Development of the ATLAS integrated structural analysis and design system was initiated by The Boeing Commercial Airplane Company in 1969. Continued development efforts have resulted in the release and application of several extended versions of the system to aerospace and civilian structures. Those capabilities of the current ATLAS version developed under the NASA Langley Contract No. NAS1-12911 include the following: geometry control, thermal stress, fuel generation/management, payload management, loadability curve generation, flutter solution, residual flexibility, strength design of composites, thermal fully stressed design, and interactive graphics. The monitor of this contract was G. L. Giles. The inertia loading capability was developed under the Army Contract No. DAAG46-75-C-0072.

This document is one volume of a series of documents describing the ATLAS System. The remaining documents present details of the program design, the input and execution data, the engineering method used by the computational modules, and system-demonstration problems.

The key responsibilities for development of ATLAS have been within the Integrated Analysis/Design Systems Group of the Structures Research Unit of BCAC and the ATLAS System Group of the BCS Integrated Systems and Systems Technology Unit. R. E. Miller, Jr. was the Program Manager of ATLAS up to 1976 after which K. H. Dickenson assumed this position. The current ATLAS System is the result of the combined efforts of many Boeing engineering and programming personnel. Those who contributed directly to the current version of ATLAS are as follows:

B. F. Backman  H. B. Hansteen  C. D. Mounier
G. N. Bates    B. A. Harrison  F. D. Nelson
L. C. Carpenter J. M. Held   M. C. Redman
R. E. Clemmons M. Y. Hiryama  R. A. Samuel
R. L. Dreibach J. R. Hogley  M. Tamekuni
W. J. Erickson H. E. Huffman  G. von Limbach
S. H. Gadre    D. W. Johnson  S. O. Wahlstrom
F. P. Gray     A. S. Kawaguchi  R. A. Woodward
D. W. Halstead
ABSTRACT

A complete catalog is presented for the Random Access Files used by the ATLAS integrated structural analysis and design system. ATLAS consists of several technical computation modules which output data matrices to corresponding Random Access Files. A description of the matrices written on these files is contained herein.

1.0 INTRODUCTION

ATLAS is an integrated structural analysis and design system operational on the Control Data Corporation (CDC) 6600/CYBER computers in a batch mode or in a time-shared mode via interactive text or graphic terminals. It is a modular system of computer codes with common executive and data-base management components. ATLAS provides an extensive set of general-purpose technical programs with aeroelastic analytical capabilities including stiffness, stress, loads, mass, substructuring, strength design, unsteady aerodynamics, vibration and flutter analyses. A finite-element structural-analysis approach is used wherein the distributed physical properties of the problem are represented by a finite number of idealized elements.

This document presents detailed descriptions of all the matrices written on the system Random Access Files. Documentation of the system architecture and user interfaces are contained in references 1-1 and 1-2.

The descriptions in this document contain seven blocks of information for each matrix. These are:

**File:** This defines the name of the ATLAS random access file on which the matrix resides.

**Index Name:** The matrix index names used in this catalog are shown as a combination of capital and lower case characters. The characters that are capitalized are fixed, whereas, the lower case characters are variable and are defined below.

- **a**: Display code equivalent of the data set number
- **b**: Display code equivalent of the boundary condition stage number
- **bs**: Buckling set number
- **c**: Display code equivalent of the design cycle number
- **ddd**: Subset number
- **eee**: Number of the AICINDX entry for the corresponding AIC matrix
- **ff**: Mass fuel condition number
- **g**: Concentrated mass subset number
- **h**: Mass auxiliary panel subset number
- **i**: Display code equivalent of the aerodynamic case number
- **j**: Display code equivalent of the aerodynamic condition number
- **k**: Display code equivalent of the Mach number index
- **l**: Display code equivalent of the K-value index
- **m**: Display code equivalent of the control surface number
n  Display code equivalent of the mode shape number
p  Display code equivalent of the retention vector set number
pp Mass payload condition number
qqq Mass condition number
rr  Sequential extract number
s  Display code equivalent of the buckling set number
sss Substructure number
t  Weight factor table identification
tt  Fuel tank attitude number
u  Display code equivalent of the flutter change set number
v  Display code equivalent of the flutter altitude identifier
vs Vibration set number
w  Display code equivalent of the flutter record number
xxxx One to seven user specified characters
y  Display code equivalent of the partition number for the matrices on AF10RNF
yy  Display code equivalent of the output K-value index
zz  Display code equivalent of the partition number for the matrices on DUBLRNF
001,002 Matrix block numbers

Following the index name, certain matrices which contain analysis data describing the overall problem are identified as user matrices. The format of these matrices and the user matrices residing on the CHOLRNF, MERGRNF, and MULTRNF random access files are described in reference 1.1.
Type: This represents the SNARK matrix type, REAL, MIXED, NULL, or DIAGONAL.

Dimensions: The row and column dimensions of each matrix are defined here.

Auxiliary ID: This block of information defines the ten words of auxiliary ID stored within the SNARK header. The contents described represent the data stored by the various preprocessors and processors. In addition, when a matrix is saved on the ATLAS save files, the random access file name is stored in Word 1 and the matrix index name is stored in Word 2.

Elements: The contents and format of each data matrix are defined within this block of information.

Generation: This specifies which routine or module generates the described matrix.
**ADDINT_DATA_CASE_CONTROL_MATRIX**

**File:** ADDIRNF

**Index_Name:** xxxxx

**Type:** MIXED

**Dimensions:** (NOUTK+12)*1 where NOUTK is the number of output generalized air force matrices (the number of output K-values)

**Auxiliary_ID:**
- Word 1: ADDIRNF
- Word 2: Matrix index name
- Word 3: MACH, Mach number
- Word 4: BREF, Reference length for the reduced frequency
- Words 5-10: Zero

**Elements:** Items 1-6 each contain 2 packed 30 bit integers defined as follows:

- **Item 1:**
  - Bits 59-30: The number of constants (2)
  - Bits 29-0: Pointer to the row containing the first constant (7)

- **Item 2:**
  - Bits 59-30: The number of output K-values (NOUTK)
  - Bits 29-0: Pointer to the row containing the first K-value (13)

- **Item 3:**
  - Bits 59-30: The number of Mach numbers (1)
  - Bits 29-0: Pointer to the row containing the Mach number (9)

- **Item 4:**
  - Bits 59-30: The number of problem size numbers (1)
  - Bits 29-0: Pointer to the row containing the problem size number (10)
Item 5: Bits 59-30: The number of matrix size numbers (1)

Bits 29-0: Pointer to the row containing the matrix size number (11)

Item 6: Bits 59-30: The number of altitudes (1)

Bits 29-0: Pointer to the row containing the altitude (12)

Item 7: BREF, Reference length for the reduced frequency

Item 8: SPAN/2

Item 9: MACH, the Mach number

Item 10: NMODES, the number of modes

Item 11: 2*NMODES*NMODES, the size of the generalized air force matrices

Item 12: ALT, the altitude or 10HNO ALT

Items 13 - (NOUTK+12) contain the NOUTK output K-values for which generalized air forces are prepared.

Generation: Program RSPW, RCCIW, or RMW of the ADDINT processor.
GENERALIZED AIR FORCE MATRIX

File: ADDIRNF

Index_Name: xxxxxyy

Type: REAL

Dimensions: \((2 \times NMODES) \times NMODES\) (NMODES \times NMODES complex) where NMODES is the number of mode shapes.

Auxiliary_ID:
Word 1: ADDIRNF
Word 2: Matrix index name
Word 3: MACH, mach number
Word 4: BREF, Reference length for the reduced frequency
Words 5-10: Zero

Elements: Element \((i, j)\) is the work done by the motion of the surface in the \(i\)-th mode acting against the unsteady aerodynamic pressure in the \(j\)-th mode divided by \(-\omega^2 \rho\) where \(\rho\) is the density of the air and \(\omega\) is the circular frequency of oscillation.

Generation: Program RSPW, RCCIW, or RMW of the ADDINT processor.
AERODYNAMIC CONTROL MATRIX

File: AF10RNF

Index Name: ACMij

Type: MIXED

Dimensions: (60+NKVALS)*1

Auxiliary ID:
Word 1: AF10RNF
Word 2: ACMij
Words 3-10: Zero

Elements:

Item 1: Bits 59-30: Number of constants (8)
        Bits 29-0: Location of the first constant (6)

Item 2: Bits 59-30: Number of reduced frequencies (NKVAL)
        Bits 29-0: Location of the first reduced frequency (NKPTR)

Item 3: Zero

Item 4: Bits 59-30: Number of problem size indicators
        Bits 29-0: Location of the first problem size indicator (NNSPTR)

Item 5: Bits 59-30: Number of matrix size indicators
        Bits 29-0: Location of the first matrix size indicator (NMSPTR)

Item 6: Reference Length

Item 7: Case Number

Item 8: Condition Number

Item 9: Geometric symmetry option (SYMMETRIC, ANTISYM, NONSYMM)

20.1
| Item 10: | Two dimensional analysis option (TWOD, NONE) |
| Item 11: | MOPT option (MOPT, NONE) |
| Item 12: | Quasi Steady Option (QS, NONE) |
| Item 13: | Checkprint Option (CHKOPT, NONE) |
| Item 14: | Revised test symmetry option (SYMmetric, ANTISYM, NONSYMM, INDEFINITE) |

| Item NNSPTR: | Number of modes |
| Item NNSPTR+1: | Number of main surfaces |
| Item NNSPTR+2: | Number of control surfaces |
| Item NNSPTR+3: | Number of tabs |
| Item NNSPTR+4: | Total number of strips |
| Item NNSPTR+5: | Number of rigid body modes |
| Item NNSPTR+6: | Number of elastic modes |
| Item NNSPTR+7: | Number of unit rotation modes |
| Item NNSPTR+8: | Number of reduced frequencies |
| Item NNSPTR+9: | Maximum number of modes in a partition |
| Item NNSPTR+10: | Number of antisymmetric test cases |
| Item NNSPTR+11: | Number of nonsymmetric test cases |
| Item NNSPTR+12: | Number of symmetric test cases |
| Item NMSPTR: | Length of main surface geometry array |
| Item NMSPTR+1: | Length of control surface geometry array |
| Item NMSPTR+2: | Length of tab geometry array |
| Item NMSPTR+3: | Length of strip data array |
| Item NMSPTR+4: | Length of control surface control data array |
Item NMSPTR+5: Length of tab control data array
Item NMSPTR+6: Length of AFCCi array
Item NMSPTR+7: Length of AFTC{ array
Item NMSPTR+8: Length of APFCsi array
Item NMSPTR+9: Length of the largest modal interpolation coefficient array
Item NMSPTR+10: Length of rigid body modes array
Item NMSPTR+11: Length of unit rotation modes array
Item NMSPTR+12: Length of ACF{ array
Item NMSPTR+13: Length of indirect data array
Item NMSPTR+14: Length of AFPM{ array
Item NMSPTR+15: Length of control array
Item NMSPTR+16: Length of MICij array
Item NMSPTR+17: Length of M2Cij array
Item NMSPTR+18: Length of CGCij array
Item NMSPTR+19: Length of TGCij array
Item NMSPTR+20: Length of CTCij array
Item NMSPTR+21: Length of normal wash array
Item NMSPTR+22: Length of static induction array
Item NMSPTR+23: Length of the component force arrays
Item NMSPTR+24: Length of the sectional lift arrays
Item NMSPTR+25: Zero
Item NMSPTR+26: Length of the generalized forces array
Item NMSPTR+27: Length of the MCM array
Item NMSPTR+28: Length of the induced normal wash array
Item NMSPTR+29: Length of the C(k) array
Item NMSPTR+30: Length of the input MD array

Generation: Program AFGEOM of the AF1 processor.
COMPONENT FORCE MATRICES

File: AF10RN

Index Name: CAyijAL
               CByijAL
               CCyijAL
               CDyijAL
               CEyijAL

Type: REAL

Dimensions: K12 * NUMMOD * NMOD where:

K12 = 1 if the component matrix is real
      2 if the component matrix is complex

NUMMOD = number of modal coordinates used to calculate the generalized airforces

NMOD = number of modes in the partition.

Auxiliary ID: Word 1: AF10RN
              Word 2: The matrix index name
              Word 3: Reduced frequency value
              Word 4: Reference length
              Words 5-10: Zero

Elements: The items of these matrices (real or complex) represent the forces on mode i due to oscillatory displacements in mode j.

CAyijAL: noncirculatory aerodynamic stiffness (Real)

CByijAL: noncirculatory aerodynamic damping (Real)

CCyijAL: noncirculatory aerodynamic inertia (Real)

CDyijAL: circulatory aerodynamic stiffness (Real or complex)

CEyijAL: circulatory aerodynamic damping (Real or complex)

Generation Program AFGAF of the AF1 processor.
CONTROL SURFACE GEOMETRY

File: AF10RNF

Index Name: CGCij

Type: MIXED

Dimensions: 1*N where N = 3*NUMMSS + 3
NUMMSS = Number of strips

Auxiliary ID:
Word 1: AF10RNF
Word 2: CGCij
Words 3-10: Zero

Elements:

Item 1: Bits 59-30: Number of strips

Bits 29-0: Location of control surface hinge line x-coordinate for first strip

Item 2: Bits 59-30: Number of strips

Bits 29-0: Location of y-coordinate of strip center line for first strip

Item 3: Bits 59-30: Number of strips

Bits 29-0: Location of z-coordinate of strip center line for first strip.

Items 4 to NUMMSS + 3:

x-coordinate of control surface hinge line at each strip centerline

Items NUMMSS+4 to 2*NUMMSS+3:

Y-coordinate of strip centerline for each strip

Items 2*NUMMSS+4 to 3*NUMMSS+3:

z-coordinate of strip centerline for each strip

Generation: Program AFGEOM of the AF1 processor.
GEOMETRY CORRESPONDENCE TABLE

File: AF1ORNF
Index_Name: CTCij
Type: MIXED
Dimensions: 1 * (NUMCT + NUMMS + NUMCS + NUMTS + 4), where
    NUMCT = Number of strips
    NUMMS = Number of main surfaces
    NUMCS = Number of control surfaces
    NUMTS = Number of tabs

Auxiliary_ID:
    Word 1: AF1ORNF
    Word 2: CTCij
    Words 3-10: Zero

Elements:
    Item 1: Bits 59-30: Number of elements in the correspondence table (NUMCT)
            Bits 29-0: Location of first element in the correspondence table (CTPTR)
    Item 2: Bits 59-30: Number of main surface names (NUMMS)
            Bits 29-0: Location of first main surface name (MSPTR)
    Item 3: Bits 59-30: Number of control surface names (NUMCS)
            Bits 29-0: Location of first control surface name (CSPTR)
    Item 4: Bits 59-30: Number of tab names (NUMTS)
            Bits 29-0: Location of first tab name (TSPTR)

Items CTPTR to (CTPTR + NUMCT -1):
    Surfaces intersected by each strip.
            Bits 59-45: Zero
Bits 44-30: Main surface index
Bits 29-15: Control surface index
Bits 14-0: Tab index

Items MSPTR to (MSPTR + NUMMS - 1):

Main surface identification
Bits 59-30: Main surface name
Bits 29-15: Index of the first strip on the surface
Bits 14-0: Index of the last strip on the surface

Items CSPTR to (CSPTR + NUMCS - 1):

Control surface identification
Bits 59-30: Control surface name
Bits 29-15: Index of the first strip on the surface
Bits 14-0: Index of the last strip on the surface

Items TSPTR to (TSPTR + NUMTS - 1):

Tab identification
Bits 59-30: Tab name
Bits 29-15: Index of the first strip on the tab
Bits 14-0: Index of the last strip on the tab

Generation: Program AFGEOM of the AF1 processor.
GENERALIZED FORCE MATRIX

File:        AF10RNF
Index Name:  GF0ijAl
Type:        REAL
Dimensions:  K12 * NUMMOD * NUMMOD, where:
              K12   = 1 for Quasi-steady airforces
              = 2 for Unsteady airforces
              NUMMOD = Number of modal coordinates

Auxiliary ID:  Word 1:        AF10RNF
               Word 2:        GF0ijAl
               Word 3:        Reduced Frequency
               Word 4:        Reference length
               Words 5-10:    Zero

Elements:     A real array for quasi-steady airforces, or
               element pairs forming a complex array for
               unsteady airforces. The (i,j) term represents
               the force on the ith modal coordinate due to a
               unit amplitude oscillatory displacement of the
               jth coordinate.

Generation:   Program AFGAF of the AF1 processor.
**MAIN SURFACE GEOMETRY (PART 1)**

**File:** AF10RNF  
**Index Name:** M1Cij  
**Type:** MIXED  
**Dimensions:** 8 + (NUMMSS * 8) where:  
NUMMSS = number of strips  
**Auxiliary ID:**  
Word 1: AF10RNF  
Word 2: M1Cij  
Words 3-10: Zero  

**Elements:**  
Item 1:  
Bits 59-30: Number of dihedral angles (NUMMSS)  
Bits 29-0: The location of the first dihedral angle (GAMPTR)  
Item 2:  
Bits 59-30: Number of quarter chord x-coordinates, (NUMMSS)  
Bits 29-0: Location of the first quarter chord x-coordinate (X25PTR)  
Item 3:  
Bits 59-30: Number of three quarter chord x-coordinates (NUMMSS)  
Bits 29-0: Location of the first three quarter x-coordinate (X75PTR)  
Item 4:  
Bits 59-30: Number of strip centerline y-coordinates, (NUMMSS)  
Bits 29-0: Location of the first strip centerline y-coordinate (YCLPTR)  
Item 5:  
Bits 59-30: Number of strip centerline z-coordinates (NUMMSS)  
Bits 29-0: Location of the first strip centerline z-coordinate (ZCLPTR)
<table>
<thead>
<tr>
<th>Item</th>
<th>Bits 59-30:</th>
<th>Bits 29-0:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Item 6:</td>
<td>Number of strip widths (NUMMSS)</td>
<td>Location of the first strip width (DYPTR)</td>
</tr>
<tr>
<td>Item 7:</td>
<td>Number of elastic axis x-coordinates (NUMMSS)</td>
<td>Location of the first elastic axis x-coordinate (XEAPTR)</td>
</tr>
<tr>
<td>Item 8:</td>
<td>Number of strips (NUMMSS)</td>
<td>Location of the &quot;2D Static Induction&quot; for the first strip. (DSIPTR)</td>
</tr>
</tbody>
</table>

Items GAMPTR to (GAMPTR + NUMMSS - 1):
- Dihedral angle of each strip

Items X25PTR to (X25PTR + NUMMSS - 1):
- x - coordinate of the intersection of the quarter chord and the centerline of each strip.

Items X75PTR to (X75PTR + NUMMSS - 1):
- x - coordinate of the intersection of the three quarter chord and the centerline of each strip.

Items YCLPTR to (YCLPTR + NUMMSS - 1):
- y - coordinate of each strip centerline

Items ZCLPTR to (ZCLPTR + NUMMSS - 1):
- z - coordinate of each strip centerline

Items DY PTR to (DY PTR + NUMMSS - 1):
- Width of each strip

Items XEAPTR to (XEAPTR + NUMMSS - 1):
- x - coordinate of the intersection of the elastic axis and the centerline of each strip.
Items DSIPT to \((DSIPT + NUMSS - 1)\):

\[\frac{1}{4} \times \text{chord} \times \cos(\text{sweep angle})\] for each strip

**Generation:** Program AFGEOM of the AFI processor.
MAIN SURFACE GEOMETRY (PART 2)

File: AF10RNF

Index_Name: M2Cij

Type: MIXED

Dimensions: \((N*\text{NUMMSS} + 8)\) where:

\[\text{NUMMSS} = \text{number of strips}\]
\[N = \text{number of arrays present}\]

Auxiliary ID:

Word 1: AF10RNF
Word 2: M2Cij
Words 3-10: Zero

Elements:

Item 1: Bits 59-30: Number of elements in the A-array (NUMA = NUMMSS)

Bits 29-0: Location of A for the first strip (APTR)

Item 2: Bits 59-30: Number of strips

Bits 29-0: Location of first strip semichord (SPTR)

Item 3: Bits 59-30: Number of elements in the C-array (NUMC = NUMMSS or 0)

Bits 29-0: Location of C for the first strip (CPTR)

Item 4: Bits 59-30: Number of elements in the D-array (NUMD = NUMMSS or 0)

Bits 29-0: Location of D for the first strip (DPTR)
Item 5:  Bits 59-30:  Number of elements in the L-array  
(NUML = NUMSS or 0)

Bits 29-0:  Location of L for the first strip  
(LPTR)

Item 6:  Bits 59-30:  Number of elements in the M-array  
(NUMM = NUMSS or 0)

Bits 29-0:  Location of M for the first strip  
(MPTR)

Item 7:  Bits 59-30:  Number of strips  

Bits 29-0:  Location of the first strip width  
(DYPTR)

Item 8:  Bits 59-30:  Number of strips  

Bits 29-0:  Location of the y - coordinate of  
the first strip centerline.  
(YCLPTR)

Item 9:  Bits 59-30:  Number of strips  

Bits 29-0:  Location of the first strip  
dihedral angle (GAMPTR)

Items APTR to (APTR + NUMSS - 1):

The distance along the strip centerline from the  
midchord to the elastic axis as a fraction of semichord  
for each strip

Items BPTR to (BPTR + NUMSS - 1):

The semichord of each strip

Items CPTR to (CPTR + NUMC - 1):

The distance along the strip centerline from the  
midchord to the control surface hinge line

20.14
Items DPTR to (DPTR + NUMD - 1):

The distance along the strip centerline from the midchord to the tab hinge line as a fraction of semichord for each strip.

Items LPTR to (LPTR + NUML - 1):

The distance along the strip centerline from the control surface leading edge to its hinge line as a fraction of semichord for each strip.

Items MPTR to (MPTR + NUMM - 1):

The distance along the strip centerline from the tab leading edge to its hinge line as a fraction of semichord for each strip.

Items DYPTR to (DYPTR + NUMMSS - 1):

The width of each strip.

Items YCLPTR to (YCLPTR + NUMMSS - 1):

y - coordinate for each strip.

Items GAMPTR to (GAMPTR + NUMMSS - 1):

The dihedral of each strip.

Generation: Program AFGEOM of the AF1 processor.
SECTIONAL FORCE MATRICES

File: AF10RNF

Index Name: SAYijAl
           SCyijAl
           SCyijAl
           SDyijAl
           SEyijAl

Type: REAL

Dimensions: \((K12 \times NUMMSS*NS) \times NMOD\) where:

\(K12\) = 1 if the matrix is real
           2 if the matrix is complex

\(NUMMSS\) = Number of strips

\(NS\) = 2 if no control surfaces or tabs are present
         3 if control surfaces only are present
         4 if control surfaces and tabs are present

\(NMOD\) = Number of modal coordinates in this partition.

Auxiliary ID: Word 1: AF10RNF
              Word 2: The matrix index name
              Word 3: Reduced frequency
              Word 4: Reference length
              Words 5-10: Zero

Elements: The items of these matrices represent the elements of a real array or element pairs forming a complex array representing the force and moment about the reference axis, control surface and tab hinge lines on strip i due to unit oscillatory displacements of modal coordinate j.

\(SAYijAl\): noncirculatory aerodynamic stiffness (Real)

\(SByijAl\): noncirculatory aerodynamic damping (Real)
SCyijAl: noncirculatory aerodynamic inertia (Real)

SDyijAl: circulatory aerodynamic stiffness
        (Real or Complex)

SEyijAl: circulatory aerodynamic damping
        (Real or Complex)

Generation: Program AFGAF of the AF1 processor.
STATIC INDUCTION MATRIX

File: AF10RNF

Index Name: SIΩij

Type: REAL

Dimensions: NUMMSS * NUMMSS where:

NUMMSS = Number of strips

Auxiliary ID:

Word 1: AF10RNF
Word 2: SIΩij
Words 3-10: Zero

Elements: This matrix contains the elements of the static induction matrix

Generation: Program AFSI of the AF1 processor.
TAB SURFACE GEOMETRY

File: AF10RNF

Index Name: TGCij

Type: MIXED

Dimensions: 1*N where N = 3*NUMMSS + 3
NUMMSS = Number of strips

Auxiliary_ID: Word 1: AF10RNF
Word 2: TGCij
Words 3-10: Zero

Elements:

Item 1: Bits 59-30: Number of strips
Bits 29-0: Location of tab surface hinge line
x-coordinate for first strip

Item 2: Bits 59-30: Number of strips
Bits 29-0: Location of y-coordinate of strip
center line for first strip

Item 3: Bits 59-30: Number of strips
Bits 29-0: Location of z-coordinate of strip
center line for first strip.

Items 4 to NUMMSS + 3:

x-coordinate of tab surface hinge line at each
strip centerline

Items NUMMSS+4 to 2*NUMMSS+3:

y-coordinate of strip centerline for each strip

Items 2*NUMMSS+4 to 3*NUMMSS+3:

z-coordinate of strip centerline for each strip

Generation: Program AFGEOM of the AF1 processor.

20.19
MODE SHAPES MATRIX

File: AF10RNF

Index Name: Wxxij

Type: REAL

Dimensions: (N * NUMMSS) * NMOD, where:

NMOD = Number of modes in this partition

NUMMSS = Number of strips

N = 2 if no control surfaces nor tabs are used
   3 if no tabs are used
   4 if control surfaces and tabs are used

Auxiliary ID: Word 1: AF10RNF
              Word 2: Wxxij
              Words 3-10: Zero

Elements: Rows 1–NUMMSS contain the elastic axis displacements.
          Rows (NUMMSS+1)–(2*NUMMSS) contain the elastic axis rotations.
          Rows (2*NUMMSS+1)–(3*NUMMSS) contain the control surface relative rotations if N equals 3 or 4.
          Rows (3*NUMMSS+1)–(4*NUMMSS) contain the tab relative rotations if N equals 4.

Generation: Program AFMODE of the AF1 processor.
LIFT CURVE SLOPE MATRIX

File: AF10RNF

Index Name: XMØij

Type: REAL

Dimensions: (NUMMSS + 1) where:

NUMMSS = Number of strips.

Auxiliary ID: Word 1: AF10RNF
               Word 2: XMØij
               Words 3-10: Zero

Elements:

Item 1: Bits 59-30: NUMMSS
        Bits 29-0: Location of the first lift curve slope (MOPTR)

Items 2 to (NUMMSS+1):

Values of the lift curve slope for each strip.

Generation: Program AFGAF of the AF1 processor.
BUCKLING_SET_CONDITION_MATRIX

File: BUCKRNF

Index Name: BSETCØN

Type: MIXED

Dimensions: NBSET * 2, where NBSET is the maximum number of buckling sets defined.

Auxiliary ID:
Word 1: BUCKRNF
Word 2: BSETCØN
Word 3-10: Zero

Elements:
Row i contains the data corresponding to buckling set number i.

Item 1: The stiffness matrix name.
Item 2: The geometric stiffness matrix name.

Generation: Program PICKUP of the buckling (vibration) processor.
BUCKLING EIGENVALUES

File: BUCKRNF

Index Name: EIGENbs (user matrix).

Type: MIXED

Dimensions: (NF*3)*1, where NF equals the number of requested eigenvalues.

Matrix Name: Word 1: Date of matrix generation (month/day/year)
Word 2: Geometric stiffness matrix name
Word 3: Stiffness matrix name
Word 4: Eigenvalue matrix name
Word 5: Generalized mass matrix name
Word 6: Generalized stiffness matrix name

Auxiliary ID: Word 1: BUCKRNF
Word 2: EIGENbs
Word 3: Type of dynamic matrix operated on.
= 1 - stiffness
= 2 - Flexibility
= 3 - Buckling
Words 4-10: Zero

Elements: The eigenvalues are stored in a row-wise, lower triangular format. (Sparse format, no leading zeros)

Generation: Program EXPAND of the buckling (vibration) processor.
BUCKLING EIGENVECTORS (MODE SHAPES)

File: BUCKRNF

Index Name: MØDESbs (user matrix).

Type: REAL

Dimensions: N*M where N equals the dimension of the stiffness matrix (number of retained degrees of freedom) and M equals the number of requested mode shapes.

Matrix Name: Word 1: Date of matrix generation (month/day/year)
Word 2: Geometric stiffness matrix name
Word 3: Stiffness matrix name
Word 4: Eigenvalue matrix name
Word 5: Generalized mass matrix name
Word 6: Generalized stiffness matrix name

Auxiliary ID: Word 1: BUCKRNF
Word 2: MØDESbs
Word 3: Number of selected rigid body modes (NFAC)
Word 4-9: Normalizing value for Ith rigid body mode (I=1, NFAC)
Word 10: Zero

Elements: Item (i, j) contains the normalized eigenvalue of the i-th freedom for the j-th mode.

Generation: Program EQCHECK of the buckling (vibration) processor.
(Only user matrices as described in reference 1-1 are written on CH\$LRNF)
ATLAS DATA DIRECTORY

File: DATARNF
Index Name: ADATDIR
Type: MIXED
Dimensions: 405 * 2

Auxiliary ID:
Word 1: DATARNF
Word 2: ADATDIR
Words 3-10: Zero

Elements:
Row i, column 1 contains the name of the ith label in the ATLAS Data Directory, in left justified, zero filled format. The names are sorted alphabetically.

Row i, column 2 contains a code word associated with the ith label as follows:

Bits 59-42: Eighteen bits (left to right) representing up to 18 attributes. A bit is on if that particular attribute is related to the label.

Bits 41-36: Element type to which the label is related. This is the standard ATLAS element number. Element number zero signifies nodes.

Bits 35-33: Code number. (ref. 1-1)

Bits 32-27: Sequence number. This is the sequence number for the label from amongst the labels that have identical element type and code. (ref. 1-1)
Bits 26-21: Matrix group number. This indicates to the Extract processor the incoming ATLAS matrix in which the value of the label resides. The matrix group number and the matrix name correspondence is built into the extract processor.

Bits 20-0: Zero

Generation: Program ELKEYPR of the elementkey preprocessor.
AF1 CONTROL SURFACE CORRESPONDENCE MATRIX

File: DATARNF

Index Name: AFCCi

Type: MIXED

Dimensions: 
\[ 1 \times \left( \sum_{i=1}^{NMS} (NCS(i) + 2) \right) \]

NMS = Number of main surfaces that have control surfaces.

NCS(i) = Number of control surfaces on main surface i.

Auxiliary ID:
Word 1: DATARNF
Word 2: AFCCi
Words 3-10: Zero

Elements:

Item 1: Bits 59-30: Name of first main surface that has a control surface.

Bits 29-0: Location of the next main surface name.

Item 2: Bits 59-30: Number of control surfaces on this main surface.

Bits 29-0: Location of the first control surface name. (CSPTR)

Items CSPTR to (CSPTR + NCS(i) - 1):

The names of the control surfaces associated with this main surface.

These items are repeated as required to define the correspondence between main surfaces and control surfaces.

Generation: Program INPAF1 of the AF1 preprocessor
AF1_DIRECT_MODIFICATION_DATA

File: DATARNF

Index_Name: AFCFi

Type: MIXED

Dimensions: $1 \times (17 + \text{NUMALP} + \sum_{i=1}^{16} \text{NUMI}(i))$ where:
- NUMALP = Number of modifier values
- NUMI(i) = Number of instructions associated with the $i$th partition.

Auxiliary_ID: Word 1: DATARNF
Word 2: AFCFi
Words 3-10: Zero

Elements:
- Items 1-16: Control information for each of the sixteen partitions of the oscillatory derivative matrix:
  - Bits 59-30: Number of instructions for this partition.
  - Bits 29-0: Location of first instruction for this partition. (0 if no instruction) (PTR(i))
- Item 17: Bits 59-30: NUMALP
  - Bits 29-0: Location of the first modifier value. (ALP PTR)
- Items ALP PTR to (ALP PTR + NUMALP-1):
  - The values of the modifiers.
  - The remaining items are repeated for each partition of the oscillatory derivative matrix that has modifying instructions associated with it.
Items PTR(i) to (PTR(i +1)-1:

Bits 59-57: Reserved

Bits 56-51: Partition number

Bits 50-42: First element of the partition to be modified.

Bits 41-33: Last element of the partition to be modified.

Bits 32-30: Modifier code, 0 for scale, 1 for replace.

Bits 29-0: Index of the first modifier to be used in this instruction.

Generation: Program INPAF1 of the AF1 preprocessor
AF1_CONTROL_SURFACE_GEOMETRY

File: DATARNF

Index_Name: AFCGi

Type: MIXED

Dimensions: 1*(\(\sum_{i=1}^{NCS} (7 + 3*(NUMLEP(i) + NUMHLP(i)))\)) where:

\(NCS =\) Number of control surfaces

\(NUMLEP(i) =\) Number of leading edge definition points for the \(i\)th control surface

\(NUMHLP(i) =\) Number of hinge line definition points for the \(i\)th control surface.

Auxiliary_ID: Word 1: DATARNF
Word 2: AFCGi
Words 3-10: Zero

Elements: The following items are repeated for each control surface.

Item 1: Bits 59-30: Control surface name.

Bits 29-0: Location of the next control surface name (0 if last control surface)

Items 2-4: Bits 59-30: NUMLEP(i)

Bits 29-0: Location of the first leading edge \(x\), \(y\) and \(z\) coordinates (LEPTR)

Items 5-7: Bits 59-30: NUMHLP(i)

Bits 29-0: Location of the first hinge line \(x\), \(y\) and \(z\) coordinates (HLPTR)

Items LEPTR to \((LEPTR + 3*NUMLEP(i)-1)\):

The leading edge \(x\)-coordinates followed by the \(y\)-coordinates and the \(z\)-coordinates.
Items HLPT to (HLPT + 3* NUMHLP-1):

The hinge line x-coordinates followed by the y-coordinates and the z-coordinates.

Generation: Program INPAF1 of the AF1 preprocessor
AF1 CONTROL MATRIX

File: DATARNF
Index Name: AFCSI
Type: MIXED
Dimensions: 1 * 44

Auxiliary ID: Word 1: DATARNF
              Word 2: AFCSI
              Words 3-10: Zero

Elements: This matrix contains the active contents of common block CONTRL, arrays NSIZE and MSIZE.

Item 1: Bits 59-30: Number of active items in NSIZE (13)
        Bits 29-0: Location of NSIZE

Item 2: Bits 59-30: Number of active items in MSIZE (29)
        Bits 29-0: Location of MSIZE

Items 3 to 15 are the first 13 items in NSIZE.

Item 3: Zero
Item 4: Number of main surfaces.
Item 5: Number of control surfaces.
Item 6: Number of tabs.
Item 7: Number of strips.
Item 8: Number of rigid body modes.
Item 9: Zero
Item 10: Number of unit rotation modes.
Item 11: Zero
Item 12: Zero

50.8
Item 13: Number of antisymmetric test cases.
Item 14: Number of nonsymmetric test cases.
Item 15: Number of symmetric test cases.
Item 16 to 44 are the first 29 items in MSIZE.

Item 16: Length of matrix AFMGi
Item 17: Length of matrix AFCGi.
Item 18: Length of matrix AFTGi.
Item 19: Length of matrix AFYGi.
Item 20: Length of matrix AFCCI.
Item 21: Length of matrix AFTCi.
Item 22: Length of matrix AFCSi.
Item 23: Length of matrix AFMCi.
Item 24: Length of matrix AFRBi.
Item 25: Length of matrix AFURi.
Item 26: Length of matrix AFCFi.
Item 27: Length of matrix AFSLi.
Item 28: Length of matrix AFPMi.
Item 29-40: Zero
Item 41: Length of matrix MCM.
Item 42-43: Zero
Item 44: Length of matrix AFDMO.

AF1 M0 MODIFICATION DATA

File: DATARNF
Index_Name: AFDMi
Type: MIXED

Dimensions: 

\[ 1 * \left( \sum_{i=1}^{ND} 3 + 2 * MNO(i) \right) \]

where:

\[ ND \]
Number of surfaces for which M0 data is available.

\[ NMO(i) \]
Number of M0 values for surface i.

Auxiliary ID:
Word 1: DATARNF
Word 2: AFDMi
Words 3-10: Zero

Elements: The following items are repeated for each surface with which M0 modification data is associated.

Item 1: Bits 59-30: Name of the surface.

Bits 29-0: Location of the next surface name.
(0 if last surface)

Item 2: Bits 59-30: Number of eta stations (NMO(i)).

Bits 29-0: Location of the first eta station (ETAPRT).

Item 3: Bits 59-30: Number of M0s (NMO(i)).

Bits 29-0: Location of the first M0 (MOPTR).

Items ETAPRT to (ETAPRT + NMO(i)-1):

Eta stations.

Items MOPTR to (MOPTR + NMO(i)-1):

M0 values.

Item 153: LTVP - length of the leading and trailing edge pointer arrays and of the trailing edge velocity potential array

Items 154-194 are from labelled common /SAMPLW/.

Item 154: ISMPLW - number of chords specified for wash sampling

Item 155-164: ICHORD(10) - chord number for sampling

Item 165-174: IBOXF(10) - first box on chord to be sampled

Item 175-184: IBOXL(10) - last box on chord to be sampled

Item 185-194: ZLOC(10) - Z-location of sampling chord, internally to correspond to wing coordinates

Items 195-217 are from labelled common /MODES/.

Item 195: NAME1 - the name of the interpolation coefficient array to be used with surface 1

Item 196: NAME2 - same as above for surface 2

Item 197: RBX

Item 198: RBY

Item 199: RBZ - global coordinates of rigid body reference point

Item 200-211: RBDEL(2,6) - array of rigid body keywords and displacement magnitudes

Item 212: FMOO1 - the first mode shape of first surface interpolation information array to be used

Item 213: FMOO2 - the first mode shape of second surface interpolation information array to be used

Item 214: LMOD1 - the last mode shape of first surface interpolation information array to be used
Item 215: LMOD2 - the last mode shape of second surface interpolation information array to be used

Item 216: NMODES: - the total number of modes from first surface interpolation information array to be used

Item 217: NMODE2 - The total number of modes from second surface interpolation information array to be used, NMODES must equal NMODE2

Items 218 and 219 are from labelled common /BOX/.

Item 218: NCHRDS - the number of chords to be used in the analysis

Item 219: XEDGE - the local coordinate x location of the leading edge of a planform box

Items 220-1223 are from labelled common /TSLOPE/.

Item 220: NTSS1 - number of thickness slopes, input for surface 1

Item 221: NTSS2 - number of thickness slopes, input for surface 2

Item 222: TSMN1 - Mach number for which surface 1 thickness slopes are to be used

Item 223: TSMN2 - Mach number for which surface 2 thickness slopes are to be used

Items 224-1223: TS - Array of thickness slopes

</table>

The above format is repeated for each pressure correction instruction input where:

- P1FLG = Keyword PRESS (or SCALA) if the pressure replacement (or scaling) option is selected
- P2PTR = Pointer to word containing the keyword PRESS (or SCALA) for the next pressure correction
- PSREAL = Real part of pressure replacement value or pressure scale factor
PSIMAG = Imaginary part of pressure replacement value or pressure scale factor
NUMBS = Number of box subsets
BSPTR = Pointer to the first box subset name, BS(1)
BS = Array of box subset names

Generation: Program INPUTP of the doublet-lattice preprocessor.
**DUBLAT RIGID BODY MODES MATRIX**

**File:** DATARNF

**Index Name:** DLRBI

**Type:** MIXED

**Dimensions:** \((10 + 6\times\text{NUMRBM})\times1\)

Where:

\[
\text{NUMRBM} = \text{Number of rigid body modes input}
\]

**Auxiliary ID:**
- Word 1: DATARNF
- Word 2: DLRBI
- Words 3-10: Zero

**Elements:**
- Item 1: LENRBI = Length of array
- Item 2: 8HMOTIONPT
- Item 3: Zero
- Item 4: NUMRBM = Number of rigid body modes
- Item 5: 1.0 = Number of first mode
- Item 6: NUMRBM = Number of last mode
- Item 7: XREF = Reference point x-coordinate
- Item 8: YREF = Reference point y-coordinate
- Item 9: ZREF = Reference point z-coordinate
- Item 10: TX = Translation in X
- Item 11: TY = Translation in Y
- Item 12: TZ = Translation in Z
- Item 13: RX = Rotation about X
- Item 14: RY = Rotation about Y
- Item 15: RZ = Rotation about Z

Items 10-15 are repeated for each mode.

Item \((10+6\times\text{NUMRBM})\): 8HMOTIONPT

**Generation:** Program INPUTP of the doublet-lattice preprocessor.
DUBLAT SUBSET DATA MATRIX

File: DATARNF

Index Name: DLSSi

Type: MIXED

Dimensions: 

\[(2 + \text{NUMSS} \times 2 + \sum_{i=1}^{\text{MAXNUM}} + 1) \times 1\]

Where:

- \text{NUMSS} = \text{Number of subsets input}
- \text{MAXNUM} = \text{Maximum numerical value of all integers in the i-th subset}

Auxiliary ID: Word 1: DATARNF
Word 2: DLSSi
Words 3-10: Zero

Elements:

<table>
<thead>
<tr>
<th>Item 1:</th>
<th>Item 2:</th>

**Generation:** Program INPUTP of the doublet-lattice preprocessor.
**GEOMETRY_COMPONENT_ID_MATRIX**

**File:** DATARNF

**Index Name:** GC0MPID

**Type:** MIXED

**Dimensions:** \(N \times 1\) where \(N\) is the total number of geometry components defined via the geometry input data (\(N \leq 60\)).

**Auxiliary ID:**
- Word 1: DATARNF
- Word 2: GC0MPID
- Words 3-10: Zero

**Elements:** Row \(i\) contains the ID name of the \(i\)-th sequentially-defined geometry component. Each ID is a user-defined unique BCD string of 1-7 characters stored in display code, left adjusted and blank filled. Interrogation of the \(i\)-th component data stored in GDEFO0i on DATARNF by the nodal preprocessor is effected by requiring the ID to be the same as the name of the nodal input reference frame.

**Generation:** Program GDEFSIM of the geometry data preprocessor.
GEOMETRY COMPONENT DATA MATRICES

File: DATARNF

Index_Name: GDEF001, GDEF002, ...., GDEF00n, where n (≤ 60) is the input sequence number of the component.

Type: MIXED

Dimensions: (4 + NB + 2*NK) where:

NB = Size of buffer containing component control curve definitions.

NK = Number of curves and their location in buffer.

Auxiliary_ID: Word 1: DATARNF
Word 2: The matrix index name
Words 3-10: Zero

Elements: These matrices, one for each component, contain the following data:

Item 1: NP = Number of points in points array, PT(NP,3)
Item 2: NL = Number of lines in lines array, ALN(NL,3)
Item 3: NK
Item 4: NB
Item 5-(NB+4):

Data defining longitudinal control curves for this component (BFR). (ref. 50-1)

Items (NB+5)-(NB+2*NK+4):

Array of curve types, KRV(NK,1), and locations, KRV(NK,2) in BFR.

Generation: Program GDEFSIM of the geometry data preprocessor.
SPACING MATRIX

File: DATARNF

Index Name: GKD001a, GKD002a, ..., GKD999a

Type: MIXED

Dimensions: M*1 where M is less than or equal to 3000. All data for a particular element are fully contained in one of the matrices.

Auxiliary ID:
Word 1: DATARNF
Word 2: The matrix index name.
Words 3-10: Zero

Elements:

Item 1: Bits 59-30: Reserved for future use.

Bits 29-15: NF, number of elements contained in this matrix.

Bits 14-0: NBEG, internal number of first element in this partition.

Item 2-(NF+1):

Each word contains descriptions of an element. Each description corresponds to the element referred to in the same position in the Flexible Element Matrix (KSF) with the same set and partition number.

Bits 59-54: EG, the element code (integer).

Bits 53-30: Reserved for future use.

Bits 29-15: NTOT, total number of words in data body.

Bits 14-0: POINT, pointer to the body of element data (0 if no spacing defined and no defaults).
Item (NF+2)-M:

These blocks of element data contain the spacing properties. Each property is a real number that is stored in one word.

Generation: Program DGINPT of the detail geometry preprocessor.

**SPACING LOWER BOUNDS MATRIX**

**File:** DATARNF

**Index Name:** GKE001a, GKE002a, ..., GKE999a

**Type:** MIXED

**Dimensions:** $M \times 1$ where $M$ is less than or equal to 3000. All data for a particular element are fully contained in one of the matrices.

**Auxiliary ID:**

Item (NF+2)-M:

These items contain the blocks of element spacing properties. Each property is a real number that is stored in one word.

Generation: Program DGINPT of the detail geometry preprocessor.
SPACING UPPER BOUNDS MATRIX

File: DATARNF

Index Name: GKF001a, GKF002a, ..., GKF999a

Type: MIXED

Dimensions: M*1 where M is less than or equal to 3000. All data for a particular element are fully contained in one of the matrices.

Auxiliary ID: Word 1: DATARNF
               Word 2: The matrix index name.
               Words 3-10: Zero

Elements:

Item 1: Bits 59-30: Reserved for future use.
        Bits 29-15: NF, number of elements contained in this matrix.
        Bits 14-0: NBEG, internal number of first element in this partition.

Item 2-(NF+1):

Each word contains descriptions of an element. Each description corresponds to the element referred to in the same position in the Flexible Element Matrix (KSF) with the same set and partition number.

Bits 59-54: EG, the element code (integer).

Bits 53-30: Reserved for future use.

Bits 29-15: NTOT, total number of words in data body.

Bits 14-0: POINT, pointer to the body of element data (0 if no spacing defined and no defaults).
Item (NF+2) - M:

These items contain the blocks of element spacing properties. Each property is a real number that is stored in one word.

Generation: Program AGINPT of the detail geometry preprocessor.
CROSS SECTION MATRIX

File: DATARNF

Index Name: GKS001a, GKS002a, ..., GKS999a

Type: MIXED

Dimensions: M*1 where M is less than or equal to 3000. All data for a particular element are fully contained in one of the matrices.

Auxiliary ID: 
- Word 1: DATARNF
- Word 2: The matrix index name.
- Word 3: M
- Words 4-10: Zero

Elements:

Item 1: 
- Bits 59-30: Reserved for future use.
- Bits 29-15: NF, number of elements contained in this matrix.
- Bits 14-0: NBEG, internal number of first element in this partition.

Item 2-(NF+1):
- Bits 59-54: EG, the element code (integer).
- Bits 53-50: CON, number of concepts described in the data body.
- Bits 49-39: Reserved for future use.
- Bits 38-30: NTOT, total number of words in element data body.
- Bits 29-15: ULABEL, element user number.
- Bits 14-0: POINT, pointer to the body of element data (0 if no concepts defined).
Item (NF+2)-M:

Additional description of the elements, (blocks of element data). The pointer word contains the following packed integers.

Bits 59-54: POINTER1, pointer to the first concept (0 if NOCON)

Bits 53-48: NUM1, number of first concept.

Bits 47-42: POINTER2, pointer to second concept (0 if no concept or NOCON).

Bits 41-36: NUM2, number of second concept.

Bits 35-30: POINTER3, pointer to third concept (0 if no concept or NOCON).

Bits 29-24: NUM3, number of third concept.

Bits 23-18: POINTER4, pointer to fourth concept (0 if no concept or NOCON)

Bits 17-12: NUM4, number of fourth concept.

Bits 11-6: POINTER5, pointer to fifth concept (0 if no concept or NOCON).

Bits 5-0: NUM5, number of fifth concept.

The word following the pointer word is the first word of the element concept data. These concept properties are real numbers written one to a word.

Generation: Program DGINPT of the detail geometry preprocessor.
CROSS SECTION LOWER BOUNDS MATRIX

File: DATARNF

Index Name: GKT001a, GKT002a, ..., GKT999a

Type: MIXED

Dimensions: M*1 where M is less than or equal to 3000. All data for a particular element are fully contained in one of the matrices.

| Bits 29-15: | ULABEL, element user number. |
| Bits 14-0:  | POINT, pointer to the body of element data (0 if no concept defined). |

50.60
Item (NF+2)-M:

Additional description of the elements, (blocks of element data). The pointer word contains the following packed integers.

Bits 59-54: POINT1, pointer to the first concept (0 if NOCON).

Bits 53-48: NUM1, number of first concept.

Bits 47-42: POINT2, pointer to second concept (0 if no concept or NOCON).

Bits 41-36: NUM2, number of second concept.

Bits 35-30: POINT3, pointer to third concept (0 if no concept or NOCON)

Bits 29-24: NUM3, number of third concept.

Bits 23-18: POINT4, pointer to fourth concept (0 if no concept or NOCON)

Bits 17-12: NUM4, number of fourth concept.

Bits 11-6: POINT5, pointer to fifth concept (0 if no concept or NOCON).

Bits 5-0: NUM5, number of fifth concept.

The word following the pointer word is the first word of the element concept data. These concept properties are real numbers written one to a word.

Generation: Program DGINPT of the detail geometry preprocessor.
CROSS SECTION UPPER BOUNDS MATRIX

File: DATARNF

Index Name: GKU001a, GKU002a, ..., GKU999a

Type: MIXED

Dimensions: M*1 where M is less than or equal to 3000. All data for a particular element are fully contained in one of the matrices.

Auxiliary_ID: Word 1: DATARNF
Word 2: The matrix index name.
Word 3: M
Words 4-10: Zero

Elements:

Item 1: Bits 59-30: Reserved for future use.
Bits 29-15: NF, number of elements contained in this matrix.
Bits 14-0: NBEG, internal number of first element in this partition.

Item 2-(NF+1):

Bits 59-54: EG, the element code (integer).
Bits 53-50: CON, number of concepts described in the data body.
Bits 49-39: Reserved for future use.

**Generation:** Program DGINPT of the detail geometry preprocessor.
SUBSTRUCTURE ASSEMBLY CONTROL VECTOR

File: DATARNF

Index Name: IACVsss

Type: MIXED

Dimensions: N * 1 where N = number of nodes in this substructure

Auxiliary_ID: Zero

Elements: A typical entry (j) in the matrix is associated with internal node number j and contains four 15 bit fields.

Bits 59-45: 15 freedom indicators for up to 15 degrees of freedom, left to right, per node. A 1 bit in this field indicates that the freedom is free. A zero bit indicates that the freedom is not free.

Bits 44-30: 15 freedom indicators for up to 15 degrees of freedom, left to right, per node. A 1 bit in this field indicates that the freedom is to be retained. A zero bit indicates that the freedom is not to be retained.

Bits 29-15: 15 freedom indicators for up to 15 degrees of freedom, left to right, per node. A 1 bit in this field indicates that the freedom is to be supported (with zero or non-zero specified displacement). A zero bit indicates that the freedom is not to be supported.

Bits 14-0: Reserved for future use.

Generation: Program LODOWN of the interact preprocessor
SUBSTRUCTURE_DOWNWARDS_LOADCASE_RUNCODES_MATRIX

File: DATARNF

Index_Name: IDLCoSSS

Type: MIXED

Dimensions: N * 1 where N = number of loadcases for the substructure at the next higher level.

Auxiliary_ID: Zero

Elements: The i-th entry corresponds to the i-th loadcase in the next higher level substructure. The value of this i-th entry is the number of the loadcase in substructure SSS which corresponds to the i-th loadcase in the higher level substructure. A value of 0 indicates that no loadcase in substructure SSS corresponds to the i-th loadcase in the next higher level substructure.

Generation: Program LODOWN of the interact preprocessor
SUBSTRUCTURE_LOADCASE_EXPANSION_RUNCODE_MATRIX

File: DATARNF

Index Name: IELC888

Type: MIXED

Dimensions: \((N+1)^*1\) where \(N\) = number of loadcases applied to the substructure.

Auxiliary_ID: Zero

Elements: Item 1 gives the total number of loadcases which are coming down to this substructure due to interaction. Item \(i\) gives the column number "coming down" of the \((i-1)\) loadcase applied to the substructure.

Generation: Program LODOWN of the interact preprocessor
SUBSTRUCTURE_FREEDOM_ACTIVITY_VECTOR

File: DATARNF

Index_Name: IFAVssss

Type: MIXED

Dimensions: N*1 where N = (number of nodes + 3)/4.

Auxiliary_ID: Zero

Elements: Item j consists of 4 packed 15 bit integers. The 15 bits are associated (left to right) with the fifteen degrees of freedom at the corresponding internal node. A "0" bit indicates no stiffness for the corresponding freedom; a "1" bit indicates positive stiffness.

Bits 59-45: Node 4j-3

Bits 44-30: Node 4j-2

Bits 29-15: Node 4j-1

Bits 14-0: Node 4j

Generation: Program JMAT of the interact preprocessor

SUBSTRUCTURE LOADCASE DOWNWARD ORDER VECTOR

File: DATARNF

Index_Name: ILDØssss

Type: MIXED

Dimensions: N*1 where N is the number of loadcases requested for back substitution.

Auxiliary_ID: Zero

Elements: Item j contains the j-th loadcase identifier requested.

Generation: Programs LODOWN and SUBCNTR of the interact preprocessor.
SUBSTRUCTURE LOADS, FREEDOM ACTIVITY VECTOR

File: DATARNF

Index Name: ILFAsss

Type: MIXED

Dimensions: N*1 where N = (number of nodes + 3)/4.

Auxiliary ID: Zero

Elements: Item j consists of 4 packed 15 bit integers. The 15 bits are associated (left to right) with the fifteen degrees of freedom at the corresponding internal node. A "0" bit indicates no load for the corresponding freedom. A "1" bit indicates a load at that freedom.

Bits 59-45: Node 4j-3
Bits 44-30: Node 4j-2
Bits 29-15: Node 4j-1
Bits 14-0: Node 4j

Generation: Program JMAT of the interact preprocessor
LOCAL COORDINATE SYSTEMS MATRIX

File: DATARNF

Index Name: IL0Cssss

Type: MIXED

Dimensions: 13*N where N is number of local coordinate systems.

Auxiliary ID:
Word 1: DATARNF
Word 2: IL0Cssss
Words 3-10: Zero

Elements:
A typical column j contains the following information pertaining to local coordinate system j:

Item 1:

Bits 17-0: The characters (BCD) CYL, SPH or REC to indicate the type of coordinate system (cylindrical, spherical or rectangular).

Item 2-4: Global coordinates of local origin (x, y, z).

Item 5-13: Elements of the 3 x 3 transformation matrix, t, that transforms a global representation to a local V(local) = t V(global). The order of the elements is t11, t21, t31, t12, ..., t33.

Generation: Program SUBCNTR of the interact preprocessor.
SUBSTRUCTURE REDUCED LOADS RUNCODE MATRIX

File: DATARNF

Index_Name: ILRcsss

Type: MIXED

Dimensions: \( N \times 1 \) where \( N \) = number of loadcases applied to the substructure.

Auxiliary_ID: Zero

Elements: The \( i \)-th item gives the internal loadcase number in the next higher substructure into which the \( i \)-th internal loadcase of this substructure is to be merged.

Generation: Program JRCGEN of the interact preprocessor
SUBSTRUCTURE NODAL CORRESPONDENCE TABLE

File: DATARNF
Index Name: INC1ssss
Type: MIXED
Dimensions: M+1 where:
\[ M = 4+J+K+N \]
\[ J = \frac{(LNN+59)}{60} - \frac{I}{60} \]
\[ I = \frac{((SSN-1)/60) \times 60}{60} + 1 \]
\[ K = \frac{(J+3)}{4} \]
\[ N = \text{Number of nodes} \]
LNN = Largest user node number
SNN = Smallest user node number

Auxiliary ID: Zero

Elements:

Item 1: I
Item 2: Highest user node number
Item 3: Pointer to start of block 2
Item 4: Pointer to start of block 3
Item 5-x: Block 1 where \( x = J+4 \)

Table to indicate the presence of a user ID. Bit 59 in the first word corresponds to the number in Item 1. Successive bits represent sequentially increasing node numbers. If a bit is "on" the number represented by it is a valid user node number.
Item $x+1-y$: Block 2 where $y = K+X$

Each word contains 4 packed 15 bit integers each of which has a value equal to the cumulative sum of all the "on" bits up to but not including the corresponding word in Block 1. Thus, the first word in Block 2 contains these sums for the first 4 words in Block 1 and so on.

Item $y+1-y+n$: Block 3 where $n =$ number of nodes

A typical row $y+i$ contains 3 packed 20 bit integers as follows:

Bits 59-40: The user node number, $(j)$, corresponding to the internal node number $(i)$.

Bits 39-20: Pointer, $(k)$ to the nodal data matrix. Row $(k)$ of the nodal data matrix contains the coordinates of internal node $(i)$, user node $(j)$.

Bits 19-0: The internal node number, $(m)$, corresponding to the user node number represented by the $i$-th "on" bit in Block 1.

Generation: Program SUBCNTR of the interact preprocessor
**SUBSTRUCTURE NODAL DATA MATRIX**

**File:** DATARNF

**Index Name:** INDMssss

**Type:** MIXED

**Dimensions:** N*4 where N is the number of nodes in this substructure.

**Auxiliary ID:** Zero

**Elements:**

A typical row of the substructure nodal data matrix contains:

- **Item 1:**
  - Bits 59-47: Contribution bit indicators for
  - and 34-18: substructures forming this substructure.
  - Bits 46-35: Analysis frame.
  - Bits 17-0: User node number.

- **Item 2:** Node x coordinate

- **Item 3:** Node y coordinate

- **Item 4:** Node z coordinate

**Generation:** Program MERGSS of the interact preprocessor
**SUBSTRUCTURE RETAINED FREEDOM VECTOR**

**File:** DATARNF

**Index Name:** IRFVssss

**Type:** MIXED

**Dimensions:** N*1 where N = number of retained freedoms in this substructure.

**Auxiliary ID:** Zero

**Elements:** Item \((j)\) is associated with the \(j\)-th retained freedom. This item contains 2 packed 30 bit integers as follows:

- **Bits 59-30:** The internal node number for this retained freedom.
- **Bits 29-0:** The freedom number for this retained freedom. Freedom number 1 is thrust in the X direction, number 5 is rotation about the Y axis, etc.

**Generation:** Program JMAT of the interact proprocessor
SUBSTRUCTURE_SORTING_POINTER_MATRIX

File: DATARNF
Index_Name: ISPnssss
Type: MIXED
Dimensions: (2N+1)*1 where N is the number of substructures interacting in this substructure.
Auxiliary_ID: Zero
Elements:
  Item 1: Pointer to the start of the information in ISRTssss for the first interacting substructure.
  Item n: Pointer to the start of the information in ISRTssss for the n-th interacting substructure.
  Item n+1: Dimension of ISRTssss.
  Item n+2: Display code equivalent of the first interacting substructure number.
  Item 2n+1: Display code equivalent of the n-th interacting substructure number.

Note: Item (i+1)-Item (i) equals the number of nodes in the i-th interacting substructure.

Generation: Program MERGSSS of the interact preprocessor.
SUBSTRUCTURE_REDUCE_STIFFNESS_RUNCODE_MATRIX

**File:** DATARNF

**Index Name:** ISRCSSS

**Type:** MIXED

**Dimensions:** $N \times 1$ where $N$ is the row dimension of the reduced stiffness matrix for this substructure.

**Auxiliary ID:** Zero

**Elements:** A typical item $i$ contains 2 packed 30 bit integers as follows:

- Bits 59-30: node number, $nn$
- Bits 29-0: freedom number, $nf$

These two integers indicate that the freedom indicated by row $i$ in the IRFVSSS matrix is synonymous with and to be merged into node $nn$ and freedom $nf$ of the next higher level substructure.

**Generation:** Program JRCGEN of the interact preprocessor
SUBSTRUCTURE_SORTING_MATRIX

File: DATARNF

Index_Name: ISRTssss

Type: MIXED

Dimensions: N*1 where N is the sum of the number of nodes in the interacting substructures forming this substructure.

Auxiliary_ID: Zero

Elements: This matrix is partitioned into groups for all interacting substructures. Each word represents one node in one substructure and contains 4 pieces of information.

Bits 59-45: 15 bits from the IACVssss entry for this node, either the "free freedoms" or the "retained freedoms"

Bits 44-33: Internal node number

Bits 32-12: User node number

Bits 11-0: Sorting position for this node in the nodal data matrix

Generation: Program MERGSS of the interact preprocessor.
## Substructure Definition Vector

<table>

</tbody>
</table>
SET/STAGE - SUBSTRUCTURE_CORRESPONDENCE_VECTOR

File: DATA RN F
Index_Name: ISSSCØR
Type: MIXED
Dimensions: N*1 where N = the number of substructures in the total analysis.

Auxiliary_ID: Word 1: DATA RN F
Word 2: ISSSCØR
Words 3-10: Zero

Elements: Item i contains 4 packed integers as follows:

Bits 41-30: NSSU = Upper substructure into which the substructure NSS is to be merged.

Bits 29-24: NSTAGE = Stage number.

Bits 23-18: NSET = Set number.

Bits 17-0: NSS = Substructure number.

The item indicates that the substructure number NSS is the same as set NSET, stage NSTAGE, and it is to be merged into substructure NSSU.

If an item has NSET = NSTAGE = 0, it implies that the substructure NSS is a higher level substructure.

If an item has NSSU = 0, it implies that the upward merging of the substructure NSS has not been defined.

One of the items may contain the following additional information.

Bit 59: ON

Bits 47-42: NSET = Set number assigned to the highest substructure.
The substructure NSS in this item is the highest substructure in the interaction process.

All items may contain the following additional information:

Bit 49: Indicator of formation of the final nodal data for the substructure. Bit is on if the final nodal data has been formed. Bit is off otherwise.

Bit 48: Indicator of formation of the "proper" freedom activity vector for the substructure. Bit is on if the proper vector has been formed. Bit is off otherwise.

Generation: Program SUBCNTR of the interact preprocessor.

Items 51-65: User selected freedom force labels (1 or 2 character BCD left-adjusted blank-filled words) for man/machine communications associated with the internal force freedoms 1-15, respectively, for all rectangular Cartesian coordinate reference frames associated with set x and stage i. Default words are FX, FY, FZ, MX, MY, and MZ.

Items 68-80: Same as items 51-65 but for all cylindrical reference frames. Default words are FR, FT, FZ, MR, MT, and MP, respectively.

Items 81-95: Same as items 51-65 but for all spherical reference frames. Default words are FR, FT, FP, MR, MT, and MP, respectively.

**Generation:** Programs JMAT and SUBCNTR of the interact preprocessor.
ELEMENT KEY MATRIX

File: DATARNF

Index Name: KELEKEY

Type: MIXED

Dimensions: N * 1 where N is a variable that is dependent upon the number of element types and the number of stress types, properties and property input combinations for each of the stiffness finite elements in the ATLAS library.

Auxiliary ID: Word 1: DATARNF
Word 2: KELEKEY
Words 3-10: Zero

Elements:

Row 1: Integer that is the total number of element types (NEL) currently available in ATLAS.

Row 2-(NEL+1):

Element identification and addresses.

Bits 59-24: Literal identifications of element types in left adjusted, blank-filled display code.

Bits 14-0: Right-adjusted 15 bit integers that are equal to the first row of data for each element type. For a specific element type (I), let ELROW(I) be the beginning row.

Row (NEL+2)-26:

Blank - reserved for future use.

The rest of the matrix will be occupied by NEL blocks of data, a block for each element type. Within each block, the following 4 groups of data
are stored in the order indicated for each element type (I).

<table>
<thead>
<tr>
<th>GROUP</th>
<th>NUMBER OF ROWS</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2</td>
<td>General information and table of contents for element type (I).</td>
</tr>
<tr>
<td>2</td>
<td>NP</td>

</tr>
<tr>
<td>3</td>
<td>NS</td>
<td>Stress literals.</td>
</tr>
<tr>
<td>4</td>
<td>NLPIC+1</td>
<td>Information for legal property input combinations.</td>
</tr>
</tbody>
</table>

The contents of each row in these 4 groups are described in detail below:

**GROUP 1:**

Row ELROW (I) - Three packed integers.

Bits 59-48: LLPCE  Relative location of legal property input combinations with respect to row ELROW(I). The information for the combinations will be stored in a block of rows beginning with row (ELROW(I) + LLPCE).

Bits 47-39: MAXNOD  Maximum number of nodes required to describe the element.

Bits 38-30: MINNOD  Minimum number of nodes required to describe the element.

Bits 29-0:  --  Zero-filled, reserved for future use.

Row ELROW(I)+1 - Five packed 12 bit integers.

Bits 59-48: NP  Number of items in the property list.

Bits 47-36: NS  Number of stress types.
Bits 35-24: NLPIC Number of legal property input combinations (≤7).

Bits 23-12: NN Maximum number of nodes used in the printing of element type information.

Bits 11-0: LSTL Relative location of stress literals with respect to ELROW(I). The stress literals are stored in a block of rows beginning with row (ELROW(I) + LSTL).

Groups 2 and 3 contain literals that are right adjusted, blank filled in display code:

**GROUP_2:**
- Row ELROW+2 PROP(1) - First element property literal.
- Row ELROW+NP+1 PROP(NS) - Last element property literal.

**GROUP_3:**
- Row ELROW(I)+LSTL STRS(1) - First element stress literal.
- Row ELROW(I)+LSTL+NS-1 STRS(NS) - Last element stress literal.

**GROUP_4:**
- Row ELROW(I)+LLPCS NLPIC 6 bit integers stored left to right, zero filled. Each integer identifies the number of input values corresponding to one of the legal property input combinations. The case where all properties are input is not included.

Rows ELROS(I)+LLPCE+1 to ELROW(I)+LLPCE+NLPIC Expansion keys for legal property input combinations. Each key is made up of 4 bit integers and occupies as many words as needed. The integers are stored left to right with zero fill in the last
word. As an example, assume the property list contains 10 items (NP = 10) and only 3 of these items are input; the other 7 being defaulted. The expansion key, 1 2 3 0 0 1 2 2 0 3, would indicate the following:

a) Input value 1 would be used for PROP(1) and PROP(6).

b) Input value 2 would be used for PROP(2), PROP(7) and PROP(8).

c) Input value 3 would be used for PROP(3) and PROP(10).

d) PROP(4), PROP(5) and PROP(9) would be set equal to zero.

Generation: Program ELKEYPR of the elementkey preprocessor.

Property Literals

Stress Literals
MATERIAL_CODE_MATRIX

File: DATARNF
Index_Name: KMATERA
Type: MIXED
Dimensions: 100 * 1
Auxiliary_ID: Word 1: DATARNF
Word 2: KMATERA
Words 3-10: Zero

Elements: Row K of the matrix contains the integer K if material properties are defined for material code K. If no properties are defined, row K is zero.

Generation: Program DPMATER of the material data preprocessor.
MATERIAL DATA MATRICES

File: DATARNF

Index Name: KM00001, KM00002, ..., KM00050 for standard materials.

KM00051, KM00052, ..., KM00099 for special materials

Type: MIXED

Dimensions: N * 32 where N is the number of temperatures at which material properties are defined for a material property code—the code being defined by MXX where XX are the last two digits in the matrix name.

Auxiliary ID: Word 1: DATARNF
Word 2: The matrix index name
Words 3-10: Zero

Elements: Each row of the matrix contains the following data:

Col. 1: The temperature at which the properties are specified (° Fahrenheit)

Col. 2: Density (lbs/cubic inch) at 70°F

Col. 3, 7, 11: E, E, E, Youngs moduli (psi)

Col. 4, 8, 12: ν12, ν23, ν31, Poissons ratios

Col. 5, 9, 13: G, G, G, Shear moduli (psi)

Col. 6, 10, 14: ε1, ε2, ε3, Linear thermal strain (percent).

Col. 15-17: FTU1, FTU2, FTU3 ultimate tension stress allowables (psi) in directions 1-2-3, respectively

Col. 18-20: FCU1, FCU2, FCU3 ultimate compression stress allowables (psi) in directions 1-2-3, respectively

Col. 21-23: FSU1, FSU2, FSU3 ultimate shear stress allowables (psi) in planes 1-2, 2-3, 3-1, respectively
Col. 24-26: FTY1, FTY2, FTY3 yield tension stress allowables (psi) in directions 1-2-3, respectively

Col. 27-29: FCY1, FCY2, FCY3 yield compression stress allowables (psi) in directions 1-2-3, respectively

Col. 30-32: FSY1, FSY2, FSY3 yield shear stress allowables (psi) in planes 1-2, 2-3, 3-1, respectively

NOTE: The property data are defined relative to the orthogonal (natural) axes, denoted by 1-2-3, of the material. A single subscript denotes a particular axis, whereas a double subscript denotes a particular natural-axes plane relative to which the property is associated.

Generation: Program DPMATER of the material data preprocessor.
COMPOSITE MATERIAL MATRIX

File: DATARNF

Index: KCMSUMM

Type: MIXED

Dimension: N*1, where N = NCO+1+NT*j*NV

Auxiliary ID:
- Word 1: DATARNF
- Word 2: KCMSUMM
- Word 3: NSP, number of materials defined.
- Words 4-10: Zero

Elements:

Item 1:
- Bits 59-29: A 1 in bit j indicates that material 60-j has been defined.
- Bits 28-5: Reserved.
- Bits 4-0: NCO, the maximum material number defined.

Item 2-NCO:
- Bits 59-48: Thickness*1000 (layer thickness).
- Bits 47-25: Future use.
- Bits 24-19: Number of values per temperature NV
- Bits 18-15: Number of temperature levels.
- Bits 14-0: Pointer to data. Item i+1 is the pointer word for material Ci.
Item NCO+2-N:

The following data for each temperature (NTj temperatures for the j-th material).

*Generation:* Program DPMATER of the material data preprocessor.
FLEXIBLE_ELEMENT_CONTROL_MATRIX

File:       DATARNF
Index_Name: KECØMAa
Type:       MIXED
Dimensions: M * 1 where M is equal to the number of flexible element matrices
Auxiliary_ID: Word 1: DATARNF
               Word 2: KECØMAa
               Words 3-10: Zero
Elements:   Row i contains the first word of the flexible element data matrix i.
Generation: Program SELEPRO of the stiffness preprocessor.
ELEMENT PROPERTY CODE MATRICES

File: DATARNF

Index Numbers: KEPCVRA (input order) KEPCVIA (internal order) KEPCVUa (user order)

Type: MIXED

Dimensions: \( M \times 1 \), where \( M = \frac{\text{Number of elements} + 4}{5} \)

Auxiliary_ID: Word 1: DATARNF
Word 2: The matrix index name.
Words 3-10: Zero

Elements: Bits 59-48 of word \( i \) contain the property code for the \((5i-4)\)th element in the respective order, Bits 47-36 contain the property code for the \((5i-3)\)th element, etc. Thus the property codes are stored left to right, 5 to a word. The unused portion of the last word is zero filled.

Generation: Programs SELERCH and SELEPRO of the stiffness preprocessor.
NODAL_INPUTCOORDINATESYSTEMS

File: DATARNF

Index_Name: KINPCSa

Type: MIXED

Dimensions: M * 1 where M equals the number of rows in the KNOALTa matrix.

Auxiliary ID:
Word 1: DATARNF
Word 2: KINPCSa
Words 3-10: Zero

Elements: A typical row of the matrix contains:

Bits 59-12: Reserved for future use

Bits 11-0: Input local coordinate system

The node represented by row i is identical to that represented by row i in the nodal data matrix. Thus the nodal correspondence table may be used to obtain the node-row correspondence of this matrix.

Generation: Program SSTINCO of the stiffness preprocessor.

50.112
LOCAL COORDINATE SYSTEMS MATRIX

File: DATARNF
Index Name: KLOC00a
Type: MIXED
Dimensions: 13 * N where N is number of local coordinate systems.
Auxiliary ID: Word 1: DATARNF
Word 2: KLOC00a
Words 3-10: Zero
Elements: A typical column j contains the following information pertaining to local coordinate system j:
Bits 17-0: The characters (BCD) CYL, SPH or REC to indicate the type of coordinate system (cylindrical, spherical or rectangular).
Item 2-4: Global coordinates of local origin (x, y, z).
Item 5-13: Elements of the 3 x 3 transformation matrix, t, that transforms a global representation to a local V(local) = t V(global). The order of the elements is t11, t21, t31, t12, ..., t33.
Generation: Program SNODRCH of the stiffness preprocessor.
**FLEXIBLE_ELEMENT NODAL MATRIX**

**File:** DATARNF

**Index Name:** KMELNØa

**Type:** MIXED

**Dimensions:** \( M \times 1 \) where:

\[
M = 1 + L + \sum_{i=1}^{L} \frac{(N_i + 4)}{5}
\]

\( L \) = number of flexible structural elements

\( N_i \) = number of nodes defining element \( i \) (\( \geq 1 \))

**Auxiliary ID:**

- Word 1: DATARNF
- Word 2: KMELNØa
- Words 3-10: Zero

**Elements:**

- **Item 1:**
  - Bits 59-15: Not used at present
  - Bits 14-0: Number of flexible structural elements.

- **Item 2-L+1:** Contain 5 packed numbers per element.
  - Bits 59-54: Element code (integer)
  - Bits 53-47: Number of nodes (integer)

The element property summary is zero except for the following elements:

- **BEAM:**
  - Bit 46: 1 if \( I_Y > 0 \)
    0 if \( I_Y = 0 \)

  - Bit 45: 1 if \( I_Z > 0 \)
    0 if \( I_Z = 0 \)

  - Bits 44-39: 0
COVER: Bit 46: 1 if upper surface present.
         0 if no surface present

Bit 45: Similar for lower surface.

Bits 44-39: 0

CPLATE: Bits 46-43: Number of laminae.

Bits 42-39: 0

CCOVER: Bits 46-43: Number of laminae in upper plate.

Bits 42-39: Lower plate.

Bits 38-30: Reserved for future use

Bits 29-15: Element user label (integer)

Bits 14-0: Pointer (within this matrix) to packed nodes for this element (integer)

Items I+2-M: Contains up to 5 packed 12 bit integers per word, representing the internal nodes for a particular element. For each element, this information starts in the left-most position of the word defined by the pointer of this element and uses as many words as needed by the number of nodes. For all words a fill left to right is employed. Unused bits are zero filled.

Generation: Program SELEPRO of the stiffness preprocessor.
**NODAL CORRESPONDENCE TABLE**

**File:** DATARNP

**Index Name:** KNC100a

**Type:** MIXED

**Dimensions:** M*1 where

\[ M = 4+J+K+N \]

\[ J = \frac{(LNN+59)}{60} - \frac{1}{60} \]

\[ I = \frac{((SNN-1)/60)*60+1}{1} \]

\[ K = (J+3)/4 \]

\[ N = \text{Number of nodes} \]

LNN = Largest user node number

SNN = Smallest user node number

**Auxiliary ID:** Zero

**Elements:**

- **Item 1:** I
- **Item 2:** Highest user node number
- **Item 3:** Pointer to start of Block 2
- **Item 4:** Pointer to start of Block 3
- **Item 5-X:** Block 1 where \( x = J+4 \)

Table to indicate the presence of a user id. Bit 59 in the first word corresponds to the number in item 1. Successive bits represent sequentially increasing node numbers. If a bit is "on" the number represented by it is a user node number.
Item X+1-Y: Block 2 where \( Y = K+X \)

Each word contains 4 packed 15 bit numbers each of which was a value equal to the cumulative sum of all the "on" bits up to but not including the corresponding word in Block 1. Thus the first word in Block 2 contains the sums for the first 4 words in Block 1 and so on.

Item Y+1-Y+N: Block 3 where \( N = \) number of nodes

A typical row \( Y+i \) contains 3 packed 20 bit integers as follows:

Bits 59-40: The user node number, \((j)\), corresponding to the internal node number \((i)\);

Bits 39-20: Pointer, \((K)\), to the nodal data matrix. Row \((K)\) of the nodal data matrix contains the coordinates of internal node \((i)\), user node \((j)\);

Bits 19-0: The internal node number, \((m)\), corresponding to the user node number represented by the \(i\)-th "on" bit in Block 1.

Generation: Program SNOODPROM of the stiffness preprocessor.
NODAL CONNECTIVITY MATRIX

File: DATARNF

Index_Name: KNDCØNa

Type: MIXED

Dimensions: N*1 where N = 1 + NOD5 + NSTR + NCON.

NOD5 = Number of nodes divided by 5.
NSTR = Number of structural nodes.
NCON = Variable depending on density of connectivity matrix.

Auxiliary_ID: Word 1: DATARNF
Word 2: KNDCØNa
words 3-10: Zero

Elements:

Item 1: Bits 59-45: Number of nodes.
Bits 44-30: Number of structural nodes.
Bits 29-15: Maximum nodal band width of lower triangular connectivity matrix (LTCM).
Bits 14-0: Maximum number of non-zero elements in one row of LTCM.

Items 2-NOD5+1:

Item i+1 corresponds to the ith internal node and contains its internal structural node number (ISNN). If it is not a structural node the item is zero.

Items NOD5+2-NOD5+NSTR+1:

Bits 59-45: ISNN of largest node connected to this structural node.
Bits 44-30: ISNN of lowest node connected to this structural node. (Zero if no lower connectivity)
Bits 29-15: Number of nodal connectivities for this node.

Bits 14-0: Pointer to row of connectivity matrix for this node.

Items NOD5+NSTR*2-N:

For each structural node, the ISNN of lower connected nodes are packed five to a word.

Generation: Program SELEPRO of the stiffness preprocessor.
ELEMENT NODAL DATA MATRIX

File: DATARNF

Index Name: KNØ001a, KNØ002a, ..., KNØ999a

Type: MIXED

Dimensions: M*1, where M is between 2500 and 3000 words, blocked so that the matrix does not contain partial element data.

Auxiliary ID: Word 1: DATARNF
Word 2: The matrix index name
Words 3-10: Zero

Elements:

Item 1: Bits 59-30: Reserved for future use.

Bits 29-15: NF, number of elements contained in this partition.

Bits 14-0: NBEG, internal number of first element in this partition.

Item 2-NF+1:

Bits 59-54: EG, the element code.

Bits 53-47: NOD, the number of nodes.

Bits 46-40: Reserved for future use.

Bits 39: Flag for indicating existence of delta coordinates (if equal to 1).

Bits 38-30: Total number of words in data body.

Bits 29-15: ULABEL, element user number.

Bits 14-0: POINT, pointer to be body of element data.
Item NF+2-M:

POINT + 0: Bits 59: Indicates existence of shear nodes.

Bits 58-47: Input sequence number of node.

Bits 46-35: Analysis coordinate system.

Bits 34-20: Input record number of nodes.

Bits 19-0: User node number.

POINT + 1: X-coordinate for the first node.

POINT + 2: Y-coordinate for the first node.

POINT + 3: Z-coordinate for the first node.

POINT + 4: ΔX-coordinate for the first node.

POINT + 5: ΔY-coordinate for the first node.

POINT + 6: ΔZ-coordinate for the first node.

Repeat for the next node as ordered in KSF matrix.

Repeat for the next element.

Generation: Program SELEPRO of the stiffness proprocessor.
NODAL DATA MATRIX

File: DATARNF
Index Name: KNOALTa
Type: MIXED
Dimensions: M*4 where M is dependent on the number and type of nodes.
Auxiliary ID: Word 1: DATARNF
Word 2: KNOALTa
Words 3-10: Zero

Elements: A typical row of the nodal data matrix contains:
Item 1: Bit 59: Reserved for future use.
      Bits 58-47: Input sequence number of the node.
      Bits 46-35: Analysis coordinate system.
      Bits 34-20: Input record number of the node.
      Bits 19-0: User node number.
Item 2: Node global X coordinate
Item 3: Node global Y coordinate
Item 4: Node global Z coordinate

In the case of a node pair two consecutive rows have the same contents in column 1. The second row, in columns 2, 3, 4 contain the ΔX, ΔY, ΔZ values for the nodes. The data for user node n does not necessarily appear in row n of the nodal data matrix. The nodal correspondence table may be referred to obtain the node-row correspondence.

Generation: Program SSTINCO of the stiffness preprocessor.
PARAMETER MATRIX

File: DATARNF

Index Name: KPARMS1

Type: MIXED

Dimensions: 25 * N where N is the maximum defined stiffness set number. N is limited to 36.

Auxiliary ID: Word 1: DATARNF
              Word 2: KPARMS1
              Words 3-10: Zero

Elements:

Item 1-8: Eighty characters for problem identification. These 80 characters are taken directly from the PROBLEM ID card appearing at the head of the control program being executed at the time this data was read.

Item 9: Number of nodes (integer ≤ 4095)

Item 10: Number of nodal data matrix rows

Item 11: Maximum user node number

Item 12: A code word indicating the status of the stiffness input preprocessing

Item 13: Number of flexible elements

Item 14: Number of flexible structural data matrices

Item 15: Number of rows (or structural elements) per structural data matrix (integer)

Item 16: Number of rigid structural elements (integer)

Item 17: Number of rigid structural data matrices (integer)

Item 18: Number of property data records input

Item 19: Number of special materials used.
Item 20: Number of defined execution stages
Item 21: Lumping factor.
Item 22: Maximum number of nodes used for brick elements.
Item 23: BIGBRICK indication -1 if nodal stresses are produced for bricks.
Item 24-25: Reserved for future use.

Generation: Program SSTINCO of the stiffness preprocessor.
PROPERTY DATA MATRIX

File: DATARNF

Index Name: KPRØPSa

Type: MIXED

Dimensions: $M \times 1$, where $M = 1 + \text{max property codes} + \sum (3 + NP_i)$ and NP is the number of properties for the ith property code.

Auxiliary ID:

Word 1: DATARNF
Word 2: KPRØPSa
Words 3-10: Zero

Elements:

Item 1:

Bits 59-12: Reserved for future use.
Bits 11-0: MC, maximum property code used.

Item 2-(MC+1):

Item $i + 1$ contains information for property code $i$. If this code is not defined, item $i + 1$ is zero.

Bits 59-28: Reserved for future use.
Bits 26-24: Pt, property type
$0 = \text{regular}, 7 = \text{composite}$

Bits 23-15: NP, number of properties for code $i$.

Bits 14-0: P, points to property identifier.

Item (MC+2)-M:

Property identifiers and property values for each property code, $NP+3$ words are stored in consecutive words as follows:
Words 1-3: Thirty character property identifier input in text mode.

Words 4-NP+1: Property values.

Generation: Program SPRORCH of the stiffness preprocessor.
**FLEXIBLE ELEMENT MATRICES (KSF-MATRICES)**

**File:** DATARNF

**Index Name:** KSF001a, KSF002a, ..., KSF999a.

**Type:** MIXED

**Dimensions:** M * 1 where M is currently not greater than 2500, initially 2500 words are reserved for each partition. When there is not enough room for the next element, or there are no more elements, its dimension is reduced to the actual number of words used.

**Auxiliary ID:**
- Word 1: DATARNF
- Word 2: The matrix index name.
- Words 3-10: Zero

**Elements:**

<table>
<thead>
<tr>
<th>Item</th>
<th>Bits 59-30:</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Reserved for future use</td>
<td></td>
</tr>
<tr>

<td>Bits 29-15:</td>
<td>ULABEL, The element user number (integer)</td>
</tr>
<tr>
<td></td>
<td>Bits 14-0:</td>
<td>POINT, pointer to the body of element data (integer)</td>
</tr>
</tbody>
</table>
Item NF+2-M: Additional description of the elements, (bodies of element data). The pointer word contains the following packed integers.

Bits 59-54: PC, number of properties (integer)
Bits 53-48: PP, property pointer, 0 if no properties (integer)
Bits 47-39: Element property summary

The element property summary is zero except for the following elements:

BEAM:
 Bit 46: 1 if IY > 0
 0 if IY = 0
 Bit 45: 1 if IZ > 0
 0 if IZ = 0

SPAR:
 Bit 46: 1 if T-Web > 0
 0 if T-Web = 0

COVER:
 Bit 46: 1 if upper surface present
 0 if no upper surface
 Bit 45: 1 if lower surface present
 0 if no lower surface

CPLATE:
 Bits 47-44: Number of laminae

CCOVER:
 Bits 47-44: Number of laminae in upper plate
 Bits 43-39: Number of laminae in lower plate

Bits 38-24: RECORD, the LODAREC input record number in which stiffness for this element was input (integer)

Bits 23-15: MC, the material code. If greater than 400B, material is MC-400B but has zero weight (integer), if zero the material is a composite.

Bits 14-0: TC, the element temperature +10000 in degrees Fahrenheit (integer)
The word following the pointer word is the first word of the element nodal data. The nodes (internal node numbers) are packed as 12 bit integers, 5 to a word, into this and the following words. The nodes are stored left to right with zero right fill. The number of nodal data words is thus \((\text{NOD}+4)/5\). There is at least one node and at most 127 nodes per element. If there are property data, PC is non-zero and the properties are stored in floating point form, one to a word directly following the nodal data. The property pointer PP is the relative address of the first property \((\text{PP}+\text{POINT})\).

A schematic picture of a flexible element matrix is shown below.

**Generation:** Program SELEPRO of the stiffness preprocessor.

PROPERTY DATA
ASSEMBLY_CONTROL VECTOR

File: DATARNF

Index_Name: KACV0ba

Type: MIXED

Dimension: N * 1 where N is the number of nodes for this data set.

Auxiliary_ID: Zero

Elements: A typical entry (j) in the matrix is associated with internal node number j and contains 4 15 bit fields.

Bits 59-45: 15 freedom indicators for up to 15 degrees of freedom, left to right, per node. A 1 bit in this field indicates that the freedom is "free," A zero bit indicates that the freedom is not free.

Bits 44-30: 15 freedom indicators for up to 15 degrees of freedom, left to right, per node. A 1 bit in this field indicates that the freedom is to be retained. A 0 bit indicates that the freedom is not to be retained.

Bits 29-15: 15 freedom indicators for up to 15 degrees of freedom, left to right, per node. A 1 bit in this field indicates that the freedom is to be supported (with zero or non-zero specified displacement). A 0 bit indicates that the freedom is not to be supported.

Bits 14-0: Reserved for future use.

Generation: Program SBCINPT of the boundary condition preprocessor.
LOAD CASE CORRESPONDENCE TABLE

File: DATARNF

Index Name: KCOReba

Type: MIXED

Dimensions: 11 * N where N is the number of load cases defined by the loads data.

Auxiliary ID: Zero

Elements: Column i contains the following information for the i-th internal load case.

Item 1: USERID. This is either a character string stored left adjusted with zero fill or a positive integer.

Item 2-11: USER TITLE. Stored as a text string. If no user title is input, rows 2-11 are zero.

Generation: Program SBCINPT of the boundary condition preprocessor.
SPECIFIED DISPLACEMENT MATRIX

File: DATARNF

Index Name: KD001ba,KD002ba,...,KD999ba

Type: MIXED

Dimensions: N*1 where N=block size (default 3000)

Auxiliary ID: Zero

Elements: This matrix consists of a set of word pairs.

Item i: Bits 59-48: Direct loads internal case number

Bits 47-36: Internal node number

Bits 35-30: Freedom number

Bits 29-15: Input record number

Bits 14-9: Reserved

Bits 8-0: Internal local coordinate system number in which load was input (0=GLOBAL)

Item i+1: Value of specified displacement

Generation: Program SBCINPT of the boundary condition preprocessor.
RETAINED_FREEDOM_VECTOR

File: DATARNF

Index_Name: KRFV0ba

Type: MIXED

Dimensions: N * 1 where N is the dimension of the reduced matrix for this data set and execution stage.

Auxiliary_ID: Zero

Elements: Item (j) is associated with the j-th retained freedom. This item contains 2 packed 30 bit integers as follows:

Bits 59-30: The internal node number for this retained freedom.

Bits 29-0: The freedom number for this retained freedom. Freedom number 1 is thrust in the X direction, number 5 is rotation about the Y axis, etc.

Generation: Program SBCINPT of the boundary condition preprocessor.
USER FREEDOM REFERENCE TABLE

File: DATARNF

Index Name: KUPRT0a

Type: MIXED

Dimensions: 95 * NS where NS is the number of defined boundary condition and superposition stages.

Auxiliary ID: Word 1: DATARNF
                Word 2: KUPRT0a
                Words 3-10: Zero

Elements: The ith column corresponds to the ith input boundary condition or superposition stage. The row entries are:

Item 1: Stage number (integer).

Item 2: Bits 59-18: User selected freedom activity label for partition 1 of the equilibrium equations (H format). Default is 4HFREE.
                       Bits 17-0: Sum of partition 1 type freedoms.

Item 3: Bits 59-18: Same as Item 2 but for partition 2. Default is 6HRETAIN.
                       Bits 17-0: Sum of partition 2 type freedoms.

Item 4: Bits 59-18: Same as Item 2 but for partition 3. Default is 7HSUPPORT.
                       Bits 17-0: Sum of partition 3 type freedoms.

Item 5: Reserved for future use.

50.135
Item 6-20: User selected freedom labels (2 character BCD left-adjusted blank-filled words) for man/machine communications associated with the internal kinematic freedoms 1-15, respectively, for all rectangular Cartesian coordinate reference frames associated with set X and state i. Default words are TX, TY, TZ, RX, FY, and RZ, respectively.

Item 21-35: Same as items 6-20 but for all cylindrical reference frames. Default words are TR, TT, TZ, FR, RT, and RZ, respectively.

Item 36-50: Same as items 6-20 but for all spherical reference frames. Default words are TR, TT, TP, RR, RT, and RP, respectively.

Item 51-65: User selected freedom-force labels (2 character BCD left-adjusted blank-filled words) for man/machine communications associated with the internal force freedoms 1-15, respectively, for all rectangular Cartesian coordinate reference frames associated with set X and stage i. Default words are FX, FY, FZ, MX, MY, and MZ, respectively.

Item 66-80: Same as items 51-65 but for all cylindrical reference frames. Default words are FR, FT, FZ, MR, MT, and MZ, respectively.

Item 81-95: Same as items 51-65 but for all spherical reference frames. Default words are FR, FT, FP, MR, MT, and MP, respectively.

Generation: Program SBCINPT of the boundary condition preprocessor.
COMBINED LOAD CASE MATRIX

**File:** DATARNF

**Index Name:** LCØMBba

**Type:** MIXED

**Dimensions:** 21 * NCLC. NCLC = number of combined load cases.

**Auxiliary ID:**
Word 1: DATARNF
Word 2: LCØMBba
Words 3-10: Zero

**Elements:** Column i contains information about the i-th combined load case.

- **Item 1:** User ID for the i-th input combination load case
- **Item j:** User ID for the (j/2)th component load case
- **Item j+1:** Factor for the (j/2)th component load case

**Generation:** Program NTRLUDE of the loads data preprocessor.
LOAD_CASE_CORRESPONDENCE_TABLE

**File:**          DATARNF

**Index_Name:**   LCØØRba

**Type:**         MIXED

**Dimensions:**   $11 \times N$ where $N$ is the number of load cases defined by the loads data.

**Auxiliary_ID:**
- Word 1:   DATARNF
- Word 2:   LCØØRba
- Words 3-10: Zero

**Elements:** Column $i$ contains the following information for the $i$-th internal load case.

**Item 1:** USERID. This is either a character string stored left-adjusted with zero fill or a positive integer.

**Item 2-11:** USER TITLE. This is stored as a text string. If no user title is input, items 2-11 are zero.

**Generation:** Program NTRLUDE of the loads data preprocessor.
SPECIFIED DISPLACEMENT MATRIX

File: DATARNF

Index Name: LD001ba, LD002ba, ..., LD999ba

Type: MIXED

Dimensions: N * 1 where N = block size (default 3000)

Auxiliary ID: Word 1: DATARNF
Word 2: The matrix index name
Words 3-10: Zero

Elements: This matrix consists of a set of word pairs.

Item i:
Bits 59-48: Direct loads internal case number
Bits 47-36: Internal node number
Bits 35-30: Freedom number
Bits 29-15: Input record number
Bits 14-9: Reserved
Bits 8-0: Internal local coordinate system number in which load was input. (0=global)

Item i+1: Value of specified displacement.

Generation: Program NTRLUDE of the loads data preprocessor.
DISTRIBUTED_LOAD_MATRIX

File:          DATARNF

Index_Name:    LE001ba, LE002ba, ..., LE999ba

Type:          MIXED

Dimensions:    N * 1 where N ≤ block size (default 3000)

Auxiliary_ID:  Word 1:          DATARNF
               Word 2:          The matrix index name
               Words 3-10:      Zero

Elements:      This matrix is a string of vectors, each vector defining the distributed loading on one element for one load case (or one face in the case of a brick). A typical vector contains:

Item 1:        Bits 59-45:      Internal element number
               Bits 44-39:      Number of values (m) following this word
               Bits 38-27:      Direct loads internal case number
               Bits 26-24:      = 0 if distributed load direction is given in global coordinates
                                 = 1 if distributed load direction is given in element local coordinate system
                                 = n if element is a brick where n is the surface number
               Bits 23-9:       Input record number
               Bits 8-0:        Pointer to the column in the matrix LEDIRba which gives the direction of the distributed load

Item 2-m+1: Distributed load values

Generation:    Program NTRLUDE of the loads data preprocessor.

50.140
ELEMENT LOAD DIRECTION MATRIX

File: DATARNF

Index Name: LEDIRba

Type: MIXED

Dimensions: 3 * N where N = number of load directions for element loading

Auxiliary ID: Word 1: DATARNF
              Word 2: LEDIRba
              Words 3-10: Zero

Elements: Column k contains either:

  Item i: The i-th component of the k-th vector defining a direction of action of applied element distributed loading. This is normalized.

  Item 1: Or the user node number whose components define a direction of action of applied element distributed loading.

  Item 2: 4RNODE

  Item 3: Zero

Generation: Program NTRLUDE of the loads data preprocessor.

DIRECT NODAL LOADS MATRIX

File: DATARNF

Index Name: LN001ba, LN002ba, ..., LN999ba

Type: MIXED

Dimensions: N * 1 where N ≤ block size (default 3000)

Auxiliary ID: Word 1: DATARNF
Word 2: The matrix index name
Words 3-10: Zero

Elements: This matrix is a set of word pairs (stored in input order).

Item i: Bits 59-48: Direct loads internal case number
Bits 47-36: Internal node number
Bits 35-30: Freedom number
Bits 29-15: Input record number
Bits 14-9: Reserved
Bits 8-0: Internal local coordinate system number in which load was input (0=global)

Item i+1: Value of the nodal load.

Generation: Program NTRLUDE of the loads data preprocessor.

50.143
**NODAL THERMAL LOAD INDEX TABLE**

**File:** DATARNF

**Index Name:** LNTLTba

**Type:** MIXED

**Dimensions:** N*1 where N = (number of nodes +1)/2

**Auxiliary ID:**
- Word 1: DATARNF
- Word 2: LNTLTba
- Words 3-10: Zero

**Elements:** Row i consists of:
- Bits 59-50: BLK for node i
- Bits 49-30: PTR for node i
- Bits 29-20: BLK for node N+i
- Bits 19-0: PTR for node N+i

Where PTR = row within block of LT------ where thermal loads are written for this node
and BLK = block of LT------ where thermal loads are written for this node

**Generation:** Program NTRLUDE of the loads data preprocessor.
**ROTATIONAL INERTIA LOADS MATRIX**

**File:** DATARNF

**Index_Name:** LRØTNba

**Type:** MIXED

**Dimensions:** 3 * N where N = number of rotation load cases input

**Auxiliary_ID:**
- Word 1: DATARNF
- Word 2: LRØTNba
- Words 3-10: Zero

**Elements**
- Column i contains the rotation definition for the i-th input inertia load case.

**Row 1:**
- Bits 59-48 Internal load case number
- Bits 47-33 Internal node number NN1
- Bits 32-18 Internal node number NN2
- Bits 17-0 Reserved

**Row 2:**
- Omega: The angular velocity

**Row 3:**
- Alpha: The angular acceleration

Where NN1 and NN2 define the axis of rotation.

**Generation:** Program NTRLUDE of the loads data preprocessor.
NODAL THERMAL LOAD MATRIX

File: DATARNF

Index_Name: LT001ba, LT002ba, ..., LT999ba

Type: REAL

Dimensions: N * NLCT where NLCT = number of thermal load cases and N = (block size)/NLCT. Default block size is 3000.

Auxiliary ID: Word 1: DATARNF
Word 2: The matrix index name
Words 3-10: Zero

Elements: Row i contains the thermal loads for the i-th internal node with thermal loading. Column j contains the thermal loads for the j-th thermal load case.

Generation: Program NTRLUDE of the loads data preprocessor.
**THERMAL_LOAD_CASE_CORRESPONDENCE_TABLE**

| **Generation:** | Program NTRLUDE of the loads data preprocessor. |

50.147
**ELEMENT THERMAL LOADS MATRIX**

**File:** DATARNF

**Index Name:** LU001ba, ..., LU999ba

**Type:** MIXED

**Dimensions:** N*1 where N ≤ 3000

**Auxiliary ID:**
- Word 1: DATARNF
- Word 2: The matrix index name
- Words 3-10: Zero

**Elements:** For each thermally loaded element there is a block of data in internal element order. These blocks are as follows.

Item i:
- Bits 59-45: Internal element number
- Bits 44-30: Element type
- Bits 29-15: NLC, Number of load cases
- Bits 14-0: User element number

Followed by NLC strings formatted as follows:

Item i+1:
- Bits 59-45: Internal loadcase number
- Bits 44-30: Number of thermal loads - NT
- Bits 29-15: Future use
- Bits 14-0: Input record number

Item (i+2)-(NT+1):
- Thermal loads

**Generation:** Program NTRLUDE of the loads data preprocessor
ELEMENT THERMAL LOAD CORRESPONDENCE

File: DATARNF

Index Name: LUX01ba, LUX99ba

Type: MIXED

Dimensions: N*1 where N equals number of elements with element thermal loading ≤ 3000

Word 1: DATARNF
Word 2: The matrix index name
Words 3-10: Zero

Elements: Each item contains pointers to the LU----- matrix

Bits 59-45: Internal element number
Bits 44-30: LU----- block number
Bits 29-15: Number of words for this element
Bits 14-0: Pointer to the first word of data

Generation: Program NTRLUDE of the loads data preprocessor
CONCENTRATED MASS DATA MATRICES

File: DATARNF

Index Name: MCMASga

Type: MIXED

Dimensions: NM*9 where NM equals the number of concentrated masses in the corresponding concentrated mass data subset.

Auxiliary ID: Word 1: DATARNF
Word 2: MCMASga
Words 3-10: Zero

Elements: Row K contains the following data for the K-th concentrated mass.

Item 1: Name of the concentrated mass

Item 2: Nodes describing the mass location:

Bits 59-36: Not used

Bits 35-30: Output local coordinate system number.

Bits 29-15: The internal node number of the mass offset

Bits 14-0: The internal node number that locates the mass center of gravity

Item 3: Weight

Item 4-9: Inertia data about the cg node. (IXX, IYY, IZZ, IXY, IXZ, IYZ)

Generation: Program MASPREP of the mass data preprocessor.
UNIQUE CONCENTRATED MASS NODES

File: DATARNF
Index Name: MCMNØDa
Type: MIXED
Dimensions: N * 1 where N equals the number of unique concentrated mass nodes.
Auxiliary_ID: Word 1: DATARNF
Word 2: MCMNØDa
Words 3-10: Zero
Elements: Row K contains the user node number which locates the K-th concentrated mass.
Generation: Program MASSMAT of the mass data preprocessor.
CONDITION DATA MATRIX

File: DATARNF

Index Name: MCØNDTa

Type: MIXED

Dimensions: CN * 5 where CN is equal to the total number of mass matrices requested.

Auxiliary ID:
- Word 1: DATARNF
- Word 2: MCØNDTa
- Words 3-10: Zero

Elements: Each row of the condition data matrix contains the following information:

Item 1: Condition paneling code
- BX = Lumped mass grid "X", where "X" is the display code equivalent to the 6 bit integer corresponding to the execution stage number.
- CX = Auxiliary panel subset "X", where "X" equals the subset number assigned the auxiliary paneling scheme for this condition.

Item 2: Mass matrix index name

Item 3: Fuel distribution code for this condition

Item 4: Payload distribution code for this condition

Item 5: Concentrated mass code for this condition.

Generation: Program MASPREP of the mass data preprocessor.
FUEL CONDITION ATTITUDE MATRIX

File: DATARNF

Index Name: MFATUDa

Type: MIXED

Dimensions: 10*N where N is the number of attitudes

Auxiliary ID:
- Word 1: DATARNF
- Word 2: MFATUDa
- Words 3-10: Zero

Elements:
Column i contains data for the ith attitude.

Item 1: A
Item 2: B Coefficients of the fuel plane equation
       AX + BY + CZ = 0
Item 3: C
Item 4: Roll angle
Item 5: Pitch angle
Item 6: Yaw angle
Item 7: X
Item 8: Y Coordinates of the rotation point
Item 9: Z
Item 10: The attitude number (integer)

Generation: Program MASSFG of the fuel generation preprocessor.
FUEL CONDITION DATA MATRIX

File: DATARNF
Index Name: MFCØNDa
Type: MIXED
Dimensions: 2*N where N is the number of fuel conditions.

Auxiliary ID:
Word 1: DATARNF
Word 2: MFCØNDa
Words 3-10: Zero

Elements: The ith column contains the data for the ith fuel condition.

Item 1:
Bits 59-40: Pointer to column in MFATUDa for attitude.
Bits 39-20: Sequence number
Bits 19-0: Condition number

Item 2: Weight

Generation: Program MASSFG of the fuel generation preprocessor.
**FUEL MANAGEMENT LOADING MATRIX**

**File:** DATARNF

**Index Name:** MFLOADa

**Type:** MIXED

**Dimensions:** N*1 where N varies depending on the number of fuel management load commands.

**Auxiliary ID:**
- Word 1: DATARNF
- Word 2: MFLOADa
- Words 3-10: Zero

**Elements:**
- Item 1: Number of sequences.
- Item 2-N: The data for each sequence is in a block as follows:
  - Word 1: Bits 59-30: Sequence ID
    - Bits 29-0: Number of load commands for this sequence.

  The data blocks for each load command within this sequence follow the first word: (5 words per load command)
  - Word 1: Bits 59-45: First tank ID
    - Bits 44-30: Second tank ID
    - Bits 29-15: Third tank ID
    - Bits 14-9: Not used
    - Bits 8-6: Number of tanks loaded in this command
    - Bits 5-3: Option number (1, 2, or 3)
    - Bits 2-0: Number 1
Word 2-4: Relative loading rates for tanks 1, 2, and 3.

Word 5: Tank ID - option 1
Weight - option 2
Total weight - option 3

Generation: Program MASSFG of the fuel generation preprocessor
FUEL MANAGEMENT USAGE MATRIX

File: DATARNF

Index_Name: MFMUSEa

Type: MIXED

Dimensions: N*1 where N varies depending on the number of fuel management usage commands.

Auxiliary ID:

Word 1: DATARNF
Word 2: MFMUSEa
Words 3-10: Zero

Elements:

Item 1: Number of sequences

Items 2-N: The data for each sequence is in a block as follows:

Word 1: Bits 59-30: Sequence ID
        Bits 29-0: Number of use and transfer commands for this sequence.

The data blocks for each command within this sequence follow the first word. (5-9 words per usage command, 2 words per transfer command)

Usage command:

Word 1: Bits 59-45: First tank ID
        Bits 44-30: Second tank ID
        Bits 29-15: Third tank ID
        Bits 14-9: Not used
        Bits 8-6: Number of tanks used in this command
Bits 5-3:  Option number (1, 2, 3, or 4)

Bits 2-0:  Number 2

Words 2-4:
Relative using rates for tanks 1, 2, 3

Word 5:  Weight - options 1 and 2
        4-15 bit packed tank idents - options 3 and 4

Word 6:  Weight - option 3

Word 6-9: Weight factors - option 4

Transfer commands:

Word 1:  Bits 59-45:  First tank ID
        Bits 44-30:  Second tank ID
        Bits 29-6:  Not used
        Bits 5-3:  Option number (1 or 2)
        Bits 2-0:  Number 3

Word 2:  Weight or percentage transferred

Generation:  Program MASSFG of the fuel generation preprocessor.
CARGO_HOLD_GEOMETRY_MATRIX

File: DATARNF
Index_Name: MHØLDSa
Type: MIXED
Dimensions: N*1 where N depends on the number of cargo holds and the type of hold description.

Auxiliary_ID: Word 1: DATARNF
Word 2: MHØLDSa
Words 3-10: Zero

Elements:

Item 1: Number of cargo holds (M)

Item 2-(2*M+1):

Word 1: Bits 59-45: User identification
Bits 44-42: Type code
Bits 41-36: Reserved
Bits 35-30: Number of hold sections
Bits 29-15: Reserved
Bits 14-0: Pointer to the hold geometry data.

Word 2: Density

Item (2*M+2)-N:

Hold geometry data, i words per section

Word 1: Bits 59-21: Reserved
Bits 20-6: Section identification
Bits 5-0: Number of nodes.
Words 2-i Contain 4 packed 15 bit internal node numbers describing each section.

**Generation:** Program MASSPL of the payload generation preprocessor.
WEIGHT STATEMENT LABEL DATA

File: DATARNF

Index_Name: MLABELa

Type: MIXED

Dimensions: N * 5 where N equals the number of defined weight statement labels.

Auxiliary_ID: Word 1: DATARNF
Word 2: MLABELa
Words 3-10: Zero

Elements: Row K contains the level identification and label for the K-th item of the weight statement.

Item 1: Level identification

Bits 59-6: The subset name or level indicator (display code)

Bits 5-3: Element component indicator (integer)

0 = all components
1 = upper spar caps and cover plates
2 = lower spar caps and cover plates
3 = spar webs

Bits 2-0: Level (integer)

Item 2-5: Weight statement label

Generation: Program MASPREP of the mass data preprocessor.
**MASS_ELEMENT_CORRESPONDENCE_TABLE**

**File:** DATARNF  
**Index_Name:** MLCT00a  
**Type:** MIXED  
**Dimensions:** M * 1 where M is the number of mass elements  
**Auxiliary_ID:**  
Word 1: DATARNF  
Word 2: MLCT00a  
Words 3-10: Zero  
**Elements:** A typical row (i) contains 4 packed 15 bit integers, (J), (K), (L), and (M) described as follows:  
Bits 59-45: (J) input sequence number corresponding to internal element (i)  
Bits 44-30: (K) internal element number corresponding to input sequence (i)  
Bits 29-15: (L) user element numbers stored in increasing order  
Bits 14-0: (M) internal element number corresponding to user element number (L)  
**Generation:** Program MASSMAT of the mass data preprocessor.
MASS Lumping DATA

File: DATARNF

Index Name: MLUMP0a

Type: MIXED

Dimensions: N*1 where N depends on the number of subsets referenced.

Auxiliary ID: Word 1: DATARNF
Word 2: MLUMP0a
Words 3-10: Zero

Elements: The data for each referenced node subset is stored in a block as follows, one word per subset.

Bits 59-12: The subset type (display code)

5LNODES
4LFUEL
7LPAYLOAD
4LSTIF
4LMASS

Bits 11-0: The subset number (integer)

Generation: Program MASSFAN of the mass data preprocessor.
MASS_ELEMENT_NODAL_MATRIX

File: DATARNF
Index_Name: MMELNØa
Type: MIXED
Dimensions: M * 1 where

\[ M = \sum_{i=1}^{L} \frac{(N_i + 4)}{5} + 1 \]

L = number of mass elements,
N = number of nodes describing element i (≥1)

Auxiliary_ID:
Word 1: DATARNF
Word 2: MMELNØa
Words 3-10: Zero

Elements:
Item 1: Bits 59-15: Not used at present
Bits 14-0: Number of mass elements

Item 2-L+1: Contain 5 packed numbers of identifiers as:
Bits 59-54: Element code (integer)
Bits 53-47: Number of nodes (integer)
Bits 46-30: Reserved for future use
Bits 29-15: Element user number (integer)
Bits 14-0: Pointer (within this matrix) to packed nodes for this element (integer)
Item L+2-M: Contains up to 5 packed 12 bit integers per word, representing the internal nodes for a particular element. For each element, this information starts in the left-most position of the word defined by the pointer of this element and uses as many words as needed by the number of nodes. For all words a fill left to right is employed. Unused bits are zero filled.

Generation: Program MASSMAT of the mass data preprocessor.
AUXILIARY PANEL DATA MATRIX

File: DATARNF

Index_Name: MPANLha

Type: MIXED

Dimensions: NPj * 3

where NPj equals the number of panels in the j-th panel data subset.

Auxiliary_ID: Word 1: DATARNF
Word 2: MPANLha
Words 3-10: Zero

Elements: Row K contains the description of the K-th panel.

Item 1: Panel identification word as follows:

Bits 59-45: Internal node number defining panel direction or the global direction indicator (1, 2, or 3)

Bits 44-39: Internal number of the output local coordinate system

Bits 38-33: Number of words in MPSETha

Bits 32-21: Pointer to row of MPSETha

Bits 20-0: Panel identification (integer)

Item 2-3: Internal node numbers defining the panel, 4 packed 15 bit integers.

Generation: Program MASSPAN of the mass data preprocessor.

50.166
**MASS_MODULE_CONTROL_DATA**

**File:** DATARNF

**Index Name:** MPARMS1

**Type:** MIXED

**Dimensions:** 50 * N where N is the largest defined mass data set number.

**Auxiliary ID:**
- Word 1: DATARNF
- Word 2: MPARMS1
- Words 3-10: Zero

**Elements:** The i-th column contains the following data for mass data set i:

- **Item 1:** Number of mass matrices requested
- **Item 2-4:** Reserved
- **Item 5:** Number of mass element matrices
- **Item 6:** Total number of mass elements
- **Item 7-10:** Reserved
- **Item 11:** Number of payload subsets
- **Item 12:** Number of fuel subsets
- **Item 13:** Number of concentrated mass subsets
- **Item 14-15:** Reserved
- **Item 16:** Number of node subsets for lumping
- **Item 17:** Number of execution stages
- **Item 18:** Number of auxiliary panel geometry matrices
- **Item 19-21:** Number of panels in each auxiliary panel matrix (3 packed 20 bit integers per word)
- **Item 22:** Reserved

50.167
Item 23: MPSETha matrix indicator, rightmost 9 bits

Bit 0: Auxiliary panel subset 1
Bit 1: Auxiliary panel subset 2

Bit 8: Auxiliary panel subset 9
0 = no MPSETha matrix defined
1 = MPSETha matrix is defined

Item 24: Reserved

Item 25: Number of grid nodes to consider at each retained node

Item 26: Reserved

Item 27: Stiffness element switch

0 - stiffness elements are not included in the mass calculations
1 - stiffness elements are included

Item 28: Number of weight correction factors

Item 29: Number of weight statement labels

Item 30: Number of unique concentrated mass points

Item 31: Mass matrix divisor factor

Item 32: Reserved

Item 33: Mass matrix grid radius

Item 34: Mass element switch

Item 35-50: Reserved

**Generation:** Program MASSMAT of the mass data preprocessor
PAYLOAD_CONDITIONS_MATRIX

File: DATAKNF

Index_Name: MPCONDa

Type: MIXED

Dimensions: 2*N, where N is the number of payload conditions

Auxiliary_ID: Word 1: DATARNF
Word 2: MPCONDa
Words 3-10: Zero

Elements:

Item 1: Bits 59-40: Number of passengers
Bits 39-20: Sequence identification
Bits 19-0: Condition identification

Item 2: Cargo weight

Generation: Program MASSPL of the payload generation preprocessor.
PAYLOAD_LOADNG_DATA

File: DATARNF

Index_Name: MPL0ADa

Type: MIXED

Dimensions: N*1 where N depends on the number of loading sequences and the type of command within each sequence.

Auxiliary_ID: Word 1: DATARNF
Word 2: MPL0ADa
Words 3-10: Zero

Elements:

Item 1: The number of loading sequences (integer)

Item 2-N: The data for each loading sequence is stored in a block as follows:

Word 1: Bits 59-51: Sequence identification

Bits 50-36: Pointer to next block of loading data.

Bits 35-24: Number of seats loaded.

Bits 23-15: Number of cargo load commands.

Bits 14-0: Pointer to the cargo commands.

Word 2-i: 4 packed 15 bit seat numbers per word stored left to right in the order of loading (i-1 words)
Word \((i+1)-j\):

Cargo loading data, one or two words for each loading command.

Bits 59-45: Cargo hold identification

Bits 44-6: Reserved

Bits 5-3: Local direction flag \((1=+x, 2=-x, 3=+y, 4=-y, 5=+z, 6=-z)\)

Bits 2-0: Option code

The following word contains the cargo weight, if specified.

**Generation:** Program MASSPL of the payload generation preprocessor.
SEAT LOCATION-LOCAL COORDINATE SYSTEMS MATRIX

File: DATARNF
Index_Name: MPL0CLa
Type: MIXED
Dimensions: 13 * N where N is the number of local coordinates systems.

Auxiliary_ID: Word 1: DATARNF
Word 2: MPL0CLa
Words 3-10: Zero

Elements: A typical column j contains the following information pertaining to local coordinate system j.

Item 1: Bits 59-18: Local coordinate system user ID Display code left-adjusted, blank-filled.

Bits 17-0: The characters (BCD) CYL, SPH, or REC to indicate the type of coordinate system (cylindrical, spherical, or rectangular).

Item 2-4: Global coordinates of local origin (x, y, z).

Item 5-13: Elements of the 3x3 transformation matrix, t, that transforms a global representation to a local V(local) = t V(global)

The order of the elements is t11, t21, t31, t12, ..., t33.

Generation: Program MASSPL of the payload generation preprocessor.
**SEAT_LOCATION_CORRESPONDENCE_TABLE**

**File:** DATARNF

**Index_Name:** MPNØCTa

**Type:** MIXED

**Dimensions:** N*1 where N=5+(highest user seat number-lowest user seat number)/50+number of seats.

**Auxiliary_ID:** Zero

**Elements:**

Item 1: A number (N) ≤ lowest seat number, N=M*60+1 where M = (smallest user seat number -1)/60

Item 2: Highest user seat number

Item 3: Pointer to start of Block 2

Item 4: Pointer to start of Block 3

Item 5-X: Block 1 where X = (item 2-item 1)/60+5

Table to indicate the presence of user id. Bit 59 in the first word corresponds to the number in item 1. Successive bits represent sequentially increasing seat numbers. If a bit is "on" the number represented by it is a user seat number.

Item X+1-Y: Block 2 where Y = ((X-3)/4+1) +X

Each word contains 4 packed 15 bit numbers each of which was a value equal to the cumulative sum of all the "on" bits up to but not including the corresponding word in Block 1. Thus the first word in Block 2 contains the sums for the first 4 words in Block 1 and so on.
Item Y+1-Y+n:

Block 3 where \( N = \) number of seats

A typical row \( Y+i \) contains 3 packed 20 bit integers as follows:

**Bits 59-40:** The user seat number, \((j)\), corresponding to the internal seat number \((i)\):

**Bits 39-20:** Pointer, \((K)\), to the seat location data matrix. Row \((K)\) of the seat location data matrix contains the coordinates of internal seat \((i)\), user seat \((j)\):

**Bits 19-0:** The internal seat number, \((m)\), corresponding to the user seat number represented by the \( i \)-th "on" bit in Block 1.

**Generation:** Program MASSPL of the payload generation preprocessor.
**SEAT LOCATION DATA MATRIX**

**File:** DATARNF

**Index Name:** MPNØDMA

**Type:** MIXED

**Dimensions:** M*4 where N equals the number of seats.

**Auxiliary ID:**
- Word 1: DATARNF
- Word 2: MPNØDMA
- Word 3: Passenger weight
- Words 4-9: IXX, IYY, IZZ, IXY, IXZ, IYZ
- Word 10: Zero

**Elements:** A typical row of the seat location data matrix contains:

- **Item 1:** Bit 59: Reserved for future use.
  - Bits 58-47: Input sequence number of the seat.
  - Bits 46-41: Input local coordinate system.
  - Bits 40-35: Reserved for future use.
  - Bits 34-20: Input record number of the seat.
  - Bits 19-0: User seat number.

- **Item 2:** Seat X coordinate

- **Item 3:** Seat Y coordinate

- **Item 4:** Seat Z coordinate

The data for seat n does not necessarily appear in row n of the seat location data matrix. The seat location correspondence table must be referenced to obtain the seat-row correspondence.

**Generation:** Program MASSPL of the payload generation preprocessor.
MASS PANEL SUBSET MATRIX

File: DATARNF

Index_Name: MPSETha

Type: MIXED

Dimensions: N*1 where N is variable but limited to a maximum of 63 words per panel in the corresponding auxiliary panel set.

Auxiliary_ID:
Word 1: DATARNF
Word 2: MPSETha
Words 3-10: Zero

Elements: MPSETha is organized into blocks of element subset numbers. Each block is referenced by the panels in the corresponding auxiliary panel set, and is organized as follows:

Item 1: Bits 59-48: Fuel - Payload indicator

Bit 54 1 indicates fuel elements
0 indicates no fuel elements

Bit 48 1 indicates payload elements
0 indicates no payload elements

Bits 47-0: Contain 4 12-bit subset indicators as follows:

Bits 11-10: Subset indicator as follows:
Mass Subset=00
Stiffness Subset=01
Mixed Subset=11

Bits 9-0: Subset number

Item 2-N: 5 packed 12-bit subset indicators as described above.

Generation: Program MASSPAN of the mass data preprocessor.
MASS ELEMENT, FUEL, AND PAYLOAD ELEMENT DATA

File: DATARNF

Index Name: MSF001a, MSF002a, ..., MSF999a (Mass Elements), MLØDppa (Payload elements), MFULffa (Fuel elements)

Type: MIXED

Dimensions: M * 1 where M is variable depending on the number of elements. The mass elements are stored in blocks of 3000 words or less. The fuel and payload elements are stored in a single block of 5000 words or less per matrix.

Auxiliary ID: Word 1: DATARNF
Word 2: Matrix index name
Word 3: The total number of elements in this data block
Words 4-10: Zero

Elements: The following element data is stored consequently beginning in row 1 with internal element 1. The data for the remaining elements follows in increasing internal element order.

Item 1: Bits 59: 1 if tapered plate or cover
Bits 58-54: The element type code
Bits 53-47: The number of nodes describing the elements
Bits 46-45: The element input format code
Bits 44-30: The element input record number
Bits 29-15: The element user number
Bits 14-0: The element internal number

Item 2: The element alphanumeric label

50.177
Item 3-n: The element properties as follows:

Rod, format 1 - Density
  - Area at node 1
  - Area at node 2

Rod, format 2 - Weight
  - Area at node 1
  - Area at node 2

Rod, format 3 - Weight

Scalar mass - Weight (IXX, IYY, IZZ, IXY, IXZ, IYZ)

Item (n+1)-(N+M):

The internal node numbers describing the element.
The nodes are stored as 4 packed 15 bit integers
per word, m words total.

Generation: Program MASSEL of the mass data preprocessor.
FUEL TANK DATA MATRIX

File: DATARNF

Index Name: MTANKSa

Type: MIXED

Dimensions: N * 1 where N varies depending on the number and type of tanks

 Auxiliary_ID: 
   Word 1: DATARNF 
   Word 2: MTANKSa 
   Words 3-10: Zero

Elements:

Item 1: Number of tanks (M)

The next 3M items are used in groups of 3 words per tank for the i-th tank

Item 1+3(i-1)+1:

   Bits 59-45: User identification 
   Bits 44-42: Type code (0 polygon, 1 brick) 
   Bits 41-36: Number of fuel levels 
   Bits 35-30: Number of sections 
   Bits 29-15: Reserved 
   Bits 14-0: Pointer to section data

Item 1+3(i-1)+2:

   Density

Item 1+3(i-1)+3:

   Percent tank usable.
The remaining items contain the section data

Pointer word:

Bits 59-21: Reserved

Bits 20-6: Section Identification

Bits 5-0: Number of nodes in this section

Pointer word +1-j:

4-15 Bit internal node numbers per word (as many words as needed for this section)

Generation: Program MASSFG of the fuel generation preprocessor.
EL3ENT WEIGHT FACTORS

File: DATARNF
Index Name: MWTFACa
Type: MIXED
Dimensions: N * 2 where N equals the number of element subsets that are to be factored.
Auxiliary ID: Word 1: DATARNF
Word 2: MWTFACa
Words 3-10: Zero
Elements: Row K contains the following data for the K-th subset to be factored.
  Item 1: Subset identification, SEKddd--i, SEMddd--i, FUEL----ff, or PAYLOAD--pp
           where i is the component indicator:
           0 = all components
           1 = upper spar caps and cover plates
           2 = lower spar caps and cover plates
           3 = spar webs
  Item 2: Subset weight factor (floating point)
or
           Bits 59-6: Zero
           Bits 5-0: Factor table identifier (integer)
Generation: Program MASPREEP of the mass data preprocessor.
**WEIGHT_FACTOR_TABLE_MATRIX**

**File:** DATARNF

**Index_Name:** MWTFTta

**Type:** MIXED

**Dimensions:** M*1 where M = 2* number of table values + number of constants + 1

**Auxiliary_ID:**
- Word 1: DATARNF
- Word 2: MWTFTta
- Words 3-10: Zero

**Elements:**

COMPRESSION ALLOWABLES TABLE

File: DATARNF

Index Name: NALL0WC

Type: MIXED

Dimensions: \(M*1, \text{ where } M = N+2 \sum_{i=1}^{N} NE_i.\)

\(N\) equals the number of tables and \(NE_i\) equals the number of gage entries for table \(i\). There is also \(NE_i\) compression allowable stress entries for table \(i\).

Auxiliary ID:

Word 1: DATARNF

Word 2: NALL0WC

Word 3: Number of tables (N)

Words 4-10: Zero

Elements:

Item 1-N:

Bits 59-45: Allowable table code (integer). The same material 1, 2, ..., varying temp. 10, 11, ..., 19, 20, 21, ... 29,

Bits 44-30: Temperature +500 (degrees Fahrenheit) (integer)

Bits 29-22: NT, number of temperatures (integer)

Bits 21-15: NE, number of entries (integer)

Bits 14-0: POINT, pointer to data (integer)

Item \((N+1)-(N+NE_i)\):

Gage (real)

50.185
Item \( (N+NEi+1)-(N+2NEi) \):

Compression allowable stress (real)

Item \( (N+2NEi+1)-M \):

Repeat for balance of tables

**Generation:** Program DESINPT of the design data preprocessor.
## SHEAR ALLOWABLES TABLE

**File:** DATARNF  
**Index Name:** NALL0WS  
**Type:** MIXED  

**Dimensions:**  
\[ M^*1, \quad \text{where} \quad M = N + 2 \sum_{i=1}^{N} NE_i. \]  

\( N \) equals the number of tables and \( NE_i \) equals the number of gage entries for table \( i \). There is also \( NE_i \) shear allowable stress entries for table \( i \).

**Auxiliary ID:**  
- Word 1: DATARNF  
- Word 2: NALL0WS  
- Word 3: Number of tables \( (N) \)  
- Words 4-10: Zero  

**Elements:**  
- **Item 1-N:**  
  - Bits 59-45: Allowable table code (integer)  
  - The same material 1, 2, ..., varying temp. 10, 11, ..., 19, 20, 21, ..., 29  
  - Bits 44-30: Temperature \(+500\) (degrees Fahrenheit (integer))  
  - Bits 29-22: \( NT \), number of temperatures (integer)  
  - Bits 21-15: \( NE \), number of entries (integer)  
  - Bits 14-0: POINT, pointer to data (integer)  

- **Item \( (N+1)-(N+NE_i) \):**  
  - Gage (real)

50.187
Item (N+NEi+1)-(N+2NEi):

Shear allowable stress (real)

Item (N+2NEi+1)-M:

Repeat for balance of tables

*Generation:* Program DESINPT of the design data preprocessor.
BUCKLING_INTERACTION_DATA_MATRIX

File: DATARNF

Index_Name: NBI001a, NBI002a, ..., NBI999a

Type: MIXED

Dimensions: M*1, where M ≤ 3100

Auxiliary_ID:
Word 1: DATARNF
Word 2: The matrix index name.
Words 3-10: Zero

Elements:

Item 1: Bits 59-30: Reserved

Bits 29-15: NF, number of elements contained in this partition (integer).

Bits 14-0: NBEG, number (internal) of first element in this partition (integer).

Item 2-(NF+1):

Bits 59-54: EC, the element code (integer).

Bits 53-15: Reserved for future use.

Bits 14-0: POINT, pointer to the body of buckling interaction data. (integer)

Item (NF+2)-M:

Buckling interaction data (real), six entries per element.

Generation: Program DESINPT of the design data preprocessor.
BUCKLING_TABLES_INDEX_MATRIX

File: DATARNF

Index_Name: NBUCTAB

Type: MIXED

Dimensions: 100 * 2

Auxiliary_ID: Word 1: DATARNF
              Word 2: NBUCTAB
              Words 3-10: Zero

Elements:

  Column 1: Row k contains the number of temperatures in
             compression allowables table NALLOWC for material
             k.

  Column 2: Row k contains the number of temperatures in shear
             allowables table NALLOWS for material k.

Generation: Program DESINPT of the design data preprocessor.
**FILE:** DATARNF

**Index_Name:** NC001ba, NC002ba, ..., NC999ba

**Type:** MIXED

**Dimensions:** M*1, where M = (NF+59)/60, and NF equals the number of elements in the corresponding NLxxxba matrix partition.

**Auxiliary_ID:** Word 1: DATARNF
Word 2: The matrix index name.
Words 3-10: Zero

**Elements:**
- Item 1-M-1: Zero (integer)
- Item M: $2^{K-1}$ (integer) where $K = NF - (M-1)*60$. This is a bit flag for the last element in the corresponding NLxxxba matrix partition.

**Generation:** Program DESINPT of the design data preprocessor.
THERMAL DESIGN LOAD CONTROL MATRIX

File: DATARNF

Index_Name: ND001ba, ND002ba, ..., ND999ba

Type: MIXED

Dimensions: \( M \times 1 \), where \( M = (NF+59)60 \), and NF equals the number of elements in the corresponding NTxxxba matrix partition.

Auxiliary_ID: Word 1: DATARNF Word 2: The matrix index name Words 3-10: Zero

Elements:

Item 1–M-1: Zero (integer)

Item M \( 2^{K-1} \) (integer), where \( K=NF-(M-1)*60 \). This is a bit flag for the last element in the corresponding NTxxxba matrix partition.

Generation: Program DESINPT of the design data preprocessor.
DESIGN_LOAD_CASE_MATRIX

File: DATARNF

Index_Name: NDLCRba

Type: MIXED

Dimensions: M*3, where M is the maximum number of design load cases (NDLC) plus 3 times the maximum number of superposition load cases (3*NSLC).

Auxiliary_ID: Word 1: DATARNF
Word 2: NDLCRba
Word 3: NDLC
Word 4: NDLC, the number of design load cases used.
Word 5: NSL, the number of superposition load cases used.
Words 6: NSC, the number of non-design ingredient loadcases used in superposition.
Words 7-10: Zero

Elements: Column 1 contains the following data:
Item 1-NDL: Internal load case number (integer)
Item (NDL+1)-NDLC: Zero (integer)
Item (NDLC+1)-(NDLC+NSC): Internal load case number (integer)
Item (NDLC+NSC+1)-M: Zero

Column 2 contains the following data:
Item 1-NDL: User label for design load cases (integer)
Item (NDL+1)-NDLC:

Zero

Item (NDLC+1)-(NDLC+NSC):

User label for non-design ingredient load cases of superposition load cases.

Item (NDLC+NSC+1)-(NDLC+2*NSLC):

Zero

Item (NDLC+2*NSLC+1)-(NDLC+2*NSLC+NSL):

User label for superposition load cases.

Item (NDLC+2*NSLC+NSL+1)-M:

Zero

Column 3 contains the following data:

Item 1-NDL: Ultimate/limit data, (0=ultimate, 1=limit) for corresponding load case (integer).

Item (NDL+1)-(NDLC+2*NSLC):

Zero

Item (NDLC+2*NSLC+1)-(NDLC+2*NSLC+NSL):

Ultimate/limit data, (0=ultimate, 1=limit) for corresponding load case (integer).

Item (NDCL+2*NSLC+NSL+1)-M:

Zero

Generation: Program DESINPT of the design data preprocessor.
**ELASTICITY_MODULUS_TABLE**

**File:** DATARNF

**Index_Name:** NEMØDUL

**Type:** MIXED

**Dimensions:** M*1, where $M = N + 2 \sum_{i=1}^{N} N_{Ei}$.

N equals the number of tables and $N_{Ei}$ equals the number of stress entries for table i. There is also $N_{Ei}$ elasticity modulus entries for table i.

**Auxiliary_ID:**
- Word 1: DATARNF
- Word 2: NEMØDUL
- Word 3: Number of tables (N)
- Words 4-10: Zero

**Elements:**

- **Item 1-N:** Bits 59-45: Modulus table code (integer). The same material 1, 2, ..., varying temp. 10, 11, ..., 19, 20, 21, ...
- Bits 44-30: Temperature +500 (degrees Fahrenheit) (integer)

ELEMENT_TYPE_AND_PARTITIONS

**File:** DATARNF

**Index Name:** NITYPEa

**Type:** MIXED

**Dimensions:** M*1, where M is the number of flexible elements for the defined data set.

**Auxiliary ID:**
- **Word 1:** DATARNF
- **Word 2:** NITYPEa
- **Words 3-10:** Zero

**Elements:** A typical row (i) contains the following packed data for internal element (i).

- **Bits 59-52:** KSFxxxx partition number.
- **Bits 51-44:** NBIXxxx partition number.
- **Bits 43-36:** NLxxxxx partition number.
- **Bits 35-33:** Reserved.
- **Bit 32:** Design property data indicator. A 1 bit indicates data was defined, a zero bit indicates it was not defined.
- **Bit 31:** Design fixed data indicator. A 1 bit indicates data was defined, a zero bit indicates it was not defined.
- **Bit 30:** Design upper bound data indicator. A 1 bit indicates data was defined, a zero bit indicates it was not defined.
- **Bit 29:** Design lower bound data indicator. A 1 bit indicates data was defined, a zero bit indicates it was not defined.
Bit 28: Design margin of safety data indicator. A 1 bit indicates data was defined, a zero bit indicates it was not defined.

Bit 27: Design resize data indicator. A 1 bit indicates data was defined, a zero bit indicates it was not defined.

Bits 26-22: Number of stiffness property values associated with this element.

Bits 21-18: Number of lamina in upper surface if this element is a composite. Otherwise it is zero.

Bits 17-14: Number of lamina in lower surface if this element is a composite with a lower surface. Otherwise it is zero.

Bits 13-6: NTxxxxx partition number.

Bits 5-0: Element type number.

Generation: Program DESINPT of the design data preprocessor.
ELEMENT_CONTROL_MATRICES

File: DATARNF

Index_Name: NKS001a, NKS002a, ..., NKS999a. Character 7 is the display code equivalent of the 6 bit integer corresponding to the data set number.

Type: MIXED

Dimensions: M*1, where M = (NF*59)/60, and NF equals the number of elements in the corresponding KSFxxx matrix partition.

Auxiliary_ID: Word 1: DATARNF
Word 2: The matrix index name
Words 3-10: Zero

Elements:

Item 1-M-1: Zero (integer)

Item M: $2^{K-1}$ (integer) where $K=\text{NF}-(M-1)*60$. This is a bit flag for the last element in the corresponding KSF matrix partition.

Generation: Program DESINPT of the design data preprocessor.

**Index Name:** NL001ba, NL002ba, ..., NL999ba

**Type:** MIXED

**Dimensions:** M*1, where M ≤ 3100. M = 1 + NF*(1 + 2*NDLC + 4*NSLC), NF is the number of elements in this partition, NDLC is the number of design loadcases, and NSLC is the number of superposition loadcases.

**Auxiliary ID:**
- Word 1: DATARNF
- Word 2: The matrix index name
- Word 3: NDLC
- Words 4-10: Zero

**Elements:**

**Item 1:**
- Bits 59-30: Reserved for future use
- Bits 29-15: NF, number of elements contained in this matrix (integer)
- Bits 14-0: NBEG, number (internal) of the first element in this partition (integer)

**Item 2-(NF+1):**
- Bits 59-54: EC, the element code number (integer)
- Bits 53-42: NSL, the number of user defined superposition load cases for this element (integer)
- Bits 41-30: NDL, the number of user defined design load cases for this element (integer)
- Bits 29-15: ULABEL, the user element number (integer)
- Bits 14-0: POINT, pointer to the body of element data (integer)
Item (NF+2)-M:

Element data.

Starting with the pointer word there are NDLC pairs of words containing design loads information as follows:

Word 1: Bits 59-9: LF, load factor (real)
        Bits 8-0: LC, loadcase number (integer), imbedded in right-most 9 bits of the LF WORD

Word 2: Element temperature (real)

Starting with the pointer word plus 2*NDLC there are NSLC sets of 4 words containing superposition loads information as follows:

Word 1: Superposition load case number (integer)

Word 2: Bits 59-9: LFS1, load factor for the first case (real)
        Bits 8-0: LCS1, loadcase number (integer)

Word 3: Bits 59-9: LFS2, load factor for the second case (real)
        Bits 8-0: LCS2, loadcase number (integer)

Word 4: Element temperature (real)

Generation: Program DESINPT of the design data preprocessor.
MATERIAL_CODE_REFERENCE_MATRIX

File: DATARNF

Index_Name: NMATERa

Dimensions: 100*3

Auxiliary_ID: Word 1: DATARNF
Word 2: NMATERa
Word 3: Maximum row in column 1 with a nonzero value.
Word 4: Number of nonzero elements in column 1.
Word 5: Number of nonzero elements in column 2.
Word 6: Number of nonzero elements in column 3.
Words 7-10: Zero

Elements:

Column 1: Row K contains the integer K if material number K has
been referenced during input of design data and if row K of the
Material Code Matrix KMATERA contains a K.

Column 2: Row K contains the integer K if the compression
Table K has been referenced during input of design data and if row K, column 1
of the buckling tables index matrix NBUCTAB contains a nonzero value.

Column 3: Row K contains the integer K if the shear table K
has been referenced during input of design data and if row K, column 2
of the buckling tables index matrix NBUCTAB contains a nonzero value.

Generation: Program DESINPT of the design data preprocessor.
MODULUS_TABLES_INDEX_MATRIX

File: DATARNF

Index Name: NMØDTab

Type: MIXED

Dimensions: 100 * 2

Auxiliary ID: Word 1: DATARNF
               Word 2: NMØDTab
               Words 3-10: Zero

Elements:

Column 1: Row k contains the number of temperatures in elasticity modulus table NEMODUL for material k.

Column 2: Row k contains the number of temperatures in shear modulus table NGMODUL for material k.

Generation: Program DESINPT of the design data preprocessor.
MARGIN OF SAFETY MATRICES

**File:** DATARNF

**Index Name:** NMS001a, NMS002a, ..., NMS999a

**Type:** MIXED

**Dimensions:** $M \times 1$, where $M = 1 + NF + \sum_{i=1}^{NF} NTOT_i$

NF is the number of elements in the corresponding partition of the KSF-matrix and NTOT is the number of words required for each block (body) of element safety data. The size of NTOT is dependent on element type.

**Auxiliary_ID:**
- **Word 1:** DATARNF
- **Word 2:** The matrix index name
- **Words 3-10:** Zero

**Elements:**

1. **Item 1:**
   - **Bits 59-30:** Reserved for future use
   - **Bits 29-15:** NF, number of elements contained in this matrix (integer)
   - **Bits 14-0:** NBEG, number (internal) of the first element in this partition (integer)

2. **Item 2-(NF+1):**
   - **Bits 59-54:** EC, the element code (integer)
   - **Bits 53-42:** Reserved for future use
   - **Bits 41-39:** NU, the number of words above pointer in data body (integer)
   - **Bits 38-30:** NTOT, total number of words in data body (integer)
Bits 29-15: ULABEL, the user element number (integer)

Bits 14-0: POINT, pointer to the body of element margin of safety data (integer)

Item (NF+2)-M: /
Margin of safety data

Generation: Program DESINPT of the design data preprocessor
OPTIMIZATION CONTROL MATRIX

File: DATARNF

Index Name: NOCNTRA

Type: MIXED

Dimensions: M*1, where M is number of optimization problems to be solved.

Auxiliary ID:
Word 1: DATARNF
Word 2: NOCNTRA
Words 3-10: Zero

Elements:

Item 1-M: Bits 59-54: MTYPE, element type.

Bits 53-42: ELID1, identity of subset 1. (0 indicates whole structure)

Bits 41-30: ELID2, identity of subset 2

Bits 29-15: Partition number of matrix NODxxxx containing problem data block.

Bits 14-0: Pointer to location of data block in NODxxxx.

Generation: Program DESINPT of the design data processor.
VARIABLE_CONSTRAINTS_CONTROL_MATRIX

File: DATARNF

Index_Name: NØDVCCa

Type: MIXED

Dimensions: M*1, where M is the number of optimization problems which can be constrained.

Auxiliary_ID: Word 1: DATARNF
Word 2: NØDVCCa
Words 3-10: Zero

Elements:

Item i: Bits 59-54: ELTYP, element type being constrained.

Bits 53-42: ELSS, subset being constrained.

Bits 41-35: Reserved.

Bits 34-30: NLT, total number of laminae for element type ELTYP in subset ELSS.

Bits 29-24: NLU, number of upper laminae in element type ELTYP in subset ELSS.

Bits 23-15: Reserved

Bits 14-0: Pointer to variable constraints data block in NVARIAa matrix. A zero indicates that constraint data is not defined for this optimization problem.

Generation: Program DESINPT of the design proprocessor.
OPTIMIZATION DATA MATRIX

File: DATARNF

Index Name: NØD001a, NØD002a, ..., NØD999a

Type: NIXED

Dimensions: M*1, M = (NW+1) * NOSM, where NOS = 3000/(NW+1) and NW = (Number of elements in data set + 59)/60. NW is number of words required for a bit position vector representing a data set of elements. NOSM represents the maximum number of data blocks in a partition. The last partition is truncated to include the number of defined data blocks.

Auxiliary_ID: Word 1: DATARNF
            Word 2: The matrix index name
            Words 3-10: Zero

Elements: Each data block is composed of a one word header and a NW word problem subset vector.

Item 1: Bits 59-45: Reserved

           Bits 44-30: NOSEK, number of elements in problem.

           Bits 29-15: MINSEK, minimum internal element number in problem.

           Bits 14-0: MAXSEK, maximum internal element number in problem.
Item 2-(NW+1):

Bits 59-0: The i-th bit of this NW word vector corresponds with the i-th internal element number associated with a particular data set. The bit numbering is left to right starting at 1. Each on bit indicates that the corresponding element is a part of the optimization problem represented by this data block.

Generation: Program DESINPT of the design data proprocessor.
PARAMETER MATRICES

File: DATARNF

Index Name: NPARAMa

Type: MIXED

Dimensions: M*1, where M = 6+2N and N equals the number of allowed stages (Max. = 10).

Auxiliary ID:
Word 1: DATARNF
Word 2: NPARAMa
Word 3: Largest stage number defined.
Word 4: Number of rows in KSF001A
Word 5: Number of elements in KSF001A
Words 6-10: Zero

Elements:

Item 1: Number of Design Data Blocks (number of NPDxxxxa partitions) (integer)

Item 2: Number of Bounds Data Blocks (number of NPBxxxxa partitions) (integer)

Item 3: Number of Margin Data Blocks (number of NMSxxxxa partitions) (integer)

Item 4: Number of Compression Allowable Tables (number of tables in NALLOWC) (integer)

Item 5: Number of Shear Allowable Tables (number of tables in NALLOWS) (integer)

Item 6: Number of Stop Sizing Blocks (number of NSTxxxxa partitions) (integer)

Item 6+2*i-1: Number of Design Loads Blocks for Stage i (number of NLxxxxba partitions) (integer)

Item 6+2*i: Number of Thermal Design Loads Blocks for Stage i (number of NTxxxxba partitions) (integer)

Generation: Program DESINPT of the design data preprocessor.
BOUND_DATA_MATRICES

File: DATARNF

Index_Name: NPB001a, NPB002a, ..., NPB999a

Type: MIXED

Dimensions: $M \times 1$, where $M = 1 + NF + \sum_{i=1}^{NF} NTOT_i$

NF is the number of elements in the corresponding partition of the KSF-matrix and NTOT is the number of words required for each block (body) of element bound data. The size of NTOT is dependent on element type.

Auxiliary_ID: Word 1: DATARNF
Word 2: The matrix index name
Words 3-10: Zero

Elements:

Item 1: Bits 59-30: Reserved for future use
        Bits 29-15: NF, number of elements contained in this matrix (integer)
        Bits 14-0: NBEG, number (internal) of the first element in this partition (integer)

Item 2-(NF+1):
        Bits 59-54: EC, the element code (integer)
        Bits 53-42: Reserved for future use
        Bits 41-39: NU, the number of words above pointer in data body (integer)
        Bits 38-30: NTOT, total number of words in the data body (integer)
        Bits 29-15: ULABEL, the user element number (integer)
Bits 14-0:  POINT, pointer to the body of element bound data (integer)

Item NF+2: Bits 59-54:  NLB, the number of lower bounds on element properties (integer)

Bits 53-48:  Reserved for future use

Bits 47-42:  NUB, the number of upper bounds on element properties (integer)

Bits 41-0:  Reserved for future use.

Item (NF+3)-(NF+NLB+2):

Lower bounds data (real, except for integer zero which indicates no change for that property)

Item (NF+NLB+3)-(NF+NLB+NUB+2):

Upper bounds data (real, except for integer zero which indicates no change for that property)

The block of bounds data are repeated for each element.

Generation:  Program DESINPT of the design data preprocessor.
DESIGN DATA MATRICES

File: DATARNF

Index Name: NPD001a, NPD002a, ..., NPD999a

Type: MIXED

Dimensions: \( M \times 1, \text{ where } M = 1 + NF + \sum_{i=1}^{NF} NTOT_i \)

NF is the number of elements in the corresponding partition of the KSF-matrix and NTOT is the number of words required for each block (body) of element design data. The size of NTOT is dependent on element type.

Auxiliary ID:
- Word 1: DATARNF
- Word 2: The matrix index name
- Words 3-10: Zero

Elements:

Item 1:
- Bits 59-30: Reserved for future use
- Bits 29-15: NF, number of elements contained in this matrix (integer)
- Bits 14-0: NBEG, number (internal) of the first element in this partition (integer)

Item 2-(NF+1):
- Bits 59-54: EC, the element code number (integer)
- Bits 53-42: Reserved for future use
- Bits 41-39: NU, the number of words above pointer in data body (integer)
- Bits 38-30: NTOT, total number of words in the data body (integer)
- Bits 29-15: ULABEL, the user element number (integer)
Bits 14-0: POINT, pointer to the body of element data (integer)

Item NF+2: Bits 59-54: DP, the number of design properties (integer)

Bits 53-48: DPP, relative pointer to design properties, 0 if no properties (integer)

Bits 47-42: FP, the number of fixed properties (integer)

Bits 41-0: Reserved for future use

Item NF+3: Bits 59-51: M, the material allowables code (integer)

Bits 50-42: MC, the compression buckling table code (integer)

Bits 41-33: MS, the shear buckling table code (integer)

Bits 32-21: Reserved for future use

Bits 20-9: MCF, the compression buckling table factor x 1000 (integer)

Bits 8-0: Reserved for future use

Item (NF+4) - (NF+DP+3):

Design property data (real, except for integer zero which indicates no change for that property)

Item (NF+DP+4) - (NF+DP+FP+3):

Fixed property data (real, except for integer zero which indicates no change for that property)

The block of design data are repeated for each element.

Generation: Program DESINPT of the design data preprocessor.
SMOOTHING PROPERTY CONTROL MATRIX

File: DATARNF

Index Name: NSMCNTa

Type: MIXED

Dimensions: M*1 where M is the total number of elements to be smoothed.

Auxiliary ID:
Word 1: DATARNF
Word 2: NSMCNTa
Words 3-10: Zero

Elements: Row i contains the following information for the i-th local element to be smoothed.

Bits 59-44: IELENO, the internal element number of the i-th element.

Bits 42-41: KO, flag indicating type of property data update to perform on composites:
0 = total replacement,
1 = layer count replacement

Bits 40-36: NP, the number of property values for element IELENO.

Bits 35-30: ITYPE, the integer type of element IELENO.

Bits 29-21: KSFPN, the partition number of the KSF matrix which contains data for IELENO.

Bits 20-15: NSPPN, the partition number of the NSP matrix which contains property data for smoothing IELENO.
Bits 14-0: IPOINT, pointer to the data block in the NSPPN partition of the NSPxxxx matrix where the property values for smoothing IELENO will be stored.

Generation: Program DESINPT of the design data preprocessor.

<tr>
<td>Row $i$ contains the following information for the $i$-th smoothing problem.</td>
<td></td>
</tr>
<tr>
<td><strong>Bits 59-58:</strong></td>
<td>KO, this is the smoothing option key. A zero value indicates that the user has specified a set of property values in the input data for smoothing. A 1 value indicates that the property values are to be obtained from internal element IDKE. A 2 value indicates that IDSM must be decoded into a 10 bit subset number and a 6 bit element type. The subset must be scanned for the maximum property values of the specified element type.</td>
</tr>
<tr>
<td><strong>Bits 57-42:</strong></td>
<td>IDSM, this is the identity of the smoothing problem. If CODE is represented by a zero bit, IDSM identifies the internal element number of an element to be smoothed. If CODE is represented by a 1 bit, IDSM identifies an element type (ITYPE, bits 47-42) within a stiffness element subset (IDS, bits 57-48) to be smoothed.</td>
</tr>
</tbody>
</table>
Bit 41: CODE, this code bit defines the use of the IDSM field. A zero bit indicates that IDSM is an internal element number (IELENO). A 1 bit indicates that IDSM is packed with a subset number (IDS) and an element type (ITYPE). See IDSM for subfield bit ranges.

Bits 40-36: NP, number of property values associated with this problem.

Bits 35-21: IDKE, identity of the element for obtaining property values if the value of KO is 1. Otherwise IDKE is zero.

Bits 20-15: NSPPN, identity of the NSPxxxx partition where the property data for smoothing is to be stored. If KO is zero, the data is stored during input. Otherwise it is stored during execution.

Bits 14-0: IPOINT, pointer to the data block in the NSPPN partition of the NSPxxxx matrix where the property values for smoothing problem i will be stored.

Generation: Program DESINPT of the design data preprocessor.
SMOOTHING PROPERTY DATA MATRIX

File: DATARNF

Index Name: NSP001a, NSP002a, ..., NSP999a

Type: MIXED

Dimensions: M*1 where M ≤ 3100

Auxiliary ID: Word 1: DATARNF
              Word 2: The matrix name.
              Words 3-10: Zero

Elements: This matrix contains a series of property data blocks that are defined in response to the smoothing data. There is one block reserved for each smoothing problem (row) of the NSMKEYa matrix. The element type associated with the smoothing problem dictates the block size.

Generation: Program DESINPT of the design data proprocessor.
**RESTRAIN_SIZEING MATRIX**

**File:** DATARNF

**Index Name:** NST001a, NST002a, ..., NST999a

**Type:** MIXED

**Dimensions:** $M \times 1$, where $M = (\text{NF}+59)/60$ and NF equals the number of elements in the corresponding KSF matrix partition.

**Auxiliary ID:**

- Word 1: DATARNF
- Word 2: The matrix index name
- Word 3: NBEG
- Words 4-10: Zero

**Elements:** Each item contains element sizing data where each bit position, numbered right to left, corresponds to an internal element number. Elements 1 through 60 are represented by row 1, elements 60(i-1) through 60i are represented by row i, etc.

The bit code is as follows:

- 0 = element is to be sized
- 1 = restrain (stop) element sizing

**Generation:** Program DESINPT of the design data preprocessor.
TEMPERATURE DATA MATRICES

File: DATARNF

Index_Name: NT001ba, NT002ba, ..., NT999ba

Type: MIXED

Dimensions: M*I, where M ≤ 3100. M=1+NF*(1+4*NTLC), NF is the number of elements in this partition, and NTLC is the number of thermal design loadcases.

Auxiliary_ID: Word 1: DATARNF
Word 2: The matrix index name
Words 3-10: Zero

Elements:

Item 1:
Bits 59-30: Reserved for future use
Bits 29-15: NF, number of elements in this matrix (integer)
Bits 14-0: NBEG, number (internal) of the first element in this partition (integer)

Item 2-(NF+1):

Bits 59-54: EC, element code number (integer)
Bits 53-42: NTL, number of defined thermal design loadcases for this element (integer)
Bits 41-30: Reserved
Bits 29-15: ULABEL, user element number (integer)
Bits 14-0: POINT, pointer to the body of element data (integer)
Item (NF+2) - M:

Element data.

Starting with the pointer word there are NTCL sets of 4 words containing thermal design loads information as follows:

Word 1: Thermal design loadcase number (integer)

Word 2: Bits 59-9: LFS1, load factor for the first case (real)

          Bits 8-0: LCS1, loadcase number (integer)

Word 3: Bits 59-9: LFS2, load factor for the second case (real)

          Bits 8-0: LCS2, loadcase number (integer)

Word 4: Element temperature (real)

Generation: Program DESINPT of the design data preprocessor.

50.224
THERMAL DESIGN LOAD CASE MATRIX

File: DATARNF

Index Name: NTLCRba

Type: MIXED

Dimensions: M*3, where M is the maximum number of thermal design load cases (NTLC) plus the maximum number of ingredient load cases (2*NTLC).

Auxiliary_ID: Word 1: DATARNF
                Word 2: NTLCRba
                Word 3: ITL, the number of thermal design load cases used.
                Word 4: ITC, the number of thermal design ingredient load cases used.
                Words 5-10: Zero

Elements: Column 1 contains the following data:

Item 1-ITC: Internal load case number (integer)

Item (ITC+1)-M:

Zero

Column 2 contains the following data:

Item 1-ITC: User label for ingredient load cases.

Item (ITC+1)-(2*NTCL):

Zero

Item (2*NTLC+1)-(2*NTLC+ITL):

User label for thermal design load cases.

Item (2*NTLC+ITL+1)-M:

Zero
Column 3 contains the following data:

Item 1-(2*NTLC):
Zero

Item (2*NTCL+1)-(2*NTLC+ITL):
Ultimate/limit data, (0=ultimate, 1=limit) for corresponding load case (integer).

Item (2*NTCL+ITL+1)-M:
Zero

Generation: Program DESINPT of the design data preprocessor.
**VARIABLE CONSTRAINTS DATA MATRIX**

**File:** DATARNF  
**Index Name:** NVARIAa  
**Type:** MIXED  
**Dimensions:** \( M \times 1 \), where \( M \) is equal to the sum of 10 times the number of CPLATE constraint problems plus 20 times the number of CCOVER constraint problems.  

**Auxiliary ID:**  
- **Word 1:** DATARNF  
- **Word 2:** NVARIAa  
- **Words 3-10:** Zero  

**Elements:**  
The elements are grouped into data blocks, one block for each constraint problem. The first 10 positions of a block are assigned to the upper layer. If a CCOVER is constrained, a second set of 10 positions are assigned to the lower layer. The indexing is 1 to 10 for a CPLATE and 1 to 20 for a CCOVER.  

Within each block the \( i \)th relative location is associated with the \( i \)th-laminae, and contains the number of the constraint lamina.  

The data blocks are accessed using pointers from the NODVCCa matrix.  

**Generation:** Program DESINPT of the design data preprocessor.
**FH03_CASE_DATA_MATRIX**

**File:** DATARNF

**Index Name:** R30i000

**Type:** MIXED

**Dimensions:** 2008 * 1

**Auxiliary ID:**
- Word 1: DATARNF
- Word 2: R30i000
- Words 3-10: Zero

**Elements:** The array contains the contents of the FH03 adjacentely stored labeled common blocks:

- **EASIC**
- **CSGEO**
- **OPTIONS**
- **TABLE**
- **COUNT**
- **COND**
- **MSGEO**
- **FILES**
- **FO**
- **3MOD**

**EASIC** contains constants, counter, and key FH03 options.

**COMMON**

- **/BASIC/**

- **ZERO** = Complex zero
- **PI** = Value of PI
- **PI02** = PI/2
- **INDCM** = C=Matrix indicator, B=main surface, N=control surface
- **SYM** = Symmetry indicator, 1-symmetric, 2-antisymmetric
- **SPAN** = Semispan
- **BO** = Root semichord (or some other reference length)
- **SH** = Span/BO
- **KVAL** = K-value, reduced frequency = BO*OMEGA/V
- **MACH** = Mach number
- **BETA** = SQRT (1-Mach**2)
- **KSQD** = KVAL**2
- **BETASQD** = BETA**2
RHO3RNF = Name of the RHO3 output random name file. INPREP extracts the name from the ATLAS labeled common block KQRNDM. It is normally equal to 7LRH03RNF.

NCASE = The data case number for the current RHO3 data case

NCOND = The data condition number for the current RHO3 data condition.

OPTIONS contains variables choosing optional paths.

COMMON /OPTIONS/

CMOPT = C-Matrix option,
        .T. = Generate a new C-matrix file
        .F. = Use/update an old C-matrix file

PRSOPT = Pressure report option,
        .T. = Report unsteady pressure at default or user defined locations
        .F. = No report

SGFOPT = Sectional generalized force option,
        .T. = Report sectional generalized forces at default or JSER defined chords,
        .F. = No generalized force calculations

GEXOPT = Gust excitation option,
        .T. = Include a gradual or non-gradual penetration gust mode

VPOPT = Velocity profile option,
        .T. = Modify modal input by user supplied velocity profile = V(LOCAL)/V(INFINITY)

MINOPT = Modal input print option,
        .T. = Print input points and deflections

MOPOPT = Modal output print option,
        .T. = Print interpolated deflection and slope at downwash points

DWPOPT = Downwash print option,
        .T. = Print downwash matrix

PCPOPT = Pressure coefficient print option,
        .T. = Print coefficients of the assumed pressure series

50.229
GFFOPT = Generalized force print option,
         -1=Print no generalized forces
         0=Print all generalized forces
         N=Print first N generalized forces

SFSOPT = Scratch file save option,
         .T.=Do not delete scratch files
              RHOSC1 and RHOSC2 following job
              completion,
         .F.=Delete scratch files

ATLASOP = ATLAS input option,
         .T.=MIFILE will be a SNARK I/O
              sequential file containing
              modal input point coordinates
              and deflection
         .F.=No ATLAS type input

NSOPT = Non-symmetric planform option,
         .T.=Planform specified has no mirror
              image, e.g., fin,
         .F.=Standard mirror image planform

MITOPT = Modal input point transformation
         option,
         .T.=Do not perform coordinate trans-
              formation on input points in
              surface spline interpolation

COUNT contains variables defining the problem size

COMMON /COUNT/

NDWC = Number of downwash chords
NPDWC = Number of points per downwash chord
NDWP = Number of downwash point=NDWC*NPDWC
NSPT = Number spanwise pressure terms
NCPT = Number of chordwise pressure terms
NPTRM = Number of assumed pressure modes=
         NSPT*NCPT
NPRC = Number of pressure report chords
NPPRC = Number of points per pressure report chord
NPPT = Number of pressure report points =
         NPRC*NPPRC
NSGFC = Number of sectional generalized
         force report chords
NDWMDS = Number of downwash modes
NWTMDS = Number of weighting function modes
         Note NDWMDS=NWIMDS+1(if GEXOPT.T.)
NOKVAL = Number of reduced frequencies
IKVAL = Reduced frequency counter
NOMACH = Number of structural grid (modal input) points

MSGEOM contains main surface geometry data

COMMON /MSGEOM/

MSID = Main surface C-matrix ID
YDWC(9) = Downwash chords
XDWP(72) = Downwash points
DXLEDWC(9) = Slope of leading edge at downwash chord intersect
XGUST = Zero phase reference point for a gradual penetration gust mode
YROOT = Y value of planform root from user input YLE, used to relocate all Y values about zero
XMDWC(9) = Mid-chord of downwash chords
BOWC(9) = Semi-chord value of downwash chord
DXTEDWC(9) = Slope of trailing edge at downwash chord intersect
NLE = Number of leading edge definition points
XLE(10) = X-value of leading edge definition points
YLE(10) = Y-value of leading edge definition points
DXLEDY(9) = Slope of leading edge definition lines
XLEDWC(9) = Leading edge of downwash chords
NTE = Number of trailing edge definition points
XTE(10) = X-value of trailing edge definition points
YTE(10) = Y-value of trailing edge definition points
DXTEDY(9) = Slope of trailing edge definition lines
XTEDWC(9) = Trailing edge of downwash chords

50.231
CSGEOM contains surface geometry data

COMMON /CSGEOM/

NOCS = Number of control surfaces
CSID(4) = Control surface C-matrix ID
CSTYPE(4) = Control surface type, 1=full, 2=tip, 3=mid, 4=partial
CSRS(4) = Surface to which control surface is related (attached)
HGAP(4) = Gap at hinge between main surface and control surface
XHLI(4) = X-value inboard hinge definition point
YHLI(4) = Y-value inboard hinge definition point
XHLBARI(4) = X-bar value of L.E. of inboard C/S side edge
XHLO(4) = X-value outboard hinge definition point
YHLO(4) = Y-value outboard hinge definition point
XHLBARO(4) = X-bar value of L.E. of outboard C/S side edge
DXHLDY(4) = Slope of hinge line
XHLDWC(4,9) = Hinge intersection of downwash chord
DXHLDWC(4,9) = Slope of hinge at downwash chord intersect

TABLE will contain the RH03 C-matrix index table

COMMON /TABLE/

RTITLE.19) = Run title with date appended
TABLE = CMFILE table of contents
(18,50) NOMAT = Number of C-matrices in CMF1 file of CMFILE
ITHMAT = The number of a C-matrix on (or to be put on) CMFILE. When extracting a C-matrix from CMFILE, ITHMAT will be the one to be read. After writing a C-matrix on CMFILE, NOMAT and ITHMAT will be the one to be read. After writing a C-matrix on CMFILE, NOMAT and ITHMAT will be equal.
The following variables are stored in TABLE prior to C-matrix generation or use. They will be stored elsewhere or discarded before TABLE is needed for C-matrix indexing.

(TABLE,YPC), (TABLE(12,1),XPPT),
(TABLE(9,14),PXLE), (TABLE(2,15),PDSLEDE),
(TABLE(14,180),PDXHLDE), (TABLE(4,21),PXTE),
(TABLE(15,21),PDXTEDE), (TABLE(8,22),PB),
(TABLE(1,23),YSGFC), (TABLE(4,24),XLESgf),
(TABLE(7,25),DXLDESf), (TABLE(10,26),XMIDSGF),
(TABLE(13,27),XHLGSgf), (TABLE(7,32),DXHLSGF),
(TABLE(1,37),XTESgf), (TABLE(4,38),DXTDESf),
(TABLE(7,39),BSgf), (TABLE(10,40),NVPPTS),
(TABLE(11,40),VPFL), (TABLE(1,42),XVP),
(TABLE(9,43),COFVP), (TABLE(1,49),DVPFL),

Variables associated with pressure report

YPC = Spanwise stations of chords containing pressure report points
XPPT = X-coordinates of pressure report points on the chords YPO
PXLE = Chord intersect with leading edge
PDXLEDE = Slope of leading edge at PXLE
PXMD = X-coordinate of chord midpoint
PXHL = Chord intersection with control surface hinge line(s) or the constant percent chord extension(s)
PDXHLDE = Slope of line intersection chord at PXHL
PXTE = Chord intersect with trailing edge
PDXTEDE = Slope of trailing edge at PXTE
PB = Length of semi-chord

Variables associated with sectional generalized forces

YSGFC = Spanwise stations of chords for sectional generalized forces
XLESgf = Chord leading edge intersect
DXLDESf = Slope of leading edge at XLESgf
XMIDSGF = X-coordinate of chord midpoint
XHLGSgf = Chord intersection with control surface hinge line(s) of the constant percent chord extension(s)
DXHLSGF = Slope of line intersecting chord at XHLSGF
XTESGF = Chord trailing edge intersect
DXTDESF = Slope of trailing edge at XTESGF
BSGF = Length of semi-chord

Variables associated with velocity profile

VPFL = Profile modification
XVP = Percent of chord corresponding 1 to 1 with VPFL
COFVP = Coefficients for cubic spline passing through the input points
DVPFPL = Slopes of cubic spline at defining points

COND contains the condition arrays, Mach number and K-values

COMMON /COND/

KVALUE(20) = Array of reduced frequencies
MACHNO(20) = Array of Mach numbers

FILES contains all of the files used by RH03 in ATLAS

COMMON /FILES/

CMFILE = C-matrix I/O file
CMF1 = First pertinent file on CMFILE
MIFILE = Modal input file
MIF1 = First pertinent file on MIFILE
MIM1 = First pertinent matrix in file MIF1 of MIFILE
GFFILE = Generalized force output file
GFF1 = First pertinent file on GFFILE
GFM1 = First pertinent matrix in file GFF1 of GFFILE
IN = Input file (normally standard input)
OUT = Output file (normally standard output)
RHOSCF1 = Scratch file, used as DWSFILE=

50.234
RHOSC2 = Scratch file, used as CMSFILE=
        C-matrix scratch file,
        COFFILE=Pressure coefficient file

RHOSC3 = Scratch file, used as IFSFILE=
        Interpolation function scratch file

RO3MOD contains the variables associated with
modal data

COMMON /RO3MOD/

MSOCOF = Name of interpolation coefficient
        matrix for main surface

CSICOF(4) = Name(s) of interpolation coefficient
            matrices for control surfaces I,
            I=1, NOCS

MOD1MS = The number of the first mode to be
         used from MSOCOF for the main
         surface

MOD1CS(4) = The number of the first mode to be
           used from CSICOF for control
           surface I, I=1 NOCS

NRBM = Number of rigid body modes

RBREF(3) = Reference point for the NRBM rigid
          body modes

RETYPE(6) = Type of the NRBM rigid body modes

RBMAG(6) = Magnitude of the NRBM rigid body
          modes

MODECS(4) = Array containing one number for
            each control surface (=0 if no user
            hinge rotations, otherwise contains
            name of record on DATARNF containing
            user rotations)

ENDR3D = Last word of a RHO3 data case (i.e.,
         last word of labelled common blocks
         to be passed from the preprocessor to
         the RHO3 technical module)

CKSMR3D = Word available for storage of array
          CHECKSUM by Matrix1 Read/Write
          routines

Generation: Program INRHO3 of the RHO3 preprocessor.
USER INPUT CUBIC HINGE ROTATION MATRICES

File: DATARNF

Index_Name: RCmi000

Type: MIXED

Dimensions: 5*NM, where NM equals the number of modes for which cubic hinge rotations were input.

Auxiliary_ID: Word 1: DATARNF  
Word 2: RCmi000  
Words 3-10: Zero

Elements: The i-th column contains the mode number and cubic hinge rotations for the i-th mode for which the user input hinge rotation coefficients.

Item 1-4: The actual cubic coefficients of hinge rotation

Item 5: The node number

Generation: Program INRHO3 of the RHO3 preprocessor.
ELEMENT_SUBSET_MATRIX

File: DATARNF

Index_Name: SEKddda, SEMddda

Type: MIXED

Dimensions: M*1 where M = (Number of elements in the data set + 59)/60.

Auxiliary_ID: Word 1: DATARNF
Word 2: The matrix index name
Word 3: Number of elements in this subset
Word 4: Minimum internal element number in this subset
Word 5: Maximum internal element number in this subset
Words 6-10: Zero

Elements: The i-th bit of this vector corresponds with the i-th internal element number associated with a particular data set. Bit 1 is the leftmost bit of the first word, bit 60 the rightmost bit of the first word, bit 61 the leftmost bit of the second word, etc. If internal element number "i" is included in the subset, the i-th bit is set to 1. Otherwise, the bit is set to zero.

Generation: Program SETDEFN of the subset-definition preprocessor.
**ORDERED_ELEMENT_SUBSET_MATRIX**

**File:** DATARNF

**Index Name:** SGKddda, SGMddda

**Type:** MIXED

**Dimensions:** M*1 where M = (number of elements in the ordered subset + 3)/4

**Auxiliary_ID:**
Word 1: DATARNF
Word 2: The matrix index name.
Words 3-10: Zero

**Elements:** The element internal id's are stored 4 per word in the order specified on the subset definition command. (Storage is left to right, word 1 to word M)

**Generation:** Program SETDEFN of the subset-definition preprocessor.
NODAL DATA SUBSET MATRIX

File: DATARNF

Index Name: SNKdddd

Type: MIXED

Dimensions: M*1 where M = (number of nodes in the data set + 59)/60.

Auxiliary ID: Word 1: DATARNF
Word 2: The matrix index name
Word 3: Number of nodes in the particular subset
Word 4: Minimum internal node number in subset
Word 5: Maximum internal node number in subset
Words 6-10: Zero

Elements: The i-th bit of this vector corresponds with the i-th internal node number associated with a particular data set. Bit 1 is the leftmost bit of the first word, bit 60 the rightmost bit of the first word, bit 61 the leftmost bit of the second word, etc. If internal node number "i" is included in the subset, the i-th bit is set to 1. Otherwise the bit is set to zero.

Generation: Program SETDEFN of the subset-definition preprocessor.
**ORDERED_NODAL_SUBSET MATRIX**

**File:** DATARNF

**Index Name:** SPRddda

**Type:** MIXED

**Dimensions:** M*1 where M = (Number of nodes in the ordered subset + 3)/4

**Auxiliary ID:**
- Word 1: DATARNF
- Word 2: The matrix index name.
- Words 3-10: Zero

**Elements:** The node internal id's are stored 4 per word in the order specified on the subset definition command. (Storage is left to right, word 1 to word M)

**Generation:** Program SETDEFN of the subset-definition preprocessor.
SUPPEPOSITION_DISPLACEMENT_CONSTRAINTS

File: DATARNF

Index_Name: SUDISba

Type: MIXED

Dimensions: N * 1, where N = NDISPLC + \sum_{k=1}^{\text{NUMDF}} \text{NUMDF}_k

NDISPLC = number of load cases specified in displacement constraints.

NUMDF = number of degrees of freedom for loadcase k.

Auxiliary_ID: Word 1: DATARNF
Word 2: SUDISba
Word 3: NDISPLC
Words 4-10: Zero

Elements:

Item 1-NDISPLC:

Bits 59-45: Loadcase ID

Bits 44-30: Number of restrained degrees of freedom NUMDF

Bits 29-15: Reserved

Bits 14-0: Pointer to data.

Item NDISPLC+1:

Internal node number (integer)

Item NDISPLC+2:

Degree of freedom indicator, 2 characters, left adjusted, with blank fill (alphanumeric)

50.241
Item NDISPLC+3:

Value VAL for the constrained degree of freedoms.
(real)

The last three items are repeated for each constrained degree of freedom.

Generation: Program SPDATIN of the stress data preprocessor.
SUPERPOSITION LOADCASE LABELS

File: DATARNF
Index Name: SULCTba
Type: MIXED
Dimensions: 11*N where N is the number of user defined superposition load cases.
Auxiliary ID: Word 1: DATARNF
             Word 2: SULCTba
             Words 3-10: Zero
Elements: Column i contains the user load case data corresponding to local loadcase i. Row 1 contains user labels (integer or alphanumeric). Rows 2 thru 11 contain user defined load case identifiers (alphanumeric).
Generation: Program SPDATIN of the stress data preprocessor.
SUPERPOSITION STAGE DATA

File: DATARNF
Index Name: SUPERba
Type: MIXED

Dimensions: N*1, where N = \( 1 + \sum_{k=1}^{NLC} (1+3*NUMLC_k) \)

where NLC is the number of loadcases to be created, and NUMLC_k is the number of component loadcases for loadcase k.

Auxiliary ID:
Word 1: DATARNF
Word 2: SUPERba
Words 3-10: Zero

Elements:

Item 1: Bits 59-50: Represent component stages in this matrix. The stage positions are numbered 1 thru 10 from left to right. On bits indicate stages represented in this supstage.

Bits 49-12: Reserved.

Bits 11-0: Total number of load cases to create (NLC)

Item 2-(NLC+1):

Bits 59-39: Reserved.

Bits 38-27: Local (internal) loadcase ID.

Bits 26-15: Number of component loadcases, NUMLC

Bits 14-0: Pointer to data.

Item NLC+2: Stage number (integer)
Item NLC+4: Load factor (real) or "QX" (alphanumeric), a factor to be calculated.

Items (NLC+2)-(NLC+4) are repeated for each component loadcase of every superposition loadcase.

Generation: Program SPDATIN of the stress data preprocessor.
SUPERPOSITION_STAGE_TABLE

File: DATARNF
Index_Name: SUPSTGa
Type: MIXED
Dimensions: 10 * 2
Auxiliary_ID: Word 1: DATARNF
             Word 2: SUPSTGa
             Words 3-10: Zero
Elements: Row i is associated with stage i. Column 1 defines the stage type:
          0 = no stage defined
          1 = standard stage
          2 = superposition stage
          Column 2 flags the existence of unknown factors in a superposition stage:
          0 = none
          1 = unknown factors present
Generation: Program SPDATIN of the stress data preprocessor.
SUPERPOSITION_STRESS_CONSTRAINTS

File: DATARNF

Index_Name: SUSTRba

Type: MIXED

Dimensions: N * 1, where N = \(N\text{STRSLC} + \sum_{k=1}^{\text{NUMSTRk}}\) 

\(N\text{STRSLC}\) = number of loadcases specified for stress constraints.

\(\text{NUMSTRk}\) = number of constrained stresses for load case k.

Auxiliary_ID:

Word 1: DATARNF
Word 2: SUSTRba
Word 3: NSTRSLC
Words 4-10: Zero

Elements:

Item 1-NSTRSLC:

Bits 59-45: Loadcase ID
Bits 44-30: Number of restrained stresses (NUMSTRk)
Bits 29-15: Reserved.
Bits 14-0: Pointer to data.

Item NSTRSLC+1:

Internal element number (integer)

Item NSTRSLC+2:

The "local" order of the requested stress as shown in the element key matrix (integer)

50.247
Item NSTRSLC+3:

Value of constrained stress (real)

The last three items are repeated for each constrained stress.

**Generation:** Program SPDATIN of the stress data preprocessor.
**FLUTTER DATA MATRIX**

**File:** DATARNF  
**Index Name:** ULCSi  
**Type:** MIXED  
**Dimensions:** NTOT*1 where:

\[
\text{NTOT} = 14 + \text{NALT} + \text{NGD} + \sum_{i=1}^{\text{NRS}} (1 + \text{NELi}) + \sum_{i=1}^{\text{NCHS}} \{\text{NWTCSi}\}
\]

- \(\text{NALT}\) = number of altitudes  
- \(\text{NGD}\) = number of generalized damping  
- \(\text{NRS}\) = number of retention vector sets  
- \(\text{NELi}\) = number of elements in the \(i\)th retention vector set.  
- \(\text{NCHS}\) = number of change sets for this case.  
- \(\text{NWTCSi}\) = number of words in the \(i\)th change set data.

**Auxiliary ID:**  
Word 1: DATARNF  
Word 2: ULCSi  
Words 3-10: Zero

**Elements:**  
This matrix contains the nominal case data and the changeset data. The nominal case data consists of a user defined title, arrays of input altitudes, and diagonal elements of the generalized structural damping and retention vector sets. (degrees of freedom) The changeset case data includes a user defined title, change matrix instructions for the generalized mass, stiffness and damping matrices, selection of retention vectors sets, eigensolution vectors, and redefinition of altitudes.

**Item 1:**  
Bits 59-30: Number of altitudes (NALT)  
Bits 29-0: Pointer to the altitude data (N1)

**Item 2:**  
Bits 59-30: Number of modes for damping (NGD)  
Bits 29-0: Pointer to the damping data (N2)
Item 3:  Bits 59-30: Number of retention vectors sets (NRS)
        Bits 29-0: Pointer to the first retention vector set data (N3)

Item 4:  Bits 59-30: Number of changesets (NCHS)
        Bits 29-0: Pointer to the first changeset data (N4)

Item 5-6: Reserved

Item 7-14: 8 word case title

Item N1-(N1+NALT-1):
Altitude data

Item N2-(N2+NGD-1):
Damping data

Item N3:  Bits 59-30: Retention vector set identifier (IDRSI)
        Bits 29-0: Number of elements in 1st retention vector set (NEL1)

Item (N3+1)-(N3+NEL1):
        Bits 59-30: Degree of freedom number.
        Bits 29-0: Degree of freedom number.

Item (N3+NEL1+1):
        Bits 59-30: Retention vector set identifier
        Bits 29-0: Number of elements in 2nd retention vector set (NEL2)

Item N4:  Changeset Number.

Item N4+1: Bits 59-30: Number of words in the changeset instruction for generalized mass (NWMCS)
Bits 29-0: Pointer to the mass changeset data. (NMCS).

Item N4+2: Bits 59-30: Number of words in the changeset instructions for stiffness matrix (NWSCS).

Bits 29-0: Pointer to the stiffness changeset data. (NSCS)

Item N4+3: Bits 59-30: Number of words in the changeset instructions for damping matrix (NWDCS)

Bits 29-0: Pointer to the damping changeset data (NDCS).

Item N4+4: Bits 59-30: Number of words in the retention vector set selection data (NWRCS)

Bits 29-0: Pointer to the retention vector selection data (NRCS)

Item N4+5: Bits 59-30: Number of words in the normal eigenvector request data (NWECS).

Bits 29-0: Pointer to the normal eigenvector request data. (NECS)

Item N4+6: Bits 59-30: Number of words in the adjoint eigenvector request data. (NWACS)

Bits 29-0: Pointer to the adjoint eigenvector request data. (NAECS)

Item N4+7: Bits 59-30: Number of words in the altitude changeset data. (NWALCS)

Bits 29-0: Pointer to the altitude changeset data. (NACS)

Item N4+8: Bits 59-30: Number of words in the eigenvalue request data. (NWEVCS)

Bits 29-0: Pointer to the eigenvalue request data. (NEACS)
Item N4+9: Pointer to 1st word of next changeset data. (NSTCS)

Item (N4+9)-(N4+17):
8 word changeset title.

Item NMCS-(NMCS+NWMCS-1):
Mass changeset data.

Item NSCS-(NSCS+NWSCS-1):
Stiffness changeset data.

Item NDCS-(NDCS+NWDCS-1):
Damping changeset data.

Item NRCS-(NRCS+NWRCS-1):
Retention set selection data.

Item NEACS-(NEACS+NWEVCS-1):
Eigenvalue request data.

Item NEVCS-(NEVCS+NWECS-1):
Normal vector request data.

Item NAECS-(NAECS+NWACS-1):
Adjoint vector request data.

Item NACS-(NACS+NWALCS-1):
Altitude redefinition data.

Item NXTCS: Changeset identifier (IDCS2)

Generation: Program FLPREP of the flutter data preprocessor.
HISTORY PARAMETER MATRIX

File: DESIRNF
Index_Name: DESPARa
Type: MIXED
Dimensions: $M \times 4$ where $M$ is the number of elements in the history minimum margin of safety matrix.

Auxiliary_ID:

<table>
<thead>
<tr>
<th>Word</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

Elements: Row $i$ contains the following data for the $i$-th element:

- **Item 1:** Internal number of the element in the corresponding row of the history minimum margin of safety matrix
- **Item 2:** Element type
- **Item 3:** Number of entries per cycle
- **Item 4:** Partition number of the minimum margins of safety matrix from which the data contained in the history minimum margins of safety matrix are obtained

Generation: Program HISTORY of the design processor.
HISTORY_MINIMUM_MARGINS_OF_SAFETY_MATRIX

File: DESIRNF

Index_Name: HISTRYa

Type: MIXED

Dimensions: M*N where M equals the number of elements for which histories were requested and N equals the number of cycles for which histories were requested.

Auxiliary_ID: Word 1: DESIRNF
Word 2: HISTRYa
Word 3: Number of elements
Words 4-10: Zero

Elements: Fow i contains the history data for the i-th element requested.

Item 1: Minimum margin of safety for the i-th element for the first cycle

Item K: Minimum margin of safety for the i-th element for the K-th cycle

Generation: Program HISTOFY of the design processor.
STRENGTH_MINIMUM_MARGINS_OF_SAFETY_MATRIX

File: DESIRNF

Index_Name: MOO1cba, MOO2cba, ..., M999cba

Type: REAL

Dimensions: M*1 where M is defined such that each partition contains the same elements as the corresponding KSF matrix partition.

Auxiliary_ID: Word 1: DESIRNF
              Word 2: The matrix index name
              Word 3: Internal element number of the first element in the partition (NFIRS)
              Word 4: Internal element number of the last element in the partition (NLAST)
              Words 5-10: Zero

Elements: The minimum margins of safety for each element in the partition are stored sequentially beginning with element NFIRS.

Item i-k: The minimum margins of safety for element j (k-i+1 words)

Generation: Program STRENGTH of the design processor.

STRENGTH PARAMETER MATRIX FOR OUTPUT
MARGINS OF SAFETY

File: DESIRNF

Index Name: MPARcba

Type: MIXED

Dimensions: M*1 where M is the total number of elements in the data set.

Auxiliary_ID:

Word 1: DESIRNF
Word 2: MPARcba
Word 3: Total number of elements
Word 4: Number of partitions for the margin of safety data
Words 5-10: Zero

Elements:

A typical entry j in the matrix contains the following data for the j-th element.

Item j:

Bits 59-30: Partition number of the strength margins of safety matrix in which the margins of safety for this element are stored

Bits 29-0: Pointer to the first margin of safety for this element

Generation: Program HISTORY of the design processor.
POINTER_MATRIX_FOR_MINIMUM_MARGINS_OF_SAFETY

File: DESIRNF

Index_Name: MPO001a, MPO002a, ..., MPO999a

Type: MIXED

Dimensions: M*1 where M is defined such that each partition contains the same elements as the corresponding minimum margins of safety matrix partition.

Auxiliary_ID: Word 1: DESIRNF
Word 2: The matrix index name
Word 3: Internal element number of the first element NFIRS
Word 4: Internal element number of the last element NLAST
Words 5-10: Zero

Element: The i-th item of this matrix contains the pointer to the beginning of the minimum margin of safety data for element NFIRS+i-1.

Generation: Program HISTORY of the design processor.
THERMAL DESIGN PARAMETER MATRIX FOR OUTPUT
MARGINS OF SAFETY

File: DESIRNF

Index_Name: MTARcba

Type: MIXED

Dimensions: M*1 where M is the total number of elements in the data set.

Auxiliary_ID: Word 1: DESIRNF
Word 2: MTARcba
Word 3: Total number of elements
Word 4: Number of partitions for the margin of safety data.
Words 5-10: Zero

Elements: A typical entry j in the matrix contains the following data for the j-th element.

Item j: Bits 59-30: Partition number of the thermal design margins of safety matrix in which the margins of safety for this element are stored.

Bits 29-0: Pointer to the first margin of safety for this element.

Generation: Program THERMLX of the design processor.
THE THERMAL DESIGN MINIMUM MARGINS OF SAFETY MATRIX

File: DESIRNF

Index_Name: N001cba, N002cba, ..., N999cba

Type: REAL

Dimensions: M*1 where M is defined such that each partition contains the same elements as the corresponding KSF matrix partition.

Auxiliary_ID: Word 1: DESIRNF
Word 2: The matrix index name
Word 3: Internal element number of the first element in the partition (NFIRS)
Word 4: Internal element number of the last element in the partition (NLAST)
Words 5-10: Zero

Elements: The minimum margins of safety for each element in the partition are stored sequentially beginning with element NFIRS.

Item i-k: The minimum margins of safety for element j (k-i+1 words)

Generation: Program THERMLX of the design processor.
STRENGTH MARGIN OF SAFETY MATRIX

File: LESIRNF

Index_Name: S001cba, S001cba, ..., S999cba

Type: REAL

Dimensions: M*1 where M is not greater than 3000. Initially 3000 words are reserved for each partition. When there is not enough room for the next element, or there are no more elements, its dimension is reduced to the actual number of words used.

Auxiliary_ID: Word 1: DESIRNF
            Word 2: The matrix index name
            Word 3: Internal element number of the first element in the partition (NFIRSF)
            Word 4: Internal element number of the last element in the partition (NLAST)
            Words 5-10: Zero

Elements: Associated with each element are k margins of safety calculated for l loadcases. The margins of safety for each element (k*l words) are stored as follows:

            Element i, loadcase 1 (k words)
            Element i, loadcase 2 (k words)
            Element i, loadcase 3 (k words)

Generation: Program HISTORY of the design processor.
### STRENGTH MARGINS OF SAFETY MATRIX

**File:** DESIRNF  
**Index_Name:** SMIMcba  
**Type:** MIXED  
**Dimensions:** $198 \times M$ where $M$ is the number of design load cases plus the number of superposition load cases ($18 \leq M \leq 25$).  
**Auxiliary_ID:**  
Word 1: DESIRNF  
Word 2: SMIMcba  
Words 3-10: Zero  
**Elements:** Column $j$ contains the data for internal load case number $j$.  
**Item i:** The internal element number of the maximum margin of safety for this element property.  
**Item i+1:** The user element number for the maximum margin of safety for this element property.  
**Item i+2:** The maximum margin of safety for this element property.  
**Item i+3:** The internal element number of the minimum margin of safety for this element property.  
**Item i+4:** The user element number for the minimum margin of safety for this element property.  
**Item i+5:** The minimum margin of safety for this element property.  

A block of the above data is reserved for each element property margins of safety. The elements are in element type number order and the properties are in order within each element group.
If the element type is not included in this cycle, stage, and set then rows i thru i+5 are zero filled.

**Generation:** Program HISTORY of the design processor.
THERMAL DESIGN MARGIN OF SAFETY MATRIX

File: DESIRNF

Index Name: T001cba, T001cba, ..., T999cba

Type: REAL

Dimensions: M*1 where M is not greater than 3000. Initially 3000 words are reserved for each partition. When there is not enough room for the next element, or there are no more elements, its dimension is reduced to the actual number of words used.

Word 2: SFBijkl
Word 3: KVAL (reduced frequency value)
Word 4: BREF (reference semi-chord)
Word 5: MACH (Mach number)
Word 6: SREF (reference semi-span)
Words 7-10: Zero

**Elements:**

The elements of the complex array

\(\text{SFB(UNMDBL,} 2\times \text{NUMMOD)}\)

Where:

\(\text{SFB(I,J)} = \text{Sectional lift coefficient for the I-th body and J-th vibration mode}\)

\(1 \leq J \leq \text{NUMMOD}\)

\(\text{SFB(I,J)} = \text{Sectional moment coefficient for the I-th body and (J-NUMMOD)th vibration mode}\)

\(1 \leq J-\text{NUMMOD} \leq \text{NUMMOD}\)

\(\text{NUMDBL} = \text{Number of bodies with doublets}\)

\(\text{NUMMOD} = \text{Number of vibration modes}\)

**Generation:**

Program MODFIn of the doublet-lattice processor.
**DUBLAT_SURFACE_SECTIONAL_FORCES_MATRIX**

**File:** DUBLRNF

**Index Name:** SF0ijkl

**Type:** REAL

**Dimensions:** \(((4*\text{NUMMOD})*(\text{NUMSPP}+\text{NUMSBP}))*1\)

Where:

\(\text{NUMSPP} = \text{Number of strips on the lifting surfaces}\)

\(\text{NUMSBP} = \text{Number of strips on the body}\)

\(\text{NUMMOD} = \text{Number of vibration modes}\)

**Auxiliary ID:**

Word 1: DUBLRNF

Word 2: SF0ijkl

Word 3: KVAL (reduced frequency value)

Word 4: BREF (reference semi-chord)

Word 5: MACH (Mach number)

Word 6: SREF (reference semi-span)

Words 7-10: Zero

**Elements:** The elements of the complex array

\(\text{SFO(\text{NUMSPP}+\text{NUMSBP}, 2*\text{NUMMOD})}\)

Where:

\(\text{SFO}(I, J) = \text{Sectional lift coefficient for the } I\text{-th strip and } J\text{-th vibration mode}\)

\((1 \leq J \leq \text{NUMMOD})\)

\(\text{SFO}(I, J) = \text{Sectional moment coefficient for the } I\text{-th strip and } (J-\text{NUMMOD})\text{th vibration mode}\)

\((1 \leq J-\text{NUMMOD} \leq \text{NUMMOD})\)

**Generation:** Program MODFIN of the doublet-lattice processor.
**DUBLAT_STRIP_GEOMETRY_MATRIX**

**File:** DUBLRNF

**Index_Name:** SGcij00

**Type:** MIXED

**Dimensions:** \[(8\times (\text{NUMSPP} + \text{NUMSBP} + 1)) \times 1\]

Where:

- \(\text{NUMSPP} = \) Number of strips on the lifting surface panels
- \(\text{NUMSBP} = \) Number of strips on the body interference panels

**Auxiliary ID:**
- Word 1: DUBLRNF
- Word 2: SGcij00
- Words 3-10: Zero

**Type:** MIXED

**Dimensions:** N*1 where N = Number of extract commands

**Auxiliary ID:**
- Word 1: EXTRRNF
- Word 2: DBEXTNM
- Words 3-10: Zero

**Elements:**
The i-th word of this matrix contains the following information for the ith user defined extract command.

- **Bits 59-18:** Alphanumeric name assigned to the ith extract command. (left adjusted, blank filled)

- **Bits 17-0:** Integer equal to the number of data matrices written out for the ith extract command.

**Generation:** Program EXCON of the extract processor.
DATA_BASE_INDEX_NAME_MATRIX

File: EXTRPNF

Index_Name: DBINDEX

Type: MIXED

Dimensions: 17 x 1

Auxiliary_ID:
Word 1: EXTRPNF
Word 2: DBINDEX
Words 3-10: Zero

Elements: Each word contains a basic attribute name (42 bits, blank filled) and an integer number used to identify the data items and indicate the number of bits there are to be assigned to the field that will contain the attribute values in the index. The order of attributes in this matrix represents the index sorting order.

The contents of this matrix are as follows:

<table>

EXTRACT CONTROL MATRIX

File: EXTRRNF

Index_Name: DBEXCØN

Type: MIXED

Dimensions: M*1 where M≤3000

Auxiliary_ID: Word 1: EXTRRNF
               Word 2: DBEXCØN
               Words 3-10: Zero

Elements: Words 1 thru N where N is the row dimension of
           matrix DBEXTNM, contain the following information,
           one word per extract command.

          Bits 59-48: Pointer (p) to the word in this
                       matrix at which the extract control
                       information starts.
          Bits 47-42: Number of attributes related to the
                       extracted data.
          Bits 41-36: Number of words (k1) required to
                       store the values and the usage type
                       of the related attributes.
          Bits 35-30: Number of attributes that are used
                       in forming the matrix index names
                       for the extracted data.
          Bits 29-24: Number of words (k2) required to
                       store the bit field location in the
                       matrix index name for the
                       attributes used.
          Bits 23-18: Number of attributes whose values
                       or the values of whose components
                       are used in formulating the INDICES
                       in the keys for the extracted data.

80.3
Bits 17-12: Number of words (k3) required to store the bit field locations in the INDICES for the attributes used.

Bits 11-0: Length (k4) of the extracted data detail.

Item P contains the following information:

Bits 59-9: 17 3 bit integers left to right, representing the 17 attributes contained in the DBINDEX matrix.

Each of the 17 integers have values between 0 and 4. They are interpreted as follows:

0 = This attribute is not related to the extracted data.

1 = This attribute is related to the extracted data and its value is not used in identifying the extracted data.

2 = This attribute is related to the extracted data and its value is used in the matrix index name for the extracted data matrices.

3 = This attribute is related to the extracted data and its value is used in the INDEX in the keys contained in the extracted data matrices.

4 = This attribute is related to the extracted data and the values of its components are used in the INDEX in the keys contained in the extracted data matrices.

Bits 8-0: Reserved
Items (P + 1) thru Q (Q = P+k1) contain the following information:

Item (P + i) contains the attribute value (integer) for the ith attribute that is associated with the extracted data.

Items (Q + 1) thru R (R = Q+k2) contain the following information:

Each word contains up to 10 6 bit integers. Each pair, from left to right, relates to an attribute that has a value of 2 in word P. The left word in one such word pair contains the position of the leftmost bit of the field that is occupied by the value of the attribute in the matrix index name. The right word in the word pair contains the position of the rightmost bit of the field. Each word contains information for up to 5 attributes.

Items (R + 1) thru S (S = R+k3) contain the following information:

Each word contains up to 10 6 bit integers as in words (Q + 1) thru R. Each pair, from left to right, relates to an attribute that has a value of 3 or 4 in word P. The left word in one such pair contains the position of the leftmost bit of the field that is occupied by the value of the attribute or its component in the index in the keys. The right word contains the position of the rightmost bit of the field.

Items (S + 1) thru T (T = S+k4) contain the following information related to the nature of the extracted data that are associated with nodes and finite elements. k4 is 112 words long and is composed of 14 blocks of 8 words. The first 8 words contain the following information:

Word S+1 contains the number of nodes for which data is extracted.
Words S+2 thru S+8 contain the selection pattern of the extracted data for node related items with codes = the 0 thru 6 respectively. The selection pattern is indicated by switching on bits from left to right for up to 60 items representing sequence numbers 1 thru 60. The sequence numbers are specified in the ATLAS data directory (ADATDIR).

The subsequent 13 8 word blocks contain information identical to the above for finite element types 1 thru 13.

**Generation:** Program EXDATA of the extract processor.
EXTRACTED_DATA_MATRICES

File: EXTRRNF
Index_Name: DB001rr, DB002rr, ..., DB999rr
Type: MIXED
Dimensions: M * 1 where M ≤ 3000
Auxiliary_ID:
   Word 1: EXTRRNF
   Word 2: The matrix index name.
   Words 3-10: Zero

Elements:
   Item 1: Bits 59-30: Reserved
            Bits 29-15: Number of keys contained in this matrix.
            Bits 14-0: Lowest key in this matrix
   Item 2-(NR+1):
            Bits 59-48: Pointer to the data body associated key.
            Bits 47-36: Length of the data body associated with this key.
            Bits 35-0: INDEX formed out of the attribute values.
   Item (NR+2)-M:
            Data body.

Generation: Program REORDAT of the extract processor.
**EXTRACTED_DATA_KEY_INDEX_MATRIX**

Type: MIXED

Dimensions: M*1 where M is the number of attributes specified by the CATlist parameter is the EXECUTE EXTRACT statement.

 Auxiliary ID: Word 1: EXTRRNF
Word 2: The matrix index name
Words 3-10: Zero

Elements: Item i contains the integer value of the ith item of the subset specified by Parameter = CATlist in the EXECUTE EXTRACT statement.

Generation: Program EXCØN of the extract processor.
LABEL SUBSET MATRIX

File: EXTRRNF

Index Name: SITM001

Type: MIXED

Dimensions: \((N+59)/60\), where \(N\) = Number of labels in the label subset.

Auxiliary ID:
- Word 1: EXTRRNF
- Word 2: SITM001
- Words 3-10: Zero

Elements: The \(i\)-th bit of this vector corresponds to the \(i\)-th label in the ATLAS DATA DIRECTORY (matrix ADATDIR). Bit 1 is the leftmost bit of the first word, bit 60 is the rightmost bit of the first word, bit 61 is the leftmost bit of the second word etc. If the \(i\)-th label is included in the subset, the \(i\)-th bit is set to 1. Otherwise the bit is set to zero.

Generation: Program EXCON of the extract processor or program SETDEFN of the subset definition processor.
BOUNDARY DEFINITION SUBSET MATRIX

File: EXTRRNF

Index Name: SPKdddda

Type: MIXED

Dimension: \[ M^*1 \text{ where } M = \frac{\text{Number of nodes in the ordered subset} + 3}{4} \]

Auxiliary ID:

Word 1: EXTRRNF
Word 2: The matrix index name
Words 3-10: Zero

Elements: The node internal id's are stored 4 per word in the order specified on the subset definition command (storage is left to right, word 1 to word \( M \))

Generation: Program EXCON of the extract processor.
FLEXAIF_DATA_CASE_CONTROL_MATRIX

File: FLEXPNF

Index Name: xxxxx

Type: MIXED

Dimensions: (NKVAL+NALT+11)*1 where NKVAL is the number of output generalized air force matrices (the number of output K-values) and NALT is the number of altitudes.

Auxiliary ID:

Word 1: FLEXPNF
Word 2: Matrix index name
Word 3: MACH, Mach number
Words 3-10: Zero

Elements: Items 1-6 each contain 2 packed 30 bit integers defined as follows:

Item 1: Bits 59-30: The number of constants (2)
Bits 29-0: Pointer to the row containing the first constant (7)

Item 2: Bits 59-30: The number of output K-values (NKVAL)
Bits 29-0: Pointer to the row containing the first K-value (12)

Item 3: Bits 59-30: The number of Mach numbers (1)
Bits 29-0: Pointer to the row containing the Mach number (9)

Item 4: Bits 59-30: The number of problem size numbers (1)
Bits 29-0: Pointer to the row containing the problem size number (10)

Item 5: Bits 59-30: The number of matrix size numbers (1)
Bits 29-0: Pointer to the row containing the matrix size number (11)

Item 6: Bits 59-30: The number of altitudes (NALT)
Bits 29-0: Pointer to the row containing the first altitude

Item 7: BREF, Reference length for the reduced frequency

Item 8: SPAN/2

Item 9: MACH, the Mach number

Item 10: NMODES, the number of modes

Item 11: 2*NMODES*NMODES, the size of the generalized air force matrices

Items 12 - (NKVAL+11) contain the NKVAL output K-values for which generalized air forces are prepared.

Items (12+NKVAL)-(NKVAL+NALT+11) contain the NALT altitudes for which generalized airforce matrices are output.

Generation: Program FLEXAIR of the residual flexibility processor.
GENERALIZED AIRFORCE MATRIX

File: FLEXRNF

Index Name: xxxxyy

Type: REAL

Dimensions: \((2\times\text{NMODES})\times\text{NMODES} \times \text{NMOCES} \times \text{NMODES} \) complex where NMODES is the number of mode shapes.

Auxiliary_ID: Word 1: FLEXRNF
            Word 2: Matrix index name
            Word 3: Mach Number
            Word 4: BREF
            Words 5-10: Zero

Elements: Element \((i,j)\) represent the force on the \(i\)th coordinate resulting from unit oscillatory motion of the \(j\)th coordinate, divided by \((-1/2)\rho V^2\) where \(\rho\) = air density, \(V\) = velocity.

Generation: Program FLEXAIR of the residual flexibility processor.
**FLUTTER_EIGENSOLUTION_DATA_MATRIX**

**File:** FLUTRNF

**Index_Name:** Fiupvjw

**Type:** MIXED

**Dimensions:** (NTOT*1) where:

\[
\begin{align*}
NTOT & = 32 + NEL + NRFE \times (2 \times 4 \times NEL) \\
NEL & = \text{Number of elements in retention vector set} \\
NRFE & = \text{Number of non zero eigenvalues} \\
& \quad (NRFE \leq NEL)
\end{align*}
\]

**Auxiliary_ID:**
- Word 1: FLUTRNF
- Word 2: Fiupvjw
- Words 3-10: Zero

**Elements:**

This matrix contains the eigenvalues, normal eigenvectors and adjoint eigenvectors at one of the user specified reduced frequencies.

- Item 1-8: 8 word user case title.
- Item 9-16: 8 word changeset title.
- Item 17: Run data
- Item 18: Problem identifier iupvj
- Item 19: Number of degrees of freedom
- Item 20: Mach number
- Item 21: Non zero simulation density
- Item 22: Reference length
- Item 23: Units system for input data
- Item 24: Retention vector set number
- Item 25: Number of elements in the retention set (NEL)
Item 26-(25+NEL):

Element numbers of the retention set

Item (26+NEL):

Altitude

Item (27+NEL):

Number of non zero eigenvalues (NRFE)

Item (28+NEL):

Reduced frequency

Item (29+NEL):

Index for eigenvalues at this k value

Item (30+NEL) - (29+NEL+NRFE*2):

Complex non zero eigenvalues

Item (30+NEL+2*NRFE):

Index for normal eigenvectors at this k value.

Item (31+NEL+2*NRFE) - (30+NEL+2*NRFE+2*NEL*NRFE):

Complex normal eigenvectors

Item (31+NEL+2*NRFE+2*NEL*NRFE):

Index for adjoint eigenvectors at this k value.

Item (32+NEL+2*NRFE+2*NEL*NRFE) - (32+NEL+2*NRFE+4*NEL*NRFE):

Complex adjoint eigenvectors

Generation: Program FLUSOL of the flutter processor.
FLUTTER OUTPUT CONTROL DATA MATRIX

File: FLUTRNF
Index Name: FLBCij
Type: MIXED
Dimensions: (NWDST*1) where NWDST = 2* (number of problems solved) + 1
Auxiliary ID: Words 1-10: Zero
Elements:

Item 1: Number of flutter problems successfully completed for this case (NWDS)

Item 2: Bits 59-48: Reserved
Bits 47-42: Case Number
Bits 41-36: Changeset number
Bits 35-30: Retention set number
Bits 29-24: Altitude number
Bits 23-18: Condition number
Bits 17-0: Reserved

Item 2 is repeated for all problems solved (NWDS words)

Item (NWDS+2):

Altitude of first problem

Item (NWDS+2) is repeated for all problems solved (NWDS words). The latter portion of this matrix is used in the flutter optimization module.

Generation: Program FLUSOL of the flutter processor.
**FLUTTER PLOT CONTROL MATRIX**

**File:** FLUTRNF

**Index_Name:** FPIupvj

**Type:** MIXED

**Dimensions:** NPCOT \* 1 where:

NPCOT = 22 \* NMODES
NMODES = Number of degrees of freedom

**Auxiliary_ID:**
- Word 1: FLUTRNF
- Word 2: FPIupvj
- Words 3-10: Zero

**Elements:** The matrix contains the general data required for producing v-g and V-f plots for the specified altitude. The plot data is contained in the matrix FPIupvjx where x is the partition number.

**Item 1-8:** 8 word user title

**Item 9:** Run date

**Item 10:** Problem identifier

- Bits 59-30: Reserved
- Bits 29-24: Condition number
- Bits 23-18: Altitude number
- Bits 17-12: Retention set number
- Bits 11-6: Changeset number
- Bits 5-0: Case number

**Item 11:** Number of degrees of freedom

**Item 12:** Mach number

**Item 13:** Number of unique reduced frequencies
Item 14: Altitude
Item 15: Reference length
Item 16: Units system
Item 17: Number of eigenvalues found (N)
Item 18: Total number of reduced frequencies
Item 19: Number of partitions of plot data matrix
Item 20: Not used
Item 21: Retention vector set number
Item 22: Number of elements of retention set (NEL)
Item 23-(22+NEL):
   Degrees of freedom retained

Generation: Program FLUSOL of the flutter processor.
FLUTTER PLOT DATA MATRIX

File: FLUTRNF

Index_Name: FFlupvjqx where x is the record number

Type: MIXED

Dimensions: NPTOT * 1 where

NPTOT = NRFB * (2+2*N)
NRFB = Number of reduced frequencies in this partition
N = Number of eigenvalues

Auxiliary_ID: Word 1: FLUTRNF
Word 2: FFlupvjqx
Word 3-10: Zero

Elements: The matrix contains the plot data for generating V-g and V-f plots. One or more records may be generated for each altitude.

Item 1: Reduced frequency
Item 2: Flag (=1) for original reduced frequency
Item 3-(2+2*N): Complex eigenvalues of V-g solution
Item (3+2*N)-(NRFB*(2+2*N)):

Items 1-(2+2*N) are repeated for all NRFB reduced frequencies.

Generation: Program FLUSOL of the flutter processor.
FLUTTER_OUTPUT_PRINT_DATA_MATRIX

File: FLUTRFN

Index_Name: FRiupvj

Type: MIXED

Dimensions: NTOT * 1 where:
NTOT = 45+NMODES+NFLMODE*(EXP)
EXP = 9*IGC+(IVECA+IVECB*NEL+IVECC*NEL)*(12+6*NEL)

IGC = Number of crossing levels
IVECA = Flag for eigenvalues at flutter
IVECB = Flag for normal vectors at flutter
IVECC = Flag for adjoint vectors at flutter
NEL = Number of elements in retention set excluding rigid body, oscillatory and zero eigenmodes.
NFLMODE = Total number of crossings
NMODES = Number of degrees of freedom

Auxiliary_ID: Word 1: FLUTRFN
Word 2: FRiupvj
Words 3-10: Zero

Elements:
Items 1-8: 8 word user case title
Items 9-16: 8 word user changeset title
Item 17: Run date
Item 18: Problem identifier iupvj
Item 19: Number of degrees of freedom
Item 20: Mach number
Item 21: Checkout print flag
Item 22: Matched point solution index
Item 23: Number of altitudes

100.7
Item 24: Number of Laguerre iterations
Item 25: Still air mode solution index
Item 26: Units system for input data
Item 27: Plot flag
Item 28: 1-7 character name of mass matrix
Item 29: 1-7 character name of stiffness matrix
Item 30: 5 character name of airforce matrix
Item 31: Number of reduced frequencies
Item 32: Non zero simulation density
Item 33: Flutter envelope minimum speed
Item 34: Flutter envelope maximum speed
Item 35: Flutter envelope minimum frequency (Hz)
Item 36: Flutter envelope maximum frequency (Hz)
Item 37: Retention vector set identifier
Item 38: Number of elements in the retention vector
Item 39-(38+NEL):
Element numbers in the retention vector
Item (39+NEL):
Altitude
Item (40+NEL):
Airspeed
Item (41+NEL):
Mass ratio
Item (42+NEL):
Number of damping levels (IGC)

Item (43+NEL):
Number of "crossings" in this matrix (NFLMODE)

Item (44+NEL):
First damping level

Item (45+NEL):
Second damping level

Item (46+NEL):
Third damping level

Item (47+NEL):
Damping level (g) (GLEV)

Item (48+NEL):
Mode number

Item (49+NEL):
Reduced frequency (k)

Item (50+NEL):
Speed index (FSI)

Item (51+NEL):
Frequency

Item (52+NEL):
Airspeed

Item (53+NEL):
\( \frac{\partial g}{\partial k} \)

100.9
Item (54+NEL):

$\partial FSI/\partial g$

Item (55+NEL):

Pointer to the beginning of data for the next crossing.

Items (47+NEL) to (55+NEL) are repeated for each crossing (NFLMODE modes)

The items following are included in this matrix if eigenvalues, normal and/or adjoint eigenvectors are requested at flutter. These items are omitted for non zero damping levels.

Item (56+NEL):

Index for eigenvalues at flutter (IVECA)

Item (57+NEL):

Real part of eigenvalues at current k value

Item (58+NEL):

Imaginary part of eigenvalues at current k value

Item (59+NEL):

Current reduced frequency (k value)

Items (56+NEL) - (59+NEL) are repeated for the previous and flutter reduced frequencies.

Items (60+NEL):

Index for normal eigenvectors at flutter (IVECB)

Items (61+NEL) - (63+NEL):

Complex eigenvalue and current reduced frequency
Items (64+NEL) - (63+3*NEL):

Normal eigenvectors at current reduced frequency

Items (60+NEL) - (63+3*NEL) are repeated for the previous and flutter reduced frequencies. For the adjoint eigenvectors at flutter, the items (60+NEL) - (63+3*NEL) are repeated at the current, previous and flutter reduced frequencies.

Generation: Program PLUSOL of the flutter processor.
INTERPOLATION COEFFICIENT MATRIX FOR SURFSPLINE

File: INTERNF

Index_Name: Cddd

Type: MIXED

Dimensions: M * 1 where:

\[ M = 17 + 2 \text{NIPTS} + (\text{NIPTS}+3) \times (\text{NCOLS}+2) + \text{NSK} \]

NIPTS = Number of input points
NCOLS = MCOLN - MCOL1 + 1
NSK = 0, when INDS = 0
      = 1, when INDS = 1
      = NIPTS when INDS = 2

Auxiliary_ID: Word 1: INTERNF
              Word 2: Cddd
              Word 3: ITx
              Word 4: ITy
              Word 5: ITz DOF indicators
              Word 6: IRx
              Word 7: IRy
              Word 8: IRz
              Word 9: Z - location of plane
              Word 10: Zero

Elements:

Item 1: M, the number of items in this matrix
Item 2: 10HSURFSPLINE
Item 3: IPOINT, pointer to the transformation matrix, (=0 - no transformation matrix)
Item 4: MCOLS, total number of modes
Item 5: MCOL1, modes 1 thru MCOL1 will be zero on output modes
Item 6: MCOLN, (MCOLN-MCOL1+1) is the number of input modes and modes MCOLN+1 thru MCOLS will be zero on output
Item 7: NIPTS, number of input points
Item 8: 14+NSK, pointer to input points x, y coordinates (NPCOOR)
Item 9: 14+NSK+2*NIPTS+2+(NIPTS+3), pointer to first spline coefficient (NPCOEF)
Item 10: XBAR, x cg location
Item 11: YBAR, y cg location
Item 12: COST, cosine of the rotation angle
Item 13: SINT, sine of the rotation angle
Item 14: RGU, Ru (radius of gyration)
Item 15: RGV, Rv (radius of gyration)
Item 16: INDS, Smoothing indicator
   0--no smoothing
   1--applies to all input points

Item 17-NPCOOR:
   SK values if present

Item (NPCOOR)-(NPCOOR+2*NIPTS):
   U, V transformed representation of input points

Item (NPCOOR+2*NIPTS+1)-(NPCORF-1):
   Scratch area of 2*(NIPTS+3)

Item (NPCORF)-(NPCOEF+N):
   Spline coefficients where
   N = (NIPTS+3)*NCOLS-1

Item (NPCOEF+N+1)-(NPCOEF+N+ITRAN):
   Transformation matrix location (if specified)
   where ITRAN = 12 if matrix exists
   = 0 if matrix does not exist
Item (NPCORF+N+ITRAN+1):

10HSURFSPLINE

Generation: Program SURFSPL of the interpolation processor.
INTERPOLATION COEFFICIENT MATRIX FOR MOTIONAXIS

File: INTERNF

Index Name: Cddd

Type: MIXED

Dimensions: M * 1 where:

\[
M = 9 + 4 \times \text{NMADP} + 6 \times \text{NSEG} + 6 \times \text{NMS} + 6 \times \text{NMS} \times \text{NCOLS} + 3 \times \text{NCOLS}
\]

NMADP = Number of motion axis definition points
NSEG = NMADP - 1
NMS = Number of motion stations (input points)
NCOLS = MCOLN - MCOL1 + 1

Auxiliary ID:

Word 1: INTERNF
Word 2: Cddd
Word 3: ITx
Word 4: ITy
Word 5: ITz
Word 6: IRx
Word 7: IRy
Word 8: IRz
Word 9: Z--location of plane
Word 10: Zero

Elements:

Item 1: M, the number of items in this matrix
Item 2: 10HMOTIONAXIS
Item 3: IPOINT, pointer to the transformation matrix, (=0--no transformation matrix)
Item 4: MCOLS, total number of modes
Item 5: MCOL1, modes 1 through MCOL1 will be zero on output
Item 6: MCOLN, the number of input modes and modes MCOLN+1 through MCOLS will be zero on output
Item 7: NMADP, number of motion axis definition points
Item 8: NMS, number of motion stations

Item 9-(8+NMADP):
XMA, x-coordinates of the motion axis definition points

Item (8+NMADP+1)-(8+2*NMADP):
XMA, y-coordinates of the motion axis definition points

Item (8+2*NMADP+1)-(8+3*NMADP):
DYDXRL, slope dy/dx of the reference lines through the definition points

Item (8+3*NMADP+1)-(8+4*NMADP):
SMA, arc length along motion axis for the i-th definition points

Item (8+4*NMADP+1)-(8+4*NMADP+NSEC):
XMAP, x mapping point for the i-th segment

Item (8+4*NMADP+NSEC+1)-(8+4*NMADP+2*NSEC):
YMAP, y mapping point for i-th segment

Item (8+4*NMADP+2*NSEC+1)-(8+4*NMADP+3*NSEC):
C0, cubic coefficient for the i-th segment

Item (8+4*NMADP+3*NSEC+1)-(8+4*NMADP+4*NSEC):
C1, cubic coefficient for the i-th segment

Item (8+4*NMADP+4*NSEC+1)-(8+4*NMADP+5*NSEC):
C2, cubic coefficient for the i-th segment

Item (8+4*NMADP+5*NSEC+1)-(8+4*NMADP+6*NSEC):
C3, cubic coefficient for the i-th segment
Item (8+4*NMADP+6*NSEG) - (8+4*NMADP+6*NSEG+NMS):

\[ S_{ms}, \text{ arc length from first node to motion stations} \]

The next block of data contains the modal displacements at the \( i \)-th input point for the \( j \)-th mode. \((N1=8+4*NMADP+6*NSEG+NMS)\).

Item \((N1+1)-(N1+NMS*NCOLS)\):

\[ T_Z \]

Item \((N1+NMS*NCOLS+1)-(N1+2*NMS*NCOLS)\):

\[ R_X \]

Item \((N1+2*NMS*NCOLS+1)-(N1+3*NMS*NCOLS)\):

\[ R_Y \]

Item \((N1+3*NMS*NCOLS+1)-(N1+4*NMS*NCOLS)\):

\[ \frac{dT_z}{ds} \]

Item \((N1+4*NMS*NCOLS+1)-(N1+5*NMS*NCOLS)\):

\[ \frac{dR_x}{ds} \]

Item \((N1+5*NMS*NCOLS+1)-(N1+6*NMS*NCOLS)\):

\[ \frac{dR_y}{ds} \]

Item \((N1+1)-(M1+1)\):

Scratch area where \( M1=N1+6*NMS*NCOLS \)

Item \((M1+3*NCOLS+1)-(M1+3*NCOLS+ITRAN)\):

ITRFN followed by the transformation matrix location (if specified)
where \( ITRAN = 12 \) is matrix exists
\[ = 0 \] is matrix does not exist

Item \((M1+3*NCOLS+ITRAN+1)\):

10HMOTIONAXIS

**Generation:** Program MOTIONA of the interpolation processor.
INTERPOLATION_COEFFICIENT_MATRIX_FOR_MOTIONPT

File: INTERNF
Index_Name: Cddd

Word 7: IRy
Word 8: IRz
Words 9-10: Zero

Elements:
Item 1: M, number of items in this matrix
Item 2: 8HMOTIONPT
Item 3: IPOINT, pointer to the transformation matrix (=0--no transformation matrix)
Item 4: MCOLS, total number of output modes
Item 5: MCOL1, models 1 through MCOL1 will be zero on output
Item 6: MCOLN, (MCOLN-MCOL1+1) is the number of input modes and modes MCOLN+1 through MCOLS will be zero on output
Item 7: X, reference point x-coordinate
Item 8: Y, reference point y-coordinate
Item 9: Z, reference point z-coordinate

110.7
Item 10: TX, translation in X
Item 11: TY, translation in Y
Item 12: TZ, translation in Z
Item 13: RX, rotation in X
Item 14: RY, rotation in Y
Item 15: RZ, rotation in Z
Item 16-(9+6*NCOLS):

The translation and rotations are repeated for each mode. (NCOLS=NCOLN-MCOL+1)

Item (9+6*NCOLS+1)-(9+6*NCOLS+ITRAN):

ITRAN followed by the transformation matrix location (if specified)
where ITRAN = 12 if matrix exists
= 0 if matrix does not exist

Item (9+6*NCOLS+ITRAN+1):

8HMOTIONPT

Generation: Program MOTIONP of the interpolation processor.
**INTERPOLATION COEFFICIENT MATRIX FOR POLYNOMIAL**

**File:** INTERNF

**Index_Name:** Cddd

**Type:** MIXED

**Dimension:** M*1 where M=7+N*NCOLS+1

**Auxiliary_ID:**
- Word 1: INTERNF
- Word 2: Cddd
- Word 3: ITx
- Word 4: ITy
- Word 5: ITz
- Word 6: IRx  DOF indicators
- Word 7: IRy
- Word 8: IRz
- Words 9-10: Zero

**Elements:**

- **Item 1:** M, number of items in this matrix
- **Item 2:** 10HPOLYNOMIAL
- **Item 3:** IPOINT, pointer to the transformation matrix (=0--no transformation matrix)
- **Item 4:** MCOLS, total number of modes
- **Item 5:** MCOL1, modes 1 thru MCOL1 will be zero on output
- **Item 6:** MCOLN, (MCOLN-MCOL1+1) is the number of input modes and modes MCOLN+1 thru MCOLS will be zero on output
- **Item 7:** IDEG, the highest degree of polynomial
- **Item 8-(7+N):**
  Polynomial coefficients for mode 1 where N={(IDEG+1)*(IDEG+2)}/2
Item (8+N)-(7+N*NCOLS):

The coefficients are repeated for each mode. 
(\text{NCOLS} = \text{NCOLN} - \text{MCOL1} + 1).

Item (7+N*NCOLS+1):

10HPOLYNOMIAL

\textbf{Generation}: Program POLY of the interpolation processor.
INTERPOLATION_COEFFICIENT_MATRIX_FOR_BEAMSPLINE

File: INTERNF
Index_Name: Cddd
Type: MIXED
Dimensions: $M \times 1$ where:

$M = 17 + 6 \cdot \text{NNODES} + 13 \cdot \text{NBEAM} + ((\text{INDC} + 3)/2) \cdot 2 \cdot \text{NNODES} \cdot \text{NCMOD}$

- NNODES = Number of nodes
- NBEAM = Number of beams
- INDC = Indicator for rotation routine
  - = 1, x-rotation
  - = 2, y-rotation
  - = 3, both x- and y-rotations
- NCMOD = Number of nodes

Auxiliary_ID:

- Word 1: INTERNF
- Word 2: Cddd
- Word 3: ITx
- Word 4: ITy
- Word 5: ITz
- Word 6: IRx DOF indicator
- Word 7: IRy
- Word 8: IRz
- Word 9: Z - location of plane
- Word 10: Zero

Elements:

- Item 1: M - number of elements in this matrix
- Item 2: 10HBEAMSPLINE
- Item 3: IPOINT - Pointer to transformation matrix
  - = 0, no transformation matrix
  - = Item 9 + N + 1 - transformation matrix location.
- Item 4: NCOLS - total number of modes
- Item 5: MCOL1 - modes up to MCOL1 but not including MCOL1 are zeros.
Item 6: MCOLN - (MCOLN-MCOL1+1) is the number of input modes. Modes MCOLN+1 through MCOLS are zeros.

Item 7: NPTS, the sum of the number of points defining all beams NPTS ≥ 4

Item 8: NBMS, the total number of beams defined for the analysis NBMS ≥ 2

Item 9: INDC, indicator for retained freedoms present in this array.
   0, TZ only
   1, TZ and RX
   2, TZ and RY
   3, TZ, RX, and RY

Item 10-15: Reserved for future use.

Item 16 - (15+NBMS+1):

   Beam pointer array, the I-th element of this array points to the elements of other arrays corresponding to the first point of the I-th beam specified.

Item (15+NBMS+2) - (15+2*NBMS+1):

   Beam extrapolation code array, the I-th element of this array contains the extrapolation code for the I-th beam.

Item (15+2*NBMS+2) - (15+2*NBMS+NPTS+1):

   Input point Y-coordinates.

Item (15+2*NBMS+NPTS+2) - (15+2*NBMS+2*NPTS+1):

   Arc length array
Item \((15+2*NBMS+2*NPTS+2) - (15+2*NBMS+2*NPTS+NSEG+1)\):

\(C_0\), the first cubic coefficient for the cubic splines defined on the beam segments.

\(NSEG = NPTS - NBMS\)

Item \((15+2*NBMS+2*NPTS+NSEG+2) - (15+2*NBMS+2*NPTS+2*NSEG+1)\):

\(C_1\), the second cubic coefficient for the cubic splines defined on the beam segments.

Item \((15+2*NBMS+2*NPTS+2*NSEG+2) - (15+2*NBMS+2*NPTS+3*NSEG+1)\):

\(C_2\), the third cubic coefficient for the cubic splines defined on the beam segment.

Item \((15+2*NBMS+2*NPTS+3*NSEG+2) - (15+2*NBMS+2*NPTS+4*NSEG+1)\):

\(C_3\), the fourth cubic coefficient for the cubic splines defined on the beam segment.

Item \((15+2*NBMS+2*NPTS+4*NSEG+2) - (15+2*NBMS+2*NPTS+4*NSEG+NDEF+1)\):

\(z\) - translation mode shapes.

\(NDEF = NPTS \times \) number of modes.

Item \((15+2*NBMS+2*NPTS+4*NSEG+NDEF+2) - (15+2*NBMS+2*NPTS+4*NSEG+2*NDEF+1)\):

\(z\)-rotation (slopes) mode shapes.

Item \((15+2*NBMS+2*NPTS+4*NSEG+2*NDEF+2) - (15+2*NBMS+2*NPTS+4*NSEG+3*NDEF+1)\):

\(X\) - translation mode shapes.

Item \((15+2*NBMS+2*NPTS+4*NSEG+3*NDEF+2) - (15+2*NBMS+3*NPTS+4*NSEG+3*NDEF+1)\):

\(X\) - rotation mode shapes.

Item \((15+2*NBMS+2*NPTS+4*NSEG+4*NDEF+2) - (15+2*NBMS+2*NPTS+4*NSEG+4*NDEF+1)\):

\(Y\) - translation mode shapes.
Item \((15 + 2*NBMS + 2*NPTS + 4*NSEG + 5*NDEF + 2) - (15 + 2*NBMS + 2*NPTS + 4*NSEG + 6*NDEF + 1)\):

\[ Y \text{ - rotation mode shapes.} \]

Item \((15 + 2*NBMS + 2*NPTS + 4*NSEG + 6*NDEF + 2) - (15 + 2*NBMS + 2*NPTS + 4*NSEG + 6*NDEF + 15*NBMS + 1)\):

Scratch area for temporary storage

Item \((15 + 2*NBMS + 2*NPTS + 4*NSEG + 6*NDEF + 15*NBMS + 2)\):

10HSURFSPLINE

**Generation:** Program BEAMSPL of the interpolation processor.
### INTERPOLATION TABLE

<table>
<thead>
<tr>
<th>File</th>

</table>

Where NCOEF is the number of coefficients generated by the interpolation utility module.

- **Auxiliary ID:**
  - Word 1: INTERNAL
  - Word 2: INTABLE
  - Words 3-10: Zero

- **Elements:** Each column of this matrix is associated with a coefficient matrix. A typical column contains:
  - **Item 1:** Coefficient matrix index name
  - **Item 2:** Number of words in the coefficient matrix
  - **Item 3:** Number of modes contained in the coefficient matrix

- **Generation:** Program SURFSPL, MOTIONA, MOTIONP, POLY, or BEAMSPL of the interpolation module.
**SPECIFIED DISPLACEMENT MATRIX**

**File:** LOADRNF

**Index Name:** DA001ba, DA002ba, ..., DA999ba

**Type:** MIXED

**Dimensions:** N*1 where N equals the block size (default 3000)

**Auxiliary ID:**
- Word 1: LOADRNF
- Word 2: The matrix index name
- Words 3-10: Zero

**Elements:**
The first word in each block consists of a keyword for merge:

4LDISP OR 10000B

The remaining elements consist of word pairs defining the specified displacement to be merged.

- **Item i:**
  - Bits 59-48: Internal loadcase number
  - Bits 47-36: Internal node number
  - Bits 35-30: Freedom number
  - Bits 29-0: Zero

- **Item i+1:** Value of displacement

**Generation:** Program DISP of the loads processor.
**LOAD_CASE_CORRESPONDENCE_TABLE**

Words 3-10: Zero |
| **Elements:**   | The i-th column contains the following data for the i-th loadcase.  
Item 1: User ID for internal loadcase i  
Item 2-11: 10 word BCD title for internal loadcase i |
| **Generation:** | Program COOR of the loads processor. |
ELEMENT TEMPERATURE MATRIX

File: LOADRNF

Index_Name: EL001ba, ..., EL999ba

Type: MIXED

Dimensions: N * 1 where N equals the block size

Auxiliary_ID: Word 1: LOADRNF
Word 2: The matrix index name
Words 3-10: Zero

Elements: The first item in each partition consists of:

Bits 59-31: Zero
Bits 30-15: Number of elements in this partition
Bits 14-0: First element in partition

The remaining items consist of blocks of data associated with each element describing the temperature of the element per loadcase.

Item 1: Bits 59-54: Element type
Bits 53-48: Number of nodes
Bits 47-30: Number of loadcases
Bits 29-15: Total number of words
Bits 14-0: Zero

Item 2: Bits 59-30: Zero
Bits 29-15: Number of default temperatures
Bits 14-0: Pointer to default temperatures
Item 3 - \((\text{number of loadcases} + 2)\)

- Bits 59-45: Internal loadcase
- Bits 44-30: Zero
- Bits 29-15: Number of temperatures
- Bits 14-0: Pointer to loads

**Generation:** Program THERMEL of the loads processor.
**ELEMENT_TEMPERATURE_CONTROL**

**File:** LOADRNF

**Index Name:** ELCØNba

**Type:** MIXED

**Dimensions:** \( N \times 1 \) where \( N \) equals number flexible elements

**Auxiliary ID:**
- Word 1: LOADRNF
- Word 2: ELCØNba
- Words 3-10: Zero

**Elements:** Pointers to element temperature matrices. Word \( i \) contains the following data for the \( i \)th element.
- Bits 59-31: Zero
- Bits 30-15: Row pointer
- Bits 14-0: Block number

**Generation:** Program THERMEL of the loads processor.
COMPOSITE_ELEMENT_INITIAL_STRESS_MATRIX

File: LOADRNF

Index_Name: IB001ba, IB002ba, ..., IB999ba

Type: REAL

Dimensions: M*1 where M ≤ buffer size (default 3000)

Auxiliary_ID: Word 1: LOADRNF
Word 2: The matrix index name
Word 3: Number of loadcases
Words 4-10: Zero

Elements: The stresses for one or more elements are fully contained in one partition and stored as follows:

(Element i) Stress 1 for loadcase 1
        Stress 2 for loadcase 1
        ...
        Stress k for loadcase 1
        Stress 1 for loadcase 2
        ...
        Stress k for loadcase n

Where k is the number of stresses for the i-th element, and n is the number of loadcases.

Generation: Program THERMU2 of the loads processor.
COMPOSITE ELEMENT
INITIAL STRESS CONTROL MATRIX

File: LOADRFN

Index Name: IBC01ba

Type: MIXED

Dimensions: \(N*1\) where \(N = (\text{Number of elements} + 1)/2\)

Auxiliary ID:
- Word 1: LOADRFN
- Word 2: IBC01ba
- Word 3: Number of loadcases
- Words 4-10: Zero

Elements:
- Item i contains information about internal elements i and N+i.

Item i:
- Bits 59-45: BLK element i
- Bits 44-30: PTR element i
- Bits 29-15: BLK element N+i
- Bits 14-0: PTR element N+i

Where:
- BLK = Partition number of the initial stress matrix containing the stresses for the element
- PTR = Pointer to the first row of stress data.

If all 30 bits are zero, no initial stresses exist for the element.

Generation: Program THERMU2 of the loads processor.
INITIAL_STRESS_MATRIX

File: LOADRNF

Index_Name: IS001ba, IS002ba, ..., IS999ba

Type: PEAL

Dimensions: M*1 where M ≤ buffer size (default 3000)

Auxiliary_ID: Word 1: LOADRNF
               Word 2: The matrix index name
               Word 3: Number of loadcases
               Words 4-10: Zero

Elements: The stresses for one or more elements are fully contained in one partition and stored as follows:

(Element i) Stress 1 for loadcase 1
          Stress 2 for loadcase 1
          ...
          Stress k for loadcase 1
          Stress 1 for loadcase 2
          ...
          Stress k for loadcase n

Where k is the number of stresses for the i-th element, and n is the number of loadcases.

Generation: Programs THERMU, THERMU2 and THERMV of the loads processor.
INITIAL STRESS CONTROL MATRIX

File: LOADRNF

Index Name: ISCO1ba

Type: MIXED

Dimensions: N*1 where N = (Number of elements +1)/2

Auxiliary ID: Word 1: LOADRNF
Word 2: ISCO1ba
Word 3: Number of loadcases
Words 4-10: Zero

Elements: Item i contains information about internal elements i and N+i.

Item i: Bits 59-45: BLK element i
Bits 44-30: PTR element i
Bits 29-15: BLK element N+i
Bits 14-0: PTR element N+i

Where:

BLK = Partition number of the initial stress matrix containing the stresses for the element
PTR = Pointer to the first row of stress data.

If all 30 bits are zero, no initial stresses exist for the element.

Generation: Programs THERMU, THERMU2, and THERMV of the loads processor.
NODAL LOADS MATRIX

File: LOADRNF

Index_Name: LA001ba, LA002ba, ..., LA999ba

Type: MIXED

Dimensions: N*1 where N equals the block size (default 3000)

Auxiliary_ID: Word 1: LOADRNF
Word 2: The matrix index name
Words 3-10: Zero

Elements: The first word in each block consists of a keyword for merge:

4LLOAD OR 10000B

The remaining elements consist of word pairs defining all nodal loads to be merged.

Item i: Bits 59-48: Internal loadcase number
Bits 47-36: Internal node number
Bits 35-30: Freedom number
Bits 29-0: Zero

Item i+1: Value of load

Generation: Program MUTHALD of the loads processor.
LOADS FREEDOM ACTIVITY VECTOR

File: LOADkNF
Index Name: LFAV0ba
Type: MIXED
Dimensions: \((N+3)/4\) where \(N\) is the number of nodes.
Auxiliary ID: Word 1: LATARNF
              Word 2: LFAV0ba
              Words 3-10: Zero
Elements: Item \(j\) consists of 4 packed 15 bit integers. The
15 bits are associated left to right with the
fifteen degrees of freedom at that node. A "0" bit indicates no load for the corresponding
freedom. A "1" bit indicates a load at that freedom.

Bits 59-45: Node 4j-3
Bits 44-30: Node 4j-2
Bits 29-15: Node 4j-1
Bits 14-0:  Node 4j

Generation: Program PIN of the loads processor.
**APPLIED LOADS RESULTANT MATRIX**

**File:** LOADRNF

**Index Name:** RSULTba

**Type:** REAL

**Dimensions:** N*6 where N equals the number of loadcases

**Auxiliary ID:**
- Word 1: LOADRNF
- Word 2: RSULTba
- Words 3-10: Zero

**Elements:** Row i contains information about the i-th loadcase.

- Item 1: Summation of Fx
- Item 2: Summation of Fy
- Item 3: Summation of Fz
- Item 4: Summation of Mx
- Item 5: Summation of My
- Item 6: Summation of Mz

**Generation:** Program MUTHALD of the loads processor.
AERODYNAMIC CONTROL MATRIX

File: MACHRNRF
Index Name: ACMij
Type: MIXED
Dimensions: \(1 \times (8 + \text{number of Mach numbers} + \text{number of K-values})\)

Auxiliary ID:
- Word 1: MACHRNRF
- Word 2: ACMij
- Word 3: Zero
- Word 4: Reference length for K values
- Word 5: Mach number
- Word 6: Semispan
- Word 7: Integration tolerance
- Word 8: Case number
- Word 9: Condition number
- Word 10: Zero

Elements: The elements of this matrix are as follows:

- **Item 1:**
  - Bits 59-30: Number of constants
  - Bits 29-0: Location of the first constant

- **Item 2:**
  - Bits 59-30: Number of K-values (NKVAL)
  - Bits 29-0: Location of the first K-value

- **Item 3:**
  - Bits 59-30: Number of Mach numbers (NMACH)
  - Bits 29-0: Location of the first Mach number

- **Item 4:**
  - Bits 59-30: Number of array sizes
  - Bits 29-0: Location of the first array size

- **Item 5:**
  - Bits 59-30: Number of zero filled words
  - Bits 29-0: Location of the last element

- **Item 6:** Reference length for K-values

- **Item 7:** Semispan of planform first surface
Item 8-(7+NKVAL):

Array of K values

Item (8+NKVAL)-(7+NKVAL+NMACH):

Array of Mach numbers

Item 8+NKVAL+NMACH:

Number of modes used

Item 9+NKVAL+NMACH:

Zero

*Generation*: Program MODES of the machbox processor.
AERODYNAMIC_INFLUENCE_COEFFICIENT_NAMES_MATRIX

File: MACHRNF

Index_Name: ACNijkl

Type: MIXED

Dimensions: 2*(NVPAIC+1+N) where NVPAIC is the number of spatial velocity potential AIC arrays calculated and N=1 if subdivision is used N=0 otherwise.

Auxiliary_ID: Word 1: MACHRNF
               Word 2: ACNijkl
               Word 3: K value
               Word 4: Reference length for K values
               Word 5: Mach number
               Word 6: Semispan value
               Word 7: AIC integration tolerance
               Word 8: Case number
               Word 9: Condition number
               Word 10: Zero

Elements: The first item of row 1 contains the number of velocity potential AIC matrices required for the given conditions.

Items 2 through n of row 1 give the AIC index entry number of the required matrices. Row 2 item 1 is 0. All other items of row 2 contain the size of the AIC matrix indicated by the corresponding items of row 1.

Generation: Program VICMAIN of the machbox processor.
VELOCITY POTENTIAL AERODYNAMIC INFLUENCE COEFFICIENT MATRIX

File: MACHRNF

Index Name: AICCeee

Dimensions: 1*number of unique sending-receiving box interactions for the receiving boxes in a plane x unit box widths above the plane of the sending surface. The box centers of the plane are offset y unit box widths for the box centers of the Mach box grid system.

Auxiliary ID: Word 1: MACHRNF
Word 2: AICCeee
Word 3: K-value
Word 4: Reference length for K-values
Word 5: Mach number
Word 6: Semispan value
Word 7: AIC integration tolerance
Word 8: Maximum block size of the uncompressed matrix.
Word 9: Offset distance in box width units
Word 10: Vertical separation in box width units

Elements: This matrix contains the velocity potential AIC array as described for matrix AICPeee when the sending surface boxes do not lie in the plane of the receiving box. The upwash and sidewash AIC array must be calculated for this situation.

Generation: Program VICMAIN of the machbox processor.
AERODYNAMIC INFLUENCE COEFFICIENT INDEX MATRIX

File: MACHRNF

Index_Name: AICINDX

Type: MIXED

Dimensions: NAIC*6 where NAIC - the number of entries in the AIC Table of Contents array

Auxiliary_ID: Word 1: MACHRNF
            Word 2: AICINDX
            Words 3-10: Zero filled

Elements: This matrix contains the Table of Contents for all AIC matrices written on MACHRNF. Each row corresponds to a unique set of AIC matrices and the row number determines the last three characters (eee) of the index names. For row i, the AIC set may consist of the following combinations of matrices:

a) one planar AIC matrix, AICC00i

b) three spatial AIC matrices and a pointer matrix

    AICC00i
    AICW00i
    AICV00i
    AICM00i

c) one planar, three spatial, and one map matrix

    AICP00i
    AICC00i
    AICW00i
    AICV00i
    AICM00i

130.5
Each row contains the following data for the corresponding set of AIC matrices:

Item 1: Mach number
Item 2: K-value
Item 3: Integration tolerance
Item 4: Size
Item 5: Horizontal offset
Item 6: Vertical separation

Generation: Program VICMAIN of the machbox processor.
AERODYNAMIC INFLUENCE COEFFICIENT POINTER MATRIX

File: MACHRNF

Index Name: AICMeee

Type: MIXED

Dimensions: 2*(number of subdivided rows of the planform)

Auxiliary ID:

Word 1: MACHRNF
Word 2: AICMeee
Word 3: K-value
Word 4: Reference length for K values
Word 5: Mach number
Word 6: Semispan value
Word 7: AIC integration tolerances
Word 8: Maximum block size of uncompressed AIC matrix
Word 9: Offset distance in box width units
Word 10: Vertical separation in box width units

Elements: The elements of this matrix are pointers describing which elements of the spatial AIC matrices, AICccee, AICWeee, and AICVeee, have been calculated. This matrix must be present to use spatial AIC's. The j-th element of the first row indicates the first sending box on the (j-1)th row. (Rows are measured forward from the row of the receiving box. Boxes are counted starting with the box on the left forward Mach cone.) The j-th element of the second row indicates the last sending box on the (j-1)th row for which a coefficient has been calculated.

Generation: Program VICMAIN of the machbox processor.

<tr>
<td>Elements:</td>
<td>This matrix contains the velocity potential aerodynamic influence coefficients for a planar planform. An element of the array may be interpreted as the velocity potential induced at the center of a receiving box due to a unit upwash uniformly distributed over a full or partial sending box. A complete AIC matrix contains a coefficient for every combination of sending box and receiving box. The size of each AIC matrix is determined by the number of boxes on the sending surface which influence the receiving box. Receiving boxes at different spanwise locations on the receiving surface will, in general, require different AIC matrices. However, receiving boxes which lie on the same chord of the receiving surface use the same AIC's, and consequently, an AIC matrix that is large enough to satisfy the requirements of the aftmost box on that surface can be used for all boxes on that chord. Note that &quot;surface&quot; includes any diaphragm areas needed in the solution of the problem. When the receiving surface lies in the</td>
</tr>
</tbody>
</table>
plane of the sending surface, one velocity potential AIC matrix may be used for all chords. The upwash AIC matrices and the sidewash AIC matrices are not needed for this situation.

**Generation:** Program VICMAIN of the machbox processor.
**SIDEWASH_AERODYNAMIC_INFLUENCE_COEFFICIENT_MATRIX**

**File:** MACHRNF

**Index Name:** AICVeee

**Type:** REAL

**Dimensions:** 1*number of unique sending-receiving box interactions for the receiving boxes in a plane x unit box widths above the plane of the sending surface. The box centers of the plane are offset y unit box widths from the box centers of the Mach box grid system.

**Auxiliary ID:**
- Word 1: MACHRNF

Elements: This matrix contains the compressed box codes for planform boxes, diaphragm boxes and wake boxes of a noncoplanar tail.

Generation: Program GEOMBX of the machbox processor.
**WING BOX CODE MATRIX**

**File:** MACHRN F

**Index_Name:** BØXi jkw

**Type:** MIXED

**Dimensions:** (N/20)*M where N equals the total number of chords and M equals the total number of rows of boxes on the wing or coplaner tail.

**Auxiliary_ID:**
- Word 1: MACHRN F
- Word 2: BØXijk W
- Word 3: Zero
- Word 4: Reference length for K values
- Word 5: Mach number
- Word 6: Semispan value
- Word 7: AIC integration tolerance
- Word 8: Case number
- Word 9: Condition number
- Word 10: Zero

**Elements:** This matrix contains the compressed box codes for planform boxes, diaphragm boxes and wake boxes of a wing or coplaner wing and tail.

**Generation:** Program GEOMBX of the machbox processor.
SECTIONAL MOMENT MATRIX

File: MACHRNF
Index_Name: CMnijkl
Type: REAL
Dimensions: 1*NCDS where NCDS is the total number of chords on surface 1 and surface 2.

Auxiliary_ID: Word 1: MACHRNF
Word 2: CMnijkl
Word 3: K-value
Word 4: Reference length for K values
Word 5: Mach number
Word 6: Semispan value
Word 7: AIC integration tolerance
Word 8: Case number
Word 9: Condition number
Word 10: Zero

Elements: This matrix contains the sectional moment for each chord of the planform.

Generation: Program FORCES of the machbox processor.
NORMAL WASH POINTER MATRIX

File: MACHRNF

Index_Name: DWpijkl

Type: MIXED

Dimensions: 2*NROWS where NROWS is the number of planform, diaphragm and wake rows for which subdivided normal wash is calculated.

Auxiliary_ID: Word 1: MACHRNF
Word 2: DWpijkl
Word 3: K-value
Word 4: Reference length for K values
Word 5: Mach number
Word 6: Semispan value
Word 7: AIC integration tolerance
Word 8: Case number
Word 9: Condition number
Word 10: Zero

Elements: This matrix contains the normal wash pointer array. The format is same as for the MPTijk matrix. Boxes of the planform diaphragm, and wake region are referenced by this matrix.

Generation: Program NWVPMBX of the machbox processor.
MACBOX_EXECUTION_PARAMETER_MATRIX

File: MACHRNF
Index_Name: EXPi
Type: MIXED
Dimensions: 1 x 1304

Auxiliary ID:
Word 1: MACHRNF
Word 2: EXPi
Word 3: Zero
Word 4: Reference length for K-values
Word 5: First Mach number of the execution list
Word 6: Semispan maximum spanwise dimension of surface 1
Word 7: AIC integration tolerance
Word 8: Case number
Word 9: Condition number
Word 10: Zero

Elements: This matrix contains all the planform geometry data and the execution parameters used by the technical module of MACBOX.

Item 220: NTSS1 - number of thickness slopes input for surface 1

Item 221: NTSS2 - number of thickness slopes input for surface 2
Item 222: TSMN1 - Mach number for which surface 1 thickness slopes are to be used

Item 223: TSMN2 - Mach number for which surface 2 thickness slopes are to be used

Items 224-1223:

TS(500,2) - Array of thickness slopes

Labelled common EXEC

Item 1224: DIHW - logical indicator for surface interaction calculations

.T. Include dihedral angle of surface 1 in the calculation of the influence of the first surface itself

.F. Use dihedral angle only in the calculation of interaction between surfaces

Item 1225: DIHT - logical indicator for surface interaction calculations

.T. Include dihedral angle of surface 2 in the calculation of the influence of the second surface itself

.F. Use dihedral angle only in the calculation of interaction between surfaces

Item 1226: SMOOTH - logical indication for application of surface least squares polynomial fitting to velocity potentials before calculation of generalized forces

.T. Velocity potentials are to be fitted by a surface fit

.F. Velocity potentials are not to be fitted by a surface fit

130.24
Item 1227: CRDFIT - logical indication for application of chordwise least squares polynomial fitting to velocity potentials before calculation of generalized forces

.T. Velocity potentials are to be fitted by a chordwise fit

.F. Velocity potentials are not to be fitted by a chordwise fit

Item 1228: EXAIC - logical indication for application of fine integration tolerances in the calculation of AIC's

.T. tolerance is .0001

.F. tolerance is .0001

Item 1229: SUBDV - logical indicator for application of subdivision technique for calculation of normal washes

.T. technique will be applied

.F. technique will not be applied

Item 1230: PLYWOOD - logical indicator for use of full box areas in calculation instead of fractional areas

.T. full box areas are used everywhere

.F. fractional areas are used for boxes that are cut by planform boundary
Item 1231: SYM - indicator for symmetry option to be applied to first surface

1  symmetric analysis

0  no left hand surface contributions are to be calculated (nonsymmetric analysis)

-1  antisymmetric analysis

Item 1232: NDEG - the degree of the polynomial fit to be applied

Item 1233: SYMT - indicator for symmetry option to be applied to second surface

1  symmetric analysis

0  no left hand surface contributions are to be calculated (nonsymmetric analysis)

-1  antisymmetric analysis

Labelled common MACH common /MACH/.

Item 1234: IMACH - index of Mach number currently being used

Item 1235: NMACHS - number of Mach numbers to be used

Items 1236-1255:

PMACH(20) - List of Mach numbers to be used

Item 1256: XMACH - the Mach number currently being used

Labelled common KVAL

Item 1257: IKVAL - index of K value currently being used

Item 1258: NKVALS - number of K values to be used
Items 1259-1278:

XKVAL(20) - List of K values after conversion of reference length

Items 1279-1298:

XKS(20) - List of input K values before conversion

Item 1299: XKREF - reference length on which input K values are to be based

Labelled common LEVEL

Items 1300-1304:

LEVELS - Logical indicators specifying that selected sets of data are to be written on MACHRFN

.T. selected information will be written on MACHRFN

.F. only box codes and generalized forces will be written on MACHRFN

Generation: Program DATAPP of the machbox processor.
REAL_GENERALIZED_AERODYNAMIC_COEFFICIENT_MATRIX

File: MACHRNRF

Index_Name: GACijkl

Type: REAL

Dimensions: NMODES * NMODES where NMODES is the number of modes used to generate the general air forces.

Auxiliary_ID: Word 1: MACHRNRF
Word 2: GACijkl
Word 3: K-value
Word 4: Reference length for K-values
Word 5: Mach number
Word 6: Semispan value
Word 7: AIC integration tolerance
Word 8: Case number
Word 9: Condition number
Word 10: Zero

Elements: The elements of this matrix are the real parts of the generalized aerodynamic coefficients as defined by the Advisory Group for Aerodynamic Research & Development (AGARD).

Generation: Program FORCES of the machbox processor.
**IMAGINARY GENERALIZED AERODYNAMIC COEFFICIENT MATRIX**

**File:** MACHRNF

**Index Name:** GCIijkl

**Type:** REAL

**Dimensions:** NMODES * NMODES where NMODES is the number of modes used to generate the general air forces.

**Auxiliary_ID:**
- Word 1: MACHRNF
- Word 2: GCIijkl
- Word 3: K-value
- Word 4: Reference length for K-values
- Word 5: Mach number
- Word 6: Semispan value
- Word 7: AIC integration tolerance
- Word 8: Case number
- Word 9: Condition number
- Word 10: Zero

**Elements:** The elements of this matrix are the imaginary parts of the generalized aerodynamic coefficients as defined by the Advisory Group for Aerodynamic Research & Development (AGARD).

**Generation:** Program FORCES of the machbox processor.
GENERALIZED_FORCE_MATRIX

File: MACHRNF

Index_Name: GF0ijkl

Type: REAL

Dimensions: NMODES * NMODES where NMODES is the number of modes used to generate the general air forces.

Auxiliary_ID: Word 1: MACHRNF
Word 2: GF0ijkl
Word 3: K-value
Word 4: Reference length for K-values
Word 5: Mach number
Word 6: Semispan value
Word 7: AIC integration tolerance
Word 8: Case number
Word 9: Condition number
Word 10: Zero

Elements: This array contains the generalized air forces generated by MACHBOX. This array will be present for every combination of Mach number and K value specified on the execution card.

Generation: Program FORCES of the machbox processor.
**MODE SHAPE PRINTING POINTER MATRIX**

**File:** MACHFN

**Index Name:** ISPijk

**Type:** MIXED

**Dimensions:** 1 x 400

**Auxiliary ID:**
- Word 1: MACHRN
- Word 2: ISPijk
- Word 3: Zero
- Word 4: Reference length for K-values
- Word 5: Mach number
- Word 6: Semispan
- Word 7: Integration tolerance for AIC generation
- Word 8: Case number
- Word 9: Condition number
- Word 10: Zero

**Elements:**
- Item 1-100: The row number of the first planform box on each chord
- Item 101-200: The number of boxes on each chord
- Item 201-300: The column number of the first planform box in each row of boxes
- Item 301-400: The number of planform boxes in each row

Elements corresponding to boxes on the second surface are located immediately after the last elements corresponding to boxes on the first surface.

**Generation:** Program MODES of the machbox processor.
WING OR WING/TAIL_LOWER_SURFACE_NORMAL_WASH_MATRIX

**File:**
MACHRNF

**Index Name:**
LNnijkl

**Type:**
REAL

**Dimensions:**
1*NBX where NBX is the number of boxes on the wing plus the number of boxes in the diaphragm area of the wing plus the number of boxes in the wake area of the wing.

**Auxiliary_ID:**
Word 1: MACHRNF
Word 2: LNnijkl
Word 3: K-value
Word 4: Reference length for K-values
Word 5: Mach number
Word 6: Semispan value
Word 7: AIC integration tolerance
Word 8: Case number
Word 9: Condition number
Word 10: Zero

**Elements:**
This matrix contains the lower surface normal wash values for the wing.

Elements of this matrix are associated with boxes of the planform, wake, or diaphragm regions by the DWPijkl matrix.

**Generation:**
Program NWVPMBX of the machbox processor.
NON_COPLANAR_TAIL_LOWER_SURFACE_NORMAL_WASH_MATRIX

File: MACHRNF

Index_Name: LTnijkl

Type: REAL

Dimensions: 1*NBX where NBX is the number of boxes on the non-coplanar tail plus the number of boxes in the diaphragm area of the tail plus the number of boxes in the wake area of the tail.

Auxiliary_ID: Word 1: MACHRNF
Word 2: LTnijkl
Word 3: K-value
Word 4: Reference length for K-values
Word 5: Mach number
Word 6: Semispan value
Word 7: AIC integration tolerance
Word 8: Case number
Word 9: Condition number
Word 10: Zero

Elements: This matrix contains the lower surface normal wash values for the tail.

Elements of this matrix are associated with boxes of the planform, wake, or diaphragm regions by the DWPijkl matrix.

Generation: Program NWVPMBEX of the machbox processor.
**File:** MACHRNF

**Index Name:** M0nijkl

**Type:** FEAL

**Dimensions:** 2*(number of planform boxes)

**Auxiliary ID:**
- Word 1: MACHRNF
- Word 2: M0nijkl
- Word 3: Zero
- Word 4: Reference length for K-values
- Word 5: Mach number
- Word 6: Semispan value
- Word 7: AIC integration tolerance
- Word 8: Case number
- Word 9: Condition number
- Word 10: Zero

**Elements:** This matrix contains the slopes and deflections for planform boxes at the box centers. The deflections are contained in row 1. The slopes are contained in row 2.

**Generation:** Program MODES of the machbox processor.
PLANFORM_Pointer_Matrix

File: MACHRNF

Index_Name: MPTijk

Type: MIXED

Dimensions: 2*(number of planform rows + 1)

Auxiliary_ID:
Word 1: MACHRNF
Word 2: MPTijk
Word 3: Zero
Word 4: Reference length for K-values
Word 5: Mach number
Word 6: Semispan
Word 7: Integration tolerance for AIC generation
Word 8: Case number
Word 9: Condition number
Word 10: Zero

Elements:
This matrix contains a pointer array that associates a box location in a sparsely filled rectangular matrix with a corresponding mode, velocity potential, box lift, or pressure difference coefficient in a single dimensional densely filled matrix.

Item j of row 1 of this matrix gives the sequential count +1 of all boxes, planform or wake regions, that are on or between the first and last planform box of all planform rows forward of the row j.

Item j of row 2 gives the chord number of the first planform box on the j-th planform row.

Elements corresponding to the second surface are found immediately following those for the first surface.

Generation: Program MODES of the machbox processor.
PRESSURE_DIFFERENCE_COEFFICIENTS_MATRIX

File: MACHRNF
Index_Name: PCnijkl
Type: REAL
Dimensions: 1*NBX where NBX is the number of boxes on the planform.

Auxiliary_ID:
Word 1: MACHRNF
Word 2: PCnijkl
Word 3: K-value
Word 4: Reference length for K-values
Word 5: Mach number
Word 6: Semispan value
Word 7: AIC integration tolerance
Word 8: Case number
Word 9: Condition number
Word 10: Zero

Elements: This matrix contains the pressure difference coefficients. Elements of this matrix are associated with boxes of the planform by the MPTijkl matrix.

Generation: Program FORCES of the machbox processor.
TAIL_SUBDIVIDED_NORMAL_WASH_POINTER_MATRIX

File: MACHRNF

Index_Name: PSTijkl

Type: MIXED

Dimensions: 2*50

Auxiliary_id: Word 1: MACHRNF
       Word 2: PSTijkl
       Word 3: K-value
       Word 4: Reference length for K-values
       Word 5: Mach number
       Word 6: Semispan
       Word 7: AIC integration tolerance
       Word 8: Case number
       Word 9: Condition number
       Word 10: Zero

Elements: This matrix contains end around pointers for the
tail subdivided normal wash matrices. The format
is similar to the MPTijkl matrix. Boxes of the
planform, diaphragm, and wake regions are
referenced.

Generation: Program NWVPMEX of the machbox processor.
WING_SUBDIVIDED_NORMAL_WASH_POINTER_MATRIX

File: MACHRNF

Index_Name: PSWijkl

Type: MIXED

Dimensions: 2*50

Auxiliary_ID:
Word 1: MACHRNF
Word 2: PSWijkl
Word 3: K-value
Word 4: Reference length for K-values
Word 5: Mach number
Word 6: Semispan value
Word 7: AIC integration tolerance
Word 8: Case number
Word 9: Condition number
Word 10: Zero

Elements: This matrix contains end around pointers for the wing subdivided normal wash matrices. The format is similar to the MPTijkl matrix. Boxes of the planform, diaphragm, and wake regions are referenced.

Generation: Program NWVPMBX of the machbox processor.
**SMOOTHED_REAL_GENERALIZED_AERODYNAMIC_COEFFICIENTMATRIX**

**File:** MACHRNF  
**Index_Name:** SACijkl  
**Type:** REAL  
**Dimensions:** NModes * NModes where nmodes is the number of modes used to generate the general air forces.

**Auxiliary_ID:**  
Word 1: MACHRNF  
Word 2: SACijkl  
Word 3: K-value  
Word 4: Reference length for K-values  
Word 5: Mach number  
Word 6: Semispan value  
Word 7: AIC integration tolerance  
Word 8: Case number  
Word 9: Condition number  
Word 10: Zero

**Elements:** The elements of this matrix are the real parts of the smoothed generalized aerodynamic coefficients as defined by the Advisory Group for Aerodynamic Research & Development (AGARD).

**Generation:** Program FORCES of the machbox processor.
SMOOTHED_BOX_LIFT_MATRIX

File: MACHRF

Index_Name: SBnikjl

Type: REAL

Dimensions: 1*NBX where NBX is the number of planform boxes.

Auxiliary_ID: Word 1: MACHRF
              Word 2: SBnikjl
              Word 3: K-value
              Word 4: Reference length for K-values
              Word 5: Mach number
              Word 6: Semispan value
              Word 7: AIC integration tolerance
              Word 8: Case number
              Word 9: Condition number
              Word 10: Zero

Elements: This matrix contains smoothed box lifts. Elements of this matrix are associated with boxes of the planform by the MPTijkl matrix.

Generation: Program FORCES of the machbox processor.
SMOOTHED IMAGINARY GENERALIZED AERODYNAMIC COEFFICIENT MATRIX

File: MACHRNF

Index_Name: SCIijkl

Type: REAL

Dimensions: NMODES * NMODES where NMODES is the number of modes used to generate the general air forces.

Auxiliary_ID: Word 1: MACHRNF
             Word 2: SCIijkl
             Word 3: K-value
             Word 4: Reference length for K-values

              Word 8: Case number
              Word 9: Condition number
              Word 10: Zero

Elements: This matrix contains the total smoothed sectional lifts for each chord due to all boxes on that chord.

Generation: Program FORCES of the machbox processor.
**TAIL_SUBDIVIDED_NORMAL_WASH_MATRIX**

**File:** MACHRFN

**Index_Name:** STnijkl

**Type:** REAL

**Dimensions:** 2*NSBX where NSBX is the total number of subdivided boxes for planform, diaphragm and wake regions on a non-coplanar tail.

**Auxiliary_ID:**
- Word 1: MACHRFN
- Word 2: STnijkl
- Word 3: K-value
- Word 4: Reference length for K-values
- Word 5: Mach number
- Word 6: Semispan value
- Word 7: AIC integration tolerance
- Word 8: Case number
- Word 9: Condition number
- Word 10: Zero

**Elements:** This matrix contains the subdivided normal wash array for the tail. Elements of this array are associated with boxes of the subdivided planform, wake, and diaphragm region by the PSTijkl matrix.

**Generation:** Program NWVPMBEX of the machbox processor.
WING_SUBDIVIDED_NORMAL_WASH_MATRIX

File: MACHRFN
Index_Name: SUnijkl
Type: REAL
Dimensions: 2*NSBX where NSBX is the total number of subdivided boxes for planform, diaphragm and wake regions for the wing or coplanar wing and tail.

Auxiliary_ID: Word 1: MACHRFN
Word 2: SUnijkl
Word 3: K-value
Word 4: Reference length for K-values
Word 5: Mach number
Word 6: Semispan value
Word 7: AIC integration tolerance
Word 8: Case number
Word 9: Condition number
Word 10: Zero

Elements: This matrix contains the subdivided normal wash array for wing or coplanar wing and tail. Elements of this array are associated with boxes of the subdivided planform, wake, and diaphragm region by the PSWijkl matrix.

Generation: Program NWVPMBX of the machbox processor.
SMOOTHED VELOCITY POTENTIAL MATRIX

File: MACHRFN
Index_Name: SVnijkl
Type: REAL
Dimensions: 1*NEP where NEP is the number of boxes.

Auxiliary_ID: Word 1: MACHRFN
Word 2: SVnijkl
Word 3: K-value
Word 4: Reference length for K-values
Word 5: Mach number
Word 6: Semispan value
Word 7: AIC integration tolerance
Word 8: Case number
Word 9: Condition number
Word 10: Zero

Elements: This matrix contains the smoothed velocity potentials. Elements of this matrix are associated with boxes of the planform region by the MPTijkl matrix.

Generation: Program SMOOTH or CHORD of the machbox processor.
**WING UPPER SURFACE NORMAL WASH MATRIX**

**File:** MACHRNF

**Index_Name:** UNnijkl

**Type:** REAL

**Dimensions:** 1*NBX where NBX is the number of boxes on the wing plus the number of boxes in the diaphragm area of the wing plus the number of boxes in the wake area of the wing.

**Auxiliary_ID:**
- Word 1: MACHRNF
- Word 2: UNnijkl
- Word 3: K-value
- Word 4: Reference length for K-values
- Word 5: Mach number
- Word 6: Semispan value
- Word 7: AIC integration tolerance
- Word 8: Case number
- Word 9: Condition number
- Word 10: Zero

**Elements:** This matrix contains the upper surface normal wash values for the wing.

Elements of this matrix are associated with boxes of the planform, wake, or diaphragm regions by the DWPIjkl matrix.

**Generation:** Program NWVPMBX of the machbox processor.
**TAIL_UPPER_SURFACE_NORMAL_WASH_MATRIX**

*File:* MACHRNF

*Index_Name:* UTnijkl

*Type:* REAL

*Dimensions:* 1*NBX where NBX is the number of boxes on the non-coplanar tail plus the number of boxes in the diaphragm area of the tail plus the number of boxes in the wake area of the tail.

*Auxiliary_ID:* Word 1: MACHRNF  
Word 2: UNnijkl  
Word 3: K-value  
Word 4: Reference length for K-values  
Word 5: Mach number  
Word 6: Semispan value  
Word 7: AIC integration tolerance  
Word 8: Case number  
Word 9: Condition number  
Word 10: Zero

*Elements:* This matrix contains the upper surface normal wash values for the tail.

Elements of this matrix are associated with boxes of the planform, wake, or diaphragm regions by the DWPIjkl matrix.

*Generation:* Program NWVPMBX of the machbox processor.
**VELOCITY_POTENTIAL_MATRIX**

**File:** MACHRNF

**Index_Name:** VPnijkl

**Type:** REAL

**Dimensions:** 1*NBX where NEX is the number of boxes.

**Auxiliary_ID:**

Word 1: MACHRNF  
Word 2: VPnijkl  
Word 3: K-value  
Word 4: Reference length for K-values  
Word 5: Mach number  
Word 6: Semispan value  
Word 7: AIC integration tolerance  
Word 8: Case number  
Word 9: Condition number  
Word 10: Zero

**Elements:** This matrix contains the smoothed velocity potentials. Elements of this matrix are associated with boxes of the planform region by the MPTijkl matrix.

**Generation:** Program NWVPMBX of the machbox processor.
OFF-PLANFORM_WASH_SAMPLE_MATRIX

File: MACHRNF
Index_Name: WSnijkl
Type: REAL
Dimensions: 1*1200

Auxiliary_ID: Word 1: MACHRNF
             Word 2: WSnijkl
             Word 3: K-value
             Word 4: Reference length for K-values
             Word 5: Mach number
             Word 6: Semispan value
             Word 7: AIC integration tolerance
             Word 8: case number
             Word 9: Condition number
             Word 10: Zero

Elements: This matrix contains three types of off-planform wash sampling values. The values are complex decimal numbers. The real part of each value is in row 1. The imaginary part is in row 2. The first 400 values are for upwash. Values 401-800 are for side wash. The last 400 values are for longitudinal wash. For each type of sample there are 40 values for each of 10 sample chords. The values correspond to the boxes on the specified chord of the planform. Sample washes will be present only for the boxes and chords specified.

Generation: Program NWVPMBX of the machbox processor.
CONCENTRATED MASS DATA MATRIX

File_Name: MASSRNF

Index_Name: Cg0001a, Cg0002a, ..., Cg9999a

Type: MIXED

Dimensions: LN * 1, where LN ≤ 5000. The dimensions are reduced such that the mass matrix for the last concentrated mass in the block is wholly contained in one block.

Auxiliary_ID:

Word 1: MASSRNF
Word 2: The matrix index name.
Word 3: Number of masses in this data set
Word 4: Internal number of the first mass in this block
Word 5: Internal number of the last mass in this block
Words 6-10: Zero

Elements:

Item 1: Identification word containing 4 packed integers.

Bits 59-36: MASS (display code)
Bits 35-30: Zero
Bits 29-15: Internal number of the first mass in the block
Bits 14-0: Internal number of the last mass in the block

Item 2-LN: Concentrated mass matrix data stored as follows:

Word 1 is an ID word containing 4 packed integers

Bits 59-45: Internal concentrated mass number
Bits 44-30: Zero
Bits 29-15: NF, number of kinematic freedoms
Bits 14-0: Zero
Words 2-\((NF+1)\) contain runcodes, each consisting of 2 packed integers

Bits 59-30: Internal node number
Bits 29-0: Freedom number

Words \((NF+2)-(NF*(NF+3)/2+2)\) contain the matrix terms, stored rowwise, lower triangular, full.

Generation: Program LUMPGEN of the mass processor.
**File:** MASSRNF

**Index Name:** CVECppa
FVECffa
PVECppa

**Type:** MIXED

**Dimensions:** 2*N where N is variable depending on the number of passengers, cargo hold loading commands, and fuel usage commands.

**Auxiliary_ID:**
Word 1: MASSRNF
Word 2: The matrix index name
Words 3-10: Zero

**Elements:** Column i contains the following data for the ith point on the vector.

- **Item 1:** Weight
- **Item 2:** X-cg

**Generation:** Program PAYVEC of the mass processor.
FUEL TABLES

File: MASSRFN

Index Name: FTtt01a, FTtt02a, ..., FTtt99a

Type: REAL

Dimensions: 11*N where N is the sum of the fuel levels of the tanks. (N ≤ 300)

Auxiliary ID: Word 1: MASSRFN
Word 2: The matrix index name.
Words 3-10: Zero

Elements: Each column contains the following data for one fuel level.

Item 1: Fuel height
Item 2: Weight of fuel in the tank
Item 3-5: X, Y, and Z coordinates of the center of gravity
Item 6-11: Ixx, Iyy, Izz, Ixy, Ixz, Iyz

Generation: Program FUELTAB of the mass processor.
**FUEL_TABLE_INDEX_MATRIX**

**File:** MASSRNF

**Index_Name:** FTINDXa

**Type:** MIXED

**Dimensions:** 
(N+1)*1 where N is the number of defined fuel tanks.

**Auxiliary_ID:** 
Word 1: MASSRNF  
Word 2: FTINDXa  
Words 3-10: Zero

**Elements:**

**Item 1:** Number of fuel tanks

**Item 2- (N+1):**

- Bits 59-45: Tank identification
- Bits 44-42: Reserved
- Bits 41-36: Number of fuel levels
- Bits 35-18: Reserved
- Bits 17-9: Fuel table block number for this tank
- Bits 8-0: Pointer to the fuel table column for this tank.

**Generation:** Program FUELTAB of the mass processor.
ELEMENT GEOMETRY DATA

File: MASSRNF

Index_Names: GK0001a, GK0002a, ..., GK9999a (Stiffness elements)
GM0001a, GM0002a, ..., GM9999a (Mass elements)
GFff01a, GFff02a, ..., GFff99a (Fuel elements)
GPpp01a, GPpp02a, ..., GPpp99a (Payload elements)

Type: MIXED

Dimensions: M * 1 where M is the matrix block size (currently 4000).

Auxiliary_ID:
Word 1: MASSRNF
Word 2: The matrix index name
Word 3: Number of elements in this block
Word 4: Internal number of the first element in this block
Word 5: Internal number of the last element in this block
Word 6: Number of elements in this block excluding spars and covers.
Word 7: Number of spars in this block
Word 8: Number of covers in this block
Words 9-10: Zero

Elements:
The property and nodal coordinate data for the ith element is stored sequentially (PROP1, ..., PROPIm, X1, Y1, Z1, ..., Xn, Yn, Zn ...) beginning at the pointer word for that element. (The pointers are stored in the IDX matrices). The words preceeding the pointer word contain the element weight factors.

The table below shows the element properties, the number of words required for the nodes coordinates, and the weight factors for each element type. (The element type is not stored)

140.7
If the plates are tapered the thicknesses at the nodes are stored in the node sequence.
(t1, t2, ..., tn)

where:
Wt = weight
Ji
IYi = area moments at node i
IZi
Ai = cross-sectional area at node i
IKj = weight moment of inertias
t = thickness
N = number of nodes describing the element

Generation: Program GEOMETRY of the mass processor.
**FUEL/PAYLOAD GEOMETRY MATRIX**

**File:** MASSRNF

**Index Name:** GFF01a, GFF02a, ..., GFF99a (Fuel)  
GP01a, GP02a, ..., GP99a (Payload)

**Type:** REAL

**Dimensions:** M*1 where M is the matrix block size (currently 4000)

**Auxiliary ID:**
- Word 1: MASSRNF
- Word 2: The matrix index name
- Word 3: Number of elements in this block
- Word 4: Internal number of the first element in this block.
- Word 5: Internal number of the last element in this block.
- Words 6-10: Zero

**Elements:**
- Fuel - The tetrahedron geometry describing the fuel distribution is stored as follows: Fuel density, X1, Y1, Z1, X2, Y2, Z2, ..., X4, Y4, Z4.
- Payload - The tetrahedron and scalar geometry describing the payload distribution is stored as follows: (tetrahedrons) Cargo density, X1, Y1, Z1, X2, Y2, Z2, ..., X4, Y4, Z4  

**Generation:** Programs FUELELM and PAYELM of the mass processor.
ELEMENT_INDEX_MATRICES

File: MASSRNF

Index Names:
- IDXK00a - (Stiffness)
- IDXM00a - (Mass elements)
- IDXFFfa - (Fuel elements)
- IDXPppa - (Payload elements)

Type: MIXED

Dimensions: M * 3 where M is equal to the number of elements in the corresponding element data set.

Auxiliary ID:
- Word 1: MASSRNF
- Word 2: The matrix index name
- Word 3: The number of mass and geometry data blocks for the corresponding data set.
- Words 4-10: Zero

Elements:
Row i of the matrix contains the following information for the ith internal element.

Item 1: Bits 59: Taper indicator for plates and covers.
- 0 = uniform thickness
- 1 = tapered

Bits 58-54: The element type code

Bits 53-47: The number of nodes describing the element

Bits 46-37: The number of the geometry data block that contains the data for element i

Bits 36-25: The row of the geometry matrix where the data for the ith element begins

Bits 24-15: The number of the element mass data block that contains the data for element i

Bits 14-0: The row of the element mass matrix where the data for the ith element begins
Item 2:  
Bits 59-45: The element user identification  
Bits 44-30: The element input record number  
Bits 29-0:  Reserved  

Item 3: The element label  

Generation: Programs GEOMETRY and TOTALWT of the mass processor.
FUEL/PAYLOAD INDEX MATRICES

File: MASSRNF

Index Names:
- IDXfffa - (Fuel)
- IDXppa - (Payload)

Type: MIXED

Dimensions: M * 3 where M is equal to the number of elements describing the fuel/payload distribution corresponding to the condition ff/pp.

Auxiliary ID:
- Word 1: MASSRNF
- Word 2: The matrix index name
- Word 3: The number of mass and geometry data blocks for the corresponding condition.
- Words 4-10: Zero

Elements: Row i of the matrix contains the following information for the ith internal element.

Item 1:
- Bits 59-54: The element type code
- Bits 53-47: The number of nodes describing the element
- Bits 46-37: The number of the geometry data block that contains the data for element i
- Bits 36-25: The row of the geometry matrix where the data for the ith element begins
- Bits 24-15: The number of the element mass data block that contains the data for element i
- Bits 14-0: The row of the element mass matrix where the data for the ith element begins

Item 2: Zero
Item 3: Fuel

Bits 59-51: Condition identification
Bits 50-42: Fuel management sequence number
Bits 41-33: Pointer to the attitude matrix
Bits 32-15: Reserved
Bits 14-0: User id of the fuel tank containing the ith tetrahedron.

Payload

Bits 59-51: Condition identification
Bits 50-42: Payload loading sequence number
Bits 41-30: Number of passengers
Bits 29-0: User id of the cargo hold containing this tetrahedron. (Zero if passenger)

Generation: Program PAYELM of the mass processor.
ELEMENT MASS MATRIX

File: MASSRFN

Index_Name: MA0001a, MA0002a, ..., MA9999a

Type: MIXED

Dimensions: IN*1, where LN < 5000. The dimensions are reduced such that the mass matrix for the last element in the block is wholly contained in one block.

Auxiliary ID: Word 1: MASSRFN
Word 2: The matrix index name.
Word 3: Number of elements in this data set
Word 4: Internal number of the first element in this block
Word 5: Internal number of the last element in this block
Words 6-10: Zero

Elements:

Item 1: Identification word containing 4 packed integers

Bits 59-36: MASS (display code)
Bits 35-30: Zero
Bits 29-15: Internal number of first element in this block
Bits 14-0: Internal number of last element in this block

Item 2-LN: Element mass matrix data, stored in order of internal element number. The data for each element is stored as follows:

Word 1 is an ID word containing 4 packed integers

Bits 59-45: Internal element number
Bits 44-30: Element type
Bits 29-15: NF, number of kinematic freedoms
Bits 14-0: Zero
Words 2-(NF+1) contain runcodes, each consisting of 2 packed integers.

Bits 59-30: Internal node number

Bits 29-0: Freedom number

Words (NF+2)- (NF*(NF+3)/2 contain matrix terms, stored rowwise, lower triangular, full.

Generation: Program LUMPGEN of the mass processor.
DIAGONAL MASS MATRICES

File: MASSRNF

Index Name: MDCqqqa (user matrix)

Type: MIXED

Dimensions: NFREE*1 where NFREE equals the number of retained freedoms.

Auxiliary ID: Word 1: MASSRNF
Word 2: MDCqqqa
Word 3: DIAGONAL
Words 4-9: Zero
Word 10: The data set number

Elements: The diagonal mass terms are stored consecutively as a vector.

Generation: Program MRGMASS of the mass processor.
## NON-DIAGONAL MASS MATRICES

**File:** MASSRNF  
**Index Name:** MDCqqqa (user matrix)  
**Type:** MIXED  
**Dimensions:** $N \times 1$ where $N$ is variable depending on the sparseness of the matrix.  
**Auxiliary ID:**  
- Word 1: MASSRNF  
- Word 2: MDCqqqa  
- Word 3: FULL  
- Words 4-9: Zero  
- Word 10: The data set number  
**Elements:** The mass matrix terms are stored in a row-wise, lower triangular format. (Sparse format, no leading zeros.)  
**Generation:** Program MRGMASS of the mass processor.
AUXILIARY PANEL WEIGHT MATRICES, NO INERTIAS

File: MASSRNF

Index Name: MDCqqqa

Type: MIXED

Dimensions: (NPAN+NMAS) * 5 where NPAN equals the number of auxiliary panels defined and NMAS equals the number of concentrated masses requested.

Auxiliary ID:

Word 1: MASSRNF
Word 2: MDCqqqa
Words 3-9: Zero
Word 10: The data set number

Elements:

Rows 1 to NPAN contain the following auxiliary panel data:

Item 1: A 8 character panel identification of the form AUXxxxxx. Where xxxxx equals the input panel identification.

Item 2: Panel weight

Item 3: X, Y, Z, coordinates of the panel center of gravity

Rows NPAN+1 to NPAN+NMAS contain the following concentrated mass data:

Item 1: The concentrated mass identification

Item 2: Weight

Item 3-5: X, Y, Z, coordinates of the mass center of gravity.

Generation: Program ASSMBLY of the mass processor.
AUXILIARY PANEL WEIGHT MATRICES, WITH INERTIAS

**File:** MASSRNF

**Index Name:** MDCqqqa

**Type:** MIXED

**Dimensions:** (NPAN+NMAS) * 11 where NPAN equals the number of auxiliary panels defined and NMAS equals the number of concentrated masses requested.

**Auxiliary ID:**
- Word 1: MASSRNF
- Word 2: MDCqqqa
- Words 3-9: Zero
- Word 10: The data set number

**Elements:** Rows 1 to NPAN contain the following auxiliary panel data:

- **Item 1:** A 8 character panel identification of the form AUXxxxxx where xxxxx equals the input panel identification
- **Item 2:** Panel weight
- **Item 3-5:** X, Y, Z, coordinates of panel center of gravity
- **Item 6-11:** Panel inertias about panel center of gravity (Ixx, Iyy, Izz, Ixy, Ixz, Iyz)

Rows NPAN+1 to NPAN+NMAS contain the following concentrated mass data.

- **Item 1:** The concentrated mass identification
- **Item 2:** Weight
- **Item 3-5:** X, Y, Z, coordinates of the mass center of gravity
- **Item 6-11:** Mass inertias about the mass center of gravity (Ixx, Iyy, Izz, Ixy, Ixz, Iyz)

**Generation:** Program ASSMBLY of the mass processor.
**FREEDOM_ACTIVITY_VECTOR**

**File:** MASSRNF

**Index Name:** MFAV00a,MFAV0ga

**Type:** MIXED

**Dimensions:** \((N+3)/4\) \* 1 where \(N\) is the number of nodes.

**Auxiliary ID:**
- **Word 1:** MASSRNF
- **Word 2:** The matrix index name.
- **Word 3:** Bits 59-45, 15 bits associated left to right with freedoms TX, TY, etc. A zero bit indicates that no node has mass for this freedom; a one bit that at least one node has mass for this freedom.
- **Words 4-10:** Zero

**Elements:** Item \(j\) consists of 4 packed 16 bit integers. The 15 bits are associated (left-to-right) with the fifteen degrees of freedom at the corresponding internal node. A "0" bit indicates no mass for the corresponding freedom; a "1" bit indicates mass.

- **Bits 59-45:** Node 4\(j-3\)
- **Bits 44-30:** Node 4\(j-2\)
- **Bits 29-15:** Node 4\(j-1\)
- **Bits 14-0:** Node 4\(j\)

**Generation:** Program LUMPGEN of the mass processor.
ELEMENT MASS DATA

File: MASSRNF

Index Name: MK0001a, MK0002a, ..., MK9999a (Stiffness elements)
MM0001a, MM0002a, ..., MM9999a (Mass elements)
MFff01a, MFff02a, ..., MFff99a (Fuel)
MPpp01a, MPpp02a, ..., MPpp99a (Payload)

Type: MIXED

Dimensions: M * 1 where M equals 10 * (the number of elements stored in the corresponding element geometry data block).

Auxiliary ID:
Word 1: MASSRNF
Word 2: The matrix index name
Word 3: Number of elements in this block
Word 4: Internal number of the first element in this block
Word 5: Internal number of the last element in this block
Words 6-10: Zero

Elements: The mass data for each element is stored sequentially as follows:

WEIGHT

XCG
YCG Center of Gravity
ZCG

IXX
IYY
IZZ Moments of inertia about the global axis origin
IXY
IXZ
IYZ

Each spar element contains 3 blocks of data (upper cap, lower cap, web)
Each cover element contains 2 blocks of data (upper surface, lower surface)

Generation: Program TOTALWT of the mass processor.

140.21
SUBSTRUCTURE_MASS_MATRICES

File: MASFNF

Index_Name: MFEDssss (user matrix)

Type: MIXED

Dimensions: N*1 where N is variable depending on the sparseness of the matrix

Auxiliary_ID: Words 1-10: Zero

Elements: The mass matrix terms are stored in a row-wise, lower triangular format. (Sparse format, no leading zeros.)

Generation: Program SUBMASS of the mass processor.
CONDITION SUMMARY MATRIX

File: MASSRNF

Index Name: TAPLWTa

Type: MIXED

Dimensions: CN * 11 where CN = the number of defined mass distribution conditions.

Auxiliary_ID: Word 1: MASSRNF
Word 2: TAPLWTa
Words 3-10: Zero

Elements: Each row of the matrix contains the following data for each condition:

Item 1: The mass matrix index name corresponding to this row of data or the name TPROPg where g equals the concentrated mass subset number requested (or 0) and a equals the display code equivalent of the data set number.

Item 2: Total weight of this mass distribution condition

Item 3-5: X, Y, Z coordinates of the center of gravity

Item 6-11: Total inertias about center of gravity (Ixx, Iyy, Izz, Ixy, Ixz, Iyz)

Generation: Programs ASSMBLY and MRGMASS of the mass processor.
DATA SUBSET TOTAL MASS PROPERTIES MATRIX

File: MASSRNF

Index Name: TYILWTA

Type: MIXED

Dimensions: 

\((4+CM+PP+FF) \times 11\) where CM equals the number of concentrated mass subsets, PP equals the number of payload subsets, and FF equals the number of fuel subsets.

Auxiliary ID: 

Word 1: MASSRNF  
Word 2: TYILWTA  
Words 3-10: Zero

Elements: The rows of the matrix contain the data for the following element subsets:

Row 1 contains flexible element data

Row 2 contains mass element data

Row 3:  
  - contains concentrated mass data

Row 4+CM

Row 3+CM  
  - contains fuel data

Row 4+CM+FF

Row 3+CM+FF  
  - contains payload data

Row 4+CM+PP+FF
Each row of the matrix contains the following data:

Item 1: Identification
Item 2: Total element subset weight
Item 3-5: \(X, Y, Z\) coordinates of the center of gravity
Item 6-11: Inertias about global axis system origin (\(I_{xx}, I_{yy}, I_{zz}, I_{xy}, I_{xz}, I_{yz}\))

Generation: Program TOTALWT of the mass processor.
**FREEDOM_ASSIGNMENT_TABLE**

**File:** MERGRNF  
**Index Name:** IFATsss  
**Type:** MIXED  
**Dimensions:** 2*N where N is the number of nodes in substructure sss.  
**Auxiliary_ID:**  
Word 1: MERGRNF  
Word 2: IFATsss  
Words 3-10: Zero  
**Elements:** Column j contains the freedom assignment information for internal node j. The contents of the two items are as follows:  
**Item 1:** Bits 59-15: This field contains 15 3-bit integers, representing the 15 degrees of freedom for the node j. Each 3-bit field contains an integer in the range 0-4 indicating the freedom type. The code is as follows:  
<table>
<thead>
<tr>
<th>Value</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>not active</td>

<tr>
<td>2</td>
<td>retain (R)</td>
</tr>
<tr>
<td>3</td>
<td>support (S)</td>
</tr>
<tr>
<td>4</td>
<td>constrained</td>
</tr>
</tbody>
</table>

Bits 14-0: 15 bit integer giving the number of active freedoms for the node.
Item 2:  

Bits 59-45: Number of free freedoms up to node j.

Bits 44-30: Number of retained freedoms up to node j.

Bits 29-15: Number of supported freedoms up to node j.

Bits 14-0: Number of constrained freedoms up to node j.

**Generation:** The MRGSET of the merge processor.
**FREEDOM_ASSIGNMENT_TABLE**

**File:** MERGRNF

**Index_Name:** KFAT0ba

**Type:** MIXED

**Dimensions:** 2 * N where N is the number of nodes

**Auxiliary_ID:**
- Word 1: MERGRNF
- Word 2: KFAT0ba
- Words 3-10: Zero

**Elements:** Column j contains the freedom assignment information for internal node j. The contents of the two items are as follows:

**Item 1:**
- **Bits 59-15:** This field contains fifteen 3-bit integers representing the 15 degrees of freedom for the node j. Each 3-bit field contains an integer in the range 0-4 indicating the freedom type. The code is as follows:

<table>
<thead>
<tr>
<th>Value</th>
<th>Type</th>

<td>Retain (R)</td>
</tr>
<tr>
<td>3</td>
<td>Support (S)</td>
</tr>
<tr>
<td>4</td>
<td>Constrain (C)</td>
</tr>
</tbody>
</table>

**Bits 14-0:** 15-bit integer giving the number of active freedoms for the node
**Item 2:**

- **Bits 59-45:** Number of Free freedoms up to node \( j \)
- **Bits 44-30:** Number of Retained freedoms up to node \( j \)
- **Bits 29-15:** Number of Supported freedoms up to node \( j \)
- **Bits 14-0:** Number of Constrained freedoms up to node \( j \)

**Generation:** Program MRGSET of the merge processor.
**RETAINED_FREEDOM_CORRESPONDENCE_TABLE**

**File:** MERGRNF  
**Index_Name:** KRTC0ba  
**Type:** MIXED  
**Dimensions:** $N^\ast 1$ where $N$ is the dimension of the reduced matrix for this data set and execution stage.  

**Auxiliary_ID:**  
- Word 1: MERGRNF  
- Word 2: KRTC0ba  
- Words 3-10: Zero  

**Elements:** The $i$th item contains the following data:  

- **Bits 59-30:** The number of the retained freedom in the assembly control vector which corresponds to the $i$th retained freedom in the retained freedom vector.  
- **Bits 29-0:** The number of the retained freedom in the retained freedom vector which corresponds to the $i$th retained freedom in the assembly control vector.  

**Generation:** Program MRGSET of the merge processor.

  Mach numbers

Item 13+NOKVAL+NOMACH:
  NWMTMDS, number of c/modes

Item 14+NOKVAL+NOMACH:
  Zero

Item 15+NOKVAL+NOMACH:
  NDWMDS, number of downwash modes

Item 16+NOKVAL+NOMACH:
  Zero

Generation: Program MIPREP of the RH03 processor.
C-MATRIX_INDEX_TABLE

File: RHO3RNF

Index Name: CM00000

Type: MIXED

Dimensions: 18*50

Auxiliary ID: Word 1: RHO3RNF
Word 2: CM00000
Word 3: Number of main surface C-matrix entries in the table (maximum of 50)
Word 4: Number of C-matrices accessible via the index table (maximum of 250)
Words 5-10: Zero

Elements: Each main surface entry in the table occupies one column in the matrix. Each column contains the following data:

Item 1: Bits 59-18: Seven character main surface identification
        Bits 17-0: An integer number indicating the chronological order in which the C-matrix was generated.

Item 2: Bits 59-48: Zero
        Bits 47-42: 1--Symmetric solution
                    2--Antisymmetric solution
                    3--Nonsymmetric solution
        Bits 41-36: NLE--Number of leading edge definition points
        Bits 35-30: NTE--Number of trailing edge definition points
        Bits 29-24: NDWC--Number of downwash chords
        Bits 23-18: NPDWC--Number of points on a downwash chord

170.3
Bits 17-12: NSPT--Number of spanwise pressure terms

Bits 11-6: NCPT--Number of chordwise pressure terms

Bits 5-0: NOCS--The number of control surfaces

Item 3: SPAN-wing semi-span

Item 4: BO--Root semi-chord

Item 5: K-value

Item 6: Mach number

Item 7-13: Run title

Item 14: Main surface entry date

Item 15-18: Data for control surfaces 1-4 are stored as follows:

Bits 59-18: Seven character control surface identification

Bits 17-9: An integer number indicating the chronological order in which the C-matrix was generated

Bits 8-0: The control surface type
1=Full trailing edge
2=Tip trailing edge
3=Mid trailing edge
4=Partial trailing edge
5=Full leading edge
6=Tip leading edge
7=Mid leading edge
8=Partial leading edge

Generation: Program RDWRTC of the RH03 processor.
C-MATRIX

File: RHO3RNF
Index_Name: CM10000
Type: REAL
Dimensions: (2*NDWP)*NPTRM (NDWP*NPTRM complex)

Where

NDWP = the number of downwash points
NPTRM = the number of pressure terms
(NPTRM=4 for a control surface)

Auxiliary_ID: Word 1: RHO3RNF
Word 2: CM10000
Word 3: K-value
Word 4: Bo--Root semi-chord
Word 5: Mach number
Word 6: SPAN-wing semi-span
Words 7-10: Zero

Elements: Let Cpq(i,j) be the element of the (p,q) partition of the C-matrix. The value of Cpq(i,j) is the downwash value at the i-th downwash point on the p-th downwash chord due to the assumed pressure mode composed of the product of the j-th spanwise and q-th chordwise pressure terms.

Generation: Programs RDWRTC and CMCALC of the RHO3 processor.

170.5
FULL DOWNWASH MATRIX

File: RHO3RNF

Index Name: DW0ijkl

Type: REAL

Dimensions: \((2*\text{NDWP})*\text{NDSMDS} \text{ (NDWP*NDWMDS complex)}\)

Where:

\(\text{NDWP} = \text{number of downwash points}\)
\(\text{NDWMDS} = \text{number of downwash modes}\)

Auxiliary ID: Word 1: RHO3RNF
Word 2: DW0ijkl
Words 3-10: Zero

Elements: Items \((i,j)p\) and \((i+1,j)p\) equal the real and imaginary parts of the kinematic downwash at the \(i\)-th downwash point on the \(p\)-th downwash chord due to the \(j\)-th vibration mode (downwash mode). The indices \(i,j\) and \(p\) are defined as follows:

\[i = 1,2,\ldots \text{ NPDWC (number of downwash points per chord)} \text{ ordered from the most forward point on each chord or from the first user input point on each chord.}\]

\[p = 1,2,\ldots \text{ NDWC (number of downwash chords)} \text{ ordered from the most outboard chord or from the first user input chord position.}\]

\[j = 1,2,\ldots \text{ NDWMDS in the order of the input modes}\]

Generation: Program PCOEFF of the RHO3 precessor.

170.6
MODIFIED_DOWNWASH_MATRIX

File: RHO3RNF

Index_Name: DWMijkl

Type: REAL

Dimensions: (2*NDWP)*NDWMDS (NDWP*NDWMDS complex)

Where:
NDWP = number of downwash points
NDWMDS = number of downwash modes

Auxiliary_ID: Word 1: RHO3RNF
Word 2: DWMijkl
Words 3-10: Zero

Elements: The elements of the modified downwash matrix are calculated by subtracting the mathematical downwash due to control surface rotation from the kinematic downwash for each downwash point and stored in the same format as the full downwash matrix.

Generation: Program PCOEFF of the RHO3 processor.
GENERALIZED FORCES

File: RHO3RNF

Index_Name: GF0ijkl

Type: REAL

Dimensions: (2*NWTMDS)*NDWMPS (NWTMDS*NDWMPS complex)

Where:

NWTMDS = number of weighting function modes
NDWMPS = number of downwash modes

Auxiliary_ID:
Word 1: RHO3RNF
Word 2: GF0ijkl
Word 3: K-value
Word 4: B0 - root semi-span
Word 5: Mach number
Word 6: SPAN - wing semi-span
Words 7-10: Zero

Elements: Element (i, j) is the work done by the motion of the lifting surface in the i-th mode acting against the unsteady aerodynamic pressure in the j-th mode divided by the dynamic pressure.

Generation: Program GFORCE of the RHO3 processor.
**CUBIC_HINGE_ROTATION_COEFFICIENTS**

**File:** RHO3RNF  
**Index Name:** HCmi00  
**Type:** REAL  
**Dimensions:** 4*NDWMDS where NDWMDS equals the number of downwash modes

**Auxiliary ID:**  
Word 1: RHO3RNF  
Word 2: HCmi00  
Words 3-10: Zero

**Elements:** The elements of the i-th column are the four cubic coefficients of hinge rotation for the i-th mode for the control surface associated with this matrix.

**Generation:** Program MIPREP of the RHO3 processor.
MODAL SLOPES AND DEFLECTIONS

**File:** RH03RNF

**Index Name:** MØ0ij00

**Type:** REAL

**Dimensions:** (2*NDWP)*NWTMDS

Where:

NDWP = number of downwash points
NWTMDS = number of weighting modes

**Auxiliary ID:**
Word 1: RH03RNF
Word 2: MØ0ij00
Words 3-10: Zero

**Elements:** Elements 1,i,j and 2,i,j are the streamwise slope and deflection of the i-th downwash point for the j-th interpolated mode shape.

**Generation:** Program DWPREP of the RH03 processor.
UNSTEADY_PRESSURE REPORT

File: RHO3RNF

Index_Name: PROijkl

Type: REAL

Dimensions: (2*INPPT)*NDWMDS (NPPT*NDWMDS complex)

Where:
NPPT = number of pressure report points
NDWMDS = number of downwash modes

Auxiliary_ID:
Word 1: RHO3RNF
Word 2: PROijkl
Word 3: K-value
Word 4: B0 - root semi-span
Word 5: Mach number
Word 6: SPAN - wing semi-span
Words 7-10: Zero

Elements: Elements (i,j) and (i+1,j) are the real and imaginary parts of the unsteady pressure at pressure report point i for the j-th downwash mode.

Generation: Program PRESURE of the RHO3 processor.
Pressure Series Coefficients

File: PHO3RNF

Index Name: PS0ijkl

Type: REAL

Dimensions: (2*NPTRM)*NDWMDS (NPTRM*NDWMDS complex)

Where:

NPTRM = number of pressure terms
NDWMDS = number of downwash modes

Auxiliary ID: Word 1: RHO3RNF
Word 2: PS0ijkl
Words 3-10: Zero

Elements: Items (i,j)q and (i+1,j)q of the q-th rot partition equal the real and imaginary parts of the coefficient for the assumed pressure mode composed of the product of the i-th spanwise pressure term and the q-th chordwise pressure term due to the modified downwash calculated from the j-th vibration mode (downwash mode)

Generation: Program PCOEFF of the RHO3 processor.
**RHO3_CASE_DATA_MATRIX**

**File:** RHO3RNF

**Index Name:** R30ij00

**Type:** MIXED

**Dimensions:** 2008*1

**Auxiliary_ID:**
- Word 1: DATARNF
- Word 2: R30i000
- Words 3-10: Zero

**Elements:**
The array contains the contents of the RHO3
adjacently stored labeled common blocks:

- **BASIC**
- **CSGEOM**
- **OPTIONS**
- **TABLE**
- **COUNT**
- **COND**
- **MSGEOM**
- **FILES**
- **RO3MOD**

**BASIC** contains constants, counter, and key RHOIII options.

**COMMON**

- **/BASIC/**
- **ZERO** = Complex zero
- **PI** = Value of PI
- **PI02** = PI/2
- **INDCM** = C-Matrix indicator, B=main surface, N=control surface
- **SYM** = Symmetry indicator, 1-symmetric, 2-antisymmetric
- **SPAN** = Semispan
- **B0** = Root semichord (or some other reference length)
- **SH** = Span/B0
- **KVAL** = K-value, reduced frequency = B0*OMEGA/V
- **MACH** = Mach number
- **BETA** = SQRT (1-Mach**2)
- **KSQD** = KVAL**2
- **BETASQD** = BETA**2

170.13
FH03RNF = Name of the RH03 output random name file. INPREP extracts the name from the ATLAS labeled common block KQRNDM. It is normally equal to 7LRH03RNF.

NCASE = The data case number for the current RH03 data case

NCOND = The data condition number for the current RH03 data condition.

OPTIONS contains variables choosing optional paths.

COMMON /OPTIONS/

CMOPT = C-Matrix option,
.T. = Generate a new C-matrix file
.F. = Use/update an old C-matrix file

PRSOPT = Pressure report option,
.T. = Report unsteady pressure at default or user defined locations
.F. = No report

SGFOPT = Sectional generalized force option,
.T. = Report sectional generalized forces at default or JSER defined chords,
.F. = No generalized force calculations

GEXOPT = Gust excitation option,
.T. = Include a gradual or non-gradual penetration gust mode

VPOPT = Velocity profile option,
.T. = Modify modal input by user supplied velocity profile = V(LOCAL)/V(INFINITY)

MINOPT = Modal input print option,
.T. = Print input points and deflections

MOPOPT = Modal output print option,
.T. = Print interpolated deflection and slope at downwash points

DWPOPT = Downwash print option,
.T. = Print downwash matrix

PCPOPT = Pressure coefficient print option,
.T. = Print coefficients of the assumed pressure series
GFOPT = Generalized force print option,
       -1=Print no generalized forces
        0=Print all generalized forces
       N=Print first N generalized forces
SFSOPT = Scratch file save option,
       .T.=Do not delete scratch files
        RHOSC1 and RHOSC2 following job
        completion,
       .F.=Delete scratch files
ATLASOP = ATLAS input option,
       .T.=MIFILE will be a SNARK I/O
        sequential file containing
        modal input point coordinates
        and deflection
       .F.=No ATLAS type input
NSPOPT = Non-symmetric planform option,
       .T.=Planform specified has no mirror
        image, e.g., fin,
       .F.=Standard mirror image planform
MITOPT = Modal input point transformation
       option,
       .T.=Do not perform coordinate trans-
        formation on inpoint points in
        surface spline interpolation

COUNT contains variables defining the problem size

COMMON /COUNT/

NDWC = Number of downwash chords
NPDWC = Number of points per downwash chord
NDWP = Number of downwash point=NDWC*NPDWC
NSPT = Number of spanwise pressure terms
NCPT = Number of chordwise pressure terms
NPTRM = Number of assumed pressure modes=
        NSPT*NCPT
NPRC = Number of pressure report chords
NPPRC = Number of points per pressure report
        chord
NPPT = Number of pressure report points=
        NPRC*NPPRC
NSGFC = Number of sectional generalized
        force report chords
NDWMDS = Number of downwash modes
NWTMDS = Number of weighting function modes
        Note NDWMDS=NWIMDS+1(if GEXOPT=.T.)
NOKVAL = Number of reduced frequencies
IKVAL = Reduced frequency counter
NOMACH = Number of Mach numbers
IMACH = Mach number counters
ICOND = Condition counter
NSGP = Number of structural grid (modal input) points

MSGEOM contains main surface geometry data

COMMON /MSGEOM/

MSID = Main surface C-matrix ID
YDWC(9) = Downwash chords
XDWP(72) = Downwash points
DXLEDWC(9) = Slope of leading edge at downwash chord intersect
XGUST = Zero phase reference point for a gradual penetration gust mode
YROOT = Y value of planform root from user input YLE, used to relocate all Y values about zero
XMDWC(9) = Mid-chord of downwash chords
BOWC(9) = Semi-chord value of downwash chord
DXTEDWC(9) = Slope of trailing edge at downwash chord intersect
NLE = Number of leading edge definition points
XLE(10) = X-value leading edge definition points
YLE(10) = Y-value of leading edge definition points
DXLEDY(9) = Slope of leading edge definition lines
XLEDWC(9) = Leading edge of downwash chords
NTE = Number of trailing edge definition points
XTE(10) = X-value of trailing edge definition points
YTE(10) = Y-value of trailing edge definition points
DXTEDY(9) = Slope of trailing edge definition lines
XTEDWC(9) = Trailing edge of downwash chords

170.16
CSGEOM contains surface geometry data

COMMON /CSGEOM/

NOCS = Number of control surfaces
CSID(4) = Control surface C-matrix ID
CSTYPE(4) = Control surface type, 1=full, 2=tip, 3=mid, 4=partial
CSRS(4) = Surface to which control surface is related (attached)
HGAP(4) = Gap at hinge between main surface and control surface
XHLI(4) = X-value inboard hinge definition point
YHLI(4) = Y-value inboard hinge definition point
XHLBARI(4)= X-bar value of L.E. of inboard C/S side edge
XHLO(4) = X-value outboard hinge definition point
YHLO(4) = Y-value outboard hinge definition point
XHLBARO(4)= X-bar value of L.E. of outboard C/S side edge
DXHLDY(4) = Slope of hinge line
XHLDWC (4,9) = Hinge intersection of downwash chord
DXHLDWC (4,9) = Slope of hinge at downwash chord intersect

TABLE will contain the RHO3 C-matrix index table

COMMON /TABLE/

FTITLE(9) = Run title with date appended
TABLE (18,50) = CMFILE table of contents
NOMAT = Number of C-matrices in CMFILE
ITHMAT = The number of a C-matrix on (or to be put on) CMFILE. When extracting a C-matrix from CMFILE, ITHMAT will be the one to be read. After writing a C-matrix on CMFILE, NOMAT and ITHMAT will be equal.
The following variables are stored in TABLE prior to C-matrix generation or use. They will be stored elsewhere or discarded before TABLE is needed for C-matrix indexing.

</table>

Variables associated with pressure report

- **YPC** = Spanwise stations of chords containing pressure report points
- **XPPT** = X-coordinates of pressure report points on the chords YPO
- **PXLE** = Chord intersect with leading edge
- **PDXLEDE** = Slope of leading edge at PXLE
- **PXMID** = X-coordinate of chord midpoint
- **PXHL** = Chord intersection with control surface hinge line(s) or the constant percent chord extension(s)
- **PDXHLDE** = Slope of line intersection chord at PXHL
- **PXTE** = Chord intersect with trailing edge
- **PDXTEDE** = Slope of trailing edge at PXTE
- **PB** = Length of semi-chord

Variables associated with sectional generalized forces

- **YSGFC** = Spanwise stations of chords for sectional generalized forces
- **XLESFG** = Chord leading edge intersect
- **LXLDESF** = Slope of leading edge at XLESFG
- **XMIDSGF** = X-coordinate of chord midpoint
- **XHLSGF** = Chord intersection with control surface hinge line(s) of the constant percent chord extension(s)
DXHLSGF = Slope of line intersecting chord at XHLSGF
XTESGF = Chord trailing edge intersect
DXTDESFG = Slope of trailing edge at XTESGF
BSGF = Length of semi-chord

Variables associated with velocity profile

VPFL = Profile modification
XVP = Percent of chord corresponding 1 to 1 with VPFL
COFVP = Coefficients for cubic spline passing through the input points
DVPFL = Slopes of cubic spline at defining points

COND contains the condition arrays, Mach number and K-values

COMMON /COND/
KVALUE(20) = Array of reduced frequencies
MACHNO(20) = Array of Mach numbers

FILES contains all of the files used by RH03 in ATLAS

COMMON /FILES/

CMFILE = C-matrix I/O file
CMF1 = First pertinent file on CMFILE
MIFILE = Modal input file
MIF1 = First pertinent file on MIFILE
MIM1 = First pertinent matrix in file MIF1 of MIFILE
GFFILE = Generalized force output file
GFF1 = First pertinent file on GFFILE
GFM1 = First pertinent matrix in file GFF1 of GFFILE
IN = Input file (normally standard input)
OUT = Output file (normally standard output)
RHOSC1 = Scratch file, used as DWSFILE= Downwash scratch file
RHOSC2 = Scratch file, used as CMSFILE= C-matrix scratch file,
         COFFILE=Pressure coefficient file
PHOSC3 = Scratch file, used as IFSFILE=
Interpolation function scratch file

RO3MOD contains the variables associated with
modal data

COMMON /RO3MOD/

MSOCOF = Name of interpolation coefficient
matrix for main surface

CSICOF(4) = Name(s) of interpolation coefficient
matrices for control surfaces I, I=1, NOCS

MOD1MS = The number of the first mode to be
used from MSOCOF for the main
surface

MOD1CS(4) = The number of the first mode to
be used from CSICOF for control
surface I, I=1, NOCS

NRBM = Number of rigid body modes

FBREF(3) = Reference point for the NRBM rigid
body modes

RSTYPE(6) = Type of the NRBM rigid body modes

RBMAG(6) = Magnitude of the NRBM rigid body
modes

MODECS(4) = Array containing one number for
each control surface (=0 if no user
hinge rotations, otherwise contains
name of record on DATARNF CONTAINING
user rotations)

ENDR3D = Last word of a RHO3 data case (i.e.,
last word of labelled common blocks
to be passed from the preprocessor to
the RHO3 technical module)

CKSMF3D = Word available for storage of array
CHECKSUM by Matrix1 Read/Write
routines

Generation: Program RHOIII of the RHO3 processor.
**SECTIONAL GENERALIZED FORCES**

**File:** PHO3PNF

**Index Name:** SFmijkl

**Type:** REAL

**Dimensions:** \((2*\text{NWTMDS})*\text{NDWMDS}\) (\text{NWTMDS}*\text{NDWMDS} \text{ complex})

Where:

\[
\text{NWTMDS} = \text{number of weighting function modes}
\]

\[
\text{NDWMDS} = \text{number of downwash modes}
\]

**Auxiliary ID:**

Word 1: RHO3RNF

Word 2: SFmijkl

Word 3: K-value

Word 4: B0 - root semi-span

Word 5: Mach number

Word 6: SPAN - wing semi-span

Word 7: Section station

Words 8-10: Zero

**Elements:** Item \(Q(i,j)k\) is the sectional generalized forces matrix for the \(k\)-th chord where the \((i,j)\)-th element is the work done on the \(k\)-th chord (by the unsteady airforces of the \(j\)-th mode acting through the \(i\)-th mode) divided by the dynamic load.

**Generation:** Program SGFORCE of the RHO3 processor.
FREEDOM_ACTIVITY_VECTOR-GEOMETRIC_STIFFNESS

File: STIFRFNF

Index_Name: GFAV01s

Type: MIXED

Dimensions: \(((N+3)/4)\)*1 where \(N\) is the number of nodes.

Auxiliary_ID: Word 1: STIFRFNF
Word 2: GFAV01s
Word 3: Bits 59-45 - 15 bits associated left to right with freedoms TX, TY, etc. A zero bit indicates that no node has an active freedom of this kind; a one bit indicates that at least one node has this freedom active.

Bits 44-0 - Reserved for future use.

Words 4-10: Zero

Elements: Item \(j\) consists of 4 packed 15 bit integers. The 15 bits are associated (left-to-right) with the fifteen degrees of freedom at the corresponding internal node. A "0" bit indicates no geometric stiffness for the corresponding freedom; a "1" bit indicates positive geometric stiffness.

Bits 59-45: Node 4\(j\)-3
Bits 44-30: Node 4\(j\)-2
Bits 29-15: Node 4\(j\)-1
Bits 14-0: Node 4\(j\)

Generation: Program GTRA of the stiffness processor.
ELEMENT_STRESS_MATRICES

**File:** STIFRNF

**Index_Name:** GP0001a, GP0002a, ..., GP9999a

**Type:** MIXED

**Dimensions:** LN*1, where LN equals the buffer size (default 6000 OCTAL). The dimensions are reduced such that the stress matrix for the last element in the block is wholly contained in one block.

**Auxiliary ID:**
- **Word 1:** STIFRNF
- **Word 2:** The matrix index name
- **Word 3:** The number of elements in this data set.
- **Word 4:** Internal number of the first element in this block
- **Word 5:** Internal number of the last element in this block
- **Words 6-10:** Zero

**Elements:** The element global stress matrix data for each element is stored as follows:

**Item 1:** Identification word containing four packed integers:
- **Bits 59-45:** Element internal number
- **Bits 44-42:** Storage format code
- **Bits 41-33:** Reserved for future use
- **Bits 32-18:** NW, number of words used to store ID, runcodes and elements
- **Bits 17-9:** M, number of rows of stress matrix
- **Bits 8-0:** N, number of columns of stress matrix
Item 2-(N+1):

Run codes—a typical run code word is associated with a stress matrix column and contains 2 packed 30 bit integers as follows:

Bits 59-30: Node number

Bits 29-0: Freedom number

Item (N+2): NW—global stress matrix elements, stored row-wise, full.

Generation: Program GTRA of the stiffness module.
ELEMENT_STIFFNESS_MATRIX

**File:** STIFRNF

**Index_Name:** KA0001a, KA0002a, ..., KA9999a

**Type:** MIXED

**Dimensions:** LN*1, where LN equals buffer size (default 6000 octal). The dimensions are reduced such that the stiffness matrix for the last element in the block is wholly contained in one block.

**Auxiliary ID:**
- **Word 1:** STIFRNF
- **Word 2:** The matrix index name
- **Word 3:** Number of elements in this data set
- **Word 4:** Internal number of the first element in this block
- **Word 5:** Internal number of the last element in this block
- **Words 6-10:** Zero

**Elements:**

**Item 1:** Identification word containing four packed integers

- **Bits 59-36:** STIF (display code)
- **Bits 35-30:** Zero
- **Bits 29-15:** Internal number of the first element in the block
- **Bits 14-0:** Internal number of the last element in the block

**Items 2-LN:** Element stiffness matrix data, stored in order of internal element number. Each element is stored as follows:

- **Word 1:** ID word containing four packed integers
- **Bits 59-45:** Internal element number
- **Bits 44-30:** Element type
Bits 29-15: NF, number of kinematic freedoms

Bits 14-0: Zero

Words 2-NF+1: Runcodes, each consisting of two packed integers.

Bits 59-30: Internal node number

Bits 29-0: Freedom number

Words NF+2 - NF(NF+3)/2+2:

Matrix terms, stored rowwise, lower triangular, full.

Generation: Program GTRA of the stiffness module.
ELEMENT GEOMETRIC_STIFFNESS_MATRIX

File: STIFRNF

Index Name: KG0001s, KG0002s, ..., KG9999s

Type: MIXED

Dimensions: LN*1, where LN equals buffer size (default 6000 octal). The dimensions are reduced such that the stiffness matrix for the last element in the block is wholly contained in one block.

Auxiliary_ID: Word 1: STIFRNF Word 2: The matrix index name Word 3: Number of elements in this data set Word 4: Internal number of the first element in this block Word 5: Internal number of the last element in this block Words 6-10: Zero

Elements:

Item 1: Identification word containing four packed integers

Bits 59-36: STIF (display code)

Bits 35-30: Zero

Bits 29-15: Internal number of the first element in the block

Bits 14-0: Internal number of the last element in the block

Items 2-LN: Element stiffness matrix data, stored in order of internal element number. Each element is stored as follows:

Word 1: ID word containing four packed integers

Bits 59-45: Internal element number

Bits 44-30: Element type
Bits 29-15: NF, number of kinematic freedoms
Bits 14-0: Zero
Words 2-NF+1: Runcodes, each consisting of two packed integers.
Bits 59-30: Internal node number
Bits 29-0: Freedom number
Words NF+2 - NF(NF+3)/2+2:
Matrix terms, stored rowwise, lower triangular, full.

Generation: Program GTRA of the stiffness module.
**FREEDOM_ACTIVITY_VECTOR**

**File:** STIFRNF

**Index_Name:** KFAV01a

**Type:** MIXED

**Dimensions:** \(((N+3)/4)*1\) where \(N\) is the number of nodes.

**Auxiliary_ID:**
- **Word 1:** STIFRNF
- **Word 2:** KFAV01a
- **Word 3:** Bits 59-45 - 15 bits associated left to right with freedoms TX, TY, etc. A zero bit indicates that no node has an active freedom of this kind; a one bit indicates that at least one node has this freedom active.
  - Bits 44-0 - Reserved for future use.

**Elements:**
Item \(j\) consists of 4 packed 15 bit integers. The 15 bits are associated (left-to-right) with the fifteen degrees of freedom at the corresponding internal node. A "0" bit indicates no stiffness for the corresponding freedom; a "1" bit indicates positive stiffness.

- **Bits 59-45:** Node 4\(j\)-3
- **Bits 44-30:** Node 4\(j\)-2
- **Bits 29-15:** Node 4\(j\)-1
- **Bits 14-0:** Node 4\(j\)

**Generation:** Program GTRA of the stiffness processor.
BRICK NODAL STRESS MATRIX

File: STRERNF

Index Name: B0001ba, B0002ba, ..., B9999ba

Type: MIXED

Dimensions: M * 1 where M = block size (default 3000) M is increased if necessary to completely hold the stresses for one node for one brick.

Auxiliary ID: Word 1: STRERNF
Word 2: Matrix index name
Word 3: NLC = no. of loadcases
Words 4-10: Zero

Elements: The total matrix is composed of a series of sub-blocks each of which contains the stresses at a node for one brick attached to that node. These blocks are sorted in increasing user node number sequence. If more than one brick attaches to a node the sub-blocks for that node are sorted in increasing user element number sequence.

Each sub-block contains the following:

Item 1: Bits 59-42: User node number
Bits 41-24: Reserved
Bits 23-9: User element number
Bits 8-0: Material code number

Item 2: Bits 50-34: Element temperature + 10000
Bits 33-17: N1 of brick
Bits 16-0: N2 of brick

Item 3: Bits 50-34: N3 of brick
Bits 33-17: N4 of brick
Bits 16-0: N5 of brick

190.1
Item 4: Bits 50-34: N6 of brick
       Bits 33-17: N7 of brick
       Bits 16-0: N8 of brick

Items 5 to (7*NLC+4):
       Stresses for loadcase 1, ..., loadcase NLC

Generation: Program BRKNPNT of the stress postprocessor.
DISPLACEMENT_CONTROL_MATRIX

File: STRERNF

Index_Name: DCNTRba

Type: MIXED

Dimensions: N*1 where N equals the number of nodes.

Auxiliary_ID:
Word 1: STRERNF
Word 2: DCNTRba
Word 3: Total number of defined loadcases
Words 4-10: Zero

Elements: The first J rows contain information for the first J nodes and the J partitions of the DI001ba matrix. The N-J remaining rows contain information for nodes only. A typical row K is as follows:

Bits 59-45: Last node in partition K of DI001ba or 0.

Bits 44-30: Binary code describing which freedoms are active for internal node number K (freedoms are numbered left to right).

Bits 29-15: Partition number of the DI001ba matrix containing displacements for the k-th node.

Bits 14-0: Position within the DI001ba partition of the start of the displacement data for the k-th node.

Generation: Program DEFLEC of the stress processor.
LOADCASE CORRESPONDENCE TABLE

File: STRERNF

Index Name: EC00Rba

Type: MIXED

Dimensions: 11*N where N is the number of loadcases

Auxiliary ID: Word 1: STRERNF
Word 2: DC00Rba
Words 3-10: Zero

Elements: The i-th column contains the following data for the i-th loadcase.

Item 1: Contains the user ID for internal loadcase i

Item 2-11: Contains the 10 word BCD titling string for internal loadcase i.

Generation: Program SETPARS of the stress processor.
DISPLACEMENT MATRIX

File: STRERNF

Index_Name: DI001ba, DI002ba, ..., DI999ba

Type: REAL

Dimensions: M*N where M=N*NLC; NLC is the number of loadcases and N is the number of active nodal displacements per loadcase that are present in this partition.

Auxiliary_ID: Word 1: STRERNF
   Word 2: The matrix index name
   Words 3-10: Zero

Elements: The displacements for each node are stored in groups in internal node number order as shown below. (The displacements for one or more nodes are fully contained in one partition)

Displacement of freedom 1 for loadcase 1
Displacement of freedom 1 for loadcase 2
•
•
Displacement of freedom 1 for loadcase NLC
Displacement of freedom 2 for loadcase 1
•
•
Displacement of freedom 2 for loadcase NLC
•
•
Displacement of freedom K for loadcase 1
•
•
Displacement of freedom K for loadcase NLC

where K is the number of active freedoms for node i and NLC is the number of loadcases.
The total set of nodal displacements are stored in internal nodal order.

**Generation:** Program DEFLEC of the stress processor.
FORCE_CONTROL_MATRIX

File: STRERNF

Index_Name: FCNTRba

Type: MIXED

Dimensions: N * 1 where N equals the number of elements

Auxiliary ID:
Word 1: STRERNF
Word 2: FCNTRba
Word 3: Number of loadcases for which we have forces
Words 4-10: Zero

Elements: Word j has data for internal element number j.

Bits 59-45: Not used

Bits 44-30: Number of kinematic freedoms for this element

Bits 29-15: Partition number of the FØ001ba matrix containing data for this element

Bits 14-0: Position within the FØ001ba matrix where the data for this element begins.

Generation: Program MULDIS of the stress processor.
**ELEMENT FORCE MATRIX**

**File:** STRERNF

**Index Name:** F0001ba, F0002ba, ...., F0999ba

**Type:** MIXED

**Dimensions:** N * 1 where N = M*(NLC+1), NLC is the number of loadcases for which forces are calculated. M is the number of forces per loadcase that are present in this partition. (N ≤ 3150)

**Auxiliary ID:**
- Word 1: STRERNF
- Word 2: The matrix index name.
- Words 3-10: Zero

**Elements:** Forces and runcodes are stored in blocks relating to internal element numbering. Each block of data has all the force and runcode information for one element. The order of data within such a block is as follows:

- Words 1 to NF where NF is the number of kinematic freedoms for the element.
- Bits 59-30: Internal node number
- Bits 29-0: Freedom number
- Words NF+1 to NF*(NF*NLC)

  - Force for loadcase 1 corresponding to 1st freedom
  - Force for loadcase 2 corresponding to 1st freedom
  - ...
  - Force for loadcase NLC corresponding to 1st freedom
  - Force for loadcase 1 corresponding to 2nd freedom
  - ...
  - Force for loadcase NLC corresponding to freedom NF

**Generation:** Program MULDIS of the stress processor.
**FLEXIBLE ELEMENT CONTROL MATRIX**

**File:** STRERNF

**Index Name:** KeCQMAa

**Type:** MIXED

**Dimensions:** \( M \times 1 \) where \( M \) is equal to the number of flexible elements matrices on STRERNF.

**Auxiliary ID:**
- **Word 1:** STRERNF
- **Word 2:** KeCQMAa
- **Words 3-10:** Zero

**Elements:** \( \text{Row } i \) contains the first word of the flexible element data matrix \( i \).

**Generation:** Program UORDER of the stress processor.
FLEXIBLE ELEMENT MATRICES (KSF-MATRICES IN USER ORDER)

File: STRERNF

Index Name: KSF001a, KSF002a, ..., KSF999a.

Type: MIXED

Dimensions: M * 1 where M is currently not greater than 2500, initially 2500 words are reserved for each partition. When there is not enough room for the next element, or there are no more elements, its dimension is reduced to the actual number of words used.

Auxiliary ID: Word 1: STRERNF  
Word 2: The matrix index name. 
Words 3-10: Zero

Elements:

Item 1: 
Bits 59-30: Reserved for future use

Bits 29-15: NF, number of elements contained in this matrix (integer)

Bits 14-0: NBEG, internal number of first element in this partition (integer)

Item 2-NF+1:

Bits 59-54: EG, the element code (integer)

Bits 53-47: NOD, the number of nodes (integer)

Bits 46-39: Reserved for future use

Bits 38-30: NTOT, total number of words in element data body (integer)

Bits 29-15: ULABEL, The element user number (integer)

Bits 14-0: POINT, pointer to the body of element data (integer)
Item NF+2-M: Additional description of the elements, (bodies of element data). The pointer word contains the following packed integers.

Bits 59-54: PC, number of properties (integer)

Bits 53-48: PP, property pointer, 0 if no properties (integer)

Bits 47-39: Element property summary

The element property summary is zero except for the following elements:

BEAM: Bit 46: 1 if IY > 0
0 if IY = 0
Bit 45: 1 if IZ > 0
0 if IZ = 0

SPAR: Bit 46: 1 if T-Web > 0
0 if T-Web = 0

COVER: Bit 46: 1 if upper surface present
0 if no upper surface
Bit 45: 1 if lower surface present
0 if no lower surface

CPLATE: Bits 47-44: Number of laminae

CCOVER: Bits 47-44: Number of laminae in upper plate
Bits 43-39: Number of laminae in lower plate

Bits 38-24: RECORD, the IODAREC input record number in which stiffness for this element was input (integer)

Bits 23-15: MC, the material code. If greater than 400B, material is MC-400B but has zero weight (integer), if zero the material is a composite.

Bits 14-0: TC, the element temperature *10000 in degrees Fahrenheit (integer)
The word following the pointer word is the first word of the element nodal data. The nodes (internal node numbers) are packed as 12 bit integers, 5 to a word, into this and the following words. The nodes are stored left to right with zero right fill. The number of nodal data words is thus \((\text{NOD}+4)/5\). There is at least one node and at most 127 nodes per element. If there are property data, \(PC\) is non-zero and the properties are stored in floating point form, one to a word directly following the nodal data. The property pointer \(PP\) is the relative address of the first property \((PP+\text{POINT})\).

A schematic picture of a flexible element matrix is shown below.

**Generation:** Program UORDER of the stress processor.
STRESS_CONTROL_MATRIX

File: STRERNF

Index Name: SCN01ba, SCN02ba, ..., SCN99ba

Type: MIXED

Dimensions: N*1 where N equals the number of elements. If there are more than 2000 elements, each partition is limited to 2000 words.

Auxiliary_ID: Word 1: STRERNF
Word 2: The matrix index name
Word 3: Number of loadcases for which stresses are calculated
Words 4-10: Zero

Elements: A typical item contains information for one element.

Item i: Contains information for internal element i

Bits 59-36: Not used
Bits 35-24: Number of stresses for this element

Bits 23-14: Partition number of the ST001ba matrix containing the stress for this element.

Bits 13-0: Position within the ST001ba partition for the start of the stresses for this element.

Generation: Program STRESS of the stress processor.
STRESS_ELEMENT_SORTING_INDEX_TABLE

File: STRERNF

Index_Name: SELSITa

Type: MIXED

Dimensions: N*1 where N equals the number of elements

Auxiliary_ID: Word 1: STRERNF
              Word 2: SELSITa
              Words 3-10: Zero

Elements: Item i contains the user order sequence number for internal element i.

Generation: Program UORDER of the stress processor.
STRESS_LOADCASE_SPECIFICATION_TABLE

**File:** STRERNF

**Index_Name:** SLCSTba

**Type:** MIXED

**Dimensions:** N*1 where N equals the number of loadcases specified in the last execute stress command.

**Auxiliary_ID:**
- Word 1: STRERNF
- Word 2: SLCSTba
- Words 3-10: Zero

**Elements:** Items 1 through N contain the internal loadcase numbers in increasing order as derived from the execute stress command.

**Generation:** Program SETUPARS of the stress processor.
STRESS MATRICES

File: STRERNF

Index Name: ST001ba, ST002ba, ..., ST999ba

Type: REAL

Dimensions: M*1 where M equals N*NLC; NLC is the number of loadcases specified by the user in the execute stress parameters and N is the total number of stresses in this partition.

Auxiliary ID: Word 1: STRERNF
               Word 2: The matrix index name
               Words 3-10: Zero

Elements: The stresses for element i are stored as follows:
           (The stresses for one or more elements are fully contained in one partition)
           Stress 1 for loadcase 1
           Stress 2 for loadcase 1
           ...
           Stress K for loadcase 1
           Stress 1 for loadcase 2
           ...
           Stress K for loadcase NLC

           where K is the number of stresses for element i
           and NLC is the number of loadcases.

           The total set of element stresses are stored in
           internal element order.

Generation: Program STRESS of the stress processor.

SUPERPOSITION STAGE DATA

File: STRERNF
Index Name: SUPERba
Type: MIXED
Dimensions: N * 1, where N = 1 + \sum_{k=1}^{NSTA} (1 + 3*NLk)
NSTA = the number of component stages,
NLK = the number of superposition load cases containing stage NSTk

Auxiliary ID:
Word 1: STRERNF
Word 2: SUPERba
Words 3-10: Zero

Elements:

Item 1: Bits 59-50: Represents ingredient stages. The stage positions are numbered 1 thru 10 from left to right. On bits indicate stages referenced in this supstage.

Bits 49-16: Reserved.

Bits 15-12: Number of ingredient stages, NSTk.

Bits 11-0: Total number of superposition loadcases to create.

Item 2-(NSTA+1):

Bits 59-54: Ingredient stage number NSTk

Bits 53-27: Reserved

Bits 26-15: Number of superposition loadcases containing stage NSTk, NLST

Bits 14-0: Pointer to data
Item NSTA+2:

Internal superposition load case number (integer)

Item NSTA+3:

Ingredient internal loadcase number (integer)

Item NSTA+4-N:

Load factor (real)

The last three items are repeated for each loadcase for every stage.

Generation: Program SUPRFAC of the stress module
**DISPLACEMENT_MATRIX (user order)**

**File:** STRERNF

**Index Name:** UD001ba, UD002ba, ..., UD999ba

**Type:** REAL

**Dimensions:** \(M \times 1\) where \(M = N \times NLC\), \(NLC\) is the number of loadcases and \(N\) is the number of active nodal displacements per loadcase that are present in this partition. (\(M \leq 3150\))

**Auxiliary_ID:**
- Word 1: STRERNF
- Word 2: The matrix index name
- Words 3-10: Zero

**Elements:** The displacements for each node are stored in groups in user node number order as shown below. (The displacements for one or more modes are fully contained in one partition.)

- Displacement of freedom 1 for loadcase 1
- Displacement of freedom 1 for loadcase 2
- ...
- Displacement of freedom 1 for loadcase NLC
- Displacement of freedom 2 for loadcase 1
- ...
- Displacement of freedom K for loadcase NLC

(K is the number of active freedoms for this node)

**Generation:** Program UORDER of the stress processor.
NODAL DISPLACEMENT CONTROL MATRIX (USER ORDER)

File: STRERNF

Index Name: UDC01ba

Type: MIXED

Dimensions: N * 1 where N equals the number of nodes with active freedoms.

Auxiliary ID:
Word 1: STRERNF
Word 2: UDC01ba
Word 3: Number of loadcases
Word 4: Logical OR of all freedom activity bit patterns
Words 5-10: Zero

Elements: Each item contains the following data for one node. The data is ordered in increasing user number order.

Bits 59-45: Internal node number.

Bits 44-30: Binary code describing which freedoms are active for this node.

Bits 29-15: Partition number of the UDOOlba matrix containing the displacement data for the node.

Bits 14-0: Position within the UDOOlba partition of the start of the displacement data for this node.

Generation: Program UORDER of the stress processor.
**ELEMENT FORCE MATRIX (USER ORDER)**

**File:** STRERNF

**Index Name:** UF001ba, UF002ba, ..., UF999ba

**Type:** MIXED

**Dimensions:** $N \times 1$ where $N = M \times (NLC+1)$. $NLC$ is the number of loadcases for which forces are calculated. $M$ is the number of forces per loadcase that are present in this partition. ($N \leq 3150$)

**Auxiliary ID:**
- Word 1: STRERNF
- Word 2: The matrix index name.
- Words 3-10: Zero

**Elements:** Forces and runcodes are stored in blocks relating to user element numbering. Each block of data has all the forces and runcode information for one element. The order of data within such a block is as follows:

Words 1 to NF where NF is the number of kinematic freedoms for the element.

- Bits 59-30: Internal node number
- Bits 29-0: Freedom number

Words NF+1 to NF+(NF*NLC)

- Force for loadcase 1 corresponding to 1st freedom
- Force for loadcase 2 corresponding to 1st freedom
- ...
- Force for loadcase NLC corresponding to 1st freedom
- Force for loadcase 1 corresponding to 2nd freedom
- ...
- Force for loadcase NLC corresponding to freedom NF

**Generation:** Program UORDER of the stress processor.
FORCE CONTROL MATRIX (USER ORDER)

File: STRERNF

Index Name: UFC01ba

Type: MIXED

Dimensions: N * 1 where N equals the number of elements

Auxiliary ID:

Word 1: STRERNF
Word 2: UFC01ba
Word 3: Number of loadcases for which we have forces.
Words 4-10: Zero

Elements: Word j has data for the jth element in user order.

Bits 59-45: Not used

Bits 44-30: Number of kinematic freedoms for this element

Bits 29-15: Partition number of the UF001ba matrix containing data for this element

Bits 14-0: Position within the UF001ba matrix where the data for this element begins.

Generation: Program UORDER of the stress processor.
STRESS MATRICES -- USER ORDER

File: STRERNF

Index Name: US001ba, US002ba, ..., US999ba

Type: REAL

Dimensions: M*1 where M equals N*NLC; NLC is the number of loadcases specified by the user in the execute stress parameters and N is the total number of stresses in this partition.

Auxiliary ID: Word 1: STRERNF
Word 2: The matrix index name
Words 3-10: Zero

Elements: The stresses for element i are stored as follows;
(The stresses for one or more elements are fully contained in one partition)

Stress 1 for loadcase 1
Stress 2 for loadcase 1
•
•
Stress K for loadcase 1
Stress 1 for loadcase 2
•
•
Stress K for loadcase NLC

Where K is the number of stresses for element i and NLC is the number of loadcases.

The total set of element stresses are stored in user element order.

Generation: Program UORDER OF THE STRESS PROCESSOR.
STRESS_CONTROL_MATRIX - USER_CORDER

File: STRERNF

Index_Name: USC01ba, USC02ba, ..., USC99ba

Type: MIXED

Dimensions: \( N \times 1 \) where \( N \) equals the number of elements. If there are more than 2000 elements, each partition is limited to 2000 words.

Auxiliary_ID:

Word 1: STRERNF
Word 2: The matrix index name
Word 3: Number of loadcases for which stresses are calculated
Words 4-10: Zero

Elements: A typical item contains information for one element.

Item i: Contains information for the \( i \)-th element when stored in user ID order.

Bits 59-36: Not used
Bits 35-24: Number of stresses for this element
Bits 23-14: Partition number of the US001ba matrix containing the stress for this element
Bits 13-0: Position within the US001ba partition for the start of the stresses for this element

Generation: Program UORDER of the stress processor.
VIBRATION_EIGENVALUES

File: VIBRRNF

Index_Name: FREQSvs (user matrix)

Type: MIXED

Dimensions: (NF*3)*1, where NF equals the number of frequencies requested

Matrix_Name: Word 1: Date of matrix generation (month/day/year)
Word 2: Mass matrix name
Word 3: Stiffness matrix name
Word 4: Eigenvalues matrix name
Word 5: Generalized mass matrix name
Word 6: Generalized stiffness matrix name

Auxiliary_ID: Word 1: VIBRRNF
Word 2: The matrix index name
Words 3: Type of dynamic matrix operated on.
   = 1 - stiffness
   = 2 - Flexibility
   = 3 - Buckling
Words 4-10: Zero

Elements: The eigenvalues are stored in a row-wise, lower triangular format. (Sparse format, no leading zeros)

Generation: Program EXPAND of the vibration processor.
GENERALIZED MASS

File: VIBRRNF

Index_Name: GMASSvs (user matrix)

Type: REAL

Dimensions: M*M, where M equals the number of requested mode shapes

Auxiliary_ID: Word 1: VIBRRNF
Word 2: The matrix index name
Word 3: Number of normalizing factors from R.B.M.
Words 4-9: Normalizing factors from R.B.M.
Word 10: Zero

Elements: Square symmetric generalized mass matrix where each row i or column i contains the generalized mass for the i-th mode.

Generation: Program EXPAND of the vibration processor.
**GENERALIZED STIFFNESS**

**File:** VIBRRNF

**Index_Name:** GSTIFvs (user matrix)

**Type:** REAL

**Dimensions:** M*M where M equals the number of requested mode shapes.

**Auxiliary_ID:**
- Word 1: VIBRRNF
- Word 2: The matrix index name
- Words 3-10: Zero

**Elements:** Square symmetric generalized stiffness matrix where each row i or column i contains the generalized stiffness for the i-th mode.

**Generation:** Program EXPAND of the vibration processor.
VIBRATION EIGENVECTORS (MODE SHAPES)

File: VIBRRNF

Index Name: MODESVS (user matrix)

Type: REAL

Dimensions: N*M where N equals the dimension of the stiffness matrix (number of retained degrees of freedom) and M equals the number of requested mode shapes.

Matrix Name:
- Word 1: Date of matrix generation (month/day/year)
- Word 2: Mass matrix name
- Word 3: Stiffness matrix name
- Word 4: Eigenvalues matrix name
- Word 5: Generalized mass matrix name
- Word 6: Generalized stiffness matrix name

Auxiliary ID:
- Word 1: VIBRRNF
- Word 2: The matrix index name
- Word 3: Number of normalizing factors for rigid body modes
- Words 4-9: The normalizing factors
- Word 10: Zero

Elements: Item (i, j) contains the normalized displacement of the j-th freedom for the i-th mode.

Generation: Program EQCHECK of the vibration processor.
SUBSET FREEDOM AND NODE NUMBERS
(ASSOCIATED WITH SUBSET MODE SHAPES)

File: VIBRRNF

Index_Name: SFdddvs

Type: MIXED

Dimensions: NS*1, where NS is the number of retained degrees of freedom associated with its nodal subset

Matrix_Name: Word 1: Date of matrix generation (month/day/year)
             Word 2: Mass matrix name
             Word 3: Stiffness matrix name
             Word 4: Eigenvalues matrix name
             Word 5: Generalized mass matrix name
             Word 6: Generalized stiffness matrix name

Auxiliary_ID: Word 1: VIBRRNF
              Word 2: SFdddvs
              Words 3-10: Zero

Elements: Item i is associated with the i-th retained freedom. This item contains two packed 30 bit integers as follows:

Bits 59-30: The freedom number for this retained freedom

<table>
<thead>
<tr>
<th>Freedom Number</th>
<th>Freedom</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>x-translation</td>
</tr>
<tr>
<td>2</td>
<td>y-translation</td>

<tr>
<td>6</td>
<td>z-rotation</td>
</tr>
</tbody>
</table>

Bits 29-0: The user node number for this retained freedom.

Generation: Program PSUBSET of the vibration processor.

200.5
MODE SHAPES (ASSOCIATED WITH NODAL SUBSETS)

File: VIBRNNF
Index Name: SMdddvs (user matrix)
Type: REAL
Dimensions: NS*M, where NS is the number of retained degrees of freedom associated with its nodal subset and M equals the number of requested mode shapes.

Matrix Name:
Word 1: Date of matrix generation (month/day/year)
Word 2: Mass matrix name
Word 3: Stiffness matrix name
Word 4: Eigenvalues matrix name
Word 5: Generalized mass matrix name
Word 6: Generalized stiffness matrix name

Auxiliary ID:
Word 1: VIBRNNF
Word 2: SMdddvs
Words 3-10: Zero

Elements: Item (i,j) contains the normalized displacement of the j-th freedom for the i-th mode.

Generation: Program PSUBSET of the vibration processor.
TOTAL MASS MATRIX

File: VIBPRNF

Index_Name: TOTWTvs (user matrix)

Type: REAL

Dimension: 6*6

Auxiliary ID:
Word 1: VIBRRNF
Word 2: The matrix index name
Words 3-10: Zero

Elements: Total mass and inertias positioned as follows:

```
--  W  O  O  O  O  O  --
    |    |    |    |    |    |
    |  O  W  O  O  O  O  |
    |    |    |    |    |    |
    |  O  O  W  O  O  O  |
    |    |    |    |    |    |
    |  O  O  O  Ixx Ixy Ixz |
    |    |    |    |    |    |
    |  O  O  O  Ixx Iyy Iyz |
    |    |    |    |    |    |
    |  O  O  O  Izx Izy Izz |
--  --  --  --  --  --  --
```

Generation: Program RIGIDBM of the vibration processor.
**VIBRATION SET CONDITION MATRIX**

**File:** VIBRRNF

**Index_Name:** VSETCON

**TYPE:** MIXED

**Dimension:** NVSET * 3, where NVSET is the maximum number of vibration sets.

**Auxiliary_ID:**
- Word 1: VIBRRNF
- Word 2: VSETCON
- Words 3-10: Zero

**Elements:** Row i contains the following data for vibration set number i.

- **Item 1:**
  - Bits 59-30: Set number
  - Bits 29-0: Stage number

- **Item 2:** Stiffness or Flexibility matrix name.

- **Item 3:** Mass matrix name.

**Generation:** Program PICKUP of the vibration processor.
APPENDIX A - BIT NUMBERING CONVENTION

The bit references in the matrix descriptions are based on a 60 bit word numbered left to right as indicated below.

59 . . . . . . . . . . . . . 0

60 BIT WORD
APPENDIX B - MATRIX USAGE

AEDINT Processor:

**Input**

1. ACMij00
2. GFøijkl

**Output**

1. xxxxx Data case control
2. xxxxyy Generalized airforce matrix

AF1 processor

**Input**

1. AFCCi
2. AFCFi
3. AFCGi
4. AFCSi
5. AFMCi
6. APMGi
7. AFSLi
8. AFPMi
9. AFRBi
10. AFTCi
11. AFTrGi
12. AFURi
13. AFYGi
14. Cddd
15. INTABLE

**Output**

1. ACMij
2. CAyiAl
3. CGCij
4. CTCij
5. GF0ijAl
6. M1Cij
BUCKLING Processor

Input

1 xxxxxxxx Geometric stiffness matrix
2 KRFV0ba
3 KNØALTa
4 KNC100a
5 KLØC00a

Output

1 BSETCWN
2 EIGNbs
3 MØDESbs

DESIGN Processor

Input

1 NALLØWC
2 NALLØWS
3 NBI001a
4 NBUCTAB
5 NC001ba
6 NDLCRba
7 NDP001a
8 ND001ba
9 NITYPEa
10 NKS001a
11 NI001ba
12 NMATERa
13 NMS001a
14 NØCNTRa
15 NØDVCCA
16 NØD001a
17  NPARAMa
18  NPBOO1a
19  NPD001a
20  NSMCNTa
21  NSMKEYa
22  NSP001a
23  NST001a
24  NVARIAa
25  LCØRba
26  KPARMS1
27  KSF001a
28  KM00001
29  SEKdda
30  SCN01ba
31  SLCSStba
32  ST001ba

Output
1  DESPARa
2  HISTRYa
3  KSF001a
4  MIN01ca
5  MFARcba
6  MPØ001a
7  MTARcba
8  M001cba
9  N001cba
10  S001cba
11  SMIMcba
12  TMIMcba
13  T001cba

DUBLAT Processor

Input
1  DLCSi
2  DLPGi
3  DLBGi
4  DIDIi
5  DLVII
6  DIPIi
7  DLMCi
8  DLRBi
9  DLSSi
10  Cddd
11  INTABLE

**Output**

1  B1Cij00
2  B2Cij00
3  ACMij00
4  DBCij00
5  GF0ijkl
6  M10ij00
7  M30ij00
8  PD0ijkl
9  PScij00
10  Q00xxkl
11  SBCij00
12  SD0ijkl
13  SFBijkl
14  SF0ijkl
15  SGCij00
16  VPCij00

**EXTRACT processor**

**Input**

1  ADATDIR
2  BSETCOØN
3  CVECO1a
4  DCNTRba
5  DC00Rba
6  DI001ba
7  EIGENO1

REFERENCES

A complete catalog of the random access files used by the ATLAS integrated structural analysis and design system is presented in this document. ATLAS is comprised of a number of technical computational modules which output data matrices to corresponding random access files. Each of the data matrices written on these files is described in detail.
