DATA ANALYSIS SOFTWARE FOR THE AUTORADIOGRAPHIC ENHANCEMENT PROCESS, VOLS. 1, 2, AND 3, AND APPENDIX

By S. P. Singh
ESPEE, Inc.
500 Wynn Drive
Huntsville, Alabama 35805

Final Report

November 1979

Prepared for

NASA - GEORGE C. MARSHALL SPACE FLIGHT CENTER
Marshall Space Flight Center, Alabama 35812
This report presents the computer software developed to set up a method for Wiener spectrum analysis of photographic films. This method is used for the quantitative analysis of the autoradiographic enhancement process.

Volume 1 presents the software requirements and design for the autoradiographic enhancement process, Volume 2 contains the program listings, and Volume 3 is the users manual. The Appendix, containing a software description and program listings, is a modification of the data analysis software presented in the main text of the report and should be used in conjunction with it.
VOLUME 1

SOFTWARE REQUIREMENTS AND DESIGN
FOR EVALUATION OF
THE AUTORADIOGRAPHIC ENHANCEMENT PROCESS
PREFACE

This is the Software Requirements and Software Design Document for the evaluation of the Wiener Spectrum and Modulation Transfer Function of the Autoradiographic Enhancement Process.

This report is Volume 1 of the Final Report prepared by ESPEE, INC. under Contract No. NAS8-33405 for the Space Sciences Laboratory of the George C. Marshall Space Flight Center. This Volume 1 is an update of and supersedes an earlier report dated December 31, 1978. The NASA COR for this contract is Dr. C. A. Lundquist.

1. INTRODUCTION

1.1 Objective: The objective of this work is to develop capabilities to evaluate the Wiener Spectrum and Modulation Transfer Function of the autoradiographic enhancement process. The autoradiographic enhancement process is a technique for increasing the amount of information which is recovered from photographic film, plates and prints. The technique consists of radioactivating the image silver by chemically combining it with a beta emitting isotope, sulfur-35; the autoradiograph, an enhanced copy of the underexposed image, is made by exposing a second film to the radiation from the underexposed original. The efficient response of the photographic emulsion to beta radiation produces an autoradiograph image which is enhanced in density and contrast so that images which were invisible or only faintly visible on the original film can be easily seen on the autoradiograph.

The Perkin-Elmer 1010A Microdensitometer is used to generate raw data from film.

Evaluation of the Wiener Spectrum and Modulation Transfer Function provides a measure of effectiveness of image recovery in terms of signal-to-noise ratio and detective quantum efficiency. It is the quantitative evaluation of the information transfer due to autoradiographic intensification.

Software is being developed to provide data analysis capabilities for autoradiographic image processing and other image processing applications where the microdensitometer is being used. The data analysis capabilities shall be developed on the NOVA 2 computer located in room 369 of building 4481. While IDAPS provides many of the analysis capabilities to be developed on the NOVA, IDAPS is designed for only 8-bits of resolution while the microdensitometer output provides 12-bits of resolution. For the autoradiographic enhancement process, the 12-bits of resolution is definitely needed, especially for signal to noise ratio calculations. Also, the data on microdensitometer output tape cannot be used as is with IDAPS because of header information included in each data record and because of the 12-bit length of the data.

The effort reported in this document is the software requirements definition and the preliminary software design of the analysis capabilities to be implemented on NOVA 2.
2. SYSTEM CONFIGURATION

Figure 2.1 illustrates the system configuration for data analysis. The piece of film is scanned by the microdensitometer and the image density is recorded on a 9-track, 800 BPI magnetic tape. The tape is input to the NOVA 2 where the data is analyzed and a copy of the results is obtained from the Textronix 4014 hard copy unit.
Figure 2.1 System Configuration
3. REQUIREMENTS FOR SOFTWARE DEVELOPMENT

The software shall be designed to analyze the film-scan data obtained from the Perkin-Elmers Microdensitometer.

3.1 Inputs

The Inputs to the software shall be:

(1) The microdensitometer output tape

(2) User-specified variables

3.1.1 Microdensitometer Output Tape

The data from the microdensitometer output tape is obtained via a 9-track magnetic tape. The tape data format is illustrated in Figure 3.1.

A magnetic tape record is generated by the microdensitometer control system at the conclusion of each scan line, or segment thereof. Termination of the record consists of an IBM-compatible Inter-Record-Gap.

After the last record has been written for a given scanning program, the microdensitometer control system causes the writing of an IBM-compatible standard End of File Mark.

Tape Format:

1. Start of Record - Two tape characters containing the hexadecimal characters "FFFF". These characters have no relation or value relative to any of the data to follow.

2. Identification - Forty tape characters, each containing an eight-bit byte representing the ASCII code for the alphanumeric characters entered during the IDENT mode of operation.

3. Number of Samples - Two tape characters containing a sixteen-bit binary number representing the (positive) number of data values included in the record, following completion of the coordinate information.
Figure 3.1 Data Format of the Microdensitometer Output Tape
Tape Format (cont'd):

4. **X-Coordinate** - Four tape characters containing a thirty-two bit binary number representing the position along the X-axis at which the current scan line commenced. The number is justified to the LSB end of the word; a negative position is indicated as a two's complement of the absolute value. All position readings are in microns.

5. **Y-Coordinate** - Four tape characters containing a thirty-two bit binary number representing the Y-axis coordinate at which the current scan line commenced. Interpretation as noted above.

6. **Delta X** - Four tape characters containing a thirty-two bit binary number representing the sampling interval along the X-axis. Interpretation as above. (A negative number indicates that the direction of scanning was negative.)

7. **Data Values in Buffer** - Two tape characters for each of the data values enumerated in "3" above. Each pair of characters contains a sixteen-bit binary number, the leading twelve bits of which are significant. The final four bits are to be discarded. Interpretation of the data is as follows: Convert the binary number to decimal and divide by 800. The quotient is the data value for the density or transmittance reading, as recorded during the scan.

The data corresponding to a scan line is stored on one record provided the number of samples is no greater than 3200. If the number of samples per scan line is greater than 3200, then the scan line data is segmented and stored on more than one record on tape. Start of each new scan line, however, causes a new record to be written.

3.1.2 User-Specified Variables

The following user-specified variables are supplied in response to software-query:

(a) No. of File NF, to be read from the microdensitometer tape.

(b) The Diffuse Density Factor, DD

(c) The Maximum Lag Factor, M

(d) The Length of the scanning slit, SL
3.2 Analysis Capabilities

The software shall be designed to have the following data analysis capabilities:

(1) Compute Histograms
(2) Filter Data
(3) Compute Means
(4) Compute Standard Deviation
(5) Compute Autocorrelation Functions
(6) Compute Power Spectral Density Functions

The software shall be designed to permit future capabilities to be developed and integrated with the existing software.

3.2.1 Histograms

The density data range from a scan frame shall be divided into fifty classes. The data from a scan frame shall be distributed over these classes to generate a histogram.

3.2.2 Filters

The software shall have the capability to filter raw data from the microdensitometer. The specific filter or filters are yet to be determined.

3.2.3 Means

The software shall have the capability to compute mean of the raw data and mean of the data normalized by a diffuse density factor. The software shall normalize data to zero mean.

3.2.4 Standard Deviation

The software shall have the capability to compute mean square value and standard deviation of the data.
3.2.5 Autocorrelation Functions

Using the user-specified maximum lag factor, the software shall be capable of computing autocorrelation functions and also of normalizing autocorrelations functions with respect to zero-lag autocorrelation function.

3.2.6 Power Spectral Density

The software shall be capable of computing power spectral density functions. It shall also compute smoothed power spectral density functions.

3.3 Outputs

The software shall have the following outputs:

1) Data Identification from Microdensitometer Tape
2) Raw data mean
3) Mean Square Value
4) Standard Deviation Value
5) Histogram table
6) Autocorrelation and Normalized Autocorrelation Functions
4. PRELIMINARY SOFTWARE DESIGN

The software design is modular. An overview of the preliminary software design showing the top-modules is illustrated in Figure 4.1. The main program calls independent modules which implement unique data input, data preparation and data analysis capabilities. The sequence of execution is top-down and left to right.

4.1 Structure Charts

The detailed software design is presented in structure charts shown in Figures 4.2 thru 4.4 and the HIPO's of section 4.2. The sequence of execution of modules in the structure chart is top-down and left to right. Each module has one entry and one exit. Control always returns to the next statement in the calling module. Arrows on a line indicate multiple calls. Arrows on a group of lines indicate multiple sequence of calls.
Figure 4.1 Microdensitometer Data Analysis Software Design Overview
Figure 4.2 Partial Structure Chart – Data Preparation Modules
Figure 4.3 Partial Structure Chart – Data Analysis Modules (Part 1)
Figure 4.4 Partial Structure Chart – Data Analysis Modules (Part 2).
4.2 HIPO'S

The Hierarchical Input-Process-Output (HIPO) charts are given for the modules shown on the structure charts. A HIPO gives an overview of the actions performed within a module.
### 4.2.1 HIPO-Main

**PURPOSE:** Main accepts the user-supplied data and calls other modules for preparation of tape data and data analysis

<table>

<td>Else record number of records, no. of words per record and call WRITR to put data in file TD.</td>
<td>TD</td>
</tr>
<tr>
<td>5.</td>
<td></td>
<td>Go to step 2</td>
<td></td>
</tr>
<tr>
<td>6.</td>
<td></td>
<td>Return</td>
<td></td>
</tr>
</tbody>
</table>
4.2.5 HIP-O-HDR

Purpose: HDR reads first record in disk file TD and prints I.D. and computes $H = \text{Delta } X$.

<table>
<thead>
<tr>
<th>Step No.</th>
<th>Input</th>
<th>Process</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>TD</td>
<td>Call READR to read first record from disk file TD to Temp. array ITEMP</td>

<td></td>
</tr>
<tr>
<td>3.</td>
<td>ITEMP</td>
<td>Print no. of samples = ITEMP (22)</td>
<td></td>
</tr>
<tr>
<td>4.</td>
<td>ITEMP</td>
<td>Call CORD 3 times to compute X, Y coordinates and Delta X. After each call, print the coordinates and Delta X = NH.</td>
<td>NH</td>
</tr>
<tr>
<td>5.</td>
<td></td>
<td>Return</td>
<td></td>
</tr>
</tbody>
</table>
### 1.2.6 HIPO-CORD

**Purpose:** CORD computes X, Y coordinates and Delta X from 2 input words for each value.

<table>
<thead>
<tr>
<th>Step No.</th>
<th>Input</th>
<th>Process</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>ITEMP, J</td>
<td>Load a double precision word IWD with 2 input words</td>
<td>IWD</td>

</tr>
</tbody>
</table>
APPENDIX A

Appendix A contains the mathematical formulae and notations used for analysis of autoradiographic image data. These mathematical formulae form the basis for implementation into programs.

Notation

\* 1 = Slit height
\* a = Slit width
\* \( \Delta \) or \( H \) = Sampling Interval
\( D_n \) = Raw Data Point
\( N \) = Total number of data points
\( \bar{D}_n \) = Mean of raw data, \( D_n \)
SIG = Standard Deviation
\( d_n \) = Raw Data converted to diffuse density
\( Z_n \) = Zero Mean Data (in diffuse density)
\( Z_n' \) = Zero Mean Data after low frequency filtering
\( Z_n'' \) = Zero Mean Data after high frequency filtering
\* p = Parameter in low frequency filter
\* q = Parameter in high frequency filter
\( R(r) \) = Autocorrelation function
\( r \) = lag factor
\* m = Maximum lag factor
\* DDF = Diffuse density factor
\( \tilde{S}_k \) = Spectral density function
\( \tilde{S}_k' \) = Spectral density function after inverse filter
\( \tilde{S}_k'' \) = Spectral density function after aperture compensation
\( \hat{S}_k \) = Smoothed spectral density function
\( k = 0, 1, 2, \ldots, m \)
\( f = Frequency = \frac{k}{2 \cdot \Delta \cdot m} \)

\* User-specified variables.
Raw Mean

\[ \bar{D}_n = \frac{1}{N} \sum_{n=1}^{N} D_n \]

Normalized Data

\[ U_n = D_n / DDF \]

Zero-Mean Data

\[ Z_n = U_n - \bar{U}_n \]

Mean Square Value

\[ MSV = \frac{1}{N} \sum_{n=1}^{N} D_n^2 \]

Standard Deviation

\[ SIG = \left( \frac{1}{N} \sum_{n=1}^{N} \frac{(D_n^2/N-1)}{MSV} \right)^{\frac{1}{2}} \]

Low-frequency Filter

\[ Z'_n = Z_n - \frac{1}{2p+1} \sum_{j=-p}^{p} Z_{j+n}, \quad n = p+1, p+2, \ldots, N-p \]

High Frequency Filter

\[ Z''_n = \frac{1}{2q+1} \sum_{j=-q}^{q} Z'_{j+n}, \quad n = q+1, q+2, \ldots, N-q \]

Autocorrelation Function

\[ \hat{R}_r = \frac{1}{N-r} \sum_{n=1}^{N-r} Z''_n \cdot Z''_{n+r}, \quad r = 0, 1, \ldots, m \]
Normalized Autocorrelation Function

\[ \hat{R}_r / \hat{R}_o , \ r=0,1,2,\ldots,m \]

Note that: \(-1 \leq \hat{R}_r / \hat{R}_o \leq 1\)

Spectral Density Function

\[ \hat{G}_k' = 2Hl (\hat{R}_o + 2 \sum_{r=1}^{m-1} \hat{R}_r \cos(\pi r k/m) + (-1)^k \hat{R}_m) \]

\[ k = 0,1,\ldots,m \]

Inverse Filter

\[ \hat{G}_k'' = \hat{G}_k'' \left[ \frac{2Hl}{(2q+1)} \right]^2 \]

\[ k = 1,2,\ldots,m \]

\[ \hat{G}_o'' = \hat{G}_o'' (2q+1)^2 \]

Aperture Compensation

\[ \hat{G}_k'' = \hat{G}_k'' \left[ \frac{2Hl}{\sin(\pi/2m)} \right]^2 \]

\[ k = 1,2,\ldots,m \]

\[ \hat{G}_o'' = 0 \]

Smooth Power Spectral Density Function

\[ \hat{G}_o = 0.5 (\hat{G}_o + \hat{G}_1) \]

\[ \hat{G}_m = 0.5 (\hat{G}_{m-1} + \hat{G}_m) \]

\[ \hat{G}_k = 0.5 \hat{G}_k + 0.25 (\hat{G}_{k-1} + \hat{G}_{k+1}) \]

\[ k = 1,2,\ldots,m-1 \]
Typical Values

.5mm x 20mm ................. Actual Slit Size
(4x) x (10x) = 40x ......... System Magnification
12.5 \mu \times 500 \mu ......... Effective Aperture
-1
50mm .......................... Max. Spatial Frequency
10mm^{-1} ...................... \Delta \omega \ (band \ width)
5\% ............................... s = error
20mm ......................... Required Data Length (X)
X = 2 \times 10^3 ............... N = no. of data points

\sigma x = \frac{1}{2T_{max}} = \frac{1}{(2)(50 \text{mm}^{-1})}

10 \mu ......................... DDF
1200 .......................... DDF
10 .............................. m = \frac{1}{\sigma x \cdot \Delta \omega} = \frac{1}{.01 \text{mm} \times 10 \text{mm}^{-1}}
VOLUME 2
PROGRAM LISTINGS
FOR
AUTORADIOGRAPHIC ENHANCEMENT PROCESS
DATA ANALYSIS SOFTWARE
PREFACE

This is the Program Listings for the software developed for the evaluation of the Wiener Spectrum and Modulation Transfer Function of the Autoradiographic Enhancement Process.

This report is Volume 2 of the Final Report prepared by ESPEE, INC. under Contract No. NAS8-33405 for the Space Sciences Laboratory of the George C. Marshall Space Flight Center. The NASA COR for this contract is Dr. C. A. Lundquist.

USERS MANUAL FOR

AUTORADIOGRAPHIC ENHANCEMENT PROCESS
DATA ANALYSIS SOFTWARE
PREFACE

This is the User Manual for the software developed for the evaluation of the Wiener Spectrum and Modulation Transfer Function of the Autoradiographic Enhancement Process.

This report is Volume 3 of the Final Report prepared by ESPEE, INC. under Contract No. NAS8-33405 for the Space Sciences Laboratory of the George C. Marshall Space Flight Center. The NASA COR for this contract is Dr. C. A. Lundquist.

1. INTRODUCTION

This manual is a description of the use of the Autoradiographic Data Analysis software package with the Data General NOVA 1200 computer system.

In the following description, the symbol \( \downarrow \) means a carriage return on the tektronix. If at any time a typing mistake is made, the character typed may be deleted by typing the RUBOUT key. Any execution of a program or command may be nullified by pressing the CNTRL and A keys simultaneously.

In case of problems, call the person in charge of the computer system.
2. NOVA POWER-UP PROCEDURE

Before the Autoradiographic Data Analysis software package may be used, the NOVA system must be powered up and the operating system placed into the computer. The procedure for doing this is as follows:

1. Turn power on to the NOVA computer using the front panel key.
2. Turn power on to the disk controller (mounted on the DATA GENERAL rack) using the front panel key.
3. Make sure the pack labelled ESPEE is mounted in the disk drive.
   If it is not, the pack labelled ESPEE may be mounted as follows:
   (a). Remove the pack inside the drive by following these steps:
      (i). Raise the lid of the disk drive.
      (ii). Set the clear plastic cover onto the disk pack.
      (iii). Turn the handle counterclockwise until a pop is heard.
      (iv). Raise the disk pack out and place it on the bottom cover.
      (v). Lock the bottom cover.
   (b). Replace the pack marked ESPEE inside the drive by following these steps:
      (i). Unlock and remove the bottom cover from the disk pack.
      (ii). Place the pack in the drive.
      (iii). Turn the handle clockwise until tight.
      (iv). Remove the clear plastic cover.
      (v). Close the lid of the disk drive.
4. Turn power on to the disk drive by pressing the on button on the drive. Wait for the green light on the disk drive.
to come on before proceeding.

5. Turn power on to the Tektronix graphics display.
After the screen brightens, press the CLEAR button. Flip
the LINE/LOCAL switch to LOCAL. Press the ESC key. Press
the ; key. Flip the LINE/LOCAL switch back to LINE. This
sets the character size for the terminal to the smallest.
For medium and large character sizes respectively, press
9 and 8 instead of ; in the above procedure.

6. Turn power on to the Hard Copy Unit. The unit requires
about 10 minutes to warm up.

7. Set the switches on the NOVA computer panel to octal 00033.
(This corresponds to switches 11,12,14 and 15 up; all other
down). Raise the RESET switch momentarily. Next, raise
the switch 0 on the computer panel up. Now raise momentarily
the PROGRAM LOAD switch on the computer panel.
This series of operations loads the operating system into
the computer memory. The word FILENAME? will appear on the
Tektronix screen.

8. Type the word SYS32K). When requested by the computer,
enter the date using the format MM/DD/YY), and the time
using the format HH:MM:SS). Computer types R.

This completes the steps required to get the computer
powered-up. The next series of steps are required to prepare
for using the Autoradiographic Data Analysis package.
3. TAPE MOUNTING PROCEDURE

The source of input data for the Autoradiographic Data Analysis package is the Microdensitometer output tape. The procedure for mounting the tape is as follows:

1. Turn power on to the magnetic tape recorder.
2. Pull out the lever marked: OVERRIDE
3. Mount the tape on the available slot and turn the handle clockwise until tight.
4. Thread the tape as shown in the diagram on the tape recorder unit, and a few feet of tape on the empty reel.
5. Press the LOAD/UNLOAD button on the recorder.
6. Press the FORWARD button on the recorder.
7. When the tape stops winding, press the REMOTE button on the recorder.

The tape recorder is now ready for operation. Type INIT MT on the Tektronix terminal. The system is now ready for program execution.
4. PROGRAM EXECUTION

The program can be executed with four options: (1) Without Filters, (2) With Low Frequency Filter Only, (3) With High Frequency Filter Only, and (4) With Both Filters. For program execution the following steps are followed:

1. Without Filters
   1. Type DIR ESPEE }. Computer types R.
   2. Type SPL }. The computer will now ask for the user-specified inputs to the program, one at a time. These inputs are:
      FILE NUMBER, NF=
      DIFFUSE DENSITY FACTOR, DDF=
      MAXIMUM LAG FACTOR, M=
      HEIGHT OF SCANNING SLIT, XL=
      WIDTH OF SCANNING SLIT, XA=
   3. After typing each value, type }. When all values are specified, the computer will halt after program execution is complete.

2. With Low Frequency Filters Only
   1. Type DIR ESPEE }. Computer types R.
   2. Type SPL }. The computer will now ask for user-specified inputs to the program, one at a time. These inputs are:
      FILE NUMBER, NF=
      DIFFUSE DENSITY FACTOR, DDF=
      MAXIMUM LAG FACTOR, M=
      HEIGHT OF SCANNING SLIT, XL=
      WIDTH OF SCANNING SLIT, XA=
      LOW FREQUENCY FILTER PARAMETER, P=
   3. After typing each value, type }. When all values are specified, the computer will halt after program execution is complete.
3. **With High Frequency Filters Only**
   1. Type DIR ESPEE ). Computer types R.
   2. Type SPH).
      The computer will now ask for user-specified inputs to the program, one at a time. These inputs are:
      
      FILE NUMBER, NF=
      DIFFUSE DENSITY FACTOR, DDF=
      MAXIMUM LAG FACTOR, M=
      HEIGHT OF SCANNING SLIT, XL=
      WIDTH OF SCANNING SLIT, XA=
      HIGH FREQUENCY FILTER PARAMETER, Q=

   3. After typing each value, type ). When all values are specified, the computer will halt after program execution is complete.

4. **With Both Filters**
   1. Type DIR ESPEE ). Computer types R.
   2. Type SP2).
      The computer will now ask for user-specified inputs to the program, one at a time. These inputs are:
      
      FILE NUMBER, NF=
      DIFFUSE DENSITY FACTOR, DDF=
      MAXIMUM LAG FACTOR, M=
      HEIGHT OF SCANNING SLIT, XL=
      WIDTH OF SCANNING SLIT, XA=
      LOW FREQUENCY FILTER PARAMETER, P=
      HIGH FREQUENCY FILTER PARAMETER, Q=

   3. After typing each value, type ). When all values are specified, the computer will halt after program execution is complete.
5. OBTAINING A HARD COPY

The results of the program execution may be recorded by using the Hard Copy Unit. A copy of the Tektronix display may be obtained by pressing the AUTO PRINT/COPY switch on the Tektronix keyboard to COPY.

In case the results take more than one page, automatic copying of the results may be accomplished as follows:
1. Set the AUTO PRINT/COPY switch to AUTO PRINT.
2. Set the MARGIN CONTROL switch on the Tektronix terminal to 2.
6. SYSTEM SHUT DOWN PROCEDURE

The procedure for shutting down the system is as follows:

1. Type RELEASE MT0).
2. Type RELEASE DP0). This will cause the computer to halt.
3. Turn power off to the hard copy unit.
4. Turn power off to the Tektronix terminal.
5. Turn power off to the disk drive by pushing the ON button.
6. Press the LOAD/UNLOAD button on the tape recorder. Manually
   rewind the tape and remove it from the tape recorder.
7. (Caution: Before executing this step, make sure that the disk
   has stopped spinning.) Turn power off to the disk
   controller.
8. Turn power off to the NOVA computer.

The shut down procedure is now complete.
7. PROGRAM LIMITATIONS

The following are some of the limitations of the program. In actual practice, these limitations are not likely to be violated.

1. The maximum no. of data points on a record on the microdensitometer tape is 1000.
2. The maximum no. of records per file on the microdensitometer tape is 50.
3. The maximum value of the Maximum Lag Factor, M is 100.
4. For comparison with the microdensitometer printout, at most 300 data points will be printed from the first data record.

MODIFICATION OF DATA ANALYSIS SOFTWARE FOR AUTORADIOGRAPHIC ENHANCEMENT PROCESS

A-1
PREFACE

This is the Description and Program Listings of the modification of Data Analysis Software developed for the evaluation of the Wiener Spectrum and Modulation Transfer Function of the Autoradiographic Enhancement Process.

This report is an addendum to the three-volume report No. 79-01 of Contract No. NAS8-33405 and is the Final Report prepared by ESPEE, INC. under Contract No. P.O. H-30573B for the Space Sciences Laboratory of the George C. Marshall Space Flight Center.

The NASA COR for this Contract is Mr. Ray Hembree.

1. MODIFICATION OF DATA ANALYSIS SOFTWARE

The following modifications have been done to data analysis software developed under an earlier contract No. NAS8-33405:

1.1 Individual Record Processing

The data from each record in a file on micordensitometer tape is individually processed. All processes, namely compute histogram, compute average, normalize data, calculate zero-mean data, filter data for low frequency, filter data for high frequency, compute standard deviation, compute autocorrelation, compute power spectral density function, apply inverse filter transform, apply aperture compensation and smoothed power spectral densities are applied to each record separately. These processes were formerly applied to all records in a file combined into one record.

1.2. Averaging Results of all Records

After the autocorrelation and smoothed power spectral density function arrays are computed for each record, an average of these arrays is computed.

1.3. Computing Standard Deviation and Error

The standard deviation and error are computed for the averaged autocorrelation and smoothed power spectral density arrays. The standard deviation is computed as follows:

\[
\text{Standard Deviation} = \left[ \frac{\sum_{n=1}^{m+1} D_n^2}{M} \right]^{\frac{1}{2}}
\]

where \( M \) is the max lag factor and \( D_n \) is the \( N \)-th data point. The error is computed as follows:

\[
\text{Error} = \text{Standard Deviation} \times (N)^{\frac{1}{2}}
\]

where \( N \) is the No. of records.
1.4. **Four Cases**

The above modifications have been applied to all four cases, namely without filters, with low frequency filter only, with high frequency filter only and with both filters.
2. SOFTWARE MODULES AFFECTED

The following software modules were changed:
SP1
SP2
SPL
SPH

A new module named LAST has been added to the software. This module computes the standard deviation and error for the averaged autocorrelation and power spectral density functions. This module is the last module called by the main modules SPL, SP2, SPL and SPH.

The modifications have been made in a manner such that the use of the program is unchanged from the way described in the users manual.
3. PROGRAM LISTINGS

The program listings for the modified modules and the new module are given in the following pages. Also included are the updated list of modules and code for loading compiled modules.
