

ACCESSION NUMBER RANGES

Accession numbers cited in this Supplement fall within the following ranges.

STAR (N-10000 Series) N81-10001 – N81-12010

IAA (A-10000 Series) A81-10001 – A81-12784

AERONAUTICAL ENGINEERING

A Continuing Bibliography

Supplement 132

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in January 1981 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA)*

This supplement is available as NTISUB/141/093 from the National Technical Information Service (NTIS), Springfield, Virginia 22161 at the price of \$5.00 domestic; \$10.00 foreign.

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering. The first issue of this bibliography was published in September 1970 and the first supplement in January 1971. Since that time, monthly supplements have been issued.

This supplement to *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 342 reports, journal articles, and other documents originally announced in January 1981 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries*, in that order. The citations, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* and *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes -- subject, personal author, and contract number -- are included.

An annual cumulative index will be published.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A81-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at \$7.00 per document up to a maximum of 40 pages. The charge for each additional page is \$0.25. Microfiche⁽¹⁾ of documents announced in *IAA* are available at the rate of \$3.00 per microfiche on demand, and at the rate of \$1.25 per microfiche for standing orders for all *IAA* microfiche. The price for the *IAA* microfiche by category is available at the rate of \$1.50 per microfiche plus a \$1.00 service charge per category per issue. Microfiche of all the current AIAA Meeting Papers are available on a standing order basis at the rate of \$1.50 per microfiche.

Minimum air-mail postage to foreign countries is \$1.00 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications.

STAR ENTRIES (N81-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code followed by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard \$3.50 price, for those documents identified by a # symbol.)

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size, containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

- Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.
- Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.
- Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.
- Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.
- Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.
- Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)
- Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).
- Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.
- Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.
- Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

SUBSCRIPTION AVAILABILITY

This publication is available on subscription from the National Technical Information Service (NTIS). The annual subscription rate for the monthly supplements is \$50.00 domestic; \$100.00 foreign. All questions relating to the subscriptions should be referred to NTIS, Attn: Subscriptions, 5285 Port Royal Road, Springfield Virginia 22161.

TYPICAL CITATION AND ABSTRACT FROM STAR

TYPICAL CITATION AND ABSTRACT FROM IAA

AERONAUTICAL ENGINEERING

A Continuing Bibliography (Suppl. 132)

FEBRUARY 1981

IAA ENTRIES

A81-10045 # Reliability and engineering-economic characteristics of aircraft engines (Naderzhnost' i tekhniko-ekonomicheskie kharakteristiki aviatsionnykh dvigatelei). K. P. Alekseev. Moscow, Izdatel'stvo Transport, 1980. 103 p. 18 refs. In Russian.

The book deals with methods of evaluating the operational reliability and the safety, regularity, and economy characteristics of aircraft engines. A function defining the generalized reliability index of an engine is introduced, and a formula for calculating this index is proposed. The influence of the operational conditions on the reliability, safety, and economy of an engine is examined, and maintenance trends for modern transport-aircraft engines are discussed. V.P.

A81-10096 Design of airfoils in incompressible viscous flows by numerical optimization. H. N. V. Dutt and A. K. Sreekanth (Indian Institute of Technology, Madras, India). *Computer Methods in Applied Mechanics and Engineering*, vol. 23, Sept. 1980, p. 355-368. 10 refs.

A method is outlined for the design of airfoils in incompressible viscous flows by numerical optimization wherein a reduced number of design coordinates are used to define the airfoil shape. The optimization problem is formulated as a nongradient search in a finite constrained parameter space. The approach is to define the airfoil as a linear combination of basic shapes which may be analytically or numerically defined. The design problem is to determine the participation of each of these basic shapes in defining the optimum airfoil. The aerodynamic analysis program is specially developed to fit the requirements of the optimization program and is based on the vortex singularity method for inviscid flow analysis and the momentum integral method for boundary layer analysis. Four examples have been worked out to illustrate the proposed design method. In these, modifications to four different airfoil geometries are made to achieve either a minimum drag coefficient or a minimum pitching moment coefficient under prescribed constraints. The results show that significant drag or pitching moment reduction is possible through shape manipulation alone. (Author)

A81-10162 Comparative performance of two centrifugal fan impellers differing in blade section. M. R. Shaalan and A. M. Shibl (Riyadh, University, Riyadh, Saudi Arabia). In: Heat Transfer and Fluid Mechanics Institute, Meeting, 27th, Los Angeles, Calif., June 23-25, 1980, Proceedings. Stanford, Calif., Stanford University Press, 1980, p. 53-63. 6 refs.

Two centrifugal fan impellers, each with backward-curved blading and constant width, have been tested for overall and for detailed performance. The two impellers were designed for the same conditions but differ only in the blade section configuration. In one

impeller, the blade is of constant small thickness, which is the common practice in centrifugal fan construction. The other impeller has airfoil blading constructed from the standard C4 profile which is commonly used in axial compressors. Results indicate that the characteristics of the airfoil-bladed impellers at design velocity are significantly different when compared with other impellers. Detailed flow measurements were carried out at impeller periphery using a hot-wire anemometer and conventional instruments. (Author)

A81-10272 Acoustic structures. C. E. Kimball (Boeing Military Airplane Co., Wichita, Kan.). (*American Welding Society and Welding Research Council, International Brazing Conference, 11th, Los Angeles, Calif., Apr. 15-17, 1980.*) *Welding Journal*, vol. 59, Oct. 1980, p. 26-30.

The paper discusses a titanium brazing method for producing honeycomb acoustic cylinders. Brazing was performed with a 3003 aluminum filler metal, using an improved vacuum pumping system and argon purging. A mandrel, a rotisserie door assembly, and a brazing retort were placed into an electric furnace which heated the brazement to 1255 F held for a minimum of 2 min during the brazing operation. A 36 in. diameter cylinder was brazed within tolerances of + or - 0.010 in.; the brazements show weight advantages from 20 to 50% over conventional materials. A.T.

A81-10355 Aspect ratio variability in part-through crack life analysis. R. J. Engle, Jr. (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, Ohio). In: Part-through crack fatigue life prediction. Philadelphia, Pa., American Society for Testing and Materials, 1979, p. 74-88. 7 refs.

Various analytical solutions currently used in part-through crack life prediction are reviewed, including those which account for shape change effects as well as constant shape solutions. Comparisons of these solutions with constant amplitude experimental data are examined. Results are presented for three different materials: 2219-T851 aluminum, 6Al-4-V (beta annealed) titanium, and 9Ni-4Co-0.20C steel. (Author)

A81-10362 Part-through crack problems in aircraft structures. J. L. Rudd, H. A. Wood (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, Ohio), and T. M. Hsu (Lockheed-Georgia Co., Marietta, Ga.). In: Part-through crack fatigue life prediction.

Philadelphia, Pa., American Society for Testing and Materials, 1979, p. 168-194. 15 refs.

The most common types of flaws which exist in aircraft structures and the test data and analytical criteria needed to predict their growth are discussed. A number of special analytical and structural considerations are discussed such as small flaws, cold-worked holes, plasticity effects, failure criteria, and multiple flaw sites. The analytical crack growth and residual strength requirements which must be met as well as the initial flaw sizes and shapes which must be assumed in the Air Force damage tolerance design

requirements (MIL-A-83444) are presented. Recently developed stress intensity factor solutions for quarter elliptical corner cracks emanating from various types of fastener holes are presented. Predictions using these current solutions are correlated with other approximate solutions as well as experimental test data. (Author)

A81-10439 # *Forced vibrations of a nonlinear system excited by a centrifugal oscillator with a sloping engine characteristic (O vyznuzhennykh kolebaniakh nelineinoy sistemy, vzbuzhdaemoi tsestrobeznyim vibratorom, imeiushchim pologuiu kharakteristiku dvigatel'ia).* N. P. Plakhtienko and N. V. Lysak (Akademiia Nauk Ukrainskoi SSR, Institut Mekhaniki, Kiev, Ukrainian SSR). *Prikladnaia Mekhanika*, vol. 16, Sept. 1980, p. 110-114. 7 refs. In Russian.

Centrifugal oscillators, of the type used in dynamic analyses of mechanical systems, are powered by low-power engines. Mounted on elastic structures, such engines may give rise to interactions between the translational and rotational motions of the vibrator elements, which lead to unsteady mode shapes of vibration and hinder transition through resonance. In the present paper, these and some other associated phenomena are analyzed. V.P.

A81-10468 # *Brushless cryogenic ac motors (Beskontaknye kriogennye elektricheskie mashiny peremennogo toka).* Z. K. Sika (Akademiia Nauk Latvskoi SSR, Fiziko-Energeticheskii Institut, Riga, Latvian SSR). *Akademiia Nauk Latvskoi SSR, Izvestiia, Seriya Fizicheskikh i Tekhnicheskikh Nauk*, no. 4, 1980, p. 68-79. 26 refs. In Russian.

Basic types of brushless cryogenic equipment and their classification system are presented. Development of motors is described, including rotor designs without windings, ferromagnetic rotors without windings, and a cascade type cryogenic machine with a synchronous motor with windings. A.T.

A81-10474 # *The design of blowing-cooled aircraft electrical machines (Voprosy konstruktzii produvaemykh aviatsionnykh elektricheskikh mashin).* V. I. Naumenko, O. G. Klochkov, and V. V. Bandurin (Akademiia Nauk Ukrainskoi SSR, Institut Elektrodinamiki, Kiev, Ukrainian SSR). *Tekhnicheskaiia Elektrodinamika*, July-Aug. 1980, p. 81-87. In Russian.

The current status of air-cooled aircraft electrical machines is reviewed. The possibility of reducing the weight and size of air-cooled machines is discussed, with particular emphasis on the design of cooling systems for synchronous ac-generators. B.J.

A81-10499 # *The aircraft in the stratosphere (L'aviation dans la stratosphère).* M. Nicolet. *Académie Royale de Belgique, Classe des Sciences, Bulletin*, vol. 65, no. 12, 1979, p. 681-686. In French.

The effect of combustion gases from supersonic flights upon the ozone layer has been a major concern since the discovery that skin cancer is induced by ultraviolet radiation. An equation for the photochemical equilibrium of oxygen within the ozone layer is presented showing that several processes involving hydrogen, nitrogen, and halogen oxides are significant in the region's equilibrium. From 25 km and under, a positive effect of NO₂ dissociation which provides oxygen atoms occurs more often than the direct dissociation of O₂, while for the region above 25 km (above the maximum concentration of ozone) the NO₂ dissociation is less significant than the photodissociation of O₂. Therefore, it is believed that supersonic flights, such as the Concorde, above 25 km could, in sufficient numbers, directly affect the equilibrium of the stratospheric ozone layer. However, flights below 25 km will not destroy the ozone, but rather increase the production of the stratospheric ozone. A.C.W.

A81-10575 *NASA presses fighter gains.* C. Covault. *Aviation Week and Space Technology*, vol. 113, Oct. 27, 1980, p. 16-18.

NASA planned contracts early next year on long-range, supersonic cruise aircraft in order to gain a new technology base are

described. Attention is given to two performance concepts which will be studied: one for a European-based fighter and the other for a Middle-East-based fighter. It is shown that emphasis in NASA's 'supercruise' fighter study will be to obtain industry concepts of tactical aircraft possessing two or three times the supersonic cruise ranges of existing fighters, allowing the supercruise vehicles to fly efficiently most, if not all, of their takeoff-to-landing mission profiles at about Mach 2. Consideration is given to the primary new technologies to be evaluated, such as variable cycle engines and dry turbojets, low-aspect-ratio arrow wings, composite materials, and active controls with digital avionics. M.E.P.

A81-10632 # *The performance of slotted blades in cascade.* H. Matsumiya (Mechanical Engineering Laboratory, Sakura, Ibaraki, Japan) and M. Shirakura (Tokyo University, Tokyo, Japan). *JSME, Bulletin*, vol. 23, Aug. 1980, p. 1320-1334. 18 refs.

A precise solution of the problem of determining a two-dimensional potential flow of incompressible fluid around arbitrary shaped slotted blades in cascade was obtained by conformal mapping. This solution facilitates precise evaluation of the extremely complicated calculations around the slot even if the slot and the main aerofoil are approximated close to each other. Utilization of a modified Milne-Thomson's circle theorem together with Milne-Thomson's circle theorem, as a means of analysis, gives simple expressions of mapping function and complex potential function, suitable for electronic computer calculations. Wind tunnel tests, with comparison between slotted and unslotted cascades, were also conducted. Slight slot effect was obtained in both outer regions of flow inlet angle. However, in the middle region of inlet angle, slot effect was insufficient due to the divergent shape of slot employed. (Author)

A81-10633 # *Discrete frequency noise due to irregularity in blade row of axial fan rotor.* T. Fukano, Y. Kodama, and Y. Takamatsu (Kyushu University, Fukuoka, Japan). *JSME, Bulletin*, vol. 23, Aug. 1980, p. 1335-1343. 12 refs.

It is experimentally made clear in this paper that discrete tones appear in the frequency band lower than the blade passing frequency when a rotor has manufacturing errors of stagger angle, pitch, camber or chord length, which result is at variance with the general understanding that the frequency of discrete noise corresponds to the blade passing frequency and its harmonics. The relations between the magnitude of the deviation of the blading parameter from a design value and the induced sound pressure level of discrete tone and the resulting change of fluid dynamic characteristics of the fan are also examined. Analytic considerations of measured wave patterns of pressure fluctuation indicate that this type of discrete noise originates in a distortion of the circumferential distribution of mean flow rates through the rotor from the uniform distribution and the consequent circumferential variation of mean pressure level, arising from the unequal blade loading of each blade of a rotor due to the errors in manufacturing. (Author)

A81-10708 # *Application of the laser velocimetry technique to Langley's 0.3-meter Cryogenic Wind Tunnel.* L. R. Gartrell, P. B. Goodrum, W. W. Hunter, Jr., and J. F. Meyers. *Supersonic Tunnel Association, Semiannual Meeting, 54th, New York, N.Y., Oct. 9, 10, 1980, Paper*. 33 p. 6 refs.

A limited series of laser velocimeter tests were conducted in the Langley 0.3-m Transonic Cryogenic Tunnel. The results demonstrated that the laser velocimeter technique could be applied to the facility to obtain velocity measurements over a 51-235 m/sec range with at least + or - 1% accuracy. No seeding material was injected during these tests to augment existing Mie scattering material. It is postulated that the scattering material in these tests was liquid nitrogen normally injected to control the tunnel conditions. Signal levels obtained during the tests indicated that the average particulate size was greater than desired, more than 1.0 micron in diameter.

Tunnel vibrations were considered a potential problem before the test but no detrimental effects on the optical system were noted. It is concluded that the laser velocimeter technique is a viable method for measuring velocity in the 0.3-m Transonic Cryogenic Tunnel. The most significant problem is the reduction and control of the size of existing scattering particulates. (Author)

A81-10709 * # A numerical study of candidate transverse fuel injector configurations in the Langley scramjet engine. J. P. Drummond (NASA, Langley Research Center, Hampton, Va.). *Joint Army-Navy-NASA-Air Force Interagency Propulsion Committee, Combustion Meeting, 17th, Hampton, Va., Sept. 22-26, 1980, Paper. 27 p.* 11 refs.

A computer program has been developed that numerically solves the two-dimensional Navier-Stokes and species equations near one or more transverse hydrogen fuel injectors in a scramjet engine. The program currently computes the turbulent mixing and reaction of hydrogen fuel and air, and allows the study of separated regions of the flow immediately preceding and following the injectors. The complex shock-expansion structure produced by the injectors in this region of the engine can also be represented. Results are presented that describe the flow field near two opposing transverse fuel injectors and two opposing staged (multiple) injectors, and comparisons between the two configurations are made to assess their mixing and flameholding qualities. (Author)

A81-10711 * # Flameholding characteristics of a swept-strut H2 fuel-injector for scramjet applications. G. B. Northam, C. A. Trexler, and C. R. McClinton (NASA, Langley Research Center, Hampton, Va.). *Joint Army-Navy-NASA-Air Force Interagency Propulsion Committee, Combustion Meeting, 17th, Hampton, Va., Sept. 22-26, 1980, Paper. 20 p.* 12 refs.

A series of direct-connect tests are conducted which simulate the flow around the center swept-strut fuel-injector of a scramjet engine module. The experimental geometry includes both perpendicular and parallel fuel injectors which are swept with respect to the upstream flow direction in a manner simulating the flow geometry in the combustion region of the scramjet module. Seven different strut injector geometries are evaluated for their performance, flameholding, and inlet-combustor interaction characteristics. The most efficient combustion process is exhibited by the configuration having the deepest step with perpendicular injector orifices located 3.5 to 4.5 step heights downstream from the step. However, long center-body and staged injection configurations perform as equally well as the deep step configuration when evaluating only the amount of perpendicular fuel injection. Since the staged injection configuration exhibits the lowest ignition and flameholding limit, it is suggested that the optimum injection configuration should incorporate a deep step with staged injection in order to improve the low temperature autoignition-flameholding characteristics. A.L.W.

A81-10718 Airfield pavement demonstration-validation study. D. M. Arntzen (Department of Public Works, Chicago, Ill.), E. J. Barenberg (Illinois, University, Urbana, Ill.), and R. J. Krause (Wiss, Janney, Elstner and Associates, Inc., Northbrook, Ill.). *ASCE, Transportation Engineering Journal*, vol. 106, Nov. 1980, p. 721-730.

An instrumentation and testing program is presented which has been designed to provide realistic data for pavement designs and to validate results from a finite element program developed specifically to analyze jointed concrete pavements. Preliminary results of design and validation tests are briefly discussed. V.L.

A81-10719 Atlanta's new central passenger terminal complex. J. F. Kortan (Stevens and Wilkinson Architects, Engineers, Planners, Inc., Atlanta, Ga.). (*American Society of Civil Engineers, Annual Convention and Exposition, Atlanta, Ga., Oct. 22-26, 1979.*) *ASCE, Transportation Engineering Journal*, vol. 106, Nov. 1980, p.765-774.

Atlanta's new airport, to be opened in September 1980, will include a 500,000-sq ft two-level terminal linked underground to a satellite complex of four concourses and three runways; a fourth runway is scheduled to be added in the early 1980s. Parking will accommodate 11,500 cars. The airport design features a column-leveling system to compensate for unequal soils conditions, a unique split-complex plan dictated by the high passenger transfer rate, and the latest available people-mover system with moving sidewalk redundancy. V.L.

A81-10747 Fatigue damage mechanisms in composite materials - A review. W. W. Stinchcomb and K. L. Reifsnider (Virginia Polytechnic Institute and State University, Blacksburg, Va.). In: *Fatigue mechanisms*. Philadelphia, Pa., American Society for Testing and Materials, 1979, p. 762-781; Discussion, p. 782-787. 57 refs.

A review is presented of the current knowledge of fatigue damage mechanisms in fiber-reinforced composite materials covering damage modes, their interactions, and effects on engineering properties. The damage state occurs by various combinations of fiber, matrix, and interfacial processes; it was shown that damage is strongly dependent on the material, laminate configuration, geometry, stress state, load history, and environment. The mechanisms which cause dispersed damage result in higher notch growth resistance, while localized damage leads to shorter life and lower residual strength. It was concluded that compression can cause local buckling and delamination, producing larger degradation than a tensile stress of equal magnitude. A.T.

A81-10749 On understanding environment-enhanced fatigue crack growth - A fundamental approach. R. P. Wei (Lehigh University, Bethlehem, Pa.). In: *Fatigue mechanisms*. Philadelphia, Pa., American Society for Testing and Materials, 1979, p. 816-831; Discussion, p. 831-840. 52 refs. Contract No. N00014-75-C-0543. NR Project 036-097.

A review of fundamentals of environment-enhanced fatigue crack growth is presented. Corrosion fatigue is taken into consideration in aircraft and offshore structures, highway bridges, transmission lines, and coal conversion systems. Fracture mechanics technology, modern surface analysis, and metallurgical techniques such as Auger electron spectroscopy and low energy electron diffraction analysis made it possible to quantify environmental fatigue cracking. Types of fatigue crack behavior and sequential processes involved in embrittlement by gaseous environments are discussed; crack growth rates in AISI 4340 steel in aqueous media are analyzed. A.T.

A81-10767 Piloted simulation studies of helicopter agility. B. N. Tomlinson and G. D. Padfield (Royal Aircraft Establishment, Bedford, England). *Vertica*, vol. 4, no. 2-4, 1980, p. 79-106. 17 refs.

The need for helicopters to operate close to the ground and near obstacles has prompted a critical look at design features which affect performance and handling qualities in this environment. Some experiments using a ground-based flight simulator have been conducted to investigate this subject and to obtain data on helicopter agility. These experiments required the development of a general mathematical model capable of representing helicopter flight, including gross maneuvers, from hover to cruise and validation by comparison with flight tests. An exacting low level flying course was created on a model ground terrain and formed the primary task for the six pilots involved in the experiments. A set of rotors were represented which differed in blade flapping stiffness and inertia (Lock number). The paper describes these aspects and then goes on to describe how the simulated helicopter was flown over the agility course with each rotor to investigate the effects of rotor design. Some of the theoretical consequences of these variations are outlined and the results of piloted flights in the simulator described. (Author)

A81-10768 Helicopter tail configurations to survive tail rotor loss. A. Brocklehurst (Westland Helicopters, Ltd., Yeovil, Somerset, England) and P. Taylor (Southampton, University, South-

ampton, England). *Vertica*, vol. 4, no. 2-4, 1980, p. 107-119. 5 refs. Research supported by the Westland Helicopters.

Recently the US Army have specified that a helicopter must be capable of returning from its mission after suffering a tail rotor loss. The helicopter should possess sufficient directional stability to fly at the minimum power speed with a sideslip angle of not more than 20 deg. A simple theory, describing the yawing oscillation of a helicopter, has been applied to a typical helicopter in order to identify the stability implications on the aerodynamic design of meeting the above tail rotor loss criterion. The fin area required, for a fin and single tail rotor configuration, to meet both the above criterion and to ensure adequate lateral stability characteristics was large even if camber and incidence were used. The same helicopter but with twin tail rotors and no fin was investigated. This configuration has additional advantages including the unique ability to land in confined places after the loss of a tail rotor. (Author)

A81-10769 The aerodynamic characteristics of some new RAE blade sections, and their potential influence on rotor performance. P. G. Wilby (Royal Aircraft Establishment, Farnborough, Hants., England). *Vertica*, vol. 4, no. 2-4, 1980, p. 121-133.

The values of maximum lift coefficient and pitching moment coefficient at zero lift, and the drag characteristics, are given for several new RAE profiles and NACA 0012, as measured in steady conditions. Results from oscillatory tests are then presented for RAE 9647 (one of the new sections) and NACA 0012. These show that at $M = 0.3$, the gain in maximum lift coefficient for the new section relative to NACA 0012 is considerably greater in dynamic conditions than in steady conditions. Dynamic tests are seen to be necessary for the full assessment of new profiles. The effect of section characteristics on rotor performance is evaluated by means of a rotor performance calculation that incorporates a model of dynamic stall; the predicted onset of blade stall providing a criterion for determining the rotor thrust limits. The new sections are seen to offer a 35% increase in rotor thrust capability, relative to rotors with the NACA 0012 section. (Author)

A81-10770 Experimental application of a vibration reduction technique. W. R. Walker (Royal Aircraft Establishment, Structures Dept., Farnborough, Hants., England). *Vertica*, vol. 4, no. 2-4, 1980, p. 135-146.

Attention is drawn to a method of reducing the vibration at specific points of a structure by means of a relatively simple experimental technique. The method relies on the measurement of transfer functions, which are used to predict changes in vibratory response as structural parameters are altered. Of particular concern in this paper are the practical difficulties involved in ensuring a reasonable level of accuracy in the response predictions. This is examined by applying the technique to a helicopter tail cone. (Author)

A81-10839 An analytical method to calculate misalignment in the journal bearing of a planetary gear system. P. K. Das and S. S. Gupta (Pratt and Whitney Aircraft of Canada, Ltd., Longueuil, Quebec, Canada). *Wear*, vol. 61, June 2, 1980, p. 143-156. 7 refs.

A computerized method of calculating misalignments in hydrodynamic bearings of a planetary gearbox was developed. The program was applied to the misalignment in the bearing of a reduction gearbox in a 850 hp turboprop engine. Carrier rotational stiffness had the strongest effect on the misalignment; the rotational stiffnesses of the ring and the sun gears have a limited influence, but the misalignment can be reduced by flexible ring and sun gears. The effects of misalignment on planet bearings was not significant until the second stage, during which the peak pressure increased by 85% and the minimum film thickness decreased by 53%. A.T.

A81-10840 An experimental and theoretical investigation of pressures in four-lobe bearings. R. D. Flack, M. E. Leader, and P. E. Allaire (Virginia, University, Charlottesville, Va.). *Wear*, vol. 61, June 16, 1980, p. 233-242. 13 refs. Research supported by the Engineering Foundation; Contract No. EF-76-5-01-2479.

A four-lobe bearing 25.4 mm in diameter was tested with the load vector 'on pad' and 'off pad'. Static pressures were measured on the center line of the bearing and these experimental data are compared with two sets of theoretical results. The half-Sommerfeld and Reynolds boundary conditions were each used in the theoretical predictions. Of particular significance is the fact that the experimental data correlate best with the half-Sommerfeld solution. Differences between the data and the theoretical solution of the order of 10-35% and 15-100% are realized for the half-Sommerfeld and Reynolds boundary conditions, respectively. Moreover, the trends of pressure versus rotational speed for the experimental data and the theoretical solution are the same for the half-Sommerfeld condition but sometimes differ for the Reynolds condition. (Author)

A81-10913 Investigation of lateral forces and moments in the case of asymmetric gas flows in nozzles. G. Z. Nikulin, L. V. Pchelkina, U. G. Pirumov, and G. S. Rosliakov. (*Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, vol. 15, Mar.-Apr. 1980, p. 70-85.) *Fluid Dynamics*, vol. 15, no. 2, Sept. 1980, p. 231-244. 19 refs. Translation.

Three-dimensional supersonic nozzle flows are analyzed, using an approach which combines experimental studies with numerical calculations carried out by the small perturbation and finite-difference methods. Particular attention is given to lateral forces and moments, generated by asymmetries of the contour of conical or shaped nozzles. It is shown how the small perturbation method can be used to greatly simplify the analysis without impairing accuracy. V.P.

A81-10916 Flow past a slender profile in a channel with permeable walls. N. A. Marevtseva. (*Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, vol. 15, Mar.-Apr. 1980, p. 111-117.) *Fluid Dynamics*, vol. 15, no. 2, Sept. 1980, p. 265-270. 11 refs. Translation.

An exact solution is obtained to the boundary interference problem for the potential flow of an ideal incompressible fluid past a slender wing profile in a channel with slit-shaped perforations transverse to the flow. The degree of perforation of the upper and lower walls is assumed to be identical. The wind tunnel is assumed to be situated in a constant-pressure chamber, the pressure being equal to that of the unperturbed flow. Use is made of the condition of proportionality of the longitudinal and normal perturbed-velocity components. It is shown that under such conditions, transverse ventilation leads to an increase in wall interference. V.P.

A81-10919 Asymmetric flow of subsonic and sonic jets over an infinite wedge. N. A. Podspanina and E. G. Shifrin. (*Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, vol. 15, Mar.-Apr. 1980, p. 137-141.) *Fluid Dynamics*, vol. 15, no. 2, Sept. 1980, p. 286-289. 6 refs. Translation.

The analysis deals with the subsonic or transonic flow past an infinite wedge, in the case where the critical line of flow branches at the apex of the wedge. A flow of this type can arise only at a quite specific relationship of the geometrical parameters. The problem is solved in the hodograph plane by a numerical method proposed by Podspanina (1975) for profiling Laval nozzles. V.P.

A81-10920 Two methods for calculating the load on the surface of a slender body executing axisymmetric vibrations in a sonic gas flow. V. Iu. Ol'shanskii. (*Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, vol. 15, Mar.-Apr. 1980, p. 151-154.) *Fluid Dynamics*, vol. 15, no. 2, Sept. 1980, p. 300-302. Translation.

In the present paper, the low-frequency axisymmetric vibrations of the surface of a slender body situated in sonic flow are analyzed under the assumption of a linear velocity distribution along the body. A nonlinear equation with variable coefficients derived for the nonstationary portion of the velocity potential, is solved, first, by separation of variables and then by the method of superposition of sources. The obtained expressions for the nonstationary portion of

the velocity potential are shown to be well suited for calculating unsteady surface loads for a slender body of revolution in a sonic gas flow. V.P.

A81-11157 High-density avionic power supply. K. K. Hedel (General Electric Co., Aircraft Equipment Div., Utica, N.Y.). *IEEE Transactions on Aerospace and Electronic Systems*, vol. 16, Sept. 1980, p. 615-619.

The development of a standard 3/4 ATR 5-V, 60-A power supply is described. This novel converter circuit allows packaging a 300-W logic supply at a density of 5.7 W/cu in., thereby taking only two slots or 10% of the available volume. B.J.

A81-11158 Radar target detection and map-matching algorithm studies. L. M. Novak (MIT, Lexington, Mass.). *IEEE Transactions on Aerospace and Electronic Systems*, vol. 16, Sept. 1980, p. 620-625. 11 refs. USAF-Army-DARPA-sponsored research.

Results of a study of adaptive threshold target detection and map-matching algorithms are presented. Log threshold processing is shown to be preferred over linear threshold processing when the clutter data surrounding the target cell is contaminated by other targets, decoy corner reflectors, or bright clutter cells. Whereas previous studies have resorted to extensive Monte-Carlo simulations of log threshold algorithms, the results were obtained using a novel analytical approach based upon Parseval's theorem. A81-11242 # The 767's flight-management system - A new generation of airborne avionics. R. A. Peal (Boeing Commercial Airplane Co., Renton, Wash.). *Aeronautics and Aeronautics*, vol. 18, Nov. 1980, p. 37-39.

The procurement specifications for the 767 avionics were necessarily different from those for previous aircraft because the 767 flight management system uses not a single off-the-shelf item of equipment. Therefore this digital technology system has presented a great challenge to the design product engineers guiding it toward certification. This paper describes such developments as the new interface data base, software configuration control, the applied technology, the primary flight instruments, and the flight-management digital computer system. B.J.

A81-11244 # F/A-18's landing, launch and recovery system. D. L. Bourisaw and C. F. Brandenburg (McDonnell Aircraft Co., St. Louis, Mo.). *Aeronautics and Aeronautics*, vol. 18, Nov. 1980, p. 48-52, 63.

The F/A-18 Hornet is a carrier-based fighter and attack aircraft designed to eventually replace both the F-4 and the A-7 for the U.S. Navy and Marines. It was determined that the landing gear delivery leadtimes would be among the longest for any of the procured equipment. Furthermore, design definition efforts for a carrier-suitable landing gear that would satisfy the many operational, structural, and geometric requirements, while still fitting into the small dense airframe, added to the already strained schedule span time. This paper describes the way in which these procurement difficulties were overcome. B.J.

A81-11245 # Add fluorescent minitufts to the aerodynamicist's bag of tricks. J. P. Crowder (Boeing Commercial Airplane Co., Renton, Wash.). *Aeronautics and Aeronautics*, vol. 18, Nov. 1980, p. 54-56.

Recent experience has demonstrated the feasibility of routinely using fluorescent minitufts to visualize low-speed and transonic flows. This extension of the traditional yarn technique permits large numbers of minitufts to be applied to the surfaces of a wind tunnel model, yet produces negligible interference with the flow. Extremely thin fluorescent nylon monofilament (diameter as small as 0.0007 in.) forms the tufts. Small drops of lacquer-type adhesive attach the tufts to the model. Fluorescence photography records the visual data. B.J.

A81-11302 An experimental investigation of jet screech by air jet impingement on solid boundaries. A. M. Petrie (Paisley

College of Technology, Paisley, Scotland). *Applied Scientific Research*, vol. 36, no. 2, 1980, p. 93-108. 25 refs.

An experimental investigation has been completed to study several methods of avoiding the jet screech phenomenon due to air jet impingement on solid boundaries. Measurements were completed in the Mach number region of $M = 0.5$ using a 25 mm diameter nozzle with the air jet impinging on flat, concave and convex boundaries. Sound pressure levels were recorded in the plane of the nozzle outlet at a distance of 1.46 m from the jet axis. With the air jet impinging on the flat board normal to its surface a maximum sound pressure occurred at a spacing of approximately two nozzle diameters producing a distinct screech at a sound level of 20 dB above that of the free jet. Three methods of preventing this screech were studied: (1) inserting disturbances into the shear layer at the nozzle exit; (2) changing the geometry of the boundary shape to improve the jet stability in the impingement region; and (3) introducing disturbances at the stagnation region which had the effect of displacing the distinct screech to another frequency range. (Author)

A81-11320 # Head-up displays. III (Elektroniczno-optyczne systemy wskazan projekcyjnych /HUD/. III). E. Malinski (Instytut Lotnictwa, Warsaw, Poland). *Technika Lotnicza i Astronautyczna*, vol. 35, Aug.-Sept. 1980, p. 17-21. 10 refs. In Polish.

The development and applications of head-up displays are reviewed with emphasis on operational functions for typical ground and air attack missions. Attention is given to systems with electronic mixing of symbols and video images which project the terrain or external surroundings and the symbolic data display on a common screen. B.J.

A81-11321 # Reduction of energy consumption in the vibrational shot peening of axial compressor vanes (Obniżenie energochłonności wibrokulowania łopatek sprężarki osiowej). M. Marciniak (Warszawa, Politechnika, Warsaw, Poland). *Technika Lotnicza i Astronautyczna*, vol. 35, Aug.-Sept. 1980, p. 23, 24. In Polish.

A system for vibrational shot peening is described and the shot peening process is analyzed. A method for reducing the energy consumption in the vibrational shot peening of axial compressor vanes is presented. B.J.

A81-11322 # Methods of fuel conservation in civil aviation. I (Metody oszczędzania paliwa w lotnictwie komunikacyjnym. I). M. Kawczynski. *Technika Lotnicza i Astronautyczna*, vol. 35, Aug.-Sept. 1980, p. 36-38. In Polish.

Several methods for saving fuel in civil aviation are described. These methods include modifications in aircraft design, operational methods, and aircraft balancing during flight. B.J.

A81-11324 # Impact damage of aircraft gas turbine engines with axial compressors (Uszkodzenie udarowe w lotniczych silnikach turbinowych ze sprężarką osiową). M. Ostapowicz. *Technika Lotnicza i Astronautyczna*, vol. 35, Aug.-Sept. 1980, p. 45-47. In Polish.

Data on the foreign object damage (FOD) of axial compressors of gas turbine engines are reviewed. Methods for improving the FOD reliability of axial compressors are discussed. B.J.

A81-11338 Design and fabrication of stabilized organic matrix composites. J. A. Suarez (Grumman Aerospace Corp., Bethpage, N.Y.). (*American Ceramic Society, Annual Conferences on Composites and Advanced Materials, 2nd and 3rd, Cocoa Beach, Fla., Jan. 22-25, 1978 and Jan. 21-24, 1979.*) *Ceramic Engineering and Science Proceedings*, vol. 1, July-Aug. 1980, p. 370-385. Contract No. F33615-76-C-5311.

Integrally-stiffened graphite/epoxy compression panels representative of secondary aircraft structure were designed and fabricated. A thermal pressure forming process was developed to manufacture various panels which were designed for compression loading and

analyzed using existing analytical techniques. A structural efficiency comparison of the integrally-stiffened graphite/epoxy compression panels and a baseline sandwich panel with graphite/epoxy skins and aluminum honeycomb core was performed. (Author)

A81-11339 **Design and test of a graphite-epoxy composite A-10 slat.** J. Clarke (Fairchild Republic Co., Farmingdale, N.Y.). (*American Ceramic Society, Annual Conferences on Composites and Advanced Materials, 2nd and 3rd, Cocoa Beach, Fla., Jan. 22-25, 1978 and Jan. 21-24, 1979.*) *Ceramic Engineering and Science Proceedings*, vol. 1, July-Aug. 1980, p. 386-397.

A composite slat has been developed which has a constant cross section and consists of a lightweight full-depth corrosion-resistant aluminum honeycomb core covered with AS/3501-5 graphite epoxy skins. Design policy, materials and process development, and programs of structural testing and nondestructive evaluation are reviewed. It is shown that advance composites can be cost competitive with metals and used on aircraft to achieve low weight and low cost if applied carefully. V.L.

A81-11441 **The aerodynamics of pure subsonic flow /4th revised edition/ (Aerodynamik der reinen Unterschallströmung /4th revised edition/).** F. Dubs. Basel, Birkhäuser Verlag (Flugtechnische Reihe. Volume 1), 1979. 323 p. 131 refs. In German. \$15.30.

Fundamentals in the aerodynamics of pure subsonic flow are investigated. Aircraft wing design is examined with emphasis on achieving lift with a minimum of resistance. The production of wing profiles is considered including the determination of profiles based on potential pressure distribution and boundary layer theory. The function of the propeller in propulsion and as an aerodynamic brake is discussed along with the use of tow channels and wind channels in aerodynamics investigations. R.C.

A81-11475 **Subsequent proof of damage tolerance for a landing gear component after numerous takeoffs and landings (Nachträglicher Schadenstoleranzbeweis eines Flugzeug-Fahrwerksteiles nach zahlreichen Starts und Landungen).** E. A. B. de Graaf, P. de Rijk (National Luchtvaartlaboratorium, Emmeloord, Netherlands), and G. F. J. A. van Gestel (Van Doorne's Automobielfabriek, Eindhoven, Netherlands). (*Deutsche Gesellschaft für Zerstörungsfreie Prüfung, Jahrestagung, Göttingen, West Germany, May 12-14, 1980.*) *Materialprüfung*, vol. 22, Sept. 1980, p. 369-372. In German.

Design philosophies based on the safe-life, fail-safety, and damage-tolerance concepts are examined, along with the respective inspection intervals and regulations. Four different nondestructive tests with a landing gear component prepared on AISI 4340, low-alloy high-strength steels, are described, which revealed the 'subsequent' damage tolerance of the component, in the sense that by the time the tolerance proof became available, the component had been replaced by a new one. V.P.

A81-11602 **How to improve the performance of transport aircraft by variation of wing aspect-ratio and twist /12th Daniel and Florence Guggenheim International Memorial Lecture/.** E. Truckenbrodt (München, Technische Universität, Munich, West Germany). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 1-17. 15 refs.

The lecture deals with the influence of the wing aspect-ratio and twist on the induced drag of transport aircraft. Whereas the taper-ratio and the sweep of the wing are given, the aspect-ratio and twist are the two variable parameters. With respect to the critical transonic Mach-number a swept-forward wing has similar qualities as a swept-back wing, both at the same angle of sweep. The spanwise lift distribution will be discussed with regard to two aspects: elliptic lift distribution for the design lift coefficient and lift distribution for high lift coefficient in the vicinity of stalling. The investigation of

induced drag leads to the result that a twisted swept-forward wing is equivalent to a twisted swept-back wing with an enlarged aspect-ratio. (Author)

A81-11603 **The analysis of fatigue failures.** C. J. Peel and P. J. E. Forsyth (Royal Aircraft Establishment, Farnborough, Hants., England). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 18-29. 31 refs.

The post-failure analysis of fatigue cracking has developed during the last decade into a quantitative technique vital to both aircraft structural testing and accident investigations. The quantitative techniques used retrospectively to determine fatigue crack growth rates are explained and compared with complementary predictions based upon linear elastic fracture mechanics taking account of the limitations to both techniques. Examples include detailed analyses of fatigue cracking in undercarriages during structural testing, cracking from fastener holes in the wing of a military aircraft undergoing testing and the in-service failure of the tail-plane of a transport aircraft. The analyses consider in particular the causes of premature and unexpected fatigue failures with reference to current airworthiness philosophies. (Author)

A81-11604 * **Numerical optimization - An assessment of its role in transport aircraft aerodynamic design through a case study.** M. E. Lores, P. R. Smith (Lockheed-Georgia Co., Marietta, Ga.), and R. A. Large (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, Ohio). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 41-52. 22 refs. NASA-supported research; Contract No. F33615-78-C-3014.

An efficient transonic wing design procedure based upon numerical optimization together with three-dimensional transonic methods has been developed and used to design an advanced transport wing. The method development included an examination of the use of both full potential and extended small disturbance analysis codes and demonstrated that the former formulation was more reliable. In either case, the design procedure is economical and easy to use. Design verification in a unique semi-span test arrangement demonstrated that the design method produced a wing which satisfied the study design requirements. However, aeroelastic deformation of the wing occurred during the wind tunnel test. The computational methods used in the design procedure were employed to assess the effect of the aeroelastic deformation. The paper concludes with an evaluation of the design procedure and recommendation for its improvement. (Author)

A81-11605 **The relevance of the Flex-Hub Prop-Fan for fuel-efficient airliners.** K. W. Sambell. In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 53-62. 11 refs.

The Flex-Hub Prop-Fan, a variant of the rigid-hub prop-fan, is predicted to have improved performance and control characteristics for twin-engine M 0.8 airliners. In the one-engine inoperative case at take-off, the Flex-Hub Prop-Fan will have a more even thrust distribution in its tip-path plane and will develop higher propulsive efficiency and greater propulsive lift. A preliminary analysis, with a fixed engine core-size, compares payload capability of three aircraft: powered by fan-jets, rigid-hub prop-fans, and flex-hub prop-fans. The respective design gross weights were 300,000 lbs., 320,000 lbs., and 342,000 lbs. At a range of 2,000 n.m., the passengers carried were 232, 255 and 280. The fuel economy (seat-statute miles per U.S. gallon) was 68.7, 76.5 and 79.5. Other unique characteristics of the Flex-Hub Prop-Fan are discussed, including cross-wind control, blade de-icing, and wing trailing-vortex interaction. (Author)

A81-11606 **New concepts for design of fully-optimized configurations for future supersonic aircraft.** A. Nastase (Aachen, Rheinisch-Westfälische Technische Hochschule, Aachen, West Germany). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 63-74. 22 refs.

The drag of a supersonic aircraft can be decreased by replacing its conventional wing with a design whose geometrical characteristics are optimized for minimum drag. A graphic-analytical method for solving a variational problem for the drag-functional which contains the wing surface as the unknown and the shape of the wing projection as the unknown boundary is presented. The method was used for designing of an optimized delta wing model and the construction of the wing for the Concorde aircraft. A.T.

A81-11607 **Possibilities for the valuation of different combat aircraft configurations with respect to flight mechanics.** P. Mangold and H. Wünnenberg (Dornier GmbH, Friedrichshafen, West Germany). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 75-81. 5 refs.

Evaluation of various configurations during early design stages of aircraft is discussed. The weighted sum of all single valuations produces the most promising configuration, which is based on criteria for control about the pitch-, roll-, and yaw axis, stability behavior, center of gravity range, and sensitivity to gusts. The critical spin tendency is important in the high angle of attack flight regime of modern fighter aircraft; post-stall control is achieved by enlargement of the horizontal tail or by variations of the center of gravity position. It is concluded that the summarizing process described here produces a nearly objective numerical design. A.T.

A81-11608 **Advanced combat aircraft wing design.** B. Probert (British Aerospace Aircraft Group, Preston, Lancs., England) and D. R. Holt (British Aerospace, Aircraft Group, Brough, Humberside, England). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 82-96. Research supported by the Ministry of Defence.

The paper considers various means of achieving a typical set of design requirements for a combat aircraft, ranging from variable sweep options to a fixed wing configuration. It is shown that with the aid of transonic theoretical methods designs can be achieved which give good (L/D) values over a wide range of Mach number and lift coefficients. Use of variable sweep is a powerful means of achieving a wide range of requirements whilst use of variable camber devices has a strong influence on reconciling, often conflicting, geometric requirements especially when aeroelastic effects are taken into account. Further improvements at high lift can be achieved with slotted devices. High incidence penetration can be aided with the use of strakes and these can be designed to have only a small drag penalty at low lift coefficients. These points are illustrated by describing the design of a variable sweep and fixed wing configuration and results are described and discussed for both. (Author)

A81-11609 **Some experiences with numerical optimisation in aircraft specification and preliminary design studies.** D. A. Lovell (Royal Aircraft Establishment, Aerodynamics Dept., Farnborough, Hants., England). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 97-111. 20 refs.

The development of preliminary design methods to find the best configuration is discussed historically. A method for synthesizing a combat aircraft using a large number of design variables, and the associated analysis procedures, is summarized. This is combined with a numerical optimization method to obtain the minimum value of a nonlinear objective function subject to many nonlinear constraints

defined in the design synthesis. Applications of this multivariate optimization method are described to illustrate the effects of varying performance requirements and incorporating technological advances in the design. The dependency of the optimum configuration on the particular requirements specified and the need for a thorough investigation of the characteristics of the mathematical model that lead to the optimum configuration are emphasized. It is concluded that effort should be made to increase the acceptability of the multivariate optimization techniques in the pre-feasibility stage of design as it offers a potentially valuable guide in selecting configurations for more detailed consideration. A81-11610 **DRAPO - Computer-assisted design and manufacturing system.** F. Bernard (Avions Marcel Dassault-Breguet Aviation, Saint-Cloud, Hauts-de-Seine, France). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 112-122.

The 'DRAPO' design and manufacturing system uses computerized aerodynamic and structural analysis with teleprocessing of aircraft component geometries to manufacturing plants. Manual engineering drawing has been replaced by direct design of frames, wings, and the ribs in three dimensions using an interactive graphic console. The graphic console is also used to describe the paths of machining equipment and monitor their accuracy; applications in designing the main frame of a military aircraft and its electrical circuitry are presented. A.T.

A81-11611 **Computer aided compilation of an electrical drawing file.** J.-P. Puzat (Société Nationale Industrielle Aérospatiale, Blagnac, Haute-Garonne, France). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 123-128.

A general computer design system called GICE is being set up to draw and manage all the documents of an aircraft electrical drawing file. This system enables optimization of the design-to-cost of all the definitions of this drawing file, from the conception of the electrical data in the design office to its utilization by the production and product support departments. B.J.

A81-11612 * **Advanced fuel system technology for utilizing broadened property aircraft fuels.** G. M. Reck (NASA, Lewis Research Center, Cleveland, Ohio). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 129-143. 28 refs.

Factors which will determine the future supply and cost of aviation turbine fuels are discussed. The most significant fuel properties of volatility, fluidity, composition, and thermal stability are discussed along with the boiling ranges of gasoline, naphtha jet fuels, kerosene, and diesel oil. Tests were made to simulate the low temperature of an aircraft fuel tank to determine fuel tank temperatures for a 9100-km flight with and without fuel heating; the effect of N content in oil-shale derived fuels on the Jet Fuel Thermal Oxidation Tester breakpoint temperature was measured. Finally, compatibility of non-metallic gaskets, sealants, and coatings with increased aromatic content jet fuels was examined. A.T.

A81-11613 **Calculation of the flow field around engine-configurations.** C. Haberland, G. Sauer (Berlin Technische Universität, Berlin, West Germany), and E. Göde (Gebr. Sulzer AG, Zurich, Switzerland). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 144-157. 35 refs. Research supported by the Deutsche Forschungsgemeinschaft.

A panel method for the determination of the flow field around high bypass engines without limitations with respect to geometry, speed and mass flow rate is presented. Within this computation method any flow inside the engine contour causing an error in mass flow rate and pressure distribution has been eliminated by developing a mathematical model which represents the real physical flow by introducing a controlled distribution of singularities on the surface combined with suitable boundary conditions. Hence, this modified panel method allows to provide an arbitrary mass flow rate independent of the onset flow velocity satisfying the continuity of the inlet flow. Checking the computation model for several axisymmetric inlets and engine contours, it turns out that the calculated velocities are physically accurate in the far field as well as near the engine and compare well with experimental results. To determine the spanwise and chordwise interference effects for typical engine positions the axisymmetric engine model as a first step is combined with an infinite unswept wing. (Author)

A81-11614 Engine air intake design support by use of computational methods and comparison of theoretically derived pressure distributions with experimental data. A. Eberle and D. M. Schmitz (Messerschmitt-Bölkow-Blohm GmbH, Munich, West Germany). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 158-172. 9 refs.

Two methods based on potential theory and Euler's equations have been used for inviscid flow simulation which can be a useful tool for the evaluation of the pressure distribution along the air intake walls. The following features of the methods are emphasized: the use of a conservative artificial density scheme for the potential variational principle, semiorthogonal grid generation, and the use of a characteristic boundary algorithm for Euler's equations. The elements of the computer program can be extended to three-dimensional flows and viscous interaction. V.L.

A81-11615 A study of the air inlet efficiency of a combat aircraft concept with dorsal inlet. K. Widing (Flygtekniska Forsöksanstalten, Bromma, Sweden). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 173-182. Research sponsored by the Forsvarets Materielverk.

An experimental investigation has been carried out to increase the knowledge of the combined effects of the favorable wing flow and the disturbances from the forebody on the performance of a dorsal inlet concept at take off and landing conditions. Wind tunnel tests were performed with a 1:5 model in FFA's low speed wind tunnel. At the engine face station, both steady state and fluctuating pressure measurements were carried out to establish the inlet performance. A number of distortion indices for different engines have been calculated. Results are presented which indicate that both total pressure losses and distortion indices considered are relatively low and remain low up to moderate angles of attack and side-slip. (Author)

A81-11616 On screeching jets exhausting from an axisymmetric supersonic nozzle. G. M. Carlomagno, C. Lanniello, and P. Vigo (Napoli, Università, Naples, Italy). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 183-188. 14 refs. Research sponsored by the Consiglio Nazionale delle Ricerche.

The behavior of screeching jets exhausting from an axisymmetric convergent-divergent nozzle was studied experimentally for several nozzle configurations. Sound peaks behaving as screeches were detected in the weakly overexpanded and underexpanded regimes. The external nozzle configuration had a marked effect on the screech intensity, but did not influence the screech frequency. In the weakly overexpanded regime, two different screech frequencies

were found for a given stagnation pressure; the frequencies were not simultaneously present, which indicated an instability in the jet structure. B.J.

A81-11617 The all-electric aircraft. D. K. Bird (USAF Flight Dynamics Laboratory, Wright-Patterson AFB, Ohio). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 189-201. 21 refs.

A review of information on all-electrical aircraft is presented. Combining power-by-wire (electrical actuation) and fly-by-wire (electrical signal transmission) will unify the secondary power and the flight control systems under a single electrical medium. This will eliminate the troublesome hydraulic to electrical interface and problems of hydraulic fluid equipment; electromechanical actuation is achieved by using rare earth samarium-cobalt permanent magnets. A.T.

A81-11618 Flying qualities criteria for advanced control technology transports. H. A. Mooij (Nationaal Lucht- en Ruimtevaartlaboratorium, Amsterdam, Netherlands). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 202-208. 8 refs.

The background behind expected developments concerning primary flight control systems of future active control technology transports is indicated. A survey of research performed by the National Aerospace Laboratory to generate the necessary information to formulate low-speed flying qualities criteria for future transport aircraft employing a certain class of active control technology is presented. As tools, research flight simulators and research aircraft have been used. All evaluations have been performed using a deflection-type side-stick controller. The acceptability of neutral stick force stability for attitude stabilized aircraft is dealt with followed by a comprehensive treatment of criteria for longitudinal and lateral-directional maneuvering characteristics. (Author)

A81-11619 Improved flight control performance and failure tolerance using modern control techniques. H. Berman (Grumman Aerospace Corp., Bethpage, N.Y.). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 209-218. 15 refs.

Modern control techniques, including linear optimal control and estimation theory, have been under investigation for many years. However, application to the control of aircraft has been limited. The advent of practical digital flight control systems in recent years gives new impetus to the use of these techniques - particularly with the rapid increase in computational capability of flight-type hardware. This paper outlines an organized computer-aided procedure using modern control techniques to design digital Fly-By-Wire flight control systems. The design procedure combines a methodology for determining sampling requirements, with a direct digital design procedure for control law synthesis, with stochastic estimation as a means for sensor analytic redundancy. Applying the procedure results in facilitating the synthesis step, enhancing control performance, and increasing sensor system reliability and failure tolerance. This paper describes the theoretical basis of the techniques and their application to advanced aircraft designs. (Author)

A81-11620 OLGA, a gust alleviation system for improvement of passenger comfort of general aviation aircraft. B. Krag, D. Rohlfs (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Flugmechanik, Braunschweig, West Germany), and H. Wünnenberg (Dornier GmbH, Friedrichshafen, West Germany). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980,

Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 219-231. 8 refs.

A remotely controlled wind tunnel model and computer simulations have been used to test an open-loop gust alleviation system (OLGA) for a small civil transport aircraft. The discussion concentrates on the dynamic response of the model and the effects of measuring accuracy, gust sensor position, control surface rate limitation, and the dynamic characteristics of the sensors on the performance of the gust alleviation system and the handling qualities of the model. V.L.

A81-11621 Active flutter suppression design and test - A joint U.S.-F.R.G. program. T. Noll (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, Ohio), H. Hönflinger, O. Sensburg (Messerschmitt-Bölkow-Blomh GmbH, Ottobrunn, West Germany), and K. Schmidt (Bundeswehr, Manching, West Germany). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings.

New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 232-241. 10 refs.

A wing/store active flutter suppression system was designed, fabricated and installed on the F-4F aircraft to demonstrate and evaluate the concept in flight. The design used the existing autopilot and trailing edge ailerons with improved high-gain actuators. The feedback system used outboard wing accelerometers combined in a manner defined by optimal control theory. The external stores were internally modified and were used as a flutter stopper for flight safety during the tests. Identification problems attributed to structural nonlinearities in the wing pylon-store system were encountered during the ground and flight tests. As a result, high speed flights with the active flutter suppression system operating have not yet been accomplished. To describe the tests completed, open loop diagrams as well as damping curves for important elastic modes are presented. In addition, recent results of an active flutter suppression design analysis and a transonic wind tunnel test of a lightweight fighter aircraft configuration with a wing mounted external store are presented. Good correlation between the analyses and test data is shown. Based on these and other investigations, active flutter suppression is now a feasible concept. Following more extensive design and testing experience in the area of safety and adaptive control, active flutter suppression can be made operational and included in the design of future tactical aircraft. (Author)

A81-11622 A stability augmentation system which covers the complete flight envelope for a F-4c aircraft without gain scheduling. G. Kreisselmeier and R. Steinhauser (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Dynamik der Flugsysteme, Oberpfaffenhofen, West Germany). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings.

New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 242-246. 12 refs.

For a McDonnell-Douglas F-4c aircraft a robust, fixed gain controller is designed, which provides satisfying handling qualities of the longitudinal motion of the aircraft over the complete flight range without gain scheduling. Robustness is achieved in the sense of covering large parameter variations and providing good gain and phase margins. Only low control rates and low feedback gains are involved. The results are obtained by application of a performance vector optimization design method which allows to take care of a great many of different design objectives simultaneously and in a highly systematic fashion. (Author)

A81-11623 Multivariable aircraft control by manoeuvre commands - An application to air-to-ground gunnery. Mr. Dang Vu Binh (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings.

New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 247-256. 8 refs. (ONERA, TP no. 1980-127)

This paper describes a concept of aircraft control in which the pilot commands are variables directly related to the aircraft motion and not to deflexion angles of control surfaces. It is the airborne computer which synthesizes and coordinates the commands for the various control surfaces, so that the aircraft reaches the maneuver goal set by the pilot. Two examples of maneuver commands have been considered: The first example corresponds to a common mode of aircraft control whereby the pilot sets the sideslip, roll rate, and pitch rate; the control law is briefly described and then evaluated by digital simulation in the final phase of an air-to-ground gunfiring; the second example is specific to the air-to-ground gunnery; an approach to designing an Integrated Flight and Fire Control System is presented whereby the pilot's task is reduced to target designation. The design of both control systems is based on linear optimal control theory with model-following improvement. (Author)

A81-11624 Dynamic stability parameters at high angles of attack. K. J. Orlik-Rückemann and E. S. Hanff (National Aeronautical Establishment, Unsteady Aerodynamics Laboratory, Ottawa, Canada). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings.

New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 265-277. 21 refs.

A review is presented of some of the fluid dynamics phenomena that are associated with oscillatory flight at high angles of attack, with particular emphasis on asymmetric shedding of forebody vortices, asymmetric breakdown of leading edge vortices, the oscillatory motion of such vortices, and the time lag between the vortex motion and the causative motion of the aircraft. These phenomena cause a number of important effects on the dynamic stability parameters at high alpha, such as strong non-linearities with alpha, significant static and dynamic aerodynamic cross coupling, large time-dependent effects and a strong configuration dependence. New wind tunnel testing techniques to determine all the required direct, cross and cross-coupling moment derivatives due to oscillation in pitch, yaw and roll as well as in vertical and lateral translation are briefly described. (Author)

A81-11625 Investigation of high-maneuvrability flight vehicle dynamics. M. E. Beyers (South African Council for Scientific and Industrial Research, Flight Mechanics Div., Pretoria, Republic of South Africa). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings.

New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 278-292. 22 refs.

The potential role of wind tunnel free-flight experiments in the flight dynamic analysis of high-performance aircraft and missiles is examined. The usefulness of the approach is seen to be not only contingent on the ability to extract aerodynamic derivatives, but also lies in the broader objective of aerodynamic data/mathematical model validation. Experimental and analytical techniques were developed to study the generic nonoscillatory motion of high-maneuvrability vehicles in free flight and subsequently investigated in depth. The stability derivatives of a destabilized, air-to-air missile configuration were determined in free flight at Mach 0.7, revealing highly nonlinear behavior and, in particular, a discontinuous dynamic stability characteristic at medium angles of attack. The feasibility of aircraft model free-flight tests is demonstrated on the basis of simulations and a trajectory validation scheme proposed for the corroboration of free-flight and captive-model dynamic data. (Author)

A81-11626 Longitudinal motion of low-flying vehicles in nonlinear flowfields. R. Staufenberg and G. Kleineidam (Aachen, Rheinisch-Westfälische Technische Hochschule, Aachen, West Germany). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings.

New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 293-308. 8 refs.

The relationship between aerodynamic configuration and longitudinal stability in ground effect is investigated. It is shown that

A81-11627

longitudinal stability is an important factor affecting the design of wing-in-ground (WIG) vehicles. Airfoil characteristics and wing shapes are analyzed under static and dynamic height stability, and configurations suitable for the design of stable WIGs are proposed. A comparison between a conventional configuration and a WIG configuration is made by simulating flare maneuvers. V.L.

A81-11627 Identification of longitudinal flying characteristics of an aeroplane and the effect of nonstationary aerodynamics. V. Kocka (Vyzkumny a Zkusebni Letecky Ustav, Prague, Czechoslovakia). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 309-323. 15 refs.

Identification of aircraft longitudinal flying characteristics and its mathematical and physical variants was analyzed from a gnoseological viewpoint. A classification of nonstationary aerodynamics is presented to facilitate aerodynamic model analysis and to distinguish between the 'path' and 'attitude' changes in the angle of attack. Comparable expressions were derived for aerodynamic frequency transfers of entire aircraft, comprising normalized dimensionless transfers of the wing, the tailplane, and the interaction of the wing and the tailplane. The Strouhal number effect on complex aerodynamic derivatives was determined; the corresponding weight functions were computed by the frequency spectrum of elevator deflection and by frequency transfers for responses of the aircraft. A.T.

A81-11630 The future cockpit of the next generation of civil aircraft. J. P. Laborie (Société Nationale Industrielle Aérospatiale, Division Avions, Toulouse, France). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 347-352.

The next generation of civil aircraft will be equipped with completely new digital systems. The cockpit itself will be fitted with new equipment which improves the man/machine interface. The information will be displayed to the crew on cathode ray tubes which have a full color capacity. The design of the complete cockpit is also new and is conceived in a totally integrated concept. This paper describes the cockpit of a future aircraft: the Airbus A.310. (Author)

A81-11631 A theoretical and practical design investigation of the future military cockpit. J. W. Lyons (British Aerospace, Aircraft Group, Brough, Humberside, England). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 353-359. 6 refs.

Trends in the design of future military cockpits are examined with emphasis on ergonomic and mechanical aspects. Specific problems discussed include seat design, the use of electronic displays, ejection techniques, and conditioning systems producing low-noise environments. V.L.

A81-11633 Development and application of a moving base visual flight simulator including the design of hydraulic actuators with hydrostatic bearings. T. J. Viersma and M. Baarspul (Delft, Technische Hogeschool, Delft, Netherlands). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 371-384. 20 refs.

A survey of current manned flight simulation research at the Department of Aerospace Engineering at Delft University of Technology is presented with emphasis given to the assessment of the dynamic characteristics of flight simulator motion systems, resulting in a uniform measurement and analysis method. The design of hydraulic actuators with hydrostatic bearings for flight simulator

motion systems are also discussed. A performance diagram illustrates the connection between specifications, such as maximum excursion, maximum velocity, maximum acceleration, bandwidth, and the design parameters. It is shown that in order to eliminate Coulomb-friction which results in reversal bump, hydrostatic bearings providing a permanent oilfilm between the sliding surfaces inside the actuator are applied. A.C.W.

A81-11634 Reduction of the take-off ground run distance to a given set of atmospheric condition. D. Ionescu (Institutul National Pentru Creatie Stiintifica si Tehnica, Bucharest, Rumania). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 385-390.

A method which permits to determine the take-off ground run distance for any atmospheric conditions, if the value of this distance is available from direct measurement during a single take-off in known atmospheric conditions, is presented. Based on classical equations which define the movement of the aircraft on the ground, the effects of the atmospheric factors (pressure and temperature) on the take-off velocity and on the thrust of the engines are analyzed and finally, a formula allowing to pass from a known distance to another one obtained under different atmospheric conditions is established. The method may be useful to personnel acting in the field of flight tests to determine the take-off ground run distance variations produced by changes in atmospheric conditions or by changes of the airport's height where the aircraft operates. (Author)

A81-11635 The role of flight simulation in the design and development of the Sea Harrier Nav-Attack System. H. J. Allen (British Aerospace, Flight Simulation, Hatfield, Herts., England) and P. R. Walwyn. In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 391-400. 6 refs.

The introduction of more complex avionic systems into the single seat Harrier aircraft posed several problems, not the least of which was the question of whether the pilot workload would be acceptable. To determine this, and to obtain more detailed information on system integration and performance, well in advance of flight testing, a maths model was developed on the existing BAe Hatfield flight simulator. The paper includes a brief description of the facility and of the Sea Harrier model in particular. Numerous investigations were carried out and a pragmatic system of testing and reporting was used to ensure the results were incorporated at an early stage. The areas of study are mentioned and, to illustrate the central theme of the paper, the development of the air-to-air interception display is described fully. The simulation, used at an early stage, has been an extremely cost effective tool in eliminating faults in design conception and developing new ideas. It has a continuing support role during flight testing and future planning, and is being used as a training aid for the first squadron pilots. (Author)

A81-11636 Low-speed airfoil section research at Delft University of Technology. J. L. van Ingen, L. M. M. Boermans, and J. J. H. Blom (Delft, Technische Hogeschool, Delft, Netherlands). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 401-416. 49 refs.

A review is given of some theoretical and experimental research on the aerodynamic characteristics of airfoil sections for low speed flows. Computer programs have been developed which combine potential flow calculations with other computational methods to predict the development of the laminar boundary layer, the occurrence and possibly bursting of laminar separation bubbles, the position of transition and the development of the turbulent boundary layer. Special attention has been given to theoretical and experimental research on the subjects of laminar separation bubbles

and transition. The paper will review the main results of this research. Capabilities of the resulting computer programs will be illustrated through comparison with experimental results for some airfoils. (Author)

A81-11638 **Design and tests of an helicopter rotor blade with evolutive profile.** J. J. Thibert (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France) and J. M. Pouradier (Société Nationale Industrielle Aérospatiale, Division Hélicoptères, Marignane, Bouches-du-Rhône, France). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 429-443. (ONERA, TP no. 1980-125)

In 1974 ONERA and Aérospatiale undertook jointly a research program to improve helicopter rotor aerodynamics and particularly to design optimized blades for future machines. This paper is a synthesis of the results obtained during the design process of a blade with evolutive profile. The design methodology of a new family of airfoil sections covering a range of thickness to chord ratios from 6 to 13 percent is presented and the performances of these airfoils deduced from tests in the S3 Modane wind tunnel are compared with those of other known airfoils. The results obtained on model rotors and in flight on a SA365 Dauphin helicopter will be presented and analyzed. The use of the OA family gives an improvement of the rotor performances in hover and advancing flight and a reduction of the pitch control loads. The flight envelope has also been increased with these new airfoils. All these results will help in the setting up of the specifications of the future airfoil generation. (Author)

A81-11639 **Review of numerical methods for the problem of the supersonic flow around bodies at angle of attack.** P. I. Chushkin (Akademiia Nauk SSSR, Vychislitel'nyi Tsentri, Moscow, USSR) and G. P. Voskresensky (Akademiia Nauk SSSR, Institut Prikladnoi Matematiki, Moscow, USSR). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 444-454. 70 refs.

Numerical methods for three-dimensional steady supersonic inviscid flow around bodies modelling vehicles and their separate parts are reviewed. Three main groups of methods are considered: finite-difference net methods, method of characteristics, method of integral relations (including method of lines). A number of different examples with numerical results concerning flow structure and aerodynamic properties under various flight conditions are discussed. In some cases nonequilibrium processes in the air are taken into account. (Author)

A81-11640 **Research on transonic wings at the National Aerospace Laboratory, Japan.** N. Kamiya and N. Hirose (National Aerospace Laboratory, Tokyo, Japan). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 455-469. 41 refs.

A brief review is made of the recent research on transonic wings being conducted at the NAL in Japan with the aim of improving transonic performance of aircraft. It consists of two parts. One is the research on transonic aerodynamics and the other is the research on the optimization of transonic wings using such aerodynamics as a tool. Firstly, research on aerodynamics is described, which includes design of shock free airfoils using the hodograph method; numerical design of shock free airfoils using the method of artificial gas; numerical design of airfoils with a shock wave by use of the relaxation method; two kinds of numerical analyses of unsteady flow around airfoils, one using Euler equations and the other using full potential equations; and analysis of flow around three dimensional wings by use of integral equations. Some remarks are also made about the viscous effect evaluation. Secondly, research on optimization of transonic airfoils is described. The evaluation of the airfoil

analysis code is also described. Finally, a brief review is made of two kinds of facilities; one is the two-dimensional high Reynolds number wind tunnel, and the other is a numerical simulation project. (Author)

A81-11641 **Flow computation around multi-element airfoils in viscous transonic flow.** H. Rosch and K. D. Klevenhusen (Vereinigte Flugtechnische Werke GmbH, Bremen, West Germany). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 470-479. 22 refs.

A new singularity method is applied to multi-element airfoils in the physical plane for calculating both, the incompressible velocities and the incompressible potential- and streamfunction along the contour of each element. The values of the preceding computation are used to build an orthogonal grid in which the airfoil is mapped to a line in the streamline plane. The computational domain is this streamline plane wherein the full transonic potential equation is solved using a finite difference method. The great influence of viscous effects has been incorporated using the so-called surface transpiration concept. The representation of the displacement effect of the boundary layer and wakes is based on the well-known integral method and a trailing edge flow concept, which includes normal pressure gradients and wake curvature effects. Comparisons of the theory with high Reynolds number experiments show the good agreement for pressure distribution and lift. (Author)

A81-11642 **High lift research and its application to aircraft design.** J. R. Wedderspoon (British Aerospace, Aircraft Group, Weybridge, Surrey, England). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 480-493. 8 refs.

The aerodynamic research and development procedures used by the Weybridge-Bristol Division of British Aerospace to design efficient high lift devices for advanced civil transport aircraft are described, stressing the importance of achieving the correct balance between theory and experiment. The theoretical methods used are reviewed, and the design of a rigid Kruger slat is discussed. The main experimental techniques are described and the importance of the large body of data obtained during a major U.K. research programme the 'National High Lift Programme' is assessed. Some interesting results from this programme are quoted including the effect of supercritical section profiles on high lift performance. (Author)

A81-11643 **High-lift investigations on some small aspect ratio wings.** H. Körner (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Entwurfs-Aerodynamik, Braunschweig, West Germany). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 501-512. 19 refs.

An experimental investigation of the flow on some unconventional small aspect ratio wings at high angle of attack is given. The investigation comprises force and flow field measurements as well as flow visualization by oil-flow, wool tuft in the wake and smoke injections on backward and forward swept and hybrid wings. The study shows that a stable flow behavior can be generated for a number of different planforms. For these cases aerodynamic coefficients $C(L)$, $C(D)$, and $C(M)$ are presented. The flow visualization gives a deeper insight into the phenomenology of the flow. (Author)

A81-11644 **Optimizing the fixed leading edge shape of a transonic wing to suit the landing high-lift requirements.** M. Ingelman-Sundberg and L.-E. Eriksson (Flygtekniska Forsöksanstalten, Bromma, Sweden). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York,

American Institute of Aeronautics and Astronautics, Inc., 1980, p. 513-521. 6 refs. Research supported by the Forsvarets Materielverk.

The paper reports the results of low-speed tests conducted as part of a larger program to optimize a transonic aircraft wing for three flight phases: transonic cruise at $M = 0.85$, maneuvering at $M = 0.5$, and landing. The low-speed part of the program was limited to droop variations for the leading edge of a basic wing with planform, thickness, and twist distribution determined by transonic considerations, the objective was to find out if it could be possible to avoid movable leading edge flaps. The requirement for sufficient Reynolds numbers in tests of this kind is emphasized. V.L.

A81-11645 Winglets development at Israel Aircraft Industries. I. Darel, Y. Eliraz, and Y. Barnett (Israel Aircraft Industries, Ltd., Lod, Israel). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 522-529.

The first wind tunnel tests for the development of winglets at IAI were conducted on the ARAVA STOL transport aircraft in late 1974. On this aircraft the aim of the design was to improve the take off weight limitations with one engine inoperative, without compromising cruise performance. The flight tests confirmed the wind tunnel results at the design point and a substantial increase in the permissible take off weight was achieved. The overall cruise performance was improved as well. Following the successful winglet development on the ARAVA, a new program was started in 1978 on the IAI Westwind business jet. This design was special in that the winglets were installed on wing tip tanks. The design aim for the Westwind was greater fuel efficiency, and take off weight limitations gains were a secondary objective. As a result, a new Westwind 2 was tested and received certification, with greater fuel efficiency. This paper presents details of winglet geometry, wind tunnel and flight tests and performance improvements due to installation of winglets. (Author)

A81-11646 * Optimum subsonic, high-angle-of-attack nacelles. R. W. Luidens, N. O. Stockman, and J. H. Diedrich (NASA, Lewis Research Center, Cleveland, Ohio). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 530-541. 16 refs.

Many proposed advanced aircraft - but especially tilt-nacelle, subsonic-cruise, V/STOL aircraft - require nacelles that operate over a wide range of aerodynamic conditions. The optimum design of such nacelles and their inlets is described, including how the inlet low-speed design conditions are selected, the conditions for which the various regions of the inlet are designed, and appropriate criteria of merit. For low-speed operation the optimum internal surface velocity distributions and skin friction distributions are described for three categories of inlets: those without boundary-layer control (BLC), those with BLC, and those with blow-in door slots and retractable slats. Experimental results are presented that show the performance of the various types of inlets. At cruise speed the effect of factors that reduce the nacelle external surface area and the local skin friction is illustrated. These factors are cruise Mach number, inlet throat size, fan-face Mach number, and nacelle contour. The interrelation of these cruise-speed factors with the design requirements for good low-speed performance is discussed. Finally an inlet design without BLC and an optimized inlet design with slots and slats are compared to illustrate the possible reductions in nacelle size. (Author)

A81-11647 Vortex drag reduction by aft-mounted diffusing vanes. J. E. Hackett (Lockheed-Georgia Co., Marietta, Ga.). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 542-553. 22 refs.

A systematic experimental program is described which has led to a patented vortex diffuser device for drag reduction. This consists of a winglet-like vane mounted from a boom which trails a wing tip. Under $C(L)$ -limited conditions on the vanes, it is claimed that the use of an aft location yields greater drag reduction per square foot of vane area and larger-span vanes may be used effectively. There is little interference with the wing tip and adverse effects, such as loss of aileron power after winglet stall, are avoided. It is pointed out that a strong coupling exists between induced drag and wing root bending for near-planar wings. This coupling can be reduced significantly by employing nonplanar tips and design flexibility benefits. (Author)

A81-11648 * Leading-edge 'Vortex Flaps' for enhanced subsonic aerodynamics of slender wings. D. M. Rao (Vigyan Research Associates, Inc., Hampton, Va.). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 554-562. NASA-supported research.

The 'Vortex Flap' is a novel concept aimed at reducing the lift-dependent drag due to leading-edge flow separation on highly swept, slender wings at high angles of attack. The suction effect of coiled vortices generated via controlled separation over leading-edge flap surfaces is utilized to produce an aerodynamic thrust component. This principle was verified through wind-tunnel experiments on 74-deg and 60-deg delta wings and a supersonic-cruise slender wing aircraft configuration. Adaptation of the vortex-flap for augmentation of roll-control on the 74-deg delta at high angles of attack also was demonstrated. Selected results are presented in this paper to indicate the potential of the vortex flap concept to enhance the low-speed performance, stability and control of slender wing aircraft. (Author)

A81-11649 An experimental investigation of the interaction between a glancing shock wave and a turbulent boundary layer. H. Kubota and J. L. Stollery (Cranfield Institute of Technology, Cranfield, Beds., England). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 563-574. 14 refs. USAF-supported research.

A variable incidence wedge, mounted from the side of a supersonic tunnel, has been used to study 3-D glancing interaction. A wedge-generated oblique shock-wave interacts with the thick turbulent boundary layer growing along the tunnel side wall. Two related test programs have been completed using a 6 x 6 cm intermittent tunnel and a 23 x 23 cm continuous tunnel, both operating at a Mach number of approximately 2.5. The experimental results include oil-flow pictures, vapor-screen and smoke photographs, surface pressure distributions, local heat transfer, liquid crystal pictures of surface temperature and viscous layer surveys. The test data show that the interaction is complex, with an induced layer which originates near the root of the wedge, spreading and crossing the path of the side wall boundary layer. Separation is defined by the appearance of a complete convergence line in the surface-oil-flow pictures. No separation occurs as long as the surface stream lines are pliable enough to be bent along the edge of the induced layer, even when the surface flow deflection exceeds the shock angle. However, separation does take place when the induced layer forces the surface stream lines to deflect beyond a maximum permissible angle. A correlation of incipient separation data is given. (Author)

A81-11650 Weight optimization of wing structures according to the gradient method. D. W. Mathias, H. Röhrle, and J. Artmann (Dornier GmbH, Friedrichshafen, West Germany). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 575-582. Research supported by the Bundesministerium der Verteidigung.

For the design of wing structures with optimal weight the gradient method is applied due to the different constraints (stresses,

flutter speed). The theory and the computer program are described. As an example, an idealized wing consisting of bending/torsion bar elements is presented for which the stresses as well as the flutter speed are active restrictions. (Author)

A81-11651 **Structural optimization of advanced aircraft structures.** G. Schneider, H. Gödel, and O. Sensburg (Messerschmitt-Bölkow-Blohm GmbH, Munich, West Germany). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 583-595. 13 refs.

The application of a structure optimization program is demonstrated for several design studies, including a simplified structure to show the capabilities of the system, aeroelastic efficiency calculations for fin and rudder, and structural layout of a carbon fiber composite delta wing. The program merges several disciplines, such as static loads, stress and strain calculations by finite elements, unsteady aerodynamics, flutter calculations, static aeroelastics, and weights, which can be used separately and independently. V.L.

A81-11652 **Application of weldbonding to A-10 production aircraft.** A. Shames, R. Rupp, and J. Clarke (Fairchild Republic Co., Farmingdale, N.Y.). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 596-603. 5 refs.

The Al weldbonding process combines techniques of adhesive bonding and resistance welding for the production nacelle cowls, beaded panels, flaps, and fins in A-10 aircraft. The manufacturing method consisting of phosphoric acid anodizing, application of the weldbond adhesive, and microprocessor controlled resistance welding are described; after welding, the components are cured at 121 C for 3 hrs. 7075 and 2024 aluminum alloys were bonded and tested in an environmental chamber simulating ambient and altitude conditions at 35,000 ft; in addition, X-ray and Fokker-bond testers were used to detect delamination, lap-shear tests measured the shear strengths, and static and spectrum fatigue analyses were performed. A.T.

A81-11653 **Development of the A300 fin in modern composite fibre construction.** D. Schulz (Messerschmitt-Bölkow-Blohm, GmbH, Hamburg, West Germany). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 604-618.

On the basis of a research program sponsored by the German government development was started on the Airbus fin box in fiber-reinforced plastics in 1978. In 1984 one fin shall be certificated for airworthiness and be tested in airline service. In this paper, program and design aims are set up. Main results achieved during the first development phases are reported. Environmental conditions to be considered permit the use of 120 C-resin systems. As the result of analytical and experimental investigations with respect to weight, production costs, maintenance and reliability, a structure was chosen which is primarily reinforced by open-section stringers. By using a low-cost production concept the increased composite material cost can be offset. (Author)

A81-11654 **Nondestructive evaluation of composite structures (Contrôle non destructif des pièces en matériaux composites).** M. Tréca and J. Odorico (Société Nationale Industrielle Aérospatiale, Laboratoire Central, Suresnes, Hauts-de-Seine, France). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 619-625. In French.

Methods for evaluating carbon fiber composite structures are reviewed including both industrial and research methods. Considera-

tion is given to transmission-ultrasonic testing (e.g., C-Scan), reflection-ultrasonic testing, the eddy current technique, radiography, and holography. The evaluation method which works best for each type of structure, such as sandwich structures with a Nomex honeycomb core and carbon cladding, or adhesive bonded metal joints is examined. A.C.W.

A81-11655 **Holographic non-destructive testing of materials using pulsed lasers.** H. Fagot, F. Albe, P. Smigielski (Institut Franco-Allemand de Recherches, Saint-Louis, Haut-Rhin, France), and J. L. Arnaud (Société Nationale Industrielle Aérospatiale, Laboratoire Central, Suresnes, Hauts-de-Seine, France). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 626-633. Research supported by the Direction des Recherches, Etudes et Techniques.

The results of in situ and laboratory nondestructive testing experiments are reported in which double exposure holography with two pulsed ruby lasers is used to detect various defects in aircraft structures. It is shown that the method is particularly suitable for detecting defective bonding during maintenance or fabrication and for detecting cracks during fatigue testing. V.L.

A81-11656 **Structural flight load testing, calibration and analysis.** E. Rauscher (Vereinigte Flugtechnische Werke-Fokker GmbH, Bremen, West Germany). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 634-644. 11 refs.

In this paper structural flight load testing is reported. The calibration procedure including strain gauge bridge selection to obtain flight loads is described. There are several evaluation methods for short and long flight periods to check design loads for static and fatigue criteria. The maximum likelihood method is used to investigate aerodynamic coefficients. Counting procedures are used for statistical purposes. (Author)

A81-11657 **Flight simulation environmental fatigue crack propagation in 2024-T3 and 7475-T761 aluminium.** R. J. H. Wanhill (Nationaal Lucht- en Ruimtevaartlaboratorium, Amsterdam, Netherlands). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 645-651. 26 refs.

Flight simulation fatigue crack propagation tests on 2024-T3 and 7475-T761 aluminum alloy sheet were carried out using a gust spectrum representative of the load history of an under wing skin in a transport aircraft. The investigation included tests at several design stress levels and in environments of laboratory air and air plus water spray. The results are discussed with respect to the choice of structural concepts using 7475 alloy and evaluation of the fatigue properties of such concepts. (Author)

A81-11659 **A practical method for predicting flight-by-flight crack growth in fighter type aircraft for damage tolerance assessment.** M. Levy, A. S. Kuo, and K. P. Grube (Fairchild Republic Co., Farmingdale, N.Y.). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 666-675. 23 refs.

It has been experimentally observed that the flight-by-flight crack growth rate, da/dF , under fighter type spectra, can be uniquely related to the stress intensity factor per unit stress, α , for various forms of 2024-T3 type aluminum alloys. The crack growth analysis method based on this observation is shown to be more effective in terms of accuracy and computer time than the standard cycle-by-cycle integration method. This experimental approach was extended

to include spectrum variation, stress level differences, various initial flaw and geometry configuration, and load transfer effects. In selected cases, the technique of developing experimental crack growth curves derived directly from fractographic analysis of specimens tested with periodic marker sequence loadings is discussed. The expansion of the da/dF vs. α method is shown as a useful and viable tool in performing the fatigue crack growth analyses in support of the A-10A damage tolerance reassessment task. (Author)

A81-11662 **Operational durability of airframe structures.**

R. J. Schliekelmann (Fokker-VFW, Schiphol, Netherlands). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings.

New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 702-712. 19 refs.

The concept of the durability of airframe structures and methods of design for durability are discussed together with the relationship between the operational economy of an aircraft and the structural characteristics of the airframe. It is shown that sufficient resistance of airframe structures to working loads and environmental factors can be achieved only by a systematic approach which includes the following phases: definition of structural concepts, selection of primary structural materials and means of their protection against environmental effects, definition of joining methods, and integration. V.L.

A81-11665 **Investigation of the stalling characteristics of a general aviation aircraft.**

R. F. Stengel and W. B. Nixon (Princeton University, Princeton, N.J.). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 729-743. 32 refs. Research supported by the Schultz Foundation.

Analytical and numerical estimates of the stalling characteristics of a small, single-engine aircraft are compared with flight test results. Analyses include nonlinear simulation and linear stability-and-control evaluation using aerodynamic and thrust characteristics obtained from a full-scale test in the NASA Langley Research Center 30 x 60 ft Wind Tunnel as well as subscale model test data. Flight tests include prestall calibration runs, symmetric gradual stalls, and mildly accelerated stalls in the vertical plane. These tests tend to confirm predictions based upon wind tunnel results, and they indicate areas in which special care must be taken in collecting data for aerodynamic parameter identification. (Author)

A81-11666 **Procedures to improve flight safety in wind shear conditions.**

R. König and P. Krauspe (Braunschweig, Technische Universität, Braunschweig, West Germany). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings.

New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 744-757. 14 refs. Research supported by the Deutsche Forschungsgemeinschaft.

Wind shear on take-off and landing may crucially restrict flight safety. After a short description of the meteorological weather phenomena most closely associated with wind shear, reasons are given for the existing hazards to aircraft operations with the use of conventional cockpit instruments. Different methods to compensate for wind shear effects are evaluated (open loop wind shear elimination/total energy display/management of specific energy rate) including today's state of the art as well as an outlook on future instrumentation corresponding to the problem and a comment on groundbased wind shear warning systems. (Author)

A81-11667 **Aircraft performance optimization by forced singular perturbation.**

J. Shinar (Technion - Israel Institute of Technology, Haifa, Israel) and A. Merari. In: International Council of

the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 758-772. 35 refs.

Forced singular perturbation technique (FSPT), based on artificial insertion of a 'small' parameter into the equations of motion, has been used to generate approximate feedback solutions in several aircraft performance optimization problems. This approach has some inherent limitations, not being exposed in previous works. The paper presents and discusses such limitations revealed by a recent investigation. In spite of the restrictions FSPT provides an attractive methodology for a large class of properly formulated problems. This potential is demonstrated by two examples of air combat performance optimization. (Author)

A81-11668 **Optimal flight vehicle design and linear vector spaces.**

S. M. Ramachandra (Alfateh University, Tripoli, Libya). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings.

New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 773-777. 12 refs.

A linear vector space approach to the design and optimization of flight vehicles is presented. The design space can be explored to obtain the best performance with the current or anticipated technology, and to obtain performance approaching customer desired specifications. The sensitivity coefficient is defined for perturbations in the design vector. Parameter uncertainties, especially at the beginning of the design process, are handled with probability measures or through membership functions of the theory of fuzzy sets. The flight vehicle design of civil and multiple-role military aircraft is considered. R.C.

A81-11669 **Three years of operation of the ONERA pressurized subsonic wind tunnel.**

J.-M. Carrara and A. Masson (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings.

New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 778-792. 5 refs. (ONERA, TP no. 1980-129)

Three years after the entry into service of the pressurized subsonic wind tunnel F1 of ONERA at Le Fauga-Mauzac a first survey of its utilization was presented. After a brief description of the wind tunnel and its instrumentation, the paper describes aerodynamic characteristics and performance of the tunnel. The testing devices of the wind tunnel and some original testing techniques are presented. The variety of the tests performed is illustrated by typical examples. A comparison with flight results of those obtained on a model of Mercure makes it possible to globally validate the quality of the wind tunnel. (Author)

A81-11670 **DFVLR-dynamic model testing in wind tunnels for active controls research.**

K. Wilhelm and B. Gmelin (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Flugmechanik, Braunschweig, West Germany). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings.

New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 793-807. 39 refs.

Application of the concepts of Active Control Technology to the design of aircraft is discussed with reference to two wind tunnel facilities for dynamic model testing: (1) Installation for Dynamic Simulation in Wind Tunnels for investigations in the field of fixed-wing aircraft, and (2) Rotor Test Stand for investigations in the field of rotary-wing aircraft. Problems of transferability of measurement data from model to full-scale aircraft are discussed and test results are presented. V.L.

A81-11671 **Adaptable wind tunnel walls for 2D and 3D model tests.**

U. Ganzer (Berlin, Technische Universität, Berlin, West Germany). In: International Council of the Aeronautical Sciences,

Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 808-816. 13 refs. Research supported by the Bundesministerium für Forschung und Technologie and Deutsche Forschungsgemeinschaft.

Two-dimensional model tests were made in a test section with flexible top and bottom wall. A conventional NACA 0012 aerofoil and a supercritical CAST 7 aerofoil were used with a tunnel height to chord ratio of 1.5. It was shown that wall interference effects can be reduced by wall shaping and that transonic blockage can be avoided. The same test section was used for 3-component force-measurement of a simple swept-wing-body-combination to demonstrate convergence of the adaption process for 3D model tests. (Author)

A81-11672 * A system for model access in tunnels with an unbreathable test medium. R. R. Howel and S. D. Joplin (NASA, Langley Research Center, Hampton, Va.). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 817-822. 7 refs.

In many specialty wind tunnels, test gases other than ambient air are used to meet special testing requirements. A typical example is the use of freon as the test gas to achieve a realistic density ratio between gas and model for exploring flutter stability boundaries. Another example is the use of pressurized air to elevate the stream density and enhance Reynolds number or dynamic pressure simulation. Such specialty tunnels require a system of access to the model which will allow services and changes to the model without exposing personnel to the unnatural and perhaps hostile environment or requiring the venting and purging of the entire tunnel circuit. This paper will describe the plenum and model access systems for the forthcoming U.S. National Transonic facility where gaseous nitrogen (N₂) at temperatures between 338 and 78 K and at pressures to 9 bars is used as the test medium. The operation at cold temperatures imposes some additional requirements which make the access systems more difficult to design and time consuming to operate than for conventional wind tunnels. (Author)

A81-11673 Wind tunnel wall interference in a test section with ventilated walls. H. Sawada (National Aerospace Laboratory, Tokyo, Japan). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 823-836. 18 refs.

An approach to the ventilated wind tunnel wall interference problem is proposed in which velocity components of flow near the walls inside a test section are used as boundary conditions for solving a boundary value problem of the flow field. The wall interference on a wing model installed in a test section is estimated, since various quantities related to wall interference can be estimated with sufficient accuracy if only transversal lower harmonics of the streamwise distributions are available. The effect of suction from the side walls in a two-dimensional wind tunnel is investigated in detail. The proposed method for calculating blockage and lift interference corrections is applied to a two-dimensional test section configuration of a 2m x 2m transonic wind tunnel. The blockage factor ratio and lift interference parameters are shown to be dependent upon the lift coefficient but not significantly sensitive to either uniform Mach numbers between 0.6 and 0.8, or to the difference in the tested airfoil sections. Therefore, it becomes possible by the use of these characteristics to make corrections without measuring the pressure distributions near the walls each time. A.C.W.

A81-11674 Ground testing of aircraft antistatic protection. J. Taillet (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980,

Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 837-846. 14 refs. (ONERA, TP no. 1980-126)

The phenomena of electrostatic charging of aircraft and the consequent problem of interference with navigation and communication systems are considered in view of the development of a standard ground testing procedure for eliminating static charging hazards. It is proposed that a standard procedure for testing aircraft charging phenomena and various protections, in the laboratory, in the factory, and on the field can be realized by efficient and economical ground test simulations. The test method includes the verification of bonding between metallic surfaces, surface resistance measurements, the simulation of tribo-electric charging, and the verification of minimal coupling between dischargers and antennas. The application of the procedure can be achieved with the use of specific instruments which have been designed and implemented at ONERA, and marketed in France. The performance and application of a bonding verification device as well as an instrument which injects charged particles for the simulation are discussed in conjunction with the proposed test procedure. A.C.W.

A81-11675 Wind shear detection from PCM-recorded MLS-flight data. P. Vörsmann and M. Swolinsky (Braunschweig, Technische Universität, Braunschweig, West Germany). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings.

New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 847-855. 9 refs. Research supported by the Deutsche Forschungsgemeinschaft.

During the test phase of the SETAC microwave landing system, flight tests were performed for wind determination along the flight path. Approach profiles were curved in elevation and azimuth. All flight parameters were recorded on board in digital form by a PCM-flight data acquisition system. The evaluation of the recorded flight data on a digital computer showed that some signals contained disturbances resulting from sensor dynamics or digital noise due to numerical differentiation. Nonrecursive digital filters were applied to eliminate undesired signal properties. The longitudinal wind component and its power spectrum were computed. Wind shear was detected by the off-line use of nonrecursive digital filters as well. (Author)

A81-11676 ECS integration for fuel efficient/low life cycle cost design. V. K. Rajpaul (Boeing Military Airplane Co., Seattle, Wash.). In: International Council of the Aeronautical Sciences, Congress, 12th, Munich, West Germany, October 12-17, 1980, Proceedings. New York, American Institute of Aeronautics and Astronautics, Inc., 1980, p. 856-861.

Current technology environmental control systems (ECS) in aircraft suffer from deficiencies in two major respects: (1) the fuel penalty for engine bleed air extraction and ram air drag is high, and (2) lack of adequate system temperature and moisture controls result in excessively high avionics equipment failure rates, thereby adversely affecting life cycle costs. Studies conducted in development of energy efficient, low life cycle cost ECS are discussed with a tactical mission aircraft used for illustrating problems, new concepts and payoffs. Concepts which significantly reduce fuel consumption, thrust and drag penalties to an aircraft are related to reliability of interfacing systems, in particular the avionics. Relationship to life cycle cost of ECS/avionics systems is discussed. (Author)

A81-11722 The vibration of a multi-bearing rotor. J. L. Nikolajsen and R. Holmes (Sussex, University, Brighton, England). *Journal of Sound and Vibration*, vol. 72, Oct. 8, 1980, p. 343-350. Research supported by the Science Research Council and Ministry of Defence (Procurement Executive).

A numerical method based on the use of influence coefficients is described for the free and forced vibration analysis of a general rotor/bearing system. The method is found to combine the numerical speed of the transfer matrix method with the accuracy and versatility of the finite element method. The paper describes the prediction of

A81-11723

the vibration performance of a four-bearing rotor with which experimental results compare satisfactorily. (Author)

A81-11723 Some thoughts on the effects of flight on jet noise as observed in actual flight and in wind tunnels. R. G. Hoch (SNECMA, Centre d'Essais de Villaroche, Moissy-Cramayel, Seine-et-Marne, France). *Journal of Sound and Vibration*, vol. 72, Oct. 8, 1980, p. 379-389. 17 refs.

Evidence on differences between flight effects on jet noise as observed in flight tests and in tests with model jets in anechoic wind tunnels is briefly reviewed and discussed. The effects on noise of single stream jets is distinguished from those on noise of coaxial jets. A way of explaining the differences, both between model and engine jets and single stream and coaxial jets is proposed, which involves ideas drawn from Ribner's self-noise/shear-noise model, recent results on noise amplification of excited jets, and new lines of research.

A81-11724 Experiments on effective source locations and velocity dependence of the broad band noise from a rotating rod. U. R. Kristiansen (Trondheim, Universitetet, Trondheim, Norway). *Journal of Sound and Vibration*, vol. 72, Oct. 8, 1980, p. 403-413. 7 refs.

Effective acoustic source positions (observed from the far field) have been located for the broad band noise from a cylindrical rod rotated about its mid-point by measuring the cross spectral density function of two microphone signals on the axis of rotation. Local source position Strouhal numbers could thereby be calculated. On the basis of acoustic power measurements it was demonstrated that the noise may be normalized on a rod tip Strouhal number basis, and that the velocity exponent is nearly constant when plotted against this parameter. The results indicate that vortex shedding like that for stationary cylinders in a cross flow (occurring along the outer 1/3 of the rod for a rotational speed of 1000 rpm) is responsible for the high levels of broad band noise in a major peak region. Sources influenced by harmonics of the rod passing frequency were found for frequencies lower than the vortex shedding ones. At higher frequencies broad band noise was found to be emitted from the rod tip area.

A81-11751 Hydrogen - Its technology and implications. Volume 4 - Utilization of hydrogen. Edited by K. E. Cox and K. D. Williamson, Jr. (California, University, Los Alamos, N. Mex.). Boca Raton, Fla., CRC Press, Inc., 1979. 252 p. \$59.95.

This compilation focused on hydrogen fueled surface transportation, hydrogen-fueled aircraft, domestic uses of hydrogen, industrial applications, and safety in the handling of H. The volume includes numerous references on H properties, materials of construction for its containment, and the design of H equipment; physical properties of H and its compounds are tabulated.

A81-11753 Hydrogen-fueled aircraft. G. D. Brewer (Lockheed-California Co., Burbank, Calif.). In: Hydrogen: Its technology and implications. Volume 4. Boca Raton, Fla., CRC Press, Inc., 1979, p. 79-148. 27 refs.

A review is presented of applications of hydrogen in aircraft and aerospace. The costs of LH₂ as fuel in commercial transport aircraft are outweighed by the low energy requirements of LH₂ powered vehicles in performing long range missions; a H powered SST can save more than 25% of fuel at speeds of Mach 2.7. The NASA flight research program and the CL-400 aircraft project are described along with turbojet engine development and hypersonic aircraft studies. Transport aircraft designs including supersonic transport fuels system, engine characteristics, environmental factors, and aircraft performance are discussed.

A81-11777 Simplified vortex models for slender lifting surfaces with leading edge separation (Vereinfachte Wirbelmodelle für schlanke Tragflächen mit Vorderkantenablösung). B. Wagner (Dornier GmbH, Friedrichshafen, West Germany). *Zeitschrift für Flugwissenschaften und Weltraumforschung*, vol. 4, Sept-Oct. 1980, p. 267-279. 16 refs. In German. Bundesministerium für Verteidigung Contract No. T/RF-41/80030/81429.

Flat free vortex sheets are introduced near the edges beside the vortex cores above the wing. The flowfield is assumed to be conical and flow is permitted through the free sheets. Instead of applying the usual boundary conditions on free vortex sheets an attempt is made to fulfill the suction analogy by prescribing normal force coefficients and taking account of the condition that the whole free vortex system should be force-free. This procedure leads to satisfactory results for the pressure distributions with small total vortex strength within the free vortex sheets, but for small angle of attack the normal forces according to Smith's method have to be used instead of those according to leading edge suction analogy.

A81-11778 Calibration of the high speed wind tunnel TVM 150 in the supersonic range (Eichung des Hochgeschwindigkeitswindkanals TVM 150 im Überschallbereich). W. Weinert (Darmstadt, Technische Hochschule, Darmstadt, West Germany). *Zeitschrift für Flugwissenschaften und Weltraumforschung*, vol. 4, Sept.-Oct. 1980, p. 280-289. 20 refs. In German.

The Laval nozzle calibration and its flow quality in the test-section of the high speed wind tunnel TVM 150 at the Aeronautical Institute of the Technical University Darmstadt are presented. Investigations of Mach number and flow-angle distributions at supersonic Mach numbers were carried out with conventional pitot rakes and a combined calibration rake for measuring flow angularity. The relative maximum Mach number error increases with a decreasing Mach number and increasing radius of nozzle range. While the flow-angle of attack is directed with increasing distance from the tunnel axis against the top and bottom wall, the flow in the plane of the sideslip angle is directed against the nozzle axis. Both flow-angle errors show the same Mach number dependent tendency within the 0.1-degree-range. Along the tunnel axis there are no mentioned deviations in the test rhombus.

A81-11779 Calculation of plane transonic flows using the integral equation method and shock fitting (Berechnung ebener transsonischer Strömungen nach der Integralgleichungsmethode mit Stossanpassung). R. Voss (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Aeroelastik, Göttingen, West Germany). *Zeitschrift für Flugwissenschaften und Weltraumforschung*, vol. 4, Sept.-Oct. 1980, p. 289-295. 23 refs. In German. Research supported by the Deutsche Forschungsgemeinschaft.

The present work uses the integral equation method to compute approximately two dimensional steady transonic flows with shocks around airfoils at freestream Mach numbers less than 1. Potential flow and small disturbances are assumed. In contrast to other methods, integrals over the pressure jump along the shocks are explicitly calculated during the iterative solution of the integral equation. Shocks are fitted to the flow field at each iteration step. Shock position and shock strength are calculated by combining the normal shock conditions and the condition that shock induced profile drag and drag from entropy rise across the shock are equal.

A81-11780 Local properties of three-dimensional separation lines. E. H. Hirschel (Messerschmitt-Bölkow-Blohm, GmbH, Munich, West Germany) and W. Kordulla (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Theoretische Strömungsmechanik, Göttingen, West Germany). (*Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über Strömungen mit Ablösung, Munich, West Germany, Sept. 19, 20, 1979, Paper 79-063.*) *Zeitschrift für Flugwissenschaften und Weltraumforschung*, vol. 4, Sept.-Oct. 1980, p. 295-307. 23 refs.

Series expansions are used to examine the local properties of flow in the vicinity of steady vortex-layer separation lines. The absolute value for the tau-minimum line and the line of points of inflection are assumed to be close to the separation line. Experimental and computed boundary layers on ellipsoids and wings yield a separation criterion for three dimensional shear flow. The distribution of shear stress components in chordwise direction on a swept tapered wing is discussed along with the compressible turbulent boundary layer on a swept tapered wing with a break in the trailing edge.

A81-11782 Initial experience with methods to evaluate flight test characteristics with operational flight maneuvers (Erste Erfahrungen mit Methoden zur Bewertung von Flugeigenschaften im Flugversuch mit operationellen Flugmanövern). E. Buchacker (Bundesamt für Wehrtechnik und Beschaffung, Manching, West Germany). *Zeitschrift für Flugwissenschaften und Weltraumforschung*, vol. 4, Sept.-Oct. 1980, p. 318-321. 9 refs. In German.

A method for evaluating flight test characteristics is presented that utilizes operational maneuvers to obtain quantitative and qualitative statements. Frequency and systems analysis are used as quantitative methods, including power density spectra of control column movement and of aircraft normal acceleration. Bode diagrams of the transfer function between normal acceleration and control column movement are also presented. Clear and repeatable qualitative analyses require that test exercises are well-defined by the test engineer and reviewed with the pilot prior to flight. R.C.

A81-11797 New BBC high-efficiency gas turbines (Neue BBC-Gasturbinen grosser Leistung). E.-O. Müller and F. Pötz. *Energiewirtschaftliche Tagesfragen*, vol. 30, Oct. 1980, p. 775-781. In German.

BBC has designed and built more than 450 single-shaft gas turbines of various types and has developed a program for further developing and improving compressors, combustion chambers, and turbines. The present paper deals with two latest developments - the 13E gas turbine and Turbine-17, of 120 MW and 210 MW, respectively, and an efficiency of 0.32 and inlet temperature of 1000 C, each. A distinctive feature of these turbines is the ability to operate with low quality fuels, such as crude oils and lean gases. V.P.

A81-11818 Noise control design problems on air cushion vehicles and surface effect ships. M. E. Dvornak (Bell Aerospace Textron, New Orleans, La.). *Noise Control Engineering*, vol. 14, Jan.-Feb. 1980, p. 12-23. 13 refs.

The acoustic design features, noise criteria, noise source-path-receiver interdependencies, and design approaches to noise control in surface effect ships are reviewed. Specific noise control design approaches include low-frequency soft mounts, gas turbine/lift fan silencers, air propeller shrouds and special propeller designs, acoustic transmission loss and absorptive materials, and grouping of noise sources and compartment relocation. V.L.

A81-11820 Prediction of changes in aircraft noise exposure. D. K. Holger (Iowa State University of Science and Technology, Ames, Iowa). *Noise Control Engineering*, vol. 14, May-June 1980, p. 119-126. 10 refs. Grant No. AF-AFOSR-77-3308.

The NOISEMAP computer program of the United States Air Force for generating contours of noise exposure measured by the day-night equivalent sound level (DNL) is briefly discussed. A method is proposed for approximate manual calculation of changes in contours resulting from changes in operational data. The method is limited to cases in which the general shape of the DNL contours at a base does not change. For cases involving significant changes in flight paths or aircraft types, a full-scale base resimulation is recommended. V.L.

A81-11821 Community response to noise from a general aviation airport. S. E. Birnie, F. L. Hall, and S. M. Taylor (McMaster University, Hamilton, Ontario, Canada). *Noise Control Engineering*, vol. 15, July-Aug. 1980, p. 37-45. 6 refs.

The paper provides relationships between noise level and response variables through an analysis of social survey and physical data collected around a small general aviation airport. The responses investigated included annoyance, activity interference, health effects, and non-noise effects of general aviation traffic, such as fear of crashes, air pollution, aircraft lights, house vibration, and television interference. Results indicate a much higher response than that predicted by Schultz (1978), e.g., at 30 NEF, Schultz predicts approximately 15% highly annoyed, compared with 28% in this study. V.L.

A81-11822 * Status of knowledge of sonic booms. D. J. Maglieri, H. W. Carlson, and H. H. Hubbard (NASA, Langley Research Center, Hampton, Va.). *Noise Control Engineering*, vol. 15, Sept.-Oct. 1980, p. 57-64. 137 refs.

The effects of primary and secondary sonic boom carpets are reviewed with reference to waveform characteristics and audibility, role of the atmosphere, source characteristics, carpet measurements and predictions, effects of aircraft maneuvers, and sonic boom minimization. It is shown that primary booms which involve only propagation in the lower atmosphere are well predicted by means of current methods and are amendable to minimization. V.L.

A81-11900 # Civil aviation safety. III - Prospects of improvement. W. Tye. *Aircraft Engineering*, vol. 52, Oct. 1980, p. 2-4.

The constraints on the improvement of aircraft safety levels are of two kinds, technological capability and cost. Both are temporary and tend to limit the rate at which safety improves rather than to set any barrier. It is noted that the greatest good comes from applying safety efforts to newer aircraft or to aircraft in the design stage, as they will carry a increasing proportion of the traffic. B.J.

A81-11920 # Calculation of separated viscous flows on wing profiles by a coupling approach (Calcul d'écoulements visqueux décollés sur profils d'ailes par une approche de couplage). J. C. Le Balleur and M. Neron (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). (NATO, AGARD, Symposium on Computation of Viscous-Inviscid Interactions, Colorado Springs, Colo., Sept. 29-Oct. 1, 1980.) ONERA, TP no. 1980-122, 1980. 16 p. 18 refs. In French. Research supported by the Direction des Recherches, Etudes et Techniques.

The computation of viscous incompressible flows over single or multiple airfoils, with or without separation, is achieved using on the one hand an inviscid flow calculation, with modified boundary conditions, and on the other hand a method providing calculation and coupling for boundary layers and wakes, within conditions of strong viscous interaction. The inviscid flow is calculated with a method of singularities, the numerics of which has been improved by using both source and vortex distributions over profiles, associated with regularity conditions for the fictitious flows inside of the airfoils. The viscous calculation estimates the difference between viscous flow and inviscid interacting flow with a direct or inverse integral method, laminar or turbulent, with or without reverse flow. The numerical method for coupling determines iteratively the boundary conditions for the inviscid flow. For attached viscous layer regions an underrelaxation is locally calculated to insure stability. For separated or separating regions, a special semi-inverse algorithm is used. Comparisons with experiments are presented. (Author)

A81-11956 # Finite element analysis of natural and forced flexural vibrations of rotor systems. Z. Dzygadło. *Journal of Technical Physics*, vol. 21, no. 1, 1980, p. 63-75. 15 refs.

The finite element technique is applied to analyze flexural vibrations, critical speeds, and forced vibrations of rotors on flexible supports. The equations of dynamic equilibrium of a deformable rotor element are derived, and the influence of the shear forces, the rotation of the element and the gyroscopic moments are taken into account. Conditions relating the motion of a rigid element to a deformable one are determined. An algorithm is presented for a numerical analysis of vibration frequencies and modes, critical speeds and resonance characteristics. S.S.

A81-12024 # Gyrostabilizers for inertial control systems (Gyrostabilizatory inertial'nykh sistem upravleniia). L. A. Severov. Leningrad, Izdatel'stvo Leningradskogo Universiteta, 1979. 152 p. 80 refs. In Russian.

The book deals with gyrostabilizers for noncompensating inertial control systems of unmanned flight vehicles. Particular attention is given to the analysis and synthesis of the platform stabilization circuit and to the kinematic and dynamic description of

gyrostabilizers with various platform suspension systems and various gyroscope and stabilizing-engine arrangements. An analytical-design solution is obtained for optimal gyrostabilizer regulators. The possibility of using large amplification factors in the stabilizing circuit is analyzed both from the viewpoint of the structural stability conditions linear multivariate systems and from the viewpoint of the absolute stability conditions of systems with nonlinear elements.

A81-12078 A simple laser interferometer for wind tunnel flow visualisation. N. Pollock (Department of Defence, Aeronautical Research Laboratories, Melbourne, Australia). *Journal of Physics E - Scientific Instruments*, vol. 13, Oct. 1980, p. 1062-1066. 7 refs.

A simple interferometer design based on a conventional wind tunnel schlieren system is described. This new interferometer arrangement employs a laser light source, a lens which splits off the reference beam after test beam expansion and a lens and Lloyd mirror to recombine the two beams. The reference beam passes through the test section but is contracted to a narrow waist and displaced well away from the model location. The design combines a number of characteristics which render it particularly useful for wind tunnel tests. These characteristics include: simplicity, optical robustness, low vibration sensitivity, modest coherence requirements and ease of interferogram analysis. The main disadvantage is that only half the total field of view can be recorded on a single interferogram. Test results, confirming the above advantages, are presented from an interferometer based on the 406 mm aperture schlieren system fitted to the Aeronautical Research Laboratories transonic wind tunnel.

A81-12094 A method of helicopter low airspeed estimation based on measurement of control parameters. A. Faulkner and S. Attfellner (Messerschmitt-Bölkow-Blohm GmbH, Munich, West Germany). *European Rotorcraft and Powered Lift Aircraft Forum, 5th, Amsterdam, Netherlands, Sept. 4-7, 1979, Paper. 19 p.* (MBB-UD-276-79-0)

The pitot-static instrument fails as an indicator of airspeed at low helicopter flight speeds and hover. Airspeed and side-slip indicators would be welcome to the pilot in these modes of flight. In the present paper, an alternative indirect method of airspeed estimation is proposed which, based on measurement of control and some other control-system parameters, is particularly well suited for modern hingeless-rotor helicopters. A simplified mathematical model of the helicopter rotor is discussed. Analytical equations for the longitudinal and transverse aerodynamic velocity components are derived. Some results of a computer simulation are examined. V.P.

A81-12095 Model tests for an active rotor isolation system. R. Mehlhose, M. Obermayer ((Messerschmitt-Bölkow-Blohm GmbH, Munich, West Germany), and M. Degener (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Aeroelastik, Göttingen, West Germany). *European Rotorcraft and Powered Lift Aircraft Forum, 5th, Amsterdam, Netherlands, Sept. 4-7, 1979, Paper. 30 p.* 12 refs. (MBB-278-79-0)

The paper deals with an approach to the design of active vibration control, where the rotor/transmission system is isolated from the fuselage by special active isolation system with appropriate disturbance rejection controllers: airframe vibration control by notch insulator feedback of the transmitted isolator forces, and gearbox displacement control by integral feedback. In this concept, the isolator units are composed of electrohydraulic actuators and parallel springs for support of the fuselage and as fail safe devices. Tests showed that extremely high vibration reduction can be achieved with this concept. V.P.

A81-12096 Development of wind tunnel fan blade made of composite materials. P. Wackerle and H. Weiss (Messerschmitt-Bölkow-Blohm GmbH, Munich, West Germany). *European Rotor-*

craft and Powered Lift Aircraft Forum, 5th, Amsterdam, Netherlands, Sept. 4-7, 1979, Paper. 28 p. (MBB-UD-277-79-0)

The paper deals with the design, manufacture, and acceptance testing of carbon fiber composite fan blades for the German-Dutch wind tunnel. The design, based on well-proven methods used in aircraft and helicopter construction, involves a special blade attachment concept, precise anisotropic-stress and frequency analysis, and thermal computations. The overall static and dynamic behavior is verified by finite element calculations. Some aspects of the manufacturing process are examined. V.P.

A81-12097 Helicopter flight characteristics improvement through swept-tip rotor blades. H. Huber (Messerschmitt-Bölkow-Blohm GmbH, Munich, West Germany). *European Rotorcraft and Powered Lift Aircraft Forum, 5th, Amsterdam, Netherlands, Sept. 4-7, 1979, Paper. 24 p.* 13 refs. (MBB-UD-275-79-0)

The paper deals with a theoretical and experimental program aimed at designing, developing, and flight testing two versions of helicopter swept-tip rotor blade, and to verify the theoretically predicted improvements in aerodynamic performance, flight mechanics, and rotor load characteristics. The effect of tip design parameters was studied systematically, using various angles of tip sweep and various center of mass locations. Flight tests with the BO 105 hingeless-rotor helicopter at speeds of 300 km/h and corresponding advancing tip Mach number of 0.90 confirmed the expected potential of swept-tip design. V.P.

A81-12241 The accident/injury matrix - A tool for aircraft accident investigation. G. K. Brandon (USAF, School of Aerospace Medicine, Brooks AFB, Tex.). *Aviation, Space, and Environmental Medicine*, vol. 51, Oct. 1980, p. 1147-1149. 9 refs.

An accident/injury matrix developed for use in automobile accidents was modified for use in aviation. The matrix subdivides an accident into three temporal phases: preaccident, accident, and postaccident. Each temporal phase is then further divided into specific factors: human, environmental, aircraft, and life support equipment. This form of analysis will assist in determining the chain of events in an accident and serve as a logical tool for developing future preventive strategies. Use of the matrix is explained and examples are given for each cell produced by the subdivisions.

A81-12348 Airbus Industrie's heavenly twins - A310 and A300-600. M. Lambert. *Interavia*, vol. 35, Nov. 1980, p. 1001-1006.

In engineering terms, the A310 is to be a 200-seater, preserving the useful features of the A300, but introducing the latest technology in aerodynamics, materials, propulsion, and systems to achieve optimum fuel consumption and minimum operating costs. The A300 fuselage can be relatively simply shortened without losing the wide cabin and the good freight capacity. The brand new wing has sufficiently improved efficiency to justify itself, but has been further refined to produce the present A310 wing. The materials and systems improvements of the A310 are to be transferred back to the A300-600. V.P.

A81-12349 Computerized flight management for fuel saving. C. Bulloch. *Interavia*, vol. 35, Nov. 1980, p. 1010-1012.

The efficient flight of an aircraft involves meticulous balancing of weight (gravity), lift, thrust, and drag. All of these vary according to the density of the air, and in turn the density depends on the local conditions which may change significantly. With the advent of the ultra-compact airborne computer, it became possible to perform the power and indicated airspeed adjustments required by the local conditions and to regulate the thrust settings and the flight control surfaces to ensure the most efficient use of fuel. In the present paper, some representative computerized flight management systems are discussed. V.P.

A81-12350 Aerial survey photography. M. Grangier. *Interavia*, vol. 35, Nov. 1980, p. 1050-1054.

The development of aerial survey photography to its current state is reviewed. The discussion covers such aspects of this field as aircraft, their equipment, flight techniques, data collecting techniques (photographic emulsions, IR thermography, multispectral sensors, etc.), photogrammetric plotting, and orthophotomaps. The uses and perspectives of aerial photography are examined. V.P.

A81-12367 # An example of the transonic flow past a body with a discontinuity in the contour curvature (Primer tranzvukovogo obtekaniiia tela s razryvom krivizny kontura). V. A. Ivanov and I. A. Chernov. *Prikladnaia Matematika i Mekhanika*, vol. 44, Sept.-Oct. 1980, p. 950-952. 5 refs. In Russian.

The analysis deals with the exact solution of transonic equations, which constitutes a generalization of the well-known self-simulating solution describing the transonic flow past a convex corner. The lines of flow and the velocity field in the transonic flow past a convex corner are identified. V.P.

A81-12476 # The emulsion chamber experiment on supersonic Concorde /Echos/. J. N. Capdevielle (Bordeaux I, Université, Bordeaux, France), J. Iwai (Waseda University, Tokyo, Japan), T. Ogata, S. Toyoda (Tokyo, University, Tokyo, Japan), I. Ohta (Utsunomiya University, Utsunomiya, Japan), F. Fumuro (Kwansei Gakuin University, Nishinomiya, Japan), R. Ihara, Y. Takahashi, and T. Yanagita (Osaka University, Toyonaka, Japan). In: International Cosmic Ray Conference, 16th, Kyoto, Japan, August 6-18, 1979, Conference Papers. Volume 6. Tokyo, University of Tokyo, 1980, p. 324-329. 8 refs.

A supersonic flight experiment to observe the energy spectrum of cosmic-rays not less than TeV and nuclear interactions above 50 TeV has been carried out with an emulsion chamber. By the total integrated exposure of about 200 hours at 15 km - 17 km, more than 400 events (gamma-rays and nucleons) with energies exceeding 700 GeV are observed, in agreement with existing primary spectrum. A preliminary analysis of nuclear events with energies greater than 60 TeV is given. One of them showed high P(T) production with extraordinarily high densities in the forward rapidity space. The possibility of the second violation of scaling is briefly discussed. (Author)

A81-12608 # Optimum design of axial flow gas turbine stage. I - Formulation and analysis of optimization problem. II - Solution of the optimization problem and numerical results. S. S. Rao (Indian Institute of Technology, Kanpur, India) and R. S. Gupta (Punjab Engineering College, Chandigarh, India). *ASME, Transactions, Journal of Engineering for Power*, vol. 102, Oct. 1980, p. 782-797. 29 refs.

An attempt is made to optimize the efficiency and weight of an axial flow gas turbine stage by considering deflection, stress, and vibration aspects along with the aerodynamic requirements. The optimization problem, formulated as a nonlinear programming problem, is solved by using the interior penalty function method in which the Davidon-Fletcher-Powell variable metric unconstrained minimization technique with cubic interpolation method of one dimensional minimization is employed. Numerical solution of the problem is presented along with the results of sensitivity analysis conducted about the optimum point. V.L.

A81-12609 # Variable geometry, lean, premixed, prevaporized fuel combustor conceptual design study. A. J. Fiorentino, W. Greene, J. C. Kim (United Technologies Corp., Commercial Products Div., East Hartford, Conn.), and E. J. Mularz (U.S. Army, Propulsion Laboratory, Cleveland, Ohio). (*American Society of Mechanical Engineers, Gas Turbine Conference and Products Show, New Orleans, La., Mar. 10-13, 1980, Paper 80-GT-16.*) *ASME, Transactions, Journal of Engineering for Power*, vol. 102, Oct. 1980, p. 896-902. 14 refs.

Four lean premixed prevaporized combustor concepts have been identified which utilize variable geometry and/or other flow modula-

tion techniques to control the equivalence ratio of the initial burning zone. Lean equivalence ratios are maintained at high power engine operating conditions for low NO(x) emissions, while near stoichiometric conditions are maintained at low power for good efficiency and low emissions of carbon monoxide and unburned hydrocarbons. The goal of this program was to obtain a low level of NO(x) emissions at stratospheric cruise conditions; additional goals are to achieve the proposed 1984 EPA emission standards over the landing/take off cycle and performance and operational requirements typical of advanced aircraft engines. (Author)

A81-12619 Excitation of a circular array of cylinders with longitudinal slits. E. I. Veliev and V. P. Shestopalov (Akademiiia Nauk Ukrainskoi SSR, Institut Radiofiziki i Elektroniki, Kharkov, Ukrainian SSR). (*Radiofizika*, vol. 23, no. 2, 1980, p. 202-212.) *Radiophysics and Quantum Electronics*, vol. 23, no. 2, Aug. 1980, p. 144-151. 11 refs. Translation.

The paper considers a circular array utilizing hollow circular cylinders with longitudinal slots instead of cylindrical rods. The array is excited by a magnetic current filament. Emphasis is placed on a low-frequency mode of oscillations. Simple equations for the density of a surface current and radiation patterns are derived. V.T.

A81-12703 Linear vortex theories of a profile and wing with air intake. V. M. Shurygin. (*Akademiiia Nauk SSSR, Doklady*, vol. 250, no. 4, 1980, p. 829-833.) *Soviet Physics - Doklady*, vol. 25, Feb. 1980, p. 91-93. 5 refs. Translation.

A method previously developed for the construction of a primary vortex sheet in the case of a profile is generalized to the construction of the primary vortex surface for a wing of infinite span (in particular, a wing with an arbitrary intake line). For the construction of the primary vortex surface it is necessary to let the shape of the wing in the planform excise from each source-sink on the intake line a part of the vortex sheet corresponding to the source-sink on a plane, and then to continue the resulting attached sheet from the edges of the wing as free vortex sheets. B.J.

A81-11704 Stable near-resonant states forced by perturbation heating in a simple baroclinic model. J. O. Roads (California, University, La Jolla, Calif.). *Journal of the Atmospheric Sciences*, vol. 37, Sept. 1980, p. 1958-1967. 10 refs. NSF Grants No. ATM-77-20602; No. OCE-74-24592; No. ATM-78-24003; No. OCE-77-2282.

The stationary nonlinear response to perturbation heating is calculated in a highly truncated, two-level baroclinic model. For certain values of the intrinsic parameters and forcing, multiple equilibrium states exist. For a specific zonal and meridional wavelength, three equilibrium states are present: two are near a resonant point and one is near the zonal forcing equilibrium. Only one of these is ever stable, namely, the one where the zonal wind is on the low side of the resonant point; this state has a relatively small zonal wind and relatively large stationary perturbations. The equilibrium point on the high side of resonance is unstable mainly due to resonant instability and the equilibrium point near the forcing equilibrium is unstable mainly due to baroclinic instability. Different equilibria are obtained for each vector wavenumber because the resonant value of the zonal wind decreases with decreasing wavelength. (Author)

A81-12737 The status of rotor noise technology. R. P. White, Jr. (Systems Research Laboratories, Inc., Newport News, Va.). *American Helicopter Society, Journal*, vol. 25, Jan. 1980, p. 22-29. 55 refs.

The problem of excess noise in rotor noise technology is discussed. Excess noise arises from sources other than loads needed to fly the helicopter. The effect of free-stream turbulence is investigated along with the induced effects of the rotor wakes, lifting surfaces, and fuselages. Data collected by the inflight far-field measurement technique of Schmitz and Boxwell (1976) is presented. The negative pressure spike, due to intense compressibility effects, dominates the noise signature. The Tip Air Mass Injection (TAMI)

A81-12782

system and the Ogee tip have shown reasonable success in reducing the impulsive noise due to blade vortex interaction. Results obtained during model tests with these systems are also presented. R.C.

A81-12782 # Automation of aircraft gas-turbine power plants (Avtomatika aviatsionnykh gazoturbinnykh silovykh ustanovok). S. A. Gaevskii, F. N. Morozov, and Iu. P. Tikhomirov. Moscow, Voenizdat, 1980. 248 p. 12 refs. In Russian.

In the present book, extensive use of diagrams and illustrations is made to introduce the reader to the various aspects of aircraft gas-turbine engine automatic control. Some representative automatic control systems of such engines are discussed. V.P.

ESTIMATION OF WING NONLINEAR AERODYNAMIC CHARACTERISTICS AT SUPERSONIC SPEEDS
 Harry W. Carlson and Robert J. Mack Nov. 1980 84 p refs
 (NASA-TP-1718; L-13589) Avail: NTIS HC A05/MF A01 CSCL 01A

A computational system for estimation of nonlinear aerodynamic characteristics of wings at supersonic speeds was developed and was incorporated in a computer program. This corrected linearized theory method accounts for nonlinearities in the variation of basic pressure loadings with local surface slopes, predicts the degree of attainment of theoretical leading edge thrust, and provides an estimate of detached leading edge vortex loadings that result when the theoretical thrust forces are not fully realized. T.M.

A FAN PRESSURE RATIO CORRELATION IN TERMS OF MACH NUMBER AND REYNOLDS NUMBER FOR THE LANGLEY 0.3 METER TRANSONIC CRYOGENIC TUNNEL
 Pierce L. Lawing and Charles L. Ladson Nov. 1980 21 p refs
 (NASA-TP-1752; L-13713) Avail: NTIS HC A02/MF A01 CSCL 01A

Calibration data for the two dimensional test section of the Langley 0.3 Meter Transonic Cryogenic Tunnel were used to develop a Mach number-Reynolds number correlation for the fan pressure ratio in terms of test section conditions. Well established engineering relationships combined to form an equation which is functionally analogous to the correlation. A geometric loss coefficient which is independent of Reynolds number or Mach number was determined. Present and anticipated uses of this concept include improvement of tunnel control schemes, comparison of efficiencies for operationally similar wind tunnels, prediction of tunnel test conditions and associated energy usage, and determination of Reynolds number scaling laws for similar fluid flow systems. HOLOGRAPHIC INVESTIGATION OF SLENDER BODY VORTEX WAKES Final Report, 28 Jul. 1978 - 28 Mar. 1980

F. D. Deffenbaugh and J. L. Jacoby Jul. 1980 79 p refs
 (Contract F33615-78-C-3028; AF Proj. 2307)
 (AD-A089496; TRW-32399-6002-UT-00; AFWAL-TR-80-3061) Avail: NTIS HC A05/MF A01 CSCL 20/4

The three dimensional vortex flow field behind slender missile configurations at high angle of attack was investigated using laser holography. Holographic interferograms of the flow about two ogive cylinder models were recorded for low speed flows, M less than .1, at angles of attack from 20 to 50 degrees. Helium injected into the flow above the model was entrained into the entire vortex structure, and the three dimensional position of the core could not be determined from the interferograms. Dual exposure holograms of the flow field seeded with 40-100 micron glass microballoons were recorded using a pulsed ruby laser. Pairs of particles could not be easily identified in the reconstructed image and the three dimensional velocity field could not be measured. Surface pressures were measured and integrated to provide load distributions, normal and side force coefficients. Roll angle was varied with angle of attack and tunnel conditions constant. Conditions of maximum vortex asymmetry were determined from the measured pressure distributions. GRA

AN INVESTIGATION OF SCALE EFFECTS ON THE TRANSONIC FLOW OVER SWEEPED WINGS. PART 2: MEASUREMENTS ON A MODEL OF A VARIABLE-SWEEP STRIKE-FIGHTER CONFIGURATION

D. J. Weeks and J. Hodges London Dec. 1977 127 p refs
 Supersedes RAE-TR-77184; ARC-37815
 (ARC-R/M-3842-Pt-2; BR73152; RAE-TR-77184; ARC-37815)
 Avail: NTIS HC A07/MF A01; HMSO £ 14 PH1

Measurements of forces and wing pressures were made on a wing plus body half-model of a variable sweep strike fighter configuration at Mach numbers between 0.6 to 0.825 and at Reynolds numbers in the range 2.3×10^6 to the 6th power to 19×10^6 to the 6th power. Results were obtained with the wings swept at both 25 deg and 40 deg. The data were analyzed to show the effects of changes in Reynolds number, and in the location of transition, on the transonic flows over the upper surface of the wing at high incidence. For the 25 deg sweep configuration results are described which are consistent with those observed on the transport aircraft wing. The 40 deg sweep configuration gave examples of scale effect which were essentially three dimensional in nature and which persisted up to full scale Reynolds numbers. Author (ESA)

ANALYTICAL CHARACTERISTICS METHODS: APPLICATIONS

R. Stuff (DFVLR, Goettingen, West Germany) 1980 57 p refs
 Presented at Von Karman Inst. Lecture Ser. on Mathematical Methods in Fluid Mech., Rhode Saint Genese, Belgium, 25-29 Feb. 1980 Submitted for publication
 (VKI-Preprint-1980-10) Avail: NTIS HC A04/MF A01

The prerequisites for application of the analytical characteristics method include analytical descriptions of the geometry of wave fronts and rays, and analytical solutions of the wave equation of the potential equation for supersonic flow. The latter are applied as initial solutions to the analytical characteristics method. Examples of application range from unsteady subsonic to steady supersonic flow, from theoretical predictions to the evaluation of the flow field from near field wind tunnel test data.

IN-FLIGHT MEASUREMENT OF AERODYNAMIC LOADS ON CAPTIVE STORES. EQUIPMENT AND RESULTS

G. J. Alders 17 Apr. 1979 12 p refs Presented at AGARD Flight Mech. Panel Symp. on Missile System Flight Dyn., London, 21-24 May 1979

(NLR-MP-79013-U) Avail: NTIS HC A02/MF A01

A force balance store was developed, consisting of a support structure to be mounted on a 14 in. bomb rack, a load measuring balance and a shape representing the store to be analyzed. The shape is replaceable. A series of flight tests with two different force balance store shapes was carried out with an NF-5 aircraft. The store was mounted in the normal captive position as well as 0.15 m below. The results of the measurements are compared with data from other sources, such as wind tunnel results. Predictions, made with the computer model and using the aerodynamic data obtained with the force balance store are compared with actual drop test results. The excellent agreement indicates that in flight measurement of airloads on captive stores is a valuable tool for a better determination of the safe release envelope of external stores. Author (ESA)

A COMPREHENSIVE EVALUATION AND ANALYSIS OF TRANSONIC FLOW CALCULATIONS ON THREE RELATED WING-BODY CONFIGURATIONS

Georg Drougge, N. Agrell, and S. Hedman 1979 40 p refs (Contract FMV-F-K-82223-76-001-21-001)

(FFA-TN-AU-1418-PT-1) Avail: NTIS HC A03/MF A01

The design of a wing-body combination where an inverse procedure analysis based on the transonic small disturbance theory was studied. Features of aerodynamic interest were found. This led to modifications in the use of the numerical method in the wing-body design. The modified wing-body combination was again tested and the results analyzed further. It was concluded that the inverse method can be a powerful design tool and that in any case for moderate aspect ratios the concept of a wing as formed from two dimensional profiles can be replaced by the concept of a wing formed from two surfaces. BOUNDARY LAYER MEASUREMENTS ON A TWO-DIMENSIONAL WING WITH FLAP

B. vandenBerg Jan. 1979 110 p refs (Contract NIVR-1812)

(NLR-TR-79009-U) Avail: NTIS HC A06/MF A01

A wind tunnel experiment was performed on a wing flap configuration designed to prevent flow separations. The measurements comprised surface pressure measurements, boundary layer and wake traverses, and surface flow visualizations. Three angles of attack were applied and two widths of the gap between wing and flap, with mixing of wing wake and flap boundary layer occurring with the smaller gap. The flow phenomena were sufficiently well described by these measurements to make detail comparisons possible with calculation methods for the viscous flow around multielement airfoils. Author (ESA)

FLOW MEASUREMENTS IN THE WAKE OF A WING FITTED WITH A LEADING-EDGE ROOT EXTENSION (STRAKE)

P. J. Butterworth London HMSO Sep. 1979 40 p refs (RAE-TR-79120; RAE-Aero-3464; BR72779) Avail: NTIS HC A03/MF A01

In a low-speed wind tunnel, measurements were taken of the velocity vector in the flow field behind the wing of a combat aircraft model. The wing was fitted with a leading-edge root extension (strake) and could have either a plain leading edge or a deployed slat outboard. Four flow investigations were made: at three angles of incidence with the plain leading edge and at one angle of incidence with the slat deployed. The distribution of the total head deficit, the streamwise component of vorticity,

and a measure of the circulation distribution in the wake of the wing were computed. Author (ESA)

THEORETICAL DETERMINATION OF SUBSONIC OSCILLATORY AIRFORCE COEFFICIENTS FOR FIN-TAILPLANE CONFIGURATIONS

D. E. Davies London HMSO Sep. 1979 237 p refs (RAE-TR-79125; RAE-Struct-BF/B/0794; BR79125) Avail: NTIS HC A11/MF A01

Linearized equations of potential flow are solved numerically for the loadings for oscillation at general frequency in any antisymmetric modes, and the generalized aerodynamic coefficients obtained. Approximation to the loadings are taken as linear combinations of basis functions. The condition satisfied by the loadings at the junction of the fin and half tailplanes is imposed on the approximations and the variational principle of Flax is applied to get the coefficients in the said linear combinations. The procedure is programmed in ICL 1900 FORTRAN. Results obtained using the program on a number of examples are given. Author (ESA)

ANALYSIS OF CALCULATED THREE-DIMENSIONAL INVISCID FLOW FIELDS WITH EMBEDDED SHOCK WAVES (PRESENTATION OF A FIELD SOLUTION), PART 1

Claus Weiland and Hans-Juergen Thies Jul. 1979 52 p refs Transl. into ENGLISH of "Anal. Berechneter Dreidimensionaler Reibungsfreier Stromungsfelder mit Eingebetteten Verichtungsstoessen (Darstellung einer Felddoesung) Teil 1". Rept. DFVLR-FB-78-09 DFVLR, Cologne, Apr. 1978 Original report in GERMAN previously announced as N79-30155

(ESA-TT-558; DFVLR-FB-78-09) Avail: NTIS HC A04/MF A01; DFVLR, Cologne DM 27.90

Flow fields around a number of different body contours, and calculated by means of a finite difference procedure are analyzed. The investigated fields are three dimensional in general. The analysis is carried out with the air of characteristics, streamlines, lines of constant static pressure and static density, and with the velocity vectors at the gridpoints in planes $\phi = \text{const}$. Planes $z = \text{const}$ lines of constant cross flow Mach number and the velocity vectors of the crossflow at the gridpoints are presented. The interval of freestream Mach number considered is $1.4 < M < 3$, and the range of angle of attack α is up to 20 deg. The quality of the finite difference solution used is demonstrated by comparison with experimental data. The accuracy attained especially for the detection of the position and the contour of embedded shocks is very good. Author (ESA)

HC A05/MF A01

A nonlinear vortex-lattice method is described applying a force-free condition to the vortex sheet given the trailing-, side- and leading edges, respectively. In extensive test runs various influences on the numerical stability of the iterative rolling up process were studied such as the force free condition of the wake, the number of horseshoe vortices, the panel distribution along span and chord, the representation of the wakes by chains of straight vortex elements of different length and number, and the introduction of an artificial friction parameters. Because of numerical difficulties the slender delta wing itself could not be

treated completely. These numerical difficulties resulting from the singular behavior of line vortices are described and ways of overcoming them are suggested. Author (ESA)

SYSTEMS ANALYSIS OF THE INSTALLATION, MOUNTING, AND ACTIVATION OF EMERGENCY LOCATOR TRANSMITTERS IN GENERAL AVIATION AIRCRAFT Final Report
 David S. Hall 10 Jan. 1980 218 p
 (Contract NAS5-25444)
 (NASA-CR-160036: CRI-7846-14) Avail: NTIS HC A10/MF A01 CSCL 01C

A development program was developed to design and improve the Emergency Locator Transmitter (ELT) transmitter and to improve the installation in the aircraft and its activation subsystem. There were 1135 general aviation fixed wing aircraft accident files reviewed. A detailed description of the damage to the aircraft was produced. The search aspects of these accidents were studied. As much information as possible about the ELT units in these cases was collected. The data should assist in establishing installation and mounting criteria, better design standards for activation subsystems, and requirements for the new ELT system design in the area of crashworthiness. ENGINEERING AND DEVELOPMENT PROGRAM PLAN AIRCRAFT CRASHWORTHINESS
 C. A. Caiafa and Lawrence M. Neri Jun. 1980 55 p refs
 (AD-A089431; FAA-CT-80-166; FAA-ED-18-6) Avail: NTIS HC A04/MF A01 CSCL 01/2

The Aircraft Crashworthiness Program Plan is designed to reduce or prevent aircraft occupants from incurring serious or fatal injuries in a survivable crash impact accident by incorporating crashworthy design features into the initial stages of fixed-wing and rotary-wing aircraft development. It describes a 5 year development program for both airplanes and rotorcraft. It identifies five major subprogram areas for study and analysis to accomplish the programs goals: (1) Airframes; (2) Cabin safety; (3) Fuel system protection; (4) Emergency evacuation system; and (5) Standards, criteria, and procedures. The plan emphasizes use of available background data, development of analytical techniques, validation of analytical techniques, validation of data to determine feasibility/acceptability and transmittal of appropriate data for consideration as the basis for regulation, standards, etc. The federal aviation administration groups, other government

agencies/departments and industry organizations participating in this effort are identified. Program schedule with milestones is presented. Program management and funding requirements are also identified. GRA

HOURLY AIRPORT ACTIVITY PROFILES: 30 AIRPORTS BY USER, 3 AIRPORTS BY USER AND EQUIPMENT TYPE, SELECTED DAYS IN JUNE, JULY AND AUGUST, 1978

1980 156 p

(AD-A089450; FAA-AVP-80-7) Avail: NTIS HC A08/MF A01 CSCL 01/5

The first section of this report contains statistics on aircraft operations, by user category for 30 airports for selected days in June, July and August 1978. Using the series of tables and graphs on Atlanta as an example, the data should be interpreted as described in the following paragraphs. First, note that the data used for generating the statistics in the table included all operations occurring in Atlanta during August 1978. Local time in this case would be equivalent to eastern daylight time. Aircraft operations occurring between midnight and 1:00 a.m. are counted in time slot zero. Similarly, activity occurring between 12:00 noon and 1:00 p.m. is assigned to time slot 12:00. The second part of this report consists of six tables and seven graphs which portray total daily aircraft departures and average hourly aircraft departures by equipment type for three cities: Kansas City, Missouri; Omaha, Nebraska; and St. Louis, Missouri. This part of the report may be regarded as exploratory in nature. The tables and graphs provide, for the first time, information on departures by equipment type, by hour of the day. Previously, such information was available for air carrier operations at the top 100 air carrier airports. The information in this section includes operations by all user categories. GRA

THE DISCRETE ADDRESS BEACON SYSTEM/AIR TRAFFIC CONTROL RADAR BEACON SYSTEM/ATCRBS IFF MARK 12 SYSTEM (DABS/ATCRBS/AIMS) PERFORMANCE PREDICTION MODEL Final Report

C. Randall Crawford and C. Wayne Ehler Apr. 1980 80 p refs

(Contracts F19628-78-C-0006; DOT-FA70WAI-175; AF Proj. 649E)

(AD-A089440; ECAC-PR-77-061; FAA-RD-79-88) Avail: NTIS HC A05/MF A01 CSCL 17/9

The Discrete Address Beacon System (DABS) is to be gradually phased into the existing Air Traffic Control Radar Beacon System (ATCRBS) in the 1980's. The DABS selective address feature is designed to alleviate the ATCRBS problems of over-interrogation and synchronous garble. The FAA requested that the Electromagnetic Compatibility Analysis Center (ECAC) develop a computer model with the capability to predict mutual interference arising in a mixed secondary-surveillance radar environment. The nature of the DABS interrogation schedule required that the model be a time-event store simulation. The model inputs are selected from the ECAC data base and consist of the characteristics of a ground and air deployment of sensors and transponders. Detailed characteristics of a sensor-of-interest (So) are among the inputs. The model output is primarily a record of the events that were predicted to occur during a simulation period. The performance of each transponder is described by its reply history during the time in which the equipped aircraft is in the So mainbeam. The fruit rate at the So is predicted, and the performance of the subject sensor is represented by the results of DABS transactions and ATCRBS target evaluations. Other summary outputs are available from the model, including interrogation rates, sidelobe suppression rates, and the identity of equipments that cause observable interference. GRA

PROPOSED ATC SYSTEM FOR THE GULF OF MEXICO: HELICOPTER OPERATIONS DEVELOPMENT PROGRAM Final Report

D. J. Freund and T. K. Vickers Nov. 1979 48 p
(Contract DOT-FA79WA-4279)
(AD-A089430; FAA-RD-80-85) Avail: NTIS
HC A02/MF A01 CSCL 17/7

A helicopter ATC system for the Gulf of Mexico is set forth. It embodies a concept of evolutionary growth in four phases: (1) The Present System period of use 1980 - IFR navigation is obtained primarily with LoranC, or VLF/OMEGA. Back up systems are ADF and Airborne Weather Radar. VOR/DME is used over land. ACT is by procedural control and separation standards because no radar or other surveillance system is available off shore; (2) LOFF Loran c Flight Following Period of Evaluation 1981 - The LOFF system is placed in operation for experimentation and evaluation. While ATC is still performed by procedural control, LOFF will assist ground controllers by reducing workload, improving flexibility, etc. Experiments will also be performed on secondary radar systems ATCRBS VLATME to provide surveillance; (3) Augmented LOFF Period of use 1983 and beyond - IFR helicopters will be able to fly direct, offset or segmented RNAV routes. ATC will be essentially equivalent to the NAS. Navigation by Loran C will expand. Surveillance will be by LOFF and/or secondary radar. Area of control will be 1,500 to 10,000 over entire Gulf, and 4 RNAV Traffic Control Period of use 1985 and beyond - IFR helicopters will be able to use any of a number of certified navigation systems. ATC systems will adapt to varying accuracies of these systems. ATC will be based on surveillance provided by aircraft reporting of position information and/or secondary radar. Separation standards will be reduced and be equivalent to Northeast Corridor. GRA

RECOMMENDATIONS FOR SHORT-TERM SIMULATION OF ATC CONCEPTS. HELICOPTER OPERATIONS DEVELOPMENT PROGRAM Final Report

D. J. Freund and T. K. Vickers Feb. 1980 44 p
(Contract DOT-FA79WA-4279)
(AD-A089435; FAA-RD-80-86) Avail: NTIS
HC A03/MF A01 CSCL 01/5

A number of recommendations from a previous helicopter air traffic control (ATC) study (See Report FAA-RD-78-150) were examined. Those which appeared to have potential for early implementation were selected for further testing. The selected recommendations included: (1) dual-fix holding patterns to save airspace; (2) speed control procedures and short approach paths to save fuel; (3) various methods of reducing separation in order to increase airport or heliport capacity. Under item 3 above, a rationale for utilizing existing parallel approaches of helicopters and CTOL aircraft was presented for consideration. Extensive use of flight simulation and ATC simulation was recommended in order to reduce the time and cost of evaluating the potential improvements. The steps of the recommended simulation program

were arranged in the order of ascending cost, to learn as much as possible about the subject as quickly as possible and to weed out or revise impractical solutions before they reach a more expensive stage of evaluation or development. A detailed simulation program was prepared using a modified factorial design in order to isolate the effects of changes in various parameters. GRA

IMPACT OF THE DISCRETE ADDRESS BEACON SYSTEM (DABS) ON AIR TRAFFIC CONTROL RADAR BEACON SYSTEM (ATCRBS) PERFORMANCE IN SELECTED DEPLOYMENTS Final Report

T. Keach and G. Fleming Apr. 1980 57 p refs
(Contract F19628-78-C-0006)
(AD-A089611; FAA-RD-80-93; ECAC-CR-79-127) Avail: NTIS
HC A04/MF A01 CSCL 17/7

A computer analysis was conducted to investigate the effect of the proposed Discrete Address Beacon System (DABS) on the Air Traffic Control Radar Beacon System (ATCRBS) in a future (1982) Los Angeles, CA, air traffic environment. The performance of ATCRBS was examined at two sites, both with (a) the existing all-ATCRBS ground environment and (b) a mixed ATCRBS/DABS ground environment (using various levels of DABS channel activity). It was observed that, in general, DABS operations will not affect the ability of ATCRBS interrogators to perform their air traffic control function of reliably detecting aircraft. GRA

RECOMMENDED SHORT-TERM ATC IMPROVEMENTS FOR HELICOPTERS. VOLUME 1: SUMMARY OF SHORT TERM IMPROVEMENTS Final Report

T. K. Vickers and D. J. Freund Aug. 1980 48 p
(Contract DOT-FA79WA-4279)
(AD-A089521; FAA-RD-80-88-1) Avail: NTIS
HC A03/MF A01 CSCL 17/7

A summary report is made of all improvements studied. Improvements are categorized as to those that can be recommended for immediate operational consideration or use and those that require limited short term simulation or test. The recommendations for immediate use include: (1) Helicopter ATC training material, (2) Operational Description of Loran Offshore Flight Following (LOFF), (3) Recommendations concerning military training routes and (4) Survey data for use in Gulf communications and route structure planning. The recommendations for short term simulation include: (1) Dual waypoint holding patterns, (2) other holding patterns and (3) shortened entry procedures for intercepting final approach path. GRA

ANALYSIS OF THE FUNCTION PRINCIPLE AND OPERATIONAL ASSESSMENT OF AN ONBOARD GLIDEPATH GUIDANCE SYSTEM FOR VISUAL APPROACHES (VISUAL APPROACH MONITOR (VAM))

Josef Thomas and Helmut Stein Oct. 1979 107 p refs In GERMAN; ENGLISH summary Report will also be announced as translation (ESA-TT-655)
(DFVLR-FB-79-38) Avail: NTIS HC A06/MF A01; DFVLR, Cologne DM 20.00

The visual approach monitor, VAM, a head-up display system for manual approach was analyzed as regards its functioning principles and associated error characteristics. System simulations and flight tests were carried out with special emphasis on performance and stability studies. Experimental comparisons between VAM guided and unaided visual approaches revealed no significant advantages for VAM as far as flight path accuracy is concerned. However, VAM performed significantly better with regard to variances and extreme values for nearly all flight guidance parameters. Its overall performance was found to be comparable to that of the instrument landing system. Author (ESA)

AIRCRAFT HYDRAULIC SYSTEMS DYNAMIC ANALYSIS. VOLUME 6: STEADY STATE FLOW ANALYSIS SSFAN COMPUTER PROGRAM TECHNICAL DESCRIPTION Final Technical Report, Jun. 1978 - Nov. 1979

Ray Levek and Bob Young Wright-Patterson AFB AFAPL Apr. 1980 339 p refs Revised (Contract F33615-74-C-2016)

(AD-A089240; AFAPL-TR-76-43-Vol-6) Avail: NTIS HC A15/MF A01 CSCL 01/3

SSFAN is a steady state hydraulic flow and pressure analysis computer program. Its primary purpose is to analyze non-linear resistance aircraft hydraulic systems. The program handles complex flow networks containing flow and/or pressure discontinuities such as unbalanced area actuators and check valves. Solutions for a combination of simultaneously operating sub-systems are easily obtained. The program is designed using a building block approach so that new component or element models may be added with minimum change to the main program. The solution method is a matrix type, using iteration to obtain a final flow and pressure balance. The program internally corrects viscosities for pressure, determines whether flow is laminar,

transition or turbulent for use of appropriate resistance factors and corrects reservoir pressure for altitude effects. A quasi-transient section has been added to allow multiple steady state calculations when simulating subsystem operations. The data is stored and can be printed in either tabular form or computer plot form. The program was written with the aircraft hydraulic system designer in mind. The terminology and units are commonly used terms such as fluid viscosity in centistokes, temperatures in degrees Fahrenheit and flow in gallons per minute. Conversion of units for calculation is accomplished internally in the program. GRA

DESIGN OPTIONS STUDY. VOLUME 1: EXECUTIVE SUMMARY Final Report

W. T. Mikolowsky, L. W. Noggle, H. J. Abbey, L. A. Adkins, and H. A. Bricker Sep. 1980 27 p
(Contract F33615-78-C-0122)
(AD-A089536; LG80ER0006-Vol-1) Avail: NTIS HC A03/MF A01 CSCL 01/3

The Advanced Civil/Military Aircraft ACMA is envisioned as an advanced technology cargo aircraft with the potential for fulfilling the needs of both military airlift and commercial air freight in the 1990's and beyond. The ultimate goal of the Design Options Study is the development of fundamental information regarding both the military and commercial cost and effectiveness implications of the most significant transport aircraft functional design features. This volume, the Executive Summary of the Design Options Study Final Report, presents an overview of the requirements of potential users of the ACMA and a brief summary of the results of the study. DESIGN OPTIONS STUDY. VOLUME 3: QUALITATIVE ASSESSMENT Final Report

W. T. Mikolowsky, H. J. Abbey, L. A. Adkins, H. A. Bricker, and E. W. Caldwell Sep. 1980 177 p refs
(Contract F33615-78-C-0122)
(AD-A089538; LG80ER0008-Vol-3) Avail: NTIS HC A09/MF A01 CSCL 01/3

All functional design features and associated options that have a potential impact on military/commercial commonality of the advanced civil military aircraft are qualitatively assessed. Functional areas considered include basic aircraft performance, ground interface, airfield compatibility, cargo compartment, inflight refueling, personnel accommodations, and military/civil design criteria. Based on this assessment, the following features are recommended for further analysis: design payload, loading/unloading apertures, planform shape of the cargo compartment, floor height, takeoff distance/gear flotation, noise characteristics/engine-out climb gradient, cargo-envelope maximum height, passenger provisions, maximum structural payload, service life specifications, cargo compartment pressurization, and cargo accommodation provisions. THE USE OF PARAMETRIC COST ESTIMATING RELATIONSHIPS AS THEY PERTAIN TO AIRCRAFT AIRFRAMES: A NEW PERSPECTIVE M.S. Thesis

Bruce Robert Bennett Mar. 1980 47 p refs
(AD-A089525) Avail: NTIS HC A03/MF A01 CSCL 14/1

The purpose of this thesis was to review cost estimating relationships that have been developed and used for aircraft airframe costs, to identify existing problems, and where appropriate, to suggest alternatives for the future application of cost estimating relationships to aircraft airframes. Mahalanobis distance was explored as a means of complementing the more traditional statistical measures for regression analysis. This study supports the conclusion that cost estimating relationships should be developed for a specific system to be estimated, and that Mahalanobis distance is a potentially effective tool by which the analyst may address the important issue of analogy between the data base and the proposed system. PRELIMINARY AIRWORTHINESS EVALUATION AH-1S HELICOPTER WITH OGEE TIP SHAPE ROTOR BLADES Final Report, Nov. 1979 - Apr. 1980

Gary L. Bender, Henry Arnaiz, David Ottomeyer, Ralph Woratschek, Larry Higgins, and John S. Tulloch May 1980 40 p refs
(AD-A089625; USAAEFA-77-25) Avail: NTIS HC A03/MF A01 CSCL 01/3

The United States Army Aviation Engineering Flight Activity conducted a Preliminary Airworthiness Evaluation of the AH-1S helicopter with OGEE tip-shape main rotor blades to determine if any improvement in performance or handling qualities resulted from replacing the K747 blades. Additionally, the acoustics signature of the OGEE blades were measured by the US Army Research and Technology Laboratories (Aeromechanics Lab). Tests were conducted at Edwards Air Force Base (elevation 2302 feet) and Coyote Flats (elevation 9980 feet), California from 1 November 1979 through 8 April 1980. Forty-five test flights were flown for a total of 36.6 productive hours (63.2 total hours). Both hover and level flight performance were degraded by installation of OGEE tip-shape main rotor blades. Low-speed handling qualities were unaffected by the OGEE blades. Other handling qualities tests were not accomplished. Results of acoustics tests will be reported by the laboratories under a separate cover. GRA

OPTIMIZED COMPUTER SYSTEMS FOR AVIONICS APPLICATIONS Final Technical Report, 1 Feb. - 30 Sep. 1979

R. T. Chien and L. J. Peterson Feb. 1980 175 p refs (Contract F33615-78-C-1559; AF Proj. 2003) (AD-A089570: AFAL-TR-79-1235) Avail: NTIS HC A08/MF A01 CSCL 09/5

The main purpose of this project is to investigate the commonalities among the four subareas of signal processing, namely, radar, communications, image processing and electronic warfare; and to establish possible common functional descriptions as the basis for a common architecture. An extensive search was made to list all important kernels and algorithms in radar, communications and image processing. These kernels and algorithms were carefully analyzed with respect to their computational complexity and identification of commonality for architectural purposes. It was discovered that significant commonalities do exist in many areas. These common areas represent significant overlap and commonality which can be utilized in a common architecture. GRA

COMPARISONS OF FOUR ALTERNATIVE POWERPLANT TYPES FOR FUTURE GENERAL AVIATION AIRCRAFT

T. J. Wickenheiser, G. Knip, R. M. Plencner, and W. C. Strack Oct. 1980 50 p refs (NASA-TM-81584; E-561) Avail: NTIS HC A03/MF A01 CSCL 21E

Recently completed NASA sponsored conceptual studies were culminated in the identification of promising new technologies for future spark ignition, diesel, rotary, and turbine engines. The results of a NASA in-house preliminary assessment study that

compares these four powerplants types in several general aviation applications are reported. The evaluation consisted of installing each powerplant type in rubberized aircraft which are sized to accomplish fixed missions. The primary evaluation criteria include projected aircraft cost, total ownership cost, and mission fuel.

AN ANALYSIS OF AIR FORCE MANAGEMENT OF TURBINE ENGINE MONITORING SYSTEMS (TEMS) M.S. Thesis

Elbert B. Hubbard, III and Gregory A. Swecker Jun. 1980 118 p refs

(AD-A089365; AFIT-LSSR-68-80) Avail: NTIS
HC A06/MF A01 CSCL 21/5

Turbine Engine Monitoring Systems (TEMS) are engine health monitoring and diagnostic tools being developed and tested for use on Air Force engines in order to improve and reduce the cost of engine maintenance and management and to aid in the implementation of On Condition Maintenance. Previous researchers have described the major features of TEMS, analyzed the results of development and test efforts, and identified problems which must be overcome. This study examines the problem of fragmentation which exists in the Air Force management of TEMS development and testing. The authors describe and analyze the overall Air Force management of TEMS. Management problems were identified and classified into three major areas: structure and role problems, information flow and integration problems, and leadership and command problems. Four alternative management concepts were analyzed. Based on this analysis, the authors recommend that the management structure be modified, and a TEMS Task Force be established to more effectively utilize TEMS for Air Force engine maintenance and management. 21/4

The effect of limited fuel property variation on the performance of current, high pressure ratio, can type combustors was evaluated. The TF41 turbofan combustor was employed. This combustor has conventional, dual orifice fuel injection and film cooling. The combustion zone is approximately stoichiometric at takeoff. Twelve experimental fuels, including JP-4 and JP-8, were tested. Distillation range, hydrogen content, and aromatic type were varied by blending JP-4 and JP-8 fuels with mineral seal oil and two types of aromatic solvents. Performance tests were accomplished at idle, altitude cruise, dash, and takeoff conditions. Sea level altitude ignition tests were also completed. Fuel fouling and carboning characteristics were established. Combustor operating parameters such as linear temperature, pattern factor, ignition fuel/air ratio, lean blow out fuel/air ratio, and exhaust emissions were correlated to fuel properties. The effect of fuel properties on combustor and turbine hardware durability was assessed analytically. GRA

A residual fatigue life prediction method, suitable for retirement for cause application, has been developed for two p WA turbine disks the F100 1st-stage high pressure turbine disk and the TF30 10th-stage compressor disk. The method is based upon interaction of fracture mechanics crack propagation modeling concepts with laboratory nondestructive evaluation NDE hyperbolic sine SINH model refined during an earlier Air Force Materials Laboratory AFML program. Stress intensity K solution for the engine components were based upon experimental effective K determinations made during full-scale component fatigue tests. The NDE techniques developed for disk inspections included acoustic emission AE, eddy current EC, and fluorescent penetrants FP. Stress-enhanced penetrant and semi-automated rotating probe EC techniques were developed as periodic inspections, while the AE time-domain technique was developed as a real-time inspection tool. GRA

**QUANTITATIVE THERMOGRAPHY IN AERO-ENGINE
RESEARCH AND DEVELOPMENT**

M. Hilton 1980 21 p
(PNR-90021) Avail: NTIS HC A02/MF A01

The use of a recording thermograph to study an engine exhaust unit which is suspected of having thermal gradients of sufficient severity to cause local distortion is described. Temperature measurements obtained from color contoured thermograms are compared with thermocouples embedded in the exhaust unit. The data processing and analysis techniques are described together with the problems encountered when correlating the Thermovision results with those obtained from the thermocouples. Reasons for the discrepancies are discussed with an assessment of the problem magnitude and possible means of overcoming them in future applications. Author (ESA)

HC A17/MF A01 CSCL 01C

A motion base simulator was used to compare the flying qualities of three generic single rotor helicopters during a full attention to flight control task. Terminal area instrument approaches were flown with and without turbulence. The turbulence of helicopter static stability was investigated in terms of the values of cockpit control gradients as specified in the existing airworthiness criteria. The effectiveness of several types of stability control augmentation systems in improving the instrument flight rules capability of helicopters with reduced static stability was examined. Two levels of static stability in the pitch, roll, and yaw axes were examined for a hingeless rotor configuration; the variations were stable and neutral static stability in pitch and roll, and two levels of stability in yaw. For the lower level of static stability, four types of stability and control augmentation were examined for helicopters with three rotor types: hingeless, articulated, and teetering. S.F.

FIBERGLASS-REINFORCED RIGID POLYURETHANE EXPEDIENT PAVEMENT SUBJECT TO SIMULATED F-4 AIRCRAFT TRAFFIC

P. S. Springston May 1980 65 p refs (YF53536091) (AD-A089266; CEL-TN-1578) Avail: NTIS HC A04/MF A01 CSCL 11/2

A multipurpose expedient paving system is being developed to enable more rapid construction of expeditionary airfields by Marine Corps forces engaged in an amphibious landing. Previous research has resulted in a conceptual pavement, FIBERMAT, which consists of a facing of fiberglass-reinforced polyester resin (FRP) bonded to a core of fiberglass-reinforced rigid polyurethane foam. FIBERMAT has been subjected to a series of laboratory tests to define response to stress fatigue and environmental cycling. A similar structural sandwich of FRP and rigid polyurethane foam has been tested and found to meet F-4 aircraft static load, tailhook impact, and engine exhaust blast requirements. This report documents the results of a traffic test conducted on a section of FIBERMAT having a 5 inch thick fiberglass-reinforced foam core and a 1/4 inch thick FRP facing. Distributed traffic was applied to the test section with a load cart which simulated a main gear of an F-4 aircraft. The cart was equipped with a 30-7.7, 18 plyrating tire inflated to 265 psi and loaded to 27,000 pounds. The first failure within the test section was recorded at 136 coverages (1,306 passes) of the load cart, and the entire test section was considered failed at 310 coverages (2,141 passes). GRA

N81-10080# Battelle Columbus Labs., Ohio. **POLYMER RESEARCH IN RAPID RUNWAY REPAIR MATERIALS Final Report, Jan. - Oct. 1979**

Manfred Luttinger, Charles W. Kistler, Jr., Henry M. Grotta, and Richard G. Sinclair Tyndall AFB, Fla. Air Force Engineering and Service Lab. Nov. 1979 93 p refs (Contract F08635-79-C-0040) (AD-A089606; AFESC/ESL-TR-79-43) Avail: NTIS HC A05/MF A01 CSCL 11/1

Low viscosity, two-component epoxy resins were formulated for airless spray application over quartz or dolomite aggregates. The formulation selected for full evaluation was based on mercaptan curing systems. Trifunctional acrylate monomers were used in some formulations as modifiers. The resulting polymer concrete set up within 3 to 4 minutes after mixing at temperatures around 73 degrees F. Good cures within 1/2 hour of mixing can be obtained in wet environments down to 5 degrees C and in dry environments down to -25 degrees C. Good adhesion to wet aggregates requires the use of coupling agents, organofunctional silanes being preferred. Good bonding to asphalt and Portland cement concrete and good wear characteristics were demonstrated. Flexural strength properties are satisfactory after cool down both under dry and wet application conditions. While the polymer concrete is hot due to the exotherm of the curing reaction, flexural strength properties are low. GRA

AIRCRAFT ENGINE NACELLE FIRE TEST SIMULATOR. VOLUME 1: TECHNICAL Final Report, Sep. 1976 - Apr. 1980

Karlheinz O. W. Ball, Dennis B. Burnside, Rolf D. Hegele, and Paul R. Hughes Apr. 1980 81 p (Contract F33615-76-C-2084; AF Proj. 3048) (AD-A089629; AFWAL-TR-80-2055-Vol-1) Avail: NTIS HC A05/MF A01 CSCL 14/2

This report describes the design, installation, and initial checkout of the Aircraft Engine Nacelle Fire Test Simulator. This facility was designed to realistically reproduce the environments and combustion related phenomena encountered within an engine nacelle. The facility provides both heating and cooling of the inlet air, heating of the engine case, control of air velocity and air pressure, and for the injection of fluids, combustibles or extinguishants. The report presents the final implementation of the system and details the hardware installation, the control system, and the software needed to provide integrated control, safety, and data acquisition. Only limited checkout was possible due to the failure of the air compression and the cleaning and modification efforts required to return the system to a safe operating level. GRA

IGNITION OF A LIQUID FUEL Final Progress Report, 1 May 1978 - 30 Sep. 1979

Takashi Kashiwagi, Howard R. Baum, and John A. Rockett Jan. 1980 78 p refs (Grant AF-AFOSR-0006-79; AF Proj. 2308) (AD-A089295; AFOSR-80-0476TR) Avail: NTIS HC A05/MF A01 CSCL 20/5

This report summarizes progress in the study of ignition of a liquid fuel under high intensity radiation. It describes an experimental study of the key processes during ignition and a theoretical modeling study of part of the phenomena during the ignition period. The experiments were conducted using a CW CO2 laser with incident fluxes from 1000 to 5000 W/sq cm and n-decane as the flammable liquid. High speed photographs of ignition events showed a periodic depression in the decane surface, probably caused by the thrust of the strong decane vapor flux; radial outward motion of the liquid, probably caused by a surface tension, gradient was also observed. The first appearance flame was in the gas phase well above the surface. The proposed autoignition mechanism of decane by the CO2 laser is the absorption of the incident laser beam by the vapor plume. The effect on ignition of the incident angle of the laser beam with respect to the decane surface was studied from 90 to 30 degrees. On reducing the incident angle, the ignition delay time becomes longer and the minimum incident flux for ignition increases significantly. A theoretical model describing the flow motion in the gas phase caused by a heated surface was calculated numerically and solved analytically. GRA

A METHOD OF PERFORMANCE PREDICTION FOR CENTRIFUGAL COMPRESSORS. PART 1: ANALYSIS. PART 2: COMPARISON WITH EXPERIMENT

M. V. Herbert London Feb. 1980 175 p refs Supersedes NGTE-M78029; ARC-38052; NGTE-M78031; ARC-38053 (ARC-R/M-3843; BR73151; NGTE-M78029; ARC-38052; NGTE-M78031; ARC-38053) Avail: NTIS HC A08/MF A01; HMSO £ 18 PHI

A method was developed capable of producing reasonably accurate stage characteristics, in terms of mass flow, pressure ratio, work input and efficiency, for any centrifugal compressor with radial outflow (i.e., with no axial component of velocity at outlet), given only overall geometric properties. The analytical treatment and assumptions used are presented along with the results of applying the method to various machines and comparison of the predictions with test data. Prediction of choking flow is generally satisfactory, and the mass flow/pressure ratio characteristics produced have substantially correct form, although no general means have been found of predicting the onset of surge. For the cases examined the error in predicted efficiency level is within 1 to 2 percent at design speed, sometimes more at low speed. Author (ESA)

INLET FLOW IN CENTRIFUGAL PUMPS AT PARTIAL DELIVERIES

Mete Sen Jun. 1979 9 p In FRENCH; ENGLISH summary Presented at Soc. Hydrotech. de France Session 113 on Comportement Dyn. des Turbomachines Hydrauliques, 20-21 Jun. 1979 Submitted for publication

(VKI-Preprint-1979-16) Avail: NTIS HC A02/MF A01

Pump design parameters influencing swirling reverse flow were investigated. Several impellers were developed and tests were performed to investigate inlet flow characteristics. An important parameter is called the Pump's Critical Delivery which corresponds to the onset of swirling reverse flow at the tip of the blade's leading edge. The results showed uniform aerodynamic hub to tip blade loading to be the most important criterion associated with low critical deliveries. High critical deliveries are obtained with a high aerodynamic blade loading at the tip. Head stability is not related to swirling reversed flow. A relation does, however, exist between shaft power and reverse flow. Author (ESA)

A CONTROLLED EVALUATION OF THE DIFFERENCES BETWEEN TWO APPROACHES TO RELIABILITY INVESTMENT SCREENING M.S. Thesis

Russell M. Genet and John M. Wallace Jun. 1980 73 p refs (AD-A087506; AFIT-LSSR-36-80) Avail: NTIS HC A04/MF A01 CSCL 14/1

There is a continuing concern about the high aircraft support cost and poor availabilities caused by some aeronautical equipments. It is generally accepted that basic research, engineering development, and improvements in fielded equipments should concentrate on high burner types of equipment. This has been countered by the suggestion that the emphasis would be better placed on those equipment types with the highest return on investment. An experiment was conducted, using data from over 20,000 aeronautical equipments, to determine if the high burner and return on investment approaches really emphasize different equipment types. It was found that, in fact, different equipment types were emphasized. The high burner approach emphasized jet engines, radar sets, etc., while the return on investment approach emphasized valves and actuators, fuel gauges, and other mundane but troublesome equipments. These research findings suggest that a change in policy might be appropriate. GRA

EVALUATION OF SECTION PROPERTIES FOR HOLLOW COMPOSITE BEAMS

Vittorio Giavotto, Marco Borri, Luigi Puccinelli, Vittorio Caramaschi (Costruzioni Aeronautiche Giovanni Agusta S. P. A. Cascina Costa di Samarate, Italy), and Francesco Mussi (Costruzioni Aeronautiche Giovanni Agusta S. P. A. Cascina Costa di Samarate, Italy) 7 Sep. 1979 30 p refs Presented at the Fifth European Rotorcraft and Powered Lift Aircraft Forum, Amsterdam, 4-7 Sep. 1979

(Paper-Nr-35) Avail: NTIS HC A03/MF A01

The plan for the development and the validation of design procedures for composite beam-like structures and structural components is described. Analytical as well as experimental results are reported. The development of the program HANBA (Hollow Anisotropic Beam Analysis) which, based on an original displacement method approach, allows the evaluation of section stiffnesses and stresses is presented. The program works on a finite element idealization of the beam section and computes the stresses from the resultant forces and moments acting on the particular section, as the usual engineer's beam theory. Experimental results mainly concern the identification of elastic properties for composite laminates, at relatively low stress levels, and the validation of the results of the program HANBA. Analytical results compare very well with experimental ones, the largest differences in section stiffnesses so far evaluated being of the order of 1%. The plan is still going on and future activities are also outlined in the paper. R.K.G.

FUEL JETTISONING BY U.S. AIR FORCE AIRCRAFT. VOLUME 1: SUMMARY AND ANALYSIS Final Technical Report, Feb. 1972 - Dec. 1979
 Harvey J. Clewell, III Mar. 1980 60 p refs
 (AF Proj. 1900)
 (AD-A089010; AFESC/ESL-TR-80-17-Vol-1) Avail: NTIS HC A04/MF A01 CSCL 13/2

An analysis of 3 1/2 years of data on fuel jettisoning by US Air Force aircraft was performed to provide the basis for an accurate assessment of the environmental effects associated with this practice. The nature and extent of US Air Force jettisoning was examined, and the principal commands, aircraft, locations, altitudes, and quantities were identified. The reasons for fuel jettisoning were also investigated, and the relative importance of fuel jettisoning as a source of hydrocarbon pollution was estimated, considering both the possibility of ground contamination by liquid fuel, and the potential for production of photochemical oxidant pollution from the vapors. The analysis indicates that current Air Force policies concerning fuel jettisoning are adequate to minimize any negative environmental consequences, and that Air Force operational practices are in keeping with these policies. Fuel jettisoning as carried out by Air Force aircraft does not appear to produce any serious environmental consequences. GRA

NEW INTERPRETATIONS OF SHOCK-ASSOCIATED NOISE WITH AND WITHOUT SCREECH
 U. vonGlahn 21 Nov. 1980 25 p refs To be presented at the 100th Meeting of the ASA, Los Angeles, 17-21 Nov. 1980
 (NASA-TM-81590; E-569) Avail: NTIS HC A02/MF A01 CSCL 20A

Anomalous trends in present convergent nozzle (Mach 1) shock associated noise analyses and predictions, with particular emphasis on the roles of screech and jet temperature, are discussed. Experimentally measured values of shock associated noise are used to reassess data trends, including both frequency and sound pressure level. The data used includes model-scale nozzles, varying in nominal diameter from 5 cm to 13 cm, and full scale engine nozzles up to 48 cm. All data were obtained at static conditions. From this reassessment of the measured data, new empirical methods for the prediction of shock associated noise are developed. Separate procedures are presented for screech free and screech contaminated shock associated noise. In the present approach, shock associated noise spectra are developed from considerations that include the peak sound pressure level and its frequency, the low frequency sound pressure level slope, and the high frequency sound pressure level slope or roll-off; the latter is shown to vary with directivity angle. PRELIMINARY DESIGN CHARACTERISTICS OF A SUBSONIC BUSINESS JET CONCEPT EMPLOYING AN ASPECT RATIO 25 STRUT BRACED WING
 R. V. Turriziani, W. A. Lovell, G. L. Martin, J. E. Price, E. E. Swanson, and G. F. Washburn Oct. 1980 101 p refs
 (Contract NAS1-16000)
 (NASA-CR-159361) Avail: NTIS HC A06/MF A01 CSCL 01A

The advantages of replacing the conventional wing on a transatlantic business jet with a larger, strut braced wing of aspect ratio 25 were evaluated. The lifting struts reduce both the induced drag and structural weight of the heavier, high aspect ratio wing. Compared to the conventional airplane, the strut braced wing design offers significantly higher lift to drag ratios achieved at higher lift coefficients and, consequently, a combination of lower speeds and higher altitudes. The strut braced wing airplane

provides fuel savings with an attendant increase in construction costs. Author

 HC A99/MF A01 CSCL 01A

A stability test program was conducted to determine the effects of airspeed, collective pitch, rotor speed and shaft angle on stability and loads at speeds beyond that attained in the BMR/BO-105 flight test program. Loads and performance data were gathered at forward speeds up to 165 knots. The effect of cyclic pitch perturbations on rotor response was investigated at simulated level flight conditions. Two configuration variations were tested for their effect on stability. One variable was the control system stiffness. An axially softer pitch link was installed in place of the standard BO-105 pitch link. The second variation was the addition of elastomeric damper strips to increase the structural damping. The BMR was stable at all conditions tested. At fixed collective pitch, shaft angle and rotor speed, damping generally increased between hover and 60 knots, remained relatively constant from 60 to 90 knots, then decreased above 90 knots. Analytical predictions are in good agreement with test data up to 90 knots, but the trend of decreasing damping above 90 knots is contrary to the theory. A.R.H.

WIND TUNNEL INVESTIGATION OF THE AERODYNAMIC HYSTERESIS PHENOMENON ON THE F-4 AIRCRAFT AND ITS EFFECTS ON AIRCRAFT MOTION Final Report, 1 Oct. 1978 - 31 Oct. 1979

J. F. Herman and E. S. Washington AEDC Sep. 1980 96 p refs Sponsored by Air Force
 (AD-A089851; AEDC-TR-80-10) Avail: NTIS
 HC A05/MF A01 CSCL 20/4

A wind tunnel test program and an analytical study were conducted to investigate aerodynamic hysteresis phenomena on the F-4 aircraft. The wind tunnel test was conducted in the Arnold Engineering Development Center (AEDC) Aerodynamic Wind Tunnel (4T) to investigate the source of aerodynamic hysteresis in static aerodynamic data. The wind tunnel test also provided data that were used in a motion simulation study of the effect of hysteresis on predicted aircraft motion. Static longitudinal lateral directional force and moment data and wing pressure data were obtained on a 0.5 scale model (without pylons or external stores) with various simulated leading-edge slats. These data include the effects of Mach number, angle of attack, model movement, and time dependence on the aerodynamic hysteresis characteristics. Data are presented for the Mach number range from 0.7 to 0.95 at angles of attack from -4 to 24 deg at zero deg sideslip angle and for sideslip angles from -12 to 12 deg at angles of attack of 5, 10, 15, and 20 deg. Six degrees of freedom motion simulation studies were used to assess the effect of hysteresis in the rolling-moment coefficient on the prediction of aircraft motion. Simulations of various flight maneuvers were conducted both with and without hysteresis in the aerodynamic data. GRA

A COMPARISON OF NEWTON-LIKE METHODS FOR THE TRANSONIC SMALL DISTURBANCE EQUATION

A. B. Stephens and A. G. Werschulz 24 Jun. 1980 20 p refs
 (AD-A090270; NSWC/TR-80-271) Avail: NTIS
 HC A02/MF A01 CSCL 20/4

We investigate the efficiency of Newton's method and two variants of Newton's method for the numerical solution of the small disturbance equation of non-lifting transonic flow past a parabolic airfoil. In particular, it is shown that the efficiency of Newton's method can be substantially improved with respect to both storage and computational time if the Jacobian matrix is suitably altered. GRA

 HC A02/MF A01

The unsteady pressure fields prediction for a supercritical wing is considered from a bidimensional nonlinear method corrected for tridimensional interactions between strips using an asymptotic approximation. This approximation is derived for a wing with large aspect ratio and low sweep angle. An application of this method to a real case is described. Oscillation of the control surface on a rigid model in a transonic wind tunnel is considered. M.G.

THE TURBULENT WIND AND ITS EFFECT ON FLIGHT

Bernard Etkin Aug. 1980 93 p refs
 (UTIAS-Review-44; CN-ISSN-0082-5247) Avail: NTIS
 HC A05/MF A01

An overview of the problems posed for aviation by turbulent winds is presented. The technical issues, especially for design, simulation and certification, are delineated and commented upon. The present state of knowledge of turbulence at altitude and of the wind and turbulence near the ground are reviewed. The input/response problem is discussed in depth, with special attention to the requirement for unsteady aerodynamics and how it can be fulfilled. The four point model of the airplane is introduced and developed, and an extension made to the existing spectral theory of response to two dimensional inputs. Passenger comfort, gust alleviation, and representation of turbulence in piloted flight simulators are discussed. S.F.

EXPLORATORY STUDY OF HAZARD MITIGATION AND RESEARCH IN THE AIR TRANSPORT SYSTEM Final Report

R. L. Bisplinghoff, P. G. Dembling, A. J. Eggers, Jr., C. W. Harper, and J. D. Young 31 Mar. 1980 99 p refs
 (AD-A089204; EMW-00432) Avail: NTIS HC A05/MF A01
 CSCL 13/12

The study examines a series of principles that may effectively mitigate technological hazards within the Air Transport System. These principles are: precise design criteria and verification of the standards which relate to an airplane's operating environment; quality control in manufacturing with high levels of performance in design, construction, inspection, and maintenance of the system; periodic testing and evaluation of equipment and human elements to meet performance standards; training and education of key managers and operators in emergency procedures with emphasis in new systems and multi-problem hazards; establish communication modes linking key elements with institutions in the system to mitigate, respond, and recover from emergencies; a system of reporting incident and accident investigations in a prompt manner to allow for a coordinated recovery; and the system must be regulated, audited, and demonstrated frequently to protect public interest, including proper liability. These principles are then analyzed in three areas in which successful hazard mitigation will reduce the effects of increased technological applications. These topic areas include: design, construction, inspection, and maintenance; system development and operation; and liability and regulation. The study concludes that with the rapid development in high technology and with its subsequent rapid application to our national capability, technological hazards converge onto a wide variety of societies' activities. The report suggests that successful mitigation of technological hazards can be achieved through utilizing the previously outlined principles within the total air transport system environment. GRA

RESPONSES TO NATIONAL TRANSPORTATION SAFETY BOARD SAFETY RECOMMENDATIONS Quarterly Report, Apr. - Jun. 1980

J. R. Harrison et al Jul. 1980 167 p
(AD-A089971; FAA-ASF-80-2; ASF-300) Avail: NTIS
HC A08/MF A01 CSCL 01/2

This report contains NTSB recommendations and all FAA responses to Board recommendations that were delivered to the Board during the applicable quarter. In addition, the report includes NTSB requests and FAA responses concerning reconsiderations, status reports, and followup actions. The table of contents for this report reflects only those NTSB recommendations which are still open pending FAA action (i.e., those that have not been designated as 'closed' by the NTSB as a result of acceptable action). Accordingly, the table of contents may reflect a number of multiple recommendations (example: A-80-5 through 7), but background material is included only for those recommendations which remain in an 'open' status. Background information for those recommendations which have been closed is available in FAA headquarters files. GRA

(AD-A089914; FAA-CT-80-170; FAA-RD-80-105) Avail: NTIS
HC A06/MF A01 CSCL 17/7

With the planned construction of new control tower and TRACON facilities, the Federal Aviation Administration (FAA) has established a need for standardized supervisory desk complexes. The Air Traffic Control (ATC) Systems Applications Branch (ACT-210) at the Federal Aviation Administration (FAA) Technical Center conducted a study of selected field facilities. In addition, a seminar was held at the Technical Center which resulted in recommending several different supervisor's desk designs for future implementation at new facilities or as useful, functional, and efficient replacements for existing TRACON installations. Donald Bottomley, Edward G. Ezekiel, and Thomas Zurinskas

Aug. 1980 17 p

(AD-A089996; FAA-CT-80-40; FAA-RD-80-79) Avail: NTIS
HC A02/MF A01 CSCL 17/7

This study was accomplished in response to a request from Air Traffic Service (AAT-100), for development of a mockup to evaluate a centrally positioned terminal radar approach control in a tower cab (TRACAB) console. Presently, the Local Control position at Love Field, Dallas, Texas, generally faces both southeast runways, with all the attendant instrumentation in front of the controller. However, when conditions dictate a northwest operation, the Local Controller must turn away to see and sequence

his traffic. The work effort addressed the relocation of operational positions from their usual peripheral sites in the tower cab to a unique four-winged central console with each wing having its own instrumentation. This console housed two Local Control and two Airport Surveillance Radar (ASR) positions on one side of the console and a Ground Control position on the opposite side with identical instrumentation. These five positions were endowed with a 'flip/flop' capability as traffic dictated. The other two positions, Clearance Delivery/Flight Data and Watch Supervisor, remained constant at each end of the console, regardless of traffic flow. While the four-winged central console solved the Local Controller's instrumentation availability, it reflected two problems. Limited room on the console caused overcrowding and resultant overheating of the operational equipment. Local Control perambulation was restricted due to the two ASR controllers and tower peripheral boundaries. Since few airports require the 'flip/flop' design necessary by a tower located between dual runways, it was concluded that no further evaluation of this console concept would be made. GRA

ATARS IMPLEMENTATION TRADEOFF

Robert W. Sittler and Karl Seiler, III Jul. 1980 108 p refs
(AD-A089977; FAA-EM-80-10; AEM-200) Avail: NTIS
HC A06/MF A01 CSCL 01/2

The study is a comparative analysis of the costs and benefits from competing distributed and centralized ATARS architectures. The current DABS/ATARS structure is a distributed one; a new architecture is postulated for deployment as a centralized ATARS system. Distributed and centralized ATARS are compared as to performance, cost, reliability, maintainability, vulnerability and growth potential. Performance and reliability are treated as constraints to be met equally by all architectures. Maintainability is included in cost. The cost analysis including cost sensitivities forms the bulk of the study. It is found that centralization of most sites is more costly than a distributed deployment and that the individual sites which contribute most to a cost advantage for centralization lie in high density terminal areas. A most significant finding is that centralized ATARS is inferior to distributed ATARS in vulnerability. The options are about equal in growth potential. GRA

HC A03/MF A01 CSCL 01/2

The purpose of this paper is to describe formats developed for transmitting aviation-related messages over the Discrete Address Beacon System (DABS) data link. Initial data link applications include: Minimum Safe Altitude Warning (MSAW) alerts (Terminal Area); Takeoff Clearance Confirmation; Altitude Assignment Clearance Confirmation (Enroute); Weather Reports; Enhanced Terminal Information Service (ETIS); Downlink of Airborne Measurements. The formats described in this paper cover the DABS communications formats for uplink messages from the DABS sensor to the airborne data link system, and the downlink messages from the aircraft. Downlink messages include pilot requests for routine weather information and ETIS service, pilot acknowledgements for uplink tactical messages, and airborne measurements. GRA

IMPROVED AIRCRAFT CRUISE BY PERIODIC CONTROL Ph.D. Thesis

Daniel Thomas Lyons 1980 302 p

Avail: Univ. Microfilms Order No. 8025721

The possibility of improving aircraft cruise by periodic motion was investigated for subsonic aircraft with jet engines. Three cruise problems were studied: maximum range, maximum endurance, and peak altitude. Normal steady state cruise was compared with periodic cruise in which the controls and state variables were time-dependent periodic functions. Periodic results in improved performance under certain circumstances.

Periodic cruise gives greater peak altitudes than are possible with steady state cruise. A state inequality constraint which limits the peak altitude is required to retain dynamic pressure for aerodynamic control at the peak altitude. A large energy height is desirable for maximum peak altitude. However, the period increases rapidly as the energy height approaches the maximum energy height for steady cruise. Dissert. Abstr.

BIBLIOGRAPHY ON AERODYNAMICS OF AIRFRAME/ENGINE INTEGRATION OF HIGH-SPEED TURBINE-POWERED AIRCRAFT, VOLUME 1

Mark R. Nichols Nov. 1980 92 p refs
(NASA-TM-81814; L-13251-Vol-1) Avail: NTIS
HC A05/MF A01 CSCL 01C

This bibliography was developed as a first step in the preparation of a monograph on the subject of the aerodynamics of airframe/engine integration of high speed turbine powered aircraft. It lists 1535 unclassified documents published mainly in the period from 1955 to 1980. Primary emphasis was devoted to aerodynamic problems and interferences encountered in the integration process; however, extensive coverage also was given to the characteristics and problems of the isolated propulsion system elements. A detailed topic breakdown structure is used. The primary contents of the individual documents are indicated by the combination of the document's title and its location within the framework of the bibliography. T.M.

EXPERIMENTAL AND ANALYTICAL STUDIES OF A MODEL HELICOPTER ROTOR IN HOVER

F. X. Caradonna and C. Tung 1980 20 p refs Presented at the European Rotorcraft and Powered Lift Aircraft Forum, Bristol, England, 16-19 Sep. 1980
(AD-A089780; Rept-25) Avail: NTIS HC A02/MF A01 CSCL 20/4

The present study is a benchmark test to aid the development of various rotor performance codes. The study involves simultaneous blade pressure measurements and tip vortex surveys. Measurements were made for a wide range of tip Mach numbers including the transonic flow regime. The measured tip vortex strength and geometry permit effective blade loading predictions when used as input to a prescribed wake lifting surface code. It is also shown that with proper inflow and boundary layer modeling, the supercritical flow regime can be accurately predicted. GRA

CONTAINER LIFE ADAPTER-HELICOPTER (CLAH) OPERATIONAL PROTOTYPE (PREPRODUCTION) MILITARIZED UNITS FOR FLIGHT EVALUATION AND OPERATIONAL TESTING Final Report, Sep. 1978 - Apr. 1980

Edgar G. Ball Aug. 1980 76 p
(Contract DAAK51-78-C-0026; DA Proj. 1L1-62209-AH-76)
(AD-A089794; ER-15047; USAVRADCOM-TR-80-D-20) Avail:
NTIS HC A05/MF A01 CSCL 01/3

This report covers the efforts required to manufacture and test two operational preproduction militarized CLAHs for Army flight evaluation and operational suitability. The CLAH is an external load-carrying device that is suspended under a cargo helicopter and enables the helicopter flight crew to automatically align with, engage, lock on, pick up, transport, and deposit an 8 x 8 x 20 foot MILVAN or commercial container without assistance of ground crew. This production prototype CLAH design has evolved from a series of contracts involving research, study, development, and testing of experimental container lifting devices. The design change per this contract included eliminating the retractable guide system and the pyrotechnic emergency jettison system. Reliability, maintainability, logistic and cost analyses were conducted, and orientation/training sessions were provided to enable Government personnel to operate, maintain, repair, and provide logistic support for the CLAH field test program.

HELICOPTER ELECTRO-OPTICAL SYSTEM DISPLAY REQUIREMENTS. 1. THE EFFECTS OF CRT DISPLAY SIZE, SYSTEM GAMMA FUNCTION, AND TERRAIN TYPE ON PILOTS REQUIRED DISPLAY LUMINANCE

Aaron Hyman, Richard M. Johnson, and Paul A. Gade Mar. 1980 29 p refs
(DA Proj. 2Q1-62722-A-765)
(AD-A089755; ARI-TR-441) Avail: NTIS HC A03/MF A01 CSCL 05/8

Twenty-four Army helicopter pilots viewed videotaped segments of low-level and nap-of-the-Earth (NOE) helicopter flights as presented on television monitors designed to simulate an airborne low-light-level television cockpit display system. While viewing these displays in an environment having no additional ambient illumination, these pilots were asked to set cockpit monitor luminance at the lowest level that they judged would permit successful flight control over the terrain being overflown. Each pilot adjusted luminance levels for eight different display conditions formed by the factorial combination of display size, type of terrain, and object-luminance to display-luminance transfer function (system gamma function). Results show that pilots used lower luminance settings when viewing the larger of the two display sizes presented. They also used significantly lower luminance settings when viewing wooded terrain, with the system gamma function modified to provide 'enhanced' contrast in the luminance range of interest, as against an unmodified system gamma function. The pilot's subjective impressions agreed with their measured settings. This report discusses the impact of these results on the specifications of display requirements for a low light-level television system for aiding night NOE flight. GRA

FITMENT OF TAMAM STANDBY ATTITUDE INDICATORS TO MACCHI AIRCRAFT Engineering Report

D. K. King Aug. 1980 17 p
(AD-A089378; TI-683) Avail: NTIS HC A02/MF A01 CSCL 01/4

The Aircraft Research and Development Unit reworked Macchi MB 326H Draft Modification Order No 365 to install the 'TAMAM' Standby Attitude Indicator (SAI) in the front and rear instrument panels of Macchi aircraft. Modifications were also developed to provide independent switching and circuit protection for each SAI on the existing FIRE/OVERHEAT panel in the Right hand console of the front cockpit. RPM indicator lighting control was transferred from its individual rheostat to the panel lighting control and protection circuit. The modification was successfully test flown with particular emphasis on instrument readability, lack of conflict with the flight controls and ease of operation. Residual errors noted in the SAI's after maneuvers were large but were immediately cancelled by operation of the caging knob. Trial flying of the installation showed the modification to be operationally acceptable and fleet wide installation was recommended.

LOW-SPEED AERODYNAMIC PERFORMANCE OF 50.8-CENTIMETER-DIAMETER NOISE-SUPPRESSING INLETS FOR THE QUIET, CLEAN, SHORT-HAUL EXPERIMENTAL ENGINE (QCSEE)

John M. Abbott, James H. Diedrich, and Robert C. Williams Aug. 1978 37 p refs
(NASA-TP-1178; E-9542) Avail: NTIS HC A03/MF A01 CSCL 21E

Two basic inlet concepts, a high throat Mach number (0.79) design and a low throat Mach number (0.60) design, were tested with four diffuser acoustical treatment designs that had face sheet porosity ranging from 0 to 24 percent for the high Mach number inlet and 0 to 28 percent for the low Mach number inlet. The tests were conducted in a low speed wind tunnel at free stream velocities of 0, 41, and 62 m/sec and angles of attack to 50 deg. Inlet throat Mach number was varied about

the design value. Increasing the inlet diffuser face sheet porosity resulted in an increase in total pressure loss in the boundary layer for both the high and low Mach number inlet designs, however, the overall effect on inlet total pressure recovery of 0.991 at the design throat Mach number, a free stream velocity of 41 m/sec, and an angle of attack of 50 deg; Inlet flow separation at an angle of attack of 50 deg was encountered with only one inlet configuration the high Mach number design with the highest diffuser face sheet porosity (24 percent). A.R.H.

N81-11038*# National Aeronautics and Space Administration, Lewis Research Center, Cleveland, Ohio. Propulsion Lab. **OFF-DESIGN PERFORMANCE LOSS MODEL FOR RADIAL TURBINES WITH PIVOTING, VARIABLE-AREA STATORS** Peter L. Meitner and Arthur J. Glassman Nov. 1980 15 p refs (NASA-TP-1708; AVRADCOM-TR-80-C-13; E-455) Avail: NTIS HC A02/MF A01 CSCL 21E

An off-design performance loss model was developed for variable stator (pivoted vane), radial turbines through analytical modeling and experimental data analysis. Stator loss is determined by a viscous loss model; stator vane end-clearance leakage effects are determined by a clearance flow model. Rotor loss coefficient were obtained by analyzing the experimental data from a turbine rotor previously tested with six stators having throat areas from 20 to 144 percent of design area and were correlated with stator-to-rotor throat area ratio. An incidence loss model was selected to obtain best agreement with experimental results. Predicted turbine performance is compared with experimental results for the design rotor as well as with results for extended and cutback versions of the rotor. Sample calculations were made to show the effects of stator vane end-clearance leakage. Author

N81-11039*# National Aeronautics and Space Administration, Lewis Research Center, Cleveland, Ohio. **SURFACE PYROMETRY IN PRESENCE OF RADIATION FROM OTHER SOURCES WITH APPLICATION TO TURBINE BLADE TEMPERATURE MEASUREMENT** Donald R. Buchele Nov. 1980 19 p refs (NASA-TP-1754; E-396) Avail: NTIS HC A02/MF A01 CSCL 21E

Surface pyrometry is feasible even when the amount of surface radiation is exceeded by radiation from surrounding sources. To measure and correct for this interfering radiation, several methods that use multiple wavelength pyrometry were compared by an error analysis. For a specific application to turbine blade temperature measurement in a turbofan engine, a two wavelength method was best. Auxiliary measurements at the same wavelengths substantially improve the accuracy of the method. S.F.

N81-11040*# ARO, Inc., Arnold Air Force Station, Tenn. **AN EVALUATION OF STATISTICAL METHODS FOR THE PREDICTION OF MAXIMUM TIME-VARIANT INLET TOTAL PRESSURE DISTORTION Final Report, 1 Oct. 1978 - 24 Sep. 1979**

Marvin E. Sanders and Richard E. Christenson AEDC Sep. 1980 56 p refs Sponsored by Air Force (AD-A089817; AEDC-TR-79-77) Avail: NTIS HC A04/MF A01 CSCL 21/5

An analysis was conducted to determine the accuracies and limitations of three statistical methods used to predict engine-face maximum time-variant total pressure distortion. The statistical methods have all been proposed as low-cost alternatives to the time-consuming and costly deterministic method generally used for reducing engine-face time-variant total pressure data. The statistical methods are evaluated by comparing their predicted distortion values and patterns to those measured with the deterministic method. Data comparisons from tests of four different inlet models, covering a wide range of Mach numbers, mass flow ratios, model attitudes, and distortion factors, were used during the analysis. The results show good agreement between the measured and predicted values for all three statistical methods. The distortion pattern predictions, however, were inadequate at

conditions with high total pressure fluctuation (turbulence). It is recommended that improvements continue to be made in the statistical methods, particularly adjustments for high turbulence conditions, and that the Melick method be used as an on-line distortion analysis tool for inlet performance tests. GRA

N81-11041*# Pratt and Whitney Aircraft, West Palm Beach, Fla. Government Products Div. **DISK RESIDUAL LIFE STUDIES. PART 1: F100 1ST-STAGE TURBINE DISK (IN100)** J. S. Cargill, J. K. Malpani, and Y. W. Cheng Dec. 1979 108 p refs (Contract F33615-77-C-5172; AF Proj. 7351) (AD-A089791; PWA-FR-11878-Vol-1; AFML-TR-79-4173-Pt-1) Avail: NTIS HC A06/MF A01 CSCL 21/5

A residual fatigue life prediction method, suitable for Retirement-for-Cause application, has been developed for two P WA turbine disks: the F100 1st-stage high pressure turbine disk and the TF30 10th-stage compressor disk. The method is based upon interaction of fracture mechanics crack propagation modeling concepts with laboratory nondestructive evaluation (NDE) techniques. Fracture mechanics life models were developed using the GPD hyperbolic sine (SINH) model refined during an earlier Air Force Materials Laboratory (AFML) program. Stress intensity (K) solutions for the engine components were based upon experimental effective K determinations made during full-scale component fatigue tests. The NDE techniques developed for disk inspections included acoustic emission (AE), eddy current (EC), and fluorescent penetrants (FP). Stress-enhanced penetrant and semi-automated rotating probe EC techniques were developed as periodic inspections, while the AE time-domain technique was developed as a real-time inspection tool. GRA

N81-11042*# RAND Corp., Santa Monica, Calif. **AIRCRAFT TURBINE ENGINE MONITORING EXPERIENCE. AN OVERVIEW AND LESSONS LEARNED FROM SELECTED CASE STUDIES Interim Report** John L. Birkler and J. R. Nelson Aug. 1980 115 p refs (Contract F49620-77-C-0023) (AD-A089752; RAND/R-2440-AF) Avail: NTIS HC A06/MF A01 CSCL 21/5

Two approaches have evolved in attempts to improve engine operations, maintenance, and management while reducing support costs. The first concentrates on short-term practices (inflight data are recorded in a snapshot mode). The second approach focuses on long-term benefits through improved knowledge of the operating environment. (Data must be recorded continuously on at least a few aircraft.) Engine duty-cycle research by the military services has demonstrated that neither the services nor the manufacturers have a clear idea of power requirements and frequent throttle movements during operational sorties in fighter aircraft and have generally overestimated engine parts life and underexpected life-cycle costs. The narrow concept of cost savings over the short term should not be the sole criterion on which monitoring systems are judged. Monitoring systems for recent and future engines should include continuously recorded data now that reliability, durability, and cost issues are almost on an equal footing with performance. GRA

N81-11043*# National Aeronautics and Space Administration, Ames Research Center, Moffett Field, Calif. **SIMULATING STUDY OF THE INTERACTION BETWEEN THE PROPULSION AND FLIGHT CONTROL SYSTEMS OF A SUBSONIC LIFT FAN VTOL** Bruce E. Tinning and Gary L. Cole Nov. 1980 50 p refs (NASA-TM-81239; A-8346) Avail: NTIS HC A03/MF A01 CSCL 01C

The possibility of interactions between the propulsion and flight control systems of a three-fan subsonic VTOL aircraft was studied using nonreal time simulation. Time histories of critical internal engine parameters were obtained and possible deleterious effects of engine dynamics on flight control were identified and analyzed. No deleterious effects, with the exception of the effects of the fan actuator deadband, were found. A method of alleviating these effects through feedback of the actuator output to the flight controller was developed. T.M.

FLIGHT TERMINATION RECEIVER/DECODERS DESIGN, PERFORMANCE AND CERTIFICATION Final Report

1980 20 p Supersedes RSG-313-72
(AD-A089746; RSG-313-80; RSG-313-72) Avail: NTIS HC A02/MF A01 CSCL 16/1

This document contains design, performance, and certification test requirements for range safety flight termination system command destruct receiver/decoders. It replaces Range Commanders Council (RCC) Range Safety Group (RSG) Document 313-72. Flight termination is an emergency action taken by Range Safety for the protection of life and property when a vehicle violates established safety criteria. This action circumvents the vehicle's normal control modes and ends its power and/or controlled flight. Flight termination procedures may include any one or a combination of the following: (a) Complete vehicle destruction by explosive means; (b) Aerodynamic disruption of the flight mechanism; (c) Deployment of high drag devices; (d) Fuel cut-off to the combustion chambers of ignited motors; (e) Inhibit ignition of unburned motors; and (f) Other special actions dictated by the vehicle configuration or special problems. These actions may be activated by manual, computerized and/or automated modes. GRA

MULTIVARIABLE CLOSED-LOOP ANALYSIS AND FLIGHT CONTROL SYNTHESIS FOR AIR-TO-AIR TRACKING Final Report, 1 Jan. - 31 Dec. 1979

David K. Schmidt 18 Jun. 1980 105 p refs
(Grant AF-AFOSR-0042-79; AF Proj. 2313)
(AD-A090050; AFOSR-80-0961TR) Avail: NTIS HC A06/MF A01 CSCL 05/8

A synthesis method based on optimal control techniques, closed-loop task-oriented design objectives, and an optimal control model of the human pilot was applied to augment the system dynamics in the air-to-air tracking task. Single and multi-axis analyses were performed. Single axis results, obtained for longitudinal pitch tracking with different sets of active sight display dynamics, indicate the optimum system dynamics were affected by numerator (or display) dynamics. Improved tracking performance was predicted, and the trends in augmented system dynamics (eigenvalues) were shown to agree with previous results. Moving-base simulation results obtained for a highly-banked flight condition were also used to establish a new multi-axis pilot model. This model is considered suitable for simultaneous control of the dynamically interacting longitudinal and lateral-directional axes of the vehicle/display system. The system augmentation, based on this model, again was predicted to significantly improve performance. The trends in system eigenvalues for various augmentation levels showed good agreement with the above longitudinal results. However, the lateral-directional axis was found to be much more important, and significant modification of the dynamics were predicted to lead to system improvements. GRA

A MULTIVARIATE APPROACH TO HANDLING QUALITIES RATING SCALE DEVELOPMENT Final Report, 1 Jun. - 30 Sep. 1979

Ralph H. Smith and Warren S. Torgenson Jan. 1980 186 p refs
(Contract F49620-79-C-0158; AF Proj. 2313)
(AD-A089825; AFOSR-80-0876TR) Avail: NTIS HC A09/MF A01 CSCL 01/3

Recent advances in aircraft handling qualities indicate the possibility that a small number of physical dimensions can be used for handling qualities quantification. Several candidate metrics for handling qualities now exist which form a portion of the set required. An exploratory study was conducted to evaluate the use of multivariate analysis techniques for identification of the necessary physical dimensions of handling qualities. It is concluded that the Cooper-Harper scale can be considered a direction in the space defined by the first few principal components of the experimental variance-covariance matrix. A simulation experiment is proposed which should permit development of a set of nonadjectival rating scales which will complement the Cooper-Harper scale, reduce the variability of pilot rating data, and better support the flight test identification of handling deficiencies. THE PRINCIPLES AND APPLICATIONS OF CRYOGENIC WIND TUNNELS

M. J. Goodyer *In* AGARD Cryogenic Wind Tunnels Jul. 1980 6 p refs
Avail: NTIS HC A12/MF A01

The background to the emergencies of the cryogenic wind tunnel is described and its advantages compared with other means for raising the values of test Reynolds number to full scale are discussed. The basic aero and thermodynamics of wind tunnel testing is introduced and the advantages of low temperature in low speed and in transonic testing are quantified. Attention is drawn to secondary advantages unique to this tunnel, and to the potentials of unconventional test gases. Descriptions of current types and applications of cryogenic wind tunnels are included. R.K.G.

MODEL DESIGN AND INSTRUMENTATION FOR INTERMITTENT CRYOGENIC WIND TUNNELS

J. D. Cadwell *In* AGARD Cryogenic Wind Tunnels Jul. 1980 8 p refs
Avail: NTIS HC A12/MF A01

The design and instrumentation of a model for an intermittent cryogenic wind tunnel is discussed. The model requirements including tolerances and data accuracy are noted. The mechanical design of the wing, the considerations for material to be used, and the instrumentation that is to be installed in the wing are discussed. The design of the fuselage center section, the six component balance installation with heaters, and the heater for the balance-to-sting adapter is reviewed. The design and the aft fuselage and empennage, and the fuselage nose including the instrumentation package to be housed in the fuselage nose compartment is shown. The model conditioning that is required

N81-11060

to obtain acceptable data; prevent frost buildup on the model after it is cooled, and reheating the model to make model configuration changes is also discussed. R.K.G.

CALIBRATION OF A BLOWDOWN-TO-ATMOSPHERE CRYOGENIC WIND TUNNEL

J. D. Cadwell *In* AGARD Cryogenic Wind Tunnels Jul. 1980 9 p refs

Avail: NTIS HC A12/MF A01

Calibration of short duration cryogenic wind tunnels pose difficulties and requirements beyond those already present in the calibration either of conventional short run time facilities or of cryogenic continuous tunnels. The requirements and instrumentation for calibration of a transonic blowdown to atmosphere cryogenic wind tunnel are described, with emphasis on those aspects differing from the calibration of similar non-cryogenic tunnels. Reference is made of the literature for detailed descriptions of conventional calibration practices which remain applicable for cryogenic blowdown tunnels. Author

THE CONTROL OF PRESSURE, TEMPERATURE AND MACH NUMBER IN A BLOWDOWN-TO-ATMOSPHERE CRYOGENIC WIND TUNNEL

J. D. Cadwell *In* AGARD Cryogenic Wind Tunnels Jul. 1980 8 p ref

Avail: NTIS HC A12/MF A01

The control system that used in a four foot blowdown wind tunnel prior to the modification of the facility to a cryogenic operation is reviewed. The control requirements for a cryogenic blowdown tunnel and the Mach and Reynolds number controls are discussed. The proposed method to be used to control the temperature in the cryogenic tunnel is shown. The start of a blow sequence in a cryogenic blowdown tunnel and the detrimental effect that it has on a pre cooled model is considered. A transient protection system, to be evaluated in a one foot pilot tunnel that will shield the model during the start of a run is shown. The conventional method of measuring model attitude by correcting the pod angle for sting and balance deflections is shown to be inadequate in a cryogenic blowdown tunnel and alternate methods that can be used are discussed. A PROBABILISTIC ANALYSIS OF ELECTRICAL EQUIPMENT VULNERABILITY TO CARBON FIBERS

Wolf Elber Oct. 1980 31 p refs (NASA-TM-80217) Avail: NTIS HC A03/MF A01 CSCL 11D

The statistical problems of airborne carbon fibers falling onto electrical circuits were idealized and analyzed. The probability of making contact between randomly oriented finite length fibers and sets of parallel conductors with various spacings and lengths was developed theoretically. The probability of multiple fibers joining to bridge a single gap between conductors, or forming continuous networks is included. From these theoretical considerations, practical statistical analyses to assess the likelihood of causing electrical malfunctions was produced. The statistics obtained were confirmed by comparison with results of controlled experiments. A.R.H.

N81-11116# General Dynamics/Convair, San Diego, Calif. DEVELOPMENT OF ADVANCED INTERCEPTOR SUBSTRUCTURAL MATERIAL

Julius Hertz and Norman R. Adsit Aug. 1980 163 p refs (Contract DAAG46-78-C-0056; DA Proj. 1W1-62113-A-661) (AD-A090127; AMMRC-TR-80-44) Avail: NTIS HC A08/MF A01 CSCL 11/4

This report is aimed at the development of ultra-high modulus graphite/epoxy structures for use in future advanced terminal interceptors. The work has produced a preliminary full-scale design and demonstrated, experimentally and analytically, that the design will carry the loads. More study needs to be conducted and some further experimental work is recommended before a full-scale article is tested. The present work has concentrated on testing the aft joint and an intermediate ring for holding an equipment package in the frustra. GRA

FIBER RELEASE FROM IMPACTED GRAPHITE REINFORCED EPOXY COMPOSITES Final Report

T. C. Babinsky Jun. 1980 71 p Sponsored by NASA (NASA-CR-163684; AD-A090112; NSWC/TR-80-216) Avail: NTIS HC A04/MF A01 CSCL 11D

Carbon fibers released from composites by aircraft fires and crashes can cause electrical shorts and consequent equipment damage. This report investigates less vigorous release mechanisms than that previously simulated by explosive burn/blast tests. When AS/3501-6 composites are impacted by various head and weight configurations of a pendulum impactor, less than 0.2 percent by weight of the original sample is released as single fibers. Other fiber release mechanisms studied were air blasts, constant airflow, torsion, flexural, and vibration of composite samples. The full significance of the low single fiber release rates found here is to be evaluated by NASA in their aircraft vulnerability studies. GRA

MICROCRACKING IN GRAPHITE-EPOXY COMPOSITES Interim Report

Ernest G. Wolff 1 Sep. 1980 34 p refs (Contract F04701-79-C-0080) (AD-A089894; TR-0080-5950-01-1; SD-TR-80-65) Avail: NTIS HC A03/MF A01 CSCL 11/4

Microcracking in composite materials is commonly caused by ply stiffness variations in crossply layup during application of applied stress, and by differential thermal expansion coefficients of the fiber and the matrix during thermal excursions. It is responsible for changes in macro- and micromechanical properties, permeability to gases, and dimensional instability. Theories, experimental techniques, and effects of microcracking are reviewed. The coefficient of cracking expansion is defined, and procedures for reducing deleterious effects of microcracking on composite structures are presented. GRA

COMPATIBILITY OF AIRCRAFT OPERATIONAL FLUIDS WITH A GRAPHITE/EPOXY COMPOSITE: DEVELOPMENT OF AN EXTERIOR COATING SYSTEM AND REMOVER Final Report

K. G. Clark 26 Jun. 1980 43 p refs
(ZF54502001)

(AD-A090049; NADC-80046-60) Avail: NTIS
HC A03/MF A01 . CSCL 11/4

The objective of this investigation is the identification of aircraft operational and specialty chemical which are potentially detrimental to the integrity of organic matrix composites. In this report, results of several studies made with the graphite/epoxy Hercules AS/3501-6 are disclosed. Several alternatives to the problem of paint removal are discussed. It is concluded that water and maintenance fluids containing water produce significant plasticization of graphite/epoxy, while most solvents, oils, hydraulic fluids, and fuel cause no significant mechanical losses. Paint removal was found to be a significant problem due to the activity of chemical removers. Removal is complicated by the fact that stripping thermoset coatings from graphite/epoxy is more difficult than stripping from aluminum. A 'weak link' coating system using a nitrocellulose primer is, thus far, the best strippable composite coating if used with the simple methylene chloride remover designated 4-70-1. It is recommended that confirmational testing with tensile, flexure, compression, fatigue and dynamic mechanical specimens of graphite/epoxy and possibly some adhesive, be made. Following these tests, the nitrocellulose/polyurethane coating system should be field tested on graphite/epoxy aircraft substrates. GRA

THE IMPLICATIONS OF LABORATORY ACCELERATED CONDITIONING OF CARBON FIBRE COMPOSITES

E. C. Edge In AGARD Effect of Serv. Environ. on Composite Mater. Aug. 1980 17 p refs

Avail: NTIS HC A15/MF A01

The evidence on the effects of long term natural weathering of carbon fiber composites is examined and its implications with regard to the conditioning of test specimens discussed. The effects of laboratory accelerated tests on the properties of some composite materials are considered in conjunction with the relevance of data thus acquired to real life situations and the need to generate the data with reasonable speed for design considerations.

The changes in conditioning procedure which have taken place are outlined along with the factors which have influenced these changes. Author

EFFECT OF VARIOUS ENVIRONMENTAL CONDITIONS ON POLYMER MATRIX COMPOSITES

R. C. Tennyson In AGARD Effect of Serv. Environ. on Composite Mater. Aug. 1980 21 p refs

Avail: NTIS HC A15/MF A01

Experimental results obtained on the short and long term behavior of polymer matrix composites subjected to various environmental conditions are given. Changes in mechanical stiffness, strength and coefficient of thermal expansion were measured under ambient pressure and thermal vacuum conditions. In all tests involving the vacuum environment, measurements were made in-situ, necessitating the use of mechanical loading fixtures acting through flexible bellows to provide stiffness and strength data. Results are given on the effects of varying some fabrication parameters (length of post-cure time and rate of cool-down in autoclave) on the changes observed in strength and stiffness. The materials investigated include: graphite/epoxy, boron/epoxy, PRD-49/epoxy and E glass/epoxy. S.F.

N81-11131# Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Brunswick (West Germany). Inst. for Structural Mechanics.

PREDICTABILITY OF MOISTURE ABSORPTION IN GRAPHITE/EPOXY SANDWICH PANELS

H. W. Bergmann and P. Nitsch In AGARD Effect of Serv. Environ. on Composite Mater. Aug. 1980 11 p refs

Avail: NTIS HC A15/MF A01

Graphite/epoxy materials tend to degrade in hot and moist environments. The high dependence of the strength loss on the moisture content demands an assessment of the amount and distribution of absorbed moisture, particularly in the case of lightweight sandwich panels. The reliability of such predictions hinges on the formulation of theoretical considerations, the accuracy of numerical processes, the definition of material constants and a proper interpretation of the environmental conditions. The impact of errors in these parameters on predicted moisture contents, and comparisons of analytical forecasts with experimentally determined values, are the topics of this paper. S.F.

CONSTANT-AMPLITUDE AND FLIGHT-BY-FLIGHT TESTS ON CFRP SPECIMENS

F. J. Arendts, K. O. Sippel, and D. Weisgerber In AGARD Effects of Serv. Environ. on Composite Mater. Aug. 1980 12 p refs Sponsored in part by Ministry of Defense

Avail: NTIS HC A15/MF A01

Constant amplitude and flight by flight tests with five different load spectra were done with unnotched carbon fiber reinforced plastic specimens. The influence of overloads was investigated. The test results were compared with fatigue life predictions based on 'miner's rule' applied for different conditions. Overloads in all cases cause a significant reduction of the fatigue life. Fatigue life estimations based on 'miner's rule' are on the unsafe side in some cases by more than a factor 10, getting a big scatter among the cases investigated. S.F.

N81-11134# Laboratorium fuer Betriebsfestigkeit, Darmstadt (West Germany).

FATIGUE STRENGTH OF CFRP UNDER COMBINED FLIGHT-BY-FLIGHT LOADING AND FLIGHT-BY-FLIGHT TEMPERATURE CHANGES

J. J. Gerharz and D. Schuetz In AGARD Effect of Serv. Environ. on Composite Mater. Aug. 1980 24 p refs

Avail: NTIS HC A15/MF A01

Influence of environment on the fatigue of carbon fiber reinforced plastics unnotched, notched and bolted specimens is studied. The specimens are simultaneously subjected to load and environmental histories. A flight by flight load and environment sequence typical for the wing root of a fighter airplane is applied. Tests with simplified simulation of environment, allowing high loading frequencies, are run. The admissibility of the simplifications is evaluated by comparing the results of each simplified test with the results from long time quasi real time test with temperatures accompanying the loads in each flight. The 'quasi real time' flight by flight program includes temperature cycles and a humidity cycle. The specimens are heated and cooled by preconditioned air forced through the test chamber. The results of room temperature fatigue tests and of static tests at various environmental conditions are available. For a constant fatigue stress level residual strength and stiffness data demonstrate the damage growth made apparent by ultrasonic scan records. S.F.

N81-11135# Royal Netherlands Aircraft Factories Fokker, Rijswijk.

FATIGUE TEST RESULTS OF CARBON FIBER REINFORCED PLASTIC F28 AIRCRAFT COMPONENT AND ITS STRUCTURAL DETAILS

J. A. A. M. Dijns *In* AGARD Effect of Serv. Environ. on Composite Mater. Aug. 1980 5 p

Avail: NTIS HC A15/MF A01

As a part of the development program on the structural application of carbon fiber reinforced plastic composites in aircraft structures, a speedbrake was designed and built in carbon fiber reinforced plastics and aramide fiber composites. Different configurations were studied and one was selected for a detailed design in the form of a schematic model. Test were carried out on structural details and two schematic speedbrake models were fabricated for full scale static and dynamic load tests. One speedbrake was produced for flight testing on an operational aircraft. The tests resulted in a design of the speedbrake in which no metal parts were used and in which all joints were bonded with 120 C and room temperature curing adhesives, without the use of additional fasteners. The first model speedbrake was successfully tested to ultimate load without failure or any plastic deformation. The second model speedbrake was tested at a maximum fatigue load equal to 65 percent of the ultimate load. The full size CFRP speedbrake showed a weight saving of 25 percent when compared with the Al alloy design. S.F.

EROSION AND IMPACTS ON COMPOSITE HELICOPTER BLADES [EROSION ET IMPACTS SUR LES PALES D'HELICOPTERES EN COMPOSITES]

M. Torres *In* AGARD Effect of Serv. Environ. on Composite Mater. Aug. 1980 10 p *In* FRENCH

Avail: NTIS HC A15/MF A01

Helicopter rotors are subjected to a certain number of aggressions associated with the environment in which they rotate. The use of new materials such as carbon and glass epoxy composites requires the manufacturer to conduct specific qualification research programs for each of these aggressions. The modes of degradation from rain and sand erosion and from civil and military impacts on blades made of composite materials are presented. Research on erosion enabled selection of the most effective protective materials. Experience in the use of blades as well as results from firing and impact tests show an excellent fatigue behavior after shocks and impact, due in a large measure to the fail-safe character of composite materials. This good behavior, associated with the possibility of very extensive repairs, is an important factor to the superiority of composite blades over metal blades. Transl. by A.R.H.

N81-11139*# National Aeronautics and Space Administration, Langley Research Center, Hampton, Va.

GRAPHITE-EPOXY PANEL COMPRESSION STRENGTH REDUCTION DUE TO LOCAL IMPACT

Michael F. Card and Marvin D. Rhodes *In* AGARD Effect of Serv. Environ. on Composite Mater. Aug. 1980 13 p refs

Avail: NTIS HC A15/MF A01 CSCL 11D

The effects of low velocity impact on the compressive strength of graphite/epoxy structures are reviewed. Extensive tests were conducted on sandwich beams, laminated plates and stiffened panels. Conditions for failures were investigated by impact tests on statically loaded test specimens. Lightly loaded graphite structures (such as aircraft secondary structure) were insensitive to impact damage. In more heavily loaded structures, (such as wing panels), appreciable reductions in compressive strength occurred. The implications of the tests for structural design are discussed by comparing panel masses for designs where ultimate strains were reduced due to impact considerations with the masses of designs with higher ultimate strains. Preliminary test data are presented to show the possibility of improvements in damage to tolerance achievable by using an alternate matrix material. R.K.G.

N81-11141# Centre d'Essai Aeronautique, Toulouse (France). **ASSESSING THE BEHAVIOR OF HIGH MODULUS COMPOSITE MATERIALS IN LIGHTNING [EVALUATION DU COMPORTEMENT A LA Foudre DE STRUCTURES EN MATERIAUX COMPOSITES HAUT MODULE]**

J. Rouchon and D. Gall *In* AGARD Effect of Serv. Environ. on Composite Mater. Aug. 1980 14 p *In* FRENCH

Avail: NTIS HC A15/MF A01

Lightning strikes of aircraft in flight are relatively frequent and result in damage and even destruction to both equipment and structures, particularly those made of composite materials. Generalities about lightning are reviewed and methods for measuring it during flight and simulating it on the ground are described. Results are presented for laboratory tests on carbon-epoxy monolithic and boron-epoxy coated sandwich specimens, and on the elements of real structures. Associated control processes are also considered. Transl. by A.R.H.

N81-11142# Boeing Co., Seattle, Wash. **LIGHTNING PROTECTION CONSIDERATIONS FOR GRAPHITE/EPOXY AIRCRAFT STRUCTURE**

S. D. Schneider *In* AGARD Effect of Serv. Environ. on Composite Mater. Aug. 1980 6 p refs

Avail: NTIS HC A15/MF A01

When advanced composites such as graphite/epoxy were first being considered for aircraft structure, a common belief was that lightning would heavily damage the structure. This belief has since proven to be false. Advanced composites react to lightning strikes in a manner different from aluminum, but the resultant damage is by no means alarming. Two basic types of lightning damage to which aircraft structures are subjected, are discussed. Known, documented techniques and design philosophies for protection against lightning caused structural damage are reviewed for classical aluminum aircraft structure fabricated

with metal fasteners, and the impact of graphite/epoxy on these classical approaches is addressed. Detailed lightning test criteria, test techniques, and criteria are also given and related to graphite structures. R.K.G.

THE POTENTIAL FOR DAMAGE FROM THE ACCIDENTAL RELEASE OF CONDUCTIVE CARBON FIBERS FROM AIRCRAFT COMPOSITES

Vernon L. Bell *In* AGARD Effect of Serv. Environ. on Composite Mater. Aug. 1980 21 p refs

Avail: NTIS HC A15/MF A01 CSCL 11D

Carbon and graphite fibers are known to be electrically conductive. The rapidly accelerating use of carbon fibers as the reinforcement in filamentary composite materials brought up the possibility of accidental release of carbon fibers from the burning of crashed commercial airliners with carbon composite parts. Such release could conceivably cause widespread damage to electrical and electronic equipment. The experimental and analytical results of a comprehensive investigation of the various elements necessary to assess the extent of such potential damage in terms of annual expected costs and maximum losses at low probabilities of occurrence are presented. A review of NASA materials research program to provide alternate or modified composite materials to overcome any electrical hazards from the use of carbon composites in aircraft structures is described. R.K.G.

US NAVY SERVICE EXPERIENCE WITH ADVANCED COMPOSITES

A. Somoroff, M. Dubberly, J. M. McGinn, M. Tarricone, and A. Manno (Naval Air Development Center, Warminster, Pa.) *In* AGARD Effect of Serv. Environ. on Composite Mater. Aug. 1980 16 p refs

Avail: NTIS HC A15/MF A01

Lifetime durability information encompassing laboratory programs, exposure of ground specimens and observation of flight structures is presented. The specific structures discussed include the F-14 horizontal stabilizer and the H-46 rotor blade which are in production, and the YAV-8B wing developed for production of the AV-8B. Also discussed are S-3 spoilers and F-4 access doors which were developed exclusively to acquire service data. It is noted that the F-18 aircraft makes extensive use of graphite-epoxy composites in primary wing, horizontal stabilizer, and vertical stabilizer skin structure. As of the end of February 1980, eleven F-18 development aircraft are engaged in flight test evaluation. A cumulative total of more than 900 flight hours have been accumulated with the highest number of flight hours for an individual aircraft being 214 and the longest calendar service time for an individual aircraft being 18 months. During this period the graphite-epoxy structure has performed well and without incident. J.M.S.

TOXICITY OF SYNTHETIC HIGH DENSITY AND CONVENTIONAL HYDROCARBON JET FUELS TO A SOIL BACTERIUM Technical Report, Sep. 1978 - Sep. 1979

Sheldon A. London and Charlie R. Mantel Aug. 1980 22 p refs

(AF Proj. 6302)

(AD-A089527; AFAMRL-TR-80-105)

Avail: NTIS

HC A02/MF A01 CSCL 06/20

The effects of selected high density and conventional jet fuels on the growth kinetics of a soil microorganism were determined. A culture of *Enterobacter cloacae* isolated from soil was exposed to various concentrations of each fuel in a mineral salts medium and bacterial growth was monitored turbidimetrically and by viable count techniques. Effects were indicated by observing changes in maximum bacterial growth, growth rate, lag time, and death rate. The majority of the fuels studied manifested their effects by decreasing the number of viable organisms during the stationary growth period. Stable emulsion formation resulted in erroneous turbidimetric determina-

tions. The applicability of bacterial systems as indicators of toxicity of water insoluble jet propellants was discussed. GRA

COMPUTER BASED IN-FLIGHT MONITORING

Kjell Folkesson *In* AGARD Fault Tolerance Design and Redundancy Management Tech. Sep. 1980 23 p

Avail: NTIS HC A08/MF A01

Various computer techniques used to monitor flight safety critical flight control systems components such as sensors, servos, and the FCS computer itself are described. Flight safety critical FCS sensors and usually redundant. The degree of redundancy is a function of the control authority of the sensors, the stability of the aircraft, and existing back-up arrangements. The digital FCS computer can be used for servo monitoring in many different ways. The servo configuration usually determines the best monitor solution. In redundant servo configurations, various signals, such as electrical current, differential pressure, velocity, or servo position, can be provided to the digital computer and monitored for failure detection. The FCS digital computer is usually a flight safety critical element and must be closely monitored. Failures must be detected and isolated with very high confidence. In redundant digital FCS computers, both computer self test and monitoring of the computer outputs are used to detect computer failures. The monitoring can be realized in software or in external hardware. E.D.K.

DETECTING THE FAILURE OF AIRCRAFT SENSORS USING ANALYTICAL REDUNDANCY [DETECTION DE PANNE DE CAPTEURS D'AVION PAR UTILISATION DE LA REDONDANCE ANALYTIQUE]

Marc Labarrere *In* AGARD Fault Tolerance Design and Redundancy Management Tech. Sep. 1980 17 p refs *In* FRENCH; ENGLISH summary

Avail: NTIS HC A08/MF A01

Failure detection techniques implemented on-board aircraft must be simple and robust. By replacing a triplex vital system with a duplex system associated with analytical redundancy, the problem is reduced to isolating the failed sensor. Estimation techniques are well suited here because of the atmospheric turbulence factor. Different techniques have been used according to whether the nature of the analytical redundancy is stochastic, deterministic, static, or dynamic. Various estimation algorithms used include: (1) mixed observations; (2) estimation by observers or Kalman filters, using one or several equations and one or several measurements; and (3) autoadaptive techniques by identifying the flight configuration. A solution based on the choice and use of deterministic redundancy relations which are independent of atmospheric disturbances is presented and applied to the records of real flights. FAILURE MANAGEMENT TECHNIQUES FOR HIGH SURVIVABILITY

Thomas B. Cunningham *In* AGARD Fault Tolerance Design and Redundancy Management Tech. Sep. 1980 25 p refs

Avail: NTIS HC A08/MF A01

Survivability of aircraft can be greatly enhanced by employing a number of considerations and techniques in design and placement of avionics components. The initial sizing and location of surfaces should include the impact of survivability. Avionics hardware sharing offers cost reductions and can provide high performance if reliability and survivability issues are successfully addressed. Observers offer a structure for seeking solutions to survivability problems. Observers for in the loop sensor reconstruction often require stability margin enhancement. Techniques for examining this problem and improving stability exist. These considerations are discussed in detail and are combined with

trends in sensor and computer technology to formulate a candidate for a flutter mode control implementation. E.D.K.

FAILURE MANAGEMENT FOR THE SAAB VIGGEN JA37 AIRCRAFT

Kjell Folkesson *In* AGARD Fault Tolerance Design and Redundancy Management Tech. Sep. 1980 21 p ref

Avail: NTIS HC A08/MF A01

The JA-37 Viggen is the first military aircraft in series production and field-service equipped with a digital automatic flight control system. The JA-37 Digital Automatic Flight Control System has high control authority and is a flight safety critical system. It has duplex sensors, a single channel digital computer, and simple secondary servos. The digital computer performs control-law calculation and sensor and servo monitoring, as well as extensive self test on ground and during flight. The sensors are monitored by comparison. The servos are monitored by comparing the output from a software model with the servo output. E.D.K.

FLIGHT EXPERIENCE WITH FLIGHT CONTROL REDUNDANCY MANAGEMENT

Kenneth J. Szalai, Richard R. Larson, and Richard D. Glover *In* AGARD Fault Tolerance Design and Redundancy Management Tech. Sep. 1980 27 p refs

Avail: NTIS HC A08/MF A01 CSCL01C

Flight experience with both current and advanced redundancy management schemes was gained in recent flight research programs using the F-8 digital fly by wire aircraft. The flight performance of fault detection, isolation, and reconfiguration (FDIR) methods for sensors, computers, and actuators is reviewed. Results of induced failures as well as of actual random failures are discussed. Deficiencies in modeling and implementation techniques are also discussed. The paper also presents comparison of multisensor tracking in smooth air, in turbulence, during large maneuvers, and during maneuvers typical of those of large commercial transport aircraft. The results of flight tests of an advanced analytic redundancy management algorithm are compared with the performance of a contemporary algorithm in terms of time to detection, false alarms, and missed alarms. The performance of computer redundancy management in both iron bird and flight tests is also presented. E.D.K.

ROBUST CONTROL SYSTEM DESIGN

J. Ackermann *In* AGARD Fault Tolerance Design and Redundancy Management Tech. Sep. 1980 14 p refs

Avail: NTIS HC A08/MF A01

The short period longitudinal mode of an F 4-E with horizontal canards is instable in subsonic flight and insufficiently damped at supersonic speed. The control system has to provide acceptable pole locations according to military specifications for flying qualities. A fixed gain controller using three paralleled gyros is designed, such that the pole region requirements in four typical flight conditions are robust with respect to gain reduction to one third. Thus nothing bad happens immediately after one or two gyro failures. Failure detection and redundancy management may be performed at a higher hierarchical level, which does not have to be extremely fast. The use of accelerometers or air data sensors for angle of attack or dynamic pressure is totally avoided in this concept and no gain scheduling is necessary. The design for robustness with respect to different flight conditions and sensor failures is performed by a novel parameter space design tool. E.D.K.

TEST AND EVALUATION OF THE AIRPORT SURVEILLANCE RADAR (ASR)-8 WIND SHEAR DETECTION SYSTEM

(PHASE 2), REVISION Interim Report, Apr. - Dec. 1979
D. L. Offi, W. Lewis, T. Lee, and A. DeLaMarche Aug. 1980
40 p refs Revised

(FAA Proj. 022-242-830)

(AD-A090111; FAA-CT-80-17-A-Rev; FAA-RD-80-21-A-Rev)
Avail: NTIS HC A03/MF A01 CSCL 17/9

A wind shear detection system developed by the Wave Propagation Laboratory (WPL) to operate with the Federal Aviation Administration (FAA) Airport Surveillance Radar (ASR)-8 was installed and is being tested at the FAA technical Center. Initial efforts, previously reported in Report NA-78-59-LR, were directed toward hardware and software shakedown and feasibility determination. Second phase tests compared radar with aircraft and tower winds, evaluated the wind shear measurement capability under various weather conditions, and investigated the effectiveness of a simple two-azimuth pointing strategy and system capabilities and limitations. Results showed the system to be compatible with and to operate satisfactorily with the ASR-8. The processing and spectral display of clear air and precipitation returns is feasible. The accuracy of agreement between radar-measured winds and components of the aircraft-measured winds in both radially oriented flights and runway offset flights, using a two-azimuth pointing technique, was examined. Radar versus tower wind agreement was also examined. Potentially dangerous wind shears associated with weather during these tests were detectable. Certain system limitations also have been defined and considered. It is recommended that tests continue to complete definition of and demonstrate capabilities in all weather situations, to optimize performance, and to provide information to specify system design for possible development of a prototype model.

SUPERHYBRID COMPOSITE BLADE IMPACT STUDIES

C. C. Chamis, R. F. Lark, and J. H. Sinclair [1980] 16 p refs
Proposed for presentation at the 26th Ann. Intern. Gas Turbine Conf., Houston, Tex., 9-12 Mar. 1981

(NASA-TM-81597; E-580) Avail: NTIS HC A02/MF A01 CSCL 20K

The feasibility of superhybrid composite blades for meeting the mechanical design and impact resistance requirements of large fan blades for aircraft turbine engine applications was investigated. Two design concepts were evaluated: leading edge spar (TiCom) and center spar (TiCore), both with superhybrid composite shells. The investigation was both analytical and experimental. The results obtained show promise that superhybrid composites can be used to make light weight, high quality, large fan blades with good structural integrity. The blades tested successfully demonstrated their ability to meet steady state operating conditions, overspeed, and small bird impact requirements. A.R.H.

FLIGHT SIMULATION ENVIRONMENTAL FATIGUE CRACK PROPAGATION IN 2024-T3 AND 7475-T761 ALUMINUM

R. J. H. Wanhill Jan. 1980 10 p refs Presented at the 12th ICAS Congr., Munich, 12-17 Oct. 1980

(NLR-MP-80003-U; ICAF-1168) Avail: NTIS
HC A02/MF A01

A gust spectrum representative of the load history of an under wing skin in a transport aircraft was used in flight simulation fatigue crack propagation tests on 2024-T3 and 7475-T761 aluminum alloy sheet. Tests were conducted at several design stress levels and in environments of air and air plus water spray. Results show that the fatigue crack propagation resistance of 2024-T3 sheet under gust spectrum loading is generally superior to that of 7475-T761 sheet, and that this superiority is mainly due to a greater amount of crack growth retardation during the less severe loads and flights that follow the peak loads in severe flights. The straightforward use of 7475 alloy in tension-critical structures like the under wing skin of a transport aircraft would result in decreased crack propagation resistance. In order to utilize the higher static structural efficiency and fracture toughness of 7475 alloy (in relation to 2024-T3), it may be possible to improve the relative performance by selecting an adhesive bonded laminated sheet or sandwich panel concepts. AN ANALYTICAL TECHNIQUE FOR APPROXIMATING UNSTEADY AERODYNAMICS IN THE TIME DOMAIN

H. J. Dunn Nov. 1980 31 p refs

(NASA-TP-1738; L-13255) Avail: NTIS HC A03/MF A01
CSCL 20K

An analytical technique is presented for approximating unsteady aerodynamic forces in the time domain. The order of elements of a matrix Pade approximation was postulated, and the resulting polynomial coefficients were determined through a combination of least squares estimates for the numerator coefficients and a constrained gradient search for the denominator coefficients which insures stable approximating functions. The number of differential equations required to represent the aerodynamic forces to a given accuracy tends to be smaller than that employed in certain existing techniques where the denominator coefficients are chosen a priori. Results are shown for an aeroelastic, cantilevered, semispan wing which indicate a good fit to the aerodynamic forces for oscillatory motion can be achieved with a matrix Pade approximation having fourth order numerator and second order denominator polynomials. PERFORMANCE OF A STEEL SPAR WIND TURBINE BLADE ON THE MOD-0 100 kW EXPERIMENTAL WIND TURBINE Final Report

Theo G. Keith, Jr. (Toledo Univ.), Timothy L. Sullivan, and Larry A. Viterna Sep. 1980 24 p refs

(Contract EX-76-1-01-1028)

(NASA-TM-81588; DOE/NASA/1028-27; E-567) Avail: NTIS
HC A02/MF A01 CSCL 10B

The performance and loading of a large wind rotor, 38.4 m in diameter and composed of two low-cost steel spar blades were examined. Two blades were fabricated at Lewis Research Center and successfully operated on the Mod-0 wind turbine at Plum Brook. The blades were operated on a tower on which the natural bending frequency were altered by placing the tower on a leaf-spring apparatus. It was found that neither blade performance nor loading were affected significantly by this tower softening technique. Rotor performance exceeded prediction while blade loads were found to be in reasonable agreement with those predicted. Seventy-five hours of operation over a five month period resulted in no deterioration in the blade. Author

DEFINITIVE GENERIC STUDY FOR THE EFFECT OF HIGH LIFT AIRFOILS ON WIND TURBINE EFFECTIVENESS.

EXECUTIVE SUMMARY Final Report

Peter B. S. Lissaman, Robert E. Wilson, R. W. Thresher, and Stel N. Walker May 1979 93 p refs
(Contract EG-77-C-01-4042)

(SERI/TR-98003-2) Avail: NTIS HC A05/MF A01

The effect of high lift airfoils on the cost effectiveness of HAWT and VAWT (horizontal and vertical axis wind turbine) machines is studied. The scope involved first studying modern two dimensional airfoils, and developing a generalized formulation for their performance in terms of lift, drag, and thickness at appropriate Reynolds numbers. Single element, multi-element, symmetrical, extra thick airfoils and jet flap airfoils were analyzed. The jet flap airfoils were considered to be unacceptable because of excessive power requirements. Then the effect of using the above airfoils on the rotors of a variety of wind turbines was made. Qualitative representation of the type of airfoils studied is given. DOE

ALTERNATIVE ENERGY SOURCES FOR NON-HIGHWAY TRANSPORTATION, VOLUME 1

E. N. Cart, Jr., ed. Jun. 1980 26 p refs

(Contract DE-AC05-77CS-55438)

(DOE/CS-05438/T1-Vol-1) Avail: NTIS HC A03/MF A01

Alternate fuels for nonhighway transportation (aircraft, rail, marine, and pipeline) were investigated. A recommendation of what alternate fuels may be of interest to nonhighway transportation users from now through 2025 is made. The research and development needed to allow nonpetroleum derived fuels to be used in nonhighway transportation is discussed. In the near term (present-1985), there is unlikely to be any major change in the fuels used in any of the four modes of transportation except that the average quality of the marine fuel is likely to get worse. In the midterm period (1985-2000), there will be a transition to nonpetroleum fuels, based primarily on shale oil derived liquids assuming a shale oil industry is started during this time. DOE

AN AUTOMATED PROCEDURE FOR DEVELOPING HYBRID COMPUTER SIMULATIONS OF TURBOFAN ENGINES

John R. Szuch and Susan M. Krosel 1980 19 p refs Proposed for presentation at the 14th Ann. Simulation Symp., Tampa, Fla., 18-20 Mar. 1981

(NASA-TM-81605; E-598) Avail: NTIS HC A02/MF A01 CSDL 09B

A systematic, computer-aided, self-documenting methodology for developing hybrid computer simulations of turbofan engines is presented. The methodology makes use of a host program that can run on a large digital computer and a machine-dependent target (hybrid) program. The host program performs all of the calculations and data manipulations needed to transform user-supplied engine design information to a form suitable for the hybrid computer. The host program also trims the self contained engine model to match specified design point information. A test case is described and comparisons between hybrid simulation and specified engine performance data are presented. S.F.

CORE NOISE MEASUREMENTS FROM A SMALL, GENERAL AVIATION TURBOFAN ENGINE

Meyer Reshotko and Allen Karchmer 21 Nov. 1980 28 p refs Presented at the 100th Meeting of the Acoust. Soc. of Am., Los Angeles, 17-21 Nov. 1980

(NASA-TM-81610; E-607) Avail: NTIS HC A03/MF A01 CSDL 20A

As part of a program to investigate combustor and other core noises, simultaneous measurements of internal fluctuating pressure and far field noise were made with a JT15D turbofan engine. Acoustic waveguide probes, located in the engine at the combustor, at the turbine exit and in the core nozzle wall, were used to measure internal fluctuating pressures. Low frequency acoustic power determined at the core nozzle exit corresponds in level to the far field acoustic power at engine speeds below 65% of maximum, the approach condition. At engine speeds above 65% of maximum, the jet noise dominates in the far field, greatly exceeding that of the core. From coherence measurements, it is shown that the combustor is the dominant source of the low frequency core noise. The results obtained from the JT15D engine were compared with those obtained previously from a YF102 engine, both engines having reverse flow annular combustors and being in the same size class. EFFECT OF A SEMI-ANNULAR THERMAL ACOUSTIC SHIELD ON JET EXHAUST NOISE

J. Goodykoontz 21 Nov. 1980 21 p refs Presented at the 100th Meeting of the Acoust. Soc. of Am., Los Angeles, 17-21 Nov. 1980

(NASA-TM-81615; E-616) Avail: NTIS HC A02/MF A01 CSDL 20A

Reductions in jet exhaust noise obtained by the use of an annular thermal acoustic shield consisting of a high temperature, low velocity gas stream surrounding a high velocity central jet exhaust appear to be limited by multiple reflections. The effect of a semi-annular shield on jet exhaust noise was investigated with the rationale that such a configuration would eliminate or reduce the multiple reflection mechanism. Noise measurements for a 10 cm conical nozzle with a semi-annular acoustic shield are presented in terms of lossless free field data at various angular locations with respect to the nozzle. Measurements were made on both the shielded and unshielded sides of the nozzle. The results are presented parametrically, showing the effects of various shield and central system velocities and temperatures.

Selected results are scaled up to a typical full scale engine size to determine the perceived noise level reductions. A.R.H.

COOPERATIVE INVESTIGATION OF THE NOISE PRODUCING REGION OF AN AXISYMMETRIC JET Final Report
 W. K. George, R. E. A. Arndt, and H. M. Nagib Jul. 1980
 34 p refs
 (Contract F49620-78-C-0047)
 (AD-A089692; AFOSR-80-0754TR) Avail: NTIS
 HC A03/MF A01

The objectives of this three-university effort are: to determine whether or not large scale structures exist in the mixing layer of an axisymmetric jet; to determine whether or not these large scale structures (if they exist) contribute to the radiated noise; and to quantify the above conclusions so that the results can be used for evaluation of jet noise theories and for prediction of radiated noise. This is a report on the initial phase of the work in which the primary emphasis has been on the construction of the experimental facilities, the acquisition and assembly of the measurement hardware and the development of computer software. Noteworthy advances include an analysis and extension of the burst-mode LDA, and the continued development of digitally sampled flow visualization techniques. Experiments on various nozzle shapes at low Reynolds number indicate that nozzle shape plays an important role in determining the vortex pairing in the mixing layer and the radiated noise. This does not appear to be the case at high Reynolds numbers. The preliminary conclusion is that the pairing and turbulence structures observed at low Reynolds numbers have little to do with jet noise. GRA

(Contract F33615-79-C-3208; AF Proj. 2401)
 (AD-A089770; NA-80-247; AFWAL-TR-80-3050) Avail: NTIS
 HC A11/MF A01 CSCL 20/1

During development of the B-1 aircraft, an extensive cavity noise measurement and noise reduction program using wind tunnel models and evaluation on a flight-test aircraft was conducted. Substantial cavity noise reduction was achieved with retrofitted spoilers for a Mach 0.6 to 1 range for the weapon bay cavity of $L/D = 2.2$. A substantial amount of cavity unsuppressed and suppressed data were acquired from wind tunnel models and the full-scale aircraft. Data for weapon bay cavities with internal stores and multiple open cavities was also obtained. The data acquired during development of B-1 cavity noise suppressors are correlated and compared with previously published data. The data are correlated with existing prediction techniques and modifications to the current prediction techniques, and guidelines are recommended. GRA

US ARMY DESIGN-TO-COST EXPERIENCE
 Richard B. Lewis, II, Edward P. Laughlin, and Francis E. Spring In AGARD Design to Cost and Life Cycle Cost Jul. 1980
 11 p
 Avail: NTIS HC A15/MF A01

Design-to-Cost procedures were included in all major U.S. Army aviation procurements since 1972. Experience was gained during design, development, procurement and initial fielding of several major systems. The ownership cost of this equipment is considered during development. Production and operational phases and techniques for cost control are discussed. Lessons learned as a result of joint Government-Industry Design-To-Unit-Production-Cost programs are presented. Techniques which were effective in cost management on utility and attack helicopters and turbine engine programs are listed. Producibility engineering planning, initial production tooling, and facilitization to reduce production costs are discussed. The role of warranties in controlling operating and support costs is illustrated. It is concluded that Design-To-Unit-Production-Cost techniques were effective in achieving lower production costs, but that additional work is necessary to better control operating and support costs and thereby achieve optimal life cycle costs. E.D.K.

THE HORNET PROGRAM: A DESIGN TO LIFE CYCLE COST CASE STUDY

Robert D. Dighton /in AGARD Design to Cost and Life Cycle Cost Jul. 1980 12 p

Avail: NTIS HC A15/MF A01

A primary requirement of the Hornet program is significant reduction in life cycle cost (LCC). The design and management techniques used to develop a new fighter/attack system at an affordable LCC are described. The designer must consider key elements of LCC such as reliability, maintainability, unit production cost, and logistics support cost elements in parallel with traditional concerns of weight and performance when designing life cycle costs. Examples of trade studies resulting in relatively large LCC avoidances are summarized. E.D.K.

DESIGN TO COST AND THE F-16 MULTIROLE FIGHTER
W. M. Rowell /in AGARD Design to Cost and Life Cycle Cost Jul. 1980 14 p refs

Avail: NTIS HC A15/MF A01

The low cost of the F-16 Fighter Aircraft is the result of a selected balance of innovative technologies, available low cost material and equipment, and cost reducing configuration options. This was implemented through the application of design to cost concepts from the beginning of the program. The F-16 full scale development contract contained several clauses which provided downstream cost control including control of both acquisition and operations. A key part of this plan was the identification and close tracking of a few cost drivers which comprise over 50% of the air vehicle cost. A number of specific contract provisions are aimed at control of operating and support costs. These provisions provide financial incentives and penalties for consideration of reliability and other logistic support parameters. Other control provisions require cost considerations in trade studies, engineering change proposals, and in vendor selections. E.D.K.

STRUCTURAL INTEGRATION AS A MEANS OF COST REDUCTION

P. E. Siebert /in AGARD Design to Cost and Life Cycle Cost Jul. 1980 17 p

Avail: NTIS HC A15/MF A01

Through some components of the Tornado fighter aircraft it is demonstrated how costs can be reduced by structural integration. The components are two flat panels, the wing carry through box and the Taileron. Cost savings could be achieved from 15% to a maximum of 68%. E.D.K.

DESIGN-TO-COST AND NEW TECHNOLOGIES [DESIGN-TO-COST ET TECHNOLOGIES NOUVELLES]

Francois Cordie /in AGARD Design to Cost and Life Cycle Cost Jul. 1980 8 p In FRENCH

N81-11902 02-81)

Avail: NTIS HC A15/MF A01

Modern combat aircraft design can no longer be undertaken without giving equal consideration to mission cost and performance when making compromises which lead to the choice of an aircraft formula. These compromises are based on technologies which can be used from the beginning of production. Usually they are new technologies which have passed the laboratory stage and applied to existing aircraft before being integrated

into the design on a large scale. With respect to structures, carbon-epoxy composite technology is one of the most remarkable. Its introduction at the design stage results in reduction of mass and cost, first on the elements to which it is applied, and then by the amplifying effect on the assembly of the structure and the rest of the aircraft: engine, equipment, and fuel. Such a process supposes that the technology to be applied has attained a degree of maturation which permits prediction of performance and cost with certitude. Transl. by A.R.H.

ORGANIZING A DESIGN-TO-COST PROGRAM
Robert Tassinari /in AGARD Design to Cost and Life Cycle Cost Jul. 1980 14 p

Avail: NTIS HC A15/MF A01

Total cost control at all development and production stages is a prerequisite to any significant design-to-cost (DTC) program. Design to life cycle cost (DTLCC) methods further require intimate knowledge of operational and maintenance costs. Specialists in this cost management method are aware of these two principles. Less obvious, perhaps are the great advantages to be derived through an organization specifically trained in the application of DTC and DTLC principles. A specialized organization and methods for integrating costs into all phases of new programs was created much in the way that weights were calculated into programs in the past. To keep pace with this reorganization in development, emphasis was placed on training personnel in value analysis and DTC methods. Results of these efforts first became apparent in 1977, during development of the A 200. Today, the same principles are being applied in development of the A 310. E.D.K.

A NEW METHOD FOR ESTIMATING TRANSPORT AIRCRAFT DIRECT OPERATING COSTS

Keith Grayson /in AGARD Design to Cost and Life Cycle Cost Jul. 1980 20 p refs

Avail: NTIS HC A15/MF A01

A means of estimating aircraft direct operating costs for comparative purposes was developed which was able to recognize and include the potential benefits to be gained from technology and design innovation when applied to commercial transport aircraft. The work performed on this subject is reviewed. The validity of the developed methods and how they can be used in the evaluation of aircraft for an airline's fleet is also demonstrated. E.D.K.

DESIGN-TO-COST APPLIED TO THE AS350 HELICOPTER [LE DESIGN TO COST APPLIQUE A L'HELICOPTERE AS350]

Rene Mouille /in AGARD Design to Cost and Life Cycle Cost Jul. 1980 18 p In FRENCH

Avail: NTIS HC A15/MF A01

In order to remain competitive on the international market, cost reduction studies were undertaken at Aerospatiale and were concretized in the design of the AS350 helicopter after two years' effort by a small experimental research group. The development of this helicopter, which is definitely more economical than the Alouette 2 or the Gazelle, has followed the same cost reduction spirit as was used in its design. The method is classic and is based on (1) analysis of the value of functions and of the parts assuring these functions; (2) criticism of the solution; (3) search for new solutions; and (4) choice of compromises. The experience of the participants permitted rapid elimination of the most expensive choice as well as those with least performance. The benefits to be obtained from proceeding correctly from the design stage can be very important with regards to both acquisition and utilization costs. This is of interest to both civil and military users. Transl. by A.R.H.

RELIABILITY-CENTERED MAINTENANCE
 F. S. Nowlan *In* AGARD Design to Cost and Life Cycle Cost
 Jul. 1980 13 p refs

Avail: NTIS HC A15/MF A01

The use of reliability centered maintenance principles are discussed with respect to aircraft component life cycle costs. The following inherent reliability characteristics are emphasized: failure consequences, judged by the effect of loss of function on safety, mission capability and operational readiness; failure modes which lead to an item's loss of function; exposure to secondary damage that results from certain failure modes; visibility of the failure process and a mechanic's ability to discover potential failures and thereby prevent functional failures; evidence by which the operating crew can realize that a functional failure has occurred; exposure to the consequences of multiple failures; and failure rates. SOME ENGINEERING ASPECTS OF LIFE CYCLE COSTING
 G. W. Bleasdale *In* AGARD Design to Cost and Life Cycle Cost Jul. 1980 9 p refs

Avail: NTIS HC A15/MF A01

The constituents that are common to most life cycle cost methods are identified. Ways in which some of the engineering costs can be minimized are discussed. It is shown that the extra cost of better engineering design may increase the acquisition cost but this will be more than offset by the large reduction in support costs complemented by the increase in reliability and aircraft availability. Examples are given showing typical contributions to high support costs of mechanical components. R.C.T.

DESIGN TO COST AND SYSTEMS, LLC

Klaus Wickel *In* AGARD Design to Cost and Life Cycle Cost Jul. 1980 9 p

Avail: NTIS HC A15/MF A01

Different aspects of the design to costs approach are addressed with special attention given to their operational and maintenance cost and methodological implications. Three major subtasks of the design to cost task are examined: design to financial feasibility; design to personnel feasibility; and design to system's life cycle costs. It is shown that design to cost is indisputably an absolutely essential approach to tackling the cost problems as long as the objective does not degenerate to mere design to financial feasibility. THE ROLE OF ADVANCED TECHNOLOGY OF TURBINE ENGINE LIFE CYCLE COST

N81-11928

Robert F. Panella, Michael A. Barga, and Richard G. McNally
In AGARD Design to Cost and Life Cycle Cost Jul. 1980
13 p refs
Avail: NTIS HC A15/MF A01

The advanced technology of the turbine engine and its impact on life cycle costs (LCC) is addressed. To adequately assess this advanced technology, LCC techniques are to be developed which are sensitive to performance, structural design, manufacturing processes, reliability and maintainability. These techniques are then used to determine the performance/life/cost trade-offs of the advanced technology. An overview of current efforts in LCC techniques, and trade-offs is given. R.C.T.

COST/BENEFIT ANALYSIS OF ADVANCED MATERIALS TECHNOLOGY CANDIDATES FOR THE 1980'S, PART 2 Final Report

R. E. Dennis and H. F. Maertins Aug. 1980 106 p refs
(Contract NAS3-20073)
(NASA-CR-165176; AIRESEARCH-21-3663-PT-2) Avail: NTIS HC A06/MF A01 CSCL 05A

Cost/benefit analyses to evaluate advanced material technologies projects considered for general aviation and turboprop commuter aircraft through estimated life-cycle costs, direct operating costs, and development costs are discussed. Specifically addressed is the selection of technologies to be evaluated; development of property goals; assessment of candidate technologies on typical engines and aircraft; sensitivity analysis of the changes in property goals on performance and economics, cost, and risk analysis for each technology; and ranking of each technology by relative value. The cost/benefit analysis was applied to a domestic, nonrevenue producing, business-type jet aircraft configured with two TFE731-3 turbofan engines, and to a domestic, nonrevenue producing, business type turboprop aircraft configured with two TPE331-10 turboprop engines. In addition, a cost/benefit analysis was applied to a commercial turboprop aircraft configured with a growth version of the TPE331-10. M.G.

AIR FORCE TECHNICAL OBJECTIVE DOCUMENT FY 1981

Sidney O. Davis Dec. 1979 30 p Supersedes AFML-TR-78-195
(AD-A089709; AFML-TR-79-4222; AFML-TR-78-195) Avail: NTIS HC A03/MF A01 CSCL 15/3

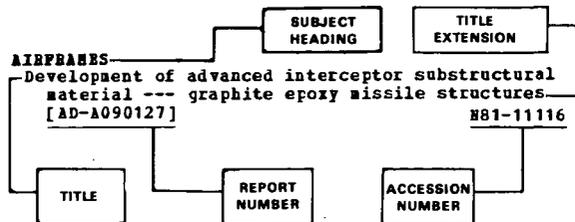

This technical objective document was prepared by the Materials Laboratory and describes the materials technology areas for meeting future Air Force operational needs. The six technology areas encompass the full spectrum of materials capabilities required for future aircraft, missile, space, and electronic systems: thermal protection materials; aerospace structural materials; aerospace propulsion materials, fluid, lubricant, and elastomeric materials; protective coatings and materials, and electromagnetic windows and electronics. Presented for each TA is the general objective, specific goals, technical approaches, and a Laboratory TA focal point who can facilitate face-to-face discussions with Laboratory engineers and scientists. AIR TRANSPORTATION

Airbus Industrie's heavenly twins - A310 and A300-600
N81-12348

Airport activity statistics of certificated route air carriers, calendar year 1979
[AD-A089748] N81-11023

Alternative energy sources for non-highway transportation, appendices
[DOE/CS-05438/T1-VOL-3] N81-11500

AIRBORNE/SPACEBORNE COMPUTERS

The 767's flight-management system - A new generation of airborne avionics
N81-11242

AIRCRAFT ACCIDENT INVESTIGATION

The accident/injury matrix - A tool for aircraft accident investigation
N81-12241

AIRCRAFT ACCIDENTS

Helicopter tail configurations to survive tail rotor loss
N81-10768

Civil aviation safety. III - Prospects of improvement
N81-11900

Annual review of aircraft accident data, U.S. General aviation calendar year 1978
[FB80-201916] N81-10028

AIRCRAFT CONFIGURATIONS

New concepts for design of fully-optimized configurations for future supersonic aircraft
N81-11606

Some experiences with numerical optimisation in aircraft specification and preliminary design studies
N81-11609

Bibliography on aerodynamics of airframe/engine integration of high-speed turbine-powered aircraft, volume 1
[NASA-TM-81814] N81-11032

AIRCRAFT CONSTRUCTION MATERIALS

Acoustic structures --- titanium brazing method for producing honeycomb structures for jet engine noise reduction
N81-10272

A practical method for predicting flight-by-flight crack growth in fighter type aircraft for damage tolerance assessment
N81-11659

Composite components on commercial aircraft
N81-11147

Air Force applications and in-service experience with composite structures
N81-11148

Cost/benefit analysis of advanced materials technology candidates for the 1980's, part 2
[NASA-CR-165176] N81-11953

AIRCRAFT CONTROL

The all-electric aircraft
N81-11617

Improved flight control performance and failure tolerance using modern control techniques
N81-11619

DPVLR-dynamic model testing in wind tunnels for active controls research
N81-11670

System simulation applied to the evaluation of displays for guidance and control
[DPVLR-MITT-79-10] N81-10064

AIRCRAFT DESIGN

The aerodynamics of pure subsonic flow /4th revised edition/ --- German book
N81-11441

How to improve the performance of transport aircraft by variation of wing aspect-ratio and twist /12th Daniel and Florence Guggenheim International Memorial Lecture/
N81-11602

Numerical optimization - An assessment of its role in transport aircraft aerodynamic design through a case study
N81-11604

The relevance of the Flex-Hub Prop-Fan for fuel-efficient airliners
N81-11605

AIRCRAFT DETECTION

SUBJECT INDEX

- New concepts for design of fully-optimized configurations for future supersonic aircraft
A81-11606
- Advanced combat aircraft wing design
A81-11608
- Some experiences with numerical optimisation in aircraft specification and preliminary design studies
A81-11609
- DRAPO - Computer-assisted design and manufacturing system
A81-11610
- Computer aided compilation of an electrical drawing file
A81-11611
- The all-electric aircraft
A81-11617
- Active flutter suppression design and test - A joint U.S.-F.R.G. program
A81-11621
- A stability augmentation system which covers the complete flight envelope for a F-4c aircraft without gain scheduling
A81-11622
- The future cockpit of the next generation of civil aircraft
A81-11630
- A theoretical and practical design investigation of the future military cockpit
A81-11631
- Research on transonic wings at the National Aerospace Laboratory, Japan
A81-11640
- High lift research and its application to aircraft design
A81-11642
- Winglets development at Israel Aircraft Industries
A81-11645
- Optimum subsonic, high-angle-of-attack nacelles
A81-11646
- Structural optimization of advanced aircraft structures
A81-11651
- Optimal flight vehicle design and linear vector spaces
A81-11668
- Hydrogen-fueled aircraft
A81-11753
- Engineering and development program plan aircraft crashworthiness
[AD-A089431] N81-10022
- The XV-15 tilt rotor research aircraft
[NASA-TM-81244] N81-10054
- Design options study. Volume 1: Executive summary --- user requirements for the advanced civil military aircraft
[AD-A089536] N81-10056
- Design options study. Volume 2: Approach and summary results --- advanced civil military aircraft: cost estimates
[AD-A089537] N81-10057
- Design options study. Volume 3: Qualitative assessment --- advanced civil military aircraft
[AD-A089538] N81-10058
- Preliminary design characteristics of a subsonic business jet concept employing an aspect ratio 25 strut braced wing
[NASA-CR-159361] N81-11013
- Evolution of techniques for LCC analysis
N81-11909
- The Hornet program: A design to life cycle cost case study
N81-11910
- Design-to-cost and new technologies
N81-11913
- AIRCRAFT DETECTION**
- Systems analysis of the installation, mounting, and activation of emergency locator transmitters in general aviation aircraft
[NASA-CR-160036] N81-10020
- AIRCRAFT ENGINES**
- Reliability and engineering-economic characteristics of aircraft engines --- Russian book
A81-10045
- Impact damage of aircraft gas turbine engines with axial compressors
A81-11324
- Calculation of the flow field around engine-wing-configurations
A81-11613
- Hydrogen-fueled aircraft
A81-11753
- Variable geometry, lean, premixed, prevaporized fuel combustor conceptual design study
[ASME PAPER 80-GT-16] A81-12609
- Automation of aircraft gas-turbine power plants --- Russian book
A81-12782
- Comparisons of four alternative powerplant types for future general aviation aircraft
[NASA-TM-81584] N81-10067
- Aircraft engine nacelle fire test simulator. Volume 1: Technical
[AD-A089629] N81-10081
- Summary of AGARD Lecture Series 107: The Application of Design to Cost and Life Cycle Cost to Aircraft Engines
N81-11926
- Cost/benefit analysis of advanced materials technology candidates for the 1980's, part 2

[AD-A089629] N81-10081
- Assessing the behavior of high modulus composite materials in lightning
N81-11141
- The potential for damage from the accidental release of conductive carbon fibers from aircraft composites
N81-11143

SUBJECT INDEX

AIRCRAFT SAFETY

AIRCRAFT HYDRAULIC SYSTEMS

Development and application of a moving base visual flight simulator including the design of hydraulic actuators with hydrostatic bearings
A81-11633

AIRCRAFT INDUSTRY

A review and assessment of system cost reduction activities
N81-11906

Using cost reduction concepts at Messier-Hispano-Bugatti
N81-11923

AIRCRAFT INSTRUMENTS

Head-up displays. III
A81-11320

Wind shear detection from PCM-recorded MLS-flight data
A81-11675

AIRCRAFT LANDING

F/A-18's landing, launch and recovery system
A81-11244

Optimizing the fixed leading edge shape of a transonic wing to suit the landing high-lift requirements
A81-11644

An analytical study of landing flare [DFVLR-FB-79-40]
N81-10062

Airport activity statistics of certificated route air carriers, calendar year 1979 [AD-A089748]
N81-11023

AIRCRAFT LAUNCHING DEVICES

F/A-18's landing, launch and recovery system
A81-11244

AIRCRAFT MAINTENANCE

Compatibility of aircraft operational fluids with a graphite/epoxy composite: Development of an exterior coating system and remover [AD-A090049]
N81-11120

Reliability-centered maintenance
N81-11917

Impact of maintainability of life cycle costs
N81-11921

AIRCRAFT MANEUVERS

Piloted simulation studies of helicopter agility
A81-10767

Multivariable aircraft control by manoeuvre commands - An application to air-to-ground gunnery [ONERA, TP NO. 1980-127]
A81-11623

Initial experience with methods to evaluate flight test characteristics with operational flight maneuvers
A81-11782

A multivariate approach to handling qualities rating scale development [AD-A089825]
N81-11047

AIRCRAFT MODELS

Model tests for an active rotor isolation system [HBB-278-79-0]
A81-12095

Model design and instrumentation for intermittent cryogenic wind tunnels
N81-11058

AIRCRAFT NOISE

Prediction of changes in aircraft noise exposure
A81-11820

Community response to noise from a general aviation airport
A81-11821

The status of rotor noise technology
A81-12737

Survey population response to airplane noise, part 1 [NASA-TM-75790]
N81-10576

AIRCRAFT PARTS

Structural integration as a means of cost reduction
N81-11912

AIRCRAFT PERFORMANCE

How to improve the performance of transport aircraft by variation of wing aspect-ratio and twist /12th Daniel and Florence Guggenheim International Memorial Lecture/
A81-11602

Possibilities for the valuation of different combat aircraft configurations with respect to flight mechanics
A81-11607

Identification of longitudinal flying characteristics of an aeroplane and the effect of nonstationary aerodynamics
A81-11627

Aircraft performance optimization by forced singular perturbation
A81-11667

Optimal flight vehicle design and linear vector spaces
A81-11668

DFVLR-dynamic model testing in wind tunnels for active controls research
A81-11670

The use of data items on aircraft performance measurement [ESDU-80009]
N81-10053

The XV-15 tilt rotor research aircraft [NASA-TM-81244]
N81-10054

Improved aircraft cruise by periodic control
N81-11030

AIRCRAFT PILOTS

Multivariable closed-loop analysis and flight control synthesis for air-to-air tracking [AD-A090050]
N81-11046

AIRCRAFT PRODUCTION

DRAPO - Computer-assisted design and manufacturing system
A81-11610

Application of weldbonding to A-10 production aircraft
A81-11652

AIRCRAFT PRODUCTION COSTS

Design to Cost and Life Cycle Cost [AGARD-CP-289]
N81-11902

The Hornet program: A design to life cycle cost case study
N81-11910

Design to cost and the F-16 multirole fighter
N81-11911

Structural integration as a means of cost reduction
N81-11912

Design-to-cost and new technologies
N81-11913

Organizing a design-to-cost program
N81-11914

A new method for estimating transport aircraft direct operating costs
N81-11915

Design-to-cost applied to the AS350 helicopter
N81-11916

Estimation of relative total cost for aircraft systems
N81-11922

Using cost reduction concepts at Messier-Hispano-Bugatti
N81-11923

AIRCRAFT RELIABILITY

Reliability and engineering-economic characteristics of aircraft engines --- Russian book
A81-10045

Subsequent proof of damage tolerance for a landing gear component after numerous takeoffs and landings
A81-11475

A piloted simulator investigation of static stability and stability/control augmentation effects on helicopter handling qualities for instrument approach [NASA-TM-81188]
N81-10077

Exploratory study of hazard mitigation and research in the air transport system [AD-A089204]
N81-11021

Summary of Federal Aviation Administration responses to National Transportation Safety Board safety recommendations [AD-A089971]
N81-11022

Some engineering aspects of life cycle costing
N81-11918

AIRCRAFT SAFETY

Ground testing of aircraft antistatic protection [ONERA, TP NO. 1980-126]
A81-11674

Civil aviation safety. III - Prospects of improvement
A81-11900

NASA Aviation Safety Reporting System [NASA-TM-81225]
N81-10021

Engineering and development program plan aircraft crashworthiness [AD-A089431]
N81-10022

AIRCRAFT SPECIFICATIONS

SUBJECT INDEX

Evaluation of safety programs with respect to the causes of general aviation accidents. Volume 2: Appendices [AD-A089181] N81-10023
 Handbook on bird management and control [AD-A089009] N81-10024
 Applications of pyrotechniques in aviation [SNIAS-792-422-103] N81-10025
 Search and rescue methods and equipment. A bibliography with abstracts [PB80-812837] N81-10026
 Bird strikes and aviation safety. Citations from the NTIS data base [PB80-812944] N81-10027
 Exploratory study of hazard mitigation and research in the air transport system [AD-A089204] N81-11021
 Summary of Federal Aviation Administration responses to National Transportation Safety Board safety recommendations [AD-A089971] N81-11022
 ATARS implementation tradeoff [AD-A089977] N81-11026

AIRCRAFT SPECIFICATIONS
 Some experiences with numerical optimisation in aircraft specification and preliminary design studies N81-11609

AIRCRAFT STABILITY

A stability augmentation system which covers the complete flight envelope for a F-4c aircraft without gain scheduling N81-11622
 Dynamic stability parameters at high angles of attack N81-11624
 Model tests for an active rotor isolation system [MBB-278-79-0] N81-12095

AIRCRAFT STRUCTURES

Aspect ratio variability in part-through crack life analysis N81-10355
 Part-through crack problems in aircraft structures N81-10362
 Experimental application of a vibration reduction technique N81-10770
 Design and test of a graphite-epoxy composite A-10 slat N81-11339
 The analysis of fatigue failures N81-11603
 Weight optimization of wing structures according to the gradient method N81-11650
 Structural optimization of advanced aircraft structures N81-11651
 Development of the A300 fin in modern composite fibre construction N81-11653
 Nondestructive evaluation of composite structures N81-11654
 Holographic non-destructive testing of materials using pulsed lasers --- for aircraft structures N81-11655
 Structural flight load testing, calibration and analysis N81-11656
 Operational durability of airframe structures N81-11662
 Ground testing of aircraft antistatic protection [ONERA, TP NO. 1980-126] N81-11674
 Elastomers used in aeronautics industry [SNIAS-801-551-105] N81-10168
 Evaluation of section properties for hollow composite beams [PAFER-NB-35] N81-10454
 Lightning protection considerations for graphite/epoxy aircraft structure N81-11142
 Air Force applications and in-service experience with composite structures N81-11148
 US Navy service experience with advanced composites --- in aircraft composite structures N81-11149

AIRCRAFT SURVIVABILITY

Helicopter tail configurations to survive tail rotor loss N81-10768
 The analysis of fatigue failures N81-11603
 Failure management techniques for high survivability N81-11272

AIRFIELD SURFACE MOVEMENTS

NASA Aviation Safety Reporting System [NASA-TM-81225] N81-10021

AIRFOIL PROFILES

Design of airfoils in incompressible viscous flows by numerical optimization N81-10096
 The performance of slotted blades in cascade N81-10632
 Low-speed airfoil section research at Delft University of Technology N81-11636
 Design and tests of an helicopter rotor blade with evolutive profile [ONERA, TP NO. 1980-125] N81-11638
 Calculation of separated viscous flows on wing profiles by a coupling approach [ONERA, TP NO. 1980-122] N81-11920
 Linear vortex theories of a profile and wing with air intake N81-12703

AIRFOILS

The aerodynamic characteristics of some new RAF blade sections, and their potential influence on rotor performance N81-10769
 Flow computation around multi-element airfoils in viscous transonic flow N81-11641

A comparison of Newton-like methods for the transonic small disturbance equation [AD-A090270] N81-11017
 Definitive generic study for the effect of high lift airfoils on wind turbine effectiveness, executive summary [SERI/TR-98003-2] N81-11492

AIRFRAME MATERIALS

Flight simulation environmental fatigue crack propagation in 2024-T3 and 7475-T761 aluminium N81-11657
 Operational durability of airframe structures N81-11662
 Cast Aluminum Structures Technology (CAST). Technology transfer (phase 6) [AD-A087492] N81-10152
 Exploratory study of hazard mitigation and research in the air transport system [AD-A089204] N81-11021
 Air Force technical objective document FY 1981 [AD-A089709] N81-12010

AIRFRAMES

The use of parametric cost estimating relationships as they pertain to aircraft airframes: A new perspective [AD-A089525] N81-10060
 Bibliography on aerodynamics of airframe/engine integration of high-speed turbine-powered aircraft, volume 1 [NASA-TM-81814] N81-11032
 Development of advanced interceptor substructural material --- graphite epoxy missile structures [AD-A090127] N81-11116

AIRLINE OPERATIONS

Methods of fuel conservation in civil aviation. I N81-11322
 Hourly airport activity profiles: 30 Airports by user, 3 airports by user and equipment type, selected days in June, July and August, 1978 [AD-A089450] N81-10031
 A new method for estimating transport aircraft direct operating costs N81-11915

AIRPORT PLANNING

Airfield pavement demonstration-validation study N81-10718
 Atlanta's new central passenger terminal complex N81-10719
 Reduction of the take-off ground run distance to a given set of atmospheric condition N81-11634

SUBJECT INDEX

AVIONICS

- Prediction of changes in aircraft noise exposure
A81-11820

AXIAL FLOW TURBINES

SUBJECT INDEX

Microcomputer array processor system --- design for electronic warfare N81-11673

Estimation of relative total cost for aircraft systems N81-11922

Summary of AGARD Lecture Series 100: Methodology for control of life cycle costs for avionics systems N81-11924

The role of advanced technology of turbine engine life cycle cost N81-11927

AXIAL FLOW TURBINES

Optimum design of axial flow gas turbine stage. I - Formulation and analysis of optimization problem. II - Solution of the optimization problem and numerical results A81-12608

B

B-1 AIRCRAFT

Weapon bay cavity noise environments, data correlation and prediction for the B-1 aircraft [AD-A08977G] N81-11778

BAYS (STRUCTURAL UNITS)

Weapon bay cavity noise environments, data correlation and prediction for the B-1 aircraft [AD-A089770] N81-11778

BEAMS (SUPPORTS)

Evaluation of section properties for hollow composite beams [PAPER-NR-35] N81-10454

BEARINGLESS ROTORS

Full scale wind tunnel investigation of a bearingless main helicopter rotor --- Ames 40 by 80 foot wind tunnel test using the EO-105 helicopter [NASA-CR-152373] N81-11014

BEARINGS

The vibration of a multi-bearing rotor A81-11722

BENDING VIBRATION

Finite element analysis of natural and forced flexural vibrations of rotor systems A81-11956

BIBLIOGRAPHIES

Search and rescue methods and equipment. A bibliography with abstracts [PB80-812837] N81-10026

Bird strikes and aviation safety. Citations from the NTIS data base [PB80-812944] N81-10027

Adiabatic gas flow. Citations from the NTIS data base [PB80-808546] N81-10048

Head up displays. Citations from the International Aerospace Abstracts data base [NASA-CR-163656] N81-10049

Design-to-cost and new technologies N81-11913

SUBJECT INDEX

COMPOSITE MATERIALS

CARBON FIBERS

- A probabilistic analysis of electrical equipment vulnerability to carbon fibers
[NASA-TM-80217] N81-11113
- Fiber release from impacted graphite reinforced epoxy composites
[NASA-CR-163684] N81-11117
- The implications of laboratory accelerated conditioning of carbon fibre composites
N81-11129

CARGO

- Container Life Adapter-Helicopter (CLAH) operational prototype (preproduction) militarized units for flight evaluation and operational testing
[AD-A089794] N81-11034

CARGO AIRCRAFT

- Design options study. Volume 1: Executive summary --- user requirements for the advanced civil military aircraft
[AD-A089536] N81-10056
- Design options study. Volume 2: Approach and summary results --- advanced civil military aircraft: cost estimates
[AD-A089537] N81-10057
- Design options study. Volume 3: Qualitative assessment --- advanced civil military aircraft
[AD-A089538] N81-10058
- Design options study. Volume 4: Detailed analyses supporting appendices --- advanced civil military aircraft
[AD-A089539] N81-10059

CASCADE FLOW

- The performance of slotted blades in cascade
A81-10632

CAST ALLOYS

- Cast Aluminum Structures Technology (CAST). Technology transfer (phase 6)
[AD-A087492] N81-10152

CAVITIES

- Weapon bay cavity noise environments, data correlation and prediction for the B-1 aircraft
[AD-A089770] N81-11778

CEMENTS

- Polymer research in rapid runway repair materials
[AD-A089606] N81-10080

CENTRIFUGAL COMPRESSORS

- Comparative performance of two centrifugal fan impellers differing in blade section
A81-10162

- A method of performance prediction for centrifugal compressors. Part 1: Analysis. Part 2: Comparison with experiment
[ABC-E/M-3843] N81-10436

CENTRIFUGAL PUMPS

- Inlet flow in centrifugal pumps at partial deliveries
[VKI-PREPRINT-1979-16] N81-10437

CENTRIFUGES

- Axial flow compressors. Citations from the Engineering Index data base
[PB80-808611] N81-10076

CERTIFICATION

- Flight termination receiver/decoders design, performance and certification
[AD-A089746] N81-11045

CHANNEL FLOW

- Flow past a slender profile in a channel with permeable walls
A81-10916

CHEMICAL EQUILIBRIUM

- The aircraft in the stratosphere --- effects on ozone layer equilibrium
A81-10499

CIRCUIT DIAGRAMS

- Characteristics and status of the US National Transonic Facility
N81-11065

CIVIL AVIATION

- Methods of fuel conservation in civil aviation. I
A81-11322
- OIGA, a gust alleviation system for improvement of passenger comfort of general aviation aircraft
A81-11620
- Civil aviation safety. III - Prospects of improvement
A81-11500

- Systems analysis of the installation, mounting, and activation of emergency locator transmitters in general aviation aircraft
[NASA-CR-160036] N81-10020
- NASA Aviation Safety Reporting System
[NASA-TM-81225] N81-10021
- Summary of Federal Aviation Administration responses to National Transportation Safety Board safety recommendations
[AD-A089971] N81-11022
- Proceedings of the 1979 Seminar on Air Traffic Control. Terminal Radar Approach Control (TRACON) facility supervisory desk complex
[AD-A089914] N81-11024

COATINGS

- Compatibility of aircraft operational fluids with a graphite/epoxy composite: Development of an exterior coating system and remover
[AD-A090049] N81-11120

COCKPIT SIMULATORS

- Piloted simulation studies of helicopter agility
A81-10767

COCKPITS

- The future cockpit of the next generation of civil aircraft
A81-11630
- A theoretical and practical design investigation of the future military cockpit
A81-11631

COLLISIONS

- Civil helicopter wire strike assessment study. Volume 2: Accident analysis briefs
[NASA-CR-152390] N81-10019

COMBUSTION CHAMBERS

- Variable geometry, lean, premixed, prevaporized fuel combustor conceptual design study
[ASME PAPER 80-GT-16] A81-12609
- Fuel character effects on current, high pressure ratio, can-type turbine combustion systems
[AD-A089182] N81-10073

COMBUSTION EFFICIENCY

- Flameholding characteristics of a swept-strut H2 fuel-injector for scramjet applications
A81-10711
- Variable geometry, lean, premixed, prevaporized fuel combustor conceptual design study
[ASME PAPER 80-GT-16] A81-12609

COMMAND AND CONTROL

- Multivariable aircraft control by manoeuvre commands - An application to air-to-ground gunnery
[ONERA, TP NO. 1980-127] A81-11623

COMMERCIAL AIRCRAFT

- The future cockpit of the next generation of civil aircraft
A81-11630

- Design options study. Volume 1: Executive summary --- user requirements for the advanced civil military aircraft
[AD-A089536] N81-10056

- Design options study. Volume 2: Approach and summary results --- advanced civil military aircraft: cost estimates
[AD-A089537] N81-10057

- Design options study. Volume 3: Qualitative assessment --- advanced civil military aircraft
[AD-A089538] N81-10058

- Design options study. Volume 4: Detailed analyses supporting appendices --- advanced civil military aircraft

SUBJECT INDEX

CRYOGENIC WIND TUNNELS

CONTROL STABILITY
 A stability augmentation system which covers the complete flight envelope for a F-4c aircraft without gain scheduling
 A81-11622

CONTROL THEORY
 Improved flight control performance and failure tolerance using modern control techniques
 A81-11619

CONTROLLABILITY
 Piloted simulation studies of helicopter agility
 A81-10767
 The control of pressure, temperature and Mach number in a blowdown-to-atmosphere cryogenic wind tunnel
 N81-11063

CONVERGENT NOZZLES
 New interpretations of shock-associated noise with and without screech
 [NASA-TM-81590] N81-10807

CONVERGENT-DIVERGENT NOZZLES
 On screeching jets exhausting from an axisymmetric supersonic nozzle
 A81-11616
 Calibration of the high speed wind tunnel TVM 150 in the supersonic range
 A81-11778

COSMIC RAYS
 The emulsion chamber experiment on super-sonic Concorde /Echos/
 A81-12476

COST ANALYSIS
 ATARS implementation tradeoff
 [AD-A089977] N81-11026
 Life Cycle Cost Analysis (LCCA) in military aircraft procurement
 N81-11903
 Evolution of techniques for LCC analysis
 N81-11909
 Cost/benefit analysis of advanced materials technology candidates for the 1980's, part 2
 [NASA-CR-165176] N81-11953

COST EFFECTIVENESS
 Definitive generic study for the effect of high lift airfoils on wind turbine effectiveness, executive summary
 [SBEI/TR-98003-2] N81-11492
 Cost considerations of engine fuel control systems
 N81-11928

COST ESTIMATES
 Design options study. Volume 2: Approach and summary results --- advanced civil military aircraft: cost estimates
 [AD-A089537] N81-10057
 The use of parametric cost estimating relationships as they pertain to aircraft airframes: A new perspective
 [AD-A089525] N81-10060
 Maritime patrol aircraft engine study. General Electric derivative engines. Volume 2: Appendix A. Performance data - GE27/T3 study a1 turboprop
 [AD-A089336] N81-10068
 Maritime patrol aircraft engine study. General Electric derivative engines. Volume 3: Appendix B. Performance data - TP34/T7 study A1 turboprop
 [AD-A089279] N81-10069
 The potential for damage from the accidental release of conductive carbon fibers from aircraft composites
 N81-11143
 US Army design-to-cost experience
 N81-11905
 A review and assessment of system cost reduction activities
 N81-11906
 Design to life cycle cost research
 N81-11907
 A new method for estimating transport aircraft direct operating costs
 N81-11515

COST REDUCTION
 Design to Cost and Life Cycle Cost
 [AGARD-CP-289] N81-11502
 The Hornet program: A design to life cycle cost case study
 N81-11910

Design-to-cost and new technologies
 N81-11913
 Design-to-cost applied to the AS350 helicopter
 N81-11916
 Using cost reduction concepts at Messier-Hispano-Bugatti
 N81-11923

CRACK INITIATION
 Fatigue damage mechanisms in composite materials - A review
 A81-10747

CRACK PROPAGATION
 Aspect ratio variability in part-through crack life analysis
 A81-10355
 Part-through crack problems in aircraft structures
 A81-10362
 Fatigue damage mechanisms in composite materials - A review
 A81-10747
 On understanding environment-enhanced fatigue crack growth - A fundamental approach
 A81-10749
 Flight simulation environmental fatigue crack propagation in 2024-T3 and 7475-T761 aluminium
 A81-11657
 A practical method for predicting flight-by-flight crack growth in fighter type aircraft for damage tolerance assessment
 A81-11659
 Disk residual life studies. Part 1: F100 1st-stage turbine disk (IN100)
 [AD-A089791] N81-11041
 Flight simulation environmental fatigue crack propagation in 2024-T3 and 7475-T761 aluminium --- wing panels for transport aircraft
 [NLR-PP-80003-U] N81-11415

CRACKING (FRACTURING)
 The analysis of fatigue failures
 A81-11603

CRASHES
 Systems analysis of the installation, mounting, and activation of emergency locator transmitters in general aviation aircraft
 [NASA-CR-160036] N81-10020
 Engineering and development program plan aircraft crashworthiness
 [AD-A089431] N81-10022

CRITICAL FLOW
 Inlet flow in centrifugal pumps at partial deliveries
 [VKI-PREPRINT-1979-16] N81-10437

CRUISING FLIGHT
 Improved aircraft cruise by periodic control
 N81-11030

CRYOGENIC EQUIPMENT
 Brushless cryogenic ac motors
 A81-10468

CRYOGENIC WIND TUNNELS
 A system for model access in tunnels with an unbreathable test medium
 A81-11672
 A fan pressure ratio correlation in terms of Mach number and Reynolds number for the Langley 0.3 meter transonic cryogenic tunnel
 [NASA-TP-1752] N81-10005
 The principles and applications of cryogenic wind tunnels
 N81-11049
 Model design and instrumentation experiences with continuous-flow cryogenic tunnels
 N81-11057
 Model design and instrumentation for intermittent cryogenic wind tunnels
 N81-11058
 Calibration of a blowdown-to-atmosphere cryogenic wind tunnel
 N81-11060
 The control of pressure, temperature and Mach number in a blowdown-to-atmosphere cryogenic wind tunnel
 N81-11063
 Characteristics and status of the US National Transonic Facility
 N81-11065

CUMULATIVE DAMAGE

SUBJECT INDEX

CUMULATIVE DAMAGE

A practical method for predicting flight-by-flight crack growth in fighter type aircraft for damage tolerance assessment
A81-11659

CUTTING
Applications of pyrotechniques in aviation [SNIAS-792-422-103]
N81-10025

CYCLIC LOADS
On understanding environment-enhanced fatigue crack growth - A fundamental approach
A81-10749

CYLINDRICAL ANTENNAS
Excitation of a circular array of cylinders with longitudinal slits --- in radio antennas
A81-12619

D

DAMAGE

The potential for damage from the accidental release of conductive carbon fibers from aircraft composites
N81-11143

DAMAGE ASSESSMENT

A practical method for predicting flight-by-flight crack growth in fighter type aircraft for damage tolerance assessment
A81-11659

Assessing the behavior of high modulus composite materials in lightning
N81-11141

Fatigue and damage propagation in composite rotor blades
N81-11145

DATA ACQUISITION

Wind shear detection from PCM-recorded MLS-flight data
A81-11675

A six-channel quick-look unit for the aerodynamics division MKI airborne data acquisition package [AD-A089975]
N81-11364

DATA CORRELATION

Weapon bay cavity noise environments, data correlation and prediction for the B-1 aircraft [AD-A089770]
N81-11778

DATA LINKS

Formats for DABS data link applications [AD-A089963]
N81-11028

DATA PROCESSING

The use of data items on aircraft performance measurement [ESDU-80009]
N81-10053

DECISION MAKING

Balanced design: Minimum cost solution
N81-11919

Design to cost and systems, LCC
N81-11920

DECISION THEORY

Estimation of relative total cost for aircraft systems
N81-11922

DEFENSE INDUSTRY

Air Force technical objective document FY 1981 [AD-A089709]
N81-12010

DESIGN ANALYSIS

Design of airfoils in incompressible viscous flows by numerical optimization
A81-10096

Possibilities for the valuation of different combat aircraft configurations with respect to flight mechanics
A81-11607

Airbus Industrie's heavenly twins - A310 and A30C-600
A81-12348

Evaluation of section properties for hollow composite beams [PAPER-NR-35]
N81-10454

ATABS implementation tradeoff [AD-A089977]
N81-11026

The European Transonic Wind tunnel ETW
N81-11064

The implications of laboratory accelerated conditioning of carbon fibre composites
N81-11129

Design to Cost and Life Cycle Cost [AGARD-CP-289]
N81-11902

Reliability-centered maintenance
N81-11917

Design to cost and systems, LCC
N81-11920

Summary of AGARD Lecture Series 107: The Application of Design to Cost and Life Cycle Cost to Aircraft Engines
N81-11926

DIESEL ENGINES

Comparisons of four alternative powerplant types for future general aviation aircraft [NASA-TM-81584]
N81-10067

DIFFERENCE EQUATIONS

A comparison of Newton-like methods for the transonic small disturbance equation [AD-A090270]
N81-11017

DIFFUSERS

Vortex drag reduction by aft-mounted diffusing vanes
A81-11647

DIGITAL COMPUTERS

Failure management for the SAAB Viggen JA37 aircraft
N81-11273

DIGITAL TO ANALOG CONVERTERS

A six-channel quick-look unit for the aerodynamics division MKI airborne data acquisition package [AD-A089975]
N81-11364

DIRECTIONAL STABILITY

Helicopter tail configurations to survive tail rotor loss
A81-10768

DISCRETE ADDRESS BEACON SYSTEM

The Discrete Address Beacon System/Air Traffic Control Radar Beacon System/ATCRBS IPP Mark 12 system (DAES/ATCRBS/AIMS) performance prediction model [AD-A089440]
N81-10034

Impact of the discrete Address Beacon System (DABS) on Air Traffic Control Radar Beacon System (ATCRBS) performance in selected deployments [AD-A089611]
N81-10039

Formats for DABS data link applications [AD-A089963]
N81-11028

DISKS (SHAPE)

Disk residual life studies. Part 2: TF30 10th-stage compressor disk (INCOLOY 901) [AD-A089524]
N81-10074

DISPLAY DEVICES

The future cockpit of the next generation of civil aircraft
A81-11630

A theoretical and practical design investigation of the future military cockpit
A81-11631

Head up displays. Citations from the International Aerospace Abstracts data base [NASA-CR-163656]
N81-10049

System simulation applied to the evaluation of displays for guidance and control [DFVLR-MITT-79-10]
N81-10064

Proceedings of the 1979 Seminar on Air Traffic Control. Terminal Radar Approach Control (TRACON) facility supervisory desk complex [AD-A089914]
N81-11024

Helicopter electro-optical system display requirements. 1. The effects of CRT display size, system gamma function, and terrain type on pilots required display luminance [AD-A089755]
N81-11035

DISTANCE

Reduction of the take-off ground run distance to a given set of atmospheric condition
A81-11634

DISTORTION

An evaluation of statistical methods for the prediction of maximum time-variant inlet total pressure distortion [AD-A089817]
N81-11040

DOCUMENT STORAGE

Computer aided compilation of an electrical drawing file
A81-11611

DOMESTIC ENERGY

Hydrogen - Its technology and implications. Volume 4 - Utilization of hydrogen --- Book
A81-11751

DOPPLER RADAR			
Contributions to the United Kingdom microwave landing system research and development program, 1974 to 1978. Volume 1 [RAE-TR-79052-VOL-1]	N81-10044		
Contributions to the United Kingdom microwave landing system research and development program, 1974 to 1978. Volume 2 [RAE-TR-79052-VOL-2]	N81-10045		
Contributions to the United Kingdom microwave landing system research and development program, 1974 to 1978. Volume 3 [RAE-TR-79052-VOL-3]	N81-10046		
Test and evaluation of the Airport Surveillance Radar (ASR)-8 wind shear detection system (phase 2), revision [AD-A090111]	N81-11290		
DRAFTING (DRAWING)			
Computer aided compilation of an electrical drawing file			A81-11611
DRAG MEASUREMENT			
Drag increment due to rear fuselage upsweep [ESDU-80006]	N81-10001		
DRAG REDUCTION			
Vortex drag reduction by aft-mounted diffusing vanes			A81-11647
Leading-edge 'Vortex Flaps' for enhanced subsonic aerodynamics of slender wings			A81-11648
DURABILITY			
Operational durability of airframe structures			A81-11662
Aircraft turbine engine monitoring experience. An overview and lessons learned from selected case studies [AD-A089752]	N81-11042		
DYNAMIC CHARACTERISTICS			
Development and application of a moving base visual flight simulator including the design of hydraulic actuators with hydrostatic bearings			A81-11633
Flow measurements in the wake of a wing fitted with a leading-edge root extension (strake) [RAE-TR-79120]	N81-10015		
DYNAMIC MODELS			
DFVLB-dynamic model testing in wind tunnels for active controls research			A81-11670
DYNAMIC RESPONSE			
Missile motion sensitivity to dynamic stability derivatives [AD-A089750]	N81-11093		
DYNAMIC STABILITY			
Dynamic stability parameters at high angles of attack			A81-11624
DYNAMIC STRUCTURAL ANALYSIS			
The vibration of a multi-bearing rotor			A81-11722
E			
ECONOMIC FACTORS			
Reliability and engineering-economic characteristics of aircraft engines --- Russian book			A81-10045
EDDY CURRENTS			
Disk residual life studies. Part 1: F100 1st-stage turbine disk (IN100) [AD-A089791]	N81-11041		
ELASTOMERS			
Elastomers used in aeronautics industry [SNIAS-801-551-105]	N81-10168		
ELECTRIC CONTROL			
The all-electric aircraft			A81-11617
ELECTRIC EQUIPMENT			
A probabilistic analysis of electrical equipment vulnerability to carbon fibers [NASA-TN-80217]	N81-11113		
ELECTRIC MOTORS			
Brushless cryogenic ac motors			A81-10468
The all-electric aircraft			A81-11617
ELECTRIC NETWORKS			
Computer aided compilation of an electrical drawing file			A81-11611
ELECTRIC POWER SUPPLIES			
High-density avionics power supply			A81-11157
ELECTRICAL PROPERTIES			
Assessing the behavior of high modulus composite materials in lightning			N81-11141
ELECTRON OPTICS			
Head-up displays. III			A81-11320
ELECTROSTATIC CHARGE			
Ground testing of aircraft antistatic protection [ONERA, TP NO. 1980-126]			A81-11674
ENERGY CONSERVATION			
Reduction of energy consumption in the vibrational shot peening of axial compressor vanes			A81-11321
Methods of fuel conservation in civil aviation. I			A81-11322
The relevance of the Flex-Hub Prop-Pan for fuel-efficient airliners			A81-11605
ENERGY CONSUMPTION			
Characteristics and status of the US National Transonic Facility			N81-11065
ENERGY CONVERSION EFFICIENCY			
New BBC high-efficiency gas turbines			A81-11797
ENERGY POLICY			
Definitive generic study for the effect of high lift airfoils on wind turbine effectiveness, executive summary [SERI/TR-98003-2]			N81-11492
Alternative energy sources for non-highway transportation, appendices [DOE/CS-05438/T1-VOL-3]			N81-11500
ENERGY SPECTRA			
The emulsion chamber experiment on super-sonic Concorde /Echos/			A81-12476
ENERGY TECHNOLOGY			
Hydrogen - Its technology and implications. Volume 4 - Utilization of hydrogen --- Book			A81-11751
ENGINE CONTROL			
The all-electric aircraft			A81-11617
Computerized flight management for fuel saving			A81-12349
ENGINE DESIGN			
A numerical study of candidate transverse fuel injector configurations in the Langley scramjet engine			A81-10709
Engine air intake design support by use of computational methods and comparison of theoretically derived pressure distributions with experimental data			A81-11614
Hydrogen-fueled aircraft			A81-11753
Optimum design of axial flow gas turbine stage. I - Formulation and analysis of optimization problem. II - Solution of the optimization problem and numerical results			A81-12608
Variable geometry, lean, premixed, prevaporized fuel combustor conceptual design study [ASME PAPER 80-GT-16]			A81-12609
Automation of aircraft gas-turbine power plants --- Russian book			A81-12782
Maritime patrol aircraft engine study. General Electric derivative engines. Volume 2: Appendix A. Performance data - GE27/T3 study a 1 turboprop [AD-A089336]			N81-10068
Maritime patrol aircraft engine study. General Electric derivative engines. Volume 3: Appendix B. Performance data - TF34/T7 study A 1 turboprop [AD-A089279]			N81-10069

ENGINE FAILURE

SUBJECT INDEX

Cost/benefit analysis of advanced materials technology candidates for the 1980's, part 2 [NASA-CR-165176] N81-11953

ENGINE FAILURE
Impact damage of aircraft gas turbine engines with axial compressors A81-11324

ENGINE INLETS
Engine air intake design support by use of computational methods and comparison of theoretically derived pressure distributions with experimental data A81-11614
Optimum subsonic, high-angle-of-attack nacelles A81-11646
Low-speed aerodynamic performance of 50.8-centimeter-diameter noise-suppressing inlets for the Quiet, Clean, Short-haul Experimental Engine (QCSEE) --- Lewis 9- by 15-foot low speed wind tunnel tests [NASA-TP-1178] N81-11037

ENGINE NOISE
Acoustic structures --- titanium brazing method for producing honeycomb structures for jet engine noise reduction A81-10272
Core noise measurements from a small, general aviation turbofan engine [NASA-TM-81610] N81-11769

ENGINE TESTING LABORATORIES
Quantitative thermography in aero-engine research and development [PNR-90021] N81-10075

ENGINE TESTS
Reliability and engineering-economic characteristics of aircraft engines --- Russian book A81-10045
Forced vibrations of a nonlinear system excited by a centrifugal oscillator with a sloping engine characteristic A81-10439
Aircraft turbine engine monitoring experience. An overview and lessons learned from selected case studies [AD-A089752] N81-11042

ENVIRONMENT MANAGEMENT
Handbook on bird management and control [AD-A089009] N81-10024

ENVIRONMENT SIMULATION
Prediction of changes in aircraft noise exposure A81-11820

ENVIRONMENTAL CONTROL
ECS integration for fuel efficient/low life cycle cost design --- Environmental Control Systems in aircraft A81-11676

ENVIRONMENTAL TESTS
Effect of service environment on composite materials [AGARD-CP-288] N81-11128
Effect of various environmental conditions on polymer matrix composites N81-11130
Fatigue strength of CFRP under combined flight-by-flight loading and flight-by-flight temperature changes N81-11134
Flight simulation environmental fatigue crack propagation in 2024-T3 and 7475-T761 aluminum --- wing panels for transport aircraft [NLB-MP-80003-U] N81-11415

EPOXY RESINS
Microcracking in graphite-epoxy composites [AD-A089894] N81-11118

EQUATIONS OF MOTION
An exact solution of the problem of the motion of a gyroscope in a Cardan suspension A81-12704

EROSION
Erosion and impacts on composite helicopter blades N81-11138

ERROR ANALYSIS
Predictability of moisture absorption in graphite/epoxy sandwich panels N81-11131

ESCAPE (ABANDONMENT)
Applications of pyrotechniques in aviation [SNIAS-792-422-1C3] N81-10025

ESCAPE SYSTEMS
Engineering and development program plan aircraft crashworthiness [AD-A089431] N81-10022

EUROPEAN AIRBUS
Airbus Industrie's heavenly twins - A310 and A300-600 A81-12348

EVAUATING (TRANSPORTATION)
Applications of pyrotechniques in aviation [SNIAS-792-422-103] N81-10025

EXTERNAL STORES
In-flight measurement of aerodynamic loads on captive stores. Equipment and results [NLB-MP-79013-U] N81-10012

F

F-4 AIRCRAFT
Active flutter suppression design and test - A joint U.S.-F.R.G. program A81-11621
A stability augmentation system which covers the complete flight envelope for a F-4c aircraft without gain scheduling A81-11622
Fiberglass-reinforced rigid polyurethane expedient pavement subject to simulated F-4 aircraft traffic [AD-A089266] N81-10079
Wind tunnel investigation of the aerodynamic hysteresis phenomenon on the F-4 aircraft and its effects on aircraft motion [AD-A089851] N81-11016
Robust control system design N81-11275

F-8 AIRCRAFT
Flight experience with flight control redundancy management N81-11274

F-16 AIRCRAFT
Design to cost and the F-16 multirole fighter N81-11911

F-18 AIRCRAFT
F/A-18's landing, launch and recovery system A81-11244

FABRICATION
Design and fabrication of stabilized organic matrix composites A81-11338
Development of advanced interceptor substructural material --- graphite epoxy missile structures [AD-A090127] N81-11116

FAIL-SAFE SYSTEMS
Improved flight control performance and failure tolerance using modern control techniques A81-11619

FAILURE
Detecting the failure of aircraft sensors using analytical redundancy N81-11270

FAILURE ANALYSIS
The analysis of fatigue failures A81-11603
Computer based in-flight monitoring N81-11269
Failure management techniques for high survivability N81-11272
Failure management for the S&AB Viggen JA37 aircraft N81-11273
Flight experience with flight control redundancy management N81-11274

FAN BLADES
Discrete frequency noise due to irregularity in blade row of axial fan rotor A81-10633
Development of wind tunnel fan blade made of composite materials [MBB-UD-277-79-0] A81-12096
Superhybrid composite blade impact studies [NASA-TN-81597] N81-11412

FATIGUE (MATERIALS)
Cast Aluminum Structures Technology (CAST) - Technology transfer (phase 6) [AD-A087492] N81-10152
Fatigue and damage propagation in composite rotor blades N81-11145

- FATIGUE LIFE**
 Aspect ratio variability in part-through crack life analysis A81-10355 N81-11134
 Fatigue damage mechanisms in composite materials - A review A81-10747
 The analysis of fatigue failures A81-11603
 Disk residual life studies. Part 2: TF30 10th-stage compressor disk (INCOLOY 901) [AD-A089524] N81-10074
 Airfield pavement evaluation. Citations from the NTIS data base [PB80-812860] N81-10083
 Disk residual life studies. Part 1: F100 1st-stage turbine disk (IN100) [AD-A089791] N81-11041
 Constant-amplitude and flight-by-flight tests on CFRP specimens N81-11133
- FATIGUE TESTS**
 Flight simulation environmental fatigue crack propagation in 2024-T3 and 7475-T761 aluminium A81-11657
 Fatigue strength of CFRP under combined flight-by-flight loading and flight-by-flight temperature changes N81-11134
 Fatigue test results of carbon fiber reinforced plastic F28 aircraft component and its structural details N81-11135
- FAULT TOLERANCE**
 Computer based in-flight monitoring N81-11269
 Failure management techniques for high survivability N81-11272
 Flight experience with flight control redundancy management N81-11274
 Robust control system design N81-11275
- FEEDBACK CONTROL**
 Multivariable closed-loop analysis and flight control synthesis for air-to-air tracking [AD-A090050] N81-11046
- FIBER COMPOSITES**
 Fatigue and damage propagation in composite rotor blades N81-11145
- FIBER RELEASE**
 A probabilistic analysis of electrical equipment vulnerability to carbon fibers [NASA-TM-80217] N81-11113
 Fiber release from impacted graphite reinforced epoxy composites [NASA-CN-163684] N81-11117
 The potential for damage from the accidental release of conductive carbon fibers from aircraft composites N81-11143
- FIELD THEORY (PHYSICS)**
 Analysis of calculated three-dimensional inviscid flow fields with embedded shock waves (presentation of a field solution), part 1 [ESA-TT-558] N81-10017
- FIGHTER AIRCRAFT**
 NASA presses fighter gains --- long-range supersonic cruise aircraft A81-10575
 Possibilities for the valuation of different combat aircraft configurations with respect to flight mechanics A81-11607
 Advanced combat aircraft wing design A81-11608
 A study of the air inlet efficiency of a combat aircraft concept with dorsal inlet A81-11615
 A practical method for predicting flight-by-flight crack growth in fighter type aircraft for damage tolerance assessment A81-11659
 Constant-amplitude and flight-by-flight tests on CFRP specimens N81-11133
- Fatigue strength of CFRP under combined flight-by-flight loading and flight-by-flight temperature changes N81-11134
 Fatigue test results of carbon fiber reinforced plastic F28 aircraft component and its structural details N81-11135
- FILE MAINTENANCE (COMPUTERS)**
 Computer aided compilation of an electrical drawing file A81-11611
- FINANCIAL MANAGEMENT**
 Evolution of techniques for LCC analysis N81-11909
- PINITE DIFFERENCE THEORY**
 Review of numerical methods for the problem of the supersonic flow around bodies at angle of attack A81-11639
- PINITE ELEMENT METHOD**
 Flow computation around multi-element airfoils in viscous transonic flow A81-11641
 Finite element analysis of natural and forced flexural vibrations of rotor systems A81-11956
- PINNED BODIES**
 Theoretical determination of subsonic oscillatory airforce coefficients for fin-tailplane configurations [RAE-TR-79125] N81-10016
- PINS**
 Development of the A300 fin in modern composite fibre construction A81-11653
- FIRE CONTROL**
 Multivariable aircraft control by manoeuvre commands - An application to air-to-ground gunnery [ONERA, TP NO. 1980-127] A81-11623
- FIRE PREVENTION**
 Aircraft engine nacelle fire test simulator. Volume 1: Technical [AD-A089629] N81-10081
- FIXED WINGS**
 Engineering and development program plan aircraft crashworthiness [AD-A089431] N81-10022
- FLAME HOLDERS**
 Flameholding characteristics of a swept-strut H2 fuel-injector for scramjet applications A81-10711
- FLEXING**
 Finite element analysis of natural and forced flexural vibrations of rotor systems A81-11956
- FLIGHT CHARACTERISTICS**
 Identification of longitudinal flying characteristics of an aeroplane and the effect of nonstationary aerodynamics A81-11627
 Development and application of a moving base visual flight simulator including the design of hydraulic actuators with hydrostatic bearings A81-11633
 Helicopter flight characteristics improvement through swept-tip rotor blades [MBB-UD-275-79-0] A81-12097
 Improved aircraft cruise by periodic control N81-11030
 A multivariate approach to handling qualities rating scale development [AD-A089825] N81-11047
- FLIGHT CONTROL**
 The 767's flight-management system - A new generation of airborne avionics A81-11242
 Flying qualities criteria for advanced control technology transports A81-11616
 Improved flight control performance and failure tolerance using modern control techniques A81-11619
 Multivariable aircraft control by manoeuvre commands - An application to air-to-ground gunnery [ONERA, TP NO. 1980-127] A81-11623
 DPVLR-dynamic model testing in wind tunnels for active controls research A81-11670

FLIGHT HAZARDS

SUBJECT INDEX

A method of helicopter low airspeed estimation based on measurement of control parameters [MBB-UD-276-79-0] A81-12094
 Computerized flight management for fuel saving A81-12349

Recommended short-term ATC improvements for helicopters. Volume 3: Operational description of experimental LORAN-C flight following (LOFF) in the Houston area [AD-A089385] N81-10030

Fitment of TAMAM standby attitude indicators to Macchi aircraft [AD-A089378] N81-11036

Simulating study of the interaction between the propulsion and flight control systems of a subsonic lift fan VTOL [NASA-TM-81239] N81-11043

Flight termination receiver/decoders design, performance and certification [AD-A089746] N81-11045

Multivariable closed-loop analysis and flight control synthesis for air-to-air tracking [AD-A090050] N81-11046

Computer based in-flight monitoring N81-11269

Detecting the failure of aircraft sensors using analytical redundancy N81-11270

Robust control system design N81-11275

FLIGHT HAZARDS

Bird strikes and aviation safety. Citations from the NTIS data base [FB80-812944] N81-10027

FLIGHT INSTRUMENTS

Head up displays. Citations from the NTIS data base [FB80-809064] N81-10050

FLIGHT MECHANICS

The aerodynamics of pure subsonic flow /4th revised edition/ --- German book A81-11441

Possibilities for the valuation of different combat aircraft configurations with respect to flight mechanics A81-11607

Aircraft performance optimization by forced singular perturbation A81-11667

FLIGHT PATHS

Recommended short-term ATC improvements for helicopters. Volume 3: Operational description of experimental LORAN-C flight following (LOFF) in the Houston area [AD-A089385] N81-10030

FLIGHT RECORDERS

A six-channel quick-look unit for the aerodynamics division MKI airborne data acquisition package [AD-A089975] N81-11364

FLIGHT RULES

Summary of Federal Aviation Administration responses to National Transportation Safety Board safety recommendations [AD-A089971] N81-11022

FLIGHT SAFETY

Procedures to improve flight safety in wind shear conditions A81-11666

Ground testing of aircraft antistatic protection [ONERA, TP NO. 1980-126] A81-11674

Civil aviation safety. III - Prospects of improvement A81-11900

NASA Aviation Safety Reporting System [NASA-TM-81225] N81-10021

Aviation safety and noise abatement [GPO-50-923] N81-10578

Failure management for the SAAB Viggen JA37 aircraft N81-11273

FLIGHT SIMULATION

Piloted simulation studies of helicopter agility A81-10767

Identification of longitudinal flying characteristics of an aeroplane and the effect of nonstationary aerodynamics A81-11627

The role of flight simulation in the design and development of the Sea Harrier Nav-Attack System A81-11635

Recommendations for short-term simulation of ATC concepts. Helicopter operations development program [AD-A089435] N81-10038

A piloted simulator investigation of static stability and stability/control augmentation effects on helicopter handling qualities for instrument approach [NASA-TM-81188] N81-10077

Pilot-aircraft system response to wind shear [NASA-CR-3342] N81-10636

Flight simulation environmental fatigue crack propagation in 2024-T3 and 7475-T761 aluminum --- wing panels for transport aircraft [NLR-ME-80003-U] N81-11415

FLIGHT SIMULATORS

Development and application of a moving base visual flight simulator including the design of hydraulic actuators with hydrostatic bearings A81-11633

The turbulent wind and its effect on flight [OFTAS-REVIEW-44] N81-11020

Microprocessor software applications for flight training simulators N81-11658

FLIGHT STABILITY TESTS

Missile motion sensitivity to dynamic stability derivatives [AD-A089750] N81-11093

FLIGHT STRESS

Flight simulation environmental fatigue crack propagation in 2024-T3 and 7475-T761 aluminium A81-11657

FLIGHT TESTS

Active flutter suppression design and test - A joint U.S.-F.R.G. program A81-11621

Reduction of the take-off ground run distance to a given set of atmospheric condition A81-11634

Design and tests of an helicopter rotor blade with evolutive profile [ONERA, TP NO. 1980-125] A81-11638

Structural flight load testing, calibration and analysis A81-11656

Investigation of the stalling characteristics of a general aviation aircraft A81-11665

Initial experience with methods to evaluate flight test characteristics with operational flight maneuvers A81-11782

Helicopter flight characteristics improvement through swept-tip rotor blades [MBB-UD-275-79-0] A81-12097

In-flight measurement of aerodynamic loads on captive stores. Equipment and results [NLR-MP-79013-U] N81-10012

The use of data items on aircraft performance measurement [ESDU-80009] N81-10053

Flight test results of the HPB 320 model following control system for the in-flight simulation of Airbus A 130 [DFVLR-MITT-79-13] N81-10078

Aircraft turbine engine monitoring experience. An overview and lessons learned from selected case studies [AD-A089752] N81-11042

Constant-amplitude and flight-by-flight tests on CFP specimens N81-11133

FLIGHT TRAINING

Recommended short-term ATC improvements for helicopters. Volume 2: Recommended helicopter ATC training material [AD-A089441] N81-10029

Fitment of TAMAM standby attitude indicators to Macchi aircraft [AD-A089378] N81-11036

FLIGHT VEHICLES

Investigation of high-maneuvrability flight vehicle dynamics A81-11625

Optimal flight vehicle design and linear vector spaces A81-11668

SUBJECT INDEX

GAS DYNAMICS

- Gyrostabilizers for inertial control systems ---
Russian book
A81-12024
- FLOW CHARACTERISTICS**
Analytical estimation on nonlinear longitudinal characteristics of wings with small and moderate aspect ratio by the vortex lattice method in incompressible flow
[ESA-TT-585] N81-10018
The European Transonic Wind tunnel ETW
N81-11064
- FLOW DISTORTION**
Flow past a slender profile in a channel with permeable walls
A81-10916
- FLOW DISTRIBUTION**
Calculation of the flow field around engine-wing-configurations
A81-11613
Analysis of calculated three-dimensional inviscid flow fields with embedded shock waves (presentation of a field solution), part 1
[ESA-TT-558] N81-10017
- FLOW GEOMETRY**
Asymmetric flow of subsonic and sonic jets over an infinite wedge
A81-10919
An example of the transonic flow past a body with a discontinuity in the contour curvature
A81-12367
- FLOW MEASUREMENT**
High-lift investigations on some small aspect ratio wings
A81-11643
- FLOW VELOCITY**
Calculation of the flow field around engine-wing-configurations
A81-11613
- FLOW VISUALIZATION**
Add fluorescent minitufts to the aerodynamicist's bag of tricks
A81-11245
High-lift investigations on some small aspect ratio wings
A81-11643
A simple laser interferometer for wind tunnel flow visualisation
A81-12078
Holographic investigation of slender body vortex wakes
[AD-A089496] N81-10008
- FLUID BOUNDARIES**
An experimental investigation of jet screech by air jet impingement on solid boundaries
A81-11302
- FLUTTER**
Active flutter suppression design and test - A joint U.S.-F.R.G. program
A81-11621
- FLY BY WIRE CONTROL**
Improved flight control performance and failure tolerance using modern control techniques
A81-11619
Flight experience with flight control redundancy management
N81-11274
- FORCED VIBRATION**
Forced vibrations of a nonlinear system excited by a centrifugal oscillator with a sloping engine characteristic
A81-10439
The vibration of a multi-bearing rotor
A81-11722
Finite element analysis of natural and forced flexural vibrations of rotor systems
A81-11956
- FORMAT**
Formats for DAES data link applications
[AD-A089963] N81-11028
- FRACTURE MECHANICS**
Fatigue damage mechanisms in composite materials - A review
A81-10747
On understanding environment-enhanced fatigue crack growth - A fundamental approach
A81-10749
Disk residual life studies. Part 1: F100 1st-stage turbine disk (1B100)
[AD-A089791] N81-11041
- FRACTURE STRENGTH**
Relationships between impact resistance and fracture toughness in advanced composite materials
N81-11137
- FRANCE**
Annoyance from light aircraft investigation carried out around four airports near Paris
[NASA-TN-75823] N81-10577
- FREE FLIGHT**
Investigation of high-maneuvrability flight vehicle dynamics
A81-11625
- FREE VIBRATION**
The vibration of a multi-bearing rotor
A81-11722
Finite element analysis of natural and forced flexural vibrations of rotor systems
A81-11956
- FUEL COMBUSTION**
Compound Cycle Turbofan Engine (CCTE). Task 9: Carbon-Slurry Fuel Combustion Evaluation Program
[AD-A089451] N81-10072
Alternative energy sources for non-highway transportation, volume 1
[DOE/CS-05438/T1-VOL-1] N81-11513
- FUEL CONSUMPTION**
Methods of fuel conservation in civil aviation. I
A81-11322
The relevance of the Flex-Hub Prop-Fan for fuel-efficient airliners
A81-11605
Advanced fuel system technology for utilizing broadened property aircraft fuels
A81-11612
ECS integration for fuel efficient/low life cycle cost design --- Environmental Control Systems in aircraft
A81-11676
Computerized flight management for fuel saving
A81-12349
Maritime patrol aircraft engine study. General Electric derivative engines. Volume 2: Appendix A. Performance data - GE27/T3 study a1 turboprop
[AD-A089336] N81-10068
Maritime patrol aircraft engine study. General Electric derivative engines. Volume 3: Appendix B. Performance data - TP34/T7 study A1 turboprop
[AD-A089279] N81-10069
- FUEL CONTROL**
ECS integration for fuel efficient/low life cycle cost design --- Environmental Control Systems in aircraft
A81-11676
Cost considerations of engine fuel control systems
N81-11928
- FUEL INJECTION**
A numerical study of candidate transverse fuel injector configurations in the Langley scramjet engine
A81-10709
Flameholding characteristics of a swept-strut B2 fuel-injector for scramjet applications
A81-10711
- FUEL SYSTEMS**
Advanced fuel system technology for utilizing broadened property aircraft fuels
A81-11612
- FUEL TESTS**
Advanced fuel system technology for utilizing broadened property aircraft fuels
A81-11612
- FUNCTIONAL DESIGN SPECIFICATIONS**
Design options study. Volume 3: Qualitative assessment --- advanced civil military aircraft
[AD-A089538] N81-10058
- FUSELAGES**
Drag increment due to rear fuselage upsweep
[FSDU-80006] N81-10001

G

- GAS DYNAMICS**
Adiabatic gas flow. Citations from the NTIS data base
[FB80-808546] N81-10048

GAS FLOW

- Investigation of lateral forces and moments in the case of asymmetric gas flows in nozzles
A81-10913
- GAS STREAMS**
Two methods for calculating the load on the surface of a slender body executing axisymmetric vibrations in a sonic gas flow
A81-10920
- Effect of a semi-annular thermal acoustic shield on jet exhaust noise
[NASA-TM-81615]
N81-11770
- GAS TURBINE ENGINES**
Impact damage of aircraft gas turbine engines with axial compressors

 Head up displays. Citations from the NTIS data base
 [PB80-809064] N81-10050
- IMPACT DAMAGE**
 Impact damage of aircraft gas turbine engines with
 axial compressors
 A81-11324
 Relationships between impact resistance and
 fracture toughness in advanced composite materials
 N81-11137
 Graphite-epoxy panel compression strength
 reduction due to local impact
 N81-11139

IMPACT RESISTANCE

SUBJECT INDEX

IMPACT RESISTANCE

Relationships between impact resistance and fracture toughness in advanced composite materials N81-11137

Erosion and impacts on composite helicopter blades N81-11138

Superhybrid composite blade impact studies [NASA-TM-81597] N81-11412

IMPACT TESTS

Fiber release from impacted graphite reinforced epoxy composites [NASA-CR-163684] N81-11117

Graphite-epoxy panel compression strength reduction due to local impact N81-11139

IMPELLERS

Comparative performance of two centrifugal fan impellers differing in blade section A81-10162

IN-FLIGHT MONITORING

In-flight measurement of aerodynamic loads on captive stores. Equipment and results [NLR-MP-79013-U] N81-10012

Flight test results of the HFB 320 model following control system for the in-flight simulation of Airbus A 130 [DPVLR-MITT-79-13] N81-10078

Aircraft turbine engine monitoring experience. An overview and lessons learned from selected case studies [AD-A089752] N81-11042

INCOMPRESSIBLE FLOW

Design of airfoils in incompressible viscous flows by numerical optimization A81-10096

Flow past a slender profile in a channel with permeable walls A81-10916

Flow computation around multi-element airfoils in viscous transonic flow A81-11641

INDICATING INSTRUMENTS

Systems analysis of the installation, mounting, and activation of emergency locator transmitters in general aviation aircraft [NASA-CR-160036] N81-10020

INDUSTRIAL ENERGY

Hydrogen - Its technology and implications. Volume 4 - Utilization of hydrogen --- Book A81-11751

INERTIA PRINCIPLE

An exact solution of the problem of the motion of a gyroscope in a Cardan suspension A81-12704

INERTIAL NAVIGATION

Gyrostabilizers for inertial control systems --- Russian book A81-12024

Gyrocompasses. Citations from the International Aerospace Abstracts data base [NASA-CR-163675] N81-10065

INJURIES

The accident/injury matrix - A tool for aircraft accident investigation A81-12241

INLET FLOW

A study of the air inlet efficiency of a combat aircraft concept with dorsal inlet A81-11615

INLET PRESSURE

An evaluation of statistical methods for the prediction of maximum time-variant inlet total pressure distortion [AD-A089817] N81-11040

INSTRUMENT APPROACH

A piloted simulator investigation of static stability and stability/control augmentation effects on helicopter handling qualities for instrument approach [NASA-TM-81188] N81-10077

INTEGRAL EQUATIONS

Calculation of plane transonic flows using the integral equation method and shock fitting A81-11779

INTEGRATED CIRCUITS

High-density avionic power supply A81-11157

INTERFEROMETERS

A simple laser interferometer for wind tunnel flow visualisation A81-12078

INTERGRANULAR CORROSION

On understanding environment-enhanced fatigue crack growth - A fundamental approach A81-10749

INVESTMENTS

A controlled evaluation of the differences between two approaches to reliability investment screening [AD-A087506] N81-10446

INVISCID FLOW

Analysis of calculated three-dimensional inviscid flow fields with embedded shock waves (presentation of a field solution), part 1 [ESA-TT-558] N81-10017

J

JET AIRCRAFT

Preliminary design characteristics of a subsonic business jet concept employing an aspect ratio 25 strut braced wing [NASA-CR-159361] N81-11013

Fitment of TAMAM standby attitude indicators to Macchi aircraft [AD-A089378] N81-11036

JET AIRCRAFT NOISE

An experimental investigation of jet screech by air jet impingement on solid boundaries A81-11302

Some thoughts on the effects of flight on jet noise as observed in actual flight and in wind tunnels A81-11723

Status of knowledge of sonic booms A81-11822

Aviation safety and noise abatement [GPO-50-923] N81-10578

New interpretations of shock-associated noise with and without screech [NASA-TM-81590] N81-10807

Core noise measurements from a small, general aviation turbofan engine [NASA-TM-81610] N81-11769

Effect of a semi-annular thermal acoustic shield on jet exhaust noise [NASA-TM-81615] N81-11770

Cooperative investigation of the noise producing region of an axisymmetric jet [AD-A089692] N81-11774

JET ENGINE FUELS

Fuel character effects on current, high pressure ratio, can-type turbine combustion systems [AD-A089182] N81-10073

Ignition of a liquid fuel [AD-A089295] N81-10128

Fuel jettisoning by U.S. Air Force aircraft. Volume 1: Summary and analysis [AD-A089010] N81-10580

Fuel jettisoning by U.S. Air Force aircraft. Volume 2: Fuel dump listings [AD-A089076] N81-10581

Toxicity of synthetic high density and conventional hydrocarbon jet fuels to a soil bacterium [AD-A089527] N81-11233

JET ENGINES

Quantitative thermography in aero-engine research and development [FNR-90021] N81-10075

Axial flow compressors. Citations from the Engineering Index data base [EB80-808611] N81-10076

Axial flow compressors. Citations from the NTIS data base [EB80-808603] N81-10441

JET EXHAUST

On screeching jets exhausting from an axisymmetric supersonic nozzle A81-11616

JET FLOW

Effect of a semi-annular thermal acoustic shield on jet exhaust noise [NASA-TM-81615] N81-11770

SUBJECT INDEX

LIFTING BODIES

JET IMPINGEMENT

An experimental investigation of jet screech by air jet impingement on solid boundaries N81-11302

JET MIXING FLOW

Cooperative investigation of the noise producing region of an axisymmetric jet [AD-A089692] N81-11774

JET NOZZLES

On screeching jets exhausting from an axisymmetric supersonic nozzle N81-11616

JET PROPULSION

Simulating study of the interaction between the propulsion and flight control systems of a subsonic lift fan VTOL [NASA-TM-81239] N81-11043

JETTISONING

Fuel jettisoning by U.S. Air Force aircraft. Volume 1: Summary and analysis [AD-A089010] N81-10580

Fuel jettisoning by U.S. Air Force aircraft. Volume 2: Fuel dump listings [AD-A089076] N81-10581

JOINTS (JUNCTIONS)

Elastomers used in aeronautics industry [SNIAS-801-551-105] N81-10168

JOURNAL BEARINGS

An analytical method to calculate misalignment in the journal bearing of a planetary gear system N81-10839

An experimental and theoretical investigation of pressures in four-lobe bearings N81-10840

K

KARMAN VORTEX STREET

An example of the transonic flow past a body with a discontinuity in the contour curvature N81-12367

L

LAMINAR BOUNDARY LAYER

Boundary layer measurements on a two-dimensional wing with flap [NLE-TR-79009-U] N81-10014

LAMINATES

Predictability of moisture absorption in graphite/epoxy sandwich panels N81-11131

Relationships between impact resistance and fracture toughness in advanced composite materials N81-11137

LANDING AIDS

Procedures to improve flight safety in wind shear conditions N81-11666

Analysis of the function principle and operational assessment of an onboard glidepath guidance system for visual approaches (Visual Approach Monitor (VAM) [DFVLE-FB-79-38] N81-10043

LANDING GEAR

Subsequent proof of damage tolerance for a landing gear component after numerous takeoffs and landings N81-11475

LANDING MATS

Fiberglass-reinforced rigid polyurethane expedient pavement subject to simulated F-4 aircraft traffic [AD-A089266] N81-10079

LANDING SIMULATION

Analysis of the function principle and operational assessment of an onboard glidepath guidance system for visual approaches (Visual Approach Monitor (VAM) [DFVLE-FB-79-38] N81-10043

LASER APPLICATIONS

A simple laser interferometer for wind tunnel flow visualisation N81-12078

LATERAL STABILITY

Investigation of lateral forces and moments in the case of asymmetric gas flows in nozzles N81-10913

LATTICES (MATHEMATICS)

Analytical estimation on nonlinear longitudinal characteristics of wings with small and moderate aspect ratio by the vortex lattice method in incompressible flow [ESA-TT-585] N81-10018

LEADING EDGE FLAPS

Leading-edge 'Vortex Flaps' for enhanced subsonic aerodynamics of slender wings N81-11648

LEADING EDGE SLATS

Design and test of a graphite-epoxy composite A-10 slat N81-11339

LEADING EDGES

Optimizing the fixed leading edge shape of a transonic wing to suit the landing high-lift requirements N81-11644

Simplified vortex models for slender lifting surfaces with leading edge separation N81-11777

LEAST SQUARES METHOD

An analytical technique for approximating unsteady aerodynamics in the time domain [NASA-TP-1738] N81-11422

LIFE CYCLE COSTS

ECS integration for fuel efficient/low life cycle cost design --- Environmental Control Systems in aircraft N81-11676

Aircraft turbine engine monitoring experience. An overview and lessons learned from selected case studies [AD-A089752] N81-11042

Design to Cost and Life Cycle Cost [AGARD-CP-289] N81-11902

Life Cycle Cost Analysis (LCCA) in military aircraft procurement N81-11903

US Army design-to-cost experience N81-11905

A review and assessment of system cost reduction activities N81-11906

Design to life cycle cost research N81-11907

Evolution of techniques for LCC analysis N81-11909

The Hornet program: A design to life cycle cost case study N81-11910

Design to cost and the F-16 multirole fighter N81-11911

Organizing a design-to-cost program N81-11914

Some engineering aspects of life cycle costing N81-11918

Balanced design: Minimum cost solution N81-11919

Design to cost and systems, LCC N81-11920

Impact of maintainability of life cycle costs N81-11921

Using cost reduction concepts at Messier-Hispano-Bugatti N81-11923

Summary of AGARD Lecture Series 100: Methodology for control of life cycle costs for avionics systems N81-11924

Summary of AGARD Lecture Series 107: The Application of Design to Cost and Life Cycle Cost to Aircraft Engines N81-11926

The role of advanced technology of turbine engine life cycle cost N81-11927

LIFT DEVICES

High lift research and its application to aircraft design N81-11642

LIFTING BODIES

Simplified vortex models for slender lifting surfaces with leading edge separation N81-11777

LIGHT AIRCRAFT

SUBJECT INDEX

LIGHT AIRCRAFT

Annoyance from light aircraft investigation carried out around four airports near Paris [NASA-TM-75023] N81-10577

Preliminary design characteristics of a subsonic business jet concept employing an aspect ratio 25 strut braced wing [NASA-CR-159361] N81-11013

LIGHTNING

Assessing the behavior of high modulus composite materials in lightning N81-11141

Lightning protection considerations for graphite/epoxy aircraft structure N81-11142

LIQUID FUELS

Ignition of a liquid fuel [AD-A089295] N81-10128

LOAD TESTS

Structural flight load testing, calibration and analysis A81-11656

LOGISTICS

Container Life Adapter-Helicopter (CLAH) operational prototype (preproduction) militarized units for flight evaluation and operational testing [AD-A089794] N81-11034

Design to life cycle cost research N81-11907

LOGISTICS MANAGEMENT

An analysis of Air Force management of Turbine Engine Monitoring Systems (TEMS) [AD-A089365] N81-10070

LONGITUDINAL CONTROL

A stability augmentation system which covers the complete flight envelope for a P-4c aircraft without gain scheduling A81-11622

LONGITUDINAL STABILITY

Longitudinal motion of low-flying vehicles in nonlinear flowfields A81-11626

LORAN

Recommended short-term ATC improvements for helicopters. Volume 3: Operational description of experimental LORAN-C flight following (LOFP) in the Houston area [AD-A089385] N81-10030

Proposed ATC system for the Gulf of Mexico: Helicopter operations development program [AD-A089430] N81-10036

Preliminary test plans of ATC concepts for longer term improvement helicopter development program [AD-A089407] N81-10037

LOW ASPECT RATIO

High-lift investigations on some small aspect ratio wings A81-11643

LOW ASPECT RATIO WINGS

Analytical estimation on nonlinear longitudinal characteristics of wings with small and moderate aspect ratio by the vortex lattice method in incompressible flow [ESA-TT-585] N81-10018

LOW COST

ECS integration for fuel efficient/low life cycle cost design --- Environmental Control Systems in aircraft A81-11676

LOW SPEED STABILITY

A method of helicopter low airspeed estimation based on measurement of control parameters [MBB-UD-276-79-0] A81-12094

LOW SPEED WIND TUNNELS

Low-speed airfoil section research at Delft University of Technology A81-11636

High-lift investigations on some small aspect ratio wings A81-11643

MACH NUMBER

A fan pressure ratio correlation in terms of Mach number and Reynolds number for the Langley 0.3 meter transonic cryogenic tunnel [NASA-TP-1752] N81-10005

M

MAGNETOHYDRODYNAMICS

Adiabatic gas flow. Citations from the NTIS data base [FB80-808546] N81-10048

MAINTENANCE

Polymer research in rapid runway repair materials [AD-A089606] N81-10080

The potential for damage from the accidental release of conductive carbon fibers from aircraft composites N81-11143

A new method for estimating transport aircraft direct operating costs N81-11915

MAN MACHINE SYSTEMS

Head-up displays. III A81-11320

The future cockpit of the next generation of civil aircraft A81-11630

The role of flight simulation in the design and development of the Sea Harrier Nav-Attack System A81-11635

Initial experience with methods to evaluate flight test characteristics with operational flight maneuvers A81-11782

System simulation applied to the evaluation of displays for guidance and control [DFVLR-MITT-79-10] N81-10064

MANAGEMENT ANALYSIS

An analysis of Air Force management of Turbine Engine Monitoring Systems (TEMS) [AD-A089365] N81-10070

MANAGEMENT METHODS

Using cost reduction concepts at Messier-Hispano-Bugatti N81-11923

Summary of AGARD Lecture Series 100: Methodology for control of life cycle costs for avionics systems N81-11924

MANAGEMENT PLANNING

Air Force technical objective document FY 1981 [AD-A089709] N81-12010

MANOEUVRABILITY

Investigation of high-maneuvrability flight vehicle dynamics A81-11625

A multivariate approach to handling qualities rating scale development [AD-A089825] N81-11047

MANUFACTURING

DRAPO - Computer-assisted design and manufacturing system A81-11610

Cast Aluminum Structures Technology (CAST). Technology transfer (phase 6) [AD-A087492] N81-10152

MAP MATCHING GUIDANCE

Radar target detection and map-matching algorithm studies A81-11158

MATHEMATICAL MODELS

The use of parametric cost estimating relationships as they pertain to aircraft airframes: A new perspective [AD-A089525] N81-10060

Disk residual life studies. Part 2: TF30 10th-stage compressor disk (INCOLOY 901) [AD-A089524] N81-10074

A method of performance prediction for centrifugal compressors. Part 1: Analysis. Part 2: Comparison with experiment [ARC-E/M-3843] N81-10436

Predictability of moisture absorption in graphite/epoxy sandwich panels N81-11131

Transducer installation for the Sea King MK 50 mathematical model validation flight tests [AD-A089924] N81-11365

An analytical technique for approximating unsteady aerodynamics in the time domain [NASA-TP-1738] N81-11422

MATRIX MATERIALS

Effect of service environment on composite materials [AGARD-CP-288] N81-11128

SUBJECT INDEX

NASA PROGRAMS

Effect of various environmental conditions on polymer matrix composites
N81-11130

MECHANICAL ENGINEERING
An analytical method to calculate misalignment in the journal bearing of a planetary gear system
A81-10839

MECHANICAL OSCILLATORS
Forced vibrations of a nonlinear system excited by a centrifugal oscillator with a sloping engine characteristic
A81-10439

MESSAGE PROCESSING
Formats for DABS data link applications
[AD-A089963] N81-11028

METAL FATIGUE
On understanding environment-enhanced fatigue crack growth - A fundamental approach
A81-10749

Flight simulation environmental fatigue crack propagation in 2024-T3 and 7475-T761 aluminium
A81-11657

Flight simulation environmental fatigue crack propagation in 2024-T3 and 7475-T761 aluminium --- wing panels for transport aircraft
[NLR-MP-80003-U] N81-11415

METAL MATRIX COMPOSITES
Superhybrid composite blade impact studies
[NASA-TM-81597] N81-11412

METAL-METAL BONDING
Application of weldbonding to A-10 production aircraft
A81-11652

METEOROLOGICAL PARAMETERS
Reduction of the take-off ground run distance to a given set of atmospheric condition
A81-11634

METEOROLOGICAL RADAR
Test and evaluation of the Airport Surveillance Radar (ASR)-8 wind shear detection system (phase 2), revision
[AD-A090111] N81-11290

METHOD OF CHARACTERISTICS
Review of numerical methods for the problem of the supersonic flow around bodies at angle of attack
A81-11639

Analytical characteristics methods: Applications
[VKI-FREPRINT-1980-10] N81-10011

MICROCOMPUTERS
Microcomputer array processor system --- design for electronic warfare
N81-11673

MICROCRACKS
Microcracking in graphite-epoxy composites
[AD-A089894] N81-11118

MICROPROCESSORS
Microprocessor software applications for flight training simulators
N81-11658

MICROPROGRAMMING
Microprocessor software applications for flight training simulators
N81-11658

MICROWAVE LANDING SYSTEMS
Wind shear detection from PCM-recorded MLS-flight data
A81-11675

Contributions to the United Kingdom microwave landing system research and development program, 1974 to 1978. Volume 1
[RAE-TR-79052-VOL-1] N81-10044

Contributions to the United Kingdom microwave landing system research and development program, 1974 to 1978. Volume 2
[RAE-TR-79052-VOL-2] N81-10045

Contributions to the United Kingdom microwave landing system research and development program, 1974 to 1978. Volume 3
[RAE-TR-79052-VOL-3] N81-10046

MIDAIB COLLISIONS
NASA Aviation Safety Reporting System
[NASA-TM-81225] N81-10021

MILITARY AIRCRAFT
A theoretical and practical design investigation of the future military cockpit
A81-11631

Design options study. Volume 1: Executive summary --- user requirements for the advanced civil military aircraft
[AD-A089536] N81-10056

Design options study. Volume 2: Approach and summary results --- advanced civil military aircraft: cost estimates
[AD-A089537] N81-10057

Design options study. Volume 3: Qualitative assessment --- advanced civil military aircraft
[AD-A089538] N81-10058

Design options study. Volume 4: Detailed analyses supporting appendices --- advanced civil military aircraft
[AD-A089539] N81-10059

Life Cycle Cost Analysis (LCCA) in military aircraft procurement
N81-11903

Impact of maintainability of life cycle costs
N81-11921

MILITARY HELICOPTERS
Helicopter tail configurations to survive tail rotor loss
A81-10768

Preliminary airworthiness evaluation AH-1S helicopter with ogee tip shape rotor blades
[AD-A089625] N81-10061

Service experience with GRC helicopter blades (80-105)
N81-11146

MILITARY TECHNOLOGY
Head-up displays, III
A81-11320

US Army design-to-cost experience
N81-11905

Air Force technical objective document FY 1981
[AD-A089709] N81-12010

MISALIGNMENT
An analytical method to calculate misalignment in the journal bearing of a planetary gear system
A81-10839

MISSILE CONTROL
Missile motion sensitivity to dynamic stability derivatives
[AD-A089750] N81-11093

MISSILE STRUCTURES
Development of advanced interceptor substructural material --- graphite epoxy missile structures
[AD-A090127] N81-11116

MOISTURE CONTENT
Predictability of moisture absorption in graphite/epoxy sandwich panels
N81-11131

MCCA AIRCRAFT
Structural integration as a means of cost reduction
N81-11912

MULTIPROCESSING (COMPUTERS)
A six-channel quick-look unit for the aerodynamics division MKI airborne data acquisition package
[AD-A089975] N81-11364

Microcomputer array processor system --- design for electronic warfare
N81-11673

MULTIVARIATE STATISTICAL ANALYSIS
Some experiences with numerical optimisation in aircraft specification and preliminary design studies
A81-11609

Multivariable closed-loop analysis and flight control synthesis for air-to-air tracking
[AD-A090050] N81-11046

A multivariate approach to handling qualities rating scale development
[AD-A089825] N81-11047

N

NACELLES
Optimum subsonic, high-angle-of-attack nacelles
A81-11646

Aircraft engine nacelle fire test simulator. Volume 1: Technical
[AD-A089629] N81-10081

NASA PROGRAMS
NASA presses fighter gains --- long-range supersonic cruise aircraft
A81-10575

NATIONAL AVIATION SYSTEM

SUBJECT INDEX

NATIONAL AVIATION SYSTEM

Summary of Federal Aviation Administration responses to National Transportation Safety Board safety recommendations [AD-A089971] N81-11022

NAVIGATION AIDS
Gyrostabilizers for inertial control systems --- Russian book A81-12024

NAVIGATION INSTRUMENTS
Preliminary test plans of ATC concepts for longer term improvement helicopter development program [AD-A089407] N81-10037

NAVY
US Navy service experience with advanced composites --- in aircraft composite structures N81-11149

NEWTON-RAPHSON METHOD
A comparison of Newton-like methods for the transonic small disturbance equation [AD-A090270] N81-11017

NIGHT FLIGHTS (AIRCRAFT)
Helicopter electro-optical system display requirements. 1. The effects of CRT display size, system gamma function, and terrain type on pilots required display luminance [AD-A089755] N81-11035

NIGHT VISION
Helicopter electro-optical system display requirements. 1. The effects of CRT display size, system gamma function, and terrain type on pilots required display luminance [AD-A089755] N81-11035

NITROGEN
A system for model access in tunnels with an unbreathable test medium A81-11672

NITROGEN OXIDES
Variable geometry, lean, premixed, prevaporized fuel combustor conceptual design study [ASME PAPER 80-G1-16] A81-12609

NOISE GENERATORS
Experiments on effective source locations and velocity dependence of the broad band noise from a rotating rod A81-11724

Status of knowledge of sonic booms A81-11822

The status of rotor noise technology A81-12737

Cooperative investigation of the noise producing region of an axisymmetric jet [AD-A089692] N81-11774

NOISE INTENSITY
Community response to noise from a general aviation airport A81-11621

NOISE MEASUREMENT
Core noise measurements from a small, general aviation turboprop engine [NASA-TM-81610] N81-11769

NOISE POLLUTION
Community response to noise from a general aviation airport A81-11821

Survey population response to airplane noise, part 1 [NASA-TM-75790] N81-10576

Annoyance from light aircraft investigation carried out around four airports near Paris [NASA-TM-75823] N81-10577

NOISE PREDICTION (AIRCRAFT)
Some thoughts on the effects of flight on jet noise as observed in actual flight and in wind tunnels A81-11723

The status of rotor noise technology A81-12737

Weapon bay cavity noise environments, data correlation and prediction for the B-1 aircraft [AD-A089770] N81-11778

NOISE REDUCTION
Acoustic structures --- titanium brazing method for producing honeycomb structures for jet engine noise reduction A81-10272

Noise control design problems on air cushion vehicles and surface effect ships A81-11818

Aviation safety and noise abatement [GPO-50-923] N81-10578

Low-speed aerodynamic performance of 50.8-centimeter-diameter noise-suppressing inlets for the Quiet, Clean, Short-haul Experimental Engine (QCSEE) --- Lewis 9- by 15-foot low speed wind tunnel tests [NASA-TP-1178] N81-11037

Effect of a semi-annular thermal acoustic shield on jet exhaust noise [NASA-TM-81615] N81-11770

NONDESTRUCTIVE TESTS
Nondestructive evaluation of composite structures A81-11654

Holographic non-destructive testing of materials using pulsed lasers --- for aircraft structures A81-11655

NONLINEAR PROGRAMMING
Optimum design of axial flow gas turbine stage. I - Formulation and analysis of optimization problem. II - Solution of the optimization problem and numerical results A81-12608

NONLINEAR SYSTEMS
Forced vibrations of a nonlinear system excited by a centrifugal oscillator with a sloping engine characteristic A81-10439

Analytical estimation on nonlinear longitudinal characteristics of wings with small and moderate aspect ratio by the vortex lattice method in incompressible flow [ESA-TT-585] N81-10018

NONLINEARITY
Estimation of wing nonlinear aerodynamic characteristics at supersonic speeds [NASA-TP-1718] N81-10004

NOZZLE FLOW
Investigation of lateral forces and moments in the case of asymmetric gas flows in nozzles A81-10913

An experimental investigation of jet screech by air jet impingement on solid boundaries A81-11302

Calibration of the high speed wind tunnel TVM 150 in the supersonic range A81-11778

Adiabatic gas flow. Citations from the NTIS data base [PB80-808546] N81-10048

NOZZLE GEOMETRY
Cooperative investigation of the noise producing region of an axisymmetric jet [AD-A089692] N81-11774

NUCLEAR EMULSIONS
The emulsion chamber experiment on super-sonic Concorde /Echos/ A81-12476

NUCLEAR INTERACTIONS
The emulsion chamber experiment on super-sonic Concorde /Echos/ A81-12476

NUMERICAL ANALYSIS
A comparison of Newton-like methods for the transonic small disturbance equation [AD-A090270] N81-11017

NUMERICAL CONTROL
Computerized flight management for fuel saving A81-12349

NUMERICAL FLOW VISUALIZATION
Engine air intake design support by use of computational methods and comparison of theoretically derived pressure distributions with experimental data A81-11614

Research on transonic wings at the National Aerospace Laboratory, Japan A81-11640

OBLIQUE SHOCK WAVES
An experimental investigation of the interaction between a glancing shock wave and a turbulent boundary layer A81-11649

SUBJECT INDEX

PITCHING MOMENTS

OMEGA NAVIGATION SYSTEM

Proposed ATC system for the Gulf of Mexico: Helicopter operations development program [AD-A089430] N81-10036

ONBOARD EQUIPMENT

Head up displays. Citations from the International Aerospace Abstracts data base [NASA-CR-163656] N81-10049

Fuel jettisoning by U.S. Air Force aircraft. Volume 2: Fuel dump listings [AD-A089076] N81-10581

OPERATIONAL HAZARDS

Exploratory study of hazard mitigation and research in the air transport system [AD-A089204] N81-11021

OPERATIONS RESEARCH

Recommended short-term ATC improvements for helicopters. Volume 1: Summary of short term improvements [AD-A089521] N81-10041

An analysis of Air Force management of Turbine Engine Monitoring Systems (TEMS) [AD-A089365] N81-10070

OPERATOR PERFORMANCE

New terminal radar approach control in tower cab concept for Love Field, Dallas, Texas [AD-A089996] N81-11025

OPTIMAL CONTROL

Improved flight control performance and failure tolerance using modern control techniques A81-11619

Aircraft performance optimization by forced singular perturbation A81-11667

Multivariable closed-loop analysis and flight control synthesis for air-to-air tracking [AD-A090050] N81-11046

OPTIMIZATION

Design of airfoils in incompressible viscous flows by numerical optimization A81-10096

Some experiences with numerical optimization in aircraft specification and preliminary design studies A81-11609

Structural optimization of advanced aircraft structures A81-11651

Optimal flight vehicle design and linear vector spaces A81-11668

Optimum design of axial flow gas turbine stage. I - Formulation and analysis of optimization problem. II - Solution of the optimization problem and numerical results A81-12608

OSCILLATIONS

An introduction to dynamic derivatives (3) methods of oscillating models in pitch and yaw in a 530 by 810 millimetre transonic wind tunnel [ABL/AERO-NOTE-390] N81-10007

OZONOSPHERE

The aircraft in the stratosphere --- effects on ozone layer equilibrium A81-10499

P

PACKING DENSITY

High-density avionics power supply A81-11157

PADE APPROXIMATION

An analytical technique for approximating unsteady aerodynamics in the time domain [NASA-TP-1738] N81-11422

PANELS

Design and fabrication of stabilized organic matrix composites A81-11338

PARABOLIC BODIES

A comparison of Newton-like methods for the transonic small disturbance equation [AD-A090270] N81-11017

PARAMETER IDENTIFICATION

Simulating study of the interaction between the propulsion and flight control systems of a subsonic lift fan VTOL [NASA-TN-81239] N81-11043

PASSENGER AIRCRAFT

The relevance of the Flex-Hub Prop-Fan for fuel-efficient airliners A81-11605

OLGA, a gust alleviation system for improvement of passenger comfort of general aviation aircraft A81-11620

PAVEMENTS

Airfield pavement demonstration-validation study A81-10718

Fiberglass-reinforced rigid polyurethane expedient pavement subject to simulated F-4 aircraft traffic [AD-A089266] N81-10079

Airfield pavement evaluation. Citations from the NTIS data base [FB80-812860] N81-10083

PERFORMANCE PREDICTION

A method of performance prediction for centrifugal compressors. Part 1: Analysis. Part 2: Comparison with experiment [ARC-R/M-3843] N81-10436

Definitive generic study for the effect of high lift airfoils on wind turbine effectiveness, executive summary [SERI/TR-98003-2] N81-11492

PERFORMANCE TESTS

Comparative performance of two centrifugal fan impellers differing in blade section A81-10162

Airfield pavement demonstration-validation study A81-10718

Model tests for an active rotor isolation system [HBB-278-79-0] A81-12095

Performance of a steel spar wind turbine blade on the Mod-0 100 kW experimental wind turbine [NASA-TN-81588] N81-11448

PERIODIC VARIATIONS

Improved aircraft cruise by periodic control N81-11030

PERTURBATION THEORY

Aircraft performance optimization by forced singular perturbation A81-11667

Analytical characteristics methods: Applications [VKI-PREPRINT-1980-10] N81-10011

PHOTOGRAPHIC EQUIPMENT

Aerial survey photography A81-12350

PHOTOMAPPING

Aerial survey photography A81-12350

PILOT ERROR

Civil helicopter wire strike assessment study. Volume 2: Accident analysis briefs [NASA-CR-152390] N81-10019

PILOT PERFORMANCE

Pilot-aircraft system response to wind shear [NASA-CR-3342] N81-10636

A multivariate approach to handling qualities rating scale development [AD-A089825] N81-11047

PILOTLESS AIRCRAFT

Gyro stabilizers for inertial control systems --- Russian book A81-12024

PIPELINES

Alternative energy sources for non-highway transportation, volume 1 [DOE/CS-05438/T1-VOL-1] N81-11513

PIPES (TUBES)

Elastomers used in aeronautics industry [SNIAS-801-551-105] N81-10168

PISTON ENGINES

Comparisons of four alternative powerplant types for future general aviation aircraft [NASA-TN-81584] N81-10067

PITCHING MOMENTS

An introduction to dynamic derivatives (3) methods of oscillating models in pitch and yaw in a 530 by 810 millimetre transonic wind tunnel [ABL/AERO-NOTE-390] N81-10007

A piloted simulator investigation of static stability and stability/control augmentation effects on helicopter handling qualities for instrument approach [NASA-TN-81188] N81-10077

POLLUTION CONTROL

SUBJECT INDEX

POLLUTION CONTROL

Variable geometry, lean, premixed, prevaporized fuel combustor conceptual design study [ASME PAPER 80-G1-16] A81-12609

POLYURETHANE FOAM

Fiberglass-reinforced rigid polyurethane expedient pavement subject to simulated F-4 aircraft traffic [AD-A089266] N81-10079

POTENTIAL FLOW

Flow past a slender profile in a channel with permeable walls A81-10916

POWER CONDITIONING

High-density avionic power supply A81-11157

PREDICTION ANALYSIS TECHNIQUES

Prediction of changes in aircraft noise exposure A81-11820

An evaluation of statistical methods for the prediction of maximum time-variant inlet total pressure distortion [AD-A089817] N81-11040

PRESSURE DISTRIBUTION

Engine air intake design support by use of computational methods and comparison of theoretically derived pressure distributions with experimental data A81-11614

An investigation of scale effects on the transonic flow over swept wings. Part 2: Measurements on a model of a variable-sweep strike-fighter configuration [ARC-R/N-3842-PT-2] N81-10010

Comparison of Unsteady Pressure Fields Computed and Measured on the ZKP model [AGARD-R-688] N81-11019

PRESSURE MEASUREMENTS

An experimental and theoretical investigation of pressures in four-lobe bearings A81-10840

PRESSURE RATIO

Fuel character effects on current, high pressure ratio, can-type turbine combustion systems [AD-A089182] N81-10073

PROCUREMENT MANAGEMENT

Design to cost and systems, LCC N81-11920

PRODUCTION ENGINEERING

Reduction of energy consumption in the vibrational shot peening of axial compressor vanes A81-11321

US Army design-to-cost experience N81-11905

PRODUCTION PLANNING

A review and assessment of system cost reduction activities N81-11906

Design to life cycle cost research N81-11907

Organizing a design-to-cost program N81-11914

PROPELLER FANS

The relevance of the Flex-Hub Prop-Fan for fuel-efficient airliners A81-11605

PROPULSION SYSTEM CONFIGURATIONS

Bibliography on aerodynamics of airframe/engine integration of high-speed turbine-powered aircraft, volume 1 [NASA-TN-81814] N81-11032

Simulating study of the interaction between the propulsion and flight control systems of a subsonic lift fan VTOL [NASA-TN-81239] N81-11043

PSYCHOACOUSTICS

Survey population response to airplane noise, part 1 [NASA-TN-75790] N81-10576

PULSE CODE MODULATION

Wind shear detection from PCM-recorded MLS-flight data A81-11675

PULSED LASERS

Holographic non-destructive testing of materials using pulsed lasers --- for aircraft structures A81-11655

PUMP IMPELLERS

Inlet flow in centrifugal pumps at partial deliveries [VKI-PREPRINT-1979-16] N81-10437

PYROTECHNICS

Applications of pyrotechniques in aviation [SNIAS-792-422-103] N81-10025

Q

QUALITY CONTROL

Nondestructive evaluation of composite structures A81-11654

QUIET ENGINE PROGRAM

Low-speed aerodynamic performance of 50.8-centimeter-diameter noise-suppressing inlets for the Quiet, Clean, Short-haul Experimental Engine (QCSEE) --- Lewis 9- by 15-foot low speed wind tunnel tests [NASA-TP-1178] N81-11037

R

RADAR BEACONS

The Discrete Address Beacon System/Air Traffic Control Radar Beacon System/ATCRBS IPF Mark 12 system (DABS/ATCRBS/AINS) performance prediction model [AD-A089440] N81-10034

Impact of the discrete Address Beacon System (DABS) on Air Traffic Control Radar Beacon System (ATCRBS) performance in selected deployments [AD-A089611] N81-10039

RADAR DETECTION

Radar target detection and map-matching algorithm studies A81-11158

RADAR EQUIPMENT

Optimized computer systems for avionics applications [AD-A089570] N81-10063

RADAR MAPS

Radar target detection and map-matching algorithm studies A81-11158

RADAR NAVIGATION

Proposed ATC system for the Gulf of Mexico: Helicopter operations development program [AD-A089430] N81-10036

RADARSCOPES

Proceedings of the 1979 Seminar on Air Traffic Control. Terminal Radar Approach Control (TRACON) facility supervisory desk complex [AD-A089914] N81-11024

RADIANT HEATING

Ignition of a liquid fuel [AD-A089295] N81-10128

RADIATION PYROMETERS

Surface pyrometry in presence of radiation from other sources with application to turbine blade temperature measurement [NASA-TP-1754] N81-11039

RADIO ANTENNAS

Excitation of a circular array of cylinders with longitudinal slits --- in radio antennas A81-12619

RADIO EQUIPMENT

Preliminary test plans of ATC concepts for longer term improvement helicopter development program [AD-A089407] N81-10037

RAIL TRANSPORTATION

Alternative energy sources for non-highway transportation, appendices [DOE/CS-05438/T1-VOL-3] N81-11500

RANGE SAFETY

Flight termination receiver/decoders design, performance and certification [AD-A089746] N81-11045

REAL TIME OPERATION

ATARS implementation tradeoff [AD-A089977] N81-11026

RECONNAISSANCE AIRCRAFT

Maritime patrol aircraft engine study. General Electric derivative engines. Volume 2: Appendix A. Performance data - GE27/T3 study a1 turboprop [AD-A089336] N81-10068

Maritime patrol aircraft engine study. General Electric derivative engines. Volume 3: Appendix B. Performance data - TF34/T7 study A1 turboprop [AD-A089279] N81-10069

SUBJECT INDEX

ROTOR BLADES (TURBOMACHINERY)

RECORDING INSTRUMENTS

Wind shear detection from PCM-recorded MLS-flight data A81-11675

Quantitative thermography in aero-engine research and development [PNE-90021] N81-10075

REDUCTION

Design to cost and the F-16 multirole fighter N81-11911

REDUNDANCY

Detecting the failure of aircraft sensors using analytical redundancy N81-11270

REDUNDANCY ENCODING

Computer based in-flight monitoring N81-11269

Flight experience with flight control redundancy management N81-11274

Robust control system design N81-11275

REINFORCED PLASTICS

Development of the A300 fin in modern composite fibre construction A81-11653

REINFORCING FIBERS

Development of the A300 fin in modern composite fibre construction A81-11653

RELIABILITY ANALYSIS

Reliability and engineering-economic characteristics of aircraft engines --- Russian book A81-10045

RELIABILITY ENGINEERING

Reliability-centered maintenance N81-11917

RESCUE OPERATIONS

Systems analysis of the installation, mounting, and activation of emergency locator transmitters in general aviation aircraft [NASA-CR-160036] N81-10020

Search and rescue methods and equipment. A bibliography with abstracts [PB80-812837] N81-10026

RESEARCH AIRCRAFT

Hydrogen-fueled aircraft A81-11753

RESEARCH AND DEVELOPMENT

Contributions to the United Kingdom microwave landing system research and development program, 1974 to 1978. Volume 1 [RAE-TR-79052-VOL-1] N81-10044

Contributions to the United Kingdom microwave landing system research and development program, 1974 to 1978. Volume 2 [RAE-TR-79052-VOL-2] N81-10045

Contributions to the United Kingdom microwave landing system research and development program, 1974 to 1978. Volume 3 [RAE-TR-79052-VOL-3] N81-10046

RESIDENTIAL AREAS

Community response to noise from a general aviation airport A81-11621

RESIN MATRIX COMPOSITES

Fatigue strength of CFRP under combined flight-by-flight loading and flight-by-flight temperature changes N81-11134

Superhybrid composite blade impact studies [NASA-TN-81597] N81-11412

REYNOLDS NUMBER

A fan pressure ratio correlation in terms of Mach number and Reynolds number for the Langley 0.3 meter transonic cryogenic tunnel [NASA-TP-1752] N81-10005

The principles and applications of cryogenic wind tunnels N81-11049

RIGID ROTORS

An exact solution of the problem of the motion of a gyroscope in a Cardan suspension A81-12704

RIGID STRUCTURES

Design and fabrication of stabilized organic matrix composites A81-11338

ROLLING MOMENTS

A piloted simulator investigation of static stability and stability/control augmentation effects on helicopter handling qualities for instrument approach [NASA-TM-81188] N81-10077

ROTARY GYROSCOPES

An exact solution of the problem of the motion of a gyroscope in a Cardan suspension A81-12704

ROTARY STABILITY

Finite element analysis of natural and forced flexural vibrations of rotor systems A81-11956

ROTARY WING AIRCRAFT

Engineering and development program plan aircraft crashworthiness [AD-A089431] N81-10022

A piloted simulator investigation of static stability and stability/control augmentation effects on helicopter handling qualities for instrument approach [NASA-TM-81188] N81-10077

ROTARY WINGS

The aerodynamic characteristics of some new RAE blade sections, and their potential influence on rotor performance A81-10769

Design and tests of an helicopter rotor blade with evolutive profile [ONERA, TF NO. 1980-125] A81-11638

A method of helicopter low airspeed estimation based on measurement of control parameters [NBB-UD-276-79-0] A81-12094

Model tests for an active rotor isolation system [NBB-278-79-0] A81-12095

The status of rotor noise technology A81-12737

Civil helicopter wire strike assessment study. Volume 2: Accident analysis briefs [NASA-CR-152390] N81-10019

Preliminary airworthiness evaluation AH-1S helicopter with ogee tip shape rotor blades [AD-A089625] N81-10061

Full scale wind tunnel investigation of a bearingless main helicopter rotor --- Ames 40 by 80 foot wind tunnel test using the BO-105 helicopter [NASA-CR-152373] N81-11014

Experimental and analytical studies of a model helicopter rotor in hover [AD-A089780] N81-11033

Erosion and impacts on composite helicopter blades N81-11138

Fatigue and damage propagation in composite rotor blades N81-11145

Service experience with GRC helicopter blades (BO-105) N81-11146

ROTATING CYLINDERS

Experiments on effective source locations and velocity dependence of the broad band noise from a rotating rod A81-11724

ROTOR AERODYNAMICS

An experimental and theoretical investigation of pressures in four-lobe bearings A81-10840

Experimental and analytical studies of a model helicopter rotor in hover [AD-A089780] N81-11033

ROTOR BLADES

Helicopter flight characteristics improvement through swept-tip rotor blades [NBB-UD-275-79-0] A81-12097

ROTOR BLADES (TURBOMACHINERY)

Comparative performance of two centrifugal fan impellers differing in blade section A81-10162

Discrete frequency noise due to irregularity in blade row of axial fan rotor A81-10633

Preliminary airworthiness evaluation AH-1S helicopter with ogee tip shape rotor blades [AD-A089625] N81-10061

Fatigue and damage propagation in composite rotor blades N81-11145

ROTORS

SUBJECT INDEX

ROTORS

The vibration of a multi-bearing rotor A81-11722
 Finite element analysis of natural and forced flexural vibrations of rotor systems A81-11956
 Performance of a steel spar wind turbine blade on the Mod-0 100 kW experimental wind turbine [NASA-TM-81588] N81-11448
RUBY LASERS
 Holographic non-destructive testing of materials using pulsed lasers --- for aircraft structures A81-11655
RUNWAYS
 Analysis of potentially correctable landing delays at Atlanta [AD-A089408] N81-10032
 Polymer research in rapid runway repair materials [AD-A089606] N81-10080
 Airfield pavement evaluation. Citations from the NTIS data base [PB80-812860] N81-10083

S

SAAB 37 AIRCRAFT
 Failure management for the SAAB Viggen JA37 aircraft N81-11273
SAFETY DEVICES
 Summary of Federal Aviation Administration responses to National Transportation Safety Board safety recommendations [AD-A089971] N81-11022
SAFETY FACTORS
 Search and rescue methods and equipment. A bibliography with abstracts [PB80-812837] N81-10026
SAFETY MANAGEMENT
 The accident/injury matrix - A tool for aircraft accident investigation A81-12241
SANDWICH STRUCTURES
 Predictability of moisture absorption in graphite/epoxy sandwich panels N81-11131
SCALE EFFECT
 An investigation of scale effects on the transonic flow over swept wings. Part 2: Measurements on a model of a variable-sweep strike-fighter configuration [ABC-B/M-3842-PT-2] N81-10010
SCALING LAWS
 A fan pressure ratio correlation in terms of Mach number and Reynolds number for the Langley 0.3 meter transonic cryogenic tunnel [NASA-TP-1752] N81-10005
SCHLIEREN PHOTOGRAPHY
 A simple laser interferometer for wind tunnel flow visualisation A81-12078
SEARCH RADAR
 Search and rescue methods and equipment. A bibliography with abstracts [PB80-812837] N81-10026
SEARCHING
 Systems analysis of the installation, mounting, and activation of emergency locator transmitters in general aviation aircraft [NASA-CR-160036] N81-10020
SENSITIVITY
 Missile motion sensitivity to dynamic stability derivatives [AD-A089750] N81-11093
SEPARATED FLOW
 Simplified vortex models for slender lifting surfaces with leading edge separation A81-11777
 Local properties of three-dimensional separation lines --- in vortex layers [DGLR PAPER 79-063] A81-11780
 Calculation of separated viscous flows on wing profiles by a coupling approach [ONERA, TP NO. 1980-122] A81-11920
SERVICE LIFE
 Operational durability of airframe structures A81-11662
 Service experience with GRC helicopter blades (80-105) N81-11146

US Navy service experience with advanced composites --- in aircraft composite structures N81-11149
SHALE OIL
 Alternative energy sources for non-highway transportation, volume 1 [DOE/CS-05438/T1-VOL-1] N81-11513
SHIPS
 Alternative energy sources for non-highway transportation, appendices [DOE/CS-05438/T1-VOL-3] N81-11500
SHOCK WAVE INTERACTION
 An experimental investigation of the interaction between a glancing shock wave and a turbulent boundary layer A81-11649
SHOCK WAVE PROFILES
 Calculation of plane transonic flows using the integral equation method and shock fitting A81-11779
SHOCK WAVES
 New interpretations of shock-associated noise with and without screech [NASA-TM-81590] N81-10807
SHORT HAUL AIRCRAFT
 Low-speed aerodynamic performance of 50.8-centimeter-diameter noise-suppressing inlets for the Quiet, Clean, Short-haul Experimental Engine (QCSEE) --- Lewis 9- by 15-foot low speed wind tunnel tests [NASA-TP-1178] N81-11037
SHOT TAKBOFF AIRCRAFT
 Optimum subsonic, high-angle-of-attack nacelles A81-11646
 Flight evaluation of stabilization and command augmentation system concepts and cockpit displays during approach and landing of powered-lift STOL aircraft [NASA-TP-1551] N81-11044
SHOT PEENING
 Reduction of energy consumption in the vibrational shot peening of axial compressor vanes A81-11321
SIGNAL DETECTORS
 Systems analysis of the installation, mounting, and activation of emergency locator transmitters in general aviation aircraft [NASA-CR-160036] N81-10020
SIGNAL PROCESSING
 Optimized computer systems for avionics applications [AD-A089570] N81-10063
SIMULATION
 Flight test results of the HFB 320 model following control system for the in-flight simulation of Airbus A 130 [DFVLR-HIT-79-13] N81-10078
SKIN FRICTION
 Local properties of three-dimensional separation lines --- in vortex layers [DGLR PAPER 79-063] A81-11780
SLENDER BODIES
 Two methods for calculating the load on the surface of a slender body executing axisymmetric vibrations in a sonic gas flow A81-10920
 Holographic investigation of slender body vortex wakes [AD-A089496] N81-10008
SLENDER WINGS
 Flow past a slender profile in a channel with permeable walls A81-10916
 Leading-edge 'Vortex Flaps' for enhanced subsonic aerodynamics of slender wings A81-11648
 Simplified vortex models for slender lifting surfaces with leading edge separation A81-11777
 Preliminary design characteristics of a subsonic business jet concept employing an aspect ratio 25 strut braced wing [NASA-CR-159361] N81-11013
SLOT ANTENNAS
 Excitation of a circular array of cylinders with longitudinal slits --- in radio antennas A81-12619

- SLURRY PROPELLANTS**
Compound Cycle Turbofan Engine (CCTE). Task 9:
Carbon-Slurry Fuel Combustion Evaluation Program
[AD-A089451] N81-10072
- SMALL PERTURBATION FLOW**
A comprehensive evaluation and analysis of
transonic flow calculations on three related
wing-body configurations
[FFA-TN-AU-1418-PT-1] N81-10013
- SOLID SURFACES**
Two methods for calculating the load on the
surface of a slender body executing axisymmetric
vibrations in a sonic gas flow
A81-10920
An experimental investigation of jet screech by
air jet impingement on solid boundaries
A81-11302
- SOLVENTS**
Compatibility of aircraft operational fluids with
a graphite/epoxy composite: Development of an
exterior coating system and remover
[AD-A090049] N81-11120
- SONIC BOOMS**
Status of knowledge of sonic booms
A81-11E22
- SOUND PRESSURE**
New interpretations of shock-associated noise with
and without screech
[NASA-TN-81590] N81-10807
- SPACECRAFT INSTRUMENTS**
Gyrocompasses. Citations from the International
Aerospace Abstracts data base
[NASA-CR-163675] N81-10065
- STABILITY AUGMENTATION**
A stability augmentation system which covers the
complete flight envelope for a F-4c aircraft
without gain scheduling
A81-11622
- STABILIZED PLATFORMS**
Gyrostabilizers for inertial control systems ---
Russian book
A81-12024
- STATIC LOADS**
Cast Aluminum Structures Technology (CAST).
Technology transfer (phase 6)
[AD-A087492] N81-10152
Graphite-epoxy panel compression strength
reduction due to local impact
N81-11139
- STATIC PRESSURE**
An experimental and theoretical investigation of
pressures in four-lobe bearings
A81-10E40
- STATISTICAL ANALYSIS**
An evaluation of statistical methods for the
prediction of maximum time-variant inlet total
pressure distortion
[AD-A089817] N81-11040
A probabilistic analysis of electrical equipment
vulnerability to carbon fibers
[NASA-TN-80217] N81-11113
- STATOR BLADES**
Off-design performance loss model for radial
turbines with pivoting, variable-area stators
[NASA-TP-1708] N81-11038
- STRAKES**
Flow measurements in the wake of a wing fitted
with a leading-edge root extension (strake)
[BAE-TR-79120] N81-10015
- STRAPDOWN INERTIAL GUIDANCE**
Gyrocompasses. Citations from the International
Aerospace Abstracts data base
[NASA-CR-163675] N81-10065

Comparison of Unsteady Pressure Fields Computed
and Measured on the ZKP model
[AGARD-R-688] N81-11019
- SUPERSONIC AIRCRAFT**
New concepts for design of fully-optimized
configurations for future supersonic aircraft
A81-11606
Optimizing the fixed leading edge shape of a
transonic wing to suit the landing high-lift
requirements
A81-11644

SUPERSONIC COMBUSTION RAMJET ENGINES

SUBJECT INDEX

Status of knowledge of sonic booms A81-11822

SUPERSONIC COMBUSTION RAMJET ENGINES
 A numerical study of candidate transverse fuel injector configurations in the Langley scramjet engine A81-10709

Flameholding characteristics of a swept-strut H2 fuel-injector for scramjet applications A81-10711

SUPERSONIC CRUISE AIRCRAFT RESEARCH
 NASA presses fighter gains --- long-range supersonic cruise aircraft A81-10575

SUPERSONIC FLIGHT
 The emulsion chamber experiment on super-sonic Concorde /Echos/ A81-12476

SUPERSONIC FLOW
 Investigation of lateral forces and moments in the case of asymmetric gas flows in nozzles A81-10913

Review of numerical methods for the problem of the supersonic flow around bodies at angle of attack A81-11639

Analytical characteristics methods: Applications [VKI-PREPRINT-1980-10] N81-10011

SUPERSONIC NOZZLES
 On screeching jets exhausting from an axisymmetric supersonic nozzle A81-11616

SUPERSONIC SPEEDS
 Estimation of wing nonlinear aerodynamic characteristics at supersonic speeds [NASA-TF-1718] N81-10004

SUPERSONIC TRANSPORTS
 The aircraft in the stratosphere --- effects on ozone layer equilibrium A81-10499

SUPERSONIC WIND TUNNELS
 Calibration of the high speed wind tunnel TVM 150 in the supersonic range A81-11778

SUPPRESSORS
 Active flutter suppression design and test - A joint U.S.-P.R.G. program A81-11621

SURFACE EFFECT SHIPS
 Noise control design problems on air cushion vehicles and surface effect ships A81-11818

SURFACE FINISHING
 Compatibility of aircraft operational fluids with a graphite/epoxy composite: Development of an exterior coating system and remover [AD-A090049] N81-11120

SURFACE NAVIGATION
 Search and rescue methods and equipment. A bibliography with abstracts [PB80-812837] N81-10026

SURVEILLANCE RADAR
 New terminal radar approach control in tower cab concept for Love Field, Dallas, Texas [AD-A089996] N81-11025

Test and evaluation of the Airport Surveillance Radar (ASR)-8 wind shear detection system (phase 2), revision [AD-A090111] N81-11290

SURVEYS
 Survey population response to airplane noise, part 1 [NASA-TM-75790] N81-10576

SWEEP FORWARD WINGS
 How to improve the performance of transport aircraft by variation of wing aspect-ratio and twist /12th Daniel and Florence Guggenheim International Memorial Lecture/ A81-11602

SYNTHETIC FUELS
 Toxicity of synthetic high density and conventional hydrocarbon jet fuels to a soil bacterium [AD-A089527] N81-11233

Alternative energy sources for non-highway transportation, volume 1 [DOE/CS-05438/T1-VOL-1] N81-11513

SYSTEMS ENGINEERING
 The design of blowing-cooled aircraft electrical machines A81-10474

The role of flight simulation in the design and development of the Sea Harrier Nav-Attack System A81-11635

Evolution of techniques for LCC analysis N81-11909

The Hornet program: A design to life cycle cost case study N81-11910

Design to cost and the F-16 multirole fighter N81-11911

Some engineering aspects of life cycle costing N81-11918

SYSTEMS MANAGEMENT
 An analysis of Air Force management of Turbine Engine Monitoring Systems (TEMS) [AD-A089365] N81-10070

T

TABLES (DATA)
 Annual review of aircraft accident data, U.S. General aviation calendar year 1978 [PB80-201916] N81-10028

TAIL ROTORS
 Fatigue and damage propagation in composite rotor blades N81-11145

Service experience with GRC helicopter blades (80-105) N81-11146

TAIL SURFACES
 Theoretical determination of subsonic oscillatory airforce coefficients for fin-tailplane configurations [RAE-TR-79125] N81-10016

TAKEOFF
 Airport activity statistics of certificated route air carriers, calendar year 1979 [AD-A089748] N81-11023

TAKEOFF RUNS
 Reduction of the take-off ground run distance to a given set of atmospheric condition A81-11634

TANKS (CONTAINERS)
 Elastomers used in aeronautics industry [SNIAS-801-551-105] N81-10168

TARGET RECOGNITION
 Radar target detection and map-matching algorithm studies A81-11158

TECHNOLOGICAL FORECASTING
 NASA presses fighter gains --- long-range supersonic cruise aircraft A81-10575

New concepts for design of fully-optimized configurations for future supersonic aircraft A81-11606

The all-electric aircraft A81-11617

Flying qualities criteria for advanced control technology transports A81-11618

The future cockpit of the next generation of civil aircraft A81-11630

Air Force technical objective document FY 1981 [AD-A089709] N81-12010

TECHNOLOGY ASSESSMENT
 New BBC high-efficiency gas turbines A81-11797

Comparisons of four alternative powerplant types for future general aviation aircraft [NASA-TM-81584] N81-10067

The role of advanced technology of turbine engine life cycle cost N81-11927

TECHNOLOGY UTILIZATION
 Advanced fuel system technology for utilizing broadened property aircraft fuels A81-11612

Airbus Industrie's heavenly twins - A310 and A300-600 A81-12348

TEMPERATURE CONTROL
 The control of pressure, temperature and Mach number in a blowdown-to-atmosphere cryogenic wind tunnel N81-11063

- TEMPERATURE MEASURING INSTRUMENTS**
Quantitative thermography in aero-engine research and development [PBR-90021] N81-10075
- TENSILE PROPERTIES**
Microcracking in graphite-epoxy composites [AD-A089894] N81-11118
- TENSILE STRENGTH**
Effect of various environmental conditions on polymer matrix composites N81-11130
- TERMINAL FACILITIES**
Atlanta's new central passenger terminal complex [AD-A089746] N81-10719
- TERMINAL GUIDANCE**
Procedures to improve flight safety in wind shear conditions A81-11666

- THERMAL EXPANSION**
Effect of various environmental conditions on polymer matrix composites N81-11130
- THERMAL VACUUM TESTS**
Effect of various environmental conditions on polymer matrix composites N81-11130
- THERMOCOUPLE PYROMETERS**
Surface pyrometry in presence of radiation from other sources with application to turbine blade temperature measurement [NASA-TP-1754] N81-11039
- THIN WINGS**
Flow past a slender profile in a channel with permeable walls A81-10916
- THREE DIMENSIONAL BOUNDARY LAYER**
Local properties of three-dimensional separation lines --- in vortex layers [DGLR PAPPEE 79-063] A81-11780
- THREE DIMENSIONAL FLOW**
Investigation of lateral forces and moments in the case of asymmetric gas flows in nozzles A81-10913
Review of numerical methods for the problem of the supersonic flow around bodies at angle of attack A81-11639
Analysis of calculated three-dimensional inviscid flow fields with embedded shock waves (presentation of a field solution), part 1 [ESA-TT-558] N81-10017
- TITANIUM**
Acoustic structures --- titanium brazing method for producing honeycomb structures for jet engine noise reduction A81-10272
- TOXICITY**
Toxicity of synthetic high density and conventional hydrocarbon jet fuels to a soil bacterium [AD-A089527] N81-11233
- TRACKING (POSITION)**
Multivariable closed-loop analysis and flight control synthesis for air-to-air tracking [AD-A090050] N81-11046
- TRADEOFFS**
ATARS implementation tradeoff [AD-A089977] N81-11026
- TRAILING-EDGE FLAPS**
Boundary layer measurements on a two-dimensional wing with flap [NLI-TR-79009-U] N81-10014
- TRAINING SIMULATORS**
Microprocessor software applications for flight training simulators N81-11658
- TRAJECTORY CONTROL**
Flight termination receiver/decoders design, performance and certification [AD-A089746] N81-11045
- TRAJECTORY OPTIMIZATION**
Aircraft performance optimization by forced singular perturbation A81-11667
- TRANSDUCERS**
Transducer installation for the Sea King MK 50 mathematical model validation flight tests [AD-A089924] N81-11365
- TRANSMISSION EFFICIENCY**
A six-channel quick-look unit for the aerodynamics division MKI airborne data acquisition package [AD-A089975] N81-11364
- TRANSMISSIONS (MACHINE ELEMENTS)**
An analytical method to calculate misalignment in the journal bearing of a planetary gear system A81-10839
- TRANSONIC FLIGHT**
Research on transonic wings at the National Aerospace Laboratory, Japan A81-11640
- TRANSONIC FLOW**
Asymmetric flow of subsonic and sonic jets over an infinite wedge A81-10919
Flow computation around multi-element airfoils in viscous transonic flow A81-11641
Calculation of plane transonic flows using the integral equation method and shock fitting A81-11779
An example of the transonic flow past a body with a discontinuity in the contour curvature A81-12367
An investigation of scale effects on the transonic flow over swept wings. Part 2: Measurements on a model of a variable-sweep strike-fighter configuration [ABC-R/M-3842-PT-2] N81-10010
A comprehensive evaluation and analysis of transonic flow calculations on three related wing-body configurations [PFA-TN-AU-1418-PT-1] N81-10013
A comparison of Newton-like methods for the transonic small disturbance equation [AD-A090270] N81-11017
- TRANSONIC SPEED**
Calibration of a blowdown-to-atmosphere cryogenic wind tunnel N81-11060
Characteristics and status of the US National Transonic Facility N81-11065
- TRANSONIC WIND TUNNELS**
A system for model access in tunnels with an unbreathable test medium A81-11672
A simple laser interferometer for wind tunnel flow visualisation A81-12078
A fan pressure ratio correlation in terms of Mach number and Reynolds number for the Langley 0.3 meter transonic cryogenic tunnel [NASA-TP-1752] N81-10005
An introduction to dynamic derivatives (3) methods of oscillating models in pitch and yaw in a 530 by 810 millimetre transonic wind tunnel [ABL/AERO-NOTE-390] N81-10007
The European Transonic Wind tunnel ETW N81-11064
- TRANSPORT AIRCRAFT**
How to improve the performance of transport aircraft by variation of wing aspect-ratio and twist /12th Daniel and Florence Guggenheim International Memorial Lecture/ A81-11602
Numerical optimization - An assessment of its role in transport aircraft aerodynamic design through a case study A81-11604
Flying qualities criteria for advanced control technology transports A81-11618
An analytical study of landing flare [DFVLR-FB-79-40] N81-10062
Exploratory study of hazard mitigation and research in the air transport system [AD-A089204] N81-11021
Container Life Adapter-Helicopter (CLAH) operational prototype (preproduction) militarized units for flight evaluation and operational testing [AD-A089794] N81-11034

V

VALUE ENGINEERING

- Design to Cost and Life Cycle Cost
[AGARD-CP-289] N81-11902
- US Army design-to-cost experience
N81-11905
- A review and assessment of system cost reduction activities
N81-11906
- Design to life cycle cost research
N81-11907
- Organizing a design-to-cost program
N81-11914
- A new method for estimating transport aircraft direct operating costs
N81-11915
- Design-to-cost applied to the AS350 helicopter
N81-11916

- Using cost reduction concepts at
Messier-Hispano-Eugatti N81-11923
- VANES**
Vortex drag reduction by aft-mounted diffusing vanes
A81-11647
- VARIABLE GEOMETRY STRUCTURES**
Variable geometry, lean, premixed, prevaporized
fuel combustor conceptual design study
[ASME PAPER 80-GT-16] A81-12609
Off-design performance loss model for radial
turbines with pivoting, variable-area stators
[NASA-TF-1708] N81-11038
- VARIABLE SWEEP WINGS**
An investigation of scale effects on the transonic
flow over swept wings. Part 2: Measurements on
a model of a variable-sweep strike-fighter
configuration
[ARC-R/M-3842-PT-2] N81-10010
- VECTOR SPACES**
Optimal flight vehicle design and linear vector
spaces
A81-11668
- VELOCITY DISTRIBUTION**
Flow measurements in the wake of a wing fitted
with a leading-edge root extension (strake)
[RAF-TR-79120] N81-10015
- VENTILATION**
Wind tunnel wall interference in a test section
with ventilated walls
A81-11673
- VERY HIGH FREQUENCIES**
Preliminary test plans of ATC concepts for longer
term improvement helicopter development program
[AD-A089407] N81-10037
- VIBRATION DAMPING**
Experimental application of a vibration reduction
technique
A81-10770
Active flutter suppression design and test - A
joint U.S.-F.R.G. program
A81-11621
- VIBRATION ISOLATORS**
Model tests for an active rotor isolation system
[MBB-278-79-0] A81-12095
- VIBRATION SIMULATORS**
Forced vibrations of a nonlinear system excited by
a centrifugal oscillator with a sloping engine
characteristic
A81-10439
- VISCOUS FLOW**
Design of airfoils in incompressible viscous flows
by numerical optimization
A81-10096
Flow computation around multi-element airfoils in
viscous transonic flow
A81-11641
Calculation of separated viscous flows on wing
profiles by a coupling approach
[ONERA, TP NO. 1980-122] A81-11920
- VISUAL CONTROL**
Analysis of the function principle and operational
assessment of an onboard glidepath guidance
system for visual approaches (Visual Approach
Monitor (VAM))
[DFVLR-FE-79-38] N81-10043
- VORTEX ALLEVIATION**
Vortex drag reduction by aft-mounted diffusing vanes
A81-11647
- VORTEX AVOIDANCE**
Preliminary test plans of ATC concepts for longer
term improvement helicopter development program
[AD-A089407] N81-10037
- VORTEX FLAPS**
Vortex drag reduction by aft-mounted diffusing vanes
A81-11647
Leading-edge 'Vortex Flaps' for enhanced subsonic
aerodynamics of slender wings
A81-11648
- VORTEX SHEETS**
Simplified vortex models for slender lifting
surfaces with leading edge separation
A81-11777
Local properties of three-dimensional separation
lines --- in vortex layers
[DGLR PAPER 79-063] A81-11780
Linear vortex theories of a profile and wing with
air intake
A81-12703
- Analytical estimation on nonlinear longitudinal
characteristics of wings with small and moderate
aspect ratio by the vortex lattice method in
incompressible flow
[ESA-TT-585] N81-10018
- VORTICES**
Holographic investigation of slender body vortex
wakes
[AD-A089496] N81-10008
- VULNERABILITY**
A probabilistic analysis of electrical equipment
vulnerability to carbon fibers
[NASA-TM-80217] N81-11113
- ## W
- WAKES**
Holographic investigation of slender body vortex
wakes
[AD-A089496] N81-10008
- WALL FLOW**
Local properties of three-dimensional separation
lines --- in vortex layers
[DGLR PAPER 79-063] A81-11780
- WALL PRESSURE**
Wind tunnel wall interference in a test section
with ventilated walls
A81-11673
- WARNING SYSTEMS**
Head up displays. Citations from the NIDS data base
[PB80-809064] N81-10050
- WAVELENGTHS**
Surface pyrometry in presence of radiation from
other sources with application to turbine blade
temperature measurement
[NASA-TP-1754] N81-11039
- WEAPON SYSTEMS**
Life Cycle Cost Analysis (LCCA) in military
aircraft procurement
N81-11903
Summary of AGARD Lecture Series 100: Methodology
for control of life cycle costs for avionics
systems
N81-11924
- WEAPONS INDUSTRY**
A review and assessment of system cost reduction
activities
N81-11906
- WEATHERING**
Erosion and impacts on composite helicopter blades
N81-11138
- WEDGE FLOW**
Asymmetric flow of subsonic and sonic jets over an
infinite wedge
A81-10919
- WEIGHT INDICATORS**
In-flight measurement of aerodynamic loads on
captive stores. Equipment and results
[NLR-MP-79013-0] N81-10012
- WEIGHT REDUCTION**
Weight optimization of wing structures according
to the gradient method
A81-11650
- WELDING**
Application of weldbonding to A-10 production
aircraft
A81-11652
- WIND EFFECTS**
The turbulent wind and its effect on flight
[UTIAS-REVIEW-44] N81-11020
- WIND SHEAR**
Procedures to improve flight safety in wind shear
conditions
A81-11666
Wind shear detection from PCM-recorded MLS-flight
data
A81-11675
Pilot-aircraft system response to wind shear
[NASA-CR-3342] N81-10636
Test and evaluation of the Airport Surveillance
Radar (ASR)-8 wind shear detection system (phase
2), revision
[AD-A090111] N81-11290
- WIND TUNNEL APPARATUS**
Add fluorescent nitrofuels to the aerodynamicist's
bag of tricks
A81-11245

WIND TUNNEL CALIBRATION

SUBJECT INDEX

- Three years of operation of the ONERA pressurized subsonic wind tunnel [ONERA, TF NO. 1980-129] A81-11669
- A system for model access in tunnels with an unbreathable test medium A81-11672
- WIND TUNNEL CALIBRATION**
- Calibration of the high speed wind tunnel TVM 150 in the supersonic range A81-11778
- A fan pressure ratio correlation in terms of Mach number and Reynolds number for the Langley 0.3 meter transonic cryogenic tunnel [NASA-TP-1752] N81-10005
- WIND TUNNEL DRIVES**
- Development of wind tunnel fan blade made of composite materials [MBB-UD-277-79-0] A81-12096
- WIND TUNNEL MODELS**
- High-lift investigations on some small aspect ratio wings A81-11643
- Adaptable wind tunnel walls for 2D and 3D model tests A81-11671
- A system for model access in tunnels with an unbreathable test medium A81-11672
- Model design and instrumentation experiences with continuous-flow cryogenic tunnels N81-11057
- Model design and instrumentation for intermittent cryogenic wind tunnels N81-11058
- The European Transonic Wind tunnel ETW N81-11064
- WIND TUNNEL TESTS**
- Investigation of high-maneuvrability flight vehicle dynamics A81-11625
- An experimental investigation of the interaction between a glancing shock wave and a turbulent boundary layer A81-11649
- Investigation of the stalling characteristics of a general aviation aircraft A81-11665
- Three years of operation of the ONERA pressurized subsonic wind tunnel [ONERA, TF NO. 1980-129] A81-11669
- DFVLR-dynamic model testing in wind tunnels for active controls research A81-11670
- Adaptable wind tunnel walls for 2D and 3D model tests A81-11671
- Some thoughts on the effects of flight on jet noise as observed in actual flight and in wind tunnels A81-11723
- A simple laser interferometer for wind tunnel flow visualisation A81-12078
- An introduction to dynamic derivatives (3) methods of oscillating models in pitch and yaw in a 530 by 810 millimetre transonic wind tunnel [ARL/AERO-NOTE-390] N81-10007
- Holographic investigation of slender body vortex wakes [AD-A089496] N81-10008
- An investigation of scale effects on the transonic flow over swept wings. Part 2: Measurements on a model of a variable-sweep strike-fighter configuration [ARC-R/M-3842-PT-2] N81-10010
- Boundary layer measurements on a two-dimensional wing with flap [NLR-TR-79009-U] N81-10014
- Flow measurements in the wake of a wing fitted with a leading-edge root extension (strake) [RAE-TR-79120] N81-10015
- Full scale wind tunnel investigation of a bearingless main helicopter rotor --- Ames 40 by 80 foot wind tunnel test using the BO-105 helicopter [NASA-CR-152373] N81-11014
- Wind tunnel investigation of the aerodynamic hysteresis phenomenon on the F-4 aircraft and its effects on aircraft motion [AD-A089851] N81-11016
- Low-speed aerodynamic performance of 50.8-centimeter-diameter noise-suppressing inlets for the Quiet, Clean, Short-haul Experimental Engine (QCSEE) --- Lewis 9- by 15-foot low speed wind tunnel tests [NASA-TP-1178] N81-11037
- Calibration of a blowdown-to-atmosphere cryogenic wind tunnel N81-11060
- WIND TUNNEL WALLS**
- Adaptable wind tunnel walls for 2D and 3D model tests A81-11671
- Wind tunnel wall interference in a test section with ventilated walls A81-11673
- WINDPOWERED GENERATORS**
- Performance of a steel spar wind turbine blade on the Mod-0 100 kW experimental wind turbine [NASA-TM-81588] N81-11448
- Definitive generic study for the effect of high lift airfoils on wind turbine effectiveness, executive summary [SERI/TR-98003-2] N81-11492
- WING FLAPS**
- Leading-edge 'Vortex Flaps' for enhanced subsonic aerodynamics of slender wings A81-11648
- WING FLOW METHOD TESTS**
- Add fluorescent minitufts to the aerodynamicist's bag of tricks A81-11245
- High-lift investigations on some small aspect ratio wings A81-11643
- Winglets development at Israel Aircraft Industries A81-11645
- Adaptable wind tunnel walls for 2D and 3D model tests A81-11671
- WING LOADING**
- Weight optimization of wing structures according to the gradient method A81-11650
- Estimation of wing nonlinear aerodynamic characteristics at supersonic speeds [NASA-TP-1718] N81-10004
- An analytical technique for approximating unsteady aerodynamics in the time domain [NASA-TP-1738] N81-11422
- WING NACELLE CONFIGURATIONS**
- Calculation of the flow field around engine-wing-configurations A81-11613
- WING OSCILLATIONS**
- Active flutter suppression design and test - A joint U.S.-F.R.G. program A81-11621
- WING PANELS**
- Flight simulation environmental fatigue crack propagation in 2024-T3 and 7475-T761 aluminum --- wing panels for transport aircraft [NLR-MP-80003-U] N81-11415
- WING PROFILES**
- New concepts for design of fully-optimized configurations for future supersonic aircraft A81-11606
- Longitudinal motion of low-flying vehicles in nonlinear flowfields A81-11626
- Research on transonic wings at the National Aerospace Laboratory, Japan A81-11640
- Optimizing the fixed leading edge shape of a transonic wing to suit the landing high-lift requirements A81-11644
- WING SLOTS**
- The performance of slotted blades in cascade A81-10632
- WINGLETS**
- Winglets development at Israel Aircraft Industries A81-11645

SUBJECT INDEX**YAWING MOMENTS****WINGS**

- Numerical optimization - An assessment of its role
in transport aircraft aerodynamic design through
a case study A81-11604
- Advanced combat aircraft wing design A81-11608
- Linear vortex theories of a profile and wing with
air intake A81-12703
- Model design and instrumentation for intermittent
cryogenic wind tunnels N81-11058

WIRE

- Civil helicopter wire strike assessment study.
Volume 2: Accident analysis briefs
[NASA-CR-152390] N81-10019

X**XV-15 AIRCRAFT**

- The XV-15 tilt rotor research aircraft
[NASA-TM-81244] N81-10054

Y**YAWING MOMENTS**

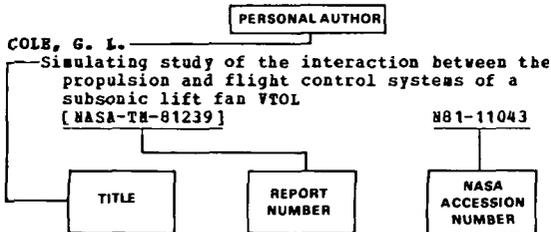

- An introduction to dynamic derivatives (3) methods
of oscillating models in pitch and yaw in a 530
by 810 millimetre transonic wind tunnel
[ARL/AERG-NOTE-390] N81-10007
- A piloted simulator investigation of static
stability and stability/control augmentation
effects on helicopter handling qualities for
instrument approach
[NASA-TM-81188] N81-10077

PERSONAL AUTHOR INDEX

AERONAUTICAL ENGINEERING / A Continuing Bibliography (Suppl. 132)

FEBRUARY 1981

Typical Personal Author Index Listing

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The accession number is located beneath and to the right of the title, e.g. N81-11043. Under any one author's name the accession numbers are arranged in sequence with the *IAA* accession numbers appearing first.

N81-10011
- SUAEBZ, J. A.
Design and fabrication of stabilized organic
matrix composites
A81-11338
- SULLIVAN, T. L.
Performance of a steel spar wind turbine blade on
the Mod-0 100 kW experimental wind turbine
[NASA-TM-81588]
N81-11448
- SWANSON, E. E.
Preliminary design characteristics of a subsonic
business jet concept employing an aspect ratio
25 strut braced wing
[NASA-CR-159361]
N81-11013
- SWECKER, G. A.
An analysis of Air Force management of Turbine
Engine Monitoring Systems (TEMS)
[AD-A089365]
N81-10070
- SWOLINSKY, B.
Wind shear detection from PCM-recorded MLS-flight
data
A81-11675
- SZALAI, K. J.
Flight experience with flight control redundancy
management
N81-11274
- SZUCH, J. E.
An automated procedure for developing hybrid
computer simulations of turbofan engines
[NASA-TM-81605]
N81-11688

T

- TAILLET, J.
Ground testing of aircraft antistatic protection
[ONERA, TP NO. 1980-126]
A81-11674
- TAKAHASHI, I.
The emulsion chamber experiment on super-sonic
Concorde /Echos/
A81-12476
- TAKAHATSU, Y.
Discrete frequency noise due to irregularity in
blade row of axial fan rotor
A81-10633
- TARRICONE, H.
US Navy service experience with advanced composites
N81-11149
- TASSINARI, R.
Organizing a design-to-cost program
N81-11914
- TAYLOR, P.
Helicopter tail configurations to survive tail
rotor loss
A81-10768
- TAYLOR, S. H.
Community response to noise from a general
aviation airport
A81-11821
- TEGGEN, U.
System simulation applied to the evaluation of
displays for guidance and control
[DFVLR-MIT-79-10]
N81-10064
- TEHNSON, B. C.
Effect of various environmental conditions on
polymer matrix composites
N81-11130
- THIBERT, J. J.
Design and tests of an helicopter rotor blade with
evolutive profile
[ONERA, TP NO. 1980-125]
A81-11638
- THIES, H. J.
Analysis of calculated three-dimensional inviscid
flow fields with embedded shock waves
(presentation of a field solution), part 1
[ESA-TT-558]
N81-10017

- THOMAS, J.
Analysis of the function principle and operational assessment of an onboard glidepath guidance system for visual approaches (Visual Approach Monitor (VAM) [DPVLR-FB-79-38] N81-10043
- THORNBER, G. H.
Impact of maintainability of life cycle costs N81-11921
- TREESHER, R. W.
Definitive generic study for the effect of high lift airfoils on wind turbine effectiveness, executive summary [SERI/TR-98003-2] N81-11492
- TIKHOMIROV, I. P.
Automation of aircraft gas-turbine power plants N81-12782
- TINLING, B. E.
Simulating study of the interaction between the propulsion and flight control systems of a subsonic lift fan VTOL [NASA-TM-81239] N81-11043
- TIPTON, A. G.
Weapon bay cavity noise environments, data correlation and prediction for the B-1 aircraft [AD-A089770] N81-11778
- TOHLINSON, B. H.
Piloted simulation studies of helicopter agility N81-10767
- TORGENSEN, W. S.
A multivariate approach to handling qualities rating scale development [AD-A089825] N81-11047
- TORRES, H.
Erosion and impacts on composite helicopter blades N81-11138
- TOYODA, S.
The emulsion chamber experiment on super-sonic Concorde /Echos/ N81-12476
- TRECA, H.
Nondestructive evaluation of composite structures N81-11654
- TREXLER, C. A.
Flameholding characteristics of a swept-strut H2 fuel-injector for scramjet applications N81-10711
- TROTH, D. L.
Fuel character effects on current, high pressure ratio, can-type turbine combustion systems [AD-A089182] N81-10073
- TRUCKENBRODT, E.
How to improve the performance of transport aircraft by variation of wing aspect-ratio and twist /12th Daniel and Florence Guggenheim International Memorial Lecture/ N81-11602
- TULLOCH, J. S.
Preliminary airworthiness evaluation AH-1S helicopter with ogee tip shape rotor blades [AD-A089625] N81-10061
- TUNG, C.
Experimental and analytical studies of a model helicopter rotor in hover [AD-AC89780] N81-11033

NASA ACCESSION
NUMBER

Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the *IAA* accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the *IAA* or *STAR* section.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA distributes its technical documents and bibliographic tools to eleven special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA

University of California, Berkeley

COLORADO

University of Colorado, Boulder

DISTRICT OF COLUMBIA

Library of Congress

GEORGIA

Georgia Institute of Technology, Atlanta

ILLINOIS

The John Crerar Library, Chicago

MASSACHUSETTS

Massachusetts Institute of Technology, Cambridge

MISSOURI

Linda Hall Library, Kansas City

NEW YORK

Columbia University, New York

OKLAHOMA

University of Oklahoma, Bizzell Library

PENNSYLVANIA

Carnegie Library of Pittsburgh

WASHINGTON

University of Washington, Seattle

NASA publications (those indicated by an "*" following the accession number) are also received by the following public and free libraries:

CALIFORNIA

Los Angeles Public Library

San Diego Public Library

COLORADO

Denver Public Library

CONNECTICUT

Hartford Public Library

MARYLAND

Enoch Pratt Free Library, Baltimore

MASSACHUSETTS

Boston Public Library

MICHIGAN

Detroit Public Library

MINNESOTA

Minneapolis Public Library

MISSOURI

Kansas City Public Library

St. Louis Public Library

NEW JERSEY

Trenton Public Library

NEW YORK

Brooklyn Public Library

Buffalo and Erie County Public Library

Rochester Public Library

New York Public Library

OHIO

Akron Public Library

Cincinnati Public Library

Cleveland Public Library

Dayton Public Library

Toledo Public Library

TENNESSEE

Memphis Public Library

TEXAS

Dallas Public Library

Fort Worth Public Library

WASHINGTON

Seattle Public Library

WISCONSIN

Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy of microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "*" and "#", from: ESA - Information Retrieval Service, European Space Agency, 8-10 rue Mario-Nikis, 75738 Paris CEDEX 15, France.
