2.0 INTRODUCTION

The digital program TBAP has been developed to provide thermal boundaries in the D/M-relative velocity (D-V), dynamic pressure-relative velocity (q-V), and altitude-relative velocity (h-V) planes. These thermal boundaries are used to design and/or analyze Shuttle Orbiter entry trajectories. The TBAP has been used extensively in supporting the Flight Performance Branch of the NASA in evaluating candidate trajectories for the Thermal Protection System design trajectory.
3.0 DISCUSSION

The method used in TBAP to establish thermal boundaries is to find a reference heat rate for a given velocity and altitude, input the reference heat rate into a simplified heating model resulting in the definition of the surface temperature for a selected panel or control point and then iterate on altitude until the panel temperature matches the critical temperature input for that panel. D/M and dynamic pressure are then found corresponding to the altitude-velocity point. This process is then repeated for a different velocity until the desired range of velocities is spanned.

The assumptions made in developing TBAP are that simplified heating models (References 1 and 2) can be used to determine surface temperature and that atmospheric density and free stream temperature can be modeled using the 1962 Standard Atmosphere.

The reference heat rate for the panels and control points as given in Reference 1 is

\[ q_{ref} = 0.82 \times 17700 \sqrt{\rho} \left( \frac{V}{10^4} \right)^3 \times 0.07 \left( 1 - \frac{h_w}{h_o} \right) \]  

(1)

where

\[ q = \text{stagnation point heat rate for a one foot sphere (BTU/ft}^2/\text{sec}), \]
\[ \rho = \text{free stream density (slugs/ft}^3) \]
The individual panel or control point heat rate (Reference 1 and 2) for laminar, transitional and turbulent flow are defined by

\[ q_{\text{panel}} = q_i(\text{lam}) \]

for \( P < R_{oi} \),

\[ q_{\text{panel}} = q_i(\text{trans}) = q_i(\text{lam}) \left( \frac{\alpha R - b}{b'_{oi}} \right)^3, \text{ for } R_{oi} \leq R \leq KR_{oi}, \]

and

\[ q_{\text{panel}} = q_i(\text{turb}) = q_i(\text{lam}) \left( \frac{R}{K_{poi}} \right)^3, \text{ for } KR_{oi} < R, \]

where \( \Lambda_i \) = deflection factor,

\[ C_i = \frac{q_i(\text{lam})}{q_{\text{ref}}}, \text{ for the } i^{th} \text{ panel} \]

= function of angle of attack, \( \alpha \),
\[ R = \text{Reynolds number behind a normal shock} \]
\[ = \frac{\rho V}{\mu_v} \]
\[ R_{0i} = \text{transition onset Reynolds number for the } i\text{th panel,} \]
\[ = \text{function of } \alpha, \]
and \( \mu_v \) = normal shock viscosity coefficient and \( a, b, c, \) and \( K \) are modeling constants. The deflection factor, \( \Delta_i \), (Equation (5)) equals one for surfaces not on the elevon or body flap and
\[ \Delta_i = 1.05 + (9.8 - \alpha) \Gamma \]
where \( \alpha = \text{angle of attack (degrees)} \)
\[ \Gamma = 0.01966 - 0.0122, \text{ for } 0 \leq \delta \leq 4 \]
\[ \Gamma = 0.02766 - 0.0443, \text{ for } 4 < \delta \leq 8 \]
\[ \Gamma = 0.036768 - 0.11758, \text{ for } 8 < \delta \leq 15' \]
\[ \Gamma = 0.046698 - 0.2665, \text{ for } 15 < \delta \]
and \( \delta = \text{deflection angle (body flap or elevon) for surfaces on the body flap or elevon}. \)

\( C_i \) and \( R_{0i} \) are stored in tables in TBAP as functions of \( \alpha \) and interpolated for the appropriate \( \alpha \). \( \mu_v \) is stored in a table as a function of \( V \) and interpolated for the appropriate \( V \). The surface temperature for the \( i\text{th} \) panel as defined in Reference 2 is given by
\[ T_i = 1000 \left( \frac{e_{\text{panel}}}{0.43761 \epsilon_i} \right)^{0.25} - 460 \]
where \( \epsilon_i = \text{surface emissivity for the } i\text{th panel} \).

Using Equations 1 through 9, a regula falsi method is used to solve for
the altitude at which panel temperature is equal to a critical temperature.

That is

\[ h_{i+1} = h_i + \left[ \frac{\Delta h}{\Delta T} \right]_i (T_C - T_i) \]  

(10)

is initialized with an altitude \( h_i \), \( \frac{\Delta h}{\Delta T} \) calculated numerically by

\[ \frac{\Delta h}{\Delta T} = \frac{h_i - h_{i-1}}{T_i - T_{i-1}} \]  

(11)

and an iteration process continued until \( T_i \) converges to \( T_C \) within an input convergence criterion.

The dynamic pressure is defined by

\[ q = \frac{1}{2} \rho V^2. \]  

(12)

In TBAP the free stream density, \( \rho \), and temperature, \( T_\infty \), (Equation 3) are computed using the SVDS (Reference 3) subroutine ATMOS which represents the 1962 Standard atmosphere. The drag acceleration is defined by

\[ \frac{D}{M} = \frac{q C_D S}{m} \]  

(13)

where \( C_D \) = drag coefficient

\( S \) = reference area

and \( m \) = vehicle mass.

\( C_D \) is computed using the SVDS subroutine ARIAC (Reference 3).
### 4.0 INPUT DESCRIPTION

The TBAP input data consists of data from the SVDS base data tape (Reference 3) for an entry run and data for the following variables which are in common arrays.

<table>

5.0 OUTPUT DESCRIPTION

Figure 1 gives an example of the initialization data which is output from TBAP. Table I defines the data in Figure 1.

Figure 2 gives an example of line printer output of thermal boundary data for a given panel from TBAP. Table II defines the data in Figure 2.

Plots of thermal data from TBAP (see Appendix A Figures 3, 4, 5) are presented in the D/H-relative velocity, altitude-relative velocity, and dynamic pressure-relative velocity planes respectively for control point 2 (body flap).

6.0 SUBROUTINE DOCUMENTATION

The following sections define TBAP subroutines. The subroutines ATMOS and AR140C are current SVDS (Reference 3) routines and hence are not documented in this note.

6.1 INTGI2

6.1.1 PURPOSE: INTGI2

Subroutine INTGI2 calls the BAP routine.

6.1.2 INPUT

NBAP Flag determining thermal boundary option

= 0 Does not call TBAP

= 1 Calls TBAP

6.1.3 OUTPUT

None applicable to BAP

6.1.4 ALGORITHM

None applicable to BAP

6.1.5 CALLING SEQUENCE

Call INTGI2

6.1.6 CONSTANT REQUIRED

None required

6.1.7 SUBROUTINE REQUIRED

BAP

Other routines not applicable to BAP

* NOTE: Only the portion of INTGI2 applicable to TRAP is documented in this design note.
The first executable statement is to determine whether to call BAP.

The remainder of subroutine INTG12 is unchanged. (see Reference 3)
6.2 BAP

6.2.1 **PURPOSE**: BAP is the executive routine used to sequence other routines in calculating thermal boundaries.

6.2.2 **INPUT**:

NP  TPS panel or control point number
V  Initial velocity (ft/sec)
VM  Maximum velocity (ft/sec)
DV  Velocity increment (ft/sec)
IALP  Angle-of-attack option flag
   = 0 ramped schedule
   = 1 constant schedule
DT  Temperature convergence criterion (°F)
NC2M  Convergence interval specification

6.2.3 **OUTPUT**:

Input identification labels
QBAR  Dynamic Pressure (lbs/ft²)
MACH  Mach number (ND)
H  Altitude (ft)
DOM  Drag acceleration (ft/sec²)
V  Relative velocity (ft/sec)

Write ENDFILE on UNIT 8

6.2.4 **ALGORITHM**

See flowchart Sec. 6.2.8

6.2.5 **CALLING SEQUENCE**

6.4 HTRATE

6.4.1 PURPOSE: HTRATE

Subroutine HTRATE determines the flow characteristic (laminar, transitional, or turbulence) for a given panel and computes the corresponding heat rate.

6.4.2 INPUT:

- ALPHA: Angle-of-attack (RAD)
- NPANEL: Number of TPS panels and control points
- QDUTC: Stagnation convective heat rate (BTU/ft²-sec)
- IV: Vehicle number
- REY: Reynolds number behind a normal shock
- DELVTR: Angle of deflection (body flap and elevon) (RAD)
- IBAP: Option for TBAP driver
  - = 0 Do not use TBAP driver
  - = 1 Use TBAP driver
- NP: TPS panel or control point number

6.4.3 OUTPUT:

- QDT: Heat rate (BTU/ft²-sec)
- IFS: Flow characteristic
  - = 1 (laminar flow)
  - = 2 (transitional flow)
  - = 3 (turbulence flow)
- REYN: Reynolds number at transition onset

6.4.4 ALGORITHM

See flowchart Sec. 6.4.9

6.4.5 CALLING SEQUENCE

Call HTRATE
6.4 HTRATE

6.4.1 PURPOSE: HTRATE

Subroutine HTRATE determines the flow characteristic (laminar, transitional, or turbulence) for a given panel and computes the corresponding heat rate.

6.4.2 INPUT:

<table>
<thead>
<tr>

7.0 REFERENCES

APPENDIX A

PROGRAM GIP
1.0 GENERATE INPUT PROGRAM (GIP)

GIP is an auxiliary program which accepts a tape of thermal boundaries data from TBAP and plots the thermal boundaries using the TRWPLT (Reference 4) routine. The GIP was written to facilitate the method of inputting data into the TRWPLT routine. An example of the printed output from GIP is given in Figure 1. Examples of thermal boundaries which were plotted using GIP and TRWPLT are presented in Figures 2, 3, and 4.

1.1 PURPOSE:

GIP accepts a data tape from TBAP, processes the data, and outputs calcomp or microfilm plots.

1.2 INPUT:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ICCOMP</td>
<td>Type plot indicator</td>
</tr>
<tr>
<td></td>
<td>= 0 Calcomp</td>
</tr>
<tr>
<td></td>
<td>= 1 Microfilm</td>
</tr>
<tr>
<td>KUNIT</td>
<td>Data tape input unit</td>
</tr>
<tr>
<td>NTRAN</td>
<td>Tape type selector</td>
</tr>
<tr>
<td></td>
<td>= 0 Input data tape was generated using FORTRAN write statements.</td>
</tr>
<tr>
<td></td>
<td>= 1 Input data tape was generated using NTRANS write statements.</td>
</tr>
<tr>
<td>NCIRC</td>
<td>Plot symbol selector</td>
</tr>
<tr>
<td>CIRCINT</td>
<td>Multiplicative factor</td>
</tr>
<tr>
<td>XLABEL1</td>
<td>Independent axis identification</td>
</tr>
<tr>
<td>YLABEL1</td>
<td>Dependent axis identification</td>
</tr>
</tbody>
</table>
1.2 INPUT: (continued)

**TITLE**  
Graph title

**IPNF**  
Total number of files on data tape for a given plot

**JANF**  
Actual file number

**NVAR2**  
Dependent variable

- 2 Altitude (ft/sec)
- 3 Drag acceleration (ft/sec^2)
- 4 Dynamic pressure (lbs/ft^2)

**L**  
Number of cards to specify scale parameters

**M**  
Number of cards to specify axis identification

1.3 OUTPUT:

**ICCOMP**  
Calcomp/microfilm indicator

**KUNIT**  
Data tape input unit

**NTRAN**  
Tape type selector

**NCHAR**  
Plot symbol selector

**CMULT**  
Multiplicative factor

**XLABEL**  
Independent axis identification

**YLABEL**  
Dependent axis identification

**TITLE**  
Plot title

**IPRINT**  
Print indicator

- -1 Print plot titles only
- 0 Suppress print
- 1 Print plot titles and data points
- n Print titles and first n data points (n ≠ 1)

**NOIREC**  
Data tape format indicator

- 0 Tape contains more than one type of record.
- 1 Tape contains only one type of record.
1.3 OUTPUT: (continued)

LINGER
End-of-file frame advance indicator
= 0 Frame or graph will be advanced normally.
= 1 The variables specified by the first PLOT card following the ENDFIL card will be plotted on the current plot.

SKIP
Number of end-of-file marks to forward positioned over

NOADV
Frame advance indicator
= 0 Frame or graph will be advanced normally.
= 1 The variable in the PLOT list will be plotted on the same graph as the previous plots.

PLOT
Specifies variable to be plotted

ENDLST
Plot list termination symbol

ENDPLT
Plot input termination symbol

ENDRUN
Job termination symbol

REWIND
Rewind the input data tape
