Attn: Donna Lee

FROM: GP/Office of Assistant General Counsel  
for Patent Matters

SUBJECT: Announcement of NASA-Owned U.S. Patents in STAR

In accordance with the procedures agreed upon by Code GP and  
Code NIT-4, the attached NASA-owned U.S. Patent is being  
forwarded for abstracting and announcement in NASA STAR.

The following information is provided:

U.S. Patent No. : 4,499,260  
Issue Date : 2-12-85  
Government or Contractor Employee: National Research Council  
NASA Case No. : ARC-11,413-1

NOTE - If this patent covers an invention made by a contractor employee under a NASA contract, the following is applicable:

YES NO

Pursuant to Section 305(a) of the National Aeronautics and Space Act, the name of the Administrator of NASA appears on the first page of the patent; however, the name of the actual inventor (author) appears at the heading of Column No. 1 of the specification, following the words "...with respect to an invention of."

(NASA-Case-ARC-11413-1) PHTHALOCYANINE POLYMERS Patent (NASA) 14 p CSCL 07D

Unclas

00/27 19057
Method of forming 4,4',4",4"'-tetraamino phthalocyanines by reducing 4,4',4",4"'-tetranitro phthalocyanines, polymerization of the metal tetraamino phthalocyanines with a tetracarboxylic dianhydride (preferably aromatic) or copolymerization with a tetracarboxylic dianhydride and a diamine (preferably also aromatic) to produce amic acids which are then dehydrocyclized to imides. Thermally and oxidatively stable polymers result which form tough, flexible films, etc.
FIG. 1
FIG. 2
PHTHALOCYANINE POLYMERS

ORIGIN OF THE INVENTION

The invention described herein was made in the performance of work under a NASA contract and is subject to the provisions of Section 305 of the National Aeronautics and Space Act of 1958, Public Law 85-568 (72 Stat. 435; 42 U.S.C. 2457).

FIELD OF THE INVENTION

The invention relates to a method of synthesizing metal 4,4',4'',4'''tetraamino phthalocyanines (1)

\[
\begin{align*}
&\text{H}_2\text{N} & & \text{N} & & \text{N} & & \text{M} & & \text{N} & & \text{H}_2\text{N} \\

\end{align*}
\]

wherein \(M\) is a metal and to the production of polymers with dianhydrides and preferably also with diamines and to the cyclization of the resulting polymers.

BACKGROUND OF THE INVENTION

The remarkable thermal stability and resistance to chemical attack coupled with the properties such as color, catalytic activity, electrical and photo-conductivity has attracted wide interest to the phthalocyanine class of compounds. Polymers having this unit in their back-bone are expected to display high thermal stability up to 500°C. Many previous attempts have been made to use the highly conjugated aromatic ring structure of phthalocyanines in the preparation of thermally stable polymers, but in most cases insoluble and infusible powders of low thermal stability have been obtained. In many of the cases they were found to undergo decomposition in air around 350°C. This failure to obtain the anticipated thermal stability may be due to (1) low degree of polymerization with structural inhomogeneties, (2) impurities and (3) the presence of connecting groups having poor thermal stability. The low degree of polymerization is due to the steric hindrance caused by the large size of the phthalocyanine molecule. The characteristic insolubility and the chemical inertness of the phthalocyanines have made it difficult to obtain polymeric material of high molecular weight.

The imide linkage is known to be very stable and has good moisture resistance in many polymeric materials. Phthalocyanine polymers incorporating this linkage, and using procedures favoring the formation of a high degree of polymerization, are expected to show high thermal stability. Synthetic procedures for making phthalocyanine polymers having imide linkages are disclosed in U.S. Pat. Nos. 3,890,274 and 3,996,196, but the procedures used to obtain either oligomeric or polymeric phthalonitrile terminated imide compounds is susceptible to giving a mixture of various side reaction products. Further, unless one uses the exact theoretical amount of metal salt to convert the end-group phthalonitriles to the phthalocyanine structure, formation of isoindoline or triazine is also possible. To suppress the formation of these side products, if one uses excess metal salt or metallic powder, there is a greater chance of incorporation of these impurities in the resulting polymers. Structural inhomogeneities or the presence of impurities will result in polymers having poor thermal stability and other undesirable properties.

OBJECTS OF THE INVENTION

Among the objects of the invention are the provision of a superior method of preparing a metal phthalocyanine monomer which is capable of polymerization to yield metal phthalocyanine polymers which are thermally stable; to provide a method whereby phthalocyanine monomers may be polymerized to a high molecular weight polymer which has good thermal stability; to provide novel polymers of a phthalocyanine monomer which have high molecular weight and are heat resistant and are capable of forming tough flexible films, heat resistant coating materials, adhesives, fibers and other useful end products.

BRIEF SUMMARY OF THE INVENTION

In accordance with the invention the metal 4,4',4'',4'''tetraamino phthalocyanine 1 is prepared in purer form from heretofore by reaction of a soluble compound of the metal \(M\), 4-nitrophthalic acid, urea and a catalyst in a suitable solvent to produce the metal 4,4',4'',4'''tetranitro phthalocyanine 2.
n being a number indicating the degree of polymerization. This polymer (an amic acid) is then dehydrocyclized to produce a polymer having the recurring unit.

Further, a mixture of the tetraamino monomer 1, a dianhydride 3 and a diamine 6

\( \text{H}_3\text{N} \equiv \text{R'} \equiv \text{NH}_3 \)

(wherein \( \text{R'} \) is a bivalent organic group) may be copolymerized to result in a copolymer (the polyamic acid form) which is then dehydrocyclized to yield a copolymer 8 as follows:
For convenience of reference, FIGS. 1, 2 and 3 illustrate the invention as follows:

FIG. 1 shows the structure of metal 4,4',4'',4''''-tetranitro phthalocyanine.

FIG. 2 shows the steps involved in producing an amic acid polymer from the phthalocyanine of FIG. 1 and a dianhydride (illustrated by 3,3',4,4''-benzophenone tetracarboxylic dianhydride) (step 1) and dehydrocyclizing the amic acid to an imide (step 2).

FIG. 3 illustrates a copolymer resulting from copolymerizing the same MPTA and the same dianhydride with 4,4''-diaminodiphenyl ether and dehydrocyclizing the resulting amic acid.

DETAILED DESCRIPTION OF THE INVENTION

EXAMPLE 1
Copper (II) 4,4',4'',4''''-Tetranitro Phthalocyanine (2a)

This has the structure of 2 above wherein M is Cu(II).

EXAMPLE 2 AND 3
Cobalt and Nickel 4,4',4'',4''''-tetranitro phthalocyanines, (compounds Ib and IC)

These were prepared by the same method as in Example 1. Each case the structure was that of formula 2 wherein M=Co (II) and Ni (II), respectively. Their structures were verified by chemical and infrared analyses.

EXAMPLE 4
Copper (II) 4,4',4'',4''''-tetraamino phthalocyanine (1a)

This had the structure 1 wherein M=Cu (II). About 10 g of finely ground copper (II) 4,4',4'',4''''-tetranitro phthalocyanine was placed in 250 ml water. To this slurry 50 g of sodium sulfide nonahydrate was added and stirred at 50°C for 5 hours. The solid product was separated by centrifuging the reaction mixture and treated with 750 ml of 1.0N hydrochloric acid. The blue precipitate of copper (II) tetraamino phthalocyanine hydrochloride was separated by centrifugation. It was then treated with 500 ml of 1.0N sodium hydroxide, stirred for 1 hour and centrifuged to separate the dark green solid complex. The product was repeatedly treated with water, stirred and centrifuged until the material was free from sodium chloride and sodium hydroxide. The pure copper complex was dried at 150°C for 2 hours.

Compound C12H26N2Cu (CuPTA), Yield 98%.

Calcd: C, 60.42; H, 3.17; N, 26.42; Cu, 9.99; Found: C, 60.66; H, 3.4; N, 26.25; Cu, 10.1.

IR absorption bands (cm⁻¹) 3289 w, 3178 w, 3079 w, 1603 s, 1409 m, 1341 s, 1302 s, 1249 m, 1135 m, 1096 m, 1053 m, 977 w, 942 w, 861 w, 820 w, 809 w, 776 w, 744 m, 730 mw.

EXAMPLES 5 AND 6
Cobalt and nickel 4,4',4'',4''''tetraamino phthalocyanines, (compounds 1b and 1c)

These having structure 1 with M=Co (II) and Ni (II) were prepared by the same method as in Example...
These polymers can be cyclized to polymers 8.

dimethyl sulfoxide (DMSO), dimethyl formamide (DMF), dimethyl acetamide (DMAc) and N-methyl pyrrolidone (NMP). A solution of this monomer in an aprotic solvent such as DMAc or DMF is reacted with air oven at 70°C. The polymer 4a (an amic acid) yields polymers 5.

Copolymers of the tetraamino phthalocyanine (la), the dianhydride (3a) and 4,4'-diaminodiphenyl ether were placed in a three-necked flask containing 138 ml of dry dimethyl sulfoxide as the solvent. The flask was fitted with a nitrogen inlet, glass stopper and a calcium chloride drying tube. Dry nitrogen gas was bubbled through the clear solution. To the vigorously stirred solution, 3.222 g of 3,3',4,4'-benzophenone tetracarboxylic dianhydride were added in small portions. The dark color of the solution turned to a lighter green after 5-10 minutes and the viscosity of the solution gradually increased. A thick viscous solution, > 3.0 dl/g, was obtained after 2 hours stirring in a current of nitrogen. The solution can either be used to cast film or the polymer can be precipitated with toluene. After removing the solvent at 75°C, thermal cyclization can be carried out either by heating at 325°C in vacuum for 1 hour or by heating at 350°C in a current of nitrogen for 1.5 hours.

Tables 1 and 2 summarize results obtained with polymers prepared by polymerizing the indicated tetraamino metal phthalocyanine with 3,3',4,4'-benzophenone tetracarboxylic dianhydride (Table 1) or with 1,2,4,5-benzene tetracarboxylic dianhydride (Table 2). Wherever in these tables a tetraamine appears alone in the column headed Amines, the polymerization was between the tetraamino phthalocyanine and the indicated dianhydride alone, and wherever a second amine is indicated the polymerization was a co-polymerization of the tetraamino phthalocyanine, the indicated second amine and the indicated dianhydride. Numbers in parentheses indicate gram proportions. BPTDA is 3,3',4,4'-benzophenone tetracarboxylic dianhydride. DMSO is dimethyl sulfoxide. PDT is polymer decomposition temperature. PTA is 4,4',4'',4'''-tetraamino phthalocyanine. DADPE is 4,4'-diamino diphenyl ether. PDA is p-phenylene diamine. DADPM is 4,4'-diamino diphenyl methane. BAF is 9,9-bis(4'-amino phenyl)fluorene. PMDA is pyromellitic dianhydride.

</table>
It will be apparent that other dihydrides and other diamines may be employed. If a greater degree of cross linking is desired anhydrides and/or amines of higher functionality than two may be used. However, the resulting polymers are likely to be intractable, insoluble materials. The phthalocyanine structure may have substituents on the benzene rings, e.g. methyl, ethyl, etc. provided they do not interfere with the copolymerization reaction and the anhydride and amine reactants may likewise have such substituents subject to the same proviso. Such substituents may be hydrocarbons or they may be or may contain hetero atoms such as, for example, chlorine, methoxy, etc.

Examples of suitable dihydrides are 1,2,4,5-benzene tetracarboxylic dihydride; bis(3,4-dicarboxyphenyl)ether dihydride; 2,3,4,5-thiophene tetracarboxylic dihydride; 3,3',4,4'-diphenyl tetracarboxylic dihydride; 3,3',4,4'-benzophenone tetracarboxylic dihydride; 1,2,4,5-naphthalene tetracarboxylic dihydride; 3,4,9,10-perylene tetracarboxylic dihydride; 1,8,9,10-benzoanthrene tetracarboxylic dihydride; 3,4,9,10-pyrene tetracarboxylic dihydride and the like. Preferred dihydrides are 3,3',4,4'-benzophenone tetracarboxylic dihydride; 1,2,4,5-benzene tetracarboxylic dihydride; 2,3,4,5-pyrazine tetracarboxylic dihydride; and 1,4,5,8-naphthalene tetracarboxylic dihydride. The most preferred ones are 3,3',4,4'-benzophenone tetracarboxylic dihydride and 1,2,4,5-benzene tetracarboxylic dihydride. Alicyclic dihydrides may be used but aromatic dihydrides are preferred. An example of an alicyclic dihydride is the following:

Dianhydrides resulting from the hydrogenation of pyromellitic dihydride and of benzophenone tetracarboxylic acid dihydride may be used.

It has been observed that MPTA/dianhydride polymers prepared with 3,3',4,4'-benzophenone tetracarboxylic dihydride and 1,2,4,5-benzene tetracarboxylic dihydride have high decomposition temperatures, e.g. 505°-565° C. in air and 550°-575° C. in nitrogen and that they have a high char yield but they do not have a high degree of polymerization as shown by inherent viscosity measurements (0.35-0.42 dl/g). This is believed to be due to steric hindrance which is overcome by the use of linking groups derived from diamines. By varying the length of the connecting group derived from the diamine, this factor (degree of polymerization) can be controlled and extended while preserving heat resistance.

By using diamines of different lengths, medium to infinite degrees of polymerization can be achieved.

Among diamines that may be used are 4,4'-diaminodiphenyl ether; 4,4'-diamino diphenyl methane; 4,4'-diamino diphenyl phenyl phosphine oxide; 4,4'-diamino diphenyl sulfide; 4,4'-diamino diphenyl silane; benzidine; 3,3'-dichloro benzidine; 1,5-diamino naphthalene; 3,3'-dimethyl-4,4'-diamino diphenyl ether; 3,3'-diethyl-4,4'-diamino diphenyl ether; 3,3'-diethoxy-4,4'-diamino di-
A. A method of forming polymers of a metal 4,4',4',4‴ tetraamino phthalocyanine which comprises

1. Any soluble salt or hydroxide of the selected metal may be used provided the counter ion is compatible with the reactants and the reaction product. For example, the metal M may be used in the form of its sulfate, chloride, nitrate, acetate, oxalate, etc. Also, it may be used in the form of a finely divided metallic powder. Preferably the reactants are used in approximately stoichiometric proportions. The ammonium chloride may be used alone as the catalyst but the use of ammonium molybdate as well allows the reaction to proceed at a lower temperature and increases the yield.

Nitrobenzene is an advantageous solvent because, besides being unreactive and being a good solvent for the reactants, it has a high boiling point (210°C). Other aprotic solvents such as quinoline and tetralin may be used. Yields of 90% or more are obtainable.

The metal M may be removed from the molecule as by dissolving it in concentrated sulfuric acid to produce the hydrogen (protonated) species in which each of the two covalent bonds is connected to hydrogen. The protonated species may then be treated with an alcholic solution of a metal salt, e.g., copper sulfate, to insert the metal, e.g., Cu(II). In this way one metal may be substituted for another. However, it is preferred to choose the desired metal initially and to insert it in the phthalocyanine molecule in the synthesis of the tetranitro compound 2.

The copolymerization of MPTA, dianhydride and diamine is carried out stepwise. In the first step copolymerization to the amic acid is effected, then decarboxylation is effected. In the first step a solvent is used, e.g., glacial acetic acid and refluxing in the presence of fused sodium acetate. The most efficient and convenient route for this purpose is the thermal cyclization method. Heating at 325°C for 1 hour in vacuum is found to be sufficient to complete the reaction. These copolymers are thermally very stable. Polymer decomposition temperature is greater than 500°C. In both air and nitrogen atmospheres. These polymers are very resistant to thermal degradation in anerobic atmosphere and their char yield varies between 65-80 at 800°C depending upon the amines, dianhydride and their molar concentrations used. The inherent viscosities obtained vary between 0.75 and >3.0 dl/g. The most preferred ratio of the molar concentrations of the metal 4,4',4',4‴-tetraamino phthalocyanine, the diamine and the dianhydride is 1.25:7:5:10. Most desirable concentration range of the monomer for the reaction is 3 to 5%. The polymer and copolymers of the present invention are useful for preparing high temperature resistant films, varnishes, adhesives and fibers.

We claim:

1. Any mono-, di- or higher valency metal M may be used in the place of divalent copper, cobalt and nickel, e.g., Cu(I), cobalt and nickel in other valence states, Fe(II), Fe(III), Zn, Al, lead, tin, palladium, germanium, vanadium, platinum and molybdenum in various valence states; monovalent metals such as Li, Na and K, etc. Where the metal is monovalent two atoms will be present, one atom above and the other atom below the plane of the phthalocyanine molecule. With a trivalent metal such as aluminium, one of the valences may be satisfied by a ligand such as Cl, F, acetate, etc., e.g., the metallic compound can be represented as M′X where M′ is the metal atom and X is an inorganic atom or radical or an organic group.

Preferably the metal is divalent and has an atomic radius close to 1.35 Å. Metals of substantially larger atomic radius may not fit well into the molecule and metals having a substantially smaller atomic radius are more likely to be extracted by strong acids, e.g., concentrated sulfuric acid. Metals having ligands may be susceptible to hydrolytic action.
reacting the metal 4,4',4'',4'''-tetraamino phthalocyanine in liquid phase at about 20°C to about 50°C with a tetracarboxylic dianhydride of the formula

wherein R is an organic group selected from the group consisting of aromatic and alicyclic groups to produce an amic acid polymer having a recurring unit wherein M is the metal and R is the organic group of the dianhydride.

2. The method of claim 1 wherein M is a divalent metal having an atomic radius of approximately 1.35 Å.

3. The method of claim 1 wherein the dianhydride is an aromatic dianhydride.

4. The method of claim 3 wherein the dianhydride is 1,2,4,5-benzene tetracarboxylic dianhydride.

5. The method of claim 3 wherein the dianhydride is 3,3',4,4'-benzophenone tetracarboxylic dianhydride.

6. The method of claim 1 comprising the additional step of dehydrocyclizing the amic acid polymer by a process selected from thermal cyclization, azetroping water of cyclization, refluxing in glacial acetic acid in the presence of fused sodium acetate to produce an imide polymer having the recurring unit wherein R is an organic group selected from the group consisting of aromatic and alicyclic groups, and a diamine of the formula H₂N—R—NH₂ wherein R' is a bivalent organic group selected from the group consisting of bivalent aliphatic groups, bivalent cycloaliphatic groups, and bivalent aromatic groups to yield an amic acid copolymer.

7. The method of claim 6 wherein the metal M is a divalent metal having an atomic radius about 1.35 Å.

8. The method of claim 6 wherein the dianhydride is aromatic.

9. The method of claim 8 wherein the dianhydride is 1,2,4,5-benzene tetracarboxylic dianhydride.

10. The method of claim 8 wherein the dianhydride is 3,3',4,4'-benzophenone tetracarboxylic dianhydride.

11. A method of forming polymers of a metal 4,4',4'',4'''-tetraamino phthalocyanine which comprises reacting the metal 4,4',4'',4'''-tetraamino phthalocyanine in liquid phase at a temperature of from about 20°C to about 50°C with a tetracarboxylic dianhydride of the formula

wherein M is the metal and R is the organic group of the dianhydride.

12. The method of claim 11 wherein the metal is a divalent metal having an atomic radius about 1.35 Å.

13. The method of claim 11 wherein the dianhydride is aromatic.

14. The method of claim 11 wherein the diamine is aromatic.

15. The method of claim 11 wherein both R and R' are aromatic.

16. The method of claim 1 comprising the additional step wherein the amic acid copolymer is dehydrocyclized by a process selected from thermal cyclization, azetroping water of cyclization, refluxing in glacial acetic acid in the presence of fused sodium acetate to produce a polymer having the recurring unit
wherein R is an organic group selected from the group consisting of aromatic and alicyclic groups which are derived from the dianhydride and R' is an organic group selected from the group consisting of aromatic, aliphatic and cycloaliphatic groups which are derived from the diamine.

17. The method of claim 16 wherein M is a divalent metal having an atomic radius about 1.35 Å.
18. The method of claim 16 wherein the dianhydride is aromatic.
19. The method of claim 16 wherein the diamine is aromatic.
20. The method of claim 16 wherein both the dianhydride and the diamine are aromatic.
21. Polymers having the following recurring unit wherein M is a metal and R is an organic group derived from a dianhydride and selected from the group consisting of aromatic groups and alicyclic groups

22. Polymers of claim 21 wherein M is divalent and has an atomic radius about 1.35 Å.
23. Polymers of claim 21 wherein R is an aromatic group derived from an aromatic dianhydride.
24. Polymers of claim 23 wherein the dianhydride is 1,2,3,4-benzene tetracarboxylic dianhydride.
25. Polymers of claim 23 wherein the dianhydride is 3,3',4,4'-benzophenone tetracarboxylic dianhydride.
26. Polymers having the following recurring unit wherein M is a metal and R is an organic group derived from a dianhydride and selected from the group consisting of aromatic groups and alicyclic groups.
17

4,499,260

18

30. Polymers of claim 28 wherein the dianhydride is 3,3',4,4'-benzophenone tetracarboxylic dianhydride.

31. Copolymers of a metal 4,4',4'',4'''-tetraamino phthalocyanine, a tetracarboxylic dianhydride selected from the group consisting of aromatic tetracarboxylic dianhydrides and alicyclic tetracarboxylic dianhydrides and a diamine selected from aromatic diamines, aliphatic diamines and cycloaliphatic diamines.

32. Polymers of claim 3 wherein the metal is a divalent metal having an atomic radius about 1.35 Å.

33. Polymers of claim 31 wherein the dianhydride is aromatic.

34. Polymers of claim 31 wherein the dianhydride is aromatic.

35. Polymers of claim 31 wherein the diamine is aromatic.

36. Polymers having the following recurring unit wherein M is a metal, R is an organic group selected from aromatic and alicyclic groups derived from a dianhydride and R' is an organic group selected from aromatic groups, cycloaliphatic groups and aliphatic groups derived from a diamine.

27. Polymers of claim 26 wherein M is a divalent metal having an atomic radius about 1.35 Å.

28. Polymers of claim 26 wherein the dianhydride is aromatic.

29. Polymers of claim 28 wherein the dianhydride is 1,2,3,4-benzene tetracarboxylic dianhydride.

37. Polymers of claim 36 wherein M is a divalent metal having an atomic radius about 1.35 Å.

38. Polymers of claim 36 wherein the dianhydride is aromatic.

39. Polymers of claim 36 wherein the diamine is aromatic.

40. Polymers of claim 36 wherein both the dianhydride and the diamine are aromatic.
