A CONTINUING BIBLIOGRAPHY
WITH INDEXES
(Supplement 297)

A selection of annotated references to unclassified reports
and journal articles that were introduced into the NASA
scientific and technical information system and announced
in April 1987 in

- Scientific and Technical Aerospace Reports (STAR)
- International Aerospace Abstracts (IAA).
This supplement is available from the National Technical Information Service (NTIS), Springfield, Virginia 22161, price code A03.
INTRODUCTION

This Supplement to Aerospace Medicine and Biology lists 89 reports, articles and other documents announced during April 1987 in Scientific and Technical Aerospace Reports (STAR) or in International Aerospace Abstracts (IAA). The first issue of the bibliography was published in July 1964.

In its subject coverage, Aerospace Medicine and Biology concentrates on the biological, physiological, psychological, and environmental effects to which man is subjected during and following simulated or actual flight in the Earth's atmosphere or in interplanetary space. References describing similar effects of biological organisms of lower order are also included. Such related topics as sanitary problems, pharmacology, toxicology, safety and survival, life support systems, exobiology, and personnel factors receive appropriate attention. In general, emphasis is placed on applied research, but references to fundamental studies and theoretical principles related to experimental development also qualify for inclusion.

Each entry in the bibliography consists of a bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged by STAR categories 51 through 55, the Life Sciences division. The citations, and abstracts when available, are reproduced exactly as they appeared originally in IAA or STAR, including the original accession numbers from the respective announcement journals. The IAA items will precede the STAR items within each category.

Seven indexes — subject, personal author, corporate source, foreign technology, contract, report number, and accession number — are included.

An annual index will be prepared at the end of the calendar year covering all documents listed in the 1987 Supplements.

Information on the availability of cited publications including addresses of organizations and NTIS price schedules is located at the back of this bibliography.

PRICE CODE A01 CSCL 06E

COSATI CODE Medical emergencies, especially those resulting from accidents, frequently require the administration of intravenous fluids to replace lost body liquids. The development of a prototype space flight intravenous injection system is presented. The definition of requirements, injectable concentrates development, water polisher, reconstitution hardware development, administration hardware development, and prototype fabrication and testing are discussed.

TITLE EFFECT OF ANTIGRAVITY SUIT INFLATION ON CARDIOVASCULAR, PRA, AND PVP RESPONSES IN HUMANS

PUBLICATION DATE

AUTHORS S. E. KRAVIK, L. C. KEIL, G. GEELEN, C. E. WADE, P. R. BARNES

AUTHOR'S AFFILIATION (NASA, Ames Research Center, Moffett Field; U.S. Army, Letterman Army Medical Center, San Francisco, CA) et al.

The effects of lower body and abdominal pressure, produced by antigravity suit inflation, on blood pressure, pulse rate, fluid and electrolyte shift, plasma vasopressin and plasma renin activity in humans in upright postures were studied. Five men and two women stood upright for 3 hr with the suit being either inflated or uninflated. In the control tests, the suit was inflated only during the latter part of the trials. Monitoring was carried out with a sphygmomanometer, with sensors for pulse rates, and using a photometer and osmometer to measure blood serum characteristics. The tests confirmed earlier findings that the anti-g suit eliminates increases in plasma renin activity. Also, the headward redistribution of blood obtained in the tests commends the anti-g suit as an alternative to water immersion or bed rest for initial weightlessness studies.

FLIGHT RESULTS FROM THE BIORACK EXPERIMENTS ON THE SPACELAB D-1 MISSION

The Biorack experiments flown on the German Spacelab D-1 mission have provided striking evidence of the effects of gravity on bacteria, unicellular organisms, white blood cells and insect development. They have shed new light on the mechanisms of geotropism in plant roots. Two major biological fields, cell proliferation and cell differentiation, have emerged as being of particular importance and meriting further investigations. Author

A87-20497
RNA AS AN ENZYME
THOMAS R. CECH (Colorado, University, Boulder) Scientific American (ISSN 0036-8733), vol. 255, Nov. 1986, p. 64-69, 72-75.

The discovery that some RNAs can catalyze their own replication and that of other RNAs and can also assemble RNAs is reviewed. The splicing process involved in these transformations is described, showing the nature of the structures that participate. The types of RNAs in various organisms that self-splice are considered, and the evolutionary implications of the enzymatic activities of these RNAs are briefly addressed. Author

A87-20869
CONTROL OF ACTIVITY OF THE DIAPHRAGM IN RAPID- EYE-MOVEMENT SLEEP

The design of an efficient and versatile closed-circuit metabolic system is described. The system includes a pressure sensor, electronic control unit for regulating air pressure within a closed chamber, and a liquid crystal display calculator. Compared with a standard indirect calorimetry system, the new device had improved precision during studies of O2 consumption both at room temperature and at 5 deg C. Some potential applications include maintenance of pressurized O2-controlled environments, exposure to toxic gases, and study of diurnal variations in metabolic rate in various species including humans. STABLE ISOTOPE EVALUATION OF THE ORIGINS OF AMINO ACIDS IN FOSSILS
MICHAEL H. ENGEL (Oklahoma, University, Norman) and STEPHEN A. MACKO (Newfoundland, Memorial University, Saint John's, Canada) Nature (ISSN 0028-0836), vol. 329, Oct. 9, 1986, p. 531-533. Research supported by the Petroleum Research Fund. refs

Laboratory experiments were carried out to evaluate the effects of racemization on the stable carbon and nitrogen isotopic compositions of amino acid enantiomers. The results indicate that after the death of an organism, low-temperature diagenetic reactions such as racemization should not cause a significant shift in the stable carbon or nitrogen isotopic compositions of the resultant D- and L-amino acid enantiomer products. Hence, a comparison of these enantiomers from individual amino acids isolated from fossils may provide a method for establishing the absolute indigeneity of these compounds. K.K.
A87-21324

EFFECTS OF HYPOXIA ON THE OPERANT BEHAVIOUR AND BRAIN CATECHOLAMINE IN RAT

Changes in the catecholamine levels and avoidance behavior of rats treated with apomorphine and bromocriptine in normoxic and hypoxic environments are analyzed. Alterations in normoxic and hypoxic conditions following exposure to oxygen and treatment with bromocriptine are described. The data reveal that: (1) avoidance behavior is suppressed as oxygen concentration is lowered below 12 percent; (2) resistance to extinction in a hypoxic environment is decreased; (3) following electric shock intensity reduction, the negative behavior contrast is not obtained in the hypoxic environment; however, it is observed in the normoxic environment; and (4) bromocriptine improves the suppression of avoidance behavior of rats under hypoxic conditions and apomorphine has no effect. I.F.

A87-21325

THERMAL BALANCE DURING INTRAPERITONEAL ELECTRIC HEATING AT VARIOUS AMBIENT TEMPERATURES IN RATS

OSAMU SHIDO and TETSUO NAGASAKA (Kanazawa University, Japan) Japanese Journal of Aerospace and Environmental Medicine (ISSN 0387-0723), vol. 23, June 1986, p. 27-32. refs

The effect of a given internal heat load on thermal balance was examined in rats with direct and indirect calorimetry at ambient temperatures (Ta) 18, 24, and 28 C. The internal heat was loaded by an intraperitoneal electric heater implanted chronically. The threshold of hypothalamic temperature (Thy) for tail skin vasodilation was lowered as Ta increased. The total heat loss, the total body thermal conductance, and heat storage over Thy during internal heating increased as Ta decreased. The energy required to raise core temperature by 1 C were 16.41 + or - 4.20, 7.73 + or - 0.54, and 5.03 + or 0.31 J/g at Ta 18, 24, and 28 C, respectively. Author

A87-21430

A HEAT-STRESSED RAT MODEL TO DETERMINE RELATIVE ANTICHOLINERGIC AND ANTICHOLINESTERASE DRUG POTENCY

CANDACE B. MATTHEW, ROGER W. HUBBARD, and RALPH P. FRANCESCONI (U.S. Army, Research Institute of Environmental Medicine, Natick, MA) Aviation, Space, and Environmental Medicine (ISSN 0095-6562), vol. 57, Nov. 1986, p. 1061-1065. refs

Matthew et al. have previously reported that atropine, the prototype of muscarinic anticholinergic drugs, elicits a dose-dependent increase in core temperature of heat-stressed rats. In the present study, the effects of other anticholinergic drugs on increments in core temperature were quantified, and the following potencies relative to atropine were derived: imipramine 0.004, amitriptyline 0.02, chlorpromazine 0.1, atropine 1, L-hyoscymine 2, atropine methyl nitrate 4, and scopolamine 16. Additionally, the efficacy of carbachol to reduce the elevated heating rate of atropinized rats was quantified as a measure of anticholinesterase efficiency. The results indicated the following relative potencies: neostigmine 8, physostigmine 2, and pyridostigmine 1. It was concluded that alterations in core temperature responses to exposure to hot environments may be a useful and sensitive bioassay for anticholinergic and anticholinesterase alloy. Author

EFFECT OF MACULAR ABLATION ON FREQUENCY AND LATENCY OF MOTION-INDUCED EMESIS IN THE SQUIRREL MONKEY

KENNETH R. BRIZZEE (Tulane University, Covington, LA) and MAKOTO IGARASHI (Baylor College of Medicine, Houston, TX) Aviation, Space, and Environmental Medicine (ISSN 0095-6562), vol. 57, Nov. 1986, p. 1066-1070. refs

The previously motion-emetic sensitive squirrel monkeys were rendered refractory to a standard motion-emetic regimen by a two-stage utriculosacculectomy procedure which preserved the cristae ampullares of semicircular canals. Three nonoperated control squirrel monkeys tested on the same motion-emetic regimen time schedule as the operated animals remained motion-emetic sensitive with regard to incidence, frequency, and latency of motion-induced emetic responses. Following a sham surgical procedure (stapedectomy) performed on two of the latter animals and one additional new animal, the emetic incidence decreased from 100 to 69 percent, but the frequency and latency were not altered significantly. VESTIBULAR-VISUAL CONFLICT IN PITCH AND YAW PLANES IN THE SQUIRREL MONKEY

MAKOTO IGARASHI, WALTER B. KULECZ, KAZUTOYO KOBAYASHI, and HIDEIMITSU ISAGO (Baylor College of Medicine, Houston, TX) Aviation, Space, and Environmental Medicine (ISSN 0095-6562), vol. 57, Nov. 1986, p. 1071-1074. refs

Direction conflicting vestibular and visual (optokinetic) stimuli either in the pitch or yaw plane were given to squirrel monkey subjects. The conflict sickness symptom score in the pitch plane was significantly higher than that in the yaw plane for the initial exposure session (p less than 0.01). A significant score difference was also encountered when the exposure sessions were repeated (p less than 0.05). Author

A87-21800

CYTOMORPHOLOGY AND ULTRASTRUCTURE OF THE MAIZE ROOT MERISTEM IN WEIGHTLESSNESS [TSITOMORFOLOGIIA I UL'ISTRUKTURA KORNEVOI MERISTEMY KUKURUZY V NEVESOMOSTI]

The root meristem cells of maize seedlings grown in weightlessness aboard the Cosmos-1515 biosatellite were examined using light microscopy and electron microscopy. Major cytological and ultrastructural characteristics, and the features of morphogenesis of the space-grown seedlings were compared with those of the control cultures. The results indicate that weightlessness and other space flight factors had no significant effect on the structural and morphogenetic characteristics of the experimental cultures. I.S.

A87-21840

STUDIES OF LITHIUM AEROSOLS THAT COULD BE RELEASED IN ACCIDENTS INVOLVING SPACE NUCLEAR SYSTEMS

The potential health hazards of accidents involving the lithium employed in space power systems are presently assessed by means of a lithium aerosol-generating system in which the metal is inductively heated to as much as 1300 C and dispersed by argon gas into a chamber where it is burned in air. The intense
white flame thus produced generates branched-chain condensation aerosol particles. Rats have been exposed to 4 hr of breathing atmospheres contaminated by these aerosols at various concentrations; histopathologic lesions were observed in the nasal turbinates, larynx, and lungs of these animals. The pulmonary lesions were a secondary extension of the upper respiratory tract lesions. O.C.

A87-21862
THE INFLUENCE OF THE VESTIBULAR APPARATUS ON THE VISUAL ANALYZER [VLJANJE VESTIBULARNOGO APPARATA NA ZRITEL'NIY ANALIZATOR]  
Evidence is presented for the influence of vestibular activity on the visual system, using measurements of the biopotentials evoked in various regions of the visual system by stimulation of the vestibular system, as well as of the changes effected by vestibular stimuli in the visual system responses to visual stimuli. The changes in the bioelectric activity of the retina and optic nerve, corpora quadrigemina, the outer geniculate body, and the optic zone of the cortex observed after application of physical stresses or electric stimuli to the vestibular apparatus are considered. The mechanisms of the vestibuloocular interactions and the physiological significance of the vestibular influence are discussed. I.S.

A87-22768
EFFECTS OF CHRONIC CONTINUOUS WAVE MICROWAVE RADIATION (2.45 GHz) ON THE FORAGING BEHAVIOR OF THE WHITE-THROATED SPARROW  
FRED E. WASSERMAN, DEBORAH A. PATTERSON, THOMAS H. KUNZ (Boston University, MA), SAM P. BATTISTA (Arthur D. Little, Inc., Cambridge, MA), and DAVID BYMAN (Pennsylvania State University, Dunmore) Space Power (ISSN 0883-6272), vol. 6, 1986, p. 99-105. Research supported by the Boston University, Manomet Bird Observatory and DOE. refs (Contract EPA-68-02-3278).  
To determine possible environmental effects of the Satellite Solar Power System, the effect of chronic continuous microwave radiation on the foraging behavior of the white-throated sparrow was studied using an optimal foraging laboratory technique. Exposure to microwaves at the proposed frequency of 2.45 GHz for seven days at power densities of 0.0, 0.1, 1.0, 10.0 and 25.0 mW/sq cm did not result in foraging behavior trends for a dose response effect. No significant differences in the foraging behaviors for these birds was noted among preexposure, exposure, and postexposure periods under the temperature and humidity conditions of the study. R.R.

USSR SPACE LIFE SCIENCES DIGEST, ISSUE 9  
(NASA-CR-3922(10); NASA 126:3922(10)) Avail: NTIS HC A05/MF A01 CSCL 06B  
This is the ninth issue of NASA’s USSR Space Life Sciences Digest. It contains abstracts of 46 papers recently published in Russian language periodicals and bound collections and of a new Soviet monograph. Selected abstracts are illustrated with figures and tables from the original. Additional features include reviews of a Russian book on biological rhythms and a description of the papers presented at a conference on space biology and medicine. A special feature describes two paradigms frequently cited in Soviet space life sciences literature. Information about English translations of Soviet materials available to readers is provided. The abstracts included in this issue have been identified as relevant to 28 areas of aerospace medicine and space biology. These areas are: adaptation, biological rhythms, body fluids, botany, cardiovascular and respiratory systems, developmental biology, endocrinology, enzymology, equipment and instrumentation, gastrointestinal system, genetics, habitability and environment effects, hematology, human performance, immunology, life support systems, mathematical modeling, metabolism, microbiology, morphology and cytology, musculoskeletal system, nutrition, neurophysiology, operational medicine, perception, personnel selection, psychology, radiobiology, and space biology and medicine.

(NASA-TM-89606; NAS 11.5:89606) Avail: NTIS HC A04/MF
A01 CSCL 06B

The Cosmic Dust Collection and Gas Grain Simulation Facilities represent collaborative efforts between the Life Sciences and Solar System Exploration Divisions designed to strengthen a natural exobiology/Planetary Sciences connection. The Cosmic Dust Collection Facility is a Planetary Science facility, with Exobiology a primary user. Conversely, the Gas Grain Facility is an exobiology facility, with Planetary Science a primary user. Requirements for the construction and operation of the two facilities, contained herein, were developed through joint workshops between the two disciplines, as were representative experiments comprising the reference payloads. In the case of the Gas Grain Simulation Facility, the astrophysics Division is an additional potential user, having participated in the workshop to select experiments and define requirements.

NEUROPHYSIOLOGICAL BASES OF EVENT-RELATED POTENTIALS Annual Report, 1 May 1985 - 30 Apr. 1986
CHARLES S. REBERT 8 Aug. 1986 66 p
Contract F49620-82-K-0016
(AD-A172995; AFOSR-85-0910TR; AR-4) Avail: NTIS HC A04/MF
A01 CSCL 06C

In order to more fully understand the physiological and psychological significance of event-related brain potentials, cortical and subcortical recordings were obtained from monkeys performing an operant conditioning task (cued reaction time). During the past year three cynomolgus monkeys were studied following the administration of MPTP, a drug that selectively destroys nigra- striatal dopaminergic neurons in the pars compacta of the substantia nigra. This manipulation indicated the critical role of the nigra-striatal dopamine for task performance enhancement would be to determine if increasing nigra-striatal dopaminergic activity would enhance performance and electrophysiological responsivity.

N87-16506# Desmatics, Inc., State College, Pa.
STATISTICAL IMPACT ACCELERATION INJURY PREDICTION MODELS BASED ON -G SUB X ACCELERATOR DATA
CARL A. MAURO, KEVIN C. BURNS, and DENNIS E. SMITH
Oct. 1986 48 p
Contract N00014-85-C-0846
(AD-A173720; TR-126-I) Avail: NTIS HC A03/MF A01 CSCL 06C

Since 1974, the Naval Biodynamics Laboratory (NBDL) has collected, as part of its research effort on acceleration impact injury prevention, an extensive data base from -G sub x accelerator runs on Rhesus subjects. Over this time period, Desmatics, Inc. has been actively involved in the development of statistically based models to predict injury in Rhesus subjects resulting from indirect head/neck impact acceleration in the -X direction. The objectives of the present technical report are: (1) to summarize, update, and consolidate the Desmatics modeling efforts for fatal injury; (2) to investigate extending the injury prediction models to include nonfatal injury criteria; and (3) to evaluate the accuracy and validity of the prediction models obtained in the modeling efforts.
ventilation and rebreathing-induced hypercapnia. During both the increase in plasma cortisol is the result of ACTH-induced steroidogenesis in the adrenal cortex.

RESPONSES TO BRIEF HIGH-INTENSITY EXERCISE IN HUMANS

Michael J. Buono, John E. Yeager, and James A. Hodge (San Diego State Heart Institute; U.S. Naval Health Research Center, San Diego, CA) Journal of Applied Physiology (ISSN 0161-7567), vol. 61, Oct. 1986, p. 1337-1339. refs

The effect of 1-min-long high-intensity exercise (on a cycle ergometer at 120 percent maximum O2 uptake) on plasma levels of cortisol and adrenocorticotropin (ACTH) was investigated. Blood samples were collected at rest and at 5, 15, and 30 min after the exercise. Following exercise, mean plasma ACTH levels increased immediately (and briefly), while the cortisol levels increased at 15 min postexercise. The observed temporal sequence suggests that the increase in plasma cortisol is the result of ACTH-induced steroidogenesis in the adrenal cortex.

INFLUENCE OF CENTRAL VENOUS PRESSURE CHANGE ON PLASMA VASOPRESSIN IN HUMANS

Peter Norsk, Flemming Bonde-Petersen, and Jorgen Warberg (Copenhagen, University, Denmark) Journal of Applied Physiology (ISSN 0161-7567), vol. 61, Oct. 1986, p. 1534-1545. Navy-supported research. refs

Simultaneous changes in central venous pressure (CVP) and plasma arginine vasopressin (AVP) were examined before, during, and after lower body positive pressure (LBPP) or lower body negative pressure (LBNP) was applied to induce graded changes in central blood volume. It was found that in spite of large changes in the CVP and significant changes in blood volume and in esophageal pressure observed as a result of LBPP and/or LBNP applications, the values of plasma AVP did not change significantly as a result of either the LBPP or the LBNP. It is concluded that cardiopulmonary mechanoreceptors in humans do not play a major role in regulation of AVP secretion during short-term changes in CVP.

EFFECT OF HYDRATION ON PLASMA VOLUME AND ENDOCRINE RESPONSES TO WATER IMMERSION

Human decompensation sickness is presumed to result from excess inert gas in the body when ambient pressure is reduced. Although the most common symptom is pain in the skeletal joints, no direct study of nitrogen exchange in this region has been undertaken. For this study, nitrogen tagged with radioactive N-13 was prepared in a linear accelerator. Nine human subjects rebreathed this gas from a closed circuit for 30 min, then completed a 40- to 100-min washout period breathing room air. The isotope N-13 was monitored continuously in the subject's knee during the entire period using positron detectors. The concentration in most knees continued to rise for at least 30 min into the washout period. Various causes of this unexpected result are discussed, the most likely of which is an extensive redistribution of gas within avascular knee tissues. Author

EFFECT OF INSPIRATORY VOLUME ON INTRATHORACIC PRESSURE GENERATED BY AN L-1 MANEUVER

Richard Cote, Lloyd Tripp, Tom Jennings, Alva Karl, Chuck Goodyear (USAF, Aerospace Medical Research Laboratories, Wright-Patterson AFB, OH) et al. Aviation, Space, and Environmental Medicine (ISSN 0095-6562), vol. 57, Nov. 1986, p. 1035-1038. refs

Since each muscle has an optimal length at which it can generate the maximum tension, an optimal inspiratory volume may exist for producing the maximum intrathoracic pressure during the
L-1 maneuver, intrathoracic pressures were measured in eight healthy men after they inspired various volumes of air and performed the L-1 straining maneuver in a 1-G environment. Both the peak and mean intrathoracic pressures increased at greater inspiratory volumes, except for the mean intrathoracic pressure at the highest volumes. The ability to increase intrathoracic pressure with large inspiratory volumes may improve +Gz tolerance.

Author A87-21424
MOTION ARTIFACT FROM SPOT AND BAND ELECTRODES DURING IMPEDANCE CARDIOGRAPHY
MINGHAI QU (Shandong University, Jinan, People's Republic of China), YUJIAN ZHANG (Shanghai University of Science and Technology, People's Republic of China), JOHN G. WEBSTER, and WILLIS J. TOMPKINS (Wisconsin, University, Madison) IEEE Transactions on Biomedical Engineering (ISSN 0018-9294), vol. BME-33, Nov. 1986, p. 1029-1036. refs

Impedance cardiography for monitoring cardiac output during stress tests was modified. Employing an off-line microcomputer, the instrument ensemble averaged impedance signals to minimize the effect of motion artifacts. A new four-spot electrode array was proposed to replace the usual encircling band electrode array. Ten normal subjects were tested, and the signal-to-noise ratio from the spot electrode array was compared to that from a typical band electrode array at rest and during four levels of exercise on a treadmill. The average of the signal-to-noise ratios for ten subjects from the spot electrode array was 13.6-45.5 percent larger than that from the band electrode array at rest and during four levels of exercise.

Author A87-21925
CARDIAC OUTPUT MONITORING BY IMPEDANCE CARDIOGRAPHY DURING TREADMILL EXERCISE
YUJUANG ZHANG (Shanghai University of Science and Technology, People's Republic of China), MINGHAI QU (Shandong University, Jinan, People's Republic of China), JOHN G. WEBSTER, WILLIS J. TOMPKINS, B. ANN WARD (Wisconsin, University, Madison) et al. IEEE Transactions on Biomedical Engineering (ISSN 0018-9294), vol. BME-33, Nov. 1986, p. 1037-1042. refs

Impedance cardiography for monitoring cardiac output during stress tests was modified. An ensemble-averaging technique was adapted for eliminating motion artifacts. An array consisting of four spot ECG electrodes was applied for impedance cardiogram (ICG) monitoring and compared to conventional encircling band electrodes. Ten normal adults were tested, comparing the cardiac output obtained by the ICG monitoring system to that simultaneously obtained by the carbon dioxide rebreathing method at rest and during three levels of treadmill exercise. The results show that the correlation coefficient between the spot electrode ICG and the CO2 rebreathing method is 0.90, and that between the band electrode ICG and the CO2 rebreathing method is 0.96. If the peak-to-valley height of dZ/dt is used instead of the peak height of dZ/dt in computing cardiac output, the correlation coefficient between the spot electrode ICG and the CO2 rebreathing method can be improved to reach the value of 0.95.

BEDREST IN HEALTHY WOMEN: EFFECTS OF MENSTRUAL FUNCTION AND ORAL CONTRACEPTIVES Final Report
SUZANNE M. FORTNEY, WILLIAM B. BECKETT (Yale Univ., New Haven, Conn.), NEIL B. VROMAN (New Hampshire Univ., Durham), JOHN DAVIS, JOHN ROCK, ALLYN KIMBELL, NORMAN LA FRANCE, and HELEN DREW 1986 160 p

With the development of the space shuttle program, space flight for the first time is available to individuals who have not been specially selected and trained to be astronauts. In addition, women are being actively recruited into the space program, both as mission specialists and as career astronauts. One purpose of this project was to examine some of the physiological responses of men and women to a simulated weightlessness program (12 day horizontal bedrest), to compare their responses to those reported in men during similar programs, and to test whether menstrual function might alter some of the physiological changes which occur during bedrest, specifically changes in the plasma volume, exercise tolerance, and venous compliance before and after bedrest.

A NEW APPROACH TO NON-INVASIVE OXYGENATED MIXED VENOUS CO2 (SUBJ2) Final Report

JOSEPH A. FISHER (Toronto Univ., Ontario) and CLIFFORD A. ANSEL 31 Mar. 1986 79 p (Contract NAS9-17516)
(NASA-CR-171949; NAS 1.26:171949) Avail: NTIS HC A05/CF A01 CSCL 06E

A clinically practical technique was developed to calculate mixed venous CO2 partial pressure for the calculation of cardiac output by the Fick technique. The Fick principle states that the cardiac output is equal to the CO2 production divided by the arterio-venous CO2 content difference of the pulmonary vessels. A review of the principles involved in the various techniques used to estimate venous CO2 partial pressure is presented. B.G.

GERALD L. MECHANIC 1986 10 p (Contract NAG2-181)
(NASA-CR-180095; NAS 1.26:180095) Avail: NTIS HC A02/CF A01 CSCL 06S

The amounts of nonmineralized and mineralized collagen in bone from control, immobilized, and immobilized reambulated monkeys were examined. In order to understand structure-function relationships of bone collagen and the response of a variety of conditions on control of the three dimensional structure of the collagen fibril, the stereochemistry of the cross-linking reactions as well as the stereospecific packing of the collagen molecules were studied. B.G.

INTRACORTICAL INTERACTIONS IN VISUAL PROCESSING Final Report

JEREMIAH I. NELSON May 1986 24 p (Contract N62689-83-M-3126)
(AD-A169674; NADC-86066-60) Avail: NTIS HC A02/CF A01 CSCL 06P

Microelectrodes were used to record responses from single cells in the visual system of cats, at the level of the visual cortex. Interactions were discovered and measured between the cell under study and neighboring cells, when these neighbors were stimulated with large patterns. The interactions obey specific rules. It is argued that these rules are ideal for separating and strengthening the neural response to one object from the response of myriad other neurons in a cluttered background. The next step in this project will be multielectrode array studies to isolate and identify the neurons participating in these interactions. GRA

G tolerance varies widely among individuals. To assure that aircrew with abnormally low G tolerance are not assigned to aircraft that operate in the high-G environment, a G-tolerance standard and the means to implement that standard are necessary. Since 1977 the USAF SAM has used, in human centrifuge operations, an informal G-tolerance standard for selecting experimental subjects, evaluating medically disqualified aircrew, and ensuring efficacy of high-G training for aircrew. That standard consists of the subject’s being able to sustain for 15 s a rapidly applied +7-G sub z load, without totally losing peripheral vision or losing consciousness, while wearing a functional anti-G suit, performing an anti-G straining maneuver, and sitting in a conventionally configured fighter aircraft seat. Inability to tolerate a 7-G, 15-s, rapid-onset G profile in a centrifuge is also the basis of internationally recognized (NATO, ASCO) definitions of low G tolerance. The rationale for choosing the 7-G, 15-s standard is discussed. Experience with use of this standard and the equivalent standard of 8-G for 5 s when the F-16-configured seat is used reveals that fewer than 1% of actively flying fighter aircrew are unable to meet the standard. EXPLORATORY STUDY OF THE POTENTIAL EFFECTS OF EXPOSURE TO SONIC BOOM ON HUMAN HEALTH. VOLUME 2: EPIDEMIOLOGICAL STUDY Final Report, Nov. 1984 - May 1986

(AD-A170953; AAMRL-TR-86-020-VOL-2) Avail: NTIS HC A08/CF A01 CSCL 06S

A study has been carried out to investigate possible human health effects caused by exposure of people to sonic boom. The subjects of the study were the residents of Nevada. This state was selected for the study because supersonic military flight operations have been conducted out in Nevada, primarily within the boundaries of the Tactical Fighter Weapons Center (TFWC) Range Complex near Las Vegas, longer than in any other area within the United States. This volume presents the results of an epidemiological study to search for any health effects. The health effects study was built entirely on a statewide epidemiologic evaluation of mortality for Nevada residents from 1968 to 1983, supplemented by hospital discharge morbidity data. The results of the statewide study revealed no convincing evidence to prove or disprove any relationship between exposure to sonic boom and adverse health phenomena. Statewide, age-adjusted mortality in Nevada is unremarkable compared to national figures. Crude death rates did vary directly with exposure to sonic booms but this relation disappeared when mortality was age-adjusted. Analyses of time trends and bivariate linear regressions failed to yield convincing associations between sonic boom exposure and age-adjusted mortality. Access to a population of weapons-range workers and to their health records, which was an additional key component of the research study, was not granted. GRA
solution to form a surface Ru(II)-N2 complex. This complex is electrochemically detectable and distinguishable from the Ru(II) precursor. At short times, the reaction follows first-order kinetics with a rate constant 10 times greater than for the equivalent homogeneous reaction. The reaction rate is proportional to PN2 up to 8 atm and possibly higher. The sensitivity approaches 1/10 atmosphere and the minimum electrode response time at elevated PN2 is 10 sec. This N2 sensing system holds promise for eventual configuration into an implantable unit for in situ measurements of tissue PN2 during compression and decompression of an experimental animal.

CSCL 05H

Considerable recent physiological and psychophysical evidence suggests that the visual system operates as a series of independent channels or analyzers, each sensitive to image structure at a different spatial scale. In this view, image structure is processed separately at different scales by the various channels. Several individuals have argued that the broad, low-frequency channels respond to global or Gestalt properties of an image and are important in early processing—for instance, during an initial glance at an image. In contrast, the high-frequency channels are sensitive to local detail and are important in later visual processing when attention has been focused on a particular aspect of the image. Two experiments investigated the ability of human observers to detect and recognize simple objects in visual images. Prior to presentation, the images were transformed by spatial frequency filters to emphasize the global- (low spatial frequencies), local- (high spatial frequencies) or intermediate- (mid spatial frequencies) scale structure. Four categories of top-view ship hulls were synthesized for the experiments. In the first experiment separate groups of observers made both detection (which quadrant of the display contained a ship?) and recognition (which of the four ships occurred?) judgements. In the second experiment, observers also selected the filter condition to be display on each trial prior to the detection or recognition response.

Efforts were directed toward improved understanding of the slow potential (SP) of the brain. This electrically recordable dynamic differs from the conventional EEG in being nonrhythmic and from durations of 1 to many fold longer than the longest enduring components of the EEG. It is best elicited by use of a conditioning stimulus and by signals (conditioning stimuli) related to them in the learning process. A study was made of the relation of multiple firing potentials of neurons to the SP as both are related to temporal (fixed interval) conditioning controlled by medial forebrain bundle (MFB) electrical reward in the rat. A correlation was observed of the pacing of the level of expectancy in the trained subject with the SP, which, in this context, has been termed the Anticipatory Potential Gradient or APG.

CSCL 065

The identification of characteristics of noise susceptible or noise resistant individuals is necessary for the development of noise susceptibility risk profiles. Fifty-six Naval aviators, categorized as having either incurred a hearing loss (i.e., hearing threshold levels greater than 40 dB at 4000 to 8000 Hz) or retained normal hearing (i.e., hearing threshold levels less than or equal to 25 dB at 125 to 8000 Hz) after thousands of flight hours were compared along several auditory and non-auditory dimensions. The following variables occurred differentially in the two groups: Minimal Auditory Intensity Differential (MAID) scores at 2000 Hz (p less than .01) and 4000 Hz (p less than .001); iris pigmentation (blue eyes were overrepresented in the noise susceptible group; p less than .05); blood type (type A occurred more often in the noise susceptible population; p less than .05); systolic blood pressure (sitting; noise susceptible group was higher; p less than .05); calcium, albumin, and LDH levels (higher in the noise resistant group; p less than .05); and present tobacco usage (more noise-susceptible aviators were currently smokers; p less than .05). The noise susceptible population also tended (p less than .10) to exhibit elevated cholesterol and triglyceride levels, higher contralateral acoustic reflexes, and had fewer individuals who had never smoked. Although no classic profile of the noise susceptible or noise resistant individual definitively emerged, results suggested that at least one measurement device (MAID test) may serve as an early warning sign. (EUT-86-E-156; ISBN-90-6144-156-0; ISSN-0167-9708; ETN-86-9712) Avail: NTIS HC A05/MF A01

Using integral transform techniques, a procedure to compute the electromagnetic field inside and outside a circularly cylindrical limb, excited by any electric or electromagnetic source is developed. The component layers of the limb are assumed to be homogeneous, anisotropic, and dissipative. The time-harmonic field of an axial pair of ring-shaped electrodes, located symmetrically inside the limb is calculated. The influences of anisotropy and boundaries on field distribution and surface charges are investigated. ESA

52 AEROSPACE MEDICINE
A variety of dose responses have been observed for cancer induction following low linear energy transfer (LET) radiation. In general, however, the response is curvilinear, with a rapidly rising component in the intermediate dose range followed by a plateau or decline in incidence at high doses. The response is more linear at low doses, whereas the response at intermediate doses is approximated by a dose-squared relationship. Models for this response are based on the biophysical theory of cellular effects. However, many types of effects contribute to the tumorigenic processes, and host factors play a major role. At low dose rates the carcinogenic effect is generally reduced, which is caused by a diminution of the dose-squared component and results in a linear response. Effects of fractionation can vary with total dose, fraction size, and fraction interval. High LET radiation is more tumorigenic. The dose-response relationships are more nearly linear and are less dose-rate dependent. The relative biological effectiveness (RBE) varies with dose, dose rate, fractionation, and target tissue.

FEATURES AND OBJECTS IN VISUAL PROCESSING

ANNE TREISMAN (California, University, Berkeley) Scientific American (ISSN 0036-8733), vol. 255, Nov. 1986, p. 114B-122, 124, 125.

The unconscious mental processes underlying the ability to perceive meaningful wholes in the visual world are discussed. The automatic extraction of features from a scene is examined, describing the experiments which reveal the simple features of the visual world that are used in the initial stage of visual processing. The assembly of these features into objects is considered, emphasizing the roles of expectation and focused attention in this process.

ANTI-G TRAINING OF JAPANESE AIR SELF DEFENSE FORCE FIGHTER PILOTS

CHIHARU SEKIGUCHI, MASAKI IWANE, and MASASHI OSHIBUCHI (Air Self-Defense Force, Aeromedical Laboratory, Tokyo, Japan) Aviation, Space, and Environmental Medicine (ISSN 0095-6562), vol. 57, Nov. 1986, p. 1029-1034. refs

The high-G training program designed for pilots of high-performance aircraft (such as the F-15) is described. The program included periods of centrifuge rides of two basic patterns: a tracking performance and a simulated aerial combat maneuver (SACM). Mean relaxed G tolerances for the gradual onset run (GOR) and the rapid onset run (ROR) were found to be +5.5 Gz and +4.9 Gz, respectively. Physiological problems included petechiae, vertigo, general malaise, limb pain, tachycardia, and neck pain. Some trainees suffered brief periods of loss of consciousness (LOC) at GOR and/or ROR, but all F-15 trainees completed the SACM pattern without LOC.

SUBJECTIVE EFFECTS OF COMBINED-AXIS VIBRATION. III - COMPARISON OF Y-AXIS AND Y-PLUS-YAW VIBRATIONS

RICHARD W. SCHONBERGER (USAF, Aerospace Medical Research Laboratories, Wright-Patterson AFB, OH) Aviation, Space, and Environmental Medicine (ISSN 0095-6562), vol. 57, Nov. 1986, p. 1075-1081. refs

Two psychophysical experiments were conducted to compare the perceived intensity of y-axis and y-plus-yaw vibrations, in which the subjects were seated either forward or aft of the axis (exp. I), or aft of the axis (exp. II). The subjects matched their perceptions of the intensity of both kinds of vibrations by adjusting the intensity of a sinusoidal z-axis response vibration. In both experiments, the results showed that, as frequency increased, the acceleration of the matching response decreased for both types of stimuli. However, in exp. I the combined-axis stimuli produced higher response accelerations than the y-axis vibrations, while in exp. II matching responses were the same for both vibration types.

THRESHOLDS FOR THE DETECTION OF THE DIRECTION OF WHOLE-BODY, LINEAR MOVEMENT IN THE HORIZONTAL PLANE

Experiments to establish thresholds for the detection of the direction of discrete whole body linear movements in the horizontal plane were performed to determine the effects of the frequency of the motion stimulus and of the subject's orientation to the axis of motion. Thresholds in the movement in the z body-axis were significantly higher than for the movements in the x or the y axes. In eight (out of the 24) subjects, the x-axis acceleration threshold was found to increase as a monotonic function of stimulus duration over the range of 0.98 to 6.96 s and exhibit frequency-dependent characteristics.

IMPACT OF CREW WORKLOAD ON SPACE STATION ON-OORBIT OPERATIONS

(AIAA PAPER 87-0505)

The complexity of the Space Station coupled with the diversity of its operations places an enormous burden on the psychological and physiological domains of each flight crewmember. This condition is exacerbated by the hazards of the environment and the remoteness and isolation of the crewmembers over extended periods in space. Also, economics demand that each crewmember's time be optimized for maximum productivity over time. Information on long-term exposure to man in space is sparse, but earlier spaceflights demonstrated that astronaut workloads were very high and that this contributed significantly to stress. The elements that make up workload and the methodologies of quantifying it are discussed. Also, the physiological and psychological factors that contribute to workload on orbit and their consequences on stress are examined. The impact of other variables such as schedules and how they add to workload and to overall stress on Space Station crewmembers is discussed.

EXPOSURE-DURATION EFFECTS IN LOCALIZATION JUDGMENTS
(Contract F49620-82-K-0024; F49620-85-K-0022)
The effects on localization accuracy of increasing exposure duration beyond 100 msec are explored for a wide range of object separations. Previous reports that localization accuracy for objects separated by a few minutes of arc increases for exposures up to at least 400 msec are confirmed. It is reported that localization of larger objects at larger separations does not improve when the exposure duration is increased beyond 100 msec. This difference between the small-scale and large-scale cases can be explained by the difference in the spatial-frequency content of the objects being localized. When high-frequency objects are substituted for spectrally broadband objects in the large-scale case, the exposure-duration effects for widely separated objects become similar to those obtained in the small-scale case. These results suggest that the exposure-duration effect previously reported in hyperacuity studies is not specific to the localization task per se but rather is a suprathreshold version of the familiar form of spatiotemporal interaction seen in contrast-threshold results. They also suggest that a single type of mechanism underlies small- and large-scale localization.

COORDINATION OF VESTIBULAR AND VISUAL PERCEPTUAL CUES IN REAL-TIME SIMULATION
The current lack of understanding of the interactions that may occur between visual, vestibular and proprioceptive information limits perceptual realism in real time flight simulation. An attempt is presently made to specify the nature of perceptual interactions in simulation, such that they may be taken into account during initial programming of platform motion and visual systems to achieve a higher degree of perceptual fidelity. Attention is given to the evaluation and calibration of criteria for displays using the human visual system as a calibrating instrument, the establishment of the characteristics of visual flow patterns to furnish optimum impression of visual motion, and the determination of physiological thresholds for vestibular/proprioceptive motion detection and identification.

A87-23067
EFFECTIVE TRAINING FOR A MODERN AIR COMBAT VEHICLE
Attention is given to a low cost, highly effective Intermediate Training Device (ITD) simulation unit for modern fighter aircraft which mediates the transition from conventional to digital aircraft instruments for navigation, stores management and radar operation. Through the implementation of hands-on training for cockpit familiarization, and the development of skills for complex attack systems capable of engaging both air and surface targets, military training objectives are met more economically with ITD than with the systems formerly employed.
O.C.
determine whether human subjects could recover 3D information at these theoretical levels, we presented subjects with pairs of displays and asked them to determine whether they represented the same or different 3D structures. Number of points was varied between 2 and 5; number of views was varied between 2 and 6; and the motion was either fixed axis with constant angular velocity, fixed axis with variable velocity, or variable axis with variable velocity. Accuracy increased with views, but decreased with points, apparently due to the increased difficulty of the comparison task as the structure became more complex. Subjects’ performance exceeded theoretical expectations, implying that they exploited regularities in addition to those in the theoretical analyses. Some possible additional regularities, and possible grouping effects, are discussed.

N87-15697# Arizona State Univ., Tempe, THE EFFECTS OF RESPONSE MODALITY ON INTERFERENCE BETWEEN STIMULUS DIMENSIONS V. G. CUOLOC and KATHRYN A. BLOEM Jul. 1986 25 p (Contract DAAG29-84-K-0197) (AD-A171177; ARO-22256.1-L5) Avail: NTIS HC A02/MF A01 CSCL 05J This report concerns the effects of response modality and the relation between stimulus dimensions on subjects ability to report one dimension of a multidimensional stimulus. Subjects were asked to report, as rapidly as possible, either the name or the ink color of colored words. The relation between the ink color and work was either congruent (Blue in blue ink), neutral (Door in blue ink), or incongruent (Blue in red ink). Responses were made either manually or vocally. Results are consistent with previous findings in the area of Stroop (Stroop, 1935) research. That is, responding to one of two dimensions is more difficult when the relation between dimensions is incongruent than when the relation between dimensions is congruent or neutral. But in addition, results show that no interference from an incongruent, ink-color dimension results when subjects respond vocally to the word dimension, whereas when subjects respond manually to this dimension, the incongruence between the colors and word produce interference. Results suggest a limitation on the usefulness of a color dimension when a word dimension requires a speeded-speech response. 

Author (GRA)

Scientific texts are typically densely packed with complex content, making it particularly difficult for novice learners to identify important information. The current study found that novice readers judge importance on the basis of form (i.e., definition or fact) in which information is presented. In this study, expert and novice physicists judged the importance of sentences in physics texts when they were presented as definitions or facts. The definitions and facts were identical in content differing only in minor wording changes. Sentence form influenced the importance judgments of novices, but not those of experts. Novices judged sentences that were identical in content as more important when they were presented as definitions. These results indicate that textbook writers need to be aware of how form influences novices’ perception of what is important in order to effectively guide attention to critical text content. Techniques for altering readers’ attention (i.e., signaling and strategy instruction) are discussed.

N87-15699# Aerospace Medical Research Labs., Wright-Patterson AFB, Ohio, HUMAN REAL TIME PERCEPTION IN NOISE MICHAEL J. STOCK, CHARLES W. NIXON, VERNIE G. FISHER, III, and CHARLES D. GOODYEAR 20 Aug. 1986 41 p (AD-A172374; AAMRL-TR-86-034) Avail: NTIS HC A03/MF A01 CSCL 20A

A novel device, the Real Time Perception Analyzer (RTPA), has been developed to measure the perception of real time as well as simple and choice reaction time under microgravic conditions on board the space shuttle. This study examined only real time perception; reaction times were not measured. The RTPA real time perception task produces a target dot that moves from left-to-right across a narrow, horizontal light bar. A vertical marker is positioned almost two inches beyond the right end of the light bar. The subject’s task is to push a switch when it is estimated that the target dot has moved beyond the end of the light bar, a region where the dot is no longer visible, and reached the vertical marker. Sixteen subjects performed the time perception task under various conditions of quiet and noise exposure. Errors consisted of underestimations or overestimations of the actual time intervals which ranged from 1.75 to 14.0 seconds. Results indicate that subjects underestimated time intervals and that the greatest errors occurred for the shortest time intervals and in noises that changed during the task. Also, female subject estimates of time intervals were consistently shorter than those of the male subjects. These findings are compared to earlier research on time estimation and verify that the RTPA provides a reliable and sensitive measure of the perception of real time in noise. 

Author (GRA)

This report describes theoretical work involved in the early stages of this research effort and gives a brief review of the literature studied during that work. In particular, it reviews work on velocity difference thresholds, since several workers have concluded that judgmental comparisons of velocities at different times accounts for the human ability to discriminate between uniform linear motion in the frontal plane and acceleration. This conclusion is consistent with physiology, where motion detecting units are found to be sensitive to speed in specific directions, and none are known to be tuned to respond to particular rates of change of speed. No models of motion perception include provisions for detecting either changes in speed or changes in direction. Direct work on acceleration, however, is flawed. Hence, we devised a novel stimulus composed of sine wave gratings that drift at an average speed across the display. The speed is sinusoidally modulated, thus introducing acceleration and jerk (the third derivative). We also control spatial frequency, drift rate and luminance contrast. An experiment is described along with a computer program to permit conduct of the experiment. 

GRA

This report describes the history, development and current practice of measuring operator performance in systems, in particular military aviation systems, with additional emphasis on measurement in air combat maneuvering (ACM). The principal themes are that: (1) performance is used interchangeably with proficiency, and as such has acquired evaluative meanings about goodness or badness of individual capabilities. Performance measures thus require the
same attention to measurement properties and validation as any other measures on individuals; (2) there are tendencies to substitute the same attention to measurement properties and validation as any other measures on individuals or systems are appropriately called performance measures; (3) task performance must be viewed as a construct. Tasks are complex and multidimensional; individual proficiency must be inferred from limited observables. For proposed measures, it is necessary to show that measures are reliable, that they tap the most important components of successful performance, and that they are credible as representatives of individual task proficiency.

A FLEXIBLE TELEROBOTIC SYSTEM FOR SPACE OPERATIONS

This paper describes the objective and design of a proposed goal-oriented knowledge-based telerobotic system for space operations. This design effort encompasses the elements of the system executive and user interface and the distribution and general structure of the knowledge base, the displays, and the task sequencing. The objective of the design effort is to provide an expandable structure for a telerobotic system that provides cooperative interaction between the human operator and computer control. The initial phase of the implementation provides a rule-based, goal-oriented script generator to interface to the existing control modes of a telerobotic research system, in the Intelligent Systems Research Lab at NASA Research Center.

ADAPTIVE CONTROL OF ROBOTIC MANIPULATORS Ph.D. Thesis
L. SABRI TOSUNOGLU 1986 269 p
Available: Univ. Microfilms Order No. DAA816692

Currently industrial robot manipulators operate slowly to avoid dynamic interactions between links. Typically each joint is controlled independently and system stability and precision are maintained at the expense of underutilizing these systems. As a result, productivity is limited, and more importantly, the lack of reliability has hindered investment and wider industrial use. This work addresses the adaptive control of spatial, serial manipulators. Centralized adaptive controllers which yield globally asymptotically stable systems are designed via the second method of Lyapunov. Actuator dynamics is also included in the system model. Lagrange equations are used in deriving dynamic equations for n-link, spatial robot manipulators which are modeled with rigid links connected by either revolute or prismatic pairs. Although manipulators may exhibit structural flexibility, the rigid link assumption is justified, because control of manipulators needs to be understood precisely before flexibility is included. The plant, which represents the actual manipulator, and the reference model, representing the ideal robot, are both expressed as distinct, nonlinear, coupled systems. Error-driven system dynamics is then written and adaptive controllers which assure global asymptotic stability of the system are given utilizing the second method of Lyapunov. It is shown that these control laws also lead to asymptotically hyperstable systems. Integral feedback is introduced to compensate for the steady-state system disturbances.

This report surveys the status of ergonomics databases in the member countries of the International Ergonomics Association. Most ergonomic data is available only in the literature where it was first reported. Few formal data collections exist and very few computerized databases were found in this survey. Handbooks and textbooks are still the main sources of collected ergonomics data. Anthropometry is the only body of information in which we found significant collections of international data currently available in computerized form. Most ergonomics data are still embedded in the published literature. Recent use of the computer for ergonomics data gathering and data analysis has created the potential for previously existing limited studies of small populations to be extended into entirely new automated databases, but this potential has not been realized. After reviewing the strengths and weaknesses of available published data compendia and then

**USE OF DISJUNCTIVE RESPONSE REQUIREMENTS IN DUAL-TASK ENVIRONMENTS: IMPLICATIONS FOR AUTOMATION Ph.D. Thesis**

ROBERT J. SCHÖMEN May 1986 107 p

(AD-A171277; AFIT/CI/NR-86-133D) Avail: NTIS HC A06/MF A01 CSCL 05J

Two experiments were conducted to assess the difference in resource requirements for choice and disjunctive (Donders Type c) responses in a dual-task environment. Experiment 1 utilized two binary tasks paired in all possible combinations of choice and disjunctive response requirements. For both tasks the disjunctive responses were faster and less error prone with the additional benefit of improving performance on the concurrent task. Experiment 2, using a primary-secondary dual-task paradigm, contrasted the resource cost of responding to the cost of not responding to stimuli that had varying degrees of similarity to the go stimuli. Results demonstrated a high degree of operator involvement in terms of resource use even when a response was not required. These results were discussed in terms of reducing operator workload within a semiautomated multitask environment by employing disjunctive responding in place of binary choice responding. **THE USE OF INTERACTIVE VOICE SYSTEMS TO IMPROVE MULTIPLE-TASK PERFORMANCE Final Report, Jan. 1982 - Aug. 1986**

Diane L. Damos 15 Aug. 1986 23 p Prepared in cooperation with the University of Southern California, Los Angeles

(Contract N00014-82-C-0179) (AD-A171492; REPT-916416-FTN) Avail: NTIS HC A02/MF A01 CSCL 17B

The primary purpose of this contract was to examine the effect of voice generation and recognition systems on dual-task performance, although three other research efforts on complementary topics also were investigated. This report is divided into four sections. The first section provides background information for the first experiments conducted under this contract. The second section describes each of the six experiments examining the effect of voice generation and recognition systems on dual-task performance and summarizes its results. The third section briefly discuss the three other research efforts performed on this contract in support of current activities at the Naval Biodynamics Laboratory and the Naval Aerospace Medical Research Laboratory. The last section lists the products of the contract. GRA

**SYSTEM MODELING AND VIBRATION ANALYSIS OF BAND/WHEEL MECHANICAL SYSTEMS Ph.D. Thesis**

Kon-Well Wang 1985 150 p

Avail: Univ. Microfilms Order No. DA8610263

High speed axially moving bands, driven by rotating wheels, are the basic elements in many machines. In this research, a model describing the coupled motions is formulated and verified. Hamilton's Principle is used to derive the equations of motion and boundary conditions. The resulting equations are linearized and then discretized by applying the Galerkin Method. The results show that the mechanism of vibration coupling is the finite equilibrium curvature of the band. The transverse vibrations of the spans are linearly coupled to their longitudinal motions and to the motion of the wheels. The contributions of various system parameters to the coupling are clarified. The effects of different types of linear damping on the band/wheel system dynamics are analyzed. The damping in each mode is examined by calculating the real part of the corresponding eigen-value. Once the dominating modes are identified, one can minimize the principal span vibration by adjusting the damping distribution of the system. Dessert Abstr.

**ROBOTIC MANIPULATOR CONTROL PERFORMANCE EVALUATION Ph.D. Thesis**

Michael B. Leahy, Jr. Aug. 1986 218 p

(AD-A172919; AFIT/CI/NR-86-173D) Avail: NTIS HC A10/MF A01 CSCL 13I

A robotic manipulator dynamically based controller performance baseline is established by the creation and utilization of a hierarchical robotic evaluation environment. Creation of a hierarchical robotic evaluation environment provides an original solution to the problems that previously constrained real-time evaluation of modern manipulator control schemes. Utilization of that environment fulfills the application of proposed theories. The performance baseline is established by simulated and experimental evaluation of feedforward dynamics and feedback loop design for joint motion high speed trajectory tracking robot control. The real-time performance produced by application of all proposed robotic control techniques to harmonic and gear driven manipulators can be extrapolated from the baseline. A feedforward loop composed of uncoupled inertia and gravity dynamics exhibited the best tracking accuracy. Forces unmodeled by those dynamics can be effectively treated as disturbances to the feedback loop. Dynamic based control techniques exhibited the potential to control high speed gross motion of a manipulator without additional sensor devices. GRA

**A PULSATING ANTI-GRAVITY SUIT FOR ACCELERATION PROTECTION: SYSTEM DESCRIPTION AND PRELIMINARY EXPERIMENTS Interim Report**

(Contract N00014-85-K-0566) (AD-A173708; NADC-86120-60) Avail: NTIS HC A02/MF A01 CSCL 06K

This document describes a system designed to study the feasibility of augmenting tolerance to acceleration stress using external pressure pulsations synchronized to the electrocardiogram. The system, known as synchronized pulsating anti-gravity suit, consists of a modified G Suit, a controller and a pneumatic subsystem. The modified suit has individual bladders for calf, thigh, and abdomen with separate inlet/outlet ports. A microcomputer controls the synchronization, phasing and sequencing of pressure pulses in the bladders. Desired high and low pressures are obtained using feedback of pressure signals to a set of comparators. Solenoid valves and related circuitry regulate the flow of air in and out of the bladders. Results based on the centrifuge experiments suggest the feasibility of obtaining improved tolerance with a synchronized pulsating suit. GRA
A program to apply the best aircraft control and display ideas and principles generated since World War II to an integrated, computer-based system for vertical and translational instrument flight is reviewed. A generic thrust-borne aircraft capable of vertical takeoff and landing (VTOL) and six degrees of maneuvering freedom was simulated, as were a forward-looking contact analog display and a downward-looking horizontal situation display. Features incorporated in these displays included command guidance symbology, directionally compatible frequency-separated quasi-pursuit flight path predictors with vernier-deviation indications and uniquely integrated presentations of altitude and vertical speed in the horizontal situation display. Features of the simulated control system included automatic stabilization of position and velocity vector against air mass movements and reduced orders of maneuvering performance control. A holistic experimental approach was applied to screen critical dynamic design variables, optimize their response surfaces, and investigate direction of display motion was applied to screen critical dynamic design variables, optimize their response surfaces, and investigate direction of display motion relationships, all leading to multiple-regression models of pilot performance in vertical and translational instrument flight.

Speech recognition technology could be especially advantageous to single-crewmember helicopters like the Light Helicopter Family (LHX). Before speech recognition can be considered a viable technology for helicopters, several issues remain to be resolved. One of these is changes in the voice that occur as a result of stress, noise, and vibration. This paper reports the results of an investigation conducted to determine the effect of vibration-induced changes in the voice on the accuracy of a speech recognition system. A series of flight tests were conducted using 12 participants and 8 different flight maneuvers. Data were collected with the participants speaking 50 phonetically balanced words into the speech recognizer while seated in the copilot's seat of a UH-1H helicopter during each of the 8 flight maneuvers. The results indicate that speech recognition system accuracy is not affected by helicopter vibration.

The production of amino acids by acid treatment of Titan tholin is experimentally investigated. The synthesis of Titan tholin and the derivatization of amino acids to N-trifluorocetyl isopropyl esters are described. The gas chromatography/mass spectroscopy analysis of the Titan tholins reveals the presence of glycine, alpha and beta alanine, and aspartic acid, and the total yield of amino acids is about 0.01.

Speech recognition technology could be especially advantageous to single-crewmember helicopters like the Light Helicopter Family (LHX). Before speech recognition can be considered a viable technology for helicopters, several issues remain to be resolved. One of these is changes in the voice that occur as a result of stress, noise, and vibration. This paper reports the results of an investigation conducted to determine the effect of vibration-induced changes in the voice on the accuracy of a speech recognition system. A series of flight tests were conducted using 12 participants and 8 different flight maneuvers. The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, the title extension is added, separated from the title by three hyphens. The (NASA or AIAA) accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence with the (NASA or AIAA) accession numbers appearing first.

Listings in this index are arranged alphabetically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

Index Listing

ACCESSION NUMBER  NASA SPONSORED  ON MICROFICHE  PAGE NUMBER

N87-11478 * # p 8

Listings in this index are arranged alphanumerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.
AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A87-10000 Series)

Publications announced in IAA are available from the AIAA Technical Information Service as follows: Paper copies of accessions are available at $10.00 per document (up to 50 pages), additional pages $0.25 each. Microfiche of documents announced in IAA are available at the rate of $4.00 per microfiche on demand. Standing order microfiche are available at the rate of $1.45 per microfiche for IAA source documents and $1.75 per microfiche for AIAA meeting papers.

Minimum air-mail postage to foreign countries is $2.50. All foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to: Technical Information Service, American Institute of Aeronautics and Astronautics, 555 West 57th Street, New York, NY 10019. Please refer to the accession number when requesting publications.

STAR ENTRIES (N87-10000 Series)

One or more sources from which a document announced in STAR is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the STAR citation. Current values for the price codes are given in the tables on NTIS PRICE SCHEDULES.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other report number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26.1 reduction).
Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: ESDU. Pricing information on specific data, computer programs, and details on ESDU topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address, both of which are on page vi.

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: US Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of $1.50 each, postage free. (See discussion of NASA patents and patent applications below.)

Avail: (US Sales Only). These foreign documents are available to users within the United States from the National Technical Information Service (NTIS). They are available to users outside the United States through the International Nuclear Information Service (INIS) representative in their country, or by applying directly to the issuing organization.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.
PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC: NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

EUROPEAN: An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in STAR. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA – Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 CEDEX 15, France.

FEDERAL DEPOSITORY LIBRARY PROGRAM
In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 50 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 50 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are not sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

STANDING ORDER SUBSCRIPTIONS
NASA SP-7011 and its supplements are available from the National Technical Information Service (NTIS) on standing order subscription as PB 86-914100 at the price of $7.00 domestic and $14.00 foreign—includes annual index. Standing order subscriptions do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber.

**IMPORTANT NOTICE**

NTIS Shipping and Handling Charges
U.S., Canada, Mexico — ADD $3.00 per TOTAL ORDER
All Other Countries — ADD $4.00 per TOTAL ORDER

Exceptions — Does NOT apply to:
ORDERS REQUESTING NTIS RUSH HANDLING
ORDERS FOR SUBSCRIPTION OR STANDING ORDER PRODUCTS ONLY

NOTE: Each additional delivery address on an order requires a separate shipping and handling charge.
**Abstract**

This bibliography lists 89 reports, articles and other documents introduced into the NASA scientific and technical information system in April, 1987.
