Annotated references to NASA-owned inventions covered by U.S. patents and applications for patent that were announced in Scientific and Technical Aerospace Reports (STAR) between January 1987 and June 1987.
This document is available from the National Technical Information Service (NTIS), Springfield, Virginia 22161, price code A03
INTRODUCTION

Several thousand inventions result each year from the aeronautical and space research supported by the National Aeronautics and Space Administration. The inventions having important use in government programs or significant commercial potential are usually patented by NASA. These inventions cover practically all fields of technology and include many that have useful and valuable commercial application.

NASA inventions best serve the interests of the United States when their benefits are available to the public. In many instances, the granting of nonexclusive or exclusive licenses for the practice of these inventions may assist in the accomplishment of this objective. This bibliography is published as a service to companies, firms, and individuals seeking new, licensable products for the commercial market.

The NASA Patent Abstracts Bibliography (NASA PAB) is a semiannual NASA publication containing comprehensive abstracts and indexes of NASA-owned inventions covered by U.S. patents and applications for patent. The citations included in NASA PAB were originally published in NASA's Scientific and Technical Aerospace Reports (STAR) and cover STAR announcements made since May 1969.

For the convenience of the user, each issue of NASA PAB has a separately bound Abstract Section (Section 1) and Index Section (Section 2). Although each Abstract Section covers only the indicated six-month period, the Index Section is cumulative covering all NASA-owned inventions announced in STAR since 1969. Thus a complete set of NASA PAB would consist of the Abstract Sections of Issue 04 (January 1974) and Issue 12 (January 1978) and the Abstract Section for all subsequent issues and the Index Section for the most recent issue.

The 85 citations published in this issue of the Abstract Section cover the period January 1987 through June 1987. The Index Section references over 4600 citations covering the period May 1969 through June 1987.

ABSTRACT SECTION (SECTION 1)

This PAB issue incorporates the 1987 STAR category revisions which include 10 major subdivisions divided into 76 specific categories and one general category/division. (See Table of Contents for the scope note of each category under which are grouped appropriate NASA inventions.) This new scheme was devised in 1975 and revised in 1987 in lieu of the 34 category divisions which were utilized in PAB supplements (01) through (06) covering STAR abstracts from May 1969 through January 1974. Each entry in the Abstract Section consists of a STAR citation accompanied by an abstract and a key illustration taken from the patent or application for patent drawing. Entries are arranged in subject category in order of the ascending NASA Accession Number originally assigned to STAR to the invention. The range of NASA Accession Numbers within each issue is printed on the inside front cover.

Abstract Citation Data Elements: Each of the abstract citations has several data elements useful for identification and indexing purposes, as follows:

- NASA Accession Number
- NASA Case Number
- Inventor's Name
- Title of invention
- U.S. Patent Application Serial Number
- U.S. Patent Number (for issued patents only)
- U.S. Patent Office Classification Number(s) (for issued patents only)

These data elements are identified in the Typical Citation and Abstract and in the indexes.
INDEX SECTION (SECTION 2)

The Index Section is divided into five indexes. These indexes are cross-indexed and are used to locate a single invention or groups of inventions.

Subject Index: Lists all inventions according to appropriate alphabetized technical term and indicates the related NASA Case Number, the Subject Category Number, and the Accession Number.

Inventor Index: Lists all inventions according to alphabetized names of inventors and indicates the related NASA Case Number, the Subject Category Number, and the Accession Number.

Source Index: Lists all inventions according to alphabetized source of invention (i.e., name of contractor or government installation where invention was made) and indicates the related NASA Case Number, the Subject Category Number, and the Accession Number.

Number Index: Lists inventions in order of ascending (1) NASA Case Number, (2) U.S. Patent Application Serial Number, (3) U.S. Patent Classification Number, and (4) U.S. Patent Number and indicates the related Subject Category Number and the Accession Number.

Accession Number Index: Lists all inventions in order of ascending Accession Number and indicates the related Subject Category Number, the NASA Case Number, the U.S. Patent Application Serial Number, the U.S. Patent Classification Number, and the U.S. Patent Number.

HOW TO USE THIS PUBLICATION TO IDENTIFY NASA INVENTIONS

To identify one or more NASA inventions within a specific technical field or subject, several techniques are possible with the flexibility incorporated into the NASA PAB.

1. Using Subject Category: To identify all NASA inventions in any one of the subject categories in this issue of NASA PAB, select the desired Subject Category in the Abstract Section (Section 1) and find the inventions abstracted thereunder.

2. Using Subject Index: To identify all NASA inventions listed under a desired technical subject index term, (A) turn to the cumulative Subject Index in the Index Section and find the invention(s) listed under the desired technical subject term. (B) Note the indicated Accession Number and the Subject Category Number. (C) Using the indicated Accession Number, turn to the inside front cover of the Index Section to determine which issue of the Abstract Section includes the Accession Number desired. (D) To find the abstract of the particular invention in the issue of the Abstract Section selected, (i) use the Subject Category Number to locate the Subject Category and (ii) use the Accession Number to locate the desired invention within the Subject Category listing.

3. Using Patent Classification Index: To identify all inventions covered by issued NASA patents (does not include applications for patent) within a desired Patent Classification, (A) turn to the Patent Classification Number in the Number Index of Section 2 and find the associated invention(s), and (B) follow the instructions outlined in (2)(B), and (D) above.
A weightlessness simulator has a chamber and a suit in the chamber. O-rings and valves hermetically seal the chamber. A vacuum pump connected to the chamber establishes a pressure in the chamber less than atmospheric pressure. A water supply tank and water supply line supply a body of water to the chamber as a result of partial vacuum created in the chamber. In use, an astronaut enters the pressure suit through a port, which remains open to ambient atmosphere, thus supplying air to the astronaut during use. The pressure less than atmospheric pressure in the chamber is chosen so that the pressure differential from the inside to the outside of the suit corresponds to the pressure differential with the suit in outer space.
TABLE OF CONTENTS

Section 1 • Abstracts

AERONAUTICS
Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).
For related information see also Astronautics.

01 AERONAUTICS (GENERAL) N.A.

02 AERODYNAMICS 1
Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.
For related information see also 34 Fluid Mechanics and Heat Transfer.

03 AIR TRANSPORTATION AND SAFETY N.A.
Includes passenger and cargo air transport operations; and aircraft accidents.
For related information see also 16 Space Transportation and 85 Urban Technology and Transportation.

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION N.A.
Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.
For related information see also 17 Space Communications, Spacecraft Communications, Command and Tracking and 32 Communications and Radar.

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE 2
Includes aircraft simulation technology.
For related information see also 18 Spacecraft Design, Testing and Performance and 39 Structural Mechanics.
For land transportation vehicles see 85 Urban Technology and Transportation.

06 AIRCRAFT INSTRUMENTATION N.A.
Includes cockpit and cabin display devices; and flight instruments.
For related information see also 19 Spacecraft Instrumentation and 35 Instrumentation and Photography.

07 AIRCRAFT PROPULSION AND POWER 2
Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and onboard auxiliary power plants for aircraft.
For related information see also 20 Spacecraft Propulsion and Power, 28 Propellants and Fuels, and 44 Energy Production and Conversion.

08 AIRCRAFT STABILITY AND CONTROL N.A.
Includes aircraft handling qualities; piloting; flight controls; and autopilots.
For related information see also 05 Aircraft Design, Testing and Performance.

09 RESEARCH AND SUPPORT FACILITIES (AIR) 3
Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tubes; and aircraft engine test stands.
For related information see also 14 Ground Support Systems and Facilities (Space).

ASTRONAUTICS
Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; space communications, spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.
For related information see also Aeronautics.

12 ASTRONAUTICS (GENERAL) N.A.
For extraterrestrial exploration see 91 Lunar and Planetary Exploration.

13 ASTRODYNAMICS N.A.
Includes powered and free-flight trajectories; and orbital and launching dynamics.

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE) N.A.
Includes launch complexes, research and production facilities; ground support equipment, e.g., mobile transporters; and simulators.
For related information see also 09 Research and Support Facilities (Air).

15 LAUNCH VEHICLES AND SPACE VEHICLES N.A.
Includes boosters; operating problems of launch/space vehicle systems; and reusable vehicles.
For related information see also 20 Spacecraft Propulsion and Power.

16 SPACE TRANSPORTATION N.A.
Includes passenger and cargo space transportation, e.g., shuttle operations; and space rescue techniques.
For related information see also 03 Air Transportation and Safety and 18 Spacecraft Design, Testing and Performance. For space suits see 54 Man/System Technology and Life Support.

17 SPACE COMMUNICATIONS, SPACECRAFT COMMUNICATIONS, COMMAND AND TRACKING 3
Includes telemetry; space communications networks; astronavigation and guidance; and radio blackout.
For related information see also 04 Aircraft Communications and Navigation and 32 Communications and Radar.
ENGINEERING

Includes engineering (general); communications and radar; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.

For related information see also Physics.

31 ENGINEERING (GENERAL)

Includes vacuum technology; control engineering; display engineering; cryogenics; and fire prevention.

32 COMMUNICATIONS AND RADAR

Includes radar; land and global communications; communications theory; and optical communications.

For related information see also 04 Aircraft Communications and Navigation and 17 Space Communications, Spacecraft Communications, Command and Tracking. For search and rescue see 03 Air Transportation and Safety and 16 Space Transportation.

33 ELECTRONICS AND ELECTRICAL ENGINEERING

Includes test equipment and maintainability; composites, e.g., tunnel diodes and transistors; microminiaturization; and integrated circuitry.

For related information see also 60 Computer Operations and Hardware and 76 Solid-State Physics.

34 FLUID MECHANICS AND HEAT TRANSFER

Includes boundary layers; hydrodynamics; fluidics; mass transfer and ablation cooling.

For related information see also 02 Aerodynamics and 77 Thermodynamics and Statistical Physics.

35 INSTRUMENTATION AND PHOTOGRAPHY

Includes remote sensors; measuring instruments and gages; detectors; cameras and photographic supplies; and holography.

For aerial photography see 43 Earth Resources and Remote Sensing. For related information see also 06 Aircraft Instrumentation and 19 Spacecraft Instrumentation.

36 LASERS AND MASERS

Includes parametric amplifiers.

For related information see also 76 Solid-State Physics.

37 MECHANICAL ENGINEERING

Includes auxiliary systems (nonpower); machine elements and processes; and mechanical equipment.

38 QUALITY ASSURANCE AND RELIABILITY

Includes product sampling procedures and techniques; and quality control.

39 STRUCTURAL MECHANICS

Includes structural element design and weight analysis; fatigue; and thermal stress.

GEOSCIENCES
Includes geosciences (general); earth resources and remote sensing; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.
For related information see also Space Sciences.

42 GEOSCIENCES (GENERAL)  N.A.

43 EARTH RESOURCES AND REMOTE SENSING  N.A.
Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography.
For instrumentation see 35 Instrumentation and Photography.

44 ENERGY PRODUCTION AND CONVERSION  22
Includes specific energy conversion systems, e.g., fuel cells; global sources of energy; geophysical conversion; and windpower.
For related information see also 07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power, and 28 Propellants and Fuels.

45 ENVIRONMENT POLLUTION  N.A.
Includes atmospheric, noise, thermal, and water pollution.

46 GEOPHYSICS  N.A.
Includes aeronomy; upper and lower atmosphere studies; ionospheric and magnetospheric physics; and geomagnetism.
For space radiation see 93 Space Radiation.

47 METEOROLOGY AND CLIMATOLOGY  N.A.
Includes weather forecasting and modification.

48 OCEANOGRAPHY  N.A.
Includes biological, dynamic, and physical oceanography; and marine resources.
For related information see also 43 Earth Resources and Remote Sensing.

LIFE SCIENCES
Includes life sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and space biology.

51 LIFE SCIENCES (GENERAL)  N.A.

52 AEROSPACE MEDICINE  N.A.
Includes physiological factors; biological effects of radiation; and effects of weightlessness on man and animals.

53 BEHAVIORAL SCIENCES  N.A.
Includes psychological factors; individual and group behavior; crew training and evaluation; and psychiatric research.

54 MAN/SYSTEM TECHNOLOGY AND LIFE SUPPORT  N.A.
Includes human engineering; biotechnology; and space suits and protective clothing.
For related information see also 16 Space Transportation.

55 SPACE BIOLOGY  N.A.
Includes exobiology; planetary biology; and extraterrestrial life.

MATHEMATICAL AND COMPUTER SCIENCES
Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

59 MATHEMATICAL AND COMPUTER SCIENCES (GENERAL)  N.A.

60 COMPUTER OPERATIONS AND HARDWARE  23
Includes hardware for computer graphics, firmware, and data processing.
For components see 33 Electronics and Electrical Engineering.

61 COMPUTER PROGRAMMING AND SOFTWARE  N.A.
Includes computer programs, routines, algorithms, and specific applications, e.g., CAD/CAM.

62 COMPUTER SYSTEMS  23
Includes computer networks and special application computer systems.

63 CYBERNETICS  N.A.
Includes feedback and control theory, artificial intelligence, robotics and expert systems.
For related information see also 54 Man/System Technology and Life Support.

64 NUMERICAL ANALYSIS  N.A.
Includes iteration, difference equations, and numerical approximation.

65 STATISTICS AND PROBABILITY  N.A.
Includes data sampling and smoothing; Monte Carlo method; and stochastic processes.

66 SYSTEMS ANALYSIS  N.A.
Includes mathematical modeling; network analysis; and operations research.

67 THEORETICAL MATHEMATICS  N.A.
Includes topology and number theory.

PHYSICS
Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.
For related information see also Engineering.

70 PHYSICS (GENERAL)  N.A.
For precision time and time interval (PTTI) see 35 Instrumentation and Photography; for geophysics, astrophysics or solar physics see 46 Geophysics, 90 Astrophysics, or 92 Solar Physics.
71 ACOUSTICS N.A.
Includes sound generation, transmission, and attenuation.
For noise pollution see 45 Environment Pollution.

72 ATOMIC AND MOLECULAR PHYSICS N.A.
Includes atomic structure, electron properties, and molecular spectra.

73 NUCLEAR AND HIGH-ENERGY PHYSICS N.A.
Includes elementary and nuclear particles; and reactor theory.
For space radiation see 93 Space Radiation.

74 OPTICS 24
Includes light phenomena and optical devices.
For lasers see 36 Lasers and Masers.

75 PLASMA PHYSICS N.A.
Includes magnetohydrodynamics and plasma fusion.
For ionospheric plasmas see 46 Geophysics. For space plasmas see 90 Astrophysics.

76 SOLID-STATE PHYSICS 25
Includes superconductivity.
For related information see also 33 Electronics and Electrical Engineering and 36 Lasers and Masers.

77 THERMODYNAMICS AND STATISTICAL PHYSICS N.A.
Includes quantum mechanics; theoretical physics; and Bose and Fermi statistics.
For related information see also 25 Inorganic and Physical Chemistry and 34 Fluid Mechanics and Heat Transfer.

SOCIAL SCIENCES
Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law, political science, and space policy; and urban technology and transportation.

80 SOCIAL SCIENCES (GENERAL) N.A.
Includes educational matters.

81 ADMINISTRATION AND MANAGEMENT N.A.
Includes management planning and research.

82 DOCUMENTATION AND INFORMATION SCIENCE N.A.
Includes information management; information storage and retrieval technology; technical writing; graphic arts; and micrography.
For computer documentation see 61 Computer Programming and Software.

83 ECONOMICS AND COST ANALYSIS N.A.
Includes cost effectiveness studies.

84 LAW, POLITICAL SCIENCE AND SPACE POLICY N.A.
Includes NASA appropriation hearings; aviation law; space law and policy; international law; international cooperation; and patent policy.

85 URBAN TECHNOLOGY AND TRANSPORTATION N.A.
Includes applications of space technology to urban problems; technology transfer; technology assessment; and surface and mass transportation.
For related information see 03 Air Transportation and Safety, 16 Space Transportation, and 44 Energy Production and Conversion.

SPACE SCIENCES
Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.
For related information see also Geosciences.

88 SPACE SCIENCES (GENERAL) N.A.

89 ASTROPHYSICS N.A.
Includes radio, gamma-ray, and infrared astronomy; and astrometry.

90 ASTROPHYSICS N.A.
Includes cosmology; celestial mechanics; space plasmas; and interstellar and interplanetary gases and dust.
For related information see also 75 Plasma Physics.

91 LUNAR AND PLANETARY EXPLORATION N.A.
Includes planetology; and manned and unmanned flights.
For spacecraft design or space stations see 18 Spacecraft Design, Testing and Performance.

92 SOLAR PHYSICS N.A.
Includes solar activity, solar flares, solar radiation and sunspots.
For related information see 93 Space Radiation.

93 SPACE RADIATION N.A.
Includes cosmic radiation; and inner and outer earth's radiation belts.
For biological effects of radiation see 52 Aerospace Medicine. For theory see 73 Nuclear and High-Energy Physics.

GENERAL
Includes aeronautical, astronautical, and space science related histories, biographies, and pertinent reports too broad for categorization; histories or broad overviews of NASA programs.

AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

N87-14282# National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.
HIGH LIFT, LOW PITCHING MOMENT AIRFOILS Patent Application

Two families of airfoil sections which can be used for helicopter/rotorcraft rotor blades or aircraft propellers of a particular shape are prepared. An airfoil of either family is one which could be produced by the combination of a camber line and a thickness distribution or a thickness distribution which is scaled from these. An airfoil of either family has a unique and improved aerodynamic performance. The airfoils of either family are intended for use as inboard sections of a helicopter rotor blade or an aircraft propeller. The novelty appears to reside in the specific shapes of the airfoil profiles which simultaneously permit high maximum lift coefficients at Mach numbers up to 0.50, low pitching moment coefficients about the quarter chord for lift coefficients from -0.2 to 1.0 at Mach numbers up to 0.63, and high drag divergence Mach numbers at lift coefficients from 0.0 to 0.30.

N87-18535# National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.
METHOD FOR LAMINAR BOUNDARY LAYER TRANSITION VISUALIZATION IN FLIGHT Patent Application
BRUCE J. HOLMES, inventor (to NASA) and PETER D. GALL, inventor (to NASA) 13 Nov. 1986 9 p (NASA-CASE-LAR-13554-1; NAS 1.71: LAR-13554-1; US-PATENT-APPL-SN-929862) Avail: NTIS HC A02/ MF A01 CSCL 01A

The invention relates to a method of visualizing laminar boundary layer transition in flight and is particularly useful in aerodynamic and hydrodynamic testing. Disclosed is a method of visualizing laminar to turbulent boundary layer transition, shock location, and laminar separation bubbles around a test surface. A liquid crystal coating is formulated using an unencapsulated liquid crystal operable in a temperature bandwidth compatible with the temperature environment around the test surface. The liquid crystal coating is applied to the test surface, which is preferably pretreated by painting with a flat, black paint to achieve a deep matte coating, after which the surface is subjected to a liquid or gas flow. Color change in the liquid crystal coating is produced in response to differences in relative shear stress within the boundary layer around the test surface. The novelty of this invention resides in the use of liquid crystals which are sensitive to shear stress to show aerodynamic phenomena such a boundary layer transition, shock location and laminar separation bubbles around a test surface.

N87-16793# National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.
GEOMETRIES FOR ROUGHNESS SHAPES IN LAMINAR FLOW Patent
one embodiment the ejectors may be advantageously positioned spanwise on the wing while the ductwork is kept to a minimum.

N87-14314* National Aeronautics and Space Administration. Langley Research Center, Hampton, Va. 
REMOTE PIVOT DECOUPLER PYLON: WING/STORE FLUTTER SUPPRESSOR Patent
J. M. HASSLER, JR., inventor (to NASA) (General Dynamics/Fort Worth, Tex.) 14 Oct. 1986 7 p Filed 10 Jan. 1985 Supersedes N85-19981 (22 - 19, p 2996) (NASA-CASE-LAR-13173-1; US-PATENT-4,616,793; US-PATENT-CLASS-244-17-27; US-PATENT-CLASS-244-118.1; US-PATENT-CLASS-91-1.54; US-PATENT-CLASS-248-638) Avail: US Patent and Trademark Office CSCL 01C A device for suspending a store from an aerodynamic support surface, such as an aircraft wing, and more specifically, for improving upon singlet pivot decoupler pylons by reducing both frequency of active store, alignment, and alignment system space and power requirements. Two links suspend a lower pylon/rack section and releasable attached store from an upper pylon section mounted under the wing. The links allow the lower pylon section to rotate in pitch about a remote pivot point. A leaf spring connected between the lower section and electrical alignment system servomechanism provides pitch alignment of the lower section/store combination. The servomechanism utilizes an electric servomotor to drive the gear train and reversibly move the leaf spring, thereby maintaining the pitch attitude of the store within acceptable limits. The damper strokes when the lower section rotates to damp large oscillations of store. Official Gazette of the US Patent and Trademark Office

N87-18561* National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif. 
HIGH PERFORMANCE FORWARD SWEPT WING AIRCRAFT Patent Application
DAVID G. KOENIG, inventor (to NASA), KIYOSHI AOYAGI, inventor (to NASA), MICHAEL E. DUDLEY, inventor (to NASA), and SUSAN B. SCHMIDT, inventor (to NASA) 24 Nov. 1986 27 p (NASA-CASE-ARC-11636-1; US-PATENT-CLASS-933963; NAS 171:ARC-11636-1) Avail: NTIS HC A03/MF A01 CSCL 01C A high performance aircraft capable of subsonic, transonic and supersonic speeds employs a forward swept wing planform and at least one first-and-second-ejector solution ejector located on the inboard section of the wing. A high degree of flow control on the inboard sections of the wing is achieved along with improved maneuverability and control of pitch, roll and yaw. Lift loss is delayed to higher angles of attack than in conventional aircraft. In
The combination of design changes results in improved cruise performance and increased climb performance while reducing fuel consumption and drag and weight penalties.

DOUBLE WINDOW VIEWING CHAMBER ASSEMBLY Patent
V. W. KELLMER, inventor (to NASA), R. B. OWEN, inventor (to NASA), B. R. ELKINS, inventor (to NASA), and W. T. WHITE, inventor (to NASA) 21 Oct. 1986 6 p Filed 2 May 1985
Supersedes N85-28951 (23 - 18, p 3063)
(NASA-CASE-MFS-28057-1; US-PATENT-4,618,215;
Avail: US Patent and Trademark Office CSCL 14B

A viewing chamber which permits observation of a sample retained therein includes a pair of double window assemblies mounted in opposed openings in the walls thereof so that a light beam can directly enter and exit from the chamber. A flexible mounting arrangement for the outer windows of the window assemblies enables the windows to be brought into proper alignment. An electrical heating arrangement prevents fogging of the outer windows whereas dessicated air in the volume between the outer and inner windows prevents fogging of the latter.

14

GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE)

Includes launch complexes, research and production facilities; ground support equipment, e.g., mobile transporters; and simulators.

N87-15253* National Aeronautics and Space Administration.
Ames Research Center, Moffett Field, Calif.
WEIGHTLESSNESS SIMULATION SYSTEM AND PROCESS Patent Application
HUBERT C. VYKUKAL, inventor (to NASA) 29 Oct. 1986 14 p
(NASA-CASE-ARC-11646-1; NAS 1.71:ARC-11646-1;
US-PATENT-APPL-SN-924398) Avail: NTIS HC A02/MF A01 CSCL 14B

A weightlessness simulator has a chamber and a suit in the chamber. O-rings and valves hermetically seal the chamber. A vacuum pump connected to the chamber establishes a pressure in the chamber less than atmospheric pressure. A water supply tank and water supply line supply a body of water to the chamber as a result of partial vacuum created in the chamber. In use, an astronaut enters the pressure suit through a port which remains open to ambient atmosphere, thus supplying air to the astronaut during use. The pressure less than atmospheric pressure in the chamber is chosen so that the pressure differential from the inside to the outside of the suit corresponds to the pressure differential with the suit in outer space.

Official Gazette of the US Patent and Trademark Office
The invention relates to a single frequency multitransmitter telemetry system that will deliver a substantial amount of data at low cost. The invention consists essentially of a plurality of sensor transmitter units at different locations, with individual signal conditioning and logic, which send sampled data signals to a single receiver. The transmitters operate independently on the same frequency in a frequency shift keying modulation system and are not synchronized to the receiver. The problem of reception of data from more than one transmitter simultaneously is solved by discarding the data - when there is overlap of data from two or more transmitters, the data is discarded and when there is no overlap the data is retained. The invention utilizes a unique overlap detection technique to determine if data should be retained or discarded. When data is received from a transmitter, it goes into a shift register.

The invention relates to a foldable self erecting joint which may be used to deploy the tetratruus frame of the proposed shuttle launched triangular space station. The frame must be folded into the payload bay of the space shuttle orbiter. To deploy the frame the tubes are automatically unfolded and once in position should remain safely. A pair of hinged, tubular members in which the hinging is located at corresponding portions of the members are nested against one of the members in substantial alignment and over-center for securely locking the joint in the unfolded position.
A space spider crane for the movement, placement, and/or assembly of various components on or in the vicinity of a space structure is described. As permanent space structures are utilized by the space program, a means will be required to transport cargo and perform various repair tasks. A space spider crane comprising a small central body with attached manipulators and legs fulfills this requirement. The manipulators may be equipped with constant pressure gripping end effectors or tools to accomplish various repair tasks. The legs are also equipped with constant pressure gripping end effectors to grip the space structure. Control of the space spider crane may be achieved either by computer software or a remotely situated human operator, who maintains visual contact via television cameras mounted on the space spider crane. One possible walking program consists of a parallel motion walking program whereby the small central body alternatively leans forward and backward relative to end effectors.

The mobile remote manipulator system (MRMS) was initially developed for transit about the trusses of the delta space station; however, it can be used just as easily for transit about the trusses of the dual keel station. The MRMS is comprised of a mobile platform having a rail system formed of transversely disposed T-shaped tracks, which engage with guide pins located at the nodes of the trusses. The guide pins form a grid and the tracks are so designed as to permit travel in either of two orthogonal directions. For travel the MRMS is provided with retractable, reversible chain drive systems, which selectively engage sprockets on the guide pins for either longitudinal or transverse travel. The MRMS provides a near-uniform traversing velocity with minimal dynamic loading on the system.

SPACE STATION ERECTABLE MANIPULATOR PLACEMENT SYSTEM Patent Application
MARGARET E. GRIMALDI, inventor (to NASA) 13 Nov. 1986
13 p
(NASA-CASE-MSC-21096-1; NAS 1.71:MSC-21096-1; US-PATENT-APPL-SN-929865) Avail: NTIS HC A02/MF A01
CSCL 22B

A habitable space station has been proposed for low Earth orbit, to be constructed from components which will be separately carried up from the Earth and thereafter assembled. A suitable manipulating system having extraordinary manipulative capability is required. The invention is an erectable manipulator placement system for use on a space station and comprising an elongate, lattice-like boom having guide tracks attached thereto, a carriage-like assembly pivotally mounted on and extending from said dolly. The system further includes a turntable base pivotally interconnected with the proximal end of the boom and positioned either on a part of a transferring vehicle, or on another payload component being carried by said transferring vehicle, or on the space station. Novelty resides in the use of a turntable base having a hinged boom with a dolly translatable therealong to carry the arm-like assembly, thus providing an additional 3 degrees of freedom to the arm.

N87-10174*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
COAXIAL TUBE TETHER/TRANSMISSION LINE FOR MANNED NUCLEAR SPACE POWER Patent Application
D. J. BENTS, inventor (to NASA) 18 Aug. 1986 15 p
CSCL 10B

A spacecraft comprising a platform, a power system and a power transmission line adapted to transmitting high voltage electrical power in a space environment is disclosed. The transmission power line tethers the suborbiting platform to the power system located in a superorbital position relative to the platform.

Also, the pallet can serve as a splint with gridded plates; as instrument mounting bases; and as a roadbed for a Mobile Service Center (MSC). The novelty resides in providing closely spaced attachment points for mounting small components to the space station beams with widely spaced attachment points. The foldable expandable pallet removes the constraint that the main structure must have closely spaced node points for attachment purposes.

20 SPACECRAFT PROPULSION AND POWER

Includes main propulsion systems and components, e.g., rocket engines; and spacecraft auxiliary power sources.

EXPANDABLE PALLET FOR SPACE STATION INTERFACE ATTACHMENTS Patent Application
CLARENCE J. WESSELSKI, inventor (to NASA) 13 Nov. 1986
18 p
(NASA-CASE-MSC-21117-1; NAS 1.71:MSC-21117-1; US-PATENT-APPL-SN-929675) Avail: NTIS HC A02/MF A01
CSCL 22B

The present invention is directed to a foldable expandable pallet having a basic square configuration. Each pallet is comprised of a plurality of struts joined together by node point fittings to make a rigid structure. The struts have hinge fittings which are spring loaded to permit collapse of the module for stowage transport to a space station in the payload bay of the space shuttle, and deployment on orbit. Dimensions of the pallet are selected to provide convenient, closely spaced attachment points between the node points of the relatively widely spaced trusses of a space station platform. A pallet is attached to a truss at four points: one close fitting hole; two oversize holes, and a slot which allows for thermal expansion/contraction and for manufacturing tolerances. Applications of the pallet include its use to attach rotary joints.

Also, the pallet can serve as a splint with gridded plates; as instrument mounting bases; and as a roadbed for a Mobile Service Center (MSC). The novelty resides in providing closely spaced attachment points for mounting small components to the space station beams with widely spaced attachment points. The foldable expandable pallet removes the constraint that the main structure must have closely spaced node points for attachment purposes.

Author
LOW LOSS INJECTOR FOR LIQUID PROPELLANT ROCKET ENGINES Patent

A low pressure loss injector element is disclosed for the main combustion chamber of a rocket engine which includes a lox post terminating in a cylindrical barrel. Received within the barrel is a lox plug which is threaded in the lox post and includes an interchangeable lox metering sieve which meters the lox into an annular lox passage. A second annular gas passage is coaxial with the annular lox passage. A cylindrical sleeve surrounds the annular gas passage and includes an interchangeable gas metering sieve having metering orifices through which a hot gas passes into the annular passage. The jets which emerge from the annular lox passage and annular gas passage intersect in a recessed area away from the combustion area. Thus, mixing and combustion stability are enhanced.

HEAT EXCHANGER FOR ELECTROTHERMAL DEVICES Patent

Synthetic procedures are described for tetraalkyls, tetraacids and dianhydrides substituted 1,1,1-triaryl-2,2,2-trifluoroethanes which comprises: (1) 1,1-bis(dialkylaryl)-1 aryl-2,2,2-trifluoroethane; (2) 1,1-bis(carboxyaryl)-1 aryl-2,2,2-trifluoroethane; or (3) cyclic dianhydride or diamine of 1,1-bis(dialkylaryl)-1 aryl-2,2,2-trifluoroethanes. The synthesis of (1) is accomplished by the condensation reaction of an aryl trifluoromethyl ketone with a dialkylaryl compound. The synthesis of (2) is accomplished by oxidation of (1). The synthesis dianhydride of (3) is accomplished by the conversion of (2) to its corresponding cyclic dianhydride. The synthesis of the diamine is accomplished by the similar reaction of an aryl trifluoromethyl ketone with aniline or alkyl substituted or disubstituted anilines. Also, other derivatives of the above are formed by nucleophilic displacement reactions.
NEW CONDENSATION POLYMIDES CONTAINING 1,1,1-TRIARYL-2,2,2-TRIFLUOROETHANE STRUCTURES Patent Application

The invention relates to a condensation polyimide containing a 1,1,1-triaryl-2,2,2-trifluoroethane structure and other related condensation polyimides. The process for their preparation, which comprises polymerization of a cyclic dianhydride with a diamine is also covered.

PREPARATION OF B-TRICHLOROBORAZINE Patent Application
SALVATORE R. RICCITIELLO, inventor (to NASA), MING-TA S. HSU, inventor (to NASA), and TIMOTHY S. CHEN, inventor (to NASA) 28 Aug. 1986 11 p

A method of preparing B-trichloroborazine is disclosed. Generally, the method includes the combination of gaseous boron trichloride and excess gaseous ammonia at ambient temperature or below, under anhydrous conditions in a polar organic solvent, heating the reaction mixture to 100 to 140 C for a time effective to produce the trichloroborazine, cooling and removing the ammonium chloride formed, removing the solvent at ambient pressure, and recovering the B-trichloroborazine. A preferred solvent in the process is anhydrous toluene. Yields of B-trichloroborazine of about 40 percent are obtained. This process provides both a laboratory and larger-scale preparation from gaseous components. B-trichloroborazine is useful in a number of chemical reactions including the formation of high temperature inorganic polymers.

CERAMIC-CERAMIC SHELL TILE THERMAL PROTECTION SYSTEM AND METHOD THEREOF Patent Application
S. R. RICCITIELLO, inventor (to NASA), M. SMITH, inventor (to NASA), H. GOLDSMITH, inventor (to NASA), and N. B. ZINNERMANN, inventor (to NASA) 14 May 1986 31 p

A ceramic reusable, externally applied composite thermal protection system (TPS) is proposed. The system functions by utilizing a ceramic/ceramic upper shell structure which effectively separates its primary functions as a thermal insulator and as a load carrier to transmit loads to the cold structure. The composite tile system also prevents impact damage to the atmospheric entry vehicle thermal protection system. The composite tile comprises a structurally strong upper ceramic/ceramic shell manufactured from ceramic fibers and ceramic matrix meeting the thermal and structural requirements of a tile used on a re-entry aerospace vehicle. In addition, a lightweight high temperature ceramic lower temperature base tile is used. The upper shell and lower tile are attached by means effective to withstand the extreme temperature (3000 to 3200 F) and stress conditions. The composite tile may include one or more layers of variable density rigid or flexible thermal insulation. The assembly of the overall tile is facilitated by two or more locking mechanisms on opposing sides of the overall tile assembly. The assembly may occur subsequent to the installation of the lower shell tile on the spacecraft structural skin.

CARBIDE/FLUORIDE/SILVER SELF-LUBRICATING COMPOSITE Patent Application
H. E. SLINLEY, inventor (to NASA) 5 May 1986 12 p

This invention relates to a self-lubricating, friction and wear reducing composite material for use over a wide temperature spectrum from cryogenic temperature to about 900 C in a chemically reactive environment. The composites are comprised of silver, barium fluoride/calcium fluoride eutectic, and bonded chromium carbide.

COMPOSITE MATERIALS
Includes physical, chemical, and mechanical properties of laminates and other composite materials.
The invention relates to seamless metal clad filament reinforced resin matrix composite tubular structures and processes for their manufacture and is particularly useful in the construction of spacecraft and space structures. Metal clad composites make a significant advancement over those composite systems being used for both spacecraft and aircraft; however, the material consolidation and tooling advances necessary to realize the potential of such metal clad composites had not hitherto been achieved. Accordingly, it is an object of this invention to provide an efficient method of producing seamless metal clad composite structures. A metallic outer sleeve is provided which is capable of enveloping a hollow metallic inner member having continuous reinforcing fibers attached to the distal end thereof. Inner member is then introduced into outer sleeve until inner member is completely enveloped by outer sleeve. A liquid matrix material is then injected into the space between inner member and outer sleeve. A pressurized heat transfer medium is flowed through the inside of inner member, thereby forming a fiber reinforced matrix composite material. The wall thicknesses of both inner member and outer sleeve are then reduced to the appropriate size by chemical etching, to adjust the thermal expansion coefficient of the metal-clad composite structure to the desired value. The novelty of this invention resides in the thermal expansion coefficient of the metal-clad composite structure and the development of efficient method of producing seamless metal clad fiber reinforced organic matrix composite structures. **METHOD AND DEVICE FOR DETERMINING HEATS OF COMBUSTION OF GASEOUS HYDROCARBONS** Patent Application

JAG J. SINGH, inventor (to NASA); DANNY R. SPRINKLE, inventor (to NASA); and RICHARD L. PUSTER, inventor (to NASA) 24 Nov. 1986 16 p

Avail: NTIS HC A02/MF A01 CSCL 21B

A method and device is provided for a quick, accurate and on-line determination of heats of combustion of gaseous hydrocarbons. First, the amount of oxygen in the carrier stream air is sensed by a oxygen sensing system. Second, three individual volumetric flow rates of oxygen, carrier stream air, and hydrocarbon test gas are introduced into a burner. The hydrocarbon test gas is fed into the burner at a volumetric flow rate, n, measured by a...
flowmeter. Third, the amount of oxygen in the resulting combustion products is sensed by an oxygen sensing system. Fourth, the volumetric flow rate of oxygen is adjusted until the amount of oxygen previously sensed in the carrier stream air is. This equalizing volumetric flow rate, \( m \), is measured by the flowmeter. The heat of combustion of the hydrocarbon test gas is then determined from the ratio \( m/n \). NASA

**MOVING WALL, CONTINUOUS FLOW ELECTROPHORESIS APPARATUS Patent Application**

Percy H. Rhodes, inventor (to NASA) 5 Sep. 1986 17 p  

This invention relates generally to electrophoresis devices and more particularly to a moving wall, continuous flow device wherein an electrophoresis chamber is angularly positionable with respect to the direction of moving belt walls. A frame having an electrophoresis chamber is rotatably supported between two synchronously driven belt walls. This allows the chamber to be angularly positionable with respect to the direction of belt travel, which compensates for electroosmotic flow within the electrophoresis chamber. Injection of a buffer solution via an opening and a homogenous sample stream via another opening is performed at end of a chamber, and collection of buffer and the fractionated species particles is done by a conventional collection array at an opposite end of the chamber. Belts are driven at a rate which exactly matches the flow of buffer and sample through the chamber, which entrains the buffer to behave as a rigid electrophoretic medium, eliminating flow distortions (Poiseuille effect). Additionally, belt material for each belt is stored at one end of the device and is taken up by drive reels at an opposite end. The novelty of this invention particularly lies in the electrophoresis chamber being angularly positionable between two moving belt walls in order to compensate for electroosmotic flow. Additionally, new belt material is continuously exposed within the chamber, minimizing flow distortions due to contamination of the belt material by the sample.

**CASTABLE HOT CORROSION RESISTANT ALLOY Patent Application**

C. A. Barrett, Inventor (to NASA) and W. H. Holt, Inventor (to NASA) 30 Jul. 1986 8 p  

About ten weight percent nickel is added to a Fe-base ferritic alloy to improve the high temperature castability and crack resistance while about 0.2 weight percent zirconium is added for improved high temperature cyclic oxidation and corrosion resistance. The basic material is a high temperature FeCrAl heater alloy, and the addition provides a material suitable for burner rig nozzles.

**HOT CASTABLE METAL Patents**

T. B. Good, Inventor (to NASA) 23 Dec. 1983 4 p  

About ten weight percent nickel is added to a Fe-base ferritic alloy to improve the high temperature castability and crack resistance while about 0.2 weight percent zirconium is added for improved high temperature cyclic oxidation and corrosion resistance. The basic material is a high temperature FeCrAl heater alloy, and the addition provides a material suitable for burner rig nozzles.
NONMETALLIC MATERIALS

Includes physical, chemical, and mechanical properties of plastics, elastomers, lubricants, polymers, textiles, adhesives, and ceramic materials.

The present invention relates to organic silicon-boron polymers which upon pyrolysis produce high-temperature ceramic materials. More particularly, it relates to the polyorganosilanes containing -Si-B- bonds which generate high-temperature ceramic materials (e.g., SiC, SiB$_4$, SiB$_6$, B$_3$C) upon thermal degradation. The processes for preparing these organic silicon-boron polymer precursors are also a part of this invention. M.G.

Sulfone-ester polymers containing pendant ethynyl groups and a direct and multistep process for preparing them are disclosed. The multistep process involves the conversion of a pendant bromo group to the ethynyl group while the direct route involves reacting hydroxy-terminated sulfone oligomers or polymers with a stoichiometric amount of 5-(4-ethynylphenoxy) isophthaloyl chloride. The 5-(4-ethynylphenoxy) isophthaloyl chloride and the process for preparing it are also disclosed.

Official Gazette of the US Patent and Trademark Office

Siloxane containing addition polyimides having improved physical property characteristics of flexibility, drape, tack, and toughness and the process for preparing and utilizing the same are disclosed. The novelty of this invention appears to reside in the composition and process of preparing addition type polyimides useful as structural adhesives as well as composite matrix materials and the process of preparing the same.

Official Gazette of the US Patent and Trademark Office

subjected to a crease test. If the film is creaseable and not brittle, the polymer is determined to be of sufficiently high molecular weight.

NASA
Alternate layers of mats of specially coated SiC fibers and silicon monofilaments are hot pressed in stages to form a fiber reinforced ceramic material. In the first stage a die is heated to a temperature for about one-half hour to remove fugitive binder. In a vacuum furnace and maintained at this temperature for about 600°C, silicon monofilaments are hot pressed in two stages to form a fiber reinforced ceramic material. In the second stage the die temperature is raised to about 1,000°C and the layers are pressed at between 35 MPa and 138 MPa. The resulting preform is placed in a reactor tube where a nitriding gas is flowed past the preform at 1,100°C to 1,400°C to nitride the same.

FIRE AND HEAT RESISTANT LAMINATING RESINS BASED ON MALEIMIDO SUBSTITUTED AROMATIC CYCLOTRIPHOSPHAZENE POLYMER Patent

4-Aminophenoxycyclophosphazenes are reacted with maleic anhydride to produce maleic acid which are converted to the maleimides. The maleimides are polymerized. By selection of starting materials (e.g., hexakis amino or trisaminophenoxy trisphenyloxy cyclophosphazenes), selection of molar proportions of reactants, use of mixtures of anhydrides and use of dianhydrides as bridging groups a variety of maleimides and polymers are produced. The polymers have high limiting oxygen indices, high char yields and other useful heat and fire resistant properties making them useful as, for example, impregnants of fabrics.

Official Gazette of the US Patent and Trademark Office CSCL 11B

MATERIALS PROCESSING

Includes space-based development of products and processes for commercial applications.
A wake shield facility providing an ultrahigh vacuum level for space processing is described. The facility is in the shape of a truncated, hollow hemispherical section, one side of the shield convex and the other concave. The shield surface is preferably made of material that has low out-gassing characteristics such as stainless steel. A material sample supporting fixture in the form of a carousel is disposed on the convex side of the shield at its apex. Movable arms, also on the convex side, are connected by the shield in proximity to the carousel, the arms supporting processing fixtures, and providing for movement of the fixtures to predetermined locations required for producing interactions with material samples. For MBE processes a vapor jet projects a stream of vaporized material onto a sample surface. The fixtures are oriented to face the surface of the sample being processed when in their extended position, and when not in use they are retractable to a storage position. The concave side of the shield has a support structure including metal struts connected to the shield, extending radially inward. The struts are joined to an end plate disposed parallel to the outer edge of the shield. This system eliminates outgassing contamination.

31 ENGINEERING (GENERAL)

CSCL 13H

A system is provided for casting thin sheets (or tapes) of particles bound together, that are used for oxygen membranes and other applications, which enables the particles to be cast at a high packing density in a tape of uniform thickness. A slurry contains the particles, a binder, and a solvent, and is cast against the inside walls of a rotating chamber. Prior to spraying the slurry against the chamber walls, a solvent is applied to a container. The solvent evaporates to saturate the chamber with solvent vapor. Only then is the slurry cast. As a result, the slurry remains fluid long enough to spread evenly over the casting surface formed by the chamber, and for the slurry particles to become densely packed. Only then is the chamber vented to remove solvent, so the slurry can dry. The major novel feature is applying solvent vapor to a rotating chamber before casting slurry against the chamber walls.

ELEVATED WATERPROOF ACCESS FLOOR SYSTEM AND METHOD OF MAKING THE SAME Patent
MARC M. COHEN, inventor (to NASA) 20 Jan. 1987 9 p
Filed 1 Jun. 1983 Supersedes N83-28281 (21 - 17, p 2736)
(NASA-CASE-ARC-11365-1; US-PATENT-4,637,181;

An elevated waterproof access floor system having subfloor channels or compartments for power lines, gas lines or the like is adapted such that it can be opened and subsequently resealed without destroying the waterproofing and without destroying its aesthetic appearance. A multiplicity of tiles are supported on a support grid, and a flooring sheet is supported on the tiles. Attachment means are provided to prevent lateral but not vertical movement of the flooring sheet with respect to the tiles so that the flooring sheet can be lifted off the tiles, but when the flooring sheet is supported on the tiles, no lateral slipping will occur. The flooring sheet is made of a heat resealable material, so that it can be cut away in sections, and the tiles therebelow lifted off, to provide access to subfloor compartments.

GROUND PLANE INTERFERENCE ELIMINATION BY PASSIVE ELEMENT Patent Application
MARK E. BONEBRIGHT, inventor (to NASA) and DERLING KILLION, inventor (to NASA) 30 Jul. 1986 12 p

The radiation pattern of a beam at elevation angles near the horizon is improved for phased array antennas by control of the radiation field intensity near the horizon to reduce multipath disturbances, and to improve the axial ratio of a circularly polarized phased array antenna. This is accomplished by placing a parasitic phase shifting element directly below the antenna beam axis. The waveguide section is designed to produce a phase shift in the portion of antenna radiation energy passing through it to cancel some of the radiation energy in the direction of the horizon. The spacing of the waveguide section in front of the antenna is determined empirically for optimum results, i.e., for reduction of beam power below about 20 deg. without affecting beam power at high elevation angles.

METHOD AND APPARATUS FOR MEASURING FREQUENCY AND PHASE DIFFERENCE Patent Application
PAUL SHORES, investigator (to NASA), CHRISTOPHER LICHTENBERG, inventor (to NASA), HERBERT S. KOBAYASHI, inventor (to NASA), and ALLEN R. CUNNINGHAM, investigator (to NASA) 29 Oct. 1986 31 p

The present invention is a system for deriving direct digital indications of frequency and phase difference between two incoming pulse trains adaptable for collision avoidance systems or the like. A pair of radar beams are directed toward a target...
and corresponding beams returning therefrom are detected. A
digital difference circuit forms a pulse train from the Doppler shift
frequencies of each beam pair having a repetition rate functionally
related to the difference in magnitude of the shift frequencies.
Pulses from the pulse train are counted as a function of time.
Visual indications thereof on display are correlative to target position
relative to beams.

N87-10231* National Aeronautics and Space Administration.
Pasadena Office, Calif.
CROSS-CONTACT CHAIN Patent Application
U. LIENEWEG, inventor (to NASA) 26 Jun. 1986 16 p
(Contract NAS7-918)
(NASA-CASE-NPO-16784-1; US-PATENT-APPL-SN-879757; NAS
1.71:NPO-16784-1) Avail: NTIS HC A02/MF A01 CSCL 09A
A system is provided for use with wafers that include multiple
integrated circuits that include two conductive layers in contact at
multiple interfaces. Contact chains are formed beside the integrated
circuits, each contact chain formed of the same two layers as the
circuits, in the form of conductive segments alternating between
the upper and lower layers and with the ends of the segments
connected in series through interfaces. A current source passes a
current through the series-connected segments, by way of a pair
of current tabs connected to opposite ends of the series of
segments. While the current flows, voltage measurements are taken
between each of a plurality of pairs of voltage tabs, the two tabs
of each pair connected to opposite ends of an interface that lies
along the series-connected segments. A plot of interface
conductances on normal probability chart enables prediction of
the yield of good integrated circuits from the wafer.

LARGE TV DISPLAY SYSTEM Patent Application
HUA-KUANG LIU, inventor (to NASA) 30 Sep. 1986 11 p
(Contract NAS7-918)
(NASA-CASE-NPO-16932-1; US-PATENT-APPL-SN-913433)
A relatively small and low cost system is provided for projecting
a large and bright television image onto a screen. A miniature
liquid crystal array is driven by video circuitry to produce a pattern
of transparencies in the array corresponding to a television image.
Light is directed against the rear surface of the array to illuminate
it, while a projection lens lies in front of the array to project the
image of the array onto a large screen. Grid lines in the liquid
crystal array are eliminated by a spatial filter which comprises a
negative of the Fourier transform of the grid.
A coaxial cable connector is provided, which resists radio frequency breakdown in coaxial cables used in the vacuum of outer space. The connector body surrounds an insulator which includes an easily compressible elastomeric portion. An insulated coaxial cable is prepared so its insulation projects beyond the outer conductor and compresses the elastomeric portion of the connector insulator.

The invention is a signal processor for measuring the oscillating frequency contained in a laser velocimeter signal burst or bursts. The input to the signal processor is applied through a fixed gain amplifier to an amplifier that has an automatic gain control provided by automatic gain circuit. The output from amplifier 14 is converted to digital by a non-linear analog-to-digital converter (ADC). The output from ADC 16 is shifted into two shift registers with a register receiving the most significant bits (MSB) from the ADC and with register receiving the least significant bits (LSB) from the ADC. A signal integration circuit under the control of the bits shifted into and out of the MSB shifter register determines when a signal burst has been captured by the shift registers. When a signal burst has been captured the data in the shift registers is transferred and processed by a bank of digital filters and other circuitry to determine the frequency in the signal burst. The automatic gain circuit is under the control of the bits shifted into and out of both shift registers. The novel feature of the invention appears to lie in the overall combination of the signal integration circuit, the automatic gain circuit with amplifiers, the ADC, the shift registers and the digital filter circuitry for processing captured signal bursts.
There is a need in the art for a heat exchanger design having a flexible core which provides contour matching capabilities, which compensates for manufacturing tolerance and distortion buildups, and which accordingly furnishes a relatively uniform thermal contact conductance between the core and external heat sources under essentially all operating conditions. The core of the heat exchanger comprises a top plate and a bottom plate, each having alternating rows of pins attached thereto. Each of the pins fits into corresponding tight-fitting recesses in the opposite plate. Thus, the pin and recess design allows the heat exchanger core to expand and contract to match the mating part contours without significantly affecting the flow distribution, since gaps of varying thickness are not created at the ends of pins by the thermal expansion and contraction of the plates. Novelty resides in the use of recesses for one end of the pins to maintain the pins in thermal contact with both plates despite the nonuniform distance between the plates.

This invention is directed to a method and apparatus for measuring emitted vibrational forces produced by a reaction wheel assembly due to imbalances, misalignment, bearing defects and the like. The apparatus includes a low mass carriage supported on a large mass base. The carriage is in the form of an octagonal frame having an opening which is adapted for receiving the reaction wheel assembly supported thereon by means of a mounting ring. The carriage is supported on the base by means of air bearings which support the carriage in a generally frictionless manner when supplied with compressed air from a source. A plurality of carriage brackets and a plurality of base blocks provided for physical coupling of the base and carriage. The sensing axes of the load cells are arranged generally parallel to the base and connected between the base and carriage such that all of the vibrational forces emitted by the reaction wheel assembly are effectively transmitted through the sensing axes of the load cells. In this manner, a highly reliable and accurate measurement of the vibrational forces of the reaction wheel assembly can be had. The output signals from the load cells are subjected to a dynamical analyzer which analyzes and identifies the rotor and spin bearing components which are causing the vibrational forces.
METHOD OF FABRICATING AN IMAGING X-RAY SPECTROMETER Patent

A process for fabricating an X-ray spectrometer having imaging and energy resolution of X-ray sources is discussed. The spectrometer has an array of adjoining rectangularly shaped detector cells formed in a silicon body. The walls of the cells are created by laser drilling holes completely through the silicon body and diffusing n+ phosphorous doping material therethrough. A thermally migrated aluminum electrode is formed centrally through each of the cells.

A process for fabricating an X-ray spectrometer having imaging and energy resolution of X-ray sources is discussed. The walls of the cells are created by laser drilling holes completely through the silicon body and diffusing n+ phosphorous doping material therethrough. A thermally migrated aluminum electrode is formed centrally through each of the cells.

In acoustic emission nondestructive testing, broadband frequency noise is distinguished from narrow banded acoustic emission signals, wherein the latter are valid events indicative of structural flaws in the material being examined. This is accomplished by separating out those signals which contain frequency components both within and beyond (either above or below) the range of valid acoustic emission events. Application to acoustic emission monitoring during nondestructive bond verification and proof loading of undensified tiles on the space shuttle orbiter is considered.

A gas particle radiator adapted to operate in a microgravity space environment having a transparent boundary which transmits involving numerous test sites while utilizing a minimum internal volume of the test structure.

**36 LASERS AND MASERS**

Includes parametric amplifiers.

**N87-17026*#** National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.

**PROJECTION LENS SCANNING LASER VELOCIMETER SYSTEM Patent**

A laser Doppler velocimeter system is disclosed that has a laser, a waist position adjusting lens, and a beam splitter which directs laser beams parallel to the optical axis of the negative lens. The negative lens is fixed relative to an afocal lens pair. A pair of planar mirrors intersect at right angles and respectively intersect the optical axis and the optical axis of the afocal lens pair. Mirrors are movable along the optical axis toward and away from the afocal lens pair to focus the laser beams in a focus area while maintaining a constant beam waist, crossing angle, and intersection with other laser beams. This produces a constant sensitive volume as the focus is changed.

Official Gazette of the US Patent and Trademark Office

**N87-14704*#** National Aeronautics and Space Administration. Pasadena Office, Calif.

**ACTIVE HOLD-DOWN FOR HEAT TREATING Patent Application**

The object of the disclosure is to provide a vacuum hold-down for holding thin sheets to a support surface, which permits the thin sheet to change dimensions as it is held down. The hold-down includes numerous holes in the support surface, through which vacuum is applied from a vacuum source. The holes are arranged in zones. The vacuum is repeatedly interrupted at only one or a few zones, while it continues to be applied to other zones, to allow the workpiece to creep along that interrupted zone. The vacuum to different zones is interrupted at different times, as by a slowly turning valve number, to allow each zone of the workpiece to creep. A positive pressure may be applied from a pressured air source to a zone when the vacuum is interrupted there, to help lift the corresponding workpiece zone off the surface to aid in creeping. The workpiece may undergo dimensional changes because of heating, cooling, drying, or other procedure.

**N87-17026*#** National Aeronautics and Space Administration. Pasadena Office, Calif.

**PASSIVELY ACTIVATED PREHENSILE DIGIT FOR A ROBOTIC END EFFECTOR Patent Application**

A common hydraulic reservoir holds one or more rows of slidable pistons or fingers in a base or hand. The individual fingers in each row expose graduated cross-sectional fluid application areas to the hydraulic fluid in the reservoir, with the smallest fluid application area in the center of the row and graduating to progressive larger fluid areas towards both ends of each row. The fingers are elongated pistons. Exposed outer ends of each piston extending away from the reservoir, house a transverse pad to contact an object to be held. The transverse pads are universally ball-joint and spring-center mounted in a longitudinally located
opening at the outer tapered end of each finger. Simple and
effective capacitance metering in the reservoir is provided for each
finger.

A composite piston structure is disclosed which provides a
simple and reliable means for joining a carbon-carbon or ceramic
piston cap with a metallic piston body. Attachment is achieved by
means of a special geometry which compensates for differences
in thermal expansion without complicated mechanical fastening
devices. The shape employs a flange created by opposed
frustoconical shapes with coincident vertices intersecting on the
radial centerline of the piston in order to retain the piston cap.
The use of carbon-carbon for the piston cap material allows a
close fit between the piston and a cylinder wall, eliminating the
need for piston rings. The elimination of extra mechanical parts of
previous composite pistons provides a lightweight composite piston
capable of extended high temperature operation.

This invention relates to an apparatus and method of removing
desirable constituents from an infusible material by infusion
extraction. A piston operating in a first chamber draws a solvent
into the first chamber where it may be heated, and then moves
the heated solvent into a second chamber containing the infusible
material, where infusion extraction takes place. The piston then
moves the solvent containing the extract through a filter into the
first chamber, leaving the extraction residue in the second chamber.
The method is applicable to operation in low or micro-gravity
environments.

This invention relates to an apparatus and method of removing
desirable constituents from an infusible material by infusion
SELF-CONTAINED, SINGLE-USE HOSE AND TUBING CLEANING MODULE Patent

A self contained, single use hose and tubing cleaning module which utilizes available water supplies without requiring access to precision cleaning facilities is presented. The module is attached to the water source at the inlet side and to the hose or tubing to be cleaned at the outlet side. The water flows through a water purification zone, a detergent dispensing zone, a filtration zone before the detergent laden water flows into the tubing to clean the tubing walls. The module contains an embedded pad which is impregnated with a pH indicator to indicate to the user when the detergent has dissolved and rinsing of the tubing begins.

SUN SHIELD Patent

ARTHUR M. FRANK, inventor (to NASA), SILVIO F. DERESPISINIS, inventor (to NASA), and JOHN MOCKOVICAIK, JR., inventor (to NASA) 20 Jan. 1987 8 p Filed 12 Aug. 1985 Supersedes N86-20803 (24-11, p 1783)

A shading device which is capable of compactly storing a flexible shade on a biased, window shade type spring roller is disclosed. It is controlled to deliver the shade selectively to either its operative shading or compact storage orientation.

NON-BACKDRIVEABLE FREE WHEELING COUPLING Patent

A rotary coupling for connecting a driven part to a source of rotary force is described. This device transmits rotary force in one direction only and disengages to permit the driven part to free wheel when the input member is stopped and precludes the backdriving of rotary force from output member to input member. The coupling includes an input member having a splined shaft, a coupling member connected to the splined shaft, and a coaxial output member. The coupling member and the output member having complementary sets of axial face clutch teeth. Guides in the form of helical grooves on the coupling member and spring loaded followers acting with the guides affect the engagement and disengagement of the clutch teeth by moving the coupling member toward and away from output member, the followers and guides themselves disengaging to permit free wheeling of output member when input member is stopped.

RADIAL AND TORSIONALLY CONTROLLED MAGNETIC BEARING Patent

A magnetic bearing including a circular stator member with a plurality of circumferential pole faces and a suspended annular ring member with corresponding number of inward facing circumferential pole faces separated by respective air gaps is presented. A source of dc magnetic flux circulates flux between the circumferential pole faces of the stator and the ring to provide axial stability along a central longitudinal axis. Flux coil means are included on the stator member to provide variable flux density along predetermined radial paths to provide active radial stabilization. Flux coil means are included on the stator to actively modulate the magnitude of the magnetic forces as well as their direction by differential flux control involving the dc magnetic flux.
to produce torquing moments about a pair of mutually orthogonal axes which are perpendicular to the central axis.

**Multi-path Peristaltic Pump Patent Application**

JOSEPH A. CHANDLER, inventor (to NASA) 7 Nov. 1986

This invention is directed to a peristaltic pump for critical laboratory or hospital applications requiring precise flow rates over an extended period of time. Within the cylindrical barrel pump housing is a single-piece, molded, elastomeric, cylindrical liner with a multiplicity of flattened helical channels created therein from one end of the liner to the other. Three cylindrical rollers rotate about the center axis of the pump around the inside surface of the liner selectively compressing the liner, and hence the helical channels between the rollers and the barrel housing, creating a pumping action by forcing trapped fluid in the helical channels axially from one end of the liner to the opposite end. The novelty of the invention appears to lie in the provision of the special liner with multiple helical channels as the pumping chamber, rather than the standard single elastomeric tubing which is squeezed repeatedly by rollers to move the liquid through a typical peristaltic pump. Large, repeated deflections on the standard tubing causes a permanent set in the tubing, thus either changing the flow rate, or requiring a new section of tubing to be positioned in the pump head. Further, this configuration minimizes the amount of outflow pulsation which is characteristic of a typical single tubing peristaltic pump.

**Orbital Maneuvering End Effectors Patent Application**

W. NEILL MYERS, inventor (to NASA), JOHN C. FORBES, inventor (to NASA), and WAYNE L. BARNES, inventor (to NASA) 16 Dec. 1986

This invention relates to an end effector device for grasping and maneuvering objects such as berthing handles of a space telescope. The device includes a V-shaped capture window defined as inclined surfaces in parallel face plates which converge toward a retainer recess in which the handle is retained. A pivotal finger meshes with a pair of pivoted fingers which rotate in counterrotation. The fingers rotate to pull a handle within the capture window into recess where latches lock handle in the recess. To align the capture window, plates may be cocked plus or minus five degrees on base. Drive means is included in the form of a motor coupled with a harmonic drive speed reducer, which provides for slow movement of the fingers at a high torque so that large articles may be handled. Novelty of the invention is believed to reside in the combined intermeshing finger structure, drive means and the harmonic drive speed reducer, which features provide the required maneuverability and strength.

**Energy Production and Conversion**

Includes specific energy conversion systems, e.g., fuel cells; global sources of energy; geophysical conversion; and windpower.

**High Band Gap 2-6 and 3-5 Tunneling Junctions for Silicon Multijunction Solar Cells Patent**

TAHER DAUD, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena) and AKARAM H. KACHARE, inventor (to NASA) 23 Dec. 1986

A multijunction silicon solar cell of high efficiency is provided by providing a tunnel junction between the solar cell junctions to connect them in series. The tunnel junction is comprised of p- and n+ layers of high band gap 3-5 or 2-6 semiconductor materials that match the lattice structure of silicon, such as GaP (band gap 2.24 eV) or ZnS (band gap 3.6 eV). Each of which has a perfect
An improved solar collector is provided for concentrating solar energy at a target aperture of a receiver. The dispersion of reflected rays to the target aperture is substantially minimized over prior art arrangements. The collector is well suited as a component of a solar dynamic power unit for terrestrial use as well as space vehicles, concentrating sunlight to drive a heat engine. The solar concentrator includes a generally paraboloidal shape which is composed of sections or gores of compound curvature, the two inner edges of each gore (which abut the corresponding edges of adjacent gores) are parabolas. The compound curvature between the two edges of each gore being defined, in cross section, by a circular arc having its center at the focal point of the paraboloid. Novelty is believed to reside in the compound geometry which combines the advantages of both parabolas and circular arcs to minimize the dispersion of reflected rays from the desired target aperture.

An improved solar collector is provided for concentrating solar energy at a target aperture of a receiver. The dispersion of reflected rays to the target aperture is substantially minimized over prior art arrangements. The collector is well suited as a component of a solar dynamic power unit for terrestrial use as well as space vehicles, concentrating sunlight to drive a heat engine. The solar concentrator includes a generally paraboloidal shape which is composed of sections or gores of compound curvature, the two inner edges of each gore (which abut the corresponding edges of adjacent gores) are parabolas. The compound curvature between the two edges of each gore being defined, in cross section, by a circular arc having its center at the focal point of the paraboloid. Novelty is believed to reside in the compound geometry which combines the advantages of both parabolas and circular arcs to minimize the dispersion of reflected rays from the desired target aperture.

In a list processing system, small reference counters are maintained in conjunction with memory cells for the purpose of identifying memory cells that become available for re-use. The counters are updated as references to the cells are created and destroyed, and when a counter of a cell is decremented to logical zero the cell is immediately returned to a list of free cells. In those cases where a counter must be incremented beyond the maximum value that can be represented in a small counter, the cell is restructured so that the additional reference count can be represented. The restructuring involves allocating an additional cell, distributing counter, tag, and pointer information among the two cells, and linking both cells appropriately into the existing list structure.

This invention is a redundant error detecting and correcting local area networked computer system having a plurality of nodes each including a network connector board within the node for connecting to an interfacing transceiver operably attached to a network cable. There is a first network cable disposed along a path to interconnect the nodes. The first network cable includes...
a plurality of first interfacing transceivers attached thereto. A second network cable is disposed in parallel with the first cable and, in like manner, includes a plurality of second interfacing transceivers attached thereto. There are a plurality of three position switches each having a signal input, three outputs for individual selective connection to the input, and a control input for receiving signals designating which of the outputs is to be connected to the signal input. Each of the switches includes means for designating a response address for responding to addressed signals appearing at the control input and each of the switches further has its signal input connected to a respective one of the input/output lines from the nodes. Also, one of the three outputs is connected to a respective one of the plurality of first interfacing transceivers. There is master switch control means having an output connected to the control inputs of the plurality of three position switches and an input for receiving directive signals for outputting addressed switch position signals to the three position switches as well as monitor and control computer means having a pair of network connector boards therein connected to respective ones of one of the first interfacing transceivers and one of the second interfacing transceivers and an output connected to the input of the master switch means for monitoring the status of the networked computer system by sending messages to the nodes and receiving and verifying messages therefrom and for sending control signals to the master switch to cause the master switch to cause respective ones of the nodes to use a desired one of the first and second cables for transmitting and receiving messages and for disconnecting desired ones of the nodes from both cables.

The invention is directed to a coaxial extending metal mirror reflector attached to the electrode housing or gas cup on a welding torch. An electric welding torch with an internal viewing system for robotic welding is provided with an annular arc light reflector to reflect light from the arc back onto the workpiece. The reflector has a vertical split or gap in its surrounding wall to permit the adjacent wall ends forming the split to be sprung open slightly to permit the reflector to be removed or slipped onto the torch housing or gas cup. The split or gap also permits the feed of weld wire therethrough to the weld area. The reflected light provides an even light distribution onto the darker surrounding areas. Novelty lies in the use of a split annular arc light reflector on the end of a welding torch having an internal viewing system.

The invention is an optical cell for containment of chemicals under conditions of high temperature and high pressure. The cell is formed of a vitreous silica tube, two optical windows comprising a vitreous silica rod inserted into the ends of a tube, and fused into position in the tube ends. Windows are spaced apart to form a cavity enclosed by the tube and the windows. A hole is drilled radially through the tube and into the cavity. Another vitreous silica tube is fused to the silica tube around the hole to form the stem, which is perpendicular to the long axis of the tube. The open end of the stem is used to load chemicals into the cavity. Then the stem may be sealed, and if desired, it may be shortened in order to reduce the volume of the cavity, which extends into the stem.

Official Gazette of the US Patent and Trademark Office

24
A welding torch arc light reflector is disclosed for welding torches having optical viewing systems. A schematic of a welding torch having an internal coaxial viewing system consisting of a lens which focuses the field of view of the weld scene of the workpiece onto the end of the fiberoptic bundle is provided. The transmitted image of the fiberoptic bundle is provided to a camera lens which focuses it onto a TV sensor array for transmission. To improve the parity of the image of the monitoring system, an arc light reflector is shown fitted to the end of the torch housing or gas cup. The arc light reflector has an internal conical section portion which is polished to serve as a mirror which reflects the bright arc light back onto the darker areas of the weld area and thereby provides a more detailed image for the monitoring system. The novelty of the invention lies in the use of an arc light reflector on welding torches having optical viewing systems.

Official Gazette of the US Patent and Trademark Office

Includes superconductivity.

An optical processor is provided which facilitates selection of any of a variety of patterns or images which are to be compared with a Fourier transform of a template image, wherein the processor can be constructed at low cost. One of the two images that are to be compared is formed by generating video signals representing the image and using those signals to drive a liquid crystal array through which light passes.
PROCESS AND APPARATUS Patent Application

Process and apparatus for growing crystals using float zone techniques are described. A rod of crystalline materials is disposed in a cylindrical container, with a space being left between the rod and container walls. The space is filled with an encapsulant, selected to have a slightly lower melting point than the crystalline material. The rod is secured to a container end cap at one end and to a shaft at its other end. A piston slides over the rod and provides pressure to prevent loss of volatile components upon melting of the rod. Prior to melting the rod the container is first heated to melt the encapsulant, with any off-gas from this step being vented to a cavity behind the piston. The piston moves slightly forward owing to volume change upon melting of the encapsulant, and the vent passageway is closed. The container is then moved longitudinally through a heated zone to progressively melt sections of the rod as in conventional float zone processes. The float zone technique may be used in the microgravity environment of space.

PROCEDURE TO PREPARE TRANSPARENT SILICA GELS Patent Application
PATRICK G. BARBER, inventor (to NASA) (Longwood Coll., Farmville, Va.) and NORMAN R. SIMPSON, inventor (to NASA) 24 Nov. 1986 11 p

This invention relates to the production of silica gels and in particular to a process for the preparation of silica gels which can be used as a crystal growth medium that simulates the convectionless environment of space to produce structurally perfect...
crystals. Modern utilizations of substances in electronics, such as radio transmitters and high frequency microphones, often require single crystals with controlled purity and structural perfection. The near convectionless environment of silica gel suppresses nucleation, thereby reducing the competitive nature of crystal growth, and provides a medium for growing single crystals with structural perfection and controlled purity. Previous methods of producing silica gels result in cloudy, translucent gels, while it is much more desirable to produce transparent gels so that the crystals can be more easily observed. In the current process, sodium ions in a sodium silicate solution are replaced with potassium ions from a soluble potassium salt solution by using cation exchange resin beads. The resulting treated silicate solution is then added to a volume of boiled, cooled distilled water, after which a volume of acetic acid solution is added to the mixture of distilled water and treated silicate solution. This mixture is then allowed to gel at room temperature, whereby a transparent silica gel is produced.

Marshall Space Flight Center, Huntsville, Ala.

METHOD AND APPARATUS FOR GROWING CRYSTALS
Patent Application
ROBERT J. NAUMANN, inventor (to NASA), SANDOR L.
LEHOCZKY, inventor (to NASA), and DONALD O. FRAZIER,
inventor (to NASA) 31 Oct. 1986 20 p
(NASA-CASE-MFS-28137-1; NAS 1.71:MFS-28137-1; US-PATENT-APPL-SN-925189)
Avail: NTIS HC A02/MF A01
CSCL 20B

This invention relates to a method and apparatus for bulk growth of defect-free compound crystals. Crystal growth is carried out in the present invention in an apparatus having an enclosure with a spherical interior which is provided with an adjustable heat source. A seed crystal is positioned within this interior and is connected to one end of a rod of heat conductive material which extends through the enclosure. The rod is independently heated, and a heat absorber is connected to an opposite end of the rod. Crystalline material is placed in the interior of the sphere and in engagement with the seed crystal, and pressure is applied to it. Encapsulant material having a slightly lower melting point than the crystalline material is disposed between the latter and the spherical container wall. A crystal structure is grown by heating the crystalline material up to a predetermined temperature while controlling heat dissipation through the rod by the application of heat to the rod. Heat application is reduced, allowing heat to escape via the seed crystal and the rod of material, causing the crystalline material to be deposited as a single crystal on the seed crystal. Novelty of the invention is believed to reside in the use of a spherical container with a heat removal rod at one pole of the sphere, the rod providing for control of the shape of the crystal-liquid interface during solidification. These features enable growth of relatively large, defect-free crystals of compound materials.

NASA
PUBLIC AVAILABILITY OF COPIES OF PATENTS AND PATENT APPLICATIONS

Copies of U.S. patents may be purchased directly from the U.S. Patent and Trademark Office, Washington, D.C. 20231 at $1.50 per copy. When ordering patents, the U.S. Patent Number should be used, and payment must be remitted in advance, preferably by money order or check payable to the Commissioner of Patents and Trademarks. Prepaid purchase coupons for ordering are also available from the Patent and Trademark Office.

NASA patent application specifications are sold in paper copy by the National Technical Information Service at price code A02. Microfiche are sold at price code A01. The US-Patent-Appl-SN-number should be used in ordering either paper copy or microfiche from NTIS.

LICENSES FOR COMMERCIAL USE:
INQUIRIES AND APPLICATIONS FOR LICENSE

NASA inventions, abstracted in NASA PAB, are available for nonexclusive or exclusive licensing in accordance with the NASA Patent Licensing Regulations. It is significant that all licenses for NASA inventions shall be by express written instruments and that no license will be granted or implied in a NASA invention except as provided in the NASA Patent Licensing Regulations.

Inquiries concerning the NASA Patent Licensing Program or the availability of licenses for the commercial use of NASA-owned inventions covered by U.S. patents or pending applications for patent should be forwarded to the NASA Patent Counsel of the NASA installation having cognizance of the specific invention, or the Associate General Counsel for Intellectual Property, code GP, National Aeronautics and Space Administration, Washington, D.C. 20546. Inquiries should refer to the NASA Case Number, the Title of the Invention, and the U.S. Patent Number or the U.S. Application Serial Number assigned to the invention as shown in NASA PAB.

The NASA Patent Counsel having cognizance of the invention is determined by the first three letters or prefix of the NASA Case Number assigned to the invention. The addresses of NASA Patent Counsels are listed alongside the NASA Case Number prefix letters in the following table.

STANDING ORDER SUBSCRIPTIONS

NASA SP-7039, Section 1 and its supplements are available from the National Technical Information Service (NTIS) on standing order subscription as PB 86-911100 at the price of $11.50 domestic and $23.00 foreign. Standing order subscriptions do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber.

PATENT LICENSING REGULATIONS

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

14 CFR Part 1245

License of NASA Inventions

AGENCY: National Aeronautics and Space Administration.

ACTION: Interim regulation with comments requested.

SUMMARY: The National Aeronautics and Space Administration (NASA) is revising its patent licensing regulations to conform with Pub L. 96-517. This interim regulation provides policies and procedures applicable for the license of federally owned inventions in the custody of the National Aeronautics and Space Administration and implements Pub L. 96-517. The object of this subpart is to use the patent system to promote the utilization of inventions arising from NASA supported research and development.

EFFECTIVE DATE: July 1, 1981. Comments must be received in writing by December 2, 1981. Unless a notice is published in the Federal Register after the comment period indicating changes to be made, this interim regulation shall become final regulation.

FOR FURTHER INFORMATION CONTACT: Mr. John C. Mannix, (202) 755-3954.

SUPPLEMENTARY INFORMATION:

PART 1245—PATENTS AND OTHER INTELLIGENT PROPERTY RIGHTS

Subpart 2—Licensing of NASA Inventions

(a) “Federally owned invention” means an invention, plant, or design which is covered by a patent, or patent application, in the United States or in a foreign country, to which the United States is entitled under law or Government regulations.

(b) “NASA invention” means an invention, plant, or design which is covered by a patent, or patent application, in the United States or in a foreign country, to which the United States is entitled under law or Government regulations.

(c) “Partially available for licensing” means an invention, plant, or design which is licensed only if the applicant has supplied the invention in the United States or in a foreign country to which the United States is entitled under law or Government regulations.

(d) “Small business concern” means a small business concern as defined at 13 CFR 121.3-8, and in subcontracting, contained in 13 CFR 121.3-12, will be used.

(e) Practical application” means to manufacture in the case of a composition or product, to practice in the case of a process or method, or to operate in the case of a machine or system; and, in each case, under such conditions as to establish that the invention is being utilized and that its benefits are to the extent permitted by law or Government regulations available to the public on reasonable terms.

(f) “United States” means the United States of America, its territories and possessions, the District of Columbia, and the Commonwealth of Puerto Rico.

§ 1245.202 Authority to grant licenses.

NASA inventions shall be made available for licensing if appropriate in the public interest. NASA may grant nonexclusive, partially exclusive, or exclusive licenses thereto under this subpart on inventions in its custody.

Restrictions and Conditions

§ 1245.300 All licenses granted under this subpart.

(a) Restrictions. (1) A license may be granted only if the applicant has supplied NASA with a satisfactory plan for development or marketing of the invention, or both, and with information about the applicant's capability to fulfill the plan.

(2) A license granting rights to use or sell under a NASA invention in the United States shall normally be granted only to a licensee who agrees that any products embodying the invention or produced through the use of the invention will be manufactured substantially in the United States.

(b) Conditions. Licenses shall contain such terms and conditions as NASA determines are appropriate for the protection of the interests of the Federal Government and the public and are not in conflict with law or this subpart. The following terms and conditions apply to any license:

(1) The duration of the license shall be for a period specified in the license agreement, unless sooner terminated in accordance with this subpart.

(2) The license may be granted for all or less than all fields of use of the invention or in specified geographical areas, or both.

(3) The license may extend to subsidiaries of the licensee or other parties if provided for in the license but shall be nonassignable without approval of NASA, except to the successor of that part of the licensee's business to which the invention pertains.

Subpart 2—Licensing of NASA Inventions

§ 1245.200 Scope of subpart.

This subpart prescribes the terms, conditions, and procedures upon which NASA inventions may be licensed. It does not affect licenses which were in effect prior to July 1, 1981; (b) may exist at the time of the Government's acquisition of title to the invention, including those resulting from the allocation of rights to inventions made under Government research and development contracts. (c) are the result of an authorized exchange of rights in the settlement of patent disputes; or (d) are otherwise authorized by law or treaty.

§ 1245.201 Policy and objective.

It is the policy and objective of this subpart to use the patent system to promote the utilization of inventions arising from NASA supported research and development.

§ 1245.202 Definitions.

(a) “Federally owned invention” means an invention, plant, or design which is covered by a patent, or patent application, in the United States or in a foreign country, to which the United States is entitled under law or Government regulations.

(b) “NASA invention” means an invention, plant, or design which is covered by a patent, or patent application, in the United States or in a foreign country, to which the United States is entitled under law or Government regulations.

(c) “Partially available for licensing” means an invention, plant, or design which is licensed only if the applicant has supplied the invention in the United States or in a foreign country to which the United States is entitled under law or Government regulations.

(d) “Small business concern” means a small business concern as defined at 13 CFR 121.3-8, and in subcontracting, contained in 13 CFR 121.3-12, will be used.

(e) Practical application” means to manufacture in the case of a composition or product, to practice in the case of a process or method, or to operate in the case of a machine or system; and, in each case, under such conditions as to establish that the invention is being utilized and that its benefits are to the extent permitted by law or Government regulations available to the public on reasonable terms.

(f) “United States” means the United States of America, its territories and possessions, the District of Columbia, and the Commonwealth of Puerto Rico.

§ 1245.203 Authority to grant licenses.

NASA inventions shall be made available for licensing if appropriate in the public interest. NASA may grant nonexclusive, partially exclusive, or exclusive licenses thereto under this subpart on inventions in its custody.

Restrictions and Conditions

§ 1245.300 All licenses granted under this subpart.

(a) Restrictions. (1) A license may be granted only if the applicant has supplied NASA with a satisfactory plan for development or marketing of the invention, or both, and with information about the applicant's capability to fulfill the plan.

(2) A license granting rights to use or sell under a NASA invention in the United States shall normally be granted only to a licensee who agrees that any products embodying the invention or produced through the use of the invention will be manufactured substantially in the United States.

(b) Conditions. Licenses shall contain such terms and conditions as NASA determines are appropriate for the protection of the interests of the Federal Government and the public and are not in conflict with law or this subpart. The following terms and conditions apply to any license:

(1) The duration of the license shall be for a period specified in the license agreement, unless sooner terminated in accordance with this subpart.

(2) The license may be granted for all or less than all fields of use of the invention or in specified geographical areas, or both.

(3) The license may extend to subsidiaries of the licensee or other parties if provided for in the license but shall be nonassignable without approval of NASA, except to the successor of that part of the licensee's business to which the invention pertains.
PATENT LICENSING REGULATIONS

(4) The license may provide the licensor the right to grant sublicenses under the license subject to the approval of NASA. Each sublicense shall make reference to the license, including the rights retained by the Government, and a copy of such sublicense shall be furnished to NASA.

(5) The license shall require the licensee to carry out the plan for development or marketing of the invention, or both, to bring the invention to practical application within a period specified in the license, and to continue to make the benefits of the invention reasonably accessible to the public.

(6) The license shall require the licensee to report periodically on the utilization or efforts at obtaining utilization that are being made by the licensee, with particular reference to the plan submitted.

(7) All licenses shall normally require royalties or other consideration.

(8) Where an agreement is obtained pursuant to §1245.204(a)(2) that any product embodying the invention or produced through use of the invention will be manufactured substantially in the United States, the license shall recite such agreement.

(9) The license shall provide for the right of NASA to terminate the license, in whole or in part, if:
   (i) NASA determines that the licensee is not executing the plan submitted with its request for a license and the licensee cannot otherwise demonstrate to the satisfaction of NASA that it has taken or can be expected to take within a reasonable time effective steps to achieve practical application of the invention;
   (ii) NASA determines that such action is necessary to meet requirements for public use specified by Federal regulations issued after the date of the license and such requirements are not reasonably satisfied by the licensee;
   (iii) The licensee has willfully made a false statement of or willfully omitted a material fact in the license application or in any report required by the license agreement; or
   (iv) The licensee commits a substantial breach of a covenant or agreement contained in the license.

The license may be modified or terminated, consistent with this subpart, upon mutual agreement of NASA and the licensee.

(11) Nothing relating to the grant of a license, nor the grant itself, shall be construed to confer upon any person any immunity from or defenses under the antitrust laws or from a charge of patent misuse, and the acquisition and use of rights pursuant to this subpart shall not be immunized from the operation of state or Federal law by reason of the source of the grant.

Types of Licenses

§1245.205 Nonexclusive licenses.
(a) Availability of licenses. Nonexclusive licenses may be granted under NASA inventions without publication of availability or notice of a prospective license.

(b) Conditions. In addition to the provisions of §1245.204, the nonexclusive license may also provide that, after termination of a period specified in the license agreement, NASA may restrict the license to the fields of use or geographic areas, or both, in which the licensee has brought the invention to practical application and continues to make the benefits of the invention reasonably accessible to the public. However, such restriction shall be made only in order to grant an exclusive or partially exclusive license in accordance with this subpart.

§1245.206 Exclusive and partially exclusive licenses.

(a) Domestic licenses. Exclusive or partially exclusive licenses may be granted on NASA inventions:
   (i) 3 months after notice of the invention's availability has been announced in the Federal Register, or
   (ii) the license shall reserve to NASA the right of enforcement of the licensed patent pursuant to the provisions of Chapter 29 of Title 35, United States Code, or other statutes, as determined appropriate in the public interest.

(b) Foreign licenses.
   (1) Availability of licenses. Exclusive or partially exclusive licenses may be granted on a NASA invention covered by a foreign patent, patent application, or other form of protection, provided that:
      (i) Notice of a prospective license,
identifying the invention and prospective licensee, has been published in the Federal Register, providing
opportunity for filing written objections within a 60-day period and following
consideration of such objections:

(iii) NASA has not determined that
the grant of such license will tend
substantially to lessen competition or
result in undue concentration in any
section of the United States or in any line
of commerce to which the technology to
be licensed relates, or to create or
maintain other situations inconsistent
with antitrust laws.

(2) Conditions. In addition to the
provisions of § 1245.204, the following
terms and conditions apply to foreign
exclusive and partially exclusive
licensing:

(i) The license shall be subject to the
terms of a confidentiality agreement
to which the licensee, or to create or
maintain other situations inconsistent
with antitrust laws.

(ii) The license shall be subject to the
irrevocable, royalty-free right of the
Government to which the technology to
be licensed relates, or to create or
maintain other situations inconsistent
with antitrust laws.

(iii) NASA has considered whether the
interests of the Federal Government or
be

prospective licensee, has been published
or international organization pursuant
to any existing or future treaty or
agreement with the United States.

(iv) The license shall be subject to any
licenses in force at the time of the grant
of the exclusive or partially exclusive
license.

(v) The license may grant the licensee
the right to take any suitable and
necessary actions to protect the licensed
property, on behalf of the Federal
Government.

(c) Record of determinations. NASA
shall maintain a record of
determinations to grant exclusive or
partially exclusive licenses.

Procedures

§ 1245.207 Application for a license.

An application for a license should be
addressed to the Patent Counsel at the
NASA installation having responsibility
for the invention and shall normally include:

(a) Identification of the invention for
which the license is desired, including
the patent application serial number or
patent number, title, and date, if known;

(b) Identification of the type of license
for which the application is submitted;

(c) Name and address of the person,
company, or organization applying for
the license and the citizenship or place
of incorporation of the applicant;

(d) Name, address, and telephone
number of representative of applicant to
whom correspondence should be sent;

(e) Nature and type of applicant's
business, identifying products or
services which the applicant has
successfully commercialized and
approximate number of applicant's
employees;

(f) Source of information concerning
the availability of a license on the
invention:

(1) A statement indicating whether
applicant is a small business as
defined in § 1245.202(c); or

(2) A statement as to applicant's
capability and intention to fulfill the
plan, including information regarding
manufacturing, marketing, financial, and
technical resources; and

(i) Identification of the fields of use for
which applicant intends to practice the
invention; and

(ii) A statement of the geographic areas
in which applicant intends to
manufacture any products embodying
the invention and geographic areas
where applicant intends to use or sell
the invention, or both;

(iii) NASA has not determined that
the grant of such license will tend
to substantially to lessen competition or
result in undue concentration in any
section of the United States or in any line
of commerce to which the technology to
be licensed relates, or to create or
maintain other situations inconsistent
with antitrust laws.

(2) Conditions. In addition to the
provisions of § 1245.204, the following
terms and conditions apply to foreign
exclusive and partially exclusive
licensing:

Procedures

§ 1245.207 Application for a license.

An application for a license should be
addressed to the Patent Counsel at the
NASA installation having responsibility
for the invention and shall normally include:

(a) Identification of the invention for
which the license is desired, including
the patent application serial number or
patent number, title, and date, if known;

(b) Identification of the type of license
for which the application is submitted;

(c) Name and address of the person,
company, or organization applying for
the license and the citizenship or place
of incorporation of the applicant;

(d) Name, address, and telephone
number of representative of applicant to
whom correspondence should be sent;

(e) Nature and type of applicant's
business, identifying products or
services which the applicant has
successfully commercialized and
approximate number of applicant's
employees;

(f) Source of information concerning
the availability of a license on the
invention:

(1) A statement indicating whether
applicant is a small business as
defined in § 1245.202(c); or

(2) A statement as to applicant's
capability and intention to fulfill the
plan, including information regarding
manufacturing, marketing, financial, and
technical resources; and

(i) Identification of the fields of use for
which applicant intends to practice the
invention; and

(ii) A statement of the geographic areas
in which applicant intends to
manufacture any products embodying
the invention and geographic areas
where applicant intends to use or sell
the invention, or both;

(iii) Identification of licenee's previously
granted to applicant under Federally
owned inventions;

(j) A statement containing applicant's
best knowledge of the extent to which
the invention is being practiced by
private industry or Government, or both,
or is otherwise available commercially;
and

(k) Any other information which
applicant believes will support a
determination to grant the license to
applicant.

§ 1245.208 Processing applications.

(a) Applications for licenses will be
initially reviewed by the Patent Counsel
of the NASA installation having
responsibility for the invention. The
Patent Counsel shall make a preliminary
recommendation to the Director of
Licensing. NASA Headquarters, whether
to: (1) grant the license as requested, (2)
grant the license with modification after
termination with the licensee, or (3) deny
the license. The Director of Licensing
shall review the preliminary
recommendation of the Patent Counsel
and make a final recommendation to the
NASA Assistant General Counsel for
Patent Matters. Such review and final
recommendation may include, and be
based on, any additional information
obtained from applicant and other
sources that the Patent Counsel and the
Director of Licensing deem relevant to
the license requested. The determination
to grant or deny the license shall be
made by the Assistant General Counsel
for Patent Matters based on the final
recommendation of the Director of
Licensing.

(b) When notice of a prospective
exclusive or partially exclusive license
is published in the Federal Register in
accordance with § 1245.206(a)(1)(ii)(A) or
1245.206(b)(1)(i), any written
objections received in response thereto
will be considered by the Director of
Licensing in making the final
recommendation to the Assistant
General Counsel for Patent Matters.

(c) If the requested license, including
any negotiated modifications, is denied
by the Assistant General Counsel for
Patent Matters, the applicant may
request reconsideration by filing a
written request for reconsideration
within 30 days after receiving notice of
denial. This 30-day period may be
extended for good cause.

(d) In addition to, or in lieu of
requesting reconsideration, the
applicant may also appeal the denial of
the license in accordance with
§ 1245.211.

§ 1245.209 Notice to Attorney General.

A copy of the notice provided for in
§§ 1245.206(i)(1)(ii)(A) and
1245.206(b)(1)(i) shall be sent to the
Attorney General.

§ 1245.210 Modification and termination
of licenses.

Before modifying or terminating a
license, other than by mutual agreement,
NASA shall furnish the licensee and any
sublicensee of record a written notice of
intention to modify or terminate the
license, and the license and any
sublicensee shall be allowed 30 days
after such notice to remedy any breach
of the license or show cause why the
license should not be modified or
terminated.

§ 1245.211 Appeals.

(a) The following parties may appeal to
the NASA Administrator or designate
any decision or determination
concerning the grant, denial,
interpretation, modification, or
termination of a license:

(1) A person whose application for a
license has been denied;

(2) A licensee whose license has been
modified or terminated, in whole or in
part; or

(3) A person who timely filed a
written objection in response to the
notice required by
§§ 1245.206(a)(1)(ii)(A) or
and who can demonstrate to the satisfaction of NASA that such person may be damaged by the Agency action.

(b) Written notices of appeal must be filed within 30 days (or such other time as may be authorized for good cause shown) after receiving notice of the adverse decision or determination, including, an adverse decision following the request for reconsideration under § 1245.204(c). The notice of appeal, along with all supporting documentation should be addressed to the Administrator, National Aeronautics and Space Administration, Washington, DC 20546. Should the appeal raise a genuine dispute over material facts, fact-finding will be conducted by the NASA Inventions and Contributions Board. The person filing the appeal shall be afforded an opportunity to be heard and to offer evidence in support of the appeal. The Chairperson of the Inventions and Contributions Board shall prepare written findings of fact and transmit them to the Administrator or designee. The decision on the appeal shall be made by the NASA Administrator or designee. There is no further right of administrative appeal from the decision of the Administrator or designee.

§ 1245.212 Protection and administration of inventions.

NASA may take any suitable and necessary steps to protect and administer rights to NASA inventions, either directly or through contract.

§ 1245.213 Transfer of custody.

NASA having custody of certain Federally owned inventions may transfer custody and administration in whole or in part, to another Federal agency, of the right, title, or interest in any such invention.

§ 1245.214 Confidentiality of information.

Title 35, United States Code, section 209, provides that any plan submitted pursuant to § 1245.207(h) and any report required by § 1245.204(b)(6) may be treated by NASA as commercial and financial information obtained from a person and privileged and confidential and not subject to disclosure under section 552 of Title 5 of the United States Code.

James M. Boggs,
Administrator.

# NASA Patent Abstracts Bibliography

A Continuing Bibliography
Section 1: Abstracts (Supplement 31)

**Abstract**

Abstracts are provided for 85 patents and patent applications entered into the NASA scientific and technical information system during the period January 1987 through June 1987. Each entry consists of a citation, an abstract, and in most cases, a key illustration selected from the patent or patent application.
