differential Omega communications alternatives It is found that approximately fifty ground monitor stations would be required to implement a differential system for the domestic air space G R

A75-36959 * # **Recent results on parametric analysis of differential Omega error** E G Baxa, Jr and P V Piserchia (Research Triangle Institute, Research Triangle Park, N C) In Omega Symposium, 2nd, Washington, D C, November 5-7, 1974, Proceedings Washington, D C, Institute of Navigation, 1974, p 74-84 22 refs Contracts No NAS1-12043, No NAS1-13290

Previous tests of the differential Omega concept and an analysis of the characteristics of VLF propagation make it possible to delineate various factors which might contribute to the variation of errors in phase measurements at an Omega receiver site. An experimental investigation is conducted to determine the effect of each of a number of parameters on differential Omega accuracy and to develop prediction equations. The differential Omega error form is considered and preliminary results are presented of the regression analysis used to study differential error. G R

A75-36960 * # An evaluation of differential Omega for general aviation area navigation. W M Hollister and S M Dodge (MIT, Cambridge, Mass.) In Omega Symposium, 2nd, Washington, D C, November 5-7, 1974, Proceedings, Washington, D C, Institute of Navigation, 1974, p 85-95 11 refs Grant No NGL-22-009-640

This paper reports on a study which compared the expected cost and performance of Differential Omega with that of Loran-C and VORTAC for general aviation area navigation. Analysis is directed toward a comparison of the systems with respect to specified performance parameters and the cost-effectiveness of each system in relation to the specifications. Loran-C offers the highest performance with respect to accuracy. Differential Omega requires the least expenditure. It was found cost ineffective to attempt to obtain complete coverage by expanding the existing VORTAC system. (Author)

A75-36961 # State of experimentations and program of development of Differential OMEGA in France. G Nard (Serce!, Nantes, France) In Omega Symposium, 2nd, Washington, D C, November 5-7, 1974, Proceedings, Washington, D C, Institute of Navigation, 1974, p 96-107h

A75-36962 # Alternative approaches to integrated airborne OMEGA/Inertial navigation. D E Gentry, J A D'Appolito, and J F Kasper, Jr (Analytic Sciences Corp, Reading, Mass.) In Omega Symposium, 2nd, Washington, D C, November 5-7, 1974, Proceedings, Washington, D C, Institute of Navigation, 1974, p 108-110, 112, 113 11 refs

Integrated OMEGA/Inertial navigation systems appear attractive in airborne applications since the excellent short-term accuracy of an inertial navigator is well-complemented by the intermittent availability of bounded, moderately accurate OMEGA position fixes. There are a number of different approaches which can be taken to accomplish the desired system integration, three such approaches are considered. The first involves a straightforward output reset, the second is essentially a Kalman-based variant of rate-aiding and the third involves conventional optimal integration. These schemes are evaluated using models for various navigation system errors to yield predictions of system position and velocity error behavior. Additionally, the schemes are compared on the basis of operational factors such as ease of implementation and computer utilization. (Author)

A75-36963 # Airborne Omega navigation system integration and test. R L Fischer (Northrop Corp, Electronics Div, Hawthorne, Calif.) In Omega Symposium, 2nd, Washington, D C, November 5-7, 1974, Proceedings, Washington, D C, Institute of Navigation, 1974, p 114-121

The integration and test of an airborne multi-sensor (Omega-inertial-Doppler) navigation system is described with an emphasis on the systematic approach required for proper testing of major hardware/software elements that comprise the system. A systematic approach to integration, testing and evaluation of the major hardware/software elements of Omega signal measurement with other navigation sensors is reviewed. The paper includes a description of the simulation techniques utilized to verify system design and the integration of Omega derived information with data from other navigational sensors by a Kalman combinational filter, providing optimal system performance. The modular concept of integration and test, using combinations of Omega, inertial, Doppler, and aircraft

sensor signal simulations with the systems under test, is treated with the development of the system traced through the early stages of the flight test program. (Author)

A75-36964 # Mix and match - A hybrid Omega-Inertial airborne navigation system. D E Steybe (Northrop Corp, Electronics Div, Hawthorne, Calif.) In Omega Symposium, 2nd, Washington, D C, November 5-7, 1974, Proceedings, Washington, D C, Institute of Navigation, 1974, p 122-126

The hybrid system considered provides the navigation data for use in the Airborne Weather Reconnaissance System. The navigation quantities needed include latitude, longitude, attitude including accurate heading, and instantaneous velocity relative to the ground. In conjunction with true airspeed this velocity is used to compute instantaneous wind velocity. The main technical problem concerning the implementation of the system was related to the development of a mechanization which would best combine the system components to achieve the desired navigation performance. G R

A75-36965 # An empirical computed evaluation of composite Omega. D Mactaggart (Canadian Marconi Co, Montreal, Canada) In Omega Symposium, 2nd, Washington, D C, November 5-7, 1974, Proceedings, Washington, D C, Institute of Navigation, 1974, p 131-138

Computer modelling is used to demonstrate that the composite Omega technique considered is viable. The composite model is discussed, taking into account advantages and disadvantages. The accuracy obtainable is found to be quite adequate for most general navigation uses. It is pointed out that this capability is derived from fully legitimate signals intended and provided for navigation use. G R

A75-36966 # Flight test of ARN-99/V/2 Omega Navigation Set in F-4 aircraft. E J Smith (Northrop Corp, Hawthorne, Calif.) In Omega Symposium, 2nd, Washington, D C, November 5-7, 1974, Proceedings, Washington, D C, Institute of Navigation, 1974, p 139-142

Previous evaluation programs of the navigation set considered have produced excellent results in the case of multiengine aircraft operating in the subsonic flight regimes. The investigation reported was conducted to test the extension of the operational use of the navigation set to the tactical and supersonic flight regimes. To date 12 flights have been completed. The test results demonstrate the ability of the AN/ARN-99 to provide accurate navigation in a tactical aircraft under both normal and high maneuver environments. G R

A75-36967 # Airborne ONS - A low cost alternate to INS. N C Dickerson, Jr and W J Judge (Litton Systems, Inc, Amecom Div, College Park, Md.) In Omega Symposium, 2nd, Washington, D C, November 5-7, 1974, Proceedings, Washington, D C, Institute of Navigation, 1974, p 143-153

Anticipation of the expanded market made possible through the worldwide implementation of the Omega transmitting system and its obvious economic advantages for intercontinental navigation has spurred the development and testing of low cost airborne Omega Navigation Systems for the guidance and steering of military and commercial aircraft. The development of the ONS-201 by Litton addresses the problem of navigating an aircraft from takeoff to destination and providing continuous in-flight navigational output to the pilot/navigator. The basic intent of the development was to design a system which could provide the same navigational guidance as is currently provided by airborne inertial navigation systems. The results of flight tests aboard commercial and military aircraft indicate that all of the designed goals were achieved and that the system can be operated without extensive training by pilots already familiar with operations of inertial navigation systems such as Litton's LTN 72. (Author)

A75-36968 * # Binary phase locked loops for Omega receivers. K Chamberlin (Ohio University, Athens, Ohio) In Omega

Symposium, 2nd, Washington, D C , November 5-7, 1974, Proceedings Washington, D C , Institute of Navigation, 1974, p 154-159 7 refs Grant No NGR-36-009-017

An all-digital phase lock loop (PLL) is considered because of a number of problems inherent in an employment of analog PLL. The digital PLL design presented solves these problems. A single loop measures all eight Omega time slots. Memory-aiding leads to the name of this design, the memory-aided phase lock loop (MAPLL). Basic operating principles are discussed and the superiority of MAPLL over the conventional digital phase lock loop with regard to the operational efficiency for Omega applications is demonstrated.

G R

A75-36969 * # Binary processing and display concepts for low-cost Omega receivers R W Lilley (Ohio University, Athens, Ohio) In Omega Symposium, 2nd, Washington, D C , November 5-7, 1974, Proceedings Washington, D C , Institute of Navigation, 1974, p 160-167 Grant No NGR-36-009-017

A description is given of concepts related to plans for developing a low-cost, all-digital Omega receiver capable of offering to the small-aircraft pilot a reliable and accurate navigation aid. The receiver base considered includes a receiver front end module, a receiver control module, a memory-aided phase-locked loop module, a housekeeping timer module, and a synthesizer module.

G R

A75-36970 # Digital phase processing for low-cost Omega receivers D B Cox, Jr, W H Lee, W M Stonestreet (Charles Stark Draper Laboratory, Inc, Cambridge, Mass), and E V Harrington, Jr (USAF, Avionics Laboratory, Wright-Patterson AFB, Ohio) In Omega Symposium, 2nd, Washington, D C , November 5-7, 1974, Proceedings Washington, D C , Institute of Navigation, 1974, p 168-177 8 refs Contract No F33615-72-C-1335 AF Task 2,1

The functional organization of an Omega receiver incorporating serial digital phase filters (SDPF's) is considered along with operational and design details for an SDPF. It is shown that the SDPF is suitable for filtering and analog-to-digital conversion of the phase information from the front end of an Omega receiver. The SDPF performs its functions well in tracking and synchronization modes in a variety of environments. The SDPF is also found to be an unusually efficient processor which can be utilized cost-effectively to reduce the computing load on a general-purpose microprocessor.

A75-36971 * # On observations of modal interference of the North Dakota Omega transmission E G Baxa, Jr (Research Triangle Institute, Research Triangle Park, N C) and C D Lytle (NASA, Langley Research Center, Hampton, Va) In Omega Symposium, 2nd, Washington, D C , November 5-7, 1974, Proceedings Washington, D C , Institute of Navigation, 1974, p 188-197 13 refs Contracts No NAS1 12043, No NAS1-13290

Phase perturbations due to apparent modal interference make a distinctive contribution to the navigation error according to an evaluation of Omega navigation accuracies. In general the North Dakota VLF Omega signal phase has been observed to lag consistently at virtually all of the receiver sites considered. Attention is given to modal excitation in a spherical waveguide and the sensitivity of receiver phase to parameter variations. It is found that the large phase fluctuations which have occurred at night at ranges from North Dakota could deteriorate navigation accuracies particularly in and near the coastal confluence regions.

G R

A75-36972 # Blunders caused by Omega propagation - SPA's and PCA's E R Swanson (U S Naval Electronics Laboratory Center, San Diego, Calif) In Omega Symposium, 2nd, Washington, D C , November 5-7, 1974, Proceedings Washington, D C , Institute of Navigation, 1974, p 202-206 11 refs

Omega errors beyond the 95th percentile are primarily the result of Sudden Phase Anomalies (SPA's) due to Sudden Ionospheric

Disturbances (SID's) and Polar Cap Absorptions (PCA's) due to particle precipitation toward the magnetic poles resulting from certain solar flares. The statistical significance of these events is assessed. (Author)

A75-36973 # Evaluation of real-time algorithms for Omega propagation prediction A N Beavers, Jr, D E Gentry, and J F Kasper, Jr (Analytic Sciences Corp, Reading, Mass) In Omega Symposium, 2nd, Washington, D C , November 5-7, 1974, Proceedings Washington, D C , Institute of Navigation, 1974, p 207-212 8 refs

Approaches for the automatic computation of predicted propagation corrections (PPC's) in an Omega receiver are considered, taking into account the tabular storage of published PPC's, a simplified version of the existing propagation prediction process, and a functional approximation of PPC's and/or their individual components. The investigation shows that there are a number of excellent alternatives for Omega propagation prediction which are not inordinately burdensome computationally.

A75-36992 Results of an investigation of two three-dimensional low-level flight systems (Ergebnisse der Untersuchung zu zwei dreidimensionalen Tiefflugführungssystemen) A Hessel (Messerschmitt-Bolkow-Blohm GmbH, Ottobrunn, West Germany) (Deutsche Gesellschaft für Luft und Raumfahrt, Jahrestagung, 7th, Kiel, West Germany, Sept 17-19, 1974) *Zeitschrift für Flugwissenschaften*, vol 23, June 1975, p 189-196. In German.

A three-dimensional low-level flight system A, having automatic terrain-following and terrain avoidance capabilities, is compared to a system B. Terrain avoidance is achieved in system B by flying along preset waypoints. The performance of the systems was investigated by digital simulations using a three-dimensional model of natural terrain. It is demonstrated that both systems show equivalent avoidance capabilities. Essential differences are the increased number of waypoints necessary for system B and a simpler sensor. Compared to the simple terrain following, terrain avoidance means flying at a lower altitude above sea level. But the load factors have negligibly changed to lower ones. (Author)

A75-37002 # HASPA design and flight test objectives F J Petrone and P R Wessel (U S Naval Surface Weapons Center, Silver Spring, Md) *American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo , July 15-17, 1975, Paper 75-924* 12 p Navy-supported research

In the early Fall of 1975 the first of four scheduled flights to be conducted in the High Altitude Superpressured Powered Aerostat (HASPA) Program will take place. The vehicle is a remotely piloted airship of some 800,000 cubic feet volume which will operate at an altitude near 70,000 feet. This paper briefly describes the evolution of the concept and presents a general design overview. The propulsion system and the different power supplies to be used on the three powered flights are described. The power supplies are primary Ag/Zn batteries, an H₂/O₂ fuel cell, and a solar array-secondary battery combination. These units are to provide both operating power and propulsion power for nominal periods of 30 hours, 7 days, and 30 days respectively. The flight test objectives and test measurement programs are described along with the launch, flight and recovery procedures. Most of the equipment being used in the test program has been designed to allow for maximum use of existing hardware which will minimize the program length and cost. (Author)

A75-37003 # Development and flight experience of a manned thermal airship R R Parsons (Raven Industries, Inc., Sioux Falls, S Dak) *American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo , July 15-17, 1975, Paper 75-925* 6 p

A manned thermal airship has been developed. The airship is in the light payload class with a useful lift of 500 pounds. It has a true airspeed of 25 mph and duration of three hours. The airship uses hot air generated by on-board propane burners for its buoyancy medium.

By regulating the use of hot air, altitude control is achieved. An engine driven fan is used to keep the airship pressurized. The airship is propelled by a single propeller driven by a 65 hp aircraft engine. The airship was developed as a commercial venture with a wide range of uses. Flight tests have been performed and certification of the airship is underway. (Author)

A75-37004 # A balloon transport system H E Reed (Pan American World Airways, Inc., Patrick AFB, Fla.) *American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo., July 15-17, 1975, Paper 75-926* 8 p 27 refs ARPA-Navy-sponsored research

A presentation that describes the experiments and results obtained during a series of tests conducted to evaluate the feasibility of adapting the heavy lift natural-shape balloon, used commercially by the logging industry for the harvesting of timber, to off-load container ships in areas without prepared port facilities. Feasibility, operational concepts and plans, hardware definition and required critical studies and testing of such a balloon transport facility are discussed. (Author)

A75-37005 # A non-polluting powerplant for large airships F Morse (Boston University, Boston, Mass.) *American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo., July 15-17, 1975, Paper 75-927* 7 p 7 refs

A report is presented describing the features of an aircraft propulsion system which is characterized principally by (1) use of a Rankine cycle to transform chemical energy into shaft work and (2) use of liquid hydrogen as the energy source. Such a system would produce a nearly pollution-free exhaust and would have additional benefits of low sound level and marked improvement in specific fuel consumption over existing types. However, owing to relatively high specific weights, extensive condenser surfaces and the low volumetric heating value of hydrogen, the system as described would be exclusively applicable to large, lighter-than air craft. (Author)

A75-37006 # A feasibility study of a trans-ocean hybrid cargo airship operating in ground effect D E Calkins *American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo., July 15-17, 1975, Paper 75-929* 10 p 10 refs

The hybrid airship is developed in the context of an all-cargo aircraft operating in ground effect for increased performance. The concept is proposed for the transportation of containerized freight on the Trans-Atlantic route from New York to London. A performance and economic algorithm has been developed to compare the hybrid and conventional airship designs. A parametric study has been performed that covered vehicle gross weights from 250 to 4000 tons. The metric used for comparing the two designs was the Profit Margin (P M) for a year's operation. Results of the study show that the hybrid has a higher P M up to a gross weight of 1500 tons. A 1000 ton hybrid, offering a 43% higher P M over the conventional airship, is selected as a feasible design point for further development. (Author)

A75-37007 * # Evaluation of advanced airship concepts B A Joner and J J Schneider (Boeing Vertol Co., Philadelphia, Pa.) *American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo., July 15-17, 1975, Paper 75-930* 13 p NASA supported research

A historical overview of the airship, technical and operational characteristics of conventional and hybrid concepts, and the results of a parametric design analysis and evaluation are presented. The lift capabilities of certain buoyant fluids for a hypothetical 16 million cu ft volume airship are compared. The potential advanced airship concepts are surveyed, followed by a discussion of the six configurations: conventional nonrigid, conventional rigid, Deltoid (Dynairship), Guppoid (Megalifter), Helipsoid, and Heli-Stat. It is suggested that a partially buoyant Helipsoid concept of the optimum

buoyancy ratio has the potential to solve the problems facing future airship development, such as Ballast and Ballast Recovery System, Full Low-Speed Controllability, Susceptibility to Wind/Gusting, Weather/Icing Constraints, Ground Handling/Hangaring, and Direct/Indirect Operating Costs. M G

A75-37008 # The Shell natural gas airship, and other L T A. activities by Aerospace Developments J E R Wood (Aerospace Developments, London, England) *American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo., July 15-17, 1975, Paper 75-932* 5 p

Feasibility of transporting natural gas by means of lighter than air craft and the design of a large monocoque airship are studied. Neither the nonrigid, semirigid nor the Zeppelin type rigid craft are suitable for this application. Traditional methods of construction of airships are also not suitable, but tests have shown the adhesive bonding assembly techniques to be structurally advantageous, especially the honeycomb sandwich technique. The basic pre-assembly requirements for the 'unitary panel' which forms the basis of the hull structure of the airship are presented. The gas separator and the transverse membranes are discussed, in addition to the main propulsion system, control systems, and the mode of operation. An 8 million cu ft ship is predicted to fly by 1979 and the 'fleet size' craft of 100 million cu ft by 1984. M G

A75-37009 # Structural design of a High-Altitude Superpressure Powered Aerostat D R Lagerquist and L B Keen (Sheldahl, Inc., Northfield, Minn.) *American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo., July 15-17, 1975, Paper 75-933* 11 p Contract No N60921-75-C-00050

Structural design features are described for a High-Altitude Superpressure Powered Aerostat (HASPA) currently being built. Loading conditions are predicted for the flaccid launch, free ascent, and operational mode at float altitude. Special design considerations were required for the equipment bay attachment and at the stern-mounted propulsion system. Stresses and structural stability were computed by finite element and other analytical methods. A composite material consisting of Kevlar yarns and Mylar film has been designed to meet the stringent requirements on strength, weight and permeability. Design analysis and material qualification test results are presented. (Author)

A75-37010 * # Structural materials research for lighter-than-air systems V L Alley, Jr and A D McHatton (NASA, Langley Research Center, Hampton, Va.) *American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo., July 15-17, 1975, Paper 75-935* 9 p 9 refs

Inflatable systems have widespread applications in military, government, and industrial sectors. Improvements in inflatable materials have followed each salient advancement in textiles. The new organic fiber, Kevlar, is a recent and most significant advancement that justified reexamination of old and new inflatable materials' applications. A fertile frontier exists in integrating Kevlar with various other material combinations, in optimization of geometric features, and in selection of thermomechanical characteristics' compatibility with the environment. Expectations regarding Kevlar have been justified by the performance of two experimental materials. Styrene-butadiene-styrene block copolymers appear promising as a constituent adhesive for low temperature applications. Biaxial testing for both strength and material elastic properties is a technology area needing greater awareness and technology growth along with improved facilities. Because of dramatic materials' advancements, inflatable systems appear to be moving toward an increased position in tomorrow's aerospace industry. (Author)

A75-37011 # The Navy role in buoyant and semi-buoyant Proceedings Conference supported by the Israel Ministry of Transport, Israel Ministry of Defence, Israel Ministry of Commerce and Industry, et al (*Israel Journal of Technology*, vol 13, no 1-2, 1975) Jerusalem, Weizmann Science Press of Israel, 1975, 166 p

Papers are presented dealing with propulsion, control and guidance, fluid mechanics, and structural mechanics and vibrations. Some of the topics covered include a parametric study of a pyrogen-type BPN igniter for rocket motors, synthesis of disturbance-rejection controllers for linear multivariable continuous time systems, experimental study of shear lag in axially loaded panels, the role of gas flow and turbulence in electric discharge lasers, and flexure analysis of axially loaded beam by infinite element method with integral parameters

P T H

A75-37012 # Operational considerations of large rigid airships in military applications B B Levitt (Operations Research, Inc., Silver Spring, Md.) *American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo., July 15-17, 1975, Paper 75-938* 9 p

It is proposed that a large rigid airship is particularly well suited to perform the Navy's sea control mission. This mission is defined and the operational requirements examined. Two specific airship configurations are suggested for accomplishment of this mission. In the 'self-contained' version all mission requirements are performed by on-board systems. In the 'carrier' configuration improved effectiveness is achieved by the use of aircraft or RPV's operated from the airship. General characteristics are developed for each of these configurations. A number of operational considerations are then examined (Author)

A75-37015 # HASPA flight control concepts R O Hookway and J R Pretty (Martin Marietta Aerospace, Denver, Colo.) *American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo., July 15-17, 1975, Paper 75-942* 11 p 5 refs

Objectives of the HASPA control system analysis were to determine the effect of the control system concept on overall vehicle design and vice versa. The analysis helped to define the fin configuration, select the number of controls required, select the location of the center of gravity, and to design the hull to gondola attachments. The controls analysis utilized linear and nonlinear techniques. Fins are desirable, active control is required in pitch and yaw, the horizontal location of the CG should be positioned to balance the pitching moment coefficient about the center of buoyancy at zero angle of attack, vertically it should be as far below the CB as possible, relative motion between the gondola and the hull should be minimized (Author)

A75-37017 # Wing-Tip-Winglet propulsion for Aerocrane-type hybrid lift vehicles A L Elias *American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo., July 15-17, 1975, Paper 75-944* 11 p

A non-tilting propulsion scheme for the 'Aerocrane' vehicle, consisting of vertically-mounted 'Wing Tip Winglets' is analyzed. The performance of this system is naturally dependent on the program used to cycle the pitch of the Winglets. To better evaluate these programs, a geometrical limit to the performance of the system is obtained. Next, the simplest (sinusoidal) program is evaluated, and its performance found to be virtually the maximum. Simple control laws for this program are derived and a digital simulation of an All American Engineering Model 1050 Aerocrane, with added Winglets, is flown. The control performance of the basic vehicle is compared to the Winglet-equipped vehicle. The Winglet system is seen to be capable of overcoming basic control limitations of the vehicle (Author)

A75-37018 * # Computer aided airship design S J Davis and H Rosenstein (Boeing Vertol Co., Philadelphia, Pa.) *American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo., July 15-17, 1975, Paper 75-945* 12 p 5 refs NASA-supported research

The Comprehensive Airship Sizing and Performance Computer Program (CASCOMP) is described which was developed and used in the design and evaluation of advanced lighter than air (LTA) craft. The program defines design details such as engine size and number, component weight buildups, required power, and the physical dimensions of airships which are designed to meet specified mission requirements. The program is used in a comparative parametric evaluation of six advanced lighter-than-air concepts. The results indicate that fully buoyant conventional airships have the lightest gross lift required when designed for speeds less than 100 knots and the partially buoyant concepts are superior above 100 knots. When compared on the basis of specific productivity, which is a measure of the direct operating cost, the partially buoyant lifting body/tilting prop-rotor concept is optimum (Author)

A75-37019 * # Potential missions for advanced airships D T Grant and B A Joner (Boeing Vertol Co., Philadelphia, Pa.) *American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo., July 15-17, 1975, Paper 75-946* 8 p 8 refs NASA-supported research

The freight commodity transport and the intercity passenger travel markets in the US for 1967 and 1972 are analyzed, along with 1985 estimates, in order to establish the size, speed and cost enabling use of the airship in these markets. Items examined include frozen meat, confectionary, drugs, electrical equipment, mechanical parts, clothing and plastic products. A 50 ton/500 passenger payload capacity, a cruise speed of 100 kt and a VTOL capability or at minimum short take-off and vertical landing capability are needed to make an LTA vehicle viable in the transport market if it had a direct operating cost of \$500 to \$800 per hour for freight carrying and \$1100 to \$2700 an hour in passenger service with utilizations between 2000 hours and 4000 hours a year. M G

A75-37020 # A strategy for getting LTA systems airborne. J S Brown (US Navy, Military Sealift Command, Washington, D.C.) *American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo., July 15-17, 1975, Paper 75-949* 7 p

The article discusses the need for a coordinated, formalized and comprehensive program for Lighter Than Air (LTA) systems development. Broad market analysis, economic and technical studies on LTA systems, and LTA vehicle classification system, and a priorities listing of potential market/mission opportunities are needed to create a viable LTA development program. In addition to existing markets in cargo transportation, creation of new markets, employments and services based on employing the advantages in LTA capabilities is suggested for economically sustaining a new LTA vehicle system. M G

A75-37021 # Airships in gusts - Apprehensions and assurance T H Troller *American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo., July 15-17, 1975, Paper 75-950* 6 p

It is recommended that atmospheric turbulence and gusts be considered prime factors in airship design. The construction of a water tank test stand, a gust duplicating facility, is described. Means for recording longitudinal, transverse and angular displacements in a coordinated way, together with measurement of the distribution of the gust velocity were provided. Test results of Akron-Macon shape models, including the lateral and angular displacements of airships under the influence of a gust reaching its maximum strength over a distance of about one-half the length of a ship, and direct

measurements of bending moments as they occur at various stations along the hull of the ship as it travels through the gust are presented. Also, measurements were made to establish fin forces directly, and the establishment of a stand for vertical gusts is recommended. M G

A75-37048 # Modern hubs of helicopter rotors. II (Współczesne piasty wirników śmigłowcowych II). Z Brodzki *Technika Lotnicza i Astronautyczna*, vol 30, June 1975, p 27-29 11 refs In Polish

Helicopter rotors of advanced design are reviewed with particular reference to innovations and improvements in the field of rotor hubs. The use of elastomer bearings, as in the HLH hub, is noted, along with the trend of giving preference to rigid rotor structural design. The simplifications evidenced by the Lynx rotor system, the NAT-FLEX and TRIFLEX hubs, and the British Sycamore and Hafner hubs are examined. V P

A75-37063 # Flame stabilization by leading edge vortex breakdown above a delta shape. R. H. Sweat and R. L. Panton (Texas, University, Austin, Tex.) *Combustion Institute, Central and Western States Sections Meeting, San Antonio, Tex., Apr 21, 22, 1975, Paper 27* p 6 refs

A flameholding device utilizing the aerodynamics of a delta wing was investigated. Modes of combustion, combustion limits, and vortex breakdown positions were determined in tests where free-stream velocity, fuel flow rate, and angle of attack were varied. Two burner operation modes were observed: (1) symmetric in flame configuration with respect to the wing centerline, and (2) asymmetric with respect to the wing centerline. Temperature profiles showed that combustion in a symmetric mode with vortex bursting represented the hottest and most concentrated combustion zones. The observed changes in vortex burst locations were substantially different from those reported in the literature, most of the discrepancies were attributed to an interaction between pressure and combustion fields. A75-37084 General problems concerning the helicopter (Les problèmes généraux de l'hélicoptère). J. Soulez-Larivière (Société Nationale Industrielle Aérospatiale, Paris, France) *Sciences et Techniques*, June 15, 1975, p 22-28 In French

Problems in general principles, problems in technology, and problems remaining to be resolved regarding the helicopter are discussed. Long-term flight, speed and handling, cost of production, and transport capacity are the main difficulties yet to be worked out. It is concluded that the helicopter and its derivatives have increasing potential in the commercial aviation field. S J M

A75-37096 Ceramic airframe bearings. J. W. Van Wyk (Boeing Aerospace Co., Seattle, Wash.) *American Society of Lubrication Engineers, Annual Meeting, 30th, Atlanta, Ga., May 5-8, 1975, Preprint 75AM-7A-3* 7 p. Contract No. N00019 73-C-0230

A ceramic-solid-lubricant material screening test program was conducted to select materials and lubricants for a plain spherical bearing design. Friction and wear screening testing was conducted at stress levels to 7500 psi using PTFE, graphite, and molybdenum disulfide lubricants. Best performance was obtained with an alumina rider specimen sliding against a silicon nitride plate lubricated with an MoS₂ solid lubricant compact. A lubricant reservoir bearing design development program was conducted. The manufacturing details for fabricating plain spherical bearings using alumina balls in contact with an alumina lubricant reservoir race are described. Four bearings indicated low wear when tested for fifty hours in a simulated helicopter rotor pitch link test. Tests conducted under simulated hydrofoil flap bearing operation resulted in fracture of the ceramic outer race. The highest load capacity attained was 8570 psi. (Author)

A75-37135 * Digital adaptive flight control design using single stage model following indices. G. Alag and H. Kaufman (Rensselaer Polytechnic Institute, Troy, N.Y.) In Conference on Decision and Control, 5th and Symposium on Adaptive Processes, 13th, Phoenix, Ariz., November 20-22, 1974, Proceedings

New York, Institute of Electrical and Electronics Engineers, Inc., 1974, p 122-127 11 refs. Grant No. NGR 33-018 183

Simple mechanical linkages are often unable to cope with many control problems associated with high-performance aircraft. This has led to the development of digital fly-by-wire control systems and in particular digital adaptive controllers that can be efficiently adjusted during system operation. To this effect, a control law has been derived based upon the minimization of a single-stage weighted combination of control energy and the squared error between the states of a linear plant and model. This control logic is interfaced with an on-line weighted least-squares estimator and a Kalman state filter. The utility of the resultant control system is illustrated by its application to the linearized dynamics of a typical fighter aircraft. (Author)

A75-37136 Performance of a sliding window detector in a high-interference air traffic environment. B. Rubinger (U.S. Department of Transportation, Transportation Systems Center, Cambridge, Mass.) In Conference on Decision and Control, 5th and Symposium on Adaptive Processes, 13th, Phoenix, Ariz., November 20-22, 1974, Proceedings. New York, Institute of Electrical and Electronics Engineers, Inc., 1974, p 142-152 10 refs

Target detection and azimuth determination is accomplished in the enroute air traffic control radar beacon system with a sliding window processor. Due to missed replies and the presence of interference, the center mark is not deterministic, and can only be described in a statistical sense. A novel approach is taken which introduces a class of input/output sequences that establish the validity of a target start. An expression for the center mark distribution is developed around these 'valid chains'. The resulting analytic tool is used to examine sliding window performance in several current and projected ATC environments and is available to determine optimal sliding window parameter settings. An important finding is that the centermark estimate is biased, for low reply probability or high interference-rates, this term is a significant source of error. (Author)

A75-37138 A technique to improve the performance of a nonlinear filter with an application to satellite-aided aircraft navigation. A. N. Joglekar (Mitre Corp., McLean, Va.) In Conference on Decision and Control, 5th and Symposium on Adaptive Processes, 13th, Phoenix, Ariz., November 20-22, 1974, Proceedings

New York, Institute of Electrical and Electronics Engineers, Inc., 1974, p 159-164 9 refs

This paper evaluates the performance of a filter that transforms nonlinear measurements in the coordinate system of the state before using them in the filter. The bias and computational performance of this mechanization are compared with the conventional extended Kalman (EK) filter. The bias in the EK filter is a function of the covariance of the estimation error, while in the state-coordinate system (SCS) it depends on variance of the transformed measurement noise, which is independent of the estimation error and depends only on the nonlinearity. Thus when the initial covariance of the state is large, the SCS filter has less bias than the EK filter. This reduction in the bias is achieved at a cost of additional computations required to implement the transformation. The improved performance of the filter due to the coordinate transformation is then demonstrated with an example of satellite-aided aircraft navigation. (Author)

A75-37182 Near-field supersonic flow pattern of slender delta wings S N Chaudhuri (Tennessee, University, Tullahoma, Tenn) and S C Praharaj (Northrop Services, Inc, Huntsville, Ala) *International Journal of Engineering Science*, vol 13, Sept-Oct 1975, p 889-904 17 refs US Department of Transportation Contract No FA70WA-2260

The theory of linearized conical flow has been applied to calculate pressure distributions over slender delta wings and at points in the field away from the wings. The study also gives linearized results of the variations of some of the important wing parameters. Near-field flow patterns due to both first and second order conical flow fields around delta wings have been worked out. Slender delta wings with constant angle of attack, camber and thickness distribution along the span have been considered. Whitham's quasilinear approach is used for these slender delta wings to obtain a first-order uniformly valid solution. All these results are compared with those obtained from the equivalent body theory and significant differences are observed in the near-field region. (Author)

A75-37299 Anatomy of the helicopter II - Engine and transmission ratings P Brittan *Shell Aviation News*, no 429, 1975, p 8-13

A75-37300 MADGE - Evaluating a helicopter approach guidance system F W Free (British Airways Helicopters, Ltd, Horley, Surrey, England) *Shell Aviation News*, no 429, 1975, p 14-17

Successful trials performed with a Microwave Aircraft Digital Guidance Equipment (MADGE), using a Sikorsky S61N helicopter are described. The aim of the trials was to make a preliminary assessment of MADGE as an approach aid for helicopters operating on a regular daily schedule between Penzance and the Scilly Isles in the West of England. The main features of the MADGE system which operates in the 5.0 to 5.25 GHz frequency band are discussed. V P

A75-37308 # Composite box beam optimization program P J Donohue and H A Erbacher (Grumman Aerospace Corp, Bethpage, N Y) In *Reinforced plastics - Milestone 30, Proceedings of the Thirtieth Anniversary Technical and Management Conference*, Washington, D C, February 4-7, 1975. New York, Society of the Plastics Industry, Inc, 1975, p 14-A1 to 14-A6 USAF-sponsored research

The present program was undertaken to extend the design and manufacturing technological base for highly loaded wings fabricated from mixed composites and to demonstrate, with a representative component, a minimum weight savings on the order of 30 percent over a comparable baseline metal design. This was achieved by judicious structural and material optimization based on selection and integration of the newer advanced composite materials, and by minimization of the use of structural metallic elements. (Author)

A75-37309 # Kevlar 49 hybrid composites for commercial and aerospace applications P G Riewald and C Zweben (Du Pont de Nemours and Co, Inc, Industrial Fibers Div, Wilmington, Del) In *Reinforced plastics - Milestone 30, Proceedings of the Thirtieth Anniversary Technical and Management Conference*, Washington, D C, February 4-7, 1975. New York, Society of the Plastics Industry, Inc, 1975, p 14-B1 to 14-B10

Mechanical properties and projected cost reductions obtainable with Kevlar 49-graphite/epoxy and Kevlar 29-graphite/epoxy composites are presented. It is shown that Kevlar 49-graphite hybrid aircraft fuselage panels have significantly better resistance to impact damage than do all-graphite laminates. Kevlar 49-graphite hybrids used for commercial fabrication of bows and golf club shafts furnish considerable savings over conventional woven graphite implements.

A75-37310 # Design fabrication and test of an F-14 composite overwing fairing A Cowles (US Naval Air Systems Command, Washington, D C) and H Forsch (Grumman Aerospace Corp, Bethpage, N Y) In *Reinforced plastics - Milestone 30, Proceedings of the Thirtieth Anniversary Technical and Management Conference*, Washington, D C, February 4-7, 1975. New York, Society of the Plastics Industry, Inc, 1975, p 14-C1 to 14-C5

The F-14 overwing fairing considered utilizes hybrid advanced composite materials. The overwing fairing provides a smooth aerodynamic transition between the fuselage and the wing at all wing sweep positions and during wind deflection. Attention is given to a redesign of fairing elements, including the triangular panel, the inboard and outboard beams, and the fairing fingers. Questions of composite design are discussed. G R

A75-37311 # Recent development and experience of an all fiberglass RP undercarriage for a STOL-aircraft R Abelin and B Andreasson (Saab-Scania AB, Malmo Flygindustri, Malmo, Sweden) In *Reinforced plastics - Milestone 30, Proceedings of the Thirtieth Anniversary Technical and Management Conference*, Washington, D C, February 4-7, 1975. New York, Society of the Plastics Industry, Inc, 1975, p 14-D1 to 14-D2

Materials, methods of construction, and general design characteristics of an all glass fiber reinforced plastic undercarriage for the Saab-MFI 15/17 STOL aircraft are briefly described. The main landing gear consists of two legs, the same leg being used on both left and right side. The legs overlap each other in the fuselage, which allows for considerably more deflection than if they were rigidly attached to the fuselage. After full-scale drop testing of the complete undercarriage, where the ultimate load was exceeded, no damage was found on any part of the landing gear. Aircraft with this type of undercarriage are now operating under rough conditions, including fully-loaded take-offs and landings at 10,000 feet density altitude on unprepared gravel strips. P T H

A75-37405 Israel Annual Conference on Aviation and Astronautics, 17th, Tel Aviv and Haifa, Israel, May 21, 22, 1975, Proceedings. Conference supported by the Israel Ministry of Transport, Israel Ministry of Defence, Israel Ministry of Commerce and Industry, et al (*Israel Journal of Technology*, vol 13, no 1-2, 1975) Jerusalem, Weizmann Science Press of Israel, 1975, 166 p

Papers are presented dealing with propulsion, control and guidance, fluid mechanics, and structural mechanics and vibrations. Some of the topics covered include a parametric study of a pyrogen-type BPN igniter for rocket motors, synthesis of disturbance-rejection controllers for linear multivariable continuous time systems, experimental study of shear lag in axially loaded panels, the role of gas flow and turbulence in electric discharge lasers, and flexure analysis of axially loaded beam by infinite element method with integral parameters. P T H

A75-37409 Synthesis of disturbance-rejection controllers for linear multivariable continuous-time systems B Porter, T R Crossley, and A Bradshaw (Salford, University, Salford, England) (*Israel Journal of Technology*, vol 13, no 1-2, 1975) In *Israel Annual Conference on Aviation and Astronautics, 17th, Tel Aviv and Haifa, Israel, May 21, 22, 1975, Proceedings* Jerusalem, Weizmann Science Press of Israel, 1975, p 25-30 6 refs

Explicit criteria are derived which indicate clearly the extent to which constant disturbances can be rejected by the judicious introduction of integral feedback in continuous time systems with either accessible or inaccessible states. These theoretical results are illustrated by designing a disturbance rejection controller for a Sea King SH-3D helicopter in hovering flight in a steady crosswind.

A75-37423 **A parametric evaluation of the performance of the bypass jet engine** H A Arbib (Technion - Israel Institute of Technology, Haifa, Israel) (*Israel Journal of Technology*, vol 13, no 12, 1975) In Israel Annual Conference on Aviation and Astronautics, 17th, Tel Aviv and Haifa, Israel, May 21, 22, 1975, Proceedings Jerusalem, Weizmann Science Press of Israel, 1975, p 152-156

A parametric analysis of the performance of a bypass jet engine is carried out. The importance of three nondimensional parameters is brought out: the bypass ratio μ , the fraction of the available enthalpy drop transferred to the secondary stream k , and the ratio of freestream to fully expanded gas generator velocity V/V_j . The variation of the thrust augmentation ratio A with the above three parameters is considered, the conditions for optimum augmentation are investigated, and conclusions are drawn concerning these parameters. (Author)

A75-37424 **Two dimensional, inviscid, transonic flowfield around a profile** B L Coleman (Israel Aircraft Industries, Ltd., Lod, Israel) (*Israel Journal of Technology*, vol 13, no 12, 1975) In Israel Annual Conference on Aviation and Astronautics, 17th, Tel Aviv and Haifa, Israel, May 21, 22, 1975, Proceedings Jerusalem, Weizmann Science Press of Israel, 1975, p 157-161. Research supported by the Ministry of Defence of Israel.

A knowledge of the flowfield around an airfoil is important in estimating the disturbance near the walls of a wind tunnel. The method of Garabedian and Korn for calculating the pressure distribution on a profile is extended to enable the velocity vector in the physical plane to be exhibited. Examples with and without shocks are plotted. (Author)

A75-37425 # **Intuitive design** E Schatzki. *Israel Ministry of Transport, Israel Ministry of Defence, and Israel Ministry of Commerce and Industry, Israel Annual Conference on Aviation and Astronautics, 17th, Tel Aviv and Haifa, Israel, May 21, 22, 1975, Paper 12 p*

The complex character of design parameters occasionally prevent a mathematical or iterative treatment, especially when the design problem is completely novel. The designer is forced to approach it by a method of 'trial and error', which leads his search in a direction of greatest possibility. This process is partially subconscious and may end in an intuitive design solution. It is shown that intuition is composed of two diametrically opposed but interacting phases, one is creative, the other one analytical. The creative one designs, the analytical one criticizes the created design. Both are essential, they can be taught and learned. The deductions are elucidated by two examples, which form part of the design of an aircraft. (Author)

A75-37450 * # **Aircraft wake turbulence minimization by aerodynamic means** A Gessow (NASA, Washington, D C.) *American Meteorological Society and American Institute of Aeronautics and Astronautics, Conference on Aerospace and Aeronautical Meteorology, 6th, El Paso, Tex., Nov 12-14, 1974, Paper 32 p 10 refs*

The paper reviews NASA's efforts on wake vortex turbulence minimization by aerodynamic design or retrofit modifications to large transport aircraft. Theoretical and experimental (ground-based and flight) results are presented which show that the adverse effects of a vortex wake produced by a large aircraft on a small following aircraft can be reduced significantly. (Author)

A75-37489 **Pilot problems in low visibility approach and landing** F Ormonroyd (British Airways, Ruislip, Middx., England) In Human factors in safe flight operations, Proceedings of the Twenty-seventh Annual International Air Safety Seminar, Williamsburg, Va., November 10-14, 1974. Arlington, Va., Flight Safety Foundation, Inc., 1974, p 71-82

The British Airways Trident low-approach procedures in low-visibility weather conditions, especially as regards requirements for ILS systems, are reviewed. Extension of instrument performance demands from category I (autopilot down to 200 ft) to category II (to 100 ft) is recommended. Preferably, ILS systems should be reliable to category III (12 ft) or even touchdown. The ability to overshoot and the potential of automatic overshoot facilities are discussed. S J M

A75-37497 **Noise control features of the DC-10** A H Marsh (Douglas Aircraft Co., Long Beach, Calif.) *Noise Control Engineering*, vol 4, May/June 1975, p 130-139. 7 refs

The special acoustical features of the three versions of the DC-10 aircraft, designed to minimize the generation of turbo-machinery and jet noise, and to reduce noise transmitted into the cabin and crew compartments during high speed cruise conditions, are described. Designs for the acoustically absorptive linings of the inlet and exhaust ducts in the wing engine nacelle installations are illustrated, and four basic duct lining constructions are presented: perforated aluminum sheet bonded to aluminum honeycomb core, perforated fiberglass laminate bonded to slotted fiberglass laminate double diamond core, perforated steel sheet brazed to corrugated steel core, and perforated steel sheet welded to ribbed-ribbon steel core. Results of the noise control features are given in terms of aircraft flyover noise during takeoff and landing and interior cabin speech interference during cruise. M G

A75-37538 **Theory of air frame noise** W C Meecham (California, University, Los Angeles, Calif.) *Acoustical Society of America, Journal*, vol 57, June 1975, pt 2, p 1416-1420. 10 refs

Air frame noise is examined using Curle's theory for noise from rigid surfaces interacting with turbulence. Measured 'air frame noise' often is open to question because of engine contribution. A large number of examples are considered: model airfoil in a jet, glider noise, jet wing in atmospheric turbulence, boundary layer noise on trailing wing edge, flat-generated noise, landing gear noise, noise from jet impinging on flap, and some others. Of all of these estimated noise sources it appears that for commercial jets the noises from jets on flaps (when present) and from landing gear may be the only sources of possible practical significance. (Author)

A75 37593 **Rotorcraft parasite drag**, Proceedings of the Thirty-first Annual National Forum, Washington, D C., May 14, 15, 1975. Forum sponsored by the American Helicopter Society. New York, American Helicopter Society, Inc., 1975. 130 p

The papers presented deal with methods for reducing rotorcraft parasite drag, possible design tradeoffs associated with drag reduction, additional benefits resulting from drag reduction, and rotorcraft drag measurement, prediction, and analysis. A detailed examination of some present configurations indicates that, with the exception of the hub region, marked drag reductions are possible using contemporary design knowledge. The major topics discussed include guidelines for reducing helicopter parasite drag, cost effectiveness of drag reduction, effect of drag reduction on rotor dynamic loads and blade lift, and aerodynamic analysis of helicopter configurations. Individual items are announced in this issue. S D

A75-37594 # **A general review of helicopter rotor hub drag data** T W Sheehy (United Technologies Corp., Sikorsky Aircraft Div., Stratford, Conn.) In Rotorcraft parasite drag, Proceedings of the Thirty-first Annual National Forum, Washington, D C., May 14, 15, 1975. New York, American Helicopter Society, Inc., 1975, p 2-1-2-10. 18 refs. Grant No DAAJ02 74 C 0050

A data review has been conducted to identify parameters affecting the contribution of the rotor hub to the total drag of the aircraft. Significant results of the review are presented and recom-

A75-37595

mentations are given relevant to the design of helicopter hub/pylon configurations (Author)

A75-37595 * # Rotorcraft low-speed download drag definition and its reduction J C Wilson (US Army, Air Mobility Research and Development Laboratory, NASA, Langley Research Center, Low-Speed Aerodynamics Branch, Hampton, Va) In Rotorcraft parasite drag, Proceedings of the Thirty-first Annual National Forum, Washington, D C, May 14, 15, 1975
New York, American Helicopter Society, Inc, 1975, p 4 1-4 9 26 refs

Download drag for rotorcraft in hover and low speed flight is a burden which significantly affects useful load, fuel, and payload Reduction of the burden will enhance these aspects of rotorcraft and complement the forthcoming improvements in isolated rotor performance Analyses and experimental data are available, though fragmentary, regarding gross drag, thrust recovery, and other characteristics which can be utilized to define interim rotorcraft design changes to reduce the burden Eventually the experimental data and a comprehensive combination of rotor, rotor wake, and potential-flow analyses can evolve to reduce the burden to an absolute minimum (Author)

A75-37596 # Some important practical design constraints affecting drag reduction R E Gormont (US Army, Systems Development and Qualification Div, St Louis, Mo) In Rotorcraft parasite drag, Proceedings of the Thirty-first Annual National Forum, Washington, D C, May 14, 15, 1975
New York, American Helicopter Society, Inc, 1975, p 7 1 7 6 6 refs

Rotorcraft drag reduction has as its prime objectives the improvement in range, speed, payload capability, and productivity, as well as the associated reduction of operating costs A first glance at drag reduction would lead one to believe that all of the above objectives are attained by simply designing a lower drag configuration which results in a lower airframe parasite power and a resulting decrease in engine power and fuel requirements However, a more cautious approach must be taken to fully account for all of the ramifications of the low drag configuration In order to balance the ledger, all secondary design features which may result from a low drag configuration must be adequately considered when assessing the overall success or failure of a configuration drag reduction program The purpose of this paper is to provide guidelines and significant areas which must be considered in performing drag reduction tradeoffs (Author)

A75-37597 # The relationship between rotorcraft drag and stability and control J A Hoffman (Paragon Pacific, Inc, Hawthorne, Calif) In Rotorcraft parasite drag, Proceedings of the Thirty-first Annual National Forum, Washington, D C, May 14, 15, 1975
New York, American Helicopter Society, Inc, 1975, p 8 1 8 3

The influence of drag on stability and control characteristics is examined The discussion covers the reduction of empennage dynamic pressure, linear and nonlinear wake effects, and constraints on fuselage design placed by stability and control requirements Recommendations for integrating stability and control considerations into drag study programs are set forth S D

A75-37598 # Prediction of rotorcraft drag R Tracy (US Naval Air Systems Command, Washington, D C) In Rotorcraft parasite drag, Proceedings of the Thirty-first Annual National Forum, Washington, D C, May 14, 15, 1975
New York, American Helicopter Society, Inc, 1975, p 13 1-13 4

Techniques are described for predicting helicopter forward flight power in the three cases of one-day preliminary design effort, three-to-five-day review of a brochure-type proposal, and detailed

four-to-six-week evaluation of a contractor's proposal The estimates necessary to predict the capabilities of a helicopter in each of the cited cases are identified It is suggested that careful testing and more detailed documentation of results will yield enough data to provide a ready method of estimating performance in all phases of helicopter design S D

A75-37599 # Aerodynamic analysis of helicopter configurations F A Dvorak (Analytical Methods, Inc, Bellevue, Wash) In Rotorcraft parasite drag, Proceedings of the Thirty-first Annual National Forum, Washington D C, May 14, 15 1975
New York, American Helicopter Society, Inc, 1975, p 14 1-14 15 14 refs

A brief review is made of applications of two and three-dimensional aerodynamic analysis methods to rotary winged aircraft Results are shown which indicate that simple separation models considerably improve comparisons between theory and experiment Similarly, the inclusion of boundary layer displacement effects results in good predictions of aerodynamic performance Proposed extensions of these aerodynamic methods should lead to analyses capable of accurately predicting forces and moments on helicopter fuselages Inclusion of rotor wake effects both in hover and forward flight would further enhance the capability of these methods (Author)

A75-37600 # A method for correlating wind tunnel experiments with potential flow theory P S Montana (US Naval Material Command, Ship Research and Development Center, Bethesda, Md) In Rotorcraft parasite drag, Proceedings of the Thirty-first Annual National Forum, Washington, D C, May 14, 15, 1975
New York, American Helicopter Society, Inc, 1975, p 16 1-16 7 6 refs

A straightforward five step method is proposed for correlating potential flow computer analyses with experimental results for high-blockage configurations The correlation technique is developed with the cut-and-try approach, i.e., when the potential flow results fail to match the experiment, new potential flow modeling methods are tried The pressure coefficients obtained from the potential flow analysis are corrected by adjusting the reference velocity for the technique used in measuring the wind speed in the experiment and for flow leakage in the potential flow model The method incorporates the reference velocity as a fundamental parameter previously ignored in this type of theory experiment comparison An example is given for an elliptical rotor hub fairing S D

A75-37601 # Helicopter parasite drag bibliography R M Williams (US Naval Material Command, Ship Research and Development Center, Bethesda, Md) In Rotorcraft parasite drag, Proceedings of the Thirty-first Annual National Forum, Washington, D C, May 14, 15, 1975
New York, American Helicopter Society, Inc, 1975, p 17 1-17 11 169 refs

A75-37638 A multifunction radar for helicopter applications K D Knapp (Texas Instruments, Inc, Dallas, Tex) In NAECON '75, Proceedings of the National Aerospace and Electronics Conference, Dayton, Ohio, June 10 12, 1975
New York, Institute of Electrical and Electronics Engineers, Inc, 1975, p 149-155 Army-supported research

The Helicopter Multifunction System (HELMS) is a high-resolution radar designed to perform functions for helicopter instrument flight and for special helicopter missions In its basic configuration, the HELMS has operating modes for high resolution groundmapping, beacon operation, terrain avoidance, weather avoidance, enroute stationkeeping, and landing approach An attack/scout configuration has all the basic modes plus modes for moving-target indication, electro-optic sensor cueing, and fire control All these modes are described, and actual radar performance

during extensive flight testing in UH-1 helicopters is presented. The discussion of the attack/scout modes includes a description of an integral radar/electro optic system in which the HELMS radar is used (Author)

A75-37644 On-board test and monitoring of advanced weapon systems J R Stephens (Boeing Aerospace Co., Seattle, Wash.) In NAECON '75, Proceedings of the National Aerospace and Electronics Conference, Dayton, Ohio, June 10-12, 1975
New York, Institute of Electrical and Electronics Engineers, Inc., 1975, p 198-204

The impact of the advancement in electronic technology on weapon system design has led to an increased complexity and sophistication of the avionic subsystem design. In direct relationship, the requirement for improved weapon system maintenance has increased with this advancement in technology. This paper presents a brief summary of the objectives and design requirements that led to formulation of an Integrated Test System design. An introduction to the basic elements of an Integrated Test System is provided as an overview to introducing the subject. This includes a general description of each element and its functional role within the system. Following this introduction, a discussion of specific examples of Boeing's application of integrated testing functions for the B-1 is provided. This discussion is limited to integrated testing methods that are considered unique and representative of techniques applicable to advanced weapon systems (Author)

A75-37646 Full authority electronic control application to military gas turbine engines G R Adams (USAF, ASD/ENJEA, Wright-Patterson AFB, Ohio) In NAECON '75, Proceedings of the National Aerospace and Electronics Conference, Dayton, Ohio, June 10-12, 1975
New York, Institute of Electrical and Electronics Engineers, Inc., 1975, p 213-218

General and specific benefits to engine performance to be derived from implementing full-authority electronic control in present gas turbine engines and next-generation engines are discussed. General benefits include lower acquisition and life cycle costs, improved reliability and maintainability, and increased flexibility and growth potential. A specific benefit would be the incorporation of extensive self-checking and failure accommodation in electronic control, which is expected to operate at or near full performance levels with single sensor losses by detecting the loss and synthesizing a calculated value from the available sensor information. Electronic control can also take better account of coupling effects in the engine by using multi variable control techniques. The future variable cycle engine may be so complex that a full-authority electronic control will be a requirement to realize all performance gains P T H

A75-37647 Terrain following evaluation simulation K E Brostrom (Boeing Aerospace Co., Seattle, Wash.) In NAECON '75, Proceedings of the National Aerospace and Electronics Conference, Dayton, Ohio, June 10-12, 1975
New York, Institute of Electrical and Electronics Engineers, Inc., 1975, p 219-225 7 refs

The design of the B-1 Avionics has considered the interaction of the elements of the total system in order to maximize the weapon system performance. To study and evaluate the performance requires a large scale simulation of the details of each subsystem. This paper describes an all digital simulation developed by The Boeing Company and being used for evaluation of B-1 terrain following system performance. It simulates both the automatic terrain following and the manual terrain following modes. The manual mode can be used with either a man in loop cockpit or a paper pilot (Author)

A75 37674 B-52G/H Protective Systems Test Range /PSTR/ J F Feltz (Systems Research Laboratories, Inc., Dayton,

Ohio) In NAECON '75, Proceedings of the National Aerospace and Electronics Conference, Dayton, Ohio, June 10-12, 1975 .

New York, Institute of Electrical and Electronics Engineers, Inc., 1975, p 416-423 Contract No F30602-73-C-0182

An antenna range developed for obtaining high-quality, accurate antenna patterns from B-52 G/H aircraft protective systems is described. The facility consists of a B-52 G/H aircraft Phase VI ECM configuration mounted on a modified FPS-35 antenna pedestal, a computer controlled RF source in the aircraft, a tower with a computer-controlled elevator system providing variable elevation of the test range, a computer-controlled receiver system to simultaneously measure two signal amplitudes and the electrical phase between the two signals, and a control room with a data acquisition computer and control hardware. General test procedures are described. Since the installations need not be flightworthy, the tests can be performed at a fraction of the cost for flight tests P T H

A75-37700 The F-14 aircraft head up display A R Doucette (Grumman Aerospace Corp., Bethpage, N.Y.) In NAECON '75, Proceedings of the National Aerospace and Electronics Conference, Dayton, Ohio, June 10-12, 1975

New York, Institute of Electrical and Electronics Engineers, Inc., 1975, p 594-600

Difficulties are examined which were encountered in implementing a head up display in a sophisticated fighter aircraft. The optical principles involved in such a display are reviewed, and the original F-14 configuration is described which used a conventional combiner and a vertical display indicator. Problems encountered with this configuration included placement constraints due to aerodynamic considerations, multiple reflections between the windscreen and the combiner, and intrinsic windscreen reflection. Windscreen projection was employed in a reconfiguration to overcome these problems, but created a new set of problems, including sunlight reflections in the optical system and reduction of the instantaneous field of view. Ways in which sunlight reflection and alignment problems were overcome are described, and it is noted that a cockpit incorporating the concept of using the windscreen as the combiner in its original design could improve the present limited instantaneous field of view F G M

A75-37703 Performance comparison of space stable and local level inertial platform mechanizations for a strategic aircraft application J E Bergeson (Boeing Aerospace Co., Seattle, Wash.) and J H Witte (Boeing Computer Services, Inc., Seattle, Wash.) In NAECON '75, Proceedings of the National Aerospace and Electronics Conference, Dayton, Ohio, June 10-12, 1975

New York, Institute of Electrical and Electronics Engineers, Inc., 1975, p 617-624 12 refs

A75-37711 Blindside connector selection C R Hand (Boeing Commercial Airplane Co., Renton, Wash.) In NAECON '75, Proceedings of the National Aerospace and Electronics Conference, Dayton, Ohio, June 10-12, 1975
New York, Institute of Electrical and Electronics Engineers, Inc., 1975, p 709-712

Data are presented which are necessary for extrapolating current-carrying capacity for electrical connectors with single ratings assigned to them. Contact ratings are explained, and it is shown that a contact rating will depend on the wire size. Selection methods and standards are noted which are described in detail in certain cited handbooks on aircraft wiring F G M

A75-37777 Residual stresses caused by variable service loads in notches and their significance for the applicability of the linear damage accumulation hypothesis (Durch veränderliche Betriebslasten in Kerben erzeugte Eigenspannungen und ihre

Bedeutung für die Anwendbarkeit der linearen Schadensakkumulations-Hypothese D Schutz and G Gassner (Laboratorium für Betriebsfestigkeit, Darmstadt, West Germany) *Zeitschrift für Werkstofftechnik*, vol 6, June 1975, p 194-205 58 refs In German

In order to improve the reliability of fatigue life estimations based on the linear damage accumulation hypothesis, residual stresses at the notch root of open-hole specimens of the aluminum alloys AlCuMg2 (2024 T3) and AlZnMgCuAg (7075 T6) were continuously measured during their macrocrack-free life range. Based on the variation of residual stress with time, a corrected linear damage accumulation hypothesis is derived. The new hypothesis narrows down the amount of variation of the fatigue life predictions for the different loading modes from 1.6 to 1.3 S J M

A75-37778 # Autopilot for British Airways T E Ford *Aircraft Engineering*, vol 47, June 1975, p 9-12, 14

Equipped with a Marconi-Elliott autopilot E2200, the Super One-Eleven aircraft now have the ability to operate in Cat 2 conditions. The single channel automatic touchdown system and the development of the E2200 are described in detail. The E2200 autopilot operates aileron, elevator, rudder and throttle controls from signals produced by sensors, radio and manometric references together with demand signals from the autopilot controller. When engaged, flight control is accomplished by processing and amplifying these signals which then drive servo motors coupled to the aircraft control systems. The autopilot operational modes selected at the controller in conjunction with the controls on the selected flight compass are as follows: Manual - Preset Heading, Manometric - IAS Lock, Autothrottle, Height Lock, Height Acquire, Radio - VOR, Localiser, Glidepath (Auto and Manual) M G

A75-37779 # The use of computers in flight testing D Batten (Rank Xerox, Ltd, Data Systems Div, Wembley, Middx, England) *Aircraft Engineering*, vol 47, June 1975, p 15-17, 20, 23

In order to reduce the duration and cost of flight testing of high performance aircraft, computerization of the flight data processing procedure is considered. The ground station computer system can perform all the data processing for a broad range of flight test departments including: (1) flight data acquisition - the system receives, demultiplexes and analyzes data from a telemetry transmission or from a replay of flight tape, (2) secondary tape generation for distribution to other processing centers, (3) data display, in accordance with flight test engineer requests, (4) instrumentation - use of the main computer to calibrate the transducer and automatically update the library of transducer characteristics. Software and hardware developments are also discussed. M G

A75-37799 # The concept of trustworthiness in the safety of structures (Prispevek ke spoehlivostnimu pojati bezpecnosti konstrukci) O Gregr *Zpravodaj VZLU*, no 2, 1975, p 53-66 20 refs In Czech

The problem is examined of reducing the weight of modern aircraft required to perform in stringent conditions, such as instrument flight and/or landing and heavy air traffic under unfavorable meteorological conditions, without impairing economic efficiency and payload. Two approaches to the problem, one based on optimal structural design, and the other on the concept of trustworthiness are discussed. V P

A75-37823 # Aircraft loading spectra (Spektra zatizeni letounu) V Kahanek *Zpravodaj VZLU*, no 1, 1975, p 5-20 19 refs In Czech

The basic loading spectra of conventional aircraft, defined by the load factor at the center of mass, are examined. Random load-time histories are analyzed, and recommendations for selecting the proper loading spectrum are given. Current measurement

methods are critically evaluated, and improved measurement techniques are proposed. Attention is given to maneuvering and gust load spectra. V P

A75-37824 # Measurements on an isolated wing, using an aeroelastic model (Mereni na aeroelastickem modelu izolovaneho kridla) J Malecek *Zpravodaj VZLU*, no 1, 1975, p 21-33 9 refs In Czech

The properties of an isolated wing with one degree of freedom in roll, loaded by a suspended weight, are studied in a subsonic wind tunnel, using an aeroelastic model of the wing. The techniques used in impulse and frequency tests are described, along with a data processing procedure based on the use of a Minsk 22 computer and fast Fourier transforms. V P

A75-37897 # Viscous interaction with separation in transonic flow (Interaction visqueuse avec décollement en écoulement transsonique) J Delery, J-J Chattot, and J C Le Balleur (ONERA, Châtillon-sous-Bagneux, Hauts de Seine, France) (*NATO, AGARD, Symposium on Flow Separation, Göttingen, West Germany, May 27-31, 1975*) *ONERA, TP* no 1975 15, 1975 14 p 23 refs In French

Theoretical and experimental study of strong viscous interactions in transonic flows past airfoils, which give rise to thickening of the boundary layer and frequent formation of a separation region. Under these conditions, flow calculations must make use of fast interaction theories. The application of such theories to the case of a turbulent boundary layer is studied in this paper. The flow around a half profile in a transonic wind tunnel was analyzed using interferometric methods. Calculations of the flow were attempted by following Klineberg's (1972) approach. The flow is divided into two regions: a weak interaction zone where the pressure gradient is either negative or slightly positive, and a fast interaction zone in regions where separation is likely. P T H

A75-37899 # Laminar separation at a trailing edge J P Guiraud (Paris VI, Université, Paris, ONERA, Châtillon-sous-Bagneux, Hauts de Seine, France) and R Schmitt (ONERA, Châtillon-sous-Bagneux, Hauts de Seine, France) (*NATO, AGARD, Symposium on Flow Separation, Göttingen, West Germany, May 27-31, 1975*) *ONERA, TP* no 1975 13, 1975 6 p 11 refs

A model is proposed for the beginning of flow separation from the trailing edge of a thin wing in incompressible flow at very high Reynolds number. It is shown that for very large values of the product of the wedge semiangle at the trailing edge and the fourth root of the Reynolds number, one can construct a model of separated flow with a small recirculation zone and with streamwise length of a specified order of magnitude, which is compatible with a representation of the solution of the Navier-Stokes equations obtained by the method of matched asymptotic expansions for the vicinity of the trailing edge. The structure of the flow involves a triple layer of Sytchev (1972) type, very close to the separation, embedded in another triple layer of Stewartson type applied to the wholly separated flow. The flow depends on two constants: vorticity in the recirculation zone, and exact position of the separation. A solution of Sytchev's canonical triple deck problem will give one relation between these constants. P T H

A75-37900 # Methodology for certification of aircraft nuisances (Methodologie de la certification des nuisances des avions) M Pianko (ONERA, Châtillon-sous-Bagneux, Hauts de Seine, France) (*Association Aéronautique et Astronautique de France, Congrès International Aéronautique sur le Transport Aérien et*

l'Environnement, 12th, Paris, France, May 29, 30, 1975) ONERA, TP no 1975 48, 1975 22 p In French

Some guidelines are proposed with regard to certifying aircraft nuisance. Three paths are explored leading to nuisance certification: (1) acceptability by the surrounding community, (2) aircraft usefulness, and (3) increased technological efforts. A methodology for nuisance certification is outlined based chiefly on the third way, but account is also taken of the other two. Three steps leading to certification emerge: (1) classification of aircraft, (2) description of the nuisance, and (3) selection of limit levels. Solutions are discussed for noise and pollution regulation. P T H

A75-37905 # Hybrid nonstationary noise simulator of the aircraft overflight type (Simulateur hybride de bruit non stationnaire du type survol d'avion). M Ernoult and J Hay (ONERA, Châtillon sous Bagneux, Hauts-de-Seine, France) (*Colloque National sur le Traitement du Signal et ses Applications, 5th, Nice, France, June 16-21, 1975*) ONERA, TP no 1975 46, 1975 6 p In French

A hybrid noise simulator has been built, based on nonstationary noise characteristics measured by a fixed microphone during a low altitude airplane overflight. The simulator synthesizes electric noise whose second-order moment at any time is known. The main features of the device are described, and potential areas for its application are discussed which depend on knowledge of its bias and variance. S J M

A75-38052 # Elastically retracting ACLS trunks. T D Earl (Bell Aerospace Co., Buffalo, N.Y.) *Canadian Aeronautics and Space Journal*, vol 21, May 1975, p 169-173

A new rubber/nylon material has been developed for use in the retractable elastic trunks of air cushion landing systems. The Buffalo trunk, as it is called, provides a stretch ratio of approximately 3.25 in a typical area of the trunk. The inflated material thickness is about 0.1 inches for a unit weight of approximately 100 oz/sq yd and a principal (stretch) direction strength of about 600 PLI. The application of the new material to the LA 4 and Buffalo ACLS programs is described. S J M

A75-38064 Experimental study of the influence of large blade aspect ratios on axial compressor stage aerodynamic characteristics. A N Aniutin, V N Ershov, V I Komlev, V Iu Nezym, and V A Faminskii (*Aviatsionnaia Tekhnika*, vol 18, no 1, 1975, p 5-9) *Soviet Aeronautics*, vol 18, no 1, 1975, p 1-4 6 refs Translation

A75-38067 Optimizing aircraft gas turbine blade air cooling systems. II - Thermodynamic analysis. E N Bogomolov (*Aviatsionnaia Tekhnika*, vol 18, no 1, 1975, p 18-25) *Soviet Aeronautics*, vol 18, no 1, 1975, p 12-18 5 refs Translation

An exergonic method of analysis is proposed for internal blade cooling systems. Performance criteria are derived for the air supply system and for the air-cooled blade itself. A method of optimizing the parameters of the air supply system is described, along with a method of designing blades for maximum cooling depth. V P

A75-38074 Heat and mass transfer during high-enthalpy gas flow in aircraft and rocket engine flow passages. A V Fafurin, Iu D Krechetnikov, A Ia Semichev, and N A Nadyrov (*Aviatsionnaia Tekhnika*, vol 18, no 1, 1975, p 54-60) *Soviet Aeronautics*, vol 18, no 1, 1975, p 43-48 16 refs Translation

The rate of burnup of the heat-protective coating of an aircraft engine's air gas flow area is studied analytically. A solution is

obtained by integrating boundary layer equations in which unsteady-state effects caused by chemical erosion of the flow area surface are taken into account. V P

A75-38075 Analysis of characteristics of bypass turbojet engines with small gas turbine engines in the outer flow. B D Fishbein (*Aviatsionnaia Tekhnika*, vol 18, no 1, 1975, p 61-69) *Soviet Aeronautics*, vol 18, no 1, 1975, p 49-55 9 refs Translation

The results of a thermodynamic analysis of the thrust and fuel-consumption characteristics of a ducted fan engine containing a gas-turbine in the outer duct are examined and are compared with those of a turbojet engine with an afterburner. A means of reducing the specific fuel consumption during takeoff, acceleration, and supersonic flight conditions is proposed for the configuration employing a gas turbine. V P

A75-38076 Aircraft hydraulic system pressure regulator stability. V V Berdnikov and L Ia Mironiuk (*Aviatsionnaia Tekhnika*, vol 18, no 1, 1975, p 70-72) *Soviet Aeronautics*, vol 18, no 1, 1975, p 56, 57 Translation

A stability analysis is carried out for a direct-acting pressure regulator with a positive-displacement variable-stroke pump. The stability regions of the regulator are obtained in generalized coordinates. The results are applicable to the synthesis and analysis of pressure regulators of various type. V P

A75-38077 Calculation of flow field around air intake operating at zero forward speed by the distributed source-sink method. /2 D case/. K V Vafin, L N Bortnikov, V A Prusova, and A M Shapiro (*Aviatsionnaia Tekhnika*, vol 18, no 1, 1975, p 72-76) *Soviet Aeronautics*, vol 18, no 1, 1975, p 58-61 5 refs Translation

The calculations of the flow field are carried out for an ideal potential flow, assuming that the sinks and sources are distributed in the plane of the inlet and in an imaginary plane, respectively. A model for calculating air intakes without inner body is proposed, which can be readily extended to air intakes of more complex configuration and to the three-dimensional case. It is shown that allowance for finite dimensions of the air intake leads to a substantial increase in local velocities at the casing, as compared to an air intake simulated by a point sink. V P

A75-38122 Some practical considerations found in the use of solid film lubricants in aircraft systems. M B Peterson (Wear Sciences, Scotia, N.Y.), M K Gabel, and M J Devine (U.S. Naval Material Command, Naval Air Development Center, Warminster, Pa.) *Lubrication Engineering*, vol 31, July 1975, p 357-361 9 refs

The article investigates the latest technology in bonded solid film lubricants and processing used in naval aircraft, discusses present and potential applications, and suggests a direction for future research and development efforts. Areas where solid lubricants are not currently in use but could be are sealing plus lubrication (between piston and cylinder), corrosion protection plus lubrication, aid for 'run-in', rolling contact bearings, and in difficult to lubricate metals. It is recommended that a much wider use can be made of solid lubricants in aircraft to increase life and reliability of components. Applications which should be considered are hinges, brake splines, door latches, electrical connectors, control cables and microswitches. M G

A75-38136 # Mechanism of generating a normal force by a beat of the wings (O mekhanizme obrazovaniia normal'noi sily pri vzmakhe kryl'ev). S M Belotserkovskii, V V Guliaev, and M I Nisht (Tsentral'nyi Aerogidrodinamicheskii Institut, Moscow, USSR) In *Selected problems in applied mechanics. Collection of*

works dedicated to the sixtieth birthday of academician Vladimir Nikolaevich Chelomei Moscow, Izdatel'stvo VINITI, 1974, p 97-102 8 refs In Russian

Weis-Fogh (1973) has proposed a special mechanism to explain the superior performance of the chalcid wasp *Eucarsia formosa*. The buildup of the lift coefficient by other hovering insects is delayed by the Wagner effect, i.e., the time required for vorticity shedding from the trailing edge to generate the necessary circulation around the wing. *Eucarsia formosa*, however, eliminates the Wagner effect in building up maximum lift by preceding each beat of the wings by a special movement, the 'clap and fling'. In the present paper, the Weis-Fogh mechanism of lift generation is analyzed on the basis of unsteady-state aerodynamics for plane flow. It is shown that, in addition to the elimination of the Wagner effect, flow separation effects are an important factor in the Weis-Fogh mechanism. V P

A75-38144 # Investigation of self-oscillations of an autopilot mount (Issledovanie avtokolebani stenda s avtopilotom) N V Butenin, P A Zemskov, and V S Metrikin (Gor'kovskii Gosudarstvennyi Universitet, Gorki, USSR) In Selected problems in applied mechanics. Collection of works dedicated to the sixtieth birthday of academician Vladimir Nikolaevich Chelomei (A75-38126 18-39) Moscow, Izdatel'stvo VINITI, 1974, p 179-186 8 refs In Russian

The existence and uniqueness of stable asymmetric self-oscillatory motion without slippage in an autopilot mount are proven by the method of point-to-point mapping. It is shown that stable symmetric modes with slippage do not exist. Quantitative characteristics of the motion are analyzed together with the separation of the parameter plane in the region of stability. F G M

A75-38261 # The cost-effectiveness of inertial navigation for civil aircraft A A Edwards *Journal of Navigation*, vol 28, July 1975, p 274-282, Discussion, p 282-285

The article compares the 1969 predictions and the 1974 actual cost and accuracy of inertial navigation. The realized capital outlay and maintenance expenditure were greater than predicted but these were offset in 1974/5 by higher system utilization. The difference between predicted and realized expenditure did not exceed 3 percent. The earlier progress and temporary setbacks, which caused significant improvements and beneficial design changes in INS are explained. Future INS developments include a grid point storage system for magnetic variation, navigational accuracy improvement methods and new sensor techniques. Strap-down techniques are seen by the airlines as an extremely promising development and would be acceptable both as a vertical reference and as a source of navigational data. M G

A75-38262 # Future trends in flight control systems G H Hunt (Royal Aircraft Establishment, Farnborough, Hants, England) (*Royal Institute of Navigation and Institution of Electronic and Radio Engineers, Joint Meeting on Advances in Airborne Equipment for Navigation and Freight Control, London, England, Jan 15, 1975*) *Journal of Navigation*, vol 28, July 1975, p 286-299

The problems of reliability, integrity, and failure in flight control systems are followed by separate discussions of the outer-loop system, which can fail but being of limited authority can be switched out, and the inner loop system which must never completely fail, otherwise the control of the whole aircraft is lost. The relationship between system failure rate and complexity for systems principally comprised of processors, rather than sensors and actuators is shown. The fly-by-wire control system, its advantages, and the disadvantages resulting from the presence of the mechanical standby linkage are discussed. The advantages that digital computers and data transmission possess for the fly-by-wire applications are summarized. Current FBW/CCV (control configured vehicle) programs represent a large and important trend in aircraft technology, in which the control system is assuming an importance in the design cycle equal to that of the airframe and engines. M G

A75-38340 National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn, March 6, 7, 1975, Proceedings Symposium sponsored by the American Helicopter Society. New York, American Helicopter Society, Inc, 1975 224 p S20

The proceedings deal with the influence of rotor aerodynamic design on performance and noise, advanced airfoil developments, and parasite drag reduction. Among the major topics discussed are the identification of factors influencing the hovering performance of helicopter rotors, the use of antitorque devices other than tail rotors, the improvement of performance by tip air mass injection, evaluation of airfoil sections for helicopter rotor applications, the effects of parasite drag on rotor performance and dynamic response, a cost/benefit evaluation of helicopter parasite drag reductions, and a tunnel spanning airfoil testing technique. S D

A75-38341 # Uniform downwash with rotors having a finite number of blades F D Harris and M A McVeigh (Boeing Vertol Co., Philadelphia, Pa.) In National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn, March 6, 7, 1975, Proceedings. New York, American Helicopter Society, Inc, 1975, p 1-1-26 20 refs

The classical blade element momentum theory for an infinite bladed rotor is reexamined to show that the historically defined optimum rotor is not correct for a practical rotor with a finite number of blades. Fixed-wing aerodynamic theory is used to demonstrate that the loading on a single blade is better represented by treating the rotor blade as a wing in a linearly varying spanwise velocity field. An approximation for the velocity induced by a rolled-up trailed tip vortex is suggested. Realistic goals for maximum hovering performance efficiency of rotors with a finite number of blades and uniform downwash are discussed. S D

A75-38342 # A second approximation to the induced drag of a rotor in forward flight R W Prouty (Summa Corp., Hughes Helicopters Div., Culver City, Calif.) In National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn, March 6, 7, 1975, Proceedings. New York, American Helicopter Society, Inc, 1975, p 2-1-24

The method of determining the induced drag of a wing from the distribution of circulation in its wake has been adapted for an infinite bladed helicopter rotor. Using this method, a 'rotor induced efficiency factor' can be determined which will result in computing more realistic induced drag values than the conventional momentum method. The factor is shown to be a function of rotor geometry and flight conditions and is plotted for several combinations of these parameters. (Author)

A75-38343 # Trimming dual control rotors for optimum performance D W Robinson, Jr and F K Dunn (Kaman Aerospace Corp., Bloomfield, Conn.) In National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn, March 6, 7, 1975, Proceedings. New York, American Helicopter Society, Inc, 1975, p 3-1-13 5 refs

Certain advanced rotor concepts, in addition to the conventional collective and first harmonic control inputs, feature a secondary control input to alter the loading distribution, thereby improving performance. Trimming such a rotor requires selecting primary and secondary control input settings to achieve specified trim forces at the most favorable trade-off of performance parameters. Trade-off optimization using typical aeroelastic rotor analyses directly is prohibitively expensive. The paper discusses and illustrates an indirect approach using response surface analysis. Results of a limited number of aeroelastic analysis cases are used to develop a simple mathematical model of rotor responses of interest. Optimization is performed with the simple model, and the final selection of controls confirmed by the main rotor analysis program. (Author)

A75-38344 # Summary of antitorque devices other than tail rotors F Raitch (U S Army, Army Mobility Research and Development Laboratory, Fort Eustis, Va) In National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn , March 6, 7, 1975, Proceedings New York, American Helicopter Society, Inc , 1975, p 4 1-4-9 6 refs

Past and present efforts in replacing tail rotors on single-main-rotor helicopters for reasons of safety, vulnerability, noise, efficiency, and high-speed dynamics are reviewed Fan-in-fin and fan-in-fuselage designs are discussed It is shown that modifying any existing helicopter with a different antitorque and yaw control device will cause serious weight and center-of-gravity problems, and that alternatives to the tail rotor are likely to best serve their purpose on small-to-medium-sized vehicles with indifferent yaw stability contribution, especially near zero thrust Most helicopters already have insufficient yaw damping, which will be aggravated by tail rotor elimination S D

A75-38345 * # Summary of results indicating the beneficial effects of rotor vortex modification R P White, Jr , J C Balcerak (Systems Research Laboratories, Inc , Rochester, N Y), and R J Pegg (NASA, Langley Research Center, Hampton, Va) In National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn , March 6, 7, 1975, Proceedings New York, American Helicopter Society, Inc , 1975, p 5 1 5 15 15 refs

The possibility of reducing blade-slap noise and high-frequency air loads and of increasing performance by tip air mass injection (TAMI) is investigated The discussion is limited to two types of TAMI chordwise injection with air injected at the blade tip in a chordwise direction and spanwise injection with air injected in a spanwise direction Experimental and analytical results indicate that a properly designed TAMI system can restructure the near field characteristics of a concentrated vortex that trails off the tip of a lifting surface, that the tip vortex is spread by the application of chordwise TAMI, that mixing exists between the injected air mass and the vortex flow which enhances vortex decay, that the net power requirements to implement the system on operational helicopters are within acceptable levels, that maximum drop of noise level reductions of about 25 dB can be achieved, and that a decrease in the drag induced by the tip vortex in a spanwise TAMI system can be obtained by restructuring the vortex as it forms along the airfoil chord and by moving the vortex farther outboard of the tip S D

A75-38346 # The supersonic rotor J P Jones (Westland Helicopters, Ltd , Yeovil, Somerset, England) In National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn , March 6, 7, 1975, Proceedings New York, American Helicopter Society, Inc , 1975, p 6 1 6 8 9 refs

An account is given of some theoretical studies of the operation of a helicopter rotor at tip speeds which are about twice the speed of sound It is shown that the blade loadings of a supersonic rotor operating near its optimum are about three times those of a conventional rotor One horse power generates two to three pounds of lift The power required does not increase with altitude and in forward flight the supersonic lift does not vary significantly as the blade rotates Theoretical estimates of the noise are compared with experimental evidence and it is shown that the noise level will remain sensibly constant beyond a Mach number at the tip of about 1.1 There are shock-free zones above and below the rotor The implications of these features for helicopter aerodynamic design are discussed (Author)

A75-38347 # Acoustic effects of rotor-wake interaction during low-power descent B D Charles (Bell Helicopter Co , Fort Worth, Tex) In National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn , March 6, 7, 1975, Proceedings

New York, American Helicopter Society, Inc , 1975, p 7 1 7 8 6 refs

Helicopter blade vortex interaction noise has been measured in

partial-power descent using a microphone array mounted external to the vehicle The array was designed to permit spatial location of dominant slap noise sources while mapping intensity levels with forward speed and descent rate Vortex interactions were predicted using a free-wake aerodynamic analysis, and show good trend correlation with noise intensity variations with descent rate However, the predicted intersection azimuth positions yield only fair agreement with position data Vortex interaction aerodynamics are modeled simply by two-dimensional, quasi static theory and indicate that shock formation and stall may be responsible for intense slap noise (Author)

A75-38348 # A state-of-the-art survey of two-dimensional airfoil data R W Prouty (Summa Corp , Hughes Helicopters Div , Culver City, Calif) In National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn , March 6, 7, 1975, Proceedings New York, American Helicopter Society, Inc , 1975, p 8 1 8 12 32 refs

A survey of existing two dimensional airfoil data has been made in order to provide the basis for developing new airfoils with particular characteristics or for comparing an existing airfoil with the current state-of the art It is shown that the most significant aerodynamic characteristics are related to a few key physical parameters It is also shown that test differences in Reynolds numbers can seriously distort comparisons of one airfoil with another (Author)

A75-38349 * # An analytical and experimental evaluation of airfoil sections for helicopter rotor application G J Bingham and K W Noonan (U S Army, Air Mobility Research and Development Laboratory, NASA, Langley Research Center, Airfoil Research Section, Hampton, Va) In National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn , March 6, 7, 1975, Proceedings New York, American Helicopter Society, Inc , 1975, p 9 1 9 10 20 refs

The influence of the more independent airfoil parameters such as thickness, thickness distribution, leading-edge radius, camber, and camber distribution on lift Mach number characteristics is investigated at lift coefficients up to near maximum lift The analysis is based on the drag divergence Mach number (Md) prediction techniques, where Md is the free stream Mach number at which the rate of increase of drag coefficient with Mach number equals 0.1 The analytical results obtained indicate the compromises in Md which result from changes in thickness ratio, location of maximum thickness, leading edge radius, camber addition, and location of maximum camber for four and five digit airfoils and some six series airfoils of potential interest for helicopters An example of airfoil sections which combines several of the favorable geometric changes is evaluated analytically and experimentally A comparison of results shows that the relative effect of the geometric changes on the lift coefficient Md relation is realistic, and that the methods of analysis employed can be effectively used during preliminary vehicle design and airfoil selection S D

A75-38350 # A tunnel spanning airfoil testing technique D R Chaddock (U S Naval Material Command, Ship Research and Development Center, Bethesda, Md) In National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn , March 6, 7, 1975, Proceedings New York, American Helicopter Society, Inc , 1975, p 12 1-12 12 6 refs

Several helicopter airfoil blade sections are tested in a transonic wind tunnel in order to obtain transonic two-dimensional data The airfoil models are described along with the transonic wind tunnel of rectangular cross-section Center span pressures are integrated to calculate lift, pitching moment, and drag A wake rake is used to measure wake total and static pressures which are integrated to calculate drag All data are measured simultaneously by using scani-valves under identical conditions for a constant angle of attack, and balance data are averaged for each data point Comparisons

between integrated surface pressure data, balance data, and wake rake transverse show that the integrated pressure data give displaced curves, reduced pitching moments, and are consistent with the balance drag data. Wake rake data indicate a lower level and different gradient for the drag rise as a function of angle of attack than either the pressure or the balance data. Means of reducing discrepancies between the measuring techniques are discussed. S D

A75-38351 A simplified approach to generalized helicopter configuration modeling and the prediction of fuselage surface pressures. T W Sheehy (United Aircraft Corp., Sikorsky Aircraft Div., Stratford, Conn.) In National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn., March 6, 7, 1975, Proceedings. New York, American Helicopter Society, Inc., 1975, p 15 1 15 8

An analytical method using well tried potential flow techniques has been developed to analyze the aerodynamic flow field on and about aircraft configurations. To simplify the use of the techniques, a computer aided method to generate analytical models of aircraft configurations has been developed. The method has demonstrated good correlation with experimental data and its potential for being a beneficial design tool. In addition, the computer modeling technique developed reduces user responsibility while accurately modeling the configuration analyzed. (Author)

A75-38352 # Wasted fuel - Another reason for drag reduction. J P Rabbott, Jr and R H Stroub (US Army, Air Mobility Research and Development Laboratory Moffett Field, Calif.) In National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn., March 6, 7, 1975, Proceedings. New York, American Helicopter Society, Inc., 1975, p 17 1 17 6 14 refs

The effects of changes in helicopter parasite drag on fuel costs in the period 1970-1990 are reviewed for both the civil and military fleet. Factors considered include the fleet mix of light, medium and heavy helicopters and the gradual phasing out of in-service helicopters and introduction of more modern designs. This leads to a composite fleet cruise speed and equivalent flat plate parasite drag area. An equivalent speed for fuel utilization is defined and yearly parasite drag fuel costs computed based on current parasite drag design practices. Three improved levels of drag technology are postulated and associated potential savings in fuel costs presented. It is concluded that the potential savings in fuel costs are measured in tens of millions of dollars per year. (Author)

A75-38353 # Effects of parasite drag on rotor performance and dynamic response. A F Smith (Kaman Aerospace Corp., Blumfield, Conn.) In National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn., March 6, 7, 1975, Proceedings. New York, American Helicopter Society, Inc., 1975, p 18 1-18 6

A coupled aeroelastic analysis including two elastic modes and three rigid body response modes is used to compute the rotor response of a typical helicopter with the aid of FORTRAN IV language. The effect of drag on rotor dynamic loadings, bending moment distributions, blade section angle of attack, rotor power, and hub shears is evaluated over a range of forward flight speeds and typical rotor loading conditions. It is shown that (1) increasing helicopter flat plate area increases rotor power, tip angle of attack, blade flapping, resultant hub shears, and higher harmonic flatwise bending moments, but reduces first harmonic flatwise bending moments, and (2) every additional square foot of drag reduces rotor maximum forward speed by 2.5 knots. S D

A75-38354 # Effect of helicopter drag reduction on rotor dynamic loads and blade life. A W Kerr (Lockheed-California Co., Burbank, Calif.) In National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn., March 6, 7, 1975, Proceedings. New York, American Helicopter Society, Inc., 1975, p 19 1 19 7

Helicopter drag as reflected in rotor propulsive force requirements has a significant effect on dynamic blade loads which can affect blade life. These loads also generate excitation for airframe vibrations. A detailed analysis has been made to assess the impact of helicopter drag on blade and rotor hub loads. Predicted dynamic loads are presented for a 16,000 pound helicopter with a four-bladed stiff-inplane hingeless rotor flying at 150 knots with airframe (including hub and pylon) parasite drag levels between 0 and 30 square feet of equivalent flat-plate drag area. The analysis used is described briefly and correlation with flight data shown. The significance of dynamic loads on blade life and airframe vibration are discussed. Reduction of airframe drag level decreases vibration excitation and blade loads significantly, which can result in opportunity for weight reduction and a secondary impact on extension of blade life. (Author)

A75-38355 # Cost benefit evaluation of helicopter parasite drag reductions. J M Duhon (Bell Helicopter Co., Fort Worth, Tex.) In National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn., March 6, 7, 1975, Proceedings. New York, American Helicopter Society, Inc., 1975, p 16 1 16 3

The paper discusses means of evaluating the effect of drag reduction on empty weight, cost to manufacture, and cost to operate. Drag reduction in the design phase is shown to be much more effective than such reduction attempted in the development or product improvement phase. The paper proposes guidelines for determining how much weight and how many dollars can be expended beneficially on drag reduction. A numerical example shows cost and weight evaluation for a simple commercial application. (Author)

A75-38356 * # A comprehensive plan for helicopter drag reduction. R M Williams and P S Montana (US Naval National Command, Ship Research and Development Center, Bethesda, Md.) In National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn., March 6, 7, 1975, Proceedings. New York, American Helicopter Society, Inc., 1975, p 13 1-13 26 31 refs. Navy NASA-Army supported research.

Current helicopters have parasite drag levels 6 to 10 times as great as fixed wing aircraft. The commensurate poor cruise efficiency results in a substantial degradation of potential mission capability. The paper traces the origins of helicopter drag and shows that the problem (primarily due to bluff body flow separation) can be solved by the adoption of a comprehensive research and development plan. This plan, known as the Fuselage Design Methodology, comprises both nonaerodynamic and aerodynamic aspects. The aerodynamics are discussed in detail and experimental and analytical programs are described which will lead to a solution of the bluff body problem. Some recent results of work conducted at the Naval Ship Research and Development Center (NSRDC) are presented to illustrate these programs. It is concluded that a 75 per cent reduction of helicopter drag is possible by the full implementation of the Fuselage Design Methodology. (Author)

A75-38357 # A study of the potential benefits of advanced airfoils for helicopter applications. V M Paglino and D R Clark (United Aircraft Corp., Sikorsky Aircraft Div., Stratford, Conn.) In National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn., March 6, 7, 1975, Proceedings. New York, American Helicopter Society, Inc., 1975, p 11 1 11 15 6 refs. Contract No N00019-73-G 0225

An analytical study is made of the potential benefits of advanced airfoils for helicopter applications. Representative missions are defined and partial derivatives are developed which relate specific airfoil characteristics to rotor aerodynamic efficiency and to helicopter design gross weight. Selected airfoils are incorporated in design applications so that computed aerodynamic benefits are interfaced with rotor dynamic limitations, structural weight requirements, and cost elements. It is demonstrated that airfoil improvements may contribute to reduction in power required, increases

in load carrying capacity for a given blade area, or increased load factor capability during maneuvers. This study addresses the reduced power or performance benefits only. (Author)

A75-38358 A review of design objectives for advanced helicopter rotor airfoils. L. U. Dadone and T. Fukushima (Boeing Vertol Co., Philadelphia, Pa.) In National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn., March 6, 7, 1975, Proceedings. New York, American Helicopter Society, Inc., 1975, p. 10-1-10-18. 19 refs.

The main features of several recent advanced airfoils are reviewed in order to define the degree of commonality present in the guidelines under which they were developed and, when possible, to explain the differences in design objectives. The advanced airfoils are discussed under three categories: modifications of the NACA 0012 airfoil, modified versions of high speed cambered airfoils, and transonic airfoils designed for helicopter rotors based on methodology for high-speed fixed wing applications. The flow environment of a helicopter rotor and the key sectional characteristics for hover and forward flight are examined. The sectional characteristics necessary to improve Vertol rotors are determined through several airfoil design, airfoil test and rotor test iterations. It is shown that while the design guidelines under which all advanced helicopter airfoils are developed recognize the importance of high lift, low pitching moments, and good high Mach number performance, only the Vertol guidelines actually specify a lower limit for the maximum lift coefficient and prescribe nose-up pitching moments. A75-38370 Looping in a hydrogen cooling system. I. N. Moiseev (*Teplofizika Vysokikh Temperatur*, vol. 12, Nov-Dec 1974, p. 1257-1266.) *High Temperature*, vol. 12, no. 6, July 1975, p. 1103-1110. Translation.

The present paper considers the problem of circuit design for a forced hydrogen cooling system for aircraft subjected to high heat loads. The hydrogen in such systems is used both as a fuel and as a coolant. Two methods of using the hydrogen are compared: a single-circuit method and a double-circuit method. In the single-circuit system, the hydrogen flows directly in a cooling jacket, where it is heated. In the double-circuit system, the aerodynamically generated heat is accumulated by a high-temperature heat-transfer agent which circulates in a closed circuit, then the heat is transferred to the hydrogen coolant in a high-temperature heat exchanger. A liquid-metal heat-transfer agent is used in the present case. It is shown that the double-circuit system can offer considerable advantages over a single circuit system, especially for high heat loads. A. T. S.

A75-38375 Reflection of a shock wave from a wedge. G. A. Makarevich, O. A. Predvoditeleva, and G. S. Lisenkova (*Teplofizika Vysokikh Temperatur*, vol. 12, Nov-Dec 1974, p. 1318-1321.) *High Temperature*, vol. 12, no. 6, July 1975, p. 1172-1175. 12 refs. Translation.

Experimental studies were made of the reflection of shock waves of various intensities in the region of intermediate angles between regular and irregular reflections. A wedge-shaped model was used in an electric-discharge shock tube 80 mm in diameter. During the experiments, the Mach number was 1.85, 6, or 10, and the initial pressure in the tube was varied from 4 to 30 torr. High-speed motion pictures were made at rates from 125,000 to 187,000 frames/sec.

A75-38406 # Hypersonic flow past V-shaped conical wings (*Giperzvukovoe obtekanie konicheskikh kryl'ev V-obraznoi formy*). A. L. Gonor and N. A. Ostapenko (*Moskovskii Gosudarstvennyi Universitet, Institut Mekhaniki, Otchet* no. 1164, 1971. 24 p. 23 refs. In Russian).

An analytical method is proposed for calculating a hypersonic flow past a conical wing. Assuming that the flow patterns are curvilinear Mach shock waves and that the region of turbulent flow is a strongly compressed layer, a closed solution is constructed which

allows regions bounded by a contact discontinuity as well as bow and internal shock waves to be joined smoothly. It is shown that the problem reduces mathematically to the solution of two integro-differential equations. On the basis of an approximate solution, the characteristics of the flow field are determined, and the maximum L/D ratio is established with a wing conic angle of less than 180 deg. F. G. M.

A75-38407 # Integral method for calculating a detached stream behind a body in a supersonic flow (*Integral'nyi metod rascheta otrynnogo techeniia za telom v sverkhzvukovom potoke*). L. V. Gogish and G. Iu. Stepanov (*Moskovskii Gosudarstvennyi Universitet, Institut Mekhaniki, Otchet* no. 1188, 1971. 36 p. 25 refs. In Russian).

A stream behind a body in a supersonic flow is examined taking into account the basic characteristics of the flow about its leading edge: the presence of shock waves and entropic layers, the nature of the boundary layer, and its interaction with an inviscid stream. Characteristic subregions of the stream in the wake are delimited, and stream conditions in these subregions are formulated for viscous and inviscid flow layers with allowance for their interaction. Integral relations are obtained in a general form for two-dimensional viscous and inviscid gas flows in jets, layers, and wakes, and a simple method for calculating detached streams is constructed on the basis of these relations together with assumptions about velocity profiles, boundary layers, and closure relationships. Simple approximations are described for calculating a turbulent boundary layer and the wake in a gas with arbitrary pressure and heat exchange gradients. F. G. M.

A75-38550 # LTA aerodynamic data revisited. H. C. Curtiss, Jr., D. C. Hazen, and W. F. Putman (Princeton University, Princeton, N.J.) *American Institute of Aeronautics and Astronautics, Lighter Than Air Technology Conference, Snowmass, Colo., July 15-17, 1975, Paper 75-951*. 17 p. 38 refs.

Sources of aerodynamic data for lighter-than-air vehicles are surveyed, and their probable accuracy is critically evaluated. It is noted that most of the cited literature was published prior to 1930. Attention is restricted to essentially fully buoyant craft employing conventional airship-shaped hulls of more or less circular cross section and fineness ratios ranging from 3 to 10. Major topics discussed include drag, lift, and sideforce aerodynamics, equilibrium flight, dynamic stability, and controllability. It is shown that modern analytical methods based on boundary layer and flow theory should be utilized to obtain more reliable data on drag effects as well as hull forces and moments. Previously published papers on estimation of stability derivatives, response rates, coupling effects, and controllability are found to be less than satisfactory due to the inadequate testing method of the time. It is suggested that analytical predictive techniques be employed in these areas without experimental verification. F. G. M.

A75-38576 # New structural form of sandwich core. K. Miura (Tokyo University, Tokyo, Japan) *Journal of Aircraft*, vol. 12, May 1975, p. 437-441.

The purpose of this study is to present a new structural form of sandwich core. The observation, that the characteristics of honeycomb core is distinctly attributable to its stabilized perpendicular wall elements, leads to the possibility of a hypothetical core concept characterized by stabilized oblique wall elements. To embody the hypothetical concept, the core form constituted by superposing two mutually orthogonal corrugations is proposed. The resultant core can be manufactured from a single sheet by some press forming technique. The theoretical and experimental analyses of the core reveal that the shear modulus and strength are comparable with those of honeycomb core, and the elastic properties can be designed to be either isotropic or orthotropic. Other features of the core such as the simplicity of form, the applicability to both flat and curved sandwiches, and the possibility of circulating fluid between facings, may excite new applications of sandwich construction in aircraft structures. (Author)

A75-38579 # Static stability and aperiodic divergence G Sachs (Darmstadt, Technische Hochschule, Darmstadt, West Germany) *Journal of Aircraft*, vol 12, May 1975, p 497 500 6 refs

The present work shows conditions under which static stability cannot prevent aperiodic divergence and indicates cases where static stability is and is not sufficient for dynamic stability. Root locus analyses and stability boundary graphs are given for various aerodynamic quantities involved. In the cases considered, stability is found to be sufficient for dynamic stability and sufficient to prevent aperiodic divergence. S J M

A75-38601 The acoustic response of a nozzle flow to an externally applied low frequency pressure field J R Jacques (Cambridge University, Cambridge, England) *Journal of Sound and Vibration*, vol 41, July 8, 1975, p 13 32 17 refs

A theoretical discussion is presented of the noise generated when a jet exhausts from a constant pressure plenum chamber into an unsteady atmosphere. That unsteadiness provokes fluctuations at the nozzle exit and these are evaluated by taking into account a model of the axisymmetric jet instability modes. It is found that the radiated noise is virtually omnidirectional and that it depends strongly on both the jet Mach number and nozzle contraction ratio. This sound mechanism vanishes completely when the jet becomes sonic. Then, despite the unsteady external field, the nozzle flow is unperturbed. The sound power radiated scales on the sixth power of jet speed so that it is likely to dominate over the jet mixing noise at low Mach number. The mechanism can be driven by any aerodynamic perturbation around the nozzle, but it is found that if the perturbation is acoustic, the scattered energy is an altogether negligible fraction of that incident on the nozzle area. (Author)

A75-38603 A social survey to examine the variance of aircraft noise annoyance R M Edwards (Loughborough University of Technology, Loughborough, Leics, England) *Journal of Sound and Vibration*, vol 41, July 8, 1975, p 41-51 10 refs. Research supported by the Civil Aviation Authority

The large variability in the measurement of human response to aircraft noise is described, and the philosophy behind a social survey designed to eliminate some causes of this variability, by considering a small geographical area over which the noise from one aircraft flyover is nearly constant, is outlined. Results from this survey show that it is not noise measurements and noise indices that need improvement, but measures of human response. Until we have a better measure of response than McKennell's Guttman Annoyance Scale efforts to improve noise indices are wasted. The variability in annoyance score of the residents of the area studied is just as high as that in previous surveys in which NNI has been used as an Index to group areas of equal noise exposure. Some objections to the operation of this particular Guttman scale are raised. Analysis of the Coefficients of Reproducibility of the scale as used in various surveys shows that the scale has behaved differently in different surveys. (Author)

A75-38618 # Turbulent near wake of a flat plate II - Effects of boundary layer profile and compressibility K Toyoda (Hokkaido Institute of Technology, Sapporo, Japan) and N Hirayama (Tokyo Metropolitan University, Tokyo, Japan) *JSME, Bulletin*, vol 18, June 1975, p 605 611 12 refs

In the previous report, we proposed a method to calculate the development of the incompressible turbulent wake close to a flat plate. The calculated results were compared with experimental data in which the wake started from the turbulent boundary layers on both sides of a thin flat plate. The agreement between the calculated and the experimental results was very good, and we can conclude that the diffusion phenomenon of the turbulent near wake has been made clear both qualitatively and quantitatively. In that case the shape parameters of the boundary layers at the trailing edge of the

plate were all equal to 1.45. Here in this report, we extend the previous method so that we can study the effect of the boundary layer profile and that of compressibility upon the development of the turbulent wake close to a flat plate. The calculated results show that the wake profile is dependent on the boundary layer profile and compressibility. The agreement between the calculated and the experimental results is excellent. (Author)

A75-38629 Possibilities concerning a use of borescope inspection methods in nondestructive material testing and the significance of these methods (Moglichkeiten der Borescope-Untersuchungsmethoden in der zerstörungsfreien Werkstoffprüfung und deren Aussagekraft) H-G Straatmann (Lufttransport Unternehmen GmbH, Dusseldorf, West Germany) (*Deutsche Gesellschaft für Zerstörungsfreie Prüfverfahren, Vortragstagung über Zerstörungsfreie Materialprüfung, Berlin, West Germany, May 5-7, 1975*) *Materialprüfung*, vol 17, July 1975, p 220, 221. In German

Industrial glass fiber borescopes are used for the examination of cavities in the case of accessibility difficulties. The employment of the borescope technique in the case of an inspection involving an aircraft engine is discussed. The engine consists of five different modules. Openings for borescope inspection are provided in each module. G R

A75-38668 UTTAS *Air International*, vol 9, Aug 1975, p 67-74

Two competing designs for the Utility Tactical Transport Aircraft System (UTTAS) are outlined. The UTTAS will be a utility transport helicopter powered by twin turboshaft engines. Although only slightly advanced over the UH-1, which it is to replace, in terms of troop capacity, the UTTAS will have greater payload capacity in high-temperature and high-altitude operations, superior performance, and improved reliability and availability. Cutaway drawings of the two designs are provided. P T H

A75-38726 # Spike, relays and aircraft electric systems O Markowitz (U S Navy, Aviation Supply Office, Philadelphia, Pa.) In Annual National Relay Conference, 23rd, Oklahoma State University, Stillwater, Okla., April 29, 30, 1975, Proceedings Conference sponsored by the Oklahoma State University and National Association of Relay Manufacturers. Scottsdale, Ariz., National Association of Relay Manufacturers, 1975, p 12-1 to 12-14 8 refs

A spike is produced by the interruption of current flow or a sudden change in current level that releases stored magnetic energy. Spike generators are considered to be aircraft relays, solenoids, magnetic clutches, actuators, pulsing switches, motors, transformers, and the like. The specific characteristics of a spike are translated into generic characteristics which are used for defining the spike. A review of the existing approaches to spike suppression in a relay suggests that a directed total approach is required by the relay industry to provide the optimal system approach to relay suppression. A basic spike generator circuit is presented along with an aircraft electric system design. S D

DYNAMIC STALL CHARACTERISTICS OF AN OSCILLATING AIRFOIL IN A HARMONICALLY VARYING FREESTREAM VELOCITY Ph D Thesis

John Bruce Malone 1974 184 p
 Avail Univ Microfilms Order No 75-13001

The unsteady freestream environment of a helicopter rotor blade in forward flight was simulated using a gust generator mechanism installed in a low-turbulence wind tunnel. A model is used for this investigation. An operational analog computer is used to obtain both the aerodynamic moment acting on the model, and the work done by the moment during pitching oscillations of the airfoil. The experimental tests indicate that the unsteady freestream can produce large changes in the shape of the aerodynamic moment versus angle of attack hysteresis loops. The test results also show that the stability of the system can be adversely affected by the unsteady freestream under certain parametric conditions. Dissert Abstr

INVESTIGATION OF THE TURBULENT PROPERTIES OF THE WAKE BEHIND SELF PROPELLED, AXISYMMETRIC BODIES Ph D Thesis

Ching-Chang Chieng 1974 125 p
 Avail Univ Microfilms Order No 75-11930

The turbulent wakes behind a streamlined drag body a jet-propelled body and a propeller-driven body are studied experimentally in stability wind tunnel at a nominal free stream velocity of 206 ft/sec. The turbulence properties investigated are axial, radial, and tangential turbulence intensities and radial and tangential shear stresses. Data was taken at five axial stations downstream of the tail of the body $X/D = 2, 5, 10, 20$ and 40 . It is found that the propeller-driven body produces the largest wake throughout the axial distance covered by these tests. The jet-propelled body produces the middle sized wake compared to the other two models up to the station $X/D = 20$. Beyond this station this wake becomes the smallest. Dissert Abstr

TURBULENT WAKE BEHIND SLENDER BODIES, INCLUDING SELF-PROPELLED CONFIGURATIONS Ph D Thesis

Roy Charles Swanson Jr 1975 115 p
 Avail Univ Microfilms Order No 75-11950

The turbulent wakes behind a streamlined drag body a jet-propelled body and a propeller-driven body are studied experimentally in a subsonic wind tunnel at a principal nominal freestream velocity of 206 ft/sec. The wakes produced by the latter two bodies are momentumless. Mean flow data taken at five axial stations ($X/D = 2, 5, 10, 20$ and 40) downstream of the sterns of these bodies include velocity and static pressure distributions. The streamwise variation of the maximum values of axial turbulence intensity and radial shear stress are also presented. The mean flow data for the wake behind the drag body compare favorably with previous experiments and establish a rigid reference for the wakes behind slender self-propelled configurations. POTENTIAL FLOW ABOUT THREE-DIMENSIONAL STREAMLINED LIFTING CONFIGURATIONS, WITH APPLICATION TO WINGS AND ROTORS Ph D Thesis

James Michael Summa 1975 158 p
 Avail Univ Microfilms Order No 75-13606

A numerical method is developed and successfully applied for converging to the exact calculation of three-dimensional lifting

potential flows including cases of unsteady motion. The exact body surface boundary conditions are enforced, and all wake surfaces are unconstrained. The assumptions made in the theoretical model are that the fluid is ideal and that no separation may take place. The basic solution consists of the Green's function approach, where the velocity potential at any point in the fluid is represented by continuous distribution of doublets of unknown strength on each of the bounding surfaces. Application of the surface tangency condition yields a set of coupled, singular Fredholm integral equations of the first kind relating the velocity potential doublet distributions to the normal velocity on the body surfaces and subject to the Kutta-Joukowski condition at trailing edges and the dynamic and geometric surface conditions on all wakes. The results are presented for a series of low-altitude flight tests in which the trailing vortices of the Boeing 707 airplane were investigated using a 140-foot tower instrumented with airspeed, velocity, direction, temperature, and humidity sensors. Flow visualization was employed and motion picture records made. The data presented consists of plots of vortex tangential velocity distribution, peak tangential velocity as a function of time, airplane configuration, windspeed, and airplane altitude in proximity to the tower, vortex descent rates, lateral transport velocities, and specimen time histories of the velocities measured by individual sensors. COMPARISON OF MEASURED AND CALCULATED AIRCRAFT LIFT GENERATED PRESSURES

Donald S Findley Jun 1975 17 p refs
 (NASA-TM-X-72707) Avail NTIS HC \$3 25 CSCL 01A

Lift generated pressures produced by large heavy aircraft at low altitudes were investigated due to concern over their possible effects on ground objects. Aircraft lift generated pressures were calculated using elementary airfoil theory, and these values were compared with ground level measurements made during an overflight program. The predicted and the measured values were in relatively good agreement. Due to lack of experimental investigations of this phenomenon opportunity was taken during an overflight program to use a specially instrumented test range to measure the ground pressures produced for a range of aircraft weights and distances. A general method for analyzing aerodynamic flows around complex configurations is presented. By applying the Green function method, a linear integral equation relating the unknown small perturbation potential on the surface of the body, to the known downwash is obtained. The surfaces of the aircraft wake and diaphragm (if necessary) are divided into small quadrilateral elements which are approximated with hyperboloidal surfaces. The potential and its normal derivative are assumed to be constant within each element. This yields a set of linear algebraic equations and the coefficients are evaluated analytically. By using Gaussian elimination method equations are solved for the potentials at the centroids of elements. The pressure coefficient is evaluated by the finite difference method, the lift and moment coefficients are evaluated by numerical integration. Numerical results are presented, and applications to flutter are also included. Author

The effectiveness of various devices in accelerating the dissipation of wing-tip vortices has received considerable attention recently. These devices include jets blown into or near the vortex core, both in the upstream and downstream direction, small cruciform wings, both fixed and rotating, mounted close behind the wing near tip and angled fences or vortex generators mounted on the wing upper and lower surfaces so as to produce swirl opposite to that of the tip vortex. In this report are proposed mathematical models for representing some of these devices in order to calculate their effects on the wing aerodynamic properties. These models are incorporated into a lifting-line theory and examples are calculated for high-aspect-ratio, unswept, untwisted wings of the elliptic planform. In order to obtain results of a more useful kind, it is suggested that these models be used with a lifting-surface theory of the vortex-lattice type. GRA

The results of linear stability theory have been used to predict the location of boundary-layer transition with emphasis on including the effects of surface roughness and axisymmetric geometry. Both of these parameters are important in determining transition on re-entry vehicles. The effects of surface roughness were included by means of a turbulent sublayer model which attributes the effects of roughness to an alteration in the mean velocity profile. Axisymmetric effects were included by a proper consideration of the growth rate of the boundary-layer thickness. GRA

A METHOD FOR PREDICTING ACOUSTICALLY INDUCED VIBRATION IN TRANSPORT AIRCRAFT, APPENDIX Final Report
 Harold W Bartel and Cecil W Schneider Sep 1974 54 p refs
 (Contract F33615-73-C-3638, AF Proj 1370)
 (AD-A004215, LG74ER0121-App-1, AFFDL-TR-74-App-1) Avail NTIS CSCL 01/3

A method is set forth for predicting the acoustically induced structural vibration in transport category aircraft. Charts are presented which correlate third-octave random noise and vibration levels at various confidence levels for the frequency range of 50 to 2500 Hertz. The prediction charts are based on measured data from modern transport aircraft and are presented for the normal direction, ground operation, and a reference structural mass and rigidity. Shell-type structure (fuselage, pods, fairings) and box-type structure (wing horizontal/vertical stabilizer) are treated separately. Means are provided for predicting lateral and tangential vibration in pressurized cruise flight, and for correcting for changes in structural mass and rigidity. Application of the method to a hypothetical airplane design case is illustrated in an example. GRA

REYNOLDS NUMBER EFFECTS ON THE BOATTAIL CHARACTERISTICS OF A SIMULATED NACELLE AT A MACH NUMBER OF 0.8 Final Report, 1 Dec 1973 - 8 Aug 1974
 Ted Dansby Oct 1974 78 p refs
 (Contract F33615-74-C-4021, AF Proj 7064)
 (AD-A004803, LG74ER0078, ARL-74-0120) Avail NTIS CSCL 01/3

The effect of Reynolds number on the boattail drag of three simulated afterbody configurations is presented for zero angle of attack for a Mach number of 0.8. The boattail pressure drag for one of the configurations is shown to first decrease then significantly increase as the Reynolds number increases. The behavior is explained by the regular variation of pressures in regions of the boattail. The mechanism governing this behavior is discussed and is partially predicted from state-of-the-art theoretical techniques. The influence of model installations and test techniques is shown to have a marked effect on the level of the drag. GRA

EXPERIMENTAL MATING OF TRAPPED VORTEX DIFFUSERS WITH LARGE AREA RATIO THRUST AUGMENTORS Final Report, Jun 1973 - Jan 1974
Charles H Haight and Robert M ODonnell Sep 1974 52 p refs
(Contract F33615-73-C-4151 AF Proj 7116)
(AD-A004802 B-94300/4CR-8 ARL-74-0115) Avail NTIS CSCL 01/3

The performance of a straight wall diffuser and various trapped vortex diffusers was measured with a basic ARL ejector as a test bed. The straight wall diffuser, termed Configuration F by Aerospace Research Laboratories (ARL) yielded thrust augmentation ratios in near agreement with those previously obtained by ARL. Also, as noted by ARL the thrust augmentation of Configuration F was insensitive to changes in the primary injector pressure. The trapped vortex diffusers investigated were of varying lengths. GRA

A STUDY OF THE FLOW AROUND PLANE AND AXIALLY SYMMETRICAL BODIES WITH A SEPARATED SHOCK WAVE BY A FLOW AT LOW SUPERSONIC SPEED
S M Gilinski and M G Lebedev 6 Dec 1974 20 p refs
Transl into ENGLISH from Akad Nauk SSSR Izv Mekhan (USSR) no 1 Jan - Feb 1965 p 17-23
(AD-A004442, FTD-MT-24-2287-74) Avail NTIS CSCL 20/4

This work is a continuation of the study of the flow around bodies of various forms by a supersonic flow of an ideal gas. G F Telenin's method for the integration of equations of gas dynamics is used in the calculation of the flow around plane and axially symmetrical bodies by a flow at low supersonic speed. Basically the range of Mach numbers $M < 2$ is examined. A comparison is carried out with experimental data and the results of calculations with the use of other numerical methods. GRA

THEORETICAL PREDICTION OF AIRLOADS ON THIN DELTA WINGS IN INCOMPRESSIBLE FLOW
B M Rao and W P Jones Jan 1975 46 p refs
(Contract N00014-68-A-0308-0007)
(AD-A004654, TEES-3029-75-01) Avail NTIS CSCL 01/1

Two methods are developed for the prediction of aerodynamic loads on sharp-edged delta wings in incompressible flow. The first method is based on the application of the Polhamus suction analogy to the potential flow solution which is obtained in this paper by a unique numerical lifting surface method developed at Texas A and M University. The second method is a direct extension of potential flow theory. The mathematical model is modified by introducing a vortex system to represent the leading edge separation. The strength of the separated vortices are adjusted by an empirical factor whose value is chosen in such a way that the total system gives the required lift. GRA

AERODYNAMIC SPOILER FOR PREVENTING AIRPLANE STALL/SPIN TYPE ACCIDENTS Final Report
H I Chevalier Dec 1974 77 p refs
(Contract DOT-FA73WA-3192)
(AD-A006995 FAA-RD-75-21) Avail NTIS HC \$4.75 CSCL 01/3

A flight test investigation was conducted to evaluate the feasibility of an aerodynamic spoiler system installed on a Piper PA-30 airplane for deterring stall, and to determine its effectiveness as a stall deterrent for other light twin-engine general aviation airplanes. Flight tests were conducted for the airplane without the spoiler installed, with the spoiler operated manually and with the spoiler operated automatically. Test results were obtained for different c.g. locations, flap positions, and engine thrust. Flight test maneuvers included approaches to stall from straight level flight, climbs, descents, turns, slips and skids with both engines operating and with simulated single engine operation. Tests also included takeoffs and landings. Test results show that the spoiler concept is feasible for an airplane with a horizontal tail where the complete surface is moveable. Author

IMPROVEMENT OF AN/TPO-27 FILTER AND CONTROL TECHNIQUES M S Thesis
Robert Eugene Lentz Dec 1974 201 p refs
(AD-A003878) Avail NTIS CSCL 17/7

A modified linear Kalman filter with deterministic forcing is used to improve the tracking capabilities of the Marine Corps AN/TPQ-27 remote tactical aircraft guidance system. Both sixth and ninth order filters are developed and used with the Precision and Coarse Guidance simulation programs. A technique for overcoming the effects of autopilot bias is presented and tested through simulation. Precision Guidance control is modified to utilize angle error and angle error rate to generate corrective commands. Significant improvement in aircraft state estimation, bombing accuracy, and overall system response is shown. The Coarse guidance algorithms and simulation program perform aircraft guidance to the bombing run with more than adequate precision under simulated conditions. **GRA**

HIGH LIFT AIRCRAFT Patent

Willard S Blanchard, Jr and Joseph L Johnson, Jr, inventors (to NASA) Issued 20 May 1975 6 p Filed 5 Jun 1973 Supersedes N73-26007 (11-17, p 1980)
(NASA-Case-LAR-11252-1, US-Patent-3 884,432, US-Patent-Appl-SN-367268, US-Patent-Class-244-15, US-Patent-Class-D12-76 US-Patent-Class-244-13, US-Patent-Class-244-42DA, US-Patent-Class-244-55) Avail US Patent Office CSCL 01C

An aerodynamically balanced high-lift aircraft is proposed in which the problems of large nose-down pitching moments generated by the flap high-lift forces, the loss of trim lift during high-lift flight and the yawing moments caused by the loss of an engine are solved without the use of large horizontal and vertical tails. A wing is carried by and bounced on the tips by spaced-parallel fuselages, horizontal tails are mounted only onto the outboard surfaces of the wing-tip fuselages. The centroid-of-lift of the high-lift flaps is located substantially at the center of gravity of the aircraft and the exhausts of the engines are emitted in the vertical plane of symmetry of the aircraft. Yawing moments occurring during flight with an engine inoperative are reduced, the horizontal tails carry an upload and contribute positive trim lift, large nose-down pitching moments generated by the high-lift flaps are minimized and noise levels are reduced.

The initial phase covered by this report was to include the design and analysis of two canard structures, one constructed primarily of boron/aluminum, the other primarily of graphite/polyimide. Both designs were then to be compared for weight saving, cost, and technical risk. A decision was then to be made to build two canard structures for structural testing. Depending upon the outcome of the evaluation, one of each material or two of one material would be built and tested. A NASTRAN model was prepared and used in the sizing of structural elements. Up to eight iterations were required in order to achieve a design which met the requirements. The Gr/PI canard design was not successfully completed. Because of the results with the Gr/PI canard, the effort was diverted to the B/Al configuration. Two subelement specimen tests were performed in order to evaluate the use of boron/aluminum crossplied material in a reversing stress fatigue spectrum. The testing showed that microcracking can occur in the aluminum matrix material and that additional testing is necessary. A manufacturing plan and a production cost estimate were made for a canard with boron/aluminum skins and titanium substructure. GRA

HELICOPTER LIFT MARGIN SYSTEM Final Report
Bradford W Edgerton and Sidney B Williams Dec 1974 48 p refs

(Contract N00014-72-C-0001, NR Proj 213-087)
(AD-A003917, Rept-80003, JANAIR-731003) Avail NTIS CSCL 01/3

Helicopter power requirements are generally maximum when hovering out of ground effect. Thus, takeoff and landing maneuvers are the most critical, since the power requirements may not be clear to the pilot at the time he must make the corresponding decisions. Power deficiencies at takeoff or landing are very hazardous. To maximize safety of takeoff and landing operations, a system has been devised which presents to the pilot his lift margin, a figure which represents the excess weight which could be accommodated under locally-existing barometric pressure, outside-air-temperature conditions, and engine and rotor system conditions. AN INVESTIGATION OF THE DEPARTURE MODES OF A F-4D AIRCRAFT FROM A STEADY SIDESLIP FLIGHT CONDITION M.S. Thesis

Max L Hawkins Dec 1974 138 p refs
(AD-A004795, GAE/MC/74-8) Avail NTIS CSCL 01/1

This study consisted of modeling the motion of an F-4D with both the linear and non-linear equations of motion. The characteristic roots of the linear equations were first analyzed to predict the unstable flight conditions in the high angle of attack flight regime. The linear equations were then integrated to obtain a time history, and more explicit picture, of motion predicted by the characteristic roots when the aircraft is perturbed from the unstable condition. The validity of the linear equations is then checked and a more detailed picture of the nature of the motion obtained by numerically integrating the non-linear equations of motion at the same flight condition. ANALYTICAL DETERMINATION OF AIRCRAFT SPIN MODES M.S. Thesis

David L. Westgate Dec 1974 77 p refs
 (AD-A004798, GAE/MC/74-11) Avail NTIS CSCL 01/3

Six non-linear equations of motion for a rigid body are used to model the aircraft's motion while in a spin. After applying the conditions for an equilibrium spin, the resulting six non-linear simultaneous equations are solved using a method that is accurate and well suited for use with a high-speed digital computer. The solution yields the equilibrium spin conditions and these solutions were usually obtained with less than three seconds of computer time. These results are compared with the results from previous prediction schemes. The linear characteristics of the aircraft about the equilibrium points are also presented. The model chosen for this study was a delta-wing fighter configuration. GRA

DESIGN OF A DEPLOYABLE WING GLIDER M.S. Thesis
 Philip L. Abold Dec 1974 77 p refs
 (AD-A004800 GAE/MC/74D-1) Avail NTIS CSCL 01/3

An unpowered, unguided vehicle to be deployed from a 4.75 inch flare tube was designed. The design criteria were six cubic inch, two pound payload, minimum glide speed of 50 knots, and stable with particular emphasis on heading stability. Two basic configurations were considered in the analysis: the first was a tailless vehicle, and the second was a conventionally tailed vehicle. It was found that the tailless vehicle could not meet the stability requirements and thus the tailed vehicle was chosen to meet the design criteria. The analysis procedure consisted of a computer model to analyze vehicle stability, wind tunnel tests to calculate aerodynamic derivatives, and flight tests to demonstrate performance. The finalized vehicle had a folding wing and flexible tail-boom to meet the packaging requirement. The resulting vehicle had a glide ratio of 25 and was very stable in heading, while meeting all other design requirements. GRA

INVESTIGATION OF THE A-7 HOOK POINT ATTACHMENT LOOSENING PROBLEM M.S. Thesis

Allen William Roessig, Jr Dec 1974 76 p refs
 (AD-A004256) Avail NTIS CSCL 01/3

Loosening of the hook point attachment bolt in the aircraft arresting hook assembly of the A-7 attack aircraft has caused a potentially dangerous situation and has demanded considerable maintenance effort. This report reviews the history of the loosening problem and attempted solutions to it. Research into a hitherto neglected possible causal mechanism, self loosening, is discussed. Experiments designed to evaluate the contribution of this new factor to the problem are reported. The conclusions drawn from these tests are that loosening occurs as a result of plastic strain of the bolt that the crushing of the washer also causes loss of torque, and that the existence or non-existence of a self loosening contribution could not be established. Four sets of model H-34 helicopter rotor blades were built and tested by the Sikorsky Aircraft Corporation. Rotorcraft Flight Simulation Program with Aeroelastic Rotor Representation Program C81, was used to predict rotor performance and blade

bending moments for comparison with the test results. Performance predictions made using the steady-state two-dimensional airfoil data (GFE) supplied by the Army for the model airfoils showed stall characteristics at much lower rotor lift levels than recorded in the tunnel test. Application of unsteady aerodynamic and yawed flow effects did not sufficiently improve the performance correlation. The lift and stall characteristics of the model rotor in the tunnel were found to be very similar to full-scale 0012 airfoil properties. GRA

 (Contract DAAJ02-73-C-0058, DA Proj 1F1-62203-AA-33)
 (AD-A004013, USAAMRDL-TR-74-91) Avail NTIS CSCL 01/3

This report presents the results of the design concepts investigation and preliminary design of externally suspended cargo pallets and/or gondolas to be utilized with the CH-47, CH-54, and HLH helicopters. Results of the investigation demonstrated that gondolas of two sizes could be coupled to develop full payload capacity of any of the three helicopters. The basic gondola was right rectangular to accommodate vehicles and equipment or break-bulk cargo if required. The investigation and supporting analyses eliminated pallets with lifting points at the base which make it both unstable and structurally inefficient. Therefore pallets were not considered as a viable design concept. The gondola provides compatibility with ANSI/ISO geometry and can be transported with slings or other load acquisition equipment. TURBOFAN COMPRESSOR DYNAMICS DURING AFTER-BURNER TRANSIENTS

Anatole P Kurkov 1975 17 p refs Presented at the Symp on Unsteady Phenomena in Turbomachinery, Monterey, Calif

22-26 Sep 1975, sponsored by AGARD Propulsion and Energetics Panel
(NASA-TM-X-71741 E-8375) Avail NTIS HC \$3 25 CSCL 21E

The effects of afterburner light-off and shut-down transients on compressor stability were investigated. Experimental results are based on detailed high-response pressure and temperature measurements on the T130-p-3 turbofan engine. The tests were performed in an altitude test chamber simulating high-altitude engine operation. It is shown that during both types of transients flow breaks down in the forward part of the fan-bypass duct. At a sufficiently low engine inlet pressure this resulted in a compressor stall. Complete flow breakdown within the compressor was preceded by a rotating stall. At some locations in the compressor, rotating stall cells initially extended only through part of the blade span. For the shutdown transient, the time between first and last detected occurrence of rotating stall is related to the flow Reynolds number. An attempt was made to deduce the number and speed of propagation of rotating stall cells. Author

WIND TUNNEL MEASUREMENTS OF FORWARD SPEED EFFECTS ON JET NOISE FROM SUPPRESSOR NOZZLES AND COMPARISON WITH FLIGHT TEST DATA
Adolph Atencio Jr May 1975 10 p refs Presented at AIAA 8th Fluid and Plasma Dyn Conf Hartford 16-18 Jun 1975 Prepared in cooperation with Army Air Mobility R and D Lab, Moffett Field, Calif
(NASA-TM-X-62449, A-6054) Avail NTIS HC \$3 25 CSCL 20A

The results of a test program conducted in the NASA Ames 40- by 80-Foot Wind Tunnel to determine the effect of forward speed on the noise levels emanating from a conical ejector nozzle, a 32-spoke suppressor nozzle, and a 104-elliptical-tube suppressor nozzle are reported. It is shown that noise levels are reduced as forward speed is increased and that, for one suppressor configuration, forward speed enhances suppression. Comparisons of noise measurements made in the wind tunnel with those obtained in flight tests show good agreement. It is concluded that wind tunnels provide an effective means of measuring the effect of forward speed on aircraft noise. Author

INTERIM PREDICTION METHOD FOR FAN AND COMPRESSOR SOURCE NOISE
M F Heidmann Jun 1975 83 p refs
(NASA-TM-X-71763, E-8398) Avail NTIS HC \$4 75 CSCL 21E

A method is presented for interim use in assessing the noise generated by fans and compressors in turbojet and turbofan engines. One-third octave band sound pressure levels consisting of broadband, discrete tone, and combination-tone noise components are predicted. Spectral distributions and directivity variations are specified. The method is based on that developed by other investigators with modifications derived from an analysis of full-scale, single-stage fan data. Comparisons of predicted and measured noise performance are presented, and requirements for improving the method are discussed. Author

FIELD TESTS OF A LASER RAMAN MEASUREMENT SYSTEM FOR AIRCRAFT ENGINE EXHAUST EMISSIONS
Final Technical Report

Donald A Leonard Oct 1974 181 p refs
(Contract F33615-71-C-1875, AF Proj 3066)
(AD-A003648, AFAPL-TR-74-100) Avail NTIS CSCL 07/4
Laser induced Raman and fluorescence measurements were made in the exhaust of a T53-L13A gas turbine engine with a new field portable instrument devised specifically for gas turbine exhaust emission measurements. The gas turbine exhaust was analyzed by conventional instruments for CO, CO₂, NO, NO_x,

total hydrocarbons, smoke and temperature, and these data were used as a calibration standard for the evaluation of the laser Raman instrument. The most severe problem area was laser induced hydrocarbon fluorescence when the exhaust contained large total hydrocarbon concentrations. The overall conclusion was that the laser Raman method shows a good potential for aircraft gas turbine emission analysis. GRA

A single-stage centrifugal compressor designed to produce a 10:1 pressure ratio at a flow rate of 3.2 lb/sec was tested. An earlier version of this compressor was tested under US-AAMRDL Contract DAAJ02-70-C-0006 and was found to have excessive losses in the tandem inducer. In addition, diffuser damage was incurred during that testing, which also prevented the achievement of the full design potential. The objective of this follow-on program was therefore to demonstrate improved performance for the 10:1 pressure ratio single-stage centrifugal compressor with a modified inducer and a new (undamaged) diffuser. Modifications to the design of the inducer were made to improve its high-speed (Mach number) performance and to decrease the required inlet prewhirl and a test program was conducted to obtain overall and inducer performance data. GRA

SELECTION OF SAMPLING RATE FOR DIGITAL CONTROL OF AIRCRAFTS Ph D Thesis
Paul Katz 1975 242 p

Avail Univ Microfilms Order No 75-13537

The considerations in selecting the sampling rate for a digital control of aircrafts are identified and evaluated. Optimal discrete synthesis is the design method used. Due to discretization of the continuous plant this method of design does not introduce an artificial limitation on the sampling rate. The principal example used is the short period mode of a hypothetical high performance aircraft. The assumed model includes a bending mode and wind gusts. Major factors which influence the selection of the sampling rate are identified and investigated: (1) the time response to control inputs, (2) the response to an external disturbance, (3) the sensitivity to variation of parameters, and (4) the roughness of the response to control inputs. It was found that the limiting factors in the selection of the sampling rate for the example are the time response to a control input, and the response to an external disturbance. Dissert Abstr

COCKPIT-SYSTEM STUDY YAK 40 A PILOT OPINION SURVEY TO THE AIRCRAFT HANDLING AND SYSTEM QUALITIES

Konrad Steininger and Guenter Neumann 2 Jan 1975 72 p
In GERMAN, ENGLISH summary Sponsored by Bundesmin fuer Verkehr
(DLR-FB-75-15) Avail NTIS HC \$4 25 DFVLR, Porz, West Ger 24,90 DM

A representative sample of pilots employed with an airline operating the Russian short haul jet transport aircraft YAK 40 assessed the acceptability of the cockpit layout and instrumentation, the handling quality, and the feasibility of the systems with regard to the pilot's workload. The assessment of the concerned qualities was quantitatively conducted by using a 7-scale rating of 82 items of a questionnaire, and qualitatively by tape-recorded descriptions of critical experiences with the aircraft. The method of subjective assessment, rating, and description of a system was used to find the critical weakness and the favorable points of an aircraft-operation. It is a heuristic

approach towards a direct recognition of the strain and attention needed to cope with the operation of the aircraft

FRICTION AND WEAR OF CARBON-GRAPHITE MATERIALS FOR HIGH ENERGY BRAKES

Robert C Bill Washington Jun 1975 28 p refs Prepared in cooperation with Army Air Mobility R and D Lab Cleveland (NASA-TN-D-8006 E-8259) Avail NTIS HC \$3 75 CSCL 11G

Caliper-type brakes simulation experiments were conducted on seven different carbon-graphite material formulations against a steel disk material and against a carbon-graphite disk material The effects of binder level, boron carbide (B4C) additions, graphite fiber additions and graphite cloth reinforcement on friction and wear behavior were investigated Reductions in binder level and additions of B4C each resulted in increased wear The wear rate was not affected by the addition of graphite fibers Transition to severe wear and high friction was observed in the case of graphite-cloth-reinforced carbon sliding against a disk of similar composition This transition was related to the disruption of a continuous graphite shear film that must form on the sliding

surfaces if low wear is to occur The exposure of the fiber structure of the cloth constituent is believed to play a role in the shear film disruption Author

DETAILED TRANSONIC FLOW FIELD MEASUREMENTS ABOUT A SUPERCRITICAL AIRFOIL SECTION

Francis X. Hurley, Frank W. Spaid, Frederick W. Roos, Louis S. Stivers, Jr. and Angelo Bandettini. Washington, Jul 1975. 64 p. refs.
(NASA-TM-X-3244, A-5869). Avail NTIS HC \$4.25 CSCL 01A.

The transonic flow field about a Whitcomb-type supercritical airfoil profile was measured in detail. In addition to the usual surface pressure distributions and wake surveys, schlieren photographs were taken and velocity vector profiles were determined in the upper surface boundary layer and in the near wake. Spanwise variations in the measured pressures were also determined. The data are analyzed with the aid of an inviscid transonic finite-difference computer program as well as with boundary layer modeling and calculation schemes.

COMPARISON OF WIND TUNNEL TEST RESULTS AT FREE STREAM MACH 0.7 WITH RESULTS FROM THE BOEING TEA-230 SUBSONIC FLOW METHOD. Final Report

L. W. Mohn. Washington, NASA, Jul 1975. 91 p. refs.
(Contract NAS1-12214).
(NASA-CR-2554, D6-41780). Avail NTIS HC \$4.75 CSCL 01A.

The use of the Boeing TEA-230 Subsonic Flow Analysis method as a primary design tool in the development of cruise overwing nacelle configurations is presented. Surface pressure characteristics at 0.7 Mach number were determined by the TEA-230 method for a selected overwing flow-through nacelle configuration. Results of this analysis show excellent overall agreement with corresponding wind tunnel data. Effects of the presence of the nacelle on the wing pressure field were predicted accurately by the theoretical method. Evidence is provided that differences between theoretical and experimental pressure distributions in the present study would not result in significant discrepancies in the nacelle lines or nacelle drag estimates.

POTENTIAL FLOW ABOUT THREE DIMENSIONAL STREAMLINED LIFTING CONFIGURATIONS, WITH APPLICATION TO WINGS AND ROTORS. Interim Report
J. Michael Summa. Sep 1974. 160 p. refs.
(Contract F44620-73-C-0036, AF Proj 9781, AF Proj 6813).
(AD-A003697, SU-DAAR-485, AFOSR-74-1914TR). Avail NTIS CSCL 01/1.

A numerical method is developed and successfully applied which is believed capable of converging to the exact calculation of three-dimensional lifting potential flows including cases of unsteady motion. The principal current limitation on its precision is restricted funds for computation. The exact body surface boundary conditions are enforced, and all wake surfaces are unconstrained -- allowed to move with the local velocity field. The assumptions made in the theoretical model are that the fluid is ideal (incompressible and inviscid) and that no separation may take place.

EXPLORATORY FLIGHT INVESTIGATION OF AIRCRAFT RESPONSE TO THE WING VORTEX WAKE GENERATED BY THE AUGMENTOR WING JET STOL RESEARCH AIRCRAFT

Robert A. Jacobsen and Fred J. Drinkwater III. May 1975. 19 p. refs.
(NASA-TM-X-62387, A-5753). Avail NTIS HC \$3.25 CSCL 01C.

A brief exploratory flight program was conducted at Ames Research Center to investigate the vortex wake hazard of a powered-lift STOL aircraft. The study was made by flying an instrumented Cessna 210 aircraft into the wake of the augmentor wing jet STOL research aircraft at separation distances from 1 to 4 n mi. Characteristics of the wake were evaluated in terms of the magnitude of the upset of the probing aircraft. Results indicated that within 1 n mi separation the wake could cause rolling moments in excess of roll control power and yawing moments equivalent to rudder control power of the probe aircraft. Subjective evaluations by the pilots of the Cessna 210 aircraft supported by response measurements indicated that the upset caused by the wake of the STOL aircraft was comparable to that of a DC-9 in the landing configuration.

On November 3 1973, at about 1640 MST, National Airlines, Inc Flight 27 was cruising at 39 000 feet, 65 nmi southwest of Albuquerque New Mexico, when the No 3 engine fan assembly disintegrated. Fragments of the fan penetrated the fuselage the Nos 1 and 2 engine nacelles and the right wing. As a result the cabin depressurized and one cabin window which was struck by a fragment of the fan assembly separated from the fuselage. A passenger who was sitting next to the window was forced through the opening and ejected from the aircraft. The body of the passenger has not been recovered. The aircraft was landed safely at Albuquerque International Airport. The National Transportation Safety Board determines that the probable cause of this accident was the disintegration of the No 3 engine fan assembly as a result of an interaction between the fan blade tips and the fan case. AIRCRAFT ACCIDENT REPORT IBERIA LINEAS AEREAS DE ESPANA (IBERIAN AIRLINES) MCDONNELL DOUGLAS DC-10-30, EC CBN LOGAN INTERNATIONAL AIRPORT, BOSTON, MASSACHUSETTS, 17 DECEMBER 1973
 8 Nov 1974 33 p
 (PB-239890/7 NTSB-AAR-74-14) Avail NTIS HC \$3 75 CSCL 01B

About 1543 EST on December 17 1973 Iberia Lineas Aereas de Espana Flight 933 a DC-10-30 crashed while making an instrument landing system approach to runway 33 L at Logan International Airport Boston, Massachusetts. Thirteen passengers were injured slightly two passengers and one flight attendant were injured seriously during evacuation. The aircraft was substantially damaged. The National Transportation Safety Board determines that the probable cause of this accident was that the captain did not recognize and may have been unable to recognize, an increased rate of descent in time to arrest it before the aircraft struck the approach light piers. The captain's ability to detect and arrest the increased rate of descent was adversely affected by a lack of information as to the existence of the wind shear and the marginal visual cues available. All aspects of an airport airside are examined as are aspects of controller functions. A possible real time simulator is defined for simulating the tower cab under conditions of zero visibility. This system is composed of cathode ray tubes and driven by minicomputers to give a low cost portable system. The number of displays required and the computer load for these systems are defined. Application of the proposed system to several typical problems is discussed. A detailed analysis of the engineering requirement and the human factors analysis of real time simulation are included. COMPARISON OF TWO HEAD-UP DISPLAYS IN SIMULATED STANDARD AND NOISE ABATEMENT NIGHT VISUAL APPROACHES

Fred Cronn (San Jose State Univ) and Everett Palmer Washington Jul 1975 23 p refs
 (Grant NGL-05-046-002)
 (NASA-TM-X-3264 A-5993) Avail NTIS HC \$3 25 CSCL 01D

Situation and command head-up displays were evaluated for both standard and two segment noise abatement night visual approaches in a fixed base simulation of a DC-8 transport aircraft. The situation display provided glide slope and pitch attitude information. The command display provided glide slope information and flight path commands to capture a 3 deg glide slope. Landing approaches were flown in both zero wind and wind shear conditions. For both standard and noise abatement approaches the situation display provided greater glidepath accuracy in the initial phase of the landing approaches, whereas the command display was more effective in the final approach phase. Glidepath accuracy was greater for the standard approaches than for the noise abatement approaches in all phases of the landing approach. Most of the pilots preferred the command display and the standard approach. Substantial agreement was found between each pilot's judgment of his performance and his actual performance. Author

THREE METHODS OF PRESENTING FLIGHT VECTOR INFORMATION IN A HEAD-UP DISPLAY DURING SIMULATED STOL APPROACHES

James H Dwyer III and Everett A Palmer III Washington Jul 1975 16 p refs
 (NASA-TM-X-3273 A-5992) Avail NTIS HC \$3 25 CSCL 01D

A simulator study was conducted to determine the usefulness of adding flight path vector symbology to a head-up display designed to improve glide-slope tracking performance during steep 7.5 deg visual approaches in STOL aircraft. All displays included a fixed attitude symbol, a pitch- and roll-stabilized horizon bar, and a glide-slope reference bar parallel to and 7.5 deg below the horizon bar. The displays differed with respect to the flight-path marker (FPM) symbol. Display 1 had no FPM symbol, display 2 had an air-referenced FPM, and display 3 had a ground-referenced FPM. No differences between displays 1 and 2 were found on any of the performance measures. Display 3 was found to decrease height error in the early part of the approach and to reduce descent rate variation over the entire approach. Two measures of workload did not indicate any differences between the displays. Author

(NASA-CR-132669) Avail NTIS HC \$5 25 CSCL 01C

The effects of fuselage cross section and structural arrangement on the performance of actively cooled hypersonic cruise vehicles are investigated. An active cooling system which maintains the aircraft's entire surface area at temperatures below 394 K at Mach 6 is developed along with a hydrogen fuel tankage thermal protection system. Thermodynamic characteristics of the actively cooled thermal protection systems established are summarized. Design heat loads and coolant flowrate requirements are defined for each major structural section and for the total system. Cooling system weights are summarized at the major component level. Conclusions and recommendations are included. JMS

A FUSELAGE/TANK STRUCTURE STUDY FOR ACTIVELY COOLED HYPERSONIC CRUISE VEHICLES STRUCTURAL ANALYSIS Technical Report, 11 Mar 1974 - 30 Jun 1975

Allen H Baker [1975] 65 p refs

(Contract NAS1-12995)

(NASA-CR-132670) Avail NTIS HC \$4 25 CSCL 01C

The effects of fuselage cross-section (circular and elliptical) and structural arrangement (integral and nonintegral tanks) on the performance of actively cooled hypersonic cruise vehicles was evaluated. It was found that integrally machined stiffening of the tank walls while providing the most weight-efficient use of materials results in higher production costs. Fatigue and fracture mechanics appeared to have little effect on the weight of the three study aircraft. The need for thermal strain relief through insulation is discussed. Aircraft size and magnitude of the internal pressure are seen to be significant factors in tank design. Author

THE EFFECTS OF AIRCRAFT DESIGN ON STOL RIDE QUALITY

Craig R Jones and Ira D Jacobson May 1975 103 p refs
(Grant NGR-47-005-208)

(NASA-CR-143113 ESS-4035-103-75) Avail NTIS HC \$5 25 CSCL 01C

Effects of aircraft dynamic characteristics on passenger ride quality are investigated to determine ride-quality isocontours similar to aircraft handling-qualities contours. Measurements are made on a moving-base simulator while varying the aircraft short-period and Dutch Roll frequencies and dampings. Both pilot ratings and subjective ride-quality ratings are obtained during flight. Ride and handling qualities were found to be complementary for the Dutch Roll mode, but not for the short-period mode. Regions of optimal ride and handling qualities are defined for the short-period mode and the effects of turbulence levels studied. Author

PRELIMINARY DESIGN OF WINGS VOLUME 1 DESIGN PHILOSOPHY Final Technical Report, Feb 1971 - Oct 1972

Harold Switzky Mar 1974 39 p refs

(Contract F33615-71-C-1241 AF Proj 1368)

(AD-A003649 AFFDL-TR-74-20-Vol-1) Avail NTIS CSCL 01/3

A philosophy and methodology for performing preliminary designs of wings are presented. The philosophy is to treat each segment of the problem with a different degree of completeness depending upon the present state of the art. Each segment of the preliminary design is made as complete as possible within the constraints of obtaining a reliable and significant solution within a reasonable time. In segments where an analytical philosophy exists assumptions are made to result in rapid and relatively accurate solutions. In segments where it is not possible to establish analytical solutions semi-empirical statistical relationships are sought. GRA

HYDRAULIC RAM PRESSURE MEASUREMENTS M S Thesis

Clifford Milton Holm Dec 1974 51 p refs

(AD-A004241) Avail NTIS CSCL 01/3

Hydraulic ram concerns the dynamic loads and catastrophic failure of liquid-filled fuel tanks impacted by high speed projectiles. Hydraulic ram is divided into two phases: the shock phase and the drag phase. Analytic models have been proposed for the shock phase by Yurkovich and for the drag phase by Lundstrom. An attempt was made to correlate these theoretical pressure predictions with experimental data obtained from 0.22 caliber projectiles impacting a small water-filled tank. This comparison showed reasonable correlation but indicates that more work must be done to permit predictions of hydraulic ram pressures accurate enough for the purpose of fuel cell design. GRA

ACOUSTIC CHARACTERISTICS OF A LARGE SCALE WIND-TUNNEL MODEL OF A JET FLAP AIRCRAFT

Michael D Falarski, Thomas N Aiken and Kiyoshi Aoyagi Washington Jul 1975 36 p refs Prepared in cooperation with Army Air Mobility R and D Lab Moffett Field Calif

(NASA-TM-X-3263 A-5923) Avail NTIS HC \$3 75 CSCL 20A

The expanding-duct jet flap (EJF) concept is studied to determine STOL performance in turbofan-powered aircraft. The EJF is used to solve the problem of ducting the required volume of air into the wing by providing an expanding cavity between the upper and lower surfaces of the flap. The results are presented of an investigation of the acoustic characteristics of the EJF concept on a large-scale aircraft model powered by JT15D engines. The noise of the EJF is generated by acoustic dipoles as shown by the sixth power dependence of the noise on jet velocity. These sources result from the interaction of the flow turbulence with flap of internal and external surfaces and the trailing edges. Increasing the trailing edge jet from 70 percent span to 100 percent span increased the noise 2 db for the equivalent nozzle area. Blowing at the knee of the flap rather

than the trailing edge reduced the noise 5 to 10 db by displacing the jet from the trailing edge and providing shielding from high-frequency noise Deflecting the flap and varying the angle of attack modified the directivity of the underwing noise but did not affect the peak noise A forward speed of 335 m/sec (110 ft/sec) reduced the dipole noise less than 1 db Author

INSTRUMENTATION FOR MEASURING AIRCRAFT NOISE AND SONIC BOOM Patent Application

Allan J Zuckerwar inventor (to NASA) (Old Dominion Univ) Filed 1 Jul 1975 17 p
(Contract NAS1-11707)
(NASA-Case-LAR-11476-1 US-Patent-Appl-SN-592159) Avail NTIS HC \$3 25 CSCL 14B

Improvements in instrumentation suitable for measuring aircraft noise and sonic booms are reported. A converter produces an electric current proportional to the sound pressure level at a condenser microphone. The electric current is transmitted over a cable and amplified by a zero drive amplifier. The converter consists of a local oscillator, a dual gate field effect transistor (FET) mixer and a voltage regulator/impedance translator. The local oscillator generates a carrier voltage that is applied to one of the gates of the FET mixer. The FET mixer mixes the microphone signal with the carrier to produce an electrical current at the frequency of vibration of the microphone diaphragm. The voltage regulator/impedance translator regulates the voltage of the local oscillator and mixer stages, eliminates the carrier at the output and provides a low output impedance at the cable terminals. The improvements include automatic tuning compensation against changes in static microphone capacitance and means for providing a remote electrical calibration capability. NASA

(NASA-TN-D-8013 A-5698) Avail NTIS HC \$4 25 CSCL 01A

Proprorator and cantilever wing aeroelastic behavior is applied to a gimballed rotor and a hingeless rotor to develop an analytical model for prediction of tilting proprorator aircraft dynamics. Particular attention is given to the influence of coupled flap/lag bending modes, the influence of rotor blade torsion, degrees of freedom on proprorator dynamics and to a constant coefficient approximation representing the dynamics in nonaxial flow through the rotor. The following are also examined: the number of blade bending and torsion modes required; the influence of the rotor aerodynamic model; the influence of the blade trim bending deflection; the importance of the rotor rotational speed, degree of freedom and the effect of the wing aerodynamic forces. The origin of the significant influence of the blade pitch motion on the proprorator dynamics is discussed. Author

SUBJECT INDEX

AERONAUTICAL ENGINEERING / *A Special Bibliography (Suppl 62)*

OCTOBER 1975

Typical Subject Index Listing

The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, a title extension is added, separated from the title by three hyphens. The NASA or AIAA accession number is included in each entry to assist the user in locating the abstract in the abstract section of this supplement. If applicable, a report number is also included as an aid in identifying the document.

A

A-7 AIRCRAFT

Investigation of the A-7 hook point attachment bolt loosening problem
[AD-A004256] N75-25933

ABLATION

Heat and mass transfer during high-enthalpy gas flow in aircraft and rocket engine flow passages
A75-38074

ACCELEROMETERS

Regional fatigue environment study for commuter airlines --- safe wing life
[SAE PAPER 750512] A75-36655

ACCIDENT PREVENTION

Aerodynamic spoiler for preventing airplane stall/spin type accidents
[AD-A006995] N75-25894

ACOUSTIC INSTABILITY

The acoustic response of a nozzle flow to an externally applied low frequency pressure field
A75-38601

ACOUSTIC MEASUREMENTS

Acoustic effects of rotor-wake interaction during low-power descent
A75-38347

Electric energy and noise --- emphasizing noise reduction
[BLL-CE-TRANS-6550-(9022.09)] N75-27244

Instrumentation for measuring aircraft noise and sonic boom
[NASA-CASE-LAR-11476-1] N75-27334

ACOUSTIC PROPERTIES

Acoustic characteristics of a large scale wind-tunnel model of a jet flap aircraft
[NASA-TM-X-3263] N75-27008

ACOUSTIC SIMULATION

Hybrid nonstationary noise simulator of the aircraft overflight type
[ONERA, TP NO. 1975-46] A75-37905

ACTUATORS

Flight control actuator system development --- for P-4 aircraft
[AD-A004853] N75-25962

ADAPTIVE CONTROL

Digital adaptive flight control design using single stage model following indices
A75-37135

AERIAL EXPLOSIONS

Theoretical predictions of thermal explosions. Part 1: A mathematical model of a bomb in a fire
[REPT-623-PT-1] N75-26152

AERODYNAMIC BALANCE

Evaluation of a wedge on a force balance as a flow angle probe
[AD-A004765] N75-27021

AERODYNAMIC CHARACTERISTICS

Optimization method for a generalized class of functional of several variables, and its application to problems involving the determination of the shape of three-dimensional bodies with optimal aerodynamic characteristics
A75-36166

Design of low-speed airfoils by numerical optimization
[SAE PAPER 750524] A75-36664

Aviation in undulating flow - The Dolphin principle, its technical implementation, and its application in aviation
A75-36849

Aerodynamic analysis of helicopter configurations
A75-37599

Experimental study of the influence of large blade aspect ratios on axial compressor stage aerodynamic characteristics
A75-38064

Mechanism of generating a normal force by a beat of the wings
A75-38136

LTA aerodynamic data revisited
[AIAA PAPER 75-951] A75-38550

Aerodynamic characteristics of an axisymmetric body undergoing a uniform pitching motion
[AD-A003859] N75-25879

Aerodynamic analysis of a general purpose tow target
[AD-A003497] N75-25881

Reynolds number effects on the boattail characteristics of a simulated nacelle at a Mach number of 0.8
[AD-A004803] N75-25884

Air launch characteristics of the MQM-74C target drone from DC-130A airplane
[AD-A004190] N75-25892

An experimental investigation of the effect of a fuselage on wing characteristics
[AD-A003955] N75-25921

Application of rotorcraft flight simulation program (C81) to predict rotor performance and bending moments for a model four-bladed articulated rotor system
[AD-A004015] N75-25934

AERODYNAMIC COEFFICIENTS

An analytical and experimental evaluation of airfoil sections for helicopter rotor application
A75-38349

AERODYNAMIC CONFIGURATIONS

Flow about a conic wing and the optimal configuration of the wing at hypersonic velocities
A75-36099

A simplified approach to generalized helicopter configuration modeling and the prediction of fuselage surface pressures
A75-38351

Aerodynamic analysis of a general purpose tow target
[AD-A003497] N75-25881

The finite element method in low speed aerodynamics
[NASA-CR-143190] N75-26972

Potential flow about three dimensional streamlined lifting configurations, with application to wings and rotors
[AD-A003697] N75-26979

AERODYNAMIC DRAG

Drag analysis methods for light aircraft
[SAE PAPER 750526] A75-36665

AERODYNAMIC FORCES

SUBJECT INDEX

- Rotorcraft parasite drag; Proceedings of the Thirty-first Annual National Forum, Washington, D.C., May 14, 15, 1975
A75-37593
- A general review of helicopter rotor hub drag data
A75-37594
- The relationship between rotorcraft drag and stability and control
A75-37597
- Prediction of rotorcraft drag
A75-37598
- Helicopter parasite drag bibliography
A75-37601
- A second approximation to the induced drag of a rotor in forward flight
A75-38342
- Wasted fuel - Another reason for drag reduction --- in helicopters
A75-38352
- Cost benefit evaluation of helicopter parasite drag reductions
A75-38355
- A comprehensive plan for helicopter drag reduction
A75-38356
- Steady and oscillatory, subsonic and supersonic, aerodynamic pressure and generalized forces for complex aircraft configurations and applications to flutter
[NASA-CR-142983]
N75-25871
- AERODYNAMIC FORCES**
- HASPA flight control concepts --- High Altitude Superpressured Powered Aerostat
[AIAA PAPER 75-942]
A75-37015
- Airships in gusts - Apprehensions and assurance
[AIAA PAPER 75-950]
A75-37021
- Aircraft wake turbulence minimization by aerodynamic means
A75-37450
- Aerodynamic analysis of helicopter configurations
A75-37599
- Aircraft loading spectra --- emphasizing maneuvering and gust loads
A75-37823
- Aerodynamic effects of vortex suppressors
[AD-A003750]
N75-25875
- Evaluation of a wedge on a force balance as a flow angle probe
[AD-A004765]
N75-27021
- AERODYNAMIC HEATING**
- Heat exchange in the hypersonic flow of a rarefied gas past a blunt wedge
A75-35943
- AERODYNAMIC INTERFERENCE**
- Performance of a sliding window detector in a high-interference air traffic environment
A75-37136
- Effects of parasite drag on rotor performance and dynamic response
A75-38353
- AERODYNAMIC LOADS**
- Flutter of a panel supported on an elastic foundation
A75-36245
- Steady and oscillatory, subsonic and supersonic, aerodynamic pressure and generalized forces for complex aircraft configurations and applications to flutter
[NASA-CR-142983]
N75-25871
- Theoretical prediction of airloads on thin delta wings in incompressible flow
[AD-A004654]
N75-25891
- AERODYNAMIC NOISE**
- New directions in aircraft propulsor noise research
[SAE PAPER 750515]
A75-36657
- Factors affecting the noise from small propeller driven aircraft
[SAE PAPER 750516]
A75-36658
- Theory of air frame noise
A75-37538
- The acoustic response of a nozzle flow to an externally applied low frequency pressure field
A75-38601
- AERODYNAMIC STABILITY**
- Flutter of a wing with nonlinear elastic characteristic
A75-36194
- Discussion of an aeromechanical gust alleviation system to improve the ride comfort of light airplanes
[SAE PAPER 750544]
A75-36675
- High lift aircraft --- with improved stability, control, performance, and noise characteristics
[NASA-CASE-LAR-11252-1]
N75-25914
- Analytical determination of aircraft spin modes
[AD-A004798]
N75-25931
- AERODYNAMIC STALLING**
- Some ideas of vortex lift
[SAE PAPER 750547]
A75-36676
- Dynamic stall characteristics of an oscillating airfoil in a harmonically varying freestream velocity
N75-25863
- Experimental studies of flow separation and stalling on a two-dimensional airfoil at low speeds
[NASA-CR-2560]
N75-26970
- AEROELASTICITY**
- Flutter of a wing with nonlinear elastic characteristic
A75-36194
- Measurements on an isolated wing, using an aeroelastic model
A75-37824
- Trimming dual control rotors for optimum performance
A75-38343
- Effects of parasite drag on rotor performance and dynamic response
A75-38353
- AEROSPACE ENGINEERING**
- Israel Annual Conference on Aviation and Astronautics, 17th, Tel Aviv and Haifa, Israel, May 21, 22, 1975, Proceedings
A75-37405
- AFTERBURNING**
- Turbofan compressor dynamics during afterburner transients
[NASA-TM-X-71741]
N75-25944
- AIR CARGO**
- Inventory of freight transportation in the Southwest. Part 3: Air freight service in the Dallas-Fort Worth area
[PB-239820/4]
N75-26987
- AIR COOLING**
- Optimizing aircraft gas turbine blade air cooling systems. II Thermodynamic analysis
A75-38067
- AIR FLOW**
- A second approximation to the induced drag of a rotor in forward flight
A75-38342
- AIR INTAKES**
- Calculation of flow field around air intake operating at zero forward speed by the distributed source-sink method /2-D case/
A75-38077
- AIR LAUNCHING**
- Air launch characteristics of the MQM-74C target drone from DC-130A airplane
[AD-A004190]
N75-25892
- AIR NAVIGATION**
- Development of navigation systems for advanced commercial transports
A75-36368
- Commercial developments in airborne VLP navigation
[SAE PAPER 750518]
A75-36660
- Omega Symposium, 2nd, Washington, D.C., November 5-7, 1974, Proceedings
A75-36951
- Omega signal coverage prediction
A75-36952
- Accuracy specifications for automatic Omega navigators
A75-36953
- Experimental Omega four frequency format extends lane ambiguity --- global search and rescue system
A75-36954
- A comprehensive experimental program for investigation of various Omega operational modes with selected data analysis results
A75-36955
- Omega navigation systems specification and performance measurement
A75-36956

SUBJECT INDEX

AIRCRAFT CONTROL

- Recent results on parametric analysis of differential Omega error
A75-36959
- State of experimentations and program of development of Differential OMEGA in France
A75-36961
- Alternative approaches to integrated airborne OMEGA/Inertial navigation
A75-36962
- Mix and match - A hybrid Omega-Inertial airborne navigation system
A75-36964
- An empirical computed evaluation of composite Omega
A75-36965
- Flight test of ARN-99/V/2 Omega Navigation Set in F-4 aircraft
A75-36966
- Airborne ONS - A low cost alternate to INS --- Omega and Inertial Navigation Systems compared
A75-36967
- A technique to improve the performance of a nonlinear filter with an application to satellite-aided aircraft navigation
A75-37138
- The cost-effectiveness of inertial navigation for civil aircraft
A75-38261
- AIR POLLUTION**
Technology for reducing aircraft engine pollution [SAE PAPER 750550]
A75-36677
Methodology for certification of aircraft nuisances [ONERA, TP NO. 1975-48]
A75-37900
High-altitude aircraft and the stratosphere [JPRS-65171]
N75-27590
- AIR TRAFFIC**
The dynamics of the civil aviation industry --- Book
A75-36107
- AIR TRAFFIC CONTROL**
Development of navigation systems for advanced commercial transports
A75-36368
The promise of air safety --- collision avoidance systems
A75-36401
Differential Omega in the air traffic control environment
A75-36958
Performance of a sliding window detector in a high-interference air traffic environment
A75-37136
Feasibility of real time simulation of airport/airside operations [AD-A006996]
N75-26991
- AIR TRANSPORTATION**
European industry and civil air transport /28th Louis Bleriot Lecture/
A75-36718
A balloon transport system [AIAA PAPER 75-926]
A75-37004
The Navy role in buoyant and semi-buoyant systems of the future --- LTA design [AIAA PAPER 75-937]
A75-37011
Potential missions for advanced airships [AIAA PAPER 75-946]
A75-37019
Inventory of freight transportation in the Southwest. Part 3: Air freight service in the Dallas-Port Worth area [PB-239820/4]
N75-26987
- AIRBORNE EQUIPMENT**
Commercial developments in airborne VLP navigation [SAE PAPER 750518]
A75-36660
Awacs - Boeing's radar patroller
A75-36765
Alternative approaches to integrated airborne OMEGA/Inertial navigation
A75-36962
Airborne Omega navigation system integration and test
A75-36963
Mix and match - A hybrid Omega-Inertial airborne navigation system
A75-36964
Flight test of ARN-99/V/2 Omega Navigation Set in F-4 aircraft
A75-36966
Airborne ONS - A low cost alternate to INS --- Omega and Inertial Navigation Systems compared
A75-36967
- Spike, relays and aircraft electric systems
A75-38726
- AIRBORNE/SPACEBORNE COMPUTERS**
Future trends in flight control systems
A75-38262
A universal flight director computer [AD-A003634]
N75-25905
- AIRCRAFT ACCIDENT INVESTIGATION**
Aircraft accident report: Air East, Inc. Beechcraft 99A, N125AE, Johnstown-Cambria County Airport, Johnstown, Pennsylvania, 6 January 1974 [PB-239891/5]
N75-26982
Aircraft accident report. Brief format, U.S. Civil Aviation issue number 3 of 1974 accidents. File numbers: 1-0002 thru 1-0007, 1-0009 thru 1-0019, 1-0021 thru 1-0023, 1-0025 thru 1-0028, 3-1034, 3-1444, 3-1801 thru 3-2700 [PB-240364/0]
N75-26983
Aircraft accident report: New Jersey Air National Guard F106, serial number 59-0044, Piper PA-24-250, N6876P, midair collision near Saxis, Virginia, 11 October 1974 [PB-240250/1]
N75-26984
Aircraft accident report: Aircraft Pool Leasing Corporation, Lockheed super constellation, L-1049H, N6917C, Miami, Florida, 15 December 1973 [PB-240120/6]
N75-26985
Aircraft accident report: Saturn Airways Inc., Lockheed L-382, N14ST, Springfield, Illinois, 23 May 1974 [PB-240119/8]
N75-26986
Annual review of aircraft accident data, US general aviation, calendar year 1972 [PB-239608/3]
N75-26988
Aircraft accident report: National Airlines, Incorporated, DC-10-10, N60NA, near Albuquerque, New Mexico, 3 November 1973 [PB-239889/9]
N75-26989
Aircraft accident report: Iberia Lineas Aereas De Espana (Iberian Airlines). McDonnell Douglas DC-10-30, EC CBN Logan International Airport, Boston, Massachusetts, 17 December 1973 [PB-239890/7]
N75-26990
- AIRCRAFT ACCIDENTS**
Aerodynamic spoiler for preventing airplane stall/spin type accidents [AD-A006995]
N75-25894
- AIRCRAFT ANTENNAS**
B-52G/H Protective Systems Test Range /PSTR/ --- antenna radiation pattern measurement
A75-37674
- AIRCRAFT BRAKES**
Wet runway aircraft control project F-4 rain tire project [AD-A004768]
N75-25896
Design of aircraft wheels and brake systems [NASA-TT-F-15764]
N75-25918
Friction and wear of carbon-graphite materials for high energy brakes [NASA-TN-D-8006]
N75-26137
- AIRCRAFT CONFIGURATIONS**
Evaluation of advanced airship concepts [AIAA PAPER 75-930]
A75-37007
Operational considerations of large rigid airships in military applications [AIAA PAPER 75-938]
A75-37012
Wing-Tip-Winglet propulsion for Aerocrane-type hybrid lift vehicles [AIAA PAPER 75-944]
A75-37017
Aerodynamic analysis of helicopter configurations
A75-37599
Steady and oscillatory, subsonic and supersonic, aerodynamic pressure and generalized forces for complex aircraft configurations and applications to flutter [NASA-CR-142983]
N75-25871
Engine/airframe compatibility studies for supersonic cruise aircraft [NASA-CR-132610-1]
N75-25916
A computer program for fitting smooth surfaces to an aircraft configuration and other three dimensional geometries [NASA-TN-X-3206]
N75-26693
- AIRCRAFT CONTROL**
Wind tunnel and flight development of spoilers for general aviation aircraft [SAE PAPER 750523]
A75-36663
An in-flight investigation of nonlinear roll control [SAE PAPER 750528]
A75-36666

AIRCRAFT DESIGN

SUBJECT INDEX

Autopilot for British Airways	A75-37778	Low emission, water-tolerant combustor for a small, all-weather turboshaft gas turbine engine [SAE PAPER 750535]	A75-36672
Future trends in flight control systems	A75-38262	A second generation turbo-prop power plant [SAE PAPER 750536]	A75-36673
Wet runway aircraft control project F-4 rain tire project [AD-A004768]	N75-25896	Technology for reducing aircraft engine pollution [SAE PAPER 750550]	A75-36677
High lift aircraft --- with improved stability, control, performance, and noise characteristics [NASA-CASE-LAR-11252-1]	N75-25914	Full authority electronic control application to military gas turbine engines	A75-37646
Selection of sampling rate for digital control of aircrafts	N75-25959	Optimizing aircraft gas turbine blade air cooling systems. II Thermodynamic analysis	A75-38067
AIRCRAFT DESIGN		Heat and mass transfer during high-enthalpy gas flow in aircraft and rocket engine flow passages	A75-38074
Kawasaki C-1 - Japan's mini-StarLifter	A75-35899	Field tests of a laser Raman measurement system for aircraft engine exhaust emissions [AD-A003648]	N75-25949
Design of low-speed airfoils by numerical optimization [SAE PAPER 750524]	A75-36664	AIRCRAFT EQUIPMENT	
Drag analysis methods for light aircraft [ASAE PAPER 750526]	A75-36665	Blindside connector selection --- for aircraft wiring	A75-37711
Graphite composite materials applications in aircraft structures [SAE PAPER 750533]	A75-36670	Looping in a hydrogen cooling system	A75-38370
NASA General Aviation Research overview - 1975 [SAE PAPER 750500]	A75-36678	Influence of solid state electrical distribution on aircraft power generation solid state power controller compatibility --- use on B-1 aircraft [AD-A003834]	N75-26273
Handling and performance characteristics of swept-forward flying wing aircraft [SAE PAPER 750548]	A75-36679	AIRCRAFT FUEL SYSTEMS	
Aviation in undulating flow - The Dolphin principle, its technical implementation, and its application in aviation	A75-36849	Hydraulic ram pressure measurements --- fuel aircraft systems - impact damage [AD-A004241]	N75-27005
HASPA design and flight test objectives --- High Altitude Superpressured Powered Aerostat [AIAA PAPER 75-924]	A75-37002	AIRCRAFT FUELS	
Development and flight experience of a manned thermal airship [AIAA PAPER 75-925]	A75-37003	Alternative fuels for aviation	A75-36719
Evaluation of advanced airship concepts [AIAA PAPER 75-930]	A75-37007	Evaluation of the overall fuel mass penalty of an aircraft system	A75-36720
The Shell natural gas airship, and other L.T.A. activities by Aerospace Developments [AIAA PAPER 75-932]	A75-37008	AIRCRAFT GUIDANCE	
Structural design of a High-Altitude Superpressure Powered Aerostat [AIAA PAPER 75-933]	A75-37009	MADGE - Evaluating a helicopter approach guidance system	A75-37300
The Navy role in buoyant and semi-buoyant systems of the future --- LTA design [AIAA PAPER 75-937]	A75-37011	Improvement of AN/TPQ-27 filter and control techniques [AD-A003878]	N75-25903
Computer aided airship design [AIAA PAPER 75-945]	A75-37018	AIRCRAFT HAZARDS	
Airships in gusts - Apprehensions and assurance [AIAA PAPER 75-950]	A75-37021	Aircraft wake turbulence minimization by aerodynamic means	A75-37450
Design fabrication and test of an F-14 composite overwing fairing	A75-37310	AIRCRAFT HYDRAULIC SYSTEMS	
Recent development and experience of an all fiberglass RP undercarriage for a STOL-aircraft	A75-37311	Aircraft hydraulic system pressure regulator stability	A75-38076
Intuitive design --- applied to aircraft structural design	A75-37425	Hydraulic ram pressure measurements --- fuel aircraft systems - impact damage [AD-A004241]	N75-27005
The F-14 aircraft head up display	A75-37700	AIRCRAFT INDUSTRY	
The concept of trustworthiness in the safety of structures --- weight-optimal aircraft structural design	A75-37799	European industry and civil air transport /28th Louis Bleriot Lecture/	A75-36718
A/A 47U-3 tow target reeling machine launcher system [AD-A004622]	N75-25882	AIRCRAFT INSTRUMENTS	
High lift aircraft --- with improved stability, control, performance, and noise characteristics [NASA-CASE-LAR-11252-1]	N75-25914	Results of an investigation of two three-dimensional low-level flight systems	A75-36992
Aircraft design implications of opto-electronic systems	N75-26787	Performance comparison of space stable and local level inertial platform mechanizations for a strategic aircraft application	A75-37703
A fuselage/tank structure study for actively cooled hypersonic cruise vehicles: Aircraft design evaluation [NASA-CR-132668]	N75-26997	AIRCRAFT LANDING	
The effects of aircraft design on STOL ride quality [NASA-CR-143113]	N75-27001	Microwave technology in the microwave landing system	A75-36529
AIRCRAFT DETECTION		Instrument Landing System performance prediction	A75-36530
Avacs - Boeing's radar patroller	A75-36765	Propeller modulation effects on a scanning-beam microwave landing system [SAE PAPER 750521]	A75-36661
AIRCRAFT ENGINES		Flight mechanics and pilot evaluation of conventional landings [SAE PAPER 750529]	A75-36667
Aircraft engine lube oil filtration study [SAE PAPER 750505]	A75-36651	Pilot problems in low visibility approach and landing	A75-37489
		Elastically retracting ACLS trunks --- Air Cushion Landing System	A75-38052
		AIRCRAFT MAINTENANCE	
		Aircraft engine lube oil filtration study [SAE PAPER 750505]	A75-36651

SUBJECT INDEX

AIRFRAME MATERIALS

Technical diagnostics in aircraft maintenance	A75-36848	Synthesis of disturbance-rejection controllers for linear multivariable continuous-time systems --- application to hovering helicopter	A75-37409
Specific properties of high-strength and heat-resistant wrought aluminum alloys and the consideration of these properties in the maintenance of aircraft. II	A75-36850	The relationship between rotorcraft drag and stability and control	A75-37597
AIRCRAFT MANEUVERS		Aircraft loading spectra --- emphasizing maneuvering and gust loads	A75-37823
Aircraft loading spectra --- emphasizing maneuvering and gust loads	A75-37823	Static stability and aperiodic divergence --- in longitudinal flight	A75-38579
Sequential attack in aerial combat [AD-A004796]	N75-25929	AIRCRAFT STRUCTURES	
AIRCRAFT MODELS		Damage resistance of high modulus aramid fiber composites in aircraft applications [SAE PAPER 750532]	A75-36669
Measurements on an isolated wing, using an aeroelastic model	A75-37824	Graphite composite materials applications in aircraft structures [SAE PAPER 750533]	A75-36670
AIRCRAFT NOISE		Some practical considerations found in the use of solid film lubricants in aircraft systems	A75-38122
New directions in aircraft propulsor noise research [SAE PAPER 750515]	A75-36657	Organizing centralized aircraft component overhaul [NASA-TT-P-16266]	N75-27949
Factors affecting the noise from small propeller driven aircraft [SAE PAPER 750516]	A75-36658	AIRCRAFT TIRES	
Ducted propulsors - Progress in the United Kingdom [SAE PAPER 750534]	A75-36671	Wet runway aircraft control project P-4 rain tire project [AD-A004768]	N75-25896
Methodology for certification of aircraft nuisances [ONERA, TP NO. 1975-48]	A75-37900	Design of aircraft wheels and brake systems [NASA-TT-P-15764]	N75-25918
Hybrid nonstationary noise simulator of the aircraft overflight type [ONERA, TP NO. 1975-46]	A75-37905	AIRCRAFT WAKES	
Summary of results indicating the beneficial effects of rotor vortex modification	A75-38345	Aircraft wake turbulence minimization by aerodynamic means	A75-37450
A social survey to examine the variance of aircraft noise annoyance	A75-38603	Exploratory flight investigation of aircraft response to the wing vortex wake generated by the augmentor wing jet STOL research aircraft [NASA-TM-X-62387]	N75-26980
A method for predicting acoustically induced vibration in transport aircraft, appendix [AD-A004215]	N75-25883	AIRFOIL PROFILES	
Instrumentation for measuring aircraft noise and sonic boom [NASA-CASE-LAR-11476-1]	N75-27334	Wind tunnel and flight development of spoilers for general aviation aircraft [SAE PAPER 750523]	A75-36663
AIRCRAFT PERFORMANCE		Design of low-speed airfoils by numerical optimization [SAE PAPER 750524]	A75-36664
Handling and performance characteristics of swept-forward flying wing aircraft [SAE PAPER 750548]	A75-36679	Two dimensional, inviscid, transonic flowfield around a profile	A75-37424
Evaluation of the overall fuel mass penalty of an aircraft system	A75-36720	Viscous interaction with separation in transonic flow [ONERA, TP NO. 1975-15]	A75-37897
The use of computers in flight testing	A75-37779	A state-of-the-art survey of two-dimensional airfoil data	A75-38348
Cockpit-system study YAK 40. A pilot opinion survey to the aircraft handling and system qualities [DLR-PB-75-15]	N75-25961	An analytical and experimental evaluation of airfoil sections for helicopter rotor application	A75-38349
AIRCRAFT PILOTS		A tunnel spanning airfoil testing technique	A75-38350
Cockpit-system study YAK 40. A pilot opinion survey to the aircraft handling and system qualities [DLR-PB-75-15]	N75-25961	A study of the potential benefits of advanced airfoils for helicopter applications	A75-38357
AIRCRAFT PRODUCTION		A review of design objectives for advanced helicopter rotor airfoils	A75-38358
Kawasaki C-1 - Japan's mini-StarLifter	A75-35899	Detailed transonic flow field measurements about a supercritical airfoil section [NASA-TM-X-3244]	N75-26975
AIRCRAFT RELIABILITY		AIRFOILS	
Regional fatigue environment study for commuter airlines --- safe wing life [SAE PAPER 750512]	A75-36655	Drag analysis methods for light aircraft [ASAE PAPER 750526]	A75-36665
The B-1 structural integrity program [SAE PAPER 750514]	A75-36656	Numerical solution of the Navier-Stokes equations for arbitrary two-dimensional multi-element airfoils [NASA-CR-143038]	N75-25874
On-board test and monitoring of advanced weapon systems	A75-37644	Experimental studies of flow separation and stalling on a two-dimensional airfoil at low speeds [NASA-CR-2560]	N75-26970
The concept of trustworthiness in the safety of structures --- weight-optimal aircraft structural design	A75-37799	Analysis of the effects on life of leading-edge holes in an airfoil subjected to arbitrary spanwise and chordwise temperature distributions --- structural analysis [NASA-TM-X-3257]	N75-27421
A STOL airworthiness investigation using a simulation of an augmentor wing transport. Volume 2: Simulation data and analysis [NASA-TM-X-62396]	N75-25917	AIRFRAME MATERIALS	
AIRCRAFT SAFETY		The B-1 structural integrity program [SAE PAPER 750514]	A75-36656
The promise of air safety --- collision avoidance systems	A75-36401		
AIRCRAFT STABILITY			
Discussion of an aeromechanical gust alleviation system to improve the ride comfort of light airplanes [SAE PAPER 750544]	A75-36675		

AIRFRAMES

SUBJECT INDEX

AIRFRAMES

Theory of air frame noise
A75-37538

Application of high temperature composites to an aircraft component
[AD-A003546] N75-25925

AIRLINE OPERATIONS

Autopilot for British Airways
A75-37778

The cost-effectiveness of inertial navigation for civil aircraft
A75-38261

AIRPORT PLANNING

Instrument Landing System performance prediction
A75-36530

AIRPORTS

Feasibility of real time simulation of airport/airside operations
[AD-A006996] N75-26991

AIRSHIPS

Aviation in undulating flow - The Dolphin principle, its technical implementation, and its application in aviation
A75-36849

HASPA design and flight test objectives --- High Altitude Superpressured Powered Aerostat
[AIAA PAPER 75-924] A75-37002

Development and flight experience of a manned thermal airship
[AIAA PAPER 75-925] A75-37003

A non-polluting powerplant for large airships
[AIAA PAPER 75-927] A75-37005

A feasibility study of a trans-ocean hybrid cargo airship operating in ground effect
[AIAA PAPER 75-929] A75-37006

Evaluation of advanced airship concepts
[AIAA PAPER 75-930] A75-37007

The Shell natural gas airship, and other L.T.A. activities by Aerospace Developments
[AIAA PAPER 75-932] A75-37008

Structural design of a High-Altitude Superpressure Powered Aerostat
[AIAA PAPER 75-933] A75-37009

The Navy role in buoyant and semi-buoyant systems of the future --- LTA design
[AIAA PAPER 75-937] A75-37011

Operational considerations of large rigid airships in military applications
[AIAA PAPER 75-938] A75-37012

HASPA flight control concepts --- High Altitude Superpressured Powered Aerostat
[AIAA PAPER 75-942] A75-37015

Wing-Tip-Winglet propulsion for Aerocrane-type hybrid lift vehicles
[AIAA PAPER 75-944] A75-37017

Computer aided airship design
[AIAA PAPER 75-945] A75-37018

Potential missions for advanced airships
[AIAA PAPER 75-946] A75-37019

A strategy for getting LTA systems airborne
[AIAA PAPER 75-949] A75-37020

Airships in gusts - Apprehensions and assurance
[AIAA PAPER 75-950] A75-37021

LTA aerodynamic data revisited
[AIAA PAPER 75-951] A75-38550

ALGORITHMS

Evaluation of real-time algorithms for Omega propagation prediction
A75-36973

ALUMINUM ALLOYS

Specific properties of high-strength and heat-resistant wrought aluminum alloys and the consideration of these properties in the maintenance of aircraft. II
A75-36850

Residual stresses caused by variable service loads in notches and their significance for the applicability of the linear damage accumulation hypothesis --- in Al alloys
A75-37777

ANGLE OF ATTACK

Laminar boundary layer in symmetry plane of blunt-nosed body
A75-36241

An investigation of the departure modes of a F-4D aircraft from a steady sideslip flight condition
[AD-A004795] N75-25928

ANGULAR VELOCITY

The supersonic rotor --- for helicopters
A75-38346

ANTENNA RADIATION PATTERNS

B-52G/H Protective Systems Test Range /PSTR/ --- antenna radiation pattern measurement
A75-37674

ANTIFRICTION BEARINGS

Ceramic airframe bearings --- solid lubricant selection tests
[ASLE PREPRINT 75AM-7A-3] A75-37096

Application of high frequency resonance techniques for bearing diagnostics in helicopter gearboxes
[AD-A004014] N75-25936

APPROACH

Three methods of presenting flight vector information in a head-up display during simulated STOL approaches
[NASA-TM-X-3273] N75-26996

APPROACH CONTROL

Microwave technology in the microwave landing system
A75-36529

MADGE - Evaluating a helicopter approach guidance system
A75-37300

Pilot problems in low visibility approach and landing
A75-37489

AREA NAVIGATION

An evaluation of differential Omega for general aviation area navigation
A75-36960

ATMOSPHERIC TURBULENCE

Regional fatigue environment study for commuter airlines --- safe wing life
[SAE PAPER 750512] A75-36655

Airships in gusts - Apprehensions and assurance
[AIAA PAPER 75-950] A75-37021

Problems of flight in turbulence
[NASA-TT-F-16401] N75-26977

AUTOMATIC CONTROL

Accuracy specifications for automatic Omega navigators
A75-36953

AUTOMATIC FLIGHT CONTROL

Results of an investigation of two three-dimensional low-level flight systems
A75-36992

Future trends in flight control systems
A75-38262

AUTOMATIC PILOTS

Autopilot for British Airways
A75-37778

Investigation of self-oscillations of an autopilot mount
A75-38144

AVIONICS

A multifunction radar for helicopter applications
A75-37638

On-board test and monitoring of advanced weapon systems
A75-37644

Terrain following evaluation simulation --- B-1 aircraft avionics
A75-37647

AXIAL COMPRESSION LOADS

Minimum weight design of fuselage type stiffened circular cylindrical shells subject to uniform axial compression
[AD-A004412] N75-25927

AXIAL FLOW TURBINES

Design estimate of cascade performance
A75-36291

AXISYMMETRIC BODIES

Investigation of the turbulent properties of the wake behind self propelled, axisymmetric bodies
N75-25865

Aerodynamic characteristics of an axisymmetric body undergoing a uniform pitching motion
[AD-A003859] N75-25879

A study of the flow around plane and axially symmetrical bodies with a separated shock wave by a flow at low supersonic speed
[AD-A004442] N75-25887

AXISYMMETRIC FLOW

Hodograph method for axisymmetric transonic gas flows
A75-35967

B

B-1 AIRCRAFT
 The B-1 structural integrity program
 [SAE PAPER 750514] A75-36656
 On-board test and monitoring of advanced weapon
 systems A75-37644
 Terrain following evaluation simulation --- B-1
 aircraft avionics A75-37647
 Performance comparison of space stable and local
 level inertial platform mechanizations for a
 strategic aircraft application A75-37703
 Influence of solid state electrical distribution
 on aircraft power generation solid state power
 controller compatibility --- use on B-1 aircraft
 [AD-A003834] N75-26273

B-52 AIRCRAFT
 B-52G/H Protective Systems Test Range /PSTR/ ---
 antenna radiation pattern measurement A75-37674

BALLISTIC TRAJECTORIES
 Aircraft fuel tank vulnerability to hydraulic ram:
 Modification of the Northrop finite element
 computer code BR-1 to include fluid-structure
 interaction: Theory and users manual for BR-1 HR
 [AD-A003471] N75-25922

BALLOON FLIGHT
 A balloon transport system
 [AIAA PAPER 75-926] A75-37004

BEECHCRAFT AIRCRAFT
 Aircraft accident report: Air East, Inc.
 Beechcraft 99A, N125AE, Johnstown-Cambria County
 Airport, Johnstown, Pennsylvania, 6 January 1974
 [PB-239891/5] N75-26982

BENDING MOMENTS
 Application of rotorcraft flight simulation
 program (C81) to predict rotor performance and
 bending moments for a model four-bladed
 articulated rotor system
 [AD-A004015] N75-25934

BIBLIOGRAPHIES
 NASA General Aviation Research overview - 1975
 [SAE PAPER 750500] A75-36678
 Helicopter parasite drag bibliography A75-37601

BINARY DATA
 Binary phase locked loops for Omega receivers
 A75-36968

BLUFF BODIES
 A comprehensive plan for helicopter drag reduction
 A75-38356

BLUNT BODIES
 Analytic investigation of hypersonic flow around
 blunt bodies A75-36163
 Laminar boundary layer in symmetry plane of
 blunt-nosed body A75-36241
 Boundary layer transition on blunt bodies
 [AD-A004826] N75-25877

BOATTAILS
 Reynolds number effects on the boattail
 characteristics of a simulated nacelle at a Mach
 number of 0.8
 [AD-A004803] N75-25884

BODIES OF REVOLUTION
 Hodograph method for axisymmetric transonic gas
 flows A75-35967
 The resistance of bodies of revolution at
 transonic flow velocities A75-35968
 A three-dimensional method for the calculation of
 flow in turbomachines using finite elements on a
 blade-to-blade surface of revolution --- Book
 A75-36899

BODY-WING CONFIGURATIONS
 An experimental investigation of the effect of a
 fuselage on wing characteristics
 [AD-A003955] N75-25921

BOEING AIRCRAFT
 Awacs - Boeing's radar patroller
 A75-36765

BOEING 707 AIRCRAFT
 The measurement of the Boeing 707 trailing vortex
 system using the tower fly-by technique
 [AD-A008384] N75-25868

BOLTS
 Investigation of the A-7 hook point attachment
 bolt loosening problem
 [AD-A004256] N75-25933

BOMBER AIRCRAFT
 B-1 unique signal train generation application study
 [AD-A003682] N75-26994

BOMBS (ORDNANCE)
 Theoretical predictions of thermal explosions.
 Part 1: A mathematical model of a bomb in a fire
 [REPT-623-PT-1] N75-26152

BOUNDARY LAYER CONTROL
 Aerodynamic spoiler for preventing airplane
 stall/spin type accidents
 [AD-A006995] N75-25894

BOUNDARY LAYER SEPARATION
 Laminar boundary layer in symmetry plane of
 blunt-nosed body A75-36241
 Integral method for calculating a detached stream
 behind a body in a supersonic flow A75-38407
 Aerodynamic spoiler for preventing airplane
 stall/spin type accidents
 [AD-A006995] N75-25894
 Experimental studies of flow separation and
 stalling on a two-dimensional airfoil at low
 speeds [NASA-CR-2560] N75-26970

BOUNDARY LAYER TRANSITION
 Boundary layer transition on blunt bodies
 [AD-A004826] N75-25877

BOX BEAMS
 Composite box beam optimization program
 A75-37308

BYPASSES
 A parametric evaluation of the performance of the
 bypass jet engine A75-37423

C

C-1A AIRCRAFT
 Kawasaki C-1 - Japan's mini-StarLifter
 A75-35899

CALCULATORS
 Hand held calculator technology applied to an
 advanced Omega receiver
 A75-36957

CANARD CONFIGURATIONS
 Application of high temperature composites to an
 aircraft component
 [AD-A003546] N75-25925

CARBON FIBER REINFORCED PLASTICS
 Graphite composite materials applications in
 aircraft structures
 [SAE PAPER 750533] A75-36670
 Kevlar 49 hybrid composites for commercial and
 aerospace applications A75-37309

CARGO AIRCRAFT
 A feasibility study of a trans-ocean hybrid cargo
 airship operating in ground effect
 [AIAA PAPER 75-929] A75-37006

CASCADE FLOW
 Design estimate of cascade performance
 A75-36291
 Transonic flow around rotor blade elements
 [ASME PAPER 75-FE-24] A75-36890
 On the investigation of cascade and turbomachinery
 rotor wake characteristics
 [AD-A003580] N75-26323

CENTRIFUGAL COMPRESSORS
 Performance of three vaned radial diffusers with
 swirling transonic flow
 [ASME PAPER 75-FE-19] A75-36888
 Modified centrifugal compressor
 [AD-A004002] N75-25950

CERAMICS
 Application of finite element analysis to ceramic
 components
 [ACS PAPER 30-BC-73F] A75-35896
 Ceramic airframe bearings --- solid lubricant
 selection tests
 [ASLE PREPRINT 75AM-7A-3] A75-37096

CERTIFICATION

SUBJECT INDEX

CERTIFICATION	Methodology for certification of aircraft nuisances [ONERA, TP NO. 1975-48]	A75-37900	Application of high temperature composites to an aircraft component [AD-A003546]	N75-25925
CHANNEL FLOW	Uniform shear flow within rectangular parallel-walled diffusers [ASME PAPER 75-PE-34]	A75-36896	COMPRESSIBILITY EFFECTS	Turbulent near wake of a flat plate. II - Effects of boundary layer profile and compressibility
CIRCUIT PROTECTION	Blindside connector selection --- for aircraft wiring	A75-37711	COMPRESSOR BLADES	Design estimate of cascade performance
	FAA lightning protection study: Lightning protection for status and control lines of AN/GRN-27(V) instrument landing system [AD-A006997]	N75-25967		Transonic flow around rotor blade elements [ASME PAPER 75-PE-24]
CIRCULAR CYLINDERS	Analytic investigation of hypersonic flow around blunt bodies	A75-36163	COMPRESSOR ROTORS	Modified centrifugal compressor [AD-A004002]
CIVIL AVIATION	The dynamics of the civil aviation industry --- Book	A75-36107	COMPRESSORS	Turbofan compressor dynamics during afterburner transients [NASA-TM-X-71741]
	European industry and civil air transport /28th Louis Bleriot Lecture/	A75-36718	COMPUTER DESIGN	Hand held calculator technology applied to an advanced Omega receiver
	General problems concerning the helicopter	A75-37084		
	The cost-effectiveness of inertial navigation for civil aircraft	A75-38261	COMPUTER PROGRAMMING	A computer program for fitting smooth surfaces to an aircraft configuration and other three dimensional geometries [NASA-TM-X-3206]
	Aircraft accident report. Brief format, U.S. Civil Aviation issue number 3 of 1974 accidents. File numbers: 1-0002 thru 1-0007, 1-0009 thru 1-0019, 1-0021 thru 1-0023, 1-0025 thru 1-0028, 3-1034, 3-1444, 3-1801 thru 3-2700 [PB-240364/0]	N75-26983	COMPUTER PROGRAMS	Computer aided airship design [AIAA PAPER 75-945]
	Aircraft accident report: New Jersey Air National Guard F106, serial number 59-0044, Piper PA-24-250, N6876P, midair collision near Saxis, Virginia, 11 October 1974 [PB-240250/1]	N75-26984		Digital computer program DF1758 fully coupled natural frequencies and mode shapes of a helicopter rotor blade [NASA-CR-132662]
COAXIAL FLOW	Thrust reversers for the TPE-731 turbofan [SAE PAPER 750506]	A75-36652		Supersonic lifting-surface computer program for cruciform wing-body combinations [AD-A003925]
COCKPITS	Cockpit-system study YAK 40. A pilot opinion survey to the aircraft handling and system qualities [DLR-PB-75-15]	N75-25961	COMPUTER TECHNIQUES	Evaluation of real-time algorithms for Omega propagation prediction
COLLISION AVOIDANCE	The promise of air safety --- collision avoidance systems	A75-36401		A method for correlating wind tunnel experiments with potential flow theory
COMBAT	The effect of roll rate on air combat [AD-A004794]	N75-25930		The use of computers in flight testing
COMBUSTION CHAMBERS	Low emission, water-tolerant combustor for a small, all-weather turboshaft gas turbine engine [SAE PAPER 750535]	A75-36672	COMPUTERIZED DESIGN	Design of low-speed airfoils by numerical optimization [SAE PAPER 750524]
	Heat and mass transfer during high-enthalpy gas flow in aircraft and rocket engine flow passages	A75-38074		Computer aided airship design [AIAA PAPER 75-945]
COMFORT	Discussion of an aeromechanical gust alleviation system to improve the ride comfort of light airplanes [SAE PAPER 750544]	A75-36675		Preliminary design of wings. Volume 1: Design philosophy [AD-A003649]
COMPOSITE MATERIALS	Damage resistance of high modulus aramid fiber composites in aircraft applications [SAE PAPER 750532]	A75-36669		Preliminary design of wings. Volume 2: Preliminary fatigue design [AD-A003650]
	Graphite composite materials applications in aircraft structures [SAE PAPER 750533]	A75-36670		Preliminary design of wings. Volume 3: Minimum weight design of stiffened plate [AD-A003651]
	Structural design of a High-Altitude Superpressure Powered Aerostat [AIAA PAPER 75-933]	A75-37009	COMPUTERIZED SIMULATION	Airborne Omega navigation system integration and test
	Structural materials research for lighter-than-air systems [AIAA PAPER 75-935]	A75-37010		An empirical computed evaluation of composite Omega
	Composite box beam optimization program	A75-37308		Binary processing and display concepts for low-cost Omega receivers --- airborne systems simulation
	Kevlar 49 hybrid composites for commercial and aerospace applications	A75-37309		Feasibility of real time simulation of airport/airside operations [AD-A006996]
	Preliminary design of wings. Volume 4. Minimum weight design of composite structure [AD-A003667]	N75-25919	CONFERENCES	Omega Symposium, 2nd, Washington, D.C., November 5-7, 1974, Proceedings
				Israel Annual Conference on Aviation and Astronautics, 17th, Tel Aviv and Haifa, Israel, May 21, 22, 1975, Proceedings
				Rotorcraft parasite drag; Proceedings of the Thirty-first Annual National Forum, Washington, D.C., May 14, 15, 1975

SUBJECT INDEX

DESIGN ANALYSIS

- National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn., March 6, 7, 1975, Proceedings
A75-38340
- CONICAL BODIES**
Hypersonic flow past V-shaped conical wings
A75-38406
- CONICAL FLOW**
Flow about a conic wing and the optimal configuration of the wing at hypersonic velocities
A75-36099
Flow separation from yawed delta wings
A75-36288
- CONICAL NOZZLES**
Wind tunnel measurements of forward speed effects on jet noise from suppressor nozzles and comparison with flight test data [NASA-TN-X-62449]
N75-25946
- CONTROL EQUIPMENT**
Influence of solid state electrical distribution on aircraft power generation solid state power controller compatibility --- use on B-1 aircraft [AD-A003834]
N75-26273
- CONTROL SIMULATION**
An in-flight investigation of nonlinear roll control [SAE PAPER 750528]
A75-36666
HASPA flight control concepts --- High Altitude Supercritical Powered Aerostat [AIAA PAPER 75-942]
A75-37015
- CONTROL STABILITY**
Synthesis of disturbance-rejection controllers for linear multivariable continuous-time systems --- application to hovering helicopter
A75-37409
- CONTROL THEORY**
Digital adaptive flight control design using single stage model following indices
A75-37135
- CONTROLLABILITY**
Cockpit-system study YAK 40. A pilot opinion survey to the aircraft handling and system qualities [DLR-FB-75-15]
N75-25961
Flight evaluation of the M2-F3 lifting body handling qualities at Mach numbers from 0.30 to 1.61 [NASA-TN-D-8027]
N75-27015
- COOLING SYSTEMS**
Looping in a hydrogen cooling system
A75-38370
A fuselage/tank structure study for actively cooled hypersonic cruise vehicles: Active cooling system analysis [NASA-CR-132669]
N75-26998
- COORDINATE TRANSFORMATIONS**
A technique to improve the performance of a nonlinear filter with an application to satellite-aided aircraft navigation
A75-37138
- CORES**
New structural form of sandwich core
A75-38576
- CORROSION RESISTANCE**
Corrosion resistance of gas turbine blades tested in a high-temperature gas flow
A75-36040
- COST ANALYSIS**
Cost benefit evaluation of helicopter parasite drag reductions
A75-38355
- COST EFFECTIVENESS**
An evaluation of differential Omega for general aviation area navigation
A75-36960
Airborne ONS - A low cost alternate to INS --- Omega and Inertial Navigation Systems compared
A75-36967
Digital phase processing for low-cost Omega receivers
A75-36970
The cost-effectiveness of inertial navigation for civil aircraft
A75-38261
- COST ESTIMATES**
Potential missions for advanced airships [AIAA PAPER 75-946]
A75-37019
- COST REDUCTION**
Kevlar 49 hybrid composites for commercial and aerospace applications
A75-37309
- CRACK INITIATION**
Possibilities concerning a use of borescope inspection methods in nondestructive material testing and the significance of these methods
A75-38629
- CRUISING FLIGHT**
A fuselage/tank structure study for actively cooled hypersonic cruise vehicles: Structural analysis [NASA-CR-132670]
N75-26999
- CUMULATIVE DAMAGE**
Residual stresses caused by variable service loads in notches and their significance for the applicability of the linear damage accumulation hypothesis --- in Al alloys
A75-37777
- D**
- DATA ACQUISITION**
Regional fatigue environment study for commuter airlines --- safe wing life [SAE PAPER 750512]
A75-36655
A comprehensive experimental program for investigation of various Omega operational modes with selected data analysis results
A75-36955
A state-of-the-art survey of two-dimensional airfoil data
A75-38348
- DATA LINKS**
Differential Omega in the air traffic control environment
A75-36958
- DATA PROCESSING**
Astrolabe, integrated navigation and landing aid device - Land-bound and airborne presentation of information [ONERA, TP NO. 1975-17]
A75-36457
A comprehensive experimental program for investigation of various Omega operational modes with selected data analysis results
A75-36955
The use of computers in flight testing
A75-37779
- DATA SAMPLING**
Selection of sampling rate for digital control of aircrafts
N75-25959
- DC 10 AIRCRAFT**
Noise control features of the DC-10
A75-37497
Aircraft accident report: National Airlines, Incorporated, DC-10-10, N60NA, near Albuquerque, New Mexico, 3 November 1973 [PB-239889/9]
N75-26989
Aircraft accident report: Iberia Lineas Aereas De Espana (Iberian Airlines). McDonnell Douglas DC-10-30, EC CHM Logan International Airport, Boston, Massachusetts, 17 December 1973 [PB-239890/7]
N75-26990
- DELTA WINGS**
Flow separation from yawed delta wings
A75-36288
Flame stabilization by leading edge vortex breakdown above a delta shape
A75-37063
Near-field supersonic flow pattern of slender delta wings
A75-37182
Theoretical prediction of airloads on thin delta wings in incompressible flow [AD-A004654]
N75-25891
Analytical determination of aircraft spin modes [AD-A004798]
N75-25931
- DESIGN ANALYSIS**
Design estimate of cascade performance
A75-36291
The B-1 structural integrity program [SAE PAPER 750514]
A75-36656
Evaluation of advanced airship concepts [AIAA PAPER 75-930]
A75-37007
Intuitive design --- applied to aircraft structural design
A75-37425

DIFFUSERS

A review of design objectives for advanced helicopter rotor airfoils
A75-38358

DIFFUSERS
Uniform shear flow within rectangular parallel-walled diffusers [ASME PAPER 75-PE-34] A75-36896

DIGITAL COMPUTERS
Digital computer program DF1758 fully coupled natural frequencies and mode shapes of a helicopter rotor blade [NASA-CR-132662] N75-26973

DIGITAL FILTERS
Digital phase processing for low-cost Omega receivers A75-36970

DIGITAL NAVIGATION
Selection of sampling rate for digital control of aircrafts N75-25959

DIGITAL SYSTEMS
Binary phase locked loops for Omega receivers A75-36968
Digital adaptive flight control design using single stage model following indices A75-37135
MADGE - Evaluating a helicopter approach guidance system A75-37300

DISPLAY DEVICES
Astrolabe, integrated navigation and landing aid device - Land-bound and airborne presentation of information [ONERA, TP NO. 1975-17] A75-36457
The application of displays in navigation/attack systems N75-26780
Aircraft design implications of opto-electronic systems N75-26787

DOPPLER NAVIGATION
Airborne Omega navigation system integration and test A75-36963

DOPPLER RADAR
Analysis, test and evaluation support to the USAF advanced landing system program. Volume 1: Program description and results [AD-A004419] N75-27223
Analysis, test and evaluation support to the USAF advanced landing system program. Volume 2: Index of approaches [AD-A004420] N75-27224
Analysis, test and evaluation support to the USAF advanced landing system program. Volume 3, Part 1: Doppler MLS guidance error data (DOTS tracking system) [AD-A004421] N75-27225
Analysis, test and evaluation support to the USAF advanced landing system program. Volume 3, part 2: Doppler MLS guidance error data (M-33 tracking system, flights 22 June 1973 to 10 September 1974) [AD-A004422] N75-27226
Analysis, test and evaluation support to the USAF advanced landing system program. Volume 3, Part 3: Doppler MLS guidance error data (M-33 tracking system, flights 12 September 1973 to 29 January 1974) [AD-A004423] N75-27227

DOWNWASH
Uniform downwash with rotors having a finite number of blades A75-38341

DRAG
Effects of parasite drag on rotor performance and dynamic response A75-38353

DRAG REDUCTION
Evaluation of the overall fuel mass penalty of an aircraft system A75-36720
Rotorcraft parasite drag; Proceedings of the Thirty-first Annual National Forum, Washington, D.C., May 14, 15, 1975 A75-37593
A general review of helicopter rotor hub drag data A75-37594

SUBJECT INDEX

Rotorcraft low-speed download drag definition and its reduction A75-37595

Some important practical design constraints affecting drag reduction A75-37596

The relationship between rotorcraft drag and stability and control A75-37597

Wasted fuel - Another reason for drag reduction --- in helicopters A75-38352

Effect of helicopter drag reduction on rotor dynamic loads and blade life A75-38354

Cost benefit evaluation of helicopter parasite drag reductions A75-38355

A comprehensive plan for helicopter drag reduction A75-38356

DUCTED FAN ENGINES
Analysis of characteristics of bypass turbojet engines with small gas turbine engines in the outer flow A75-38075

DUCTED FANS
Ducted propulsors - Progress in the United Kingdom [SAE PAPER 750534] A75-36671

DYNAMIC CHARACTERISTICS
Turbofan compressor dynamics during afterburner transients [NASA-TM-X-71741] N75-25944

DYNAMIC LOADS
Effect of helicopter drag reduction on rotor dynamic loads and blade life A75-38354

DYNAMIC MODELS
The dynamics of the civil aviation industry --- Book A75-36107
Instrument Landing System performance prediction A75-36530

DYNAMIC RESPONSE
Effects of parasite drag on rotor performance and dynamic response A75-38353

DYNAMIC STABILITY
LTA aerodynamic data revisited [AIAA PAPER 75-951] A75-38550
Static stability and aperiodic divergence --- in longitudinal flight A75-38579

E

EARLY WARNING SYSTEMS
Awacs - Boeing's radar patroller A75-36765

EDDY VISCOSITY
Structure of turbulent jets and wakes A75-36236

EJECTORS
Investigation of a four-stage ejector for a hypersonic wind tunnel A75-36100

ELASTIC BENDING
Flutter of a wing with nonlinear elastic characteristic A75-36194

ELASTIC BODIES
Elastically retracting ACLS trunks --- Air Cushion Landing System A75-38052

ELASTIC PROPERTIES
New structural form of sandwich core A75-38576

ELECTRIC CONNECTORS
Blindside connector selection --- for aircraft wiring A75-37711

ELECTRIC POWER SUPPLIES
Spike, relays and aircraft electric systems A75-38726

ELECTRIC RELAYS
Spike, relays and aircraft electric systems A75-38726

ELECTRIC WIRE
Blindside connector selection --- for aircraft wiring A75-37711

- ELECTRO-OPTICS**
Aircraft design implications of opto-electronic systems
N75-26787
- ELECTROMAGNETIC SCATTERING**
Instrument Landing System performance prediction
A75-36530
- ELECTRONIC CONTROL**
Full authority electronic control application to military gas turbine engines
A75-37646
Future trends in flight control systems
A75-38262
- ENDOSCOPES**
Possibilities concerning a use of borescope inspection methods in nondestructive material testing and the significance of these methods
A75-38629
- ENGINE CONTROL**
Full authority electronic control application to military gas turbine engines
A75-37646
- ENGINE DESIGN**
Thrust reversers for the TPE-731 turbofan [SAE PAPER 750506]
A75-36652
Low emission, water-tolerant combustor for a small, all-weather turboshaft gas turbine engine [SAE PAPER 750535]
A75-36672
A second generation turbo-prop power plant [SAE PAPER 750536]
A75-36673
Anatomy of the helicopter. II - Engine and transmission ratings
A75-37299
Engine/airframe compatibility studies for supersonic cruise aircraft [NASA-CR-132610-1]
N75-25916
- ENGINE NOISE**
Factors affecting the noise from small propeller driven aircraft [SAE PAPER 750516]
A75-36658
Interim prediction method for fan and compressor source noise [NASA-TM-X-71763]
N75-25948
- ENGINE TESTS**
Possibilities concerning a use of borescope inspection methods in nondestructive material testing and the significance of these methods
A75-38629
- ENVIRONMENT EFFECTS**
Regional fatigue environment study for commuter airlines --- safe wing life [SAE PAPER 750512]
A75-36655
- ENVIRONMENTAL SURVEYS**
A social survey to examine the variance of aircraft noise annoyance
A75-38603
- EPOXY RESINS**
Kevlar 49 hybrid composites for commercial and aerospace applications
A75-37309
- EQUIPMENT SPECIFICATIONS**
Omega navigation systems specification and performance measurement
A75-36956
- ERROR ANALYSIS**
Accuracy specifications for automatic Omega navigators
A75-36953
Recent results on parametric analysis of differential Omega error
A75-36959
An empirical computed evaluation of composite Omega
A75-36965
- EXHAUST DIFFUSERS**
Performance of three vaned radial diffusers with swirling transonic flow [ASME PAPER 75-PE-19]
A75-36888
- EXHAUST GASES**
Low emission, water-tolerant combustor for a small, all-weather turboshaft gas turbine engine [SAE PAPER 750535]
A75-36672
Technology for reducing aircraft engine pollution [SAE PAPER 750550]
A75-36677
Field tests of a laser Raman measurement system for aircraft engine exhaust emissions [AD-A003648]
N75-25949
- EXHAUST SYSTEMS**
Thrust reversers for the TPE-731 turbofan [SAE PAPER 750506]
A75-36652
- EXPERIMENTAL DESIGN**
Design of a deployable wing glider [AD-A004800]
N75-25932
- EXTREMUM VALUES**
Optimization method for a generalized class of functional of several variables, and its application to problems involving the determination of the shape of three-dimensional bodies with optimal aerodynamic characteristics
A75-36166
- F**
- F-4 AIRCRAFT**
An investigation of the departure modes of a F-4D aircraft from a steady sideslip flight condition [AD-A004795]
N75-25928
Flight control actuator system development --- for F-4 aircraft [AD-A004853]
N75-25962
Stability analysis of an F-4C aircraft in steady level turning flight [AD-A004797]
N75-25963
- F-14 AIRCRAFT**
Design fabrication and test of an F-14 composite overwing fairing
A75-37310
The F-14 aircraft head up display
A75-37700
- FAILURE ANALYSIS**
Blunders caused by Omega propagation - SPA's and PCA's --- Sudden Phase Anomalies and Polar Cap Absorption
A75-36972
- FAIRINGS**
Design fabrication and test of an F-14 composite overwing fairing
A75-37310
- FATIGUE LIFE**
Regional fatigue environment study for commuter airlines --- safe wing life [SAE PAPER 750512]
A75-36655
Residual stresses caused by variable service loads in notches and their significance for the applicability of the linear damage accumulation hypothesis --- in Al alloys
A75-37777
Preliminary design of wings. Volume 2: Preliminary fatigue design [AD-A003650]
N75-27003
- FEASIBILITY ANALYSIS**
A feasibility study of a trans-ocean hybrid cargo airship operating in ground effect [AIAA PAPER 75-929]
A75-37006
- FEEDBACK CONTROL**
Synthesis of disturbance-rejection controllers for linear multivariable continuous-time systems --- application to hovering helicopter
A75-37409
- FIBERS**
Structural materials research for lighter-than-air systems [AIAA PAPER 75-935]
A75-37010
- FIGHTER AIRCRAFT**
Wet runway aircraft control project F-4 rain tire project [AD-A004768]
N75-25896
Sequential attack in aerial combat [AD-A004796]
N75-25929
Analytical determination of aircraft spin modes [AD-A004798]
N75-25931
- FINANCIAL MANAGEMENT**
The dynamics of the civil aviation industry --- Book
A75-36107
- FINITE DIFFERENCE THEORY**
Transonic flow around rotor blade elements [ASME PAPER 75-PE-24]
A75-36890
- FINITE ELEMENT METHOD**
Application of finite element analysis to ceramic components [ACS PAPER 30-BC-73F]
A75-35896
A three-dimensional method for the calculation of flow in turbomachines using finite elements on a blade-to-blade surface of revolution --- Book
A75-36899

FINNED BODIES

SUBJECT INDEX

- Aircraft fuel tank vulnerability to hydraulic ram:
Modification of the Northrop finite element
computer code BR-1 to include fluid-structure
interaction: Theory and users manual for BR-1 HR
[AD-A003471] N75-25922
- The finite element method in low speed aerodynamics
[NASA-CR-143190] N75-26972
- FINNED BODIES**
HASPA flight control concepts --- High Altitude
Superpressured Powered Aerostat
[AIAA PAPER 75-942] A75-37015
- FIRES**
Theoretical predictions of thermal explosions.
Part 1: A mathematical model of a bomb in a fire
[REPT-623-PT-1] N75-26152
- FLAME STABILITY**
Flame stabilization by leading edge vortex
breakdown above a delta shape
A75-37063
- FLAT PLATES**
Turbulent near wake of a flat plate. II - Effects
of boundary layer profile and compressibility
A75-38618
- FLIGHT CHARACTERISTICS**
LTA aerodynamic data revisited
[AIAA PAPER 75-951] A75-38550
Guardrail IIA RU-21H evaluation
[AD-A004009] N75-25923
Sequential attack in aerial combat
[AD-A004796] N75-25929
Problems of flight in turbulence
[NASA-TT-F-16401] N75-26977
- FLIGHT CONTROL**
HASPA flight control concepts --- High Altitude
Superpressured Powered Aerostat
[AIAA PAPER 75-942] A75-37015
Digital adaptive flight control design using
single stage model following indices
A75-37135
Flight control actuator system development --- for
F-4 aircraft
[AD-A004853] N75-25962
- FLIGHT MECHANICS**
Aviation in undulating flow - The Dolphin
principle, its technical implementation, and its
application in aviation
A75-36849
An investigation of the departure modes of a F-4D
aircraft from a steady sideslip flight condition
[AD-A004795] N75-25928
- FLIGHT PATHS**
Results of an investigation of two
three-dimensional low-level flight systems
A75-36992
- FLIGHT RECORDERS**
Investigation of system integration methods for
bubble domain flight recorders
[NASA-CR-132643] N75-26336
- FLIGHT SIMULATION**
Terrain following evaluation simulation --- B-1
aircraft avionics
A75-37647
A STOL airworthiness investigation using a
simulation of an augmentor wing transport.
Volume 2: Simulation data and analysis
[NASA-TM-X-62396] N75-25917
Application of rotorcraft flight simulation
program (C81) to predict rotor performance and
bending moments for a model four-bladed
articulated rotor system
[AD-A004015] N75-25934
- FLIGHT SIMULATORS**
Three methods of presenting flight vector
information in a head-up display during
simulated STOL approaches
[NASA-TM-X-3273] N75-26996
- FLIGHT TESTS**
Flight mechanics and pilot evaluation of
conventional landings
[SAE PAPER 750529] A75-36667
Airborne Omega navigation system integration and
test
A75-36963
Flight test of ARN-99/V/2 Omega Navigation
Set in
F-4 aircraft
A75-36966
HASPA design and flight test objectives --- High
Altitude Superpressured Powered Aerostat
[AIAA PAPER 75-924] A75-37002
- Development and flight experience of a manned
thermal airship
[AIAA PAPER 75-925] A75-37003
A balloon transport system
[AIAA PAPER 75-926] A75-37004
The use of computers in flight testing
A75-37779
Flight test and evaluation of Omega navigation for
general aviation
[NASA-CR-132677] N75-25901
Guardrail IIA RU-21H evaluation
[AD-A004009] N75-25923
Wind tunnel measurements of forward speed effects
on jet noise from suppressor nozzles and
comparison with flight test data
[NASA-TM-X-62449] N75-25946
Exploratory flight investigation of aircraft
response to the wing vortex wake generated by
the augmentor wing jet STOL research aircraft
[NASA-TM-X-62387] N75-26980
Comparison of two head-up displays in simulated
standard and noise abatement night visual
approaches
[NASA-TM-X-3264] N75-26995
- FLOW DISTRIBUTION**
Two dimensional, inviscid, transonic flowfield
around a profile
A75-37424
Calculation of flow field around air intake
operating at zero forward speed by the
distributed source-sink method /2-D case/
A75-38077
A simplified approach to generalized helicopter
configuration modeling and the prediction of
fuselage surface pressures
A75-38351
Detailed transonic flow field measurements about a
supercritical airfoil section
[NASA-TM-X-3244] N75-26975
Evaluation of a wedge on a force balance as a flow
angle probe
[AD-A004765] N75-27021
- FLOW EQUATIONS**
Analytic investigation of hypersonic flow around
blunt bodies
A75-36163
- FLOW GEOMETRY**
Structure of turbulent jets and wakes
A75-36236
Near-field supersonic flow pattern of slender
delta wings
A75-37182
- FLOW RESISTANCE**
The resistance of bodies of revolution at
transonic flow velocities
A75-35968
- FLOW THEORY**
A method for correlating wind tunnel experiments
with potential flow theory
A75-37600
- FLOW VISUALIZATION**
An experimental investigation of the effect of a
fuselage on wing characteristics
[AD-A003955] N75-25921
- FLUID FILTERS**
Aircraft engine lube oil filtration study
[SAE PAPER 750505] A75-36651
- FLUTTER**
Steady and oscillatory, subsonic and supersonic,
aerodynamic pressure and generalized forces for
complex aircraft configurations and applications
to flutter
[NASA-CR-142983] N75-25871
- FLUTTER ANALYSIS**
Flutter of a wing with nonlinear elastic
characteristic
A75-36194
Flutter of a panel supported on an elastic
foundation
A75-36245
- FLY BY WIRE CONTROL**
Digital adaptive flight control design using
single stage model following indices
A75-37135
Future trends in flight control systems
A75-38262

SUBJECT INDEX

GUST LOADS

- FRACTURE STRENGTH**
 Damage resistance of high modulus aramid fiber composites in aircraft applications [SAE PAPER 750532] A75-36669
- FREE FLOW**
 Dynamic stall characteristics of an oscillating airfoil in a harmonically varying freestream velocity N75-25863
- FRICTION MEASUREMENT**
 Ceramic airframe bearings --- solid lubricant selection tests [ASLE PREPRINT 75AM-7A-3] A75-37096
- FUEL CONSUMPTION**
 Analysis of characteristics of bypass turbojet engines with small gas turbine engines in the outer flow A75-38075
 Wasted fuel - Another reason for drag reduction --- in helicopters A75-38352
- FUEL SYSTEMS**
 Evaluation of the overall fuel mass penalty of an aircraft system A75-36720
- FUEL TANK PRESSURIZATION**
 Hydraulic ram pressure measurements --- fuel aircraft systems - impact damage [AD-A004241] N75-27005
- FUEL TANKS**
 Aircraft fuel tank vulnerability to hydraulic ram: Modification of the Northrop finite element computer code BR-1 to include fluid-structure interaction: Theory and users manual for BR-1 HR [AD-A003471] N75-25922
 A fuselage/tank structure study for actively cooled hypersonic cruise vehicles: Structural analysis [NASA-CR-132670] N75-26999
- FUELS**
 Fuel for compression micromotors [NASA-TT-F-16446] N75-26149
- FUNCTIONALS**
 Optimization method for a generalized class of functional of several variables, and its application to problems involving the determination of the shape of three-dimensional bodies with optimal aerodynamic characteristics A75-36166
- FUSELAGES**
 A simplified approach to generalized helicopter configuration modeling and the prediction of fuselage surface pressures A75-38351
 An experimental investigation of the effect of a fuselage on wing characteristics [AD-A003955] N75-25921
 Minimum weight design of fuselage type stiffened circular cylindrical shells subject to uniform axial compression [AD-A004412] N75-25927
 A fuselage/tank structure study for actively cooled hypersonic cruise vehicles: Active cooling system analysis [NASA-CR-132669] N75-26998
 A fuselage/tank structure study for actively cooled hypersonic cruise vehicles: Structural analysis [NASA-CR-132670] N75-26999
- G**
- GAS COOLING**
 Looping in a hydrogen cooling system A75-38370
- GAS FLOW**
 Hodograph method for axisymmetric transonic gas flows A75-35967
- GAS TURBINE ENGINES**
 Corrosion resistance of gas turbine blades tested in a high-temperature gas flow A75-36040
 Low emission, water-tolerant combustor for a small, all-weather turboshaft gas turbine engine [SAE PAPER 750535] A75-36672
 Full authority electronic control application to military gas turbine engines A75-37646
- Experimental study of the influence of large blade aspect ratios on axial compressor stage aerodynamic characteristics A75-38064
- Optimizing aircraft gas turbine blade air cooling systems. II Thermodynamic analysis A75-38067
- GAS TURBINES**
 Application of finite element analysis to ceramic components [SAE PAPER 30-BC-73P] A75-35896
 Modified centrifugal compressor [AD-A004002] N75-25950
- GEAR**
 Application of high frequency resonance techniques for bearing diagnostics in helicopter gearboxes [AD-A004014] N75-25936
- GENERAL AVIATION AIRCRAFT**
 Wind tunnel and flight development of spoilers for general aviation aircraft [SAE PAPER 750523] A75-36663
 Flight mechanics and pilot evaluation of conventional landings [SAE PAPER 750529] A75-36667
 NASA General Aviation Research overview - 1975 [SAE PAPER 750500] A75-36678
 An evaluation of differential Omega for general aviation area navigation A75-36960
 Flight test and evaluation of Omega navigation for general aviation [NASA-CR-132677] N75-25901
 Annual review of aircraft accident data, US general aviation, calendar year 1972 [PB-239608/3] N75-26988
- GLASS FIBER REINFORCED PLASTICS**
 Recent development and experience of an all fiberglass RP undercarriage for a STOL-aircraft A75-37311
- GLASS FIBERS**
 Possibilities concerning a use of borescope inspection methods in nondestructive material testing and the significance of these methods A75-38629
- GLIDERS**
 Some ideas of vortex lift [SAE PAPER 750547] A75-36676
 Handling and performance characteristics of swept-forward flying wing aircraft [SAE PAPER 750548] A75-36679
 Design of a deployable wing glider [AD-A004800] N75-25932
- GONDOLAS**
 Design concepts for helicopter pallets and gondolas [AD-A004013] N75-25935
- GRAPHITE**
 Kevlar 49 hybrid composites for commercial and aerospace applications A75-37309
- GROUND EFFECT**
 Flight mechanics and pilot evaluation of conventional landings [SAE PAPER 750529] A75-36667
 Comparison of measured and calculated aircraft lift generated pressures [NASA-TM-X-72707] N75-25870
- GROUND EFFECT MACHINES**
 A feasibility study of a trans-ocean hybrid cargo airship operating in ground effect [AIAA PAPER 75-929] A75-37006
 Elastically retracting ACLS trunks --- Air Cushion Landing System A75-38052
- GROUND STATIONS**
 Differential Omega in the air traffic control environment A75-36958
- GROUND TESTS**
 Propeller modulation effects on a scanning-beam microwave landing system [SAE PAPER 750521] A75-36661
- GUST ALLEVIATORS**
 Discussion of an aeromechanical gust alleviation system to improve the ride comfort of light airplanes [SAE PAPER 750544] A75-36675

HARMONICS

SUBJECT INDEX

- Aircraft loading spectra --- emphasizing maneuvering and gust loads
A75-37823
- H**
- HARMONICS**
Dynamic stall characteristics of an oscillating airfoil in a harmonically varying freestream velocity
N75-25863
- HARNESSES**
Shoulder harness and lap belt restraint system [NASA-CASE-ARC-10519-2]
N75-25915
- HEAD-UP DISPLAYS**
The F-14 aircraft head up display
A75-37700
Comparison of two head-up displays in simulated standard and noise abatement night visual approaches [NASA-TM-X-3264]
N75-26995
Three methods of presenting flight vector information in a head-up display during simulated STOL approaches [NASA-TM-X-3273]
N75-26996
- HEAT PIPES**
Heat exchange in the hypersonic flow of a rarefied gas past a blunt wedge
A75-35943
- HEAT RESISTANT ALLOYS**
Specific properties of high-strength and heat-resistant wrought aluminum alloys and the consideration of these properties in the maintenance of aircraft. II
A75-36850
- HEAT TRANSFER**
Heat exchange in the hypersonic flow of a rarefied gas past a blunt wedge
A75-35943
- HEATING EQUIPMENT**
Development and flight experience of a manned thermal airship [AIAA PAPER 75-925]
A75-37003
- HELICOPTER CONTROL**
MADGE - Evaluating a helicopter approach guidance system
A75-37300
Synthesis of disturbance-rejection controllers for linear multivariable continuous-time systems --- application to hovering helicopter
A75-37409
The relationship between rotorcraft drag and stability and control
A75-37597
Trimming dual control rotors for optimum performance
A75-38343
Summary of antitorque devices other than tail rotors
A75-38344
- HELICOPTER DESIGN**
Modern hubs of helicopter rotors. II
A75-37048
General problems concerning the helicopter
A75-37084
Anatomy of the helicopter. II - Engine and transmission ratings
A75-37299
Rotorcraft parasite drag; Proceedings of the Thirty-first Annual National Forum, Washington, D.C., May 14, 15, 1975
A75-37593
A general review of helicopter rotor hub drag data
A75-37594
Rotorcraft low-speed download drag definition and its reduction
A75-37595
Some important practical design constraints affecting drag reduction
A75-37596
Prediction of rotorcraft drag
A75-37598
Aerodynamic analysis of helicopter configurations
A75-37599
Helicopter parasite drag bibliography
A75-37601
A multifunction radar for helicopter applications
A75-37638
The supersonic rotor --- for helicopters
A75-38346
- An analytical and experimental evaluation of airfoil sections for helicopter rotor application
A75-38349
A simplified approach to generalized helicopter configuration modeling and the prediction of fuselage surface pressures
A75-38351
Effect of helicopter drag reduction on rotor dynamic loads and blade life
A75-38354
Cost benefit evaluation of helicopter parasite drag reductions
A75-38355
A comprehensive plan for helicopter drag reduction
A75-38356
A study of the potential benefits of advanced airfoils for helicopter applications
A75-38357
A review of design objectives for advanced helicopter rotor airfoils
A75-38358
UTTAS --- YUG-61A and YUH-60A competition for Utility Tactical Transport Aircraft System
A75-38668
- HELICOPTER ENGINES**
Anatomy of the helicopter. II - Engine and transmission ratings
A75-37299
- HELICOPTER PERFORMANCE**
Prediction of rotorcraft drag
A75-37598
Aerodynamic analysis of helicopter configurations
A75-37599
National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn., March 6, 7, 1975, Proceedings
A75-38340
Uniform downwash with rotors having a finite number of blades
A75-38341
Summary of results indicating the beneficial effects of rotor vortex modification
A75-38345
A tunnel spanning airfoil testing technique
A75-38350
Wasted fuel - Another reason for drag reduction --- in helicopters
A75-38352
Effects of parasite drag on rotor performance and dynamic response
A75-38353
- HELICOPTER WAKES**
A second approximation to the induced drag of a rotor in forward flight
A75-38342
Acoustic effects of rotor-wake interaction during low-power descent
A75-38347
- HELICOPTERS**
Artificial icing tests CH-47C helicopter [AD-A004008]
N75-25878
Helicopter lift margin system [AD-A003917]
N75-25926
Design concepts for helicopter pallets and gondolas [AD-A004013]
N75-25935
- HIGH ALTITUDE BALLOONS**
Structural design of a High-Altitude Superpressure Powered Aerostat [AIAA PAPER 75-933]
A75-37009
The Navy role in buoyant and semi-buoyant systems of the future --- LTA design [AIAA PAPER 75-937]
A75-37011
- HIGH RESOLUTION**
A multifunction radar for helicopter applications
A75-37638
- HIGH STRENGTH ALLOYS**
Specific properties of high-strength and heat-resistant wrought aluminum alloys and the consideration of these properties in the maintenance of aircraft. II
A75-36850
- HIGH TEMPERATURE AIR**
Development and flight experience of a manned thermal airship [AIAA PAPER 75-925]
A75-37003
- HIGH TEMPERATURE GASES**
Heat and mass transfer during high-enthalpy gas flow in aircraft and rocket engine flow passages
A75-38074

SUBJECT INDEX

INSTRUMENT ERRORS

HIGH TEMPERATURE TESTS		
Corrosion resistance of gas turbine blades tested in a high-temperature gas flow	A75-36040	
HODOGRAPHS		
Hodograph method for axisymmetric transonic gas flows	A75-35967	
HOLE DISTRIBUTION (MECHANICS)		
Analysis of the effects on life of leading-edge holes in an airfoil subjected to arbitrary spanwise and chordwise temperature distributions --- structural analysis [NASA-TM-X-3257]	N75-27421	
HOLOGRAPHY		
Technical diagnostics in aircraft maintenance	A75-36848	
HONEYCOMB STRUCTURES		
The Shell natural gas airship, and other L.T.A. activities by Aerospace Developments [AIAA PAPER 75-932]	A75-37008	
HOVERING		
Rotocraft low-speed download drag definition and its reduction	A75-37595	
HUBS		
Modern hubs of helicopter rotors. II	A75-37048	
A general review of helicopter rotor hub drag data	A75-37594	
HUMAN FACTORS ENGINEERING		
The F-14 aircraft head up display	A75-37700	
The effects of aircraft design on STOL ride quality [NASA-CR-143113]	N75-27001	
HUMAN REACTIONS		
A social survey to examine the variance of aircraft noise annoyance	A75-38603	
HYBRID NAVIGATION SYSTEMS		
Mix and match - A hybrid Omega-Inertial airborne navigation system	A75-36964	
HYDRIDES		
Alternative fuels for aviation	A75-36719	
HYDROCARBON FUELS		
Alternative fuels for aviation	A75-36719	
HYDROGEN		
Looping in a hydrogen cooling system	A75-38370	
HYDROGEN FUELS		
Alternative fuels for aviation	A75-36719	
A non-polluting powerplant for large airships [AIAA PAPER 75-927]	A75-37005	
HYPERSONIC AIRCRAFT		
A fuselage/tank structure study for actively cooled hypersonic cruise vehicles: Active cooling system analysis [NASA-CR-132669]	N75-26998	
A fuselage/tank structure study for actively cooled hypersonic cruise vehicles: Structural analysis [NASA-CR-132670]	N75-26999	
HYPERSONIC FLOW		
Heat exchange in the hypersonic flow of a rarefied gas past a blunt wedge	A75-35943	
Flow about a conic wing and the optimal configuration of the wing at hypersonic velocities	A75-36099	
Analytic investigation of hypersonic flow around blunt bodies	A75-36163	
Hypersonic flow past V-shaped conical wings	A75-38406	
HYPERSONIC VEHICLES		
A fuselage/tank structure study for actively cooled hypersonic cruise vehicles: Aircraft design evaluation [NASA-CR-132668]	N75-26997	
HYPERSONIC WIND TUNNELS		
Investigation of a four-stage ejector for a hypersonic wind tunnel	A75-36100	
ICE FORMATION		
Artificial icing tests CH-47C helicopter [AD-A004008]	N75-25878	
IMPACT DAMAGE		
Damage resistance of high modulus aramid fiber composites in aircraft applications [SAE PAPER 750532]	A75-36669	
Hydraulic ram pressure measurements --- fuel aircraft systems - impact damage [AD-A004241]	N75-27005	
IMPACT LOADS		
Hydraulic ram pressure measurements --- fuel aircraft systems - impact damage [AD-A004241]	N75-27005	
IN-FLIGHT MONITORING		
An in-flight investigation of nonlinear roll control [SAE PAPER 750528]	A75-36666	
On-board test and monitoring of advanced weapon systems	A75-37644	
INCOMPRESSIBLE FLOW		
Theoretical prediction of airloads on thin delta wings in incompressible flow [AD-A004654]	N75-25891	
INDUSTRIAL MANAGEMENT		
The dynamics of the civil aviation industry --- Book	A75-36107	
European industry and civil air transport /28th Louis Bleriot Lecture/	A75-36718	
INERTIAL NAVIGATION		
Alternative approaches to integrated airborne OMEGA/Inertial navigation	A75-36962	
Mix and match - A hybrid Omega-Inertial airborne navigation system	A75-36964	
Airborne ONS - A low cost alternate to INS --- Omega and Inertial Navigation Systems compared	A75-36967	
Performance comparison of space stable and local level inertial platform mechanizations for a strategic aircraft application	A75-37703	
The cost-effectiveness of inertial navigation for civil aircraft	A75-38261	
INERTIAL PLATFORMS		
Performance comparison of space stable and local level inertial platform mechanizations for a strategic aircraft application	A75-37703	
INFLATABLE STRUCTURES		
Structural materials research for lighter-than-air systems [AIAA PAPER 75-935]	A75-37010	
INGESTION (ENGINES)		
Effect of inlet ingestion of a wing tip vortex on compressor face flow and turbojet stall margin [NASA-TM-X-3246]	N75-26968	
INLET FLOW		
Uniform shear flow within rectangular parallel-walled diffusers [ASME PAPER 75-PE-34]	A75-36896	
INSECTS		
Mechanism of generating a normal force by a beat of the wings	A75-38136	
INSTRUMENT APPROACH		
Aircraft accident report: Air East, Inc. Beechcraft 99A, N125AE, Johnstown-Cambria County Airport, Johnstown, Pennsylvania, 6 January 1974 [PB-239891/5]	N75-26982	
INSTRUMENT ERRORS		
Alternative approaches to integrated airborne OMEGA/Inertial navigation	A75-36962	
On observations of modal interference of the North Dakota Omega transmission	A75-36971	
Evaluation of real-time algorithms for Omega propagation prediction	A75-36973

SUBJECT INDEX

MANAGEMENT PLANNING

- LANDING GEAR**
Recent development and experience of an all fiberglass RP undercarriage for a STOL-aircraft
A75-37311
- LANDING INSTRUMENTS**
Microwave technology in the microwave landing system
A75-36529
Autopilot for British Airways
A75-37778
- LASER APPLICATIONS**
The application of displays in navigation/attack systems
N75-26780
- LASERS**
Field tests of a laser Raman measurement system for aircraft engine exhaust emissions
[AD-A003648] N75-25949
- LATERAL CONTROL**
Wind tunnel and flight development of spoilers for general aviation aircraft
[SAE PAPER 750523] A75-36663
An in-flight investigation of nonlinear roll control
[SAE PAPER 750528] A75-36666
- LAUNCHERS**
A/A 470-3 tow target reeling machine launcher system
[AD-A004622] N75-25882
- LEADING EDGES**
Plane stabilization by leading edge vortex breakdown above a delta shape
A75-37063
Integral method for calculating a detached stream behind a body in a supersonic flow
A75-38407
- LIFE (DURABILITY)**
Analysis of the effects on life of leading-edge holes in an airfoil subjected to arbitrary spanwise and chordwise temperature distributions --- structural analysis
[NASA-TM-X-3257] N75-27421
- LIIFT**
Mechanism of generating a normal force by a beat of the wings
A75-38136
Comparison of measured and calculated aircraft lift generated pressures
[NASA-TM-X-72707] N75-25870
Helicopter lift margin system
[AD-A003917] N75-25926
- LIIFT AUGMENTATION**
A balloon transport system
[AIAA PAPER 75-926] A75-37004
- LIIFT DEVICES**
High lift aircraft --- with improved stability, control, performance, and noise characteristics
[NASA-CASE-LAR-11252-1] N75-25914
Potential flow about three dimensional streamlined lifting configurations, with application to wings and rotors
[AD-A003697] N75-26979
- LIIFT DRAG RATIO**
Flow about a conic wing and the optimal configuration of the wing at hypersonic velocities
A75-36099
Drag analysis methods for light aircraft
[ASAE PAPER 750526] A75-36665
- LIFTING BODIES**
Wing-Tip-Winglet propulsion for Aerocrane-type hybrid lift vehicles
[AIAA PAPER 75-944] A75-37017
Supersonic lifting-surface computer program for cruciform wing-body combinations
[AD-A003925] N75-26978
- LIFTING ROTORS**
Potential flow about three-dimensional streamlined lifting configurations, with application to wings and rotors
N75-25867
- LIGHT AIRCRAFT**
Drag analysis methods for light aircraft
[ASAE PAPER 750526] A75-36665
Discussion of an aeromechanical gust alleviation system to improve the ride comfort of light airplanes
[SAE PAPER 750544] A75-36675
- LIGHTNING**
FAA lightning protection study: Lightning protection for status and control lines of AN/GRN-27(V) instrument landing system
[AD-A006997] N75-25967
- LINEAR SYSTEMS**
Synthesis of disturbance-rejection controllers for linear multivariable continuous-time systems --- application to hovering, helicopter
A75-37409
- LOAD TESTS**
Residual stresses caused by variable service loads in notches and their significance for the applicability of the linear damage accumulation hypothesis --- in Al alloys
A75-37777
- LOCKHEED AIRCRAFT**
Aircraft accident report: Aircraft Pool Leasing Corporation, Lockheed super constellation, L-1049H, N6917C, Miami, Florida, 15 December 1973
[PB-240120/6] N75-26985
Aircraft accident report: Saturn Airways Inc., Lockheed L-382, N145T, Springfield, Illinois, 23 May 1974
[PB-240119/8] N75-26986
- LOGISTICS MANAGEMENT**
A proposal to implement statistical reliability analysis methodology into the Naval aviation maintenance program
[AD-A004264] N75-26981
- LONGITUDINAL STABILITY**
Static stability and aperiodic divergence --- in longitudinal flight
A75-38579
- LOW COST**
Binary processing and display concepts for low-cost Omega receivers --- airborne systems simulation
A75-36969
Digital phase processing for low-cost Omega receivers
A75-36970
- LOW SPEED STABILITY**
Design of low-speed airfoils by numerical optimization
[SAE PAPER 750524] A75-36664
Some ideas of vortex lift
[SAE PAPER 750547] A75-36676
Rotorcraft low-speed download drag definition and its reduction
A75-37595
- LOW VISIBILITY**
Pilot problems in low visibility approach and landing
A75-37489
- LUBRICANT TESTS**
Ceramic airframe bearings --- solid lubricant selection tests
[ASLE PREPRINT 75AM-7A-3] A75-37096
- LUBRICATING OILS**
Aircraft engine lube oil filtration study
[SAE PAPER 750505] A75-36651
Some practical considerations found in the use of solid film lubricants in aircraft systems
A75-38122
- M**
- M-2 LIFTING BODY**
Flight evaluation of the M2-F3 lifting body handling qualities at Mach numbers from 0.30 to 1.61
[NASA-TN-D-8027] N75-27015
- MACH NUMBER**
Reynolds number effects on the boattail characteristics of a simulated nacelle at a Mach number of 0.8
[AD-A004803] N75-25884
- MAINTAINABILITY**
On-board test and monitoring of advanced weapon systems
A75-37644
- MAINTENANCE**
A proposal to implement statistical reliability analysis methodology into the Naval aviation maintenance program
[AD-A004264] N75-26981
Organizing centralized aircraft component overhaul
[NASA-TT-P-16266] N75-27949
- MANAGEMENT PLANNING**
Inventory of freight transportation in the Southwest. Part 3: Air freight service in the Dallas-Fort Worth area
[PB-239820/4] N75-26987

MANEUVERABILITY

The effect of roll rate on air combat
[AD-A004794] N75-25930

MARKET RESEARCH
The dynamics of the civil aviation industry --- Book
A75-36107

Potential missions for advanced airships
[AIAA PAPER 75-946] A75-37019

A strategy for getting LTA systems airborne
[AIAA PAPER 75-949] A75-37020

MASS
Evaluation of the overall fuel mass penalty of an
aircraft system A75-36720

MATHEMATICAL MODELS
A simplified approach to generalized helicopter
configuration modeling and the prediction of
fuselage surface pressures A75-38351

Theoretical predictions of thermal explosions.
Part 1: A mathematical model of a bomb in a fire
[REPT-623-PT-1] N75-26152

MECHANICAL PROPERTIES
The B-1 structural integrity program
[SAE PAPER 750514] A75-36656

Damage resistance of high modulus aramid fiber
composites in aircraft applications
[SAE PAPER 750532] A75-36669

Graphite composite materials applications in
aircraft structures
[SAE PAPER 750533] A75-36670

Specific properties of high-strength and
heat-resistant wrought aluminum alloys and the
consideration of these properties in the
maintenance of aircraft. II A75-36850

Structural materials research for lighter-than-air
systems
[AIAA PAPER 75-935] A75-37010

Kevlar 49 hybrid composites for commercial and
aerospace applications A75-37309

MICROMOTORS
Fuel for compression micromotors
[NASA-TT-F-16446] N75-26149

MICROWAVE ANTENNAS
Astrolabe, integrated navigation and landing aid
device - Land-bound and airborne presentation of
information
[ONERA, TP NO. 1975-17] A75-36457

MICROWAVE EQUIPMENT
Analysis, test and evaluation support to the USAF
advanced landing system program. Volume 1:
Program description and results
[AD-A004419] N75-27223

Analysis, test and evaluation support to the USAF
advanced landing system program. Volume 2:
Index of approaches
[AD-A004420] N75-27224

Analysis, test and evaluation support to the USAF
advanced landing system program. Volume 3,
Part 1: Doppler MLS guidance error data (DOTS
tracking system)
[AD-A004421] N75-27225

Analysis, test and evaluation support to the USAF
advanced landing system program. Volume 3, part
2: Doppler MLS guidance error data (M-33
tracking system, flights 22 June 1973 to 10
September 1974)
[AD-A004422] N75-27226

Analysis, test and evaluation support to the USAF
advanced landing system program. Volume 3, Part
3: Doppler MLS guidance error data (M-33
tracking system, flights 12 September 1973 to 29
January 1974)
[AD-A004423] N75-27227

MICROWAVE LANDING SYSTEMS
Some system considerations for MLS airborne
processors A75-36366

Microwave technology in the microwave landing system
A75-36529

Propeller modulation effects on a scanning-beam
microwave landing system
[SAE PAPER 750521] A75-36661

MADGE - Evaluating a helicopter approach guidance
system A75-37300

MIDAIR COLLISIONS

The promise of air safety --- collision avoidance
systems A75-36401

Aircraft accident report: New Jersey Air National
Guard F106, serial number 59-0044, Piper
PA-24-250, N6876P, midair collision near Saxis,
Virginia, 11 October 1974
[PB-240250/1] N75-26984

MILITARY AIRCRAFT
A proposal to implement statistical reliability
analysis methodology into the Naval aviation
maintenance program
[AD-A004264] N75-26981

MILITARY HELICOPTERS
Some important practical design constraints
affecting drag reduction A75-37596

UTTAS --- YUG-61A and YUH-60A competition for
Utility Tactical Transport Aircraft System A75-38668

MILITARY TECHNOLOGY
Operational considerations of large rigid airships
in military applications
[AIAA PAPER 75-938] A75-37012

Full authority electronic control application to
military gas turbine engines A75-37646

MINIMAX TECHNIQUE
Aircraft wake turbulence minimization by
aerodynamic means A75-37450

MODAL RESPONSE
Digital computer program DF1758 fully coupled
natural frequencies and mode shapes of a
helicopter rotor blade
[NASA-CR-132662] N75-26973

MULTIPATH TRANSMISSION
Some system considerations for MLS airborne
processors A75-36366

N

NACELLES

Reynolds number effects on the boattail
characteristics of a simulated nacelle at a Mach
number of 0.8
[AD-A004803] N75-25884

NASA PROGRAMS
NASA General Aviation Research overview - 1975

SUBJECT INDEX

OMEGA NAVIGATION SYSTEM

NAVIGATION SATELLITES			
A technique to improve the performance of a nonlinear filter with an application to satellite-aided aircraft navigation			
	A75-37138		
NEAR FIELDS			
Near-field supersonic flow pattern of slender delta wings			
	A75-37182		
NEAR WAKES			
Turbulent near wake of a flat plate. II - Effects of boundary layer profile and compressibility			
	A75-38618		
NIGHT VISION			
Comparison of two head-up displays in simulated standard and noise abatement night visual approaches			
[NASA-TM-X-3264]	N75-26995		
NOISE GENERATORS			
Hybrid nonstationary noise simulator of the aircraft overflight type			
[ONERA, TP NO. 1975-46]	A75-37905		
The acoustic response of a nozzle flow to an externally applied low frequency pressure field			
	A75-38601		
Spike, relays and aircraft electric systems			
	A75-38726		
Interim prediction method for fan and compressor source noise			
[NASA-TM-X-71763]	N75-25948		
NOISE MEASUREMENT			
Acoustic effects of rotor-wake interaction during low-power descent			
	A75-38347		
NOISE POLLUTION			
Noise control features of the DC-10			
	A75-37497		
A social survey to examine the variance of aircraft noise annoyance			
	A75-38603		
NOISE REDUCTION			
New directions in aircraft propulsor noise research			
[SAE PAPER 750515]	A75-36657		
Factors affecting the noise from small propeller driven aircraft			
[SAE PAPER 750516]	A75-36658		
Ducted propulsors - Progress in the United Kingdom			
[SAE PAPER 750534]	A75-36671		
Noise control features of the DC-10			
	A75-37497		
Methodology for certification of aircraft nuisances			
[ONERA, TP NO. 1975-48]	A75-37900		
The shock and vibration digest, volume 6, no. 12 --- jet aircraft noise reduction			
[AD-A003455]	N75-25942		
Comparison of two head-up displays in simulated standard and noise abatement night visual approaches			
[NASA-TM-X-3264]	N75-26995		
Electric energy and noise --- emphasizing noise reduction			
[BLL-CE-TRANS-6550-(9022.09)]	N75-27244		
NONDESTRUCTIVE TESTS			
Technical diagnostics in aircraft maintenance			
	A75-36848		
Possibilities concerning a use of borescope inspection methods in nondestructive material testing and the significance of these methods			
	A75-38629		
NONLINEAR FILTERS			
A technique to improve the performance of a nonlinear filter with an application to satellite-aided aircraft navigation			
	A75-37138		
NOTCH TESTS			
Residual stresses caused by variable service loads in notches and their significance for the applicability of the linear damage accumulation hypothesis --- in Al alloys			
	A75-37777		
NOZZLE DESIGN			
Thrust reversers for the TPE-731 turbofan			
[SAE PAPER 750506]	A75-36652		
Wind tunnel measurements of forward speed effects on jet noise from suppressor nozzles and comparison with flight test data			
[NASA-TM-X-62449]	N75-25946		
NOZZLE FLOW			
The acoustic response of a nozzle flow to an externally applied low frequency pressure field			
	A75-38601		
NOZZLE THRUST COEFFICIENTS			
Analysis of characteristics of bypass turbojet engines with small gas turbine engines in the outer flow			
	A75-38075		
NUCLEAR FUELS

OPERATIONAL PROBLEMS

Digital phase processing for low-cost Omega receivers
A75-36970

On observations of modal interference of the North Dakota Omega transmission
A75-36971

Blunders caused by Omega propagation - SPA's and PCA's --- Sudden Phase Anomalies and Polar Cap Absorption
A75-36972

Evaluation of real-time algorithms for Omega propagation prediction
A75-36973

Flight test and evaluation of Omega navigation for general aviation
[NASA-CR-132677]
N75-25901

OPERATIONAL PROBLEMS
General problems concerning the helicopter
A75-37084

OPTIMAL CONTROL
Improvement of AN/TPQ-27 filter and control techniques
[AD-A003878]
N75-25903

OPTIMIZATION
Composite box beam optimization program
A75-37308

The concept of trustworthiness in the safety of structures --- weight-optimal aircraft structural design
A75-37799

Optimizing aircraft gas turbine blade air cooling systems. II Thermodynamic analysis
A75-38067

ORGANIC MATERIALS
Structural materials research for lighter-than-air systems
[AIAA PAPER 75-935]
A75-37010

OSCILLATIONS
Dynamic stall characteristics of an oscillating airfoil in a harmonically varying freestream velocity
N75-25863

P

PANEL FLUTTER
Flutter of a panel supported on an elastic foundation
A75-36245

PARABOLIC BODIES
Parabolic wing, resembling a wedge, in supersonic flow
A75-36165

PERFORMANCE PREDICTION
Instrument Landing System performance prediction
A75-36530

Performance of a sliding window detector in a high-interference air traffic environment
A75-37136

A technique to improve the performance of a nonlinear filter with an application to satellite-aided aircraft navigation
A75-37138

A parametric evaluation of the performance of the bypass jet engine
A75-37423

Prediction of rotorcraft drag
A75-37598

PERFORMANCE TESTS
Application of high frequency resonance techniques for bearing diagnostics in helicopter gearboxes
[AD-A004014]
N75-25936

PHASE DETECTORS
Digital phase processing for low-cost Omega receivers
A75-36970

PHASE ERROR
Recent results on parametric analysis of differential Omega error
A75-36959

On observations of modal interference of the North Dakota Omega transmission
A75-36971

Blunders caused by Omega propagation - SPA's and PCA's --- Sudden Phase Anomalies and Polar Cap Absorption
A75-36972

SUBJECT INDEX

PHASE LOCKED SYSTEMS
Binary phase locked loops for Omega receivers
A75-36968

Binary processing and display concepts for low-cost Omega receivers --- airborne systems simulation
A75-36969

PILOT PERFORMANCE
Flight mechanics and pilot evaluation of conventional landings
[SAE PAPER 750529]
A75-36667

Pilot problems in low visibility approach and landing
A75-37489

PITCHING MOMENTS
Aerodynamic characteristics of an axisymmetric body undergoing a uniform pitching motion
[AD-A003859]
N75-25879

PLANAR STRUCTURES
A study of the flow around plane and axially symmetrical bodies with a separated shock wave by a flow at low supersonic speed
[AD-A004442]
N75-25887

PLASTIC AIRCRAFT STRUCTURES
Design fabrication and test of an F-14 composite overwing fairing
A75-37310

Recent development and experience of an all fiberglass RP undercarriage for a STOL-aircraft
A75-37311

PLASTICS
Structural materials research for lighter-than-air systems
[AIAA PAPER 75-935]
A75-37010

PLATES (STRUCTURAL MEMBERS)
Preliminary design of wings. Volume 3: Minimum weight design of stiffened plate
[AD-A003651]
N75-27004

POLAR CAP ABSORPTION
Blunders caused by Omega propagation - SPA's and PCA's --- Sudden Phase Anomalies and Polar Cap Absorption
A75-36972

POLLUTION CONTROL
Technology for reducing aircraft engine pollution
[SAE PAPER 750550]
A75-36677

A non-polluting powerplant for large airships
[AIAA PAPER 75-927]
A75-37005

Noise control features of the DC-10
A75-37497

Methodology for certification of aircraft nuisances
[ONERA, TP NO. 1975-48]
A75-37900

POSITION (LOCATION)
Experimental Omega four frequency format extends lane ambiguity --- global search and rescue system
A75-36954

POSITION ERRORS
Accuracy specifications for automatic Omega navigators
A75-36953

On observations of modal interference of the North Dakota Omega transmission
A75-36971

POSTFLIGHT ANALYSIS
Flight evaluation of the M2-F3 lifting body handling qualities at Mach numbers from 0.30 to 1.61
[NASA-TN-D-8027]
N75-27015

POTENTIAL FLOW
A method for correlating wind tunnel experiments with potential flow theory
A75-37600

Calculation of flow field around air intake operating at zero forward speed by the distributed source-sink method /2-D case/
A75-38077

A simplified approach to generalized helicopter configuration modeling and the prediction of fuselage surface pressures
A75-38351

Potential flow about three-dimensional streamlined lifting configurations, with application to wings and rotors
N75-25867

Comparison of wind tunnel test results at free stream Mach 0.7 with results from the Boeing TEA-230 subsonic flow method --- wing flow method tests
[NASA-CR-2554]
N75-26976

SUBJECT INDEX

REMOTE CONTROL

Potential flow about three dimensional streamlined lifting configurations, with application to wings and rotors
[AD-A003697] N75-26979

POWER EFFICIENCY
Helicopter lift margin system
[AD-A003917] N75-25926

POWER TRANSMISSION
Anatomy of the helicopter. II - Engine and transmission ratings
A75-37299

PREDICTION ANALYSIS TECHNIQUES
Evaluation of real-time algorithms for Omega propagation prediction
A75-36973
Interim prediction method for fan and compressor source noise
[NASA-TN-X-71763] N75-25948

PRESSURE DISTRIBUTION
The acoustic response of a nozzle flow to an externally applied low frequency pressure field
A75-38601

PRESSURE MEASUREMENTS
Hydraulic ram pressure measurements --- fuel aircraft systems - impact damage
[AD-A004241] N75-27005

PRESSURE REGULATORS
Aircraft hydraulic system pressure regulator stability
A75-38076

PRODUCTION ENGINEERING
Organizing centralized aircraft component overhaul
[NASA-TT-F-16266] N75-27949

PROPAGATION MODES
On observations of modal interference of the North Dakota Omega transmission
A75-36971

PROPELLANT TANKS
A fuselage/tank structure study for actively cooled hypersonic cruise vehicles: Active cooling system analysis
[NASA-CR-132669] N75-26998

PROPELLER DRIVE
Factors affecting the noise from small propeller driven aircraft
[SAE PAPER 750516] A75-36658

PROPELLERS
Propeller modulation effects on a scanning-beam microwave landing system
[SAE PAPER 750521] A75-36661
Turbulent wake behind slender bodies, including self-propelled configurations
N75-25866

PROPULSION SYSTEM CONFIGURATIONS
New directions in aircraft propulsor noise research
[SAE PAPER 750515] A75-36657
Aviation in undulating flow - The Dolphin principle, its technical implementation, and its application in aviation
A75-36849

PROPULSION SYSTEM PERFORMANCE
Ducted propulsors - Progress in the United Kingdom
[SAE PAPER 750534] A75-36671
A parametric evaluation of the performance of the bypass jet engine
A75-37423
Analysis of characteristics of bypass turbojet engines with small gas turbine engines in the outer flow
A75-38075

PROPULSIVE EFFICIENCY
A non-polluting powerplant for large airships
[AIAA PAPER 75-927] A75-37005
A study of the potential benefits of advanced airfoils for helicopter applications
A75-38357

PSYCHOLOGICAL FACTORS
Intuitive design --- applied to aircraft structural design
A75-37425

R

RADAR BEACONS
Performance of a sliding window detector in a high-interference air traffic environment
A75-37136

RADAR DETECTION
Avacs - Boeing's radar patroller
A75-36765

RADAR EQUIPMENT
A multifunction radar for helicopter applications
A75-37638

RADAR NAVIGATION
A multifunction radar for helicopter applications
A75-37638

RADIAL FLOW
Performance of three vaned radial diffusers with swirling transonic flow
[ASME PAPER 75-PE-19] A75-36888

RADIO FREQUENCY INTERFERENCE
On observations of modal interference of the North Dakota Omega transmission
A75-36971

RADIO NAVIGATION
State of experimentations and program of development of Differential OMEGA in France
A75-36961

RADIO RECEIVERS
Hand held calculator technology applied to an advanced Omega receiver
A75-36957
Binary phase locked loops for Omega receivers
A75-36968
Binary processing and display concepts for low-cost Omega receivers --- airborne systems simulation
A75-36969
Digital phase processing for low-cost Omega receivers
A75-36970

RAMAN SPECTRA
Field tests of a laser Raman measurement system for aircraft engine exhaust emissions
[AD-A003648] N75-25949

RANKINE CYCLE
A non-polluting powerplant for large airships
[AIAA PAPER 75-927] A75-37005

RAREFIED GAS DYNAMICS
Heat exchange in the hypersonic flow of a rarefied gas past a blunt wedge
A75-35943

REAL TIME OPERATION
Evaluation of real-time algorithms for Omega propagation prediction
A75-36973
Feasibility of real time simulation of airport/airside operations
[AD-A006996] N75-26991

RECONNAISSANCE AIRCRAFT
Operational considerations of large rigid airships in military applications
[AIAA PAPER 75-938] A75-37012

REENTRY VEHICLES
Boundary layer transition on blunt bodies
[AD-A004826] N75-25877

REFRACTORY MATERIALS
Corrosion resistance of gas turbine blades tested in a high-temperature gas flow
A75-36040

REGRESSION ANALYSIS
Recent results on parametric analysis of differential Omega error
A75-36959

REINFORCED PLASTICS
Design fabrication and test of an F-14 composite overwing fairing
A75-37310

REINFORCING FIBERS
Damage resistance of high modulus aramid fiber composites in aircraft applications
[SAE PAPER 750532] A75-36669

RELIABILITY ANALYSIS
A proposal to implement statistical reliability analysis methodology into the Naval aviation maintenance program
[AD-A004264] N75-26981

RELIABILITY ENGINEERING
The concept of trustworthiness in the safety of structures --- weight-optimal aircraft structural design
A75-37799

REMOTE CONTROL
Improvement of AN/TPQ-27 filter and control techniques
[AD-A003878] N75-25903

REMOTELY PILOTED VEHICLES

SUBJECT INDEX

REMOTELY PILOTED VEHICLES

HASPA design and flight test objectives --- High Altitude Superpressured Powered Aerostat [ATAA PAPER 75-924] A75-37002

RESEARCH AIRCRAFT
Analytical modeling requirements for tilting prop rotor aircraft dynamics [NASA-TN-D-8013] N75-27422

RESEARCH AND DEVELOPMENT
New directions in aircraft propulsor noise research [SAE PAPER 750515] A75-36657
NASA General Aviation Research overview - 1975 [SAE PAPER 750500] A75-36678

RESIDUAL STRESS
Residual stresses caused by variable service loads in notches and their significance for the applicability of the linear damage accumulation hypothesis --- in Al alloys A75-37777

RESONANT FREQUENCIES
Digital computer program DF1758 fully coupled natural frequencies and mode shapes of a helicopter rotor blade [NASA-CR-132662] N75-26973

RETRACTABLE EQUIPMENT
Elastically retracting ACLS trunks --- Air Cushion Landing System A75-38052

REYNOLDS NUMBER
Reynolds number effects on the boattail characteristics of a simulated nacelle at a Mach number of 0.8 [AD-A004803] N75-25884

RIGID ROTOR HELICOPTERS
Modern hubs of helicopter rotors. II A75-37048

ROCKET LININGS
Heat and mass transfer during high-enthalpy gas flow in aircraft and rocket engine flow passages A75-38074

ROLL
The effect of roll rate on air combat [AD-A004794] N75-25930

ROLLING MOMENTS
An in-flight investigation of nonlinear roll control [SAE PAPER 750528] A75-36666

ROTARY WING AIRCRAFT
Aerodynamic analysis of helicopter configurations A75-37599

ROTARY WINGS
Modern hubs of helicopter rotors. II A75-37048
A general review of helicopter rotor hub drag data A75-37594
Uniform downwash with rotors having a finite number of blades A75-38341
A second approximation to the induced drag of a rotor in forward flight A75-38342
Trimming dual control rotors for optimum performance A75-38343
Summary of results indicating the beneficial effects of rotor vortex modification A75-38345
The supersonic rotor --- for helicopters A75-38346
Acoustic effects of rotor-wake interaction during low-power descent A75-38347
An analytical and experimental evaluation of airfoil sections for helicopter rotor application A75-38349
A tunnel spanning airfoil testing technique A75-38350
Effects of parasite drag on rotor performance and dynamic response A75-38353
A study of the potential benefits of advanced airfoils for helicopter applications A75-38357
A review of design objectives for advanced helicopter rotor airfoils A75-38358
Dynamic stall characteristics of an oscillating airfoil in a harmonically varying freestream velocity N75-25863

Application of rotorcraft flight simulation program (C81) to predict rotor performance and bending moments for a model four-bladed articulated rotor system [AD-A004015] N75-25934

Digital computer program DF1758 fully coupled natural frequencies and mode shapes of a helicopter rotor blade [NASA-CR-132662] N75-26973

ROTOR AERODYNAMICS
National Symposium on Helicopter Aerodynamic Efficiency, Hartford, Conn., March 6, 7, 1975, Proceedings A75-38340
Uniform downwash with rotors having a finite number of blades A75-38341
Summary of antitorque devices other than tail rotors A75-38344
Summary of results indicating the beneficial effects of rotor vortex modification A75-38345
A state-of-the-art survey of two-dimensional airfoil data A75-38348
Effects of parasite drag on rotor performance and dynamic response A75-38353
Effect of helicopter drag reduction on rotor dynamic loads and blade life A75-38354
A study of the potential benefits of advanced airfoils for helicopter applications A75-38357
A review of design objectives for advanced helicopter rotor airfoils A75-38358
Analytical modeling requirements for tilting prop rotor aircraft dynamics [NASA-TN-D-8013] N75-27422

ROTOR BLADES
Effect of helicopter drag reduction on rotor dynamic loads and blade life A75-38354
On the investigation of cascade and turbomachinery rotor wake characteristics [AD-A003580] N75-26323

ROTOR SPEED
Rotorcraft low-speed download drag definition and its reduction A75-37595

ROTORCRAFT AIRCRAFT
Rotorcraft parasite drag; Proceedings of the Thirty-first Annual National Forum, Washington, D.C., May 14, 15, 1975 A75-37593
Rotorcraft low-speed download drag definition and its reduction A75-37595
The relationship between rotorcraft drag and stability and control A75-37597
Prediction of rotorcraft drag A75-37598
Helicopter parasite drag bibliography A75-37601

ROTORS
Potential flow about three dimensional streamlined lifting configurations, with application to wings and rotors [AD-A003697] N75-26979

RUNWAYS
Wet runway aircraft control project F-4 rain tire project [AD-A004768] N75-25896

S

SAFETY DEVICES
Shoulder harness and lap belt restraint system [NASA-CASE-ARC-10519-2] N75-25915
FAA lightning protection study: Lightning protection for status and control lines of AN/GRN-27(V) instrument landing system [AD-A006997] N75-25967
B-1 unique signal train generation application study [AD-A003682] N75-26994

SUBJECT INDEX

STREAMLINED BODIES

- SANDWICH STRUCTURES**
New structural form of sandwich core
A75-38576
- SATELLITE NAVIGATION SYSTEMS**
Experimental Omega four frequency format extends
lane ambiguity --- global search and rescue system
A75-36954
- SEAT BELTS**
Shoulder harness and lap belt restraint system
[NASA-CASE-ARC-10519-2] N75-25915
- SELF OSCILLATION**
Investigation of self-oscillations of an autopilot
mount
A75-38144
- SEPARATED FLOW**
Flow separation from yawed delta wings
A75-36288
Viscous interaction with separation in transonic
flow
[ONERA, TP NO. 1975-15] A75-37897
Laminar separation at a trailing edge
[ONERA, TP NO. 1975-13] A75-37899
A comprehensive plan for helicopter drag reduction
A75-38356
Experimental studies of flow separation and
stalling on a two-dimensional airfoil at low
speeds
[NASA-CR-2560] N75-26970
- SEQUENTIAL CONTROL**
Sequential attack in aerial combat
[AD-A004796] N75-25929
- SERVICE LIFE**
Effect of helicopter drag reduction on rotor
dynamic loads and blade life
A75-38354
- SHEAR FLOW**
Uniform shear flow within rectangular
parallel-walled diffusers
[ASME PAPER 75-F-34] A75-36896
- SHOCK LAYERS**
Analytic investigation of hypersonic flow around
blunt bodies
A75-36163
- SHOCK WAVE INTERACTION**
Viscous interaction with separation in transonic
flow
[ONERA, TP NO. 1975-15] A75-37897
Reflection of a shock wave from a wedge
A75-38375
- SHOCK WAVE PROPAGATION**
The resistance of bodies of revolution at
transonic flow velocities
A75-35968
Hypersonic flow past V-shaped conical wings
A75-38406
- SHOCK WAVES**
A study of the flow around plane and axially
symmetrical bodies with a separated shock wave
by a flow at low supersonic speed
[AD-A004442] N75-25887
- SHORT TAKEOFF AIRCRAFT**
A second generation turbo-prop power plant
[SAE PAPER 750536] A75-36673
Recent development and experience of an all
fiberglass RP undercarriage for a STOL-aircraft
A75-37311
A STOL airworthiness investigation using a
simulation of an augmentor wing transport.
Volume 2: Simulation data and analysis
[NASA-TM-X-62396] N75-25917
Exploratory flight investigation of aircraft
response to the wing vortex wake generated by
the augmentor wing jet STOL research aircraft
[NASA-TM-X-62387] N75-26980
Three methods of presenting flight vector
information in a head-up display during
simulated STOL approaches
[NASA-TM-X-3273] N75-26996
The effects of aircraft design on STOL ride quality
[NASA-CR-143113] N75-27001
Acoustic characteristics of a large scale
wind-tunnel model of a jet flap aircraft
[NASA-TM-X-3263] N75-27008
- SIDESLIP**
An investigation of the departure modes of a P-4D
aircraft from a steady sideslip flight condition
[AD-A004795] N75-25928
- SIGNAL PROCESSING**
Hand held calculator technology applied to an
advanced Omega receiver
A75-36957
Binary processing and display concepts for
low-cost Omega receivers --- airborne systems
simulation
A75-36969
Digital phase processing for low-cost Omega
receivers
A75-36970
- SIGNAL TO NOISE RATIOS**
Omega signal coverage prediction
A75-36952
- SIGNAL TRANSMISSION**
Omega signal coverage prediction
A75-36952
- SLENDER BODIES**
Turbulent wake behind slender bodies, including
self-propelled configurations
N75-25866
- SLENDER WINGS**
Flow separation from yawed delta wings
A75-36288
Near-field supersonic flow pattern of slender
delta wings
A75-37182
- SLIDING FRICTION**
Friction and wear of carbon-graphite materials for
high energy brakes
[NASA-TN-D-8006] N75-26137
- SOLID LUBRICANTS**
Ceramic airframe bearings --- solid lubricant
selection tests
[ASLE PREPRINT 75AM-7A-3] A75-37096
Some practical considerations found in the use of
solid film lubricants in aircraft systems
A75-38122
- SOLID STATE DEVICES**
Influence of solid state electrical distribution
on aircraft power generation solid state power
controller compatibility --- use on B-1 aircraft
[AD-A003834] N75-26273
- SONIC BOOMS**
Instrumentation for measuring aircraft noise and
sonic boom
[NASA-CASE-LAR-11476-1] N75-27334
- SPECTRUM ANALYSIS**
Hybrid nonstationary noise simulator of the
aircraft overflight type
[ONERA, TP NO. 1975-46] A75-37905
- SPEED CONTROL**
Ducted propulsors - Progress in the United Kingdom
[SAE PAPER 750534] A75-36671
- SPIKE POTENTIALS**
Spike, relays and aircraft electric systems
A75-38726
- SPOILERS**
Wind tunnel and flight development of spoilers for
general aviation aircraft
[SAE PAPER 750523] A75-36663
Aerodynamic spoiler for preventing airplane
stall/spin type accidents
[AD-A006995] N75-25894
- SPRINGS (ELASTIC)**
Flutter of a panel supported on an elastic
foundation
A75-36245
- STATIC STABILITY**
Static stability and aperiodic divergence --- in
longitudinal flight
A75-38579
- STATISTICAL ANALYSIS**
Annual review of aircraft accident data, US
general aviation, calendar year 1972
[PB-239608/3] N75-26988
- STEAM TURBINES**
A non-polluting powerplant for large airships
[AIAA PAPER 75-927] A75-37005
- STRATOSPHERE**
High-altitude aircraft and the stratosphere
[JPRS-65171] N75-27590
- STREAMLINED BODIES**
Potential flow about three-dimensional streamlined
lifting configurations, with application to
wings and rotors
N75-25867

STRUCTURAL ANALYSIS

SUBJECT INDEX

Potential flow about three dimensional streamlined lifting configurations, with application to wings and rotors
[AD-A003697] N75-26979

STRUCTURAL ANALYSIS
Application of finite element analysis to ceramic components
[ACS PAPER 30-BC-73P] A75-35896
Technical diagnostics in aircraft maintenance A75-36848

Analysis of the effects on life of leading-edge holes in an airfoil subjected to arbitrary spanwise and chordwise temperature distributions --- structural analysis
[NASA-TM-X-3257] N75-27421

STRUCTURAL DESIGN
The Shell natural gas airship, and other L.T.A. activities by Aerospace Developments
[AIAA PAPER 75-932] A75-37008
Structural design of a High-Altitude Superpressure Powered Aerostat
[AIAA PAPER 75-933] A75-37009
Composite box beam optimization program A75-37308
Intuitive design --- applied to aircraft structural design A75-37425
New structural form of sandwich core A75-38576
Preliminary design of wings. Volume 4. Minimum weight design of composite structure
[AD-A003667] N75-25919
Preliminary design of wings. Volume 1: Design philosophy
[AD-A003649] N75-27002
Preliminary design of wings. Volume 2: Preliminary fatigue design
[AD-A003650] N75-27003
Preliminary design of wings. Volume 3: Minimum weight design of stiffened plate
[AD-A003651] N75-27004

STRUCTURAL ENGINEERING
Preliminary design of wings. Volume 4. Minimum weight design of composite structure
[AD-A003667] N75-25919

STRUCTURAL RELIABILITY
The concept of trustworthiness in the safety of structures --- weight-optimal aircraft structural design A75-37799

STRUCTURAL WEIGHT
Prediction of rotorcraft drag A75-37598

SUBSONIC FLOW
Comparison of wind tunnel test results at free stream Mach 0.7 with results from the Boeing TEA-230 subsonic flow method --- wing flow method tests
[NASA-CR-2554] N75-26976

SUBSONIC SPEED
New directions in aircraft propulsor noise research
[SAE PAPER 750515] A75-36657

SUDDEN IONOSPHERIC DISTURBANCES
Blunders caused by Omega propagation - SPA's and PCA's --- Sudden Phase Anomalies and Polar Cap Absorption A75-36972

SUPERCRITICAL WINGS
Two dimensional, inviscid, transonic flowfield around a profile A75-37424
Detailed transonic flow field measurements about a supercritical airfoil section
[NASA-TM-X-3244] N75-26975

SUPERSONIC AIRCRAFT
Engine/airframe compatibility studies for supersonic cruise aircraft
[NASA-CR-132610-1] N75-25916
High-altitude aircraft and the stratosphere
[JPRS-65171] N75-27590

SUPERSONIC AIRFOILS
Supersonic lifting-surface computer program for cruciform wing-body combinations
[AD-A003925] N75-26978

SUPERSONIC FLOW
Parabolic wing, resembling a wedge, in supersonic flow A75-36165

Near-field supersonic flow pattern of slender delta wings A75-37182
Reflection of a shock wave from a wedge A75-38375
Integral method for calculating a detached stream behind a body in a supersonic flow A75-38407
A study of the flow around plane and axially symmetrical bodies with a separated shock wave by a flow at low supersonic speed
[AD-A004442] N75-25887

SUPERSONIC SPEEDS
The supersonic rotor --- for helicopters A75-38346

SURFACE GEOMETRY
A three-dimensional method for the calculation of flow in turbomachines using finite elements on a blade-to-blade surface of revolution --- Book A75-36899

SURFACE ROUGHNESS
A computer program for fitting smooth surfaces to an aircraft configuration and other three dimensional geometries
[NASA-TM-X-3206] N75-26693

SURVEILLANCE
Experimental Omega four frequency format extends lane ambiguity --- global search and rescue system A75-36954

SURVEILLANCE RADAR
Awacs - Boeing's radar patroller A75-36765

SWEEP FORWARD WINGS
Handling and performance characteristics of swept-forward flying wing aircraft
[SAE PAPER 750548] A75-36679

SWINGBY TECHNIQUE
The measurement of the Boeing 707 trailing vortex system using the tower fly-by technique
[AD-A008384] N75-25868

SYNOPTIC MEASUREMENT
Omega signal coverage prediction A75-36952

SYSTEM EFFECTIVENESS
Omega navigation systems specification and performance measurement A75-36956
An evaluation of differential Omega for general aviation area navigation A75-36960

SYSTEMS ANALYSIS
Some system considerations for MLS airborne processors A75-36366

SYSTEMS ENGINEERING
Development of navigation systems for advanced commercial transports A75-36368
The promise of air safety --- collision avoidance systems A75-36401
Alternative approaches to integrated airborne OMEGA/Inertial navigation A75-36962
Airborne Omega navigation system integration and test A75-36963
Synthesis of disturbance-rejection controllers for linear multivariable continuous-time systems --- application to hovering helicopter A75-37409
Looping in a hydrogen cooling system A75-38370
Spike, relays and aircraft electric systems A75-38726

SYSTEMS STABILITY
Aircraft hydraulic system pressure regulator stability A75-38076

T

TAIL ASSEMBLIES
Summary of antitorque devices other than tail rotors A75-38344

TAILLESS AIRCRAFT
Handling and performance characteristics of swept-forward flying wing aircraft
[SAE PAPER 750548] A75-36679

TRANSONIC WIND TUNNELS

SUBJECT INDEX

- Detailed transonic flow field measurements about a supercritical airfoil section
[NASA-TM-X-3244] N75-26975
- TRANSONIC WIND TUNNELS**
- Viscous interaction with separation in transonic flow
[ONERA, TP NO. 1975-15] A75-37897
- TRANSPORT AIRCRAFT**
- Development of navigation systems for advanced commercial transports A75-36368
- European industry and civil air transport /28th Louis Bleriot Lecture/
A75-36718
- UTTAS --- YUG-61A and YUH-60A competition for Utility Tactical Transport Aircraft System
A75-38668
- A method for predicting acoustically induced vibration in transport aircraft, appendix
[AD-A004215] N75-25883
- TRANSPORT VEHICLES**
- A strategy for getting LTA systems airborne
[AIAA PAPER 75-949] A75-37020
- TURBINE BLADES**
- Application of finite element analysis to ceramic components
[ACS PAPER 30-BC-73F] A75-35896
- Corrosion resistance of gas turbine blades tested in a high-temperature gas flow
A75-36040
- Optimizing aircraft gas turbine blade air cooling systems. II Thermodynamic analysis
A75-38067
- TURBINE ENGINES**
- Anatomy of the helicopter. II - Engine and transmission ratings
A75-37299
- TURBOCOMPRESSORS**
- Design estimate of cascade performance
A75-36291
- Transonic flow around rotor blade elements
[ASME PAPER 75-PE-24] A75-36890
- Experimental study of the influence of large blade aspect ratios on axial compressor stage aerodynamic characteristics
A75-38064
- Interim prediction method for fan and compressor source noise
[NASA-TM-X-71763] N75-25948
- TURBOFAN ENGINES**
- Thrust reversers for the TPE-731 turbofan
[SAE PAPER 750506] A75-36652
- Analysis of characteristics of bypass turbojet engines with small gas turbine engines in the outer flow
A75-38075
- TURBOPANS**
- Turbopan compressor dynamics during afterburner transients
[NASA-TM-X-71741] N75-25944
- Interim prediction method for fan and compressor source noise
[NASA-TM-X-71763] N75-25948
- TURBOMACHINE BLADES**
- A three-dimensional method for the calculation of flow in turbomachines using finite elements on a blade-to-blade surface of revolution --- Book
A75-36899
- Possibilities concerning a use of borescope inspection methods in nondestructive material testing and the significance of these methods
A75-38629
- TURBOMACHINERY**
- On the investigation of cascade and turbomachinery rotor wake characteristics
[AD-A003580] N75-26323
- TURBOPROP ENGINES**
- A second generation turbo-prop power plant
[SAE PAPER 750536] A75-36673
- TURBULENCE EFFECTS**
- Theory of air frame noise
A75-37538
- TURBULENT BOUNDARY LAYER**
- Uniform shear flow within rectangular parallel-walled diffusers
[ASME PAPER 75-PE-34] A75-36896
- Viscous interaction with separation in transonic flow
[ONERA, TP NO. 1975-15] A75-37897
- Turbulent near wake of a flat plate. II - Effects of boundary layer profile and compressibility
A75-38618
- TURBULENT FLOW**
- Performance of three vaned radial diffusers with swirling transonic flow
[ASME PAPER 75-PE-19] A75-36888
- Hypersonic flow past V-shaped conical wings
A75-38406
- Problems of flight in turbulence
[NASA-TT-P-16401] N75-26977
- TURBULENT JETS**
- Structure of turbulent jets and wakes
A75-36236
- TURBULENT WAKES**
- Structure of turbulent jets and wakes
A75-36236
- Aircraft wake turbulence minimization by aerodynamic means
A75-37450
- Integral method for calculating a detached stream behind a body in a supersonic flow
A75-38407
- Turbulent near wake of a flat plate. II - Effects of boundary layer profile and compressibility
A75-38618
- Investigation of the turbulent properties of the wake behind self propelled, axisymmetric bodies
N75-25865
- Turbulent wake behind slender bodies, including self-propelled configurations
N75-25866
- On the investigation of cascade and turbomachinery rotor wake characteristics
[AD-A003580] N75-26323
- TURNING FLIGHT**
- Stability analysis of an F-4C aircraft in steady level turning flight
[AD-A004797] N75-25963
- TWO DIMENSIONAL BODIES**
- A state-of-the-art survey of two-dimensional airfoil data
A75-38348
- Experimental studies of flow separation and stalling on a two-dimensional airfoil at low speeds
[NASA-CR-2560] N75-26970
- TWO DIMENSIONAL FLOW**
- Structure of turbulent jets and wakes
A75-36236
- Two dimensional, inviscid, transonic flowfield around a profile
A75-37424
- Calculation of flow field around air intake operating at zero forward speed by the distributed source-sink method /2-D case/
A75-38077
- Mechanism of generating a normal force by a beat of the wings
A75-38136
- Numerical solution of the Navier-Stokes equations for arbitrary two-dimensional multi-element airfoils
[NASA-CR-143038] N75-25874

U

UH-1 HELICOPTER

- Application of high frequency resonance techniques for bearing diagnostics in helicopter gearboxes
[AD-A004014] N75-25936

UNDERCARRIAGES

- Recent development and experience of an all fiberglass RP undercarriage for a STOL-aircraft
A75-37311

UNIFORM FLOW

- Uniform shear flow within rectangular parallel-walled diffusers
[ASME PAPER 75-PE-34] A75-36896

UNSTEADY FLOW

- Mechanism of generating a normal force by a beat of the wings
A75-38136

USER MANUALS (COMPUTER PROGRAMS)

- A computer program for fitting smooth surfaces to an aircraft configuration and other three dimensional geometries
[NASA-TM-X-3206] N75-26693

SUBJECT INDEX

WING FLOW METHOD TESTS

- UTILITY AIRCRAFT**
 UTTAS --- YUG-61A and YUH-60A competition for Utility Tactical Transport Aircraft System A75-38668
 Guardrail IIA RU-21H evaluation [AD-A004009] N75-25923
- V**
- VEHICLE WHEELS**
 Design of aircraft wheels and brake systems [NASA-TT-P-15764] N75-25918
- VERTICAL TAKEOFF AIRCRAFT**
 Experimental mating of trapped vortex diffusers with large area ratio thrust augmentors [AD-A004802] N75-25885
- VERY LOW FREQUENCIES**
 Commercial developments in airborne VLP navigation [SAE PAPER 750518] A75-36660
- VISCOUS FLUIDS**
 Viscous interaction with separation in transonic flow [ONERA, TP NO. 1975-15] A75-37897
- VORTEX BREAKDOWN**
 Flame stabilization by leading edge vortex breakdown above a delta shape A75-37063
- VORTEX GENERATORS**
 Some ideas of vortex lift [SAE PAPER 750547] A75-36676
- VORTEX INJECTORS**
 Summary of results indicating the beneficial effects of rotor vortex modification A75-38345
- VORTEX SHEETS**
 Flow separation from yawed delta wings A75-36288
 The measurement of the Boeing 707 trailing vortex system using the tower fly-by technique [AD-A008384] N75-25868
- VORTICES**
 Laminar boundary layer in symmetry plane of blunt-nosed body A75-36241
 Performance of three vaned radial diffusers with swirling transonic flow [ASME PAPER 75-PE-19] A75-36888
 Acoustic effects of rotor-wake interaction during low-power descent A75-38347
 Aerodynamic effects of vortex suppressors [AD-A003750] N75-25875
 Effect of inlet ingestion of a wing tip vortex on compressor face flow and turbojet stall margin [NASA-TM-X-3246] N75-26968
- W**
- WARFARE**
 The effect of roll rate on air combat [AD-A004794] N75-25930
- WARNING SYSTEMS**
 The promise of air safety --- collision avoidance systems A75-36401
- WAVE REFLECTION**
 Reflection of a shock wave from a wedge A75-38375
- WEAPON SYSTEMS**
 On-board test and monitoring of advanced weapon systems A75-37644
 Terrain following evaluation simulation --- B-1 aircraft avionics A75-37647
 Performance comparison of space stable and local level inertial platform mechanizations for a strategic aircraft application A75-37703
 The application of displays in navigation/attack systems N75-26780
 Aircraft design implications of opto-electronic systems N75-26787
- WEAR TESTS**
 Ceramic airframe bearings --- solid lubricant selection tests [ASLE PREPRINT 75AM-7A-3] A75-37096
- Friction and wear of carbon-graphite materials for high energy brakes [NASA-TN-D-8006] N75-26137
- WEDGE FLOW**
 Heat exchange in the hypersonic flow of a rarefied gas past a blunt wedge A75-35943
 Parabolic wing, resembling a wedge, in supersonic flow A75-36165
 Reflection of a shock wave from a wedge A75-38375
- WEDGES**
 Evaluation of a wedge on a force balance as a flow angle probe [AD-A004765] N75-27021
- WEIGHT ANALYSIS**
 Cost benefit evaluation of helicopter parasite drag reductions A75-38355
- WEIGHT REDUCTION**
 Graphite composite materials applications in aircraft structures [SAE PAPER 750533] A75-36670
 Evaluation of the overall fuel mass penalty of an aircraft system A75-36720
 The concept of trustworthiness in the safety of structures --- weight-optimal aircraft structural design A75-37799
 Experimental study of the influence of large blade aspect ratios on axial compressor stage aerodynamic characteristics A75-38064
 Preliminary design of wings. Volume 3: Minimum weight design of stiffened plate [AD-A003651] N75-27004
- WIND TUNNEL APPARATUS**
 Investigation of a four-stage ejector for a hypersonic wind tunnel A75-36100
- WIND TUNNEL MODELS**
 Measurements on an isolated wing, using an aeroelastic model A75-37824
 Acoustic characteristics of a large scale wind-tunnel model of a jet flap aircraft [NASA-TM-X-3263] N75-27008
- WIND TUNNEL NOZZLES**
 Investigation of a four-stage ejector for a hypersonic wind tunnel A75-36100
- WIND TUNNEL STABILITY TESTS**
 Comparison of wind tunnel test results at free stream Mach 0.7 with results from the Boeing TEA-230 subsonic flow method --- wing flow method tests [NASA-CR-2554] N75-26976
- WIND TUNNEL TESTS**
 Wind tunnel and flight development of spoilers for general aviation aircraft [SAE PAPER 750523] A75-36663
 A method for correlating wind tunnel experiments with potential flow theory A75-37600
 A state-of-the-art survey of two-dimensional airfoil data A75-38348
 A tunnel spanning airfoil testing technique A75-38350
 Wind tunnel measurements of forward speed effects on jet noise from suppressor nozzles and comparison with flight test data [NASA-TM-X-62449] N75-25946
- WINDOWS (APERTURES)**
 Performance of a sliding window detector in a high-interference air traffic environment A75-37136
- WING FLAPS**
 Radiated noise from an externally blown flap [NASA-TN-D-7908] N75-27855
- WING FLOW METHOD TESTS**
 Comparison of wind tunnel test results at free stream Mach 0.7 with results from the Boeing TEA-230 subsonic flow method --- wing flow method tests [NASA-CR-2554] N75-26976

WING LOADING**SUBJECT INDEX**

- WING LOADING**
Composite box beam optimization program A75-37308
- WING OSCILLATIONS**
Flutter of a wing with nonlinear elastic characteristic A75-36194
Measurements on an isolated wing, using an aeroelastic model A75-37824
- WING PANELS**
Design fabrication and test of an F-14 composite overwing fairing A75-37310
- WING PROFILES**
Flow about a conic wing and the optimal configuration of the wing at hypersonic velocities A75-36099
Parabolic wing, resembling a wedge, in supersonic flow A75-36165
Hypersonic flow past V-shaped conical wings A75-38406
- WING TIPS**
Wing-Tip-Winglet propulsion for Aerocrane-type hybrid lift vehicles [AIAA PAPER 75-944] A75-37017
Aerodynamic effects of vortex suppressors [AD-A003750] N75-25875
Effect of inlet ingestion of a wing tip vortex on compressor face flow and turbojet stall margin [NASA-TM-X-3246] N75-26968
- WINGED VEHICLES**
Wing-Tip-Winglet propulsion for Aerocrane-type hybrid lift vehicles [AIAA PAPER 75-944] A75-37017
- WINGS**
Mechanism of generating a normal force by a beat of the wings A75-38136
Preliminary design of wings. Volume 4. Minimum weight design of composite structure [AD-A003667] N75-25919
Potential flow about three dimensional streamlined lifting configurations, with application to wings and rotors [AD-A003697] N75-26979
Preliminary design of wings. Volume 1: Design philosophy [AD-A003649] N75-27002
Preliminary design of wings. Volume 2: Preliminary fatigue design [AD-A003650] N75-27003
Preliminary design of wings. Volume 3: Minimum weight design of stiffened plate [AD-A003651] N75-27004
- WROUGHT ALLOYS**
Specific properties of high-strength and heat-resistant wrought aluminum alloys and the consideration of these properties in the maintenance of aircraft. II A75-36850

Y

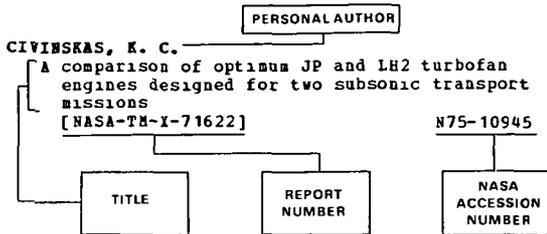

- YAK 40 AIRCRAFT**
Cockpit-system study YAK 40. A pilot opinion survey to the aircraft handling and system qualities [DLR-PB-75-15] N75-25961
- YAW**
Flow separation from yawed delta wings A75-36288

PERSONAL AUTHOR INDEX

AERONAUTICAL ENGINEERING /A Special Bibliography (Suppl 62)

OCTOBER 1975

Typical Personal Author Index Listing

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g. NASA report translation NASA contractor report). The accession number is located beneath and to the right of the title e.g. N75 10945. Under any one author's name the accession numbers are arranged in sequence with the AA accession numbers appearing first.

A

- ABELIN, R.**
Recent development and experience of an all fiberglass RP undercarriage for a STOL-aircraft
A75-37311
- ABOLD, P. L.**
Design of a deployable wing glider
[AD-A004800] N75-25932
- ADAIR, J. B.**
Inventory of freight transportation in the Southwest. Part 3: Air freight service in the Dallas-Port Worth area
[PB-239820/4] N75-26987
- ADAMS, G. R.**
Full authority electronic control application to military gas turbine engines
A75-37646
- AHNERT, L.**
Specific properties of high-strength and heat-resistant wrought aluminum alloys and the consideration of these properties in the maintenance of aircraft. II
A75-36850
- AIKEN, T. N.**
Acoustic characteristics of a large scale wind-tunnel model of a jet flap aircraft
[NASA-TM-X-3263] N75-27008
- AKSENOV, I. U. P.**
Investigation of a four-stage ejector for a hypersonic wind tunnel
A75-36100
- ALAG, G.**
Digital adaptive flight control design using single stage model following indices
A75-37135
- ALLEY, V. L., JR.**
Structural materials research for lighter-than-air systems
[AIAA PAPER 75-935] A75-37010
- ANDREASSON, B.**
Recent development and experience of an all fiberglass RP undercarriage for a STOL-aircraft
A75-37311
- ANIUTIN, A. N.**
Experimental study of the influence of large blade aspect ratios on axial compressor stage aerodynamic characteristics
A75-38064
- AOYAGI, K.**
Acoustic characteristics of a large scale wind-tunnel model of a jet flap aircraft
[NASA-TM-X-3263] N75-27008

- ARBIB, H. A.**
A parametric evaluation of the performance of the bypass jet engine
A75-37423
- ARIGA, I.**
Uniform shear flow within rectangular parallel-walled diffusers
[ASME PAPER 75-PE-34] A75-36896
- ATENCIO, A., JR.**
Wind tunnel measurements of forward speed effects on jet noise from suppressor nozzles and comparison with flight test data
[NASA-TM-X-62449] N75-25946

B

- BABICHEV, A. V.**
Fuel for compression micromotors
[NASA-TT-P-16446] N75-26149
- BADBLEY, R. H.**
Application of high frequency resonance techniques for bearing diagnostics in helicopter gearboxes
[AD-A004014] N75-25936
- BAGHDADI, S.**
Performance of three vaned radial diffusers with swirling transonic flow
[ASME PAPER 75-PE-19] A75-36888
- BAKER, A. H.**
A fuselage/tank structure study for actively cooled hypersonic cruise vehicles: Structural analysis
[NASA-CR-132670] N75-26999
- BAKER, A. J.**
The finite element method in low speed aerodynamics
[NASA-CR-143190] N75-26972
- BALCERAK, J. C.**
Summary of results indicating the beneficial effects of rotor vortex modification
A75-38345
- BALL, R. E.**
Aircraft fuel tank vulnerability to hydraulic ram: Modification of the Northrop finite element computer code BR-1 to include fluid-structure interaction: Theory and users manual for BR-1 HR
[AD-A003471] N75-25922
- BALTZER, O. J.**
Omega navigation systems specification and performance measurement
A75-36956
- BANDETTINI, A.**
Detailed transonic flow field measurements about a supercritical airfoil section
[NASA-TM-X-3244] N75-26975
- BARTEL, R. W.**
A method for predicting acoustically induced vibration in transport aircraft, appendix
[AD-A004215] N75-25883
- BATTEN, D.**
The use of computers in flight testing
A75-37779
- BAKA, E. G., JR.**
Recent results on parametric analysis of differential Omega error
A75-36959
- On observations of modal interference of the North Dakota Omega transmission**
A75-36971
- BAZILL, D. G.**
Flight control actuator system development
[AD-A004853] N75-25962
- BEAVERS, A. W., JR.**
Evaluation of real-time algorithms for Omega propagation prediction
A75-36973

- BELOTSERKOVSKII, S. M.
Mechanism of generating a normal force by a beat
of the wings
A75-38136
- BENEKE, J.
Some system considerations for MLS airborne
processors
A75-36366
- BENNETT, R. L.
Application of rotorcraft flight simulation
program (C81) to predict rotor performance and
bending moments for a model four-bladed
articulated rotor system
[AD-A004015] N75-25934
Digital computer program DP1758 fully coupled
natural frequencies and mode shapes of a
helicopter rotor blade
[NASA-CR-132662] N75-26973
- BENSON, T. P.
Guardrail IIA RU-21H evaluation
[AD-A004009] N75-25923
- BERDNIKOV, V. V.
Aircraft hydraulic system pressure regulator
stability
A75-38076
- BERGESON, J. E.
Performance comparison of space stable and local
level inertial platform mechanizations for a
strategic aircraft application
A75-37703
- BILL, R. C.
Friction and wear of carbon-graphite materials for
high energy brakes
[NASA-TN-D-8006] N75-26137
- BINGHAM, G. J.
An analytical and experimental evaluation of
airfoil sections for helicopter rotor application
A75-38349
- BLACK, D. F.
A second generation turbo-prop power plant
[SAE PAPER 750536] A75-36673
- BLANCHARD, W. S., JR.
High lift aircraft
[NASA-CASE-LAR-11252-1] N75-25914
- BOGOMOLOV, E. N.
Optimizing aircraft gas turbine blade air cooling
systems. II Thermodynamic analysis
A75-38067
- BOHNING, O. D.
Investigation of system integration methods for
bubble domain flight recorders
[NASA-CR-132643] N75-26336
- BORTNIKOV, L. N.
Calculation of flow field around air intake
operating at zero forward speed by the
distributed source-sink method /2-D case/
A75-38077
- BORTZ, J. E., SR.
Omega signal coverage prediction
A75-36952
- BRADSHAW, A.
Synthesis of disturbance-rejection controllers for
linear multivariable continuous-time systems
A75-37409
- BRADSHAW, E. S.
A comprehensive experimental program for
investigation of various Omega operational modes
with selected data analysis results
A75-36955
- BREHMER, L.
Technical diagnostics in aircraft maintenance
A75-36848
- BREWER, L. K.
Guardrail IIA RU-21H evaluation
[AD-A004009] N75-25923
- BRINDLEY, A. E.
Analysis, test and evaluation support to the USAF
advanced landing system program. Volume 1:
Program description and results
[AD-A004419] N75-27223
Analysis, test and evaluation support to the USAF
advanced landing system program. Volume 2:
Index of approaches
[AD-A004420] N75-27224
Analysis, test and evaluation support to the USAF
advanced landing system program. Volume 3,
Part 1: Doppler MLS guidance error data (DOTS
tracking system)

CONTRACT NUMBER INDEX

Typical Contract Number Index Listing

Listings in this index are arranged alphanumerically by contract number. Under each contract number the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the IAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the IAA or STAR section.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA distributes its technical documents and bibliographic tools to ten special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA

University of California, Berkeley

COLORADO

University of Colorado, Boulder

DISTRICT OF COLUMBIA

Library of Congress

GEORGIA

Georgia Institute of Technology, Atlanta

ILLINOIS

The John Crerar Library, Chicago

MASSACHUSETTS

Massachusetts Institute of Technology, Cambridge

MISSOURI

Linda Hall Library, Kansas City

NEW YORK

Columbia University, New York

PENNSYLVANIA

Carnegie Library of Pittsburgh

WASHINGTON

University of Washington, Seattle

NASA publications (those indicated by an "*" following the accession number) are also received by the following public and free libraries:

CALIFORNIA

Los Angeles Public Library

San Diego Public Library

COLORADO

Denver Public Library

CONNECTICUT

Hartford Public Library

MARYLAND

Enoch Pratt Free Library, Baltimore

MASSACHUSETTS

Boston Public Library

MICHIGAN

Detroit Public Library

MINNESOTA

Minneapolis Public Library

MISSOURI

Kansas City Public Library

St. Louis Public Library

NEW JERSEY

Trenton Public Library

NEW YORK

Brooklyn Public Library

Buffalo and Erie County Public Library

Rochester Public Library

New York Public Library

OHIO

Akron Public Library

Cincinnati Public Library

Cleveland Public Library

Dayton Public Library

Toledo Public Library

OKLAHOMA

Oklahoma County Libraries, Oklahoma City

TENNESSEE

Memphis Public Library

TEXAS

Dallas Public Library

Fort Worth Public Library

WASHINGTON

Seattle Public Library

WISCONSIN

Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 750 Third Avenue, New York, New York, 10017.

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "*" and "**", from ESRO/ELDO Space Documentation Service, European Space Research Organization, 114, av. Charles de Gaulle, 92-Neuilly-sur-Seine, France.
