THE GRAM-III MODEL

C. G. Justus, Georgia Institute of Technology

The GRAM is under continuous development and improvement. GRAM data were compared with Middle Atmosphere Program (MAP) predictions and with shuttle data (Blanchard).

An important note: Users should employ only step sizes in altitude that give vertical density gradients consistent with shuttle-derived density data. Using too small a vertical step size (finer than 1 km) will result in what appears to be unreasonably high values of density shears but what in reality is noise in the model.

GRAM

MAP16, p. 152

PRECEDING PAGE BLANK NOT FILMED
\[ \rho(z+\Delta z) = \Gamma_p(\Delta z) \rho(z) + \beta \sigma_p \omega_z \]

\[ \beta = \sqrt{1 - \Gamma_p^2(\Delta z)} \]

\[ \Gamma_p(\Delta z) = e^{-\Delta z/L} \]

\[ \Delta \rho = \rho(z+\Delta z) - \rho(z) \]

\[ \frac{(\Delta \rho)^2}{\Delta z} \rightarrow 2 \sigma_p^2 \Delta z/L \quad \Delta z/L \rightarrow 0 \]

\[ \frac{(\Delta \rho/\Delta z)^2}{\Delta z} \rightarrow 2 \sigma_p^2 / \Delta z L \]

\[ E_p(k) \sim k^{-2} \quad kL \rightarrow \infty \]
