PREFACE

The Agriculture and Resources Inventory Surveys Through Aerospace Remote Sensing is a multiyear program of research, development, evaluation, and application of aerospace remote sensing for agricultural resources, which began in fiscal year 1980. This program is a cooperative effort of the U.S. Department of Agriculture, the National Administration (U.S. Department of Commerce), the Agency for International Development (U.S. Department of State), and the U.S. Department of the Interior.

The work which is the subject of this document was performed by the Earth Resources Applications Division, Space and Life Sciences Directorate, Lyndon B. Johnson Space Center, National Aeronautics and Space Administration and Lockheed Engineering and Management Services Company, Inc. The tasks performed by Lockheed Engineering and Management Services Company, Inc., were accomplished under Contract NAS 9-15800.

1. INTRODUCTION

The FRIEDMAN program is a FORTRAN-coded implementation of Friedman's nonparametric test for several related samples with one observation per treatment/block combination, or as it is sometimes called, the two-way analysis of variance by ranks. This test is particularly useful when the assumptions of normal theory fail to hold for a randomized, complete block design. In fact, for this test, the only assumptions made are that the blocks are mutually independent and that within each block the data may be ranked from smallest to largest. A test statistic is then formed based upon the ranks, not the actual data. This statistic is then used to test the null hypothesis, as follows:

\[ H_0: \text{Treatments have identical effects.} \]
\[ H_1: \text{At least one treatment tends to yield larger observations than at least one other treatment.} \]

For further details, see reference 1.

A detailed description of the FRIEDMAN program is given in this document. A test data set and its results are also presented to aid the potential users of this program.
2. PROGRAM DESCRIPTION

2.1 GENERAL OVERVIEW

The FRIEDMAN program calculates Friedman's T-statistic for data sets with a maximum of 500 blocks and 30 treatments, allowing for only one observation per treatment/block combination. This is done via the main calling program, MAIN, and five subroutines: INPUT, SORT, XRANK, TSTAT, and OUTPUT. The FRIEDMAN program utilizes an execution time format, providing for a great deal of flexibility in the configuration of the experimental data set. The program is written in FORTRAN IV-H and is currently implemented on the AS/3000 computer in the Earth Observations Data Laboratory, NASA Johnson Space Center.
3. MAIN

The MAIN program is the main routine of FRIEDMAN. This component reads from the terminal the number of card images per block, the number of treatments, and the execution time format. Subsequently, it calls the subroutines that actually calculate the T-statistic.

CALLING PROCEDURE: Not applicable.

INPUT PARAMETERS: NC, NT, FMT

OUTPUT PARAMETERS: M

REFERENCED BY: Not applicable.

SUBPROGRAMS REFERENCED: INPUT, SORT, XRANK, TSTAT, OUTPUT

INPUT/OUTPUT DEVICES: Unit 16 (terminal), Unit 6 (disk, LRECL = 133, BLKSIZE = 133)

LOCAL VARIABLES: The following abbreviations are used in tables throughout this document.
A = alphanumeric
I = integer
R = real

Local variables for the MAIN program are as follows:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XINPUT</td>
<td>R</td>
<td>500 x 30</td>
<td>Input data set.</td>
</tr>
<tr>
<td>RANK</td>
<td>R</td>
<td>500 x 30</td>
<td>Array of ranked data.</td>
</tr>
<tr>
<td>R</td>
<td>R</td>
<td>1 x 30</td>
<td>Sum of ranks for each treatment.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Dimension</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>------</td>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>

<td>1</td>
<td>Number of blocks.</td>
</tr>
<tr>
<td>FMT</td>
<td>A</td>
<td>80</td>
<td>Format of XINPUT.</td>
</tr>
</tbody>
</table>
3.1 INPUT

The INPUT subroutine reads the experimental data set from the disk by reading in all treatments for a fixed block. That is, treatments are arranged horizontally and blocks are arranged vertically. (See figure 1 for data configuration.)

CALLING PROCEDURE: CALL INPUT(XINPUT,FMT,M,NT)

INPUT PARAMETERS: FMT, M, NT

OUTPUT PARAMETERS: XINPUT

REFERENCED BY: The INPUT subroutine is referenced by the driver routine MAIN.

SUBPROGRAM REFERENCED: None.

INPUT/OUTPUT DEVICES: Unit 5, the disk containing the experimental data set

LOCAL VARIABLES:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XINPUT</td>
<td>R</td>
<td>M x NT</td>

<td>A</td>
<td>80</td>
<td>Format of XINPUT.</td>
</tr>
</tbody>
</table>
Figure 1.- Input data configuration.

Index $I = \text{block}$; index $J = \text{treatment}$
3.2 SORT

The SORT subroutine sorts the treatment values for each block in ascending order. The algorithm used is a Shell sort (ref. 2).

CALLING PROCEDURE: CALL SORT(XINPUT, INDEX, I, M, NT)

INPUT PARAMETERS: XINPUT, I, M, NT

OUTPUT PARAMETERS: XINPUT, INDEX

REFERENCED BY: The SORT subprogram is referenced by the driver routine MAIN.

SUBPROGRAMS REFERENCED: None.

INPUT/OUTPUT DEVICES: None.

LOCAL VARIABLES:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XINPUT</td>
<td>R</td>
<td>M × NT</td>
<td>On input, the raw experimental data; on output, the sorted experimental data.</td>
</tr>
<tr>
<td>INDEX</td>
<td>R</td>
<td>NT</td>
<td>Array recording treatment exchanges that occur during the sort.</td>
</tr>
<tr>
<td>I</td>
<td>I</td>
<td>1</td>
<td>Number of current block being sorted.</td>
</tr>
<tr>
<td>M</td>
<td>I</td>
<td>1</td>
<td>Number of blocks.</td>
</tr>
<tr>
<td>NT</td>
<td>I</td>
<td>1</td>
<td>Number of treatments.</td>
</tr>
<tr>
<td>NDELTA</td>
<td>I</td>
<td>1</td>
<td>Variable used to partition each block for sorting.</td>
</tr>
<tr>
<td>NSWITCH</td>
<td>I</td>
<td>1</td>
<td>0 if no switch is made; 1 if a switch is made.</td>
</tr>
<tr>
<td>MAX</td>
<td>I</td>
<td>1</td>
<td>NT - NDELTA.</td>
</tr>
<tr>
<td>TEMP</td>
<td>R</td>
<td>1</td>
<td>Temporary storage used when interchanging of treatment values occurs.</td>
</tr>
</tbody>
</table>
3.3 XRANK

The XRANK subroutine, using the sorted experimental data, checks for ties and then assigns ranks. Using the array INDEX, XRANK positions treatment I in column I of array RANK.

CALLING PROCEDURE: CALL XRANK(XINPUT,RANK,INDEX,I,M,NT,WORK)

INPUT PARAMETERS: XINPUT, INDEX, I, M, NT

OUTPUT PARAMETERS: RANK

REFERENCED BY: The XRANK subroutine is referenced by the driver routine MAIN.

SUBPROGRAM REFERENCED: None.

INPUT/OUTPUT DEVICES: None.

LOCAL VARIABLES:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XINPUT</td>
<td>R</td>
<td>M × NT</td>
<td>Array of sorted experimental data.</td>
</tr>
<tr>
<td>RANK</td>
<td>R</td>
<td>M × NT</td>
<td>Array of ranks.</td>
</tr>
<tr>
<td>INDEX</td>
<td>R</td>
<td>NT</td>
<td>Array of treatment exchanges that occur during sort.</td>
</tr>
<tr>
<td>I</td>
<td>I</td>
<td>1</td>
<td>Block number.</td>
</tr>
<tr>
<td>M</td>
<td>I</td>
<td>1</td>
<td>Number of blocks.</td>
</tr>
<tr>
<td>NT</td>

<td>1</td>
<td>Number of treatments.</td>
</tr>
<tr>
<td>WORK</td>
<td>R</td>
<td>NT</td>
<td>Working storage.</td>
</tr>
<tr>
<td>NEQJAL</td>
<td>I</td>
<td>1</td>
<td>Number of treatment values making up a tie.</td>
</tr>
<tr>
<td>NFIRST</td>
<td>I</td>
<td>1</td>
<td>Column number of first of a sequence of equal values.</td>
</tr>
<tr>
<td>LAST</td>
<td>I</td>
<td>1</td>
<td>Column number of the last of a sequence of equal values.</td>
</tr>
</tbody>
</table>
3.4 TSTAT

The TSTAT subroutine calculates Friedman's T-statistic based upon the contents of the array RANK.

**CALLING PROCEDURE:** CALL TSTAT(RANK,R,DEV,M,NT,T)

**INPUT PARAMETERS:** RANK, M, NT

**OUTPUT PARAMETERS:** R, T

**REFERENCED BY:** The TSTAT subroutine is referenced by the driver routine MAIN.

**SUBPROGRAMS REFERENCED:** None.

**INPUT/OUTPUT DEVICES:** None.

**LOCAL VARIABLES:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RANK</td>
<td>R</td>
<td>M x NT</td>
<td>Array of the ranks of the experimental data.</td>
</tr>
<tr>
<td>R</td>
<td>R</td>
<td>1 x NT</td>
<td>Rank totals for treatments.</td>
</tr>
<tr>
<td>Z</td>
<td>R</td>
<td>1</td>
<td>Expected value of R(1,J), J = 1, ..., NT.</td>
</tr>
<tr>
<td>DEV</td>
<td>R</td>
<td>NT</td>
<td>([R(1,J) - Z]^2)</td>
</tr>
<tr>
<td>S</td>
<td>R</td>
<td>1</td>
<td>(\frac{1}{J} [R(1,J) - Z]^2)</td>
</tr>
<tr>
<td>T</td>
<td>R</td>
<td>1</td>
<td>Friedman's T-statistic.</td>
</tr>
</tbody>
</table>
3.5 OUTPUT

The OUTPUT subroutine prints an arbitrary \( M \times N \) array in the following format:

\[
\begin{array}{cccc}
  x_{1,1} & x_{1,2} & \cdots & x_{1,8} \\
  x_{2,1} & x_{2,2} & \cdots & x_{2,8} \\
  \vdots & \vdots & \ddots & \vdots \\
  x_{m,1} & x_{m,2} & \cdots & x_{m,8} \\
  x_{1,9} & x_{1,10} & \cdots & x_{1,16} \\
  x_{2,9} & x_{2,10} & \cdots & x_{2,16} \\
  \vdots & \vdots & \ddots & \vdots \\
  x_{m,9} & x_{m,10} & \cdots & x_{m,16} \\
  \vdots & \vdots & \ddots & \vdots \\
  x_{1,n-q} & \cdots & x_{1,n} \\
  x_{2,n-q} & \cdots & x_{2,n} \\
  \vdots & \vdots & \ddots & \vdots \\
  x_{m,n-q} & \cdots & x_{m,n} \\
\end{array}
\]

where \( q = \text{MOD}(NT,8) - 1 \).

CALLING PROCEDURE: CALL OUTPUT(S,NO,NV)

INPUT PARAMETERS: S, NO, NV

OUTPUT PARAMETERS: None.

REFERENCED BY: The OUTPUT subroutine is referenced by driver routine MAIN.

SUBPROGRAMS REFERENCED: None.

INPUT/OUTPUT DEVICES: UNIT 6, disk with LRECL = 133, BLKSIZE = 133
### LOCAL VARIABLES:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>R</td>
<td>NO × NV</td>
<td>Array to be printed.</td>

</tr>
<tr>
<td>L</td>
<td>I</td>
<td>1</td>
<td>Upper limit of each print iteration.</td>
</tr>
</tbody>
</table>
4. EXAMPLE

Assuming the FRIEDMAN program has been compiled, the following EXEC routine may be used to run FRIEDMAN:

&CONTROL OFF
FILEDEF 5 DISK &1 &2 &3 (PERM
FILEDEF 6 DISK FRIEDMAN OUTPUT D
   (PERM LRECL 133 BLKSIZE 13)
FILEDEF 16 TERM (PERM
LOAD (CLEAR NOMAP
START
SPOOL E NOH
PR FRIEDMAN OUTPUT D (CC
SPOOL E HOLD
&EXIT

Suppose the data set to be used is as shown in figure 2. When the above EXEC routine is executed, the following prompt will appear:

ENTER NUMBER OF CARDS PER BLOCK IN I2 FORMAT.

The user will respond with "SPACE 2." The space is necessary because of the I2 format. Upon carriage return, the prompt

ENTER NUMBER OF TREATMENTS IN I2 FORMAT

will appear. The user should respond with "SPACE 7." Upon carriage return, the final prompt will appear:

ENTER INPUT FORMAT.

The user should respond with

(4F3.0,/,3F3.0).

The output will be spooled to the printer no-hold and should appear as shown in figure 3.
Figure 2.- Data set example.
