ACCESSION NUMBER RANGES

Accession numbers cited in this Supplement fall within the following ranges.

STAR (N-10000 Series)  N87-20171 — N87-21845

IAA (A-10000 Series)   A87-31363 — A87-35190
AEROSPACE MEDICINE AND BIOLOGY

A CONTINUING BIBLIOGRAPHY WITH INDEXES

(Supplement 300)

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in July 1987 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA).*
This supplement is available from the National Technical Information Service (NTIS), Springfield, Virginia 22161, price code A05.
INTRODUCTION

This Supplement to Aerospace Medicine and Biology lists 232 reports, articles and other documents announced during July 1987 in Scientific and Technical Aerospace Reports (STAR) or in International Aerospace Abstracts (IAA). The first issue of the bibliography was published in July 1964.

In its subject coverage, Aerospace Medicine and Biology concentrates on the biological, physiological, psychological, and environmental effects to which man is subjected during and following simulated or actual flight in the Earth's atmosphere or in interplanetary space. References describing similar effects of biological organisms of lower order are also included. Such related topics as sanitary problems, pharmacology, toxicology, safety and survival, life support systems, exobiology, and personnel factors receive appropriate attention. In general, emphasis is placed on applied research, but references to fundamental studies and theoretical principles related to experimental development also qualify for inclusion.

Each entry in the bibliography consists of a bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged by STAR categories 51 through 55, the Life Sciences division. The citations, and abstracts when available, are reproduced exactly as they appeared originally in IAA or STAR, including the original accession numbers from the respective announcement journals. The IAA items will precede the STAR items within each category.

Seven indexes — subject, personal author, corporate source, foreign technology, contract, report number, and accession number — are included.

An annual index will be prepared at the end of the calendar year covering all documents listed in the 1987 Supplements.

Information on the availability of cited publications including addresses of organizations and NTIS price schedules is located at the back of this bibliography.

PAGE IV INTENTIONALLY BLANK
Medical emergencies, especially those resulting from accidents, frequently require the administration of intravenous fluids to replace lost body liquids. The development of a prototype space flight intravenous injection system is presented. The definition of requirements, injectable concentrates development, water polisher, reconstitution hardware development, administration hardware development, and prototype fabrication and testing are discussed. LIFE SCIENCES (GENERAL)

A87-31924
ACTINOMYCES ISOLATED FROM THE CENTRAL ANTARCTIC ICE SHEET [AKTINOMITYUZ TOLŠCHI LEDNIKA TSENTRAL'NOI ANTARKTIDY]

Using an aseptic method of microbial sampling and isolation, viable actinomyces of two genera (Nocardia Trevisan and Nocardiosis Meyer) were isolated from 202 ice samples taken from different depths (down to 320 m) of the central Antarctic ice sheet. The organisms were similar to those reported earlier to be present in probes of the Antarctic soil, snow, and air. The approximate age of the ice layers from which the two actinomyces were isolated is estimated to be from 150 to 9400 years.

A87-31925
PHYSICOCHEMICAL LAWS GOVERNING THE ADAPTATION OF THE ORGANISM TO EXTREME ENVIRONMENTS [FIZIKO-KHIMICHESKIE ZAKONOMERNOSTI ADAPTATSII ORGANIZMA K EKSTREML'NYM VOZDEISVIAM]

Physicochemical patterns of the parameter changes induced by extreme environments in the energy homeostasis of the human organism are examined. It is shown that under conditions of extreme environments the metabolism of an open dynamic autoregulated system shifts to a new stationary level of functioning. The qualitative and quantitative characteristics of changes in the energy exchange parameters in the transition period are obtained. It is shown that the adequacy of nonspecific defense adaptive reactions of a biological system depends on the functional state of the regulatory processes active during the transition period.

A87-32551
BROWNIAN MOTION OF A BIOPOLYMER AFFECTED BY GAUSSIAN FORCE IN A GRAVITATIONAL FIELD

Stochastic processes of a Brownian motion of biopolymer molecules are discussed in relation to the description of a phase transition of a polypeptide chain as a denaturation process of a biopolymer. In order to estimate a dynamical behavior of biopolymer molecules affected by any external force, both the velocity correlation and the spectral density of a Brownian particle affected by Gaussian force in gravitational field are calculated. As a result, it is proved that the characteristic properties of the denaturation process are affected not only by the temperature variation but also by any external force in the gravitational field.

A87-32552
SINGLE NEURON ACTIVITY IN THE RAT LATERAL HYPOTHALAMUS DURING HYPOGRAVIC SIMULATION INDUCED BY BODY SUSPENSION

The effects of sensory input changes on the activity of single lateral hypothalamic neurons (SLHN) in rats in hypogravitic conditions were examined experimentally. Unanesthetized subjects were suspended in a 45 deg head-down tilt configuration while implanted wires provided a pathway to monitoring electrical activity in the SLHNs. Other rats were monitored while standing on the floor and in a horizontal position. Head-down tilting suppressed SLHN responses in half the neurons, demonstrating the proprioceptive, vestibular and/or baroreceptor inputs all LHN activity, which also changes in response to food intake. Further studies in actual microgravity conditions are judged necessary to discern the exact impacts of behavioral, metabolic and autonomic disorders on the LHN responses.

A87-32554
DIFFERENCE IN DIRECTIONAL EFFECTS OF CENTRIFUGAL ACCELERATION (+GZ,-GZ) UPON CARDIOPULMONARY SYSTEM OF HAMSTERS
H. SATAKE, K. MATSUNAMI (Gifu University, Tsukasa, Japan), Y. MIZUNO (Daido Institute of Technology, Nagoya, Japan), H. URANO (Fuku Medical School, Japan), and S. WATANABE (Nagoya, University, Japan) IN: International Symposium on Space Technology and Science, 15th, Tokyo, Japan, May 19-23, 1986, Proceedings. Volume 2. Tokyo, AGNE Publishing, Inc., 1986, p. 2073-2078. refs

Results are reported from studies of the impact the direction of acceleration has on the cardiopulmonary responses of hamsters on a disorientator with a 1.5 m radius. The subjects were 16 male hamsters who were slightly anesthetized to stabilize the electrophysiological signals. The forces applied were +2 G and +4 G for 15 min 20 second and 14 min, respectively. ECG, stroke volume, respiratory responses and rate, and tidal volume data were recorded during and after the trials. Cardiopulmonary responses were more sensitive to +Gz than -Gz (transverse) acceleration. The biphasic stroke volume of some of the hamsters did not reverse after 4 Gz acceleration, and exhibited bradycardia, sino-atrial block and a negative P wave. The same hamsters displayed lower decreases in -Gz acceleration, which indicates that cerebral ischemia produced by a footward fluid shift in +Gz conditions may produce greater cardiopulmonary deconditioning than footward acceleration.

A87-32555  A LIFE-SUPPORT SYSTEM DEVELOPED FOR THE FISH EXPERIMENT IN SPACELAB

The life support system devised for the twolabrinthectomized carp scheduled to be flown on the Spacelab-J mission is described. Design constraints were a compact device capable of keeping the fish alive for up to 2 weeks in space without posing risks to the crew. A double-walled structure was selected to ensure that no water would escape. The fish containment parcel has a bundle of microporous polypropylene hollow fibers for circulating oxygen into the water to maintain the oxygen level at over 7.0 ppm. Activated charcoal and zeolite, in amounts of 150 g and 300 g, respectively, have been determined to be effective as filters for removing NH3, bacteria, fecal matter, and fish aroma from 50 liters of water.

A87-34300  CRYSTALLIZATION OF 30S SUBPARTICLES FROM THERMUS THERMOPHILUS RIBOSOMES [KRISTALLIZATSIIA 30S SUBCHASTITS RIBOSOM THERMUS THERMOPHILUS]

A neuronal model of space color vision is developed on the basis of data obtained in earlier neurophysiological and psychophysiological studies in primates. The model explains such psychophysiological phenomena as the color fusion of the high-frequency components of an image, the McCollough (1965) effect, simultaneous and consecutive color contrasts, the constancy of color perception, and the perception of nonspectral colors. Two principal mechanisms for color vision are proposed. The first provides a set of coefficients which describe the spatial distribution of light and color in a site of the vision field; the second is responsible for determining the color in each homogeneously colored area of this site.

A87-34705*  LOUISIANA UNIV., KY.
INTERACTIONS OF THE INTERFERON SYSTEM WITH CELLULAR METABOLISM
GERALD SONNENFELD (Louisville, University, KY) IN: Clinical applications of interferons and their inducers (2nd edition). New York, Marcel Dekker, Inc., 1986, p. 43-60. Research supported by the Kentucky Tobacco and Health Research Institute. refs (Contract EPA-R-807619; NCA2-OR-400-901; NCA2-OR-400-101)

The results of studies concerning the interaction of the interferon (Inf) system with the activities of carcinogens, tumor promoters, and cytochrome P-450 are presented. The results show that the addition of a tumor promoter (TPA or 4-O-methyl-TPA) to a tissue culture enhances virus-induced Inf-gamma production, suggesting a potential value of tumor promoters in the biosynthesis of commercial Inf. On the other hand, the carcinogens were reported to inhibit the induction of Inf-alpha/beta in cultured cells and in intact animals (with no effect on the administered or preformed Inf). The demonstration of a correlation between the carcinogenic potential of a compound and its inhibitive effect on Inf production suggests a possible use of the Inf production assay in the evaluation of the carcinogenicity of chemicals. In addition, it was shown that the induction of Inf-alpha/beta as well as the administration of this Inf depresses the levels of rat liver cytochrome P-450 which is responsible for binding lipophilic drugs, steroids, and carcinogens, thus increasing the toxicity of the respective chemical.

A87-34716*  MASSACHUSETTS UNIV., WORCESTER.
ROLE OF GLUCOCORTICOIDs IN THE RESPONSE OF RAT LEG MUSCLES TO REDUCED ACTIVITY
STEPHEN R. JASPERS (Massachusetts, University, Worcester) and MARC E. TISCHLER (Arizona, University, Tucson) Muscle and Nerve (ISSN 0148-639X), vol. 9, July-Aug. 1986, p. 554-561. refs (Contract NAGW-227; NIH-AM-28847)

Adrenalectomy did not prevent atrophy of rat soleus muscle during 6 days of tail cast suspension. Cortisol treatment enhanced the atrophy and caused atrophy of the weight-bearing soleus and both extensor digitorum longus (EDL) muscles. Unloading led to increased sarcoplasmin protein concentration in the soleus but cortisol administration increased the myofibrillar (+stromal) protein concentration in both muscles. Suspension of hindlimbs of adrenalectomized animals led to faster protein degradation, slower sarcoplasmin protein degradation, and faster myofibrillar protein synthesis in the isolated soleus, whereas with cortisol-treated animals, the difference in synthesis of myofibrillar proteins was enhanced and that of sarcoplasmin proteins was abolished. Both soleus and EDL of supported, cortisol-treated animals showed faster protein degradation. It is unlikely that any elevation in circulating glucocorticoids was solely responsible for atrophy of the soleus in this model, but catabolic amounts of glucocorticoids could alter the response of muscle to unloading.

A87-34871  SPACE STATION - OPPORTUNITIES FOR THE LIFE SCIENCES

Opportunities for bioprocessing, basic biological research and space medicine offered by the Space Station are examined. Space offers two conditions which are duplicated on earth only with great difficulty: microgravity and high vacuum. Microgravity permits enhanced control of temperature and concentration gradients and particle distributions in fluids and containerless processing. Several likely candidates for electrophoresis processing in space are identified, noting that the greatest obstacle to realizing the new industry is commercial doubts as to its viability. Areas of cell and animal physiology, radiation biology, and exobiology that would benefit from Space Station research are considered. Finally,
necessary space medicine research, by NASA and ESA, in medicine, toxicology, human factors, psychology, and adaptation to microgravity in support of the Space Station program are explored.

Sustaining life with total automation is a difficult problem for GAS canisters. The length of time between setting the experiment and flight, and the conditions of a completely sealed container, no guarantee on launch delay, orientation, and the possibility of contamination all tend to exclude experiments with living matter. This experiment examines the growth of a nontoxic, everyday fungus, Phycomyces, in a microgravity environment. Data from this experiment will help define the mechanism by which plants determine the direction of gravity. The bioengineering problems were solved only after numerous tests and design changes. Phycomyces normally have a shelf life of approximately one week. Storing the fungus for two months, activating the fungus for growth and precise timing were the major obstacles. Solutions were found for storage by drying the fungus spores onto pieces of filter paper. Activation occurs when this filter paper is dropped onto the growth medium, via a solenoid system. The problem of timing is partially solved by growing more than one chamber of the fungus at different time intervals. This experiment proves that the simpler a design, the better it works. Author

Geotaxis profiles for 20 Drosophila species and semispecies at different ages have been examined using a calibrated, adjustable slant board device. Measurements were taken at 5 deg intervals ranging from 0 deg to 85 deg. Clear strain and species differences are observed, with some groups tending to move upward (+-geotaxis) with increasing angles, while others move downward (+ geotaxis). Geotactic responses change with age in some, but not all experimental groups. Sample geotaxis profiles are presented and their application to ecological and aging studies are discussed. Data provide a baseline for future evaluations of the biological effects of microgravity. Author

51 LIFE SCIENCES (GENERAL)

LIQUID DROP STABILITY FOR PROTEIN CRYSTAL GROWTH IN MICROGRAVITY ROBERT B. OWEN, BETH H. BROOМ, ROBERT S. SNYDER, and RON DANIEL Apr. 1987 17 p

(NASA-TP-2724; NASA 1.60:2724) Avail: NTIS HC A02/MF A01 CSCL 06B

It is possible to grow protein crystals for biomedical research in microgravity by deploying a protein-rich solution from a syringe, forming a drop in which crystallization can occur with the proper degree of supersaturation. Drop stability is critical to the success of this research, due to the large drop sizes which can be achieved in space. In order to determine the type of syringe tips most suitable to support these large drops, tests were performed during brief periods of weightlessness onboard the NASA KC-135 low-gravity simulation aircraft. The drops were analyzed using three simple models in which the samples were approximated by modified pendulum and spring systems. It was concluded that the higher frequency systems were the most stable, indicating that of the syringes utilized, a disk-shaped configuration provided the most stable environment of low-gravity protein crystal growth. Author

EFFECT OF LIGHT AND DEVELOPMENT OF PHOTOSYNTHETIC CELLS Final Report M. GIBBS 1986 11 p

(Contract DE-AC02-76ER-03231) (DE87-005183; DOE/ER-03231/10) Avail: NTIS HC A02/MF A01

Green algae exposed to an anaerobic environment adapt to a hydrogen metabolism and can photoxidoize H2O to H2 and O2 as well as carbon compounds to H2 and CO2. The products from fermentation of chloroplastic starch included acetate, formate, ethanol, CO2, H2, glycerol, and lactate. Light caused an increase in H2 and CO2 and decreases in acetaldehyde and ethanol. Aerobically isolated algal chloroplasts adapted to a hydrogen metabolism where H2 was evolved. The oxyhydrogen reaction was not detected in the chloroplasts. Acelate is photoassimilated anaerobically by Chlamydomonas cells to lipid, carbohydrate, CO2, and H2 with a stoichiometry indicating a light-dependent anaerobic glyoxylate cycle as the primary assimilatory pathway. DOE

N87-20729\*# Midwest Research Inst., Golden, Colo.

(Contract DE-AC02-83CH-10093) (DE87-005578; SERI/SP-232-3079) Avail: NTIS HC A08/MF A01

The SERI Microalgae Culture Collection provides a repository for strains identified or developed for mass culture biomass production and makes these strains readily available to the research community. The strains in the collection have been selected for their potential in biomass fuel applications, and many produce significant quantities of cellular storage lipids. All of the newly added strains have been recently isolated by SERI and its subcontractors in organized screening programs. Many have been tested in outdoor mass culture systems, and several have demonstrated excellent performance as biomass producers. The strains added to the collection this year have been isolated from inland saline waters and marine waters. We believe that the strains in this collection can provide a source of extremely useful organisms, both for laboratory experimentation and for mass culture research. Most of the strains are currently nonaxenic. Again this year, cultures will be shipped free of charge to interested researchers. An important function of the culture collection catalog, in addition to listing the available strains, is to provide culture and performance data for each of the organisms. By collecting a summary of the requirements and characteristics of these organisms, we hope to allow requestors of cultures to begin productive research with a minimum of preliminary work on culture techniques. EFFECT OF LONG-TERM SPACEFLIGHT ON RAT BRAIN POLYAMINE CONTENT
Avail: NTIS HC A08/MF A01
The concentration of polyamines, i.e., putrescine, spermidine and spermine, was measured in different brain compartments of rats flown for 18.5 days on Cosmos-1129. Exposure to space flight led to changes in the polyamine content that were the most distinct in medulla oblongata. It is suggested that the changes develop as a result of a chronic stress associated with the effects of weightlessness.

52 AEROSPACE MEDICINE

Includes physiological factors; biological effects of radiation; and effects of weightlessness on man and animals.

A87-31693 AEROBIC FITNESS AND SUSCEPTIBILITY TO MOTION SICKNESS
G. R. BANTA, W. C. RIDLEY, J. MCHUGH, J. D. GRISSETT, and F. E. GUEDRY (U.S. Navy, Naval Aerospace Medical Research Laboratory, Pensacola, FL) Aviation, Space, and Environmental Medicine (ISSN 0095-6562), vol. 58, Feb. 1987, p. 105-108. refs
Susceptibility to motion sickness was evaluated in 29 males having high, moderate, and low levels of aerobic fitness. Subjects underwent Coriolis (cross-coupled) vestibular stimulation on a Stille-Werner rotator during a 10-min modification of the Brief Vestibular Disorientation Test. Variables evaluated were: spin time before aborting (ST), heart rate (HR), respiratory rate (RR), skin temperature (Tsk), subject observation values (SV), and observation values. Aerobic fitness and ST for the total population were inversely related (r = -0.506, p less than 0.01). Difference in ST was significant (F(2/26/ = 6.67, p less than 0.01), with the high aerobic group demonstrating an earlier ST and greater SV than the low aerobic group (Student-Newman-Keuls; alpha = 0.05). Analysis of HR, RR, and mean Tsk between groups revealed limited differences. Based on these data, men with high aerobic fitness appear to have an increased susceptibility to motion sickness.

A87-31569 NOISE, VIBRATION AND CHANGES IN WAKEFULNESS DURING HELICOPTER FLIGHT
ULF LANDSTROM and PER LOFSTEDT (National Board of Occupational Safety and Health, Umea, Sweden) Aviation, Space, and Environmental Medicine (ISSN 0095-6562), vol. 58, Feb. 1987, p. 109-118. Research supported by the National Board of Occupational Safety and Health of Sweden. refs
The investigation was carried out in cooperation with the helicopter school AF 1 in Boden. Measurements were made in two different types of helicopter, Hkp 3 and Hkp 6. Three different parameters were recorded during the flights: noise, vibrations, and wakefulness. Noise and vibration exposures were mainly correlated to the main rotor energy and frequency. Both types of exposure were dominated by lower frequencies, below 10 Hz. Analyses of wakefulness during long-distance flights, about 4 h, and short-distance flights, less than 2 h, were based on EEG and EKG recordings. As expected the level of wakefulness was influenced by the stress upon the pilots. Take-offs and landings, as well as unexpected events during the flight, were correlated to an increased level of wakefulness. In some cases flying was correlated to a gradual increase of weariness. The correlation between weariness, types of flying, and the external environmental factors of noise and vibration, is also discussed.
A87-31695* National Aeronautics and Space Administration. Lyndon B. Johnson Space Center, Houston, Tex. 
FAILURE OF METOCLOPRAMIDE TO CONTROL EMESIS OR NAUSEA DUE TO STRESSFUL ANGULAR OR LINEAR ACCELERATION
RANDALL LEE KOHL (NASA, Johnson Space Center; Universities Space Research Association, Houston, TX) Aviation, Space, and Environmental Medicine (ISSN 0095-6562), vol. 58, Feb. 1987, p. 125-131. refs
Orally administered metoclopramide (REGLAN) at doses of 10 or 20 mg, 75 min prior to either stressful linear acceleration (parabolic flight) or cross-coupled accelerative semicircular canal stimulation in a rotating chair was evaluated for its ability to prevent emesis or nausea I, respectively. Although metoclopramide is an effective antiemetic agent that enhances gastric emptying and prevents cancer chemotherapy-induced emesis, it was not possible to demonstrate any significant (p less than 0.05) effects of this drug on motion sickness.  

A87-31697 CHANGES OF SKIN POTENTIAL LEVEL AND OF SKIN RESISTANCE LEVEL CORRESPONDING TO LASTING MOTION DISCOMFORT
NAOJI ISU, JIRO KOO, and NOBUYUKI TAKAHASHI (National Aerospace Laboratory, Chofu, Japan) Aviation, Space, and Environmental Medicine (ISSN 0095-6562), vol. 58, Feb. 1987, p. 136-142. refs
The qualitative correspondence between degree of motion discomfort and electrodermal activity was investigated. Skin potential level (SPL) and skin resistance level (SRL) in the arousal sweat area and the thermal sweat area were recorded. In order to induce motion discomfort, Coriolis stimulation and/or horizontal body rotation were provided by using a rotatory chair. The degree of discomfort was evaluated according to reports by the subjects. It was observed that SPL depolarized in the arousal sweat area as well as in the thermal sweat area and SRL lowered in the thermal sweat area coincidentally with lasting motion discomfort. SPL showed better correspondence to lasting motion discomfort than did SRL, especially during the recovery period from the motion discomfort. 

A87-31699 HYDROSTATIC THEORY AND G PROTECTION USING TILTING AIRCRAFT SEATS
The hydrostatic theory of the cause of pilot blackout proposes that the inadequate blood pressure at the eye, which produces blackout, is caused by acceleration acting on the hydrostatic column of blood (h) supplying the eye. However, no general agreement exists as to the origin for h in the thorax. Published data pertaining to the causes of pilot blackout were reviewed with the aim of finding the correct origin for h. On the basis of the reanalysis of Burns' (1975) data relating the value of the acceleration tolerance (T) to the seat-back angle, it was found that a simple hydrostatic model, with h measured from the aortic valve to the eye, yields an excellent fit with the nonlinear equation relating the value of T to both the seat-back angle and the correction to the back angle, phi. The value of phi (13.74 deg) derived using this model and Burns's data was the same as the independent estimate of phi for the same seat derived from values of h (which were measured by X-rays with h referenced to the aortic valve and the eye) published by Burns and Whinnery (1984). 

A87-31700 INFECTIOUS DISEASE IN ANTARCTICA AND ITS RELATION TO AEROSPACE MEDICINE - A REVIEW
BARD C. COSMAN and PAUL W. BRANDT-RAUF (Columbia-Presbyterian Medical Center, New York) Aviation, Space, and Environmental Medicine (ISSN 0095-6562), vol. 58, Feb. 1987, p. 174-179. refs
In many aspects, an Antarctic Station provides parallels to the environments encountered in space exploration, particularly with reference to infectious disease. In both instances, small groups of people live in isolation for long periods of time in a functionally sterile atmosphere. Therefore, studies of infectious disease in Antarctica should provide important insights into the experiences to be expected in spaceflight. This paper presents a summary of the information on the infectious and immunologic aspects of isolation derived over the years from research in Antarctica. 

A87-31748 THE BRAIN HEMODYNAMICS OF PILOTS IN ALTITUDE CHAMBER STUDIES [SOSTOIANIE GEMODI NAMICH BLAGODATNYH POGOVOROK PRI BAROKAMERNYKH ISLEDOVANIAH]
The effect of hypoxia on the cerebral blood supply was investigated in pilots during a 30-min stay in an altitude chamber at 54 kPa using partial integral rheography. The changes in the hemocirculation parameters used to measure cerebral blood supply exhibited by subjects with poor adaptability to hypoxia were different from those of normal, well-adapted subjects. In particular, the cerebral blood flow and cerebral blood supply in well-adapted subjects increased during the high-altitude exposure and returned to normal levels 3-5 min after the exposure to atmospheric pressure. Poorly adapted subjects, on the other hand, exhibited either a decrease of the cerebral blood supply (which was particularly significant in the basal-vertebral sinus) or an increase which continued after the end of low-altitude exposure. It is suggested that encephalographic examination may reveal signs of potential hypersensitivity to hypoxia and that the presence of alpha activity in the EEGs may be of predictive value. 

A87-31976 MEDICAL SUPPORT FOR YOUNG PILOTS [MEDITSINSKOE OБESPECHENIE POLETOV, VYPOLNIAEMYKH MOLODYMI LETCHIKAMI]
Due to drastic differences between the physical and emotional environments of flight school and actual service, which are connected with unique stress during the initial period of service, pilots at the start of their career demand special medical attention. The medical program designed for the thorough examination of young pilots arriving at their base and for treating sources of potential mental or physical disorders is described. The first stage of the program includes a thorough examination of the medical history of a pilot, his present physical and emotional status, dexterity, and acuteness, as well as his habits, social skills, family life, and living conditions. This stage of the program includes lectures for pilots' wives, preparing them for their role as partners in their husbands' stressful and demanding careers. The second stage of the program consists of the appraisal of the functional status of a pilot during the first month of flight assignments. Pilots displaying slow learning or those committing errors in the piloting techniques are subjected to a battery of physiological and psychological tests designed to pinpoint the source of their unsatisfactory performance. 

I.S.

In Russian.

The symptoms of the sicknesses that are specific for divers working in shallow or deep waters and that are frequent causes of fatalities are discussed. The detrimental health conditions caused by working under water include barotrauma, which is a most frequent cause of professional fatalities in scuba divers and is a danger even in very shallow (1.5-3 m) water, decompression illness, and poisoning by either oxygen, carbon dioxide, nitrogen, or exhaust gases contaminating compressed air used in the divers' gas balloons. Emergency measures which must be taken immediately upon appearance of the symptoms of each of the above conditions are described.

A87-32005* National Aeronautics and Space Administration. Lyndon B. Johnson Space Center, Houston, Tex.

Echocardiographic measurements of left ventricular volume were obtained from 17 members of four Space Shuttle crews before and after 5- to 8-day space flights. Measurements obtained 1 h after landing indicated increases in the heart rate (HR), mean arterial pressure, and systemic vascular resistance values. On the other hand, the end-diastolic volume index (EDVI) fell 17 ml/sq m, and the stroke volume index (SVI) fell 15 ml/sq m. Measurements taken 1-2 weeks later demonstrated that the HR values returned to normal, but the EDVI and SVI values remained significantly below preflight levels, despite the ability of the subjects to ambulate and exercise. The results indicate that a space flight induces significant changes in heart volume affecting the left-ventricle function. It is suggested that the prolonged recovery period is related to the high level of aerobic conditioning in these subjects.

Artificial gravity is the only currently known method for avoiding the physiological effects of long-term weightlessness which Space Station and Mars mission crew would encounter. Techniques such as exercise and lower body negative pressure devices have not proven sufficiently effective. Vestibular excitement by the Coriolis force rules out use of a rotating room that could be contained in spaceships. A leading alternative for a Mars mission is to have a nuclear reactor tethered to a spacecraft a kilometer away. The entire configuration would rotate about its center, providing artificial gravity and minimizing the Coriolis force at the populated end. Ground-based bedrest and rotating room and proposed Space Station co-orbiting variable gravity experiments which may determine the minimal artificial gravity needed to avoid the effects of prolonged weightlessness are summarized.

A study was performed of the effects of motion sickness on electrodermal activity. Human subjects, 16-28 yr old, underwent trials in a rotary chair in darkness. Electrodes were attached to the palms distal to palmaris and two areas in the antibrachial palmaris. Skin potential measurements were collected before and during counterclockwise rotation at 6 deg/sec-sq up to 190 deg/sec rotation. Peak angular velocities were kept constant while the subjects moved their heads up and down at 5 sec intervals. Tests featuring constant 120 deg/sec rotations were also carried out for an hour or until vomiting was imminent, and at 1 deg/sec accelerations to 180 deg/sec and then deceleration to stationarity at constant rates. Skin potentials were found to depolarize with the progress of motion discomfort, then return to pre-trial levels after stopping. The degree of depolarization, particularly the magnitude of the P subwave, was correlated with the degree of discomfort.

The known effects and adaptive responses by humans to long-duration spaceflight are summarized. The absence of the mechanical tension and deformations produced by gravity on earth removes the hydrostatic pressure on blood and other fluids and the weight loads on the musculo-skeleton system and modifies the afferent input in space, producing disordered reactions of the afferent systems and sensory conflicts, decreased dorsal hypothalamic activity, and displacement of blood and other fluids. Fluid losses occur, along with blood pooling in the viscera, limited delivery to the cardiopulmonary area, inhibited erythropoiesis, decreased muscle tone, etc. Space sickness generally disappears after about 6 days, while muscular coordination is initially decreased and later regained with sufficient accuracy, though requiring less muscular effort. The Soviet experience thus far, however, indicates that bone mineral loss is reversible, and that red blood cell counts rapidly revert to normal after the return to earth. The database now extends to 8 mos duration missions.

A method is presented in which 11 echocardiographic variables are used to characterize six previously derived classes of individuals, consisting of two reference classes of airline pilots.
and four classes of Mirage 2000 fighter pilots. From the average matrix of the intrasample dispersion, a multistep calculation of the square of the distance between the sample centers is performed. From the analysis it is suggested that the division of the reference sample into two statistical samples is justified, while that of the Mirage 2000 population into four groups is not. Results from a scaling of the contributions of individual echocardiographic variables indicate that the 11 variables can be reduced to six, and the validity of the proposed Q index is discussed.

DOPPLER VELOCIMETRY UNDER A LOADING FACTOR - ATTEMPT AT EVALUATING CAROTID BLOOD FLOW [VELOCIMETRIE DOPPLER SOUS FACTEUR DE CHARGE - TENTATIVE D'EVALUATION DES DEBITS CAROTIDIENS]

The feasibility of using Doppler velocimetry in the hemodynamic investigation of the cardiovascular response to acceleration is demonstrated, with application to human physiological adaptation to space flight. The technique permits the measurement of the velocity of circulating blood and eliminates errors related to the movements of subject and test chamber. Accelerations up to 5 G at an increase of 0.25 G/s were tested in an experiment with a 32 year old male subject, and a reduction in internal carotid blood flow was shown, in agreement with classical hemodynamic theory.

PAPILLARY DRUSEN AND AERONAUTICAL FITNESS [DRUSES PAPILLAIRES ET APTITUDE AERONAUTIQUE]

Problems posed by papillary drusen are discussed in relation to the fitness of aeronautical personnel, with emphasis on their potential evolution and difficulties in their diagnosis. Papillary drusen may appear as an epiphenomenon in the course of ocular or heredodegenerative affections including glaucoma and uveitis or severe chorioretinitis, and they may be complicated by hemorrhages. The phenomenon is associated with chronic irritation of the optical nerve fibers, leading in some cases to long-term deficits in visual acuity. It is suggested that certain aeronautical stresses, particularly those which military aviation personnel are subject to, may precipitate the evolution of papillary drusen.

THE FITNESS PROBLEM WITH RESPECT TO A CORONARY MALFORMATION IN A HELICOPTER PILOT [PROBLEME D'APTITUDE A UN PILOTE D'HÉLICOPTÈRE]

The case of a helicopter pilot found to have an anomalous origin of the right coronary artery from the pulmonary artery after a continuous xiphoid murmur was observed is discussed, and the diagnosis of this anomaly and its implications for aeronautical fitness are discussed. With direct reimplantation in the aorta, the circumflex artery was found by coronaryography to be of practically normal size one year after surgery. Due to the vulnerability to coronary insufficiency and heart failure associated with this congenital abnormality, surgical correction is recommended in order to achieve adequate aeronautical fitness.

BACK PAINS OF HELICOPTER PILOTS IN 1985 - RESULTS OF A MULTIPART STUDY [RACHIALGIES DES PILOTE HÉLICOPTÈRES EN 1985 - RESULTATS D'UNE ENQUETE MULTIPARTIE]

A study, consisting of a questionnaire, a clinical examination, and an X-ray examination, of 232 helicopter pilots and 175 nonpilot flight personnel is performed to investigate the phenomenon of back pain. For the pilots, chronic back pain, particularly in the lumbar region, occurred most frequently, with fewer incidents of acute back pain and complications such as cervico-brachial neuralgia. Back pain appeared to be common to both groups, and its source is thought to be muscular-skeletal. The onset of lumbar region pain is found to occur much later in terms of accumulated flight time than in the past, presumably due to better designed seats and technological improvements damping aircraft vibration.

NEW PERSPECTIVES OFFERED BY THE SPECIFIC QUANTITY OF CUTANEOUS FREE CHOLESTEROL [PERSPECTIVES NOUVELLES OFFERTES PAR LE DOSAGE SPECIFIQUE DU CHOLESTEROL LIBRE CUTANE]

A specific skin cholesterol assay method is proposed to demonstrate the relationship between cutaneous cholesterol level and degree of aortic atheromatosis, with application to the early detection of atheromatosis and arteriosclerosis in the selection of personnel for high responsibility positions. The method of Folch et al. (1957) is used in the extraction of lipids from biological media, and the quantification of cholesterol is performed by gas-liquid chromatography. The average cholesterol rate determined from 10 samples is 0.0014 g/g of skin, in close agreement with the result of Bouissou et al. (1982).

SINUS BAROTRAUMA IN THE AERONAUTICAL ENVIRONMENT. II [DU BAROTRAUMATISME SINUSIEN EN MILIEU AERONAUTIQUE. II]

The diagnosis, treatment and prevention of nasal sinus barotrauma as they apply to aeronautical fitness are discussed, and the need for education in this area is underlined. Treatments for 1st, 2nd, and 3rd degree barotraumas are first considered, in addition to the surgical interventions often necessary for more evolved conditions including frontal sinus lesions. prophylactic approaches to sinus barotrauma include rigorous personnel selection, and the maintenance of proper pressure gradients aboard aircraft either through pressurized garments or cabin pressure maintenance. Military and civil fitness norms are discussed, and it is noted that these norms can be used to eliminate predisposed subjects. Medical-legal aspects of this condition are also considered.

MEDICATION PRESCRIPTIONS AND FITNESS FOR FLIGHT [LES PRESCRIPTIONS MEDICAMENTEUSES ET L'APTITUDE AU VOL]
Courses of medication therapy for various medical conditions are evaluated with respect to their effect on the fitness of flight personnel, with emphasis on the dangers of side-effects. Prophylactic treatments such as the malaria vaccine do not usually produce side-effects, while prophylaxis for air sickness requires monitoring. While certain illnesses such as hypothyroidism and arterial hypertension are incompatible with flight fitness, a carefully monitored well-tolerated treatment of medication (such as the use of certain diuretics and beta-blockers for hypertension) can often bring affected personnel within the medical norms for fitness. Also considered are the effects of common medications including Tagamet and nonsteroid antiinflammatories and therapies for asthma and tuberculosis.

A87-33398
SARC OIDOSIS IN AERONAUTICAL MEDICINE [LA SARCIOIDOSE EN MEDECINE AERONAUTIQUE]
The diagnosis, clinical manifestations, and possible cardiac localizations of sarcoid affections are discussed, in addition to their repercussions on the aeronautical community. Early diagnosis can usually be made with systematic thoracic radiography, and general diagnostic examinations including histopathological lesions, a particular biological profile including the elevation of angiotension converting enzyme, and the affection of certain organs. Clinical manifestations of cardiac sarcoidosis are primarily myocardial, and include congestive cardiac insufficiency and ventricular arrhythmia. Classifications which are incompatible with aeronautical fitness include a cardiac or nervous localization, the existence of pulmonary parenchymal anomalies, and the general indication of corticotherapy.

A87-33399
PROBLEMS POSED BY EXTRATERRRESTIAL RADIATION FOR MANNED SPACE FLIGHT [PROBLEMES POSES PAR LES RAYONNEMENTS EXTRATERRESTRES DANS LES VOLS SPATIAUX HABITES]
The dangers of extraterrestrial radiation for manned space flight are discussed, and results of dosimetric studies performed aboard satellites of the U.S. and USSR are considered. Highly energetic primary galactic cosmic rays (GCR) encounter atmospheric N and O nuclei to produce, by complex nuclear reactions, secondary GCR. Satellites at elevations of 1-2 AU experience 0.020-0.050 rads/d. The variation of radiation dosage with latitude and solar activity, and the dosages experienced in the radiation belts, are discussed. Solar eruptions, appearing in the sunspot regions, are characterized by strong H-alpha emission, and effects of the solar wind including nausea and vomiting have been reported during manned space flight. Deformation of the magnetosphere by the solar wind is also considered. 

A87-33400
MEDICAL FITNESS STANDARDS FOR CIVIL-AVIATION FLIGHT PERSONNEL IN THE UNITED STATES OF AMERICA [LES STANDARDS MEDICAUX D'APTITUDE DU PERSONNEL NAVAIGNT CIVIL AUX ETATS-UNIS D'AMERIQUE]
Some of the recommendations submitted to the Federal Aviation Administration for the revision of medical fitness norms for civil-aviation flight personnel are discussed. Cardiovascular manifestations including coronary disease and arterial hypertension greater than 150/95, and psychiatric problems including psychosis and pharmaco-toxic dependencies, are considered as criteria for nonfitness. Visual guidelines are suggested, and the need for spirometry for smokers and asthmatics, and for annual hematocrits for personnel above the age of 40, is underlined. Other conditions which are associated with a lack of fitness include insulin-dependent diabetes, quadriplegic antecedents to cerebral affections, and epilepsy.

A87-33401
CABIN PRESSURE VARIATION MEASUREMENTS DURING COMMERCIAL FLIGHTS - WITH REFERENCE TO BAROTRAUMATIC OTITIS [MESURE DES VARIATIONS DE PRESSION/CABINE AU COURS DES VOLS COMMERCIAUX - A PROPOS DES OTITES BAROTRAUMATIQUES]
To study the potential for occurrence of barotraumatic otitis in commercial air travel, cabin pressure measurements have been obtained for three aircraft along four different flight itineraries. Results show conformity within the recommended operational limits, with the largest variation of 1.5 mb over 1-10 s durations being insufficient to cause aerotitis, except in conjunction with a previously existing chronic condition. Furthermore, it is noted that the risk of barotrauma decreases with aeronautical experience, and varies with the ability of personnel to prepare themselves for turbulence.

A87-33450
THE EFFECTS OF WHOLE-BODY VIBRATION
HEINRICH DUPUIS (Mainz, Universitats, West Germany) and GEORG ZERLETT (Rheinische Braunkohlenwerke AG, Cologne, West Germany) Research supported by the Hauptverband der gewerblichen Berufsgenossenschaften. Berlin and New York, Springer-Verlag, 1986, 171 p. Translation. refs
The effects of whole-body vibration on the human body are examined from the perspective of occupational medicine. Chapters are devoted to terminology and definitions, the stress-strain concept in whole-body vibration (WBR), the acute effects of mechanical vibration, chronic WBR effects, the influence of particular modes of WBR, preventive measures, and protective regulations and guidelines. The most clearly proven WBR effects are found to be those on respiration (hyperventilation), the vestibular system, vision, motor performance, and (chronically) the spine and stomach. Diagrams, drawings, graphs, photographs, tables of numerical data, and a glossary are provided.

A87-33504
SENSITIVITY TO LIGHT
DONALD C. HOOD (Columbia University, New York) and MARCIA A. FINKELSTEIN (South Florida University, Tampa, FL) IN: Handbook of perception and human performance. Volume 1. New York, Wiley-Interscience, 1986, p. 5-1 to 5-66. refs
Sensitivity is studied as a function of wavelength, size, duration, and retinal eccentricity of aperiodic stimuli. Consideration is given to visual receptors and their pigments, correcting for light loss, spectral sensitivity, and photometric measurement. The absolute sensitivity, which is the sensory threshold of the dark-adapted eye, is
analyzed in terms of spatial and temporal factors, sensitivity and eccentricity, and rod and cone systems. Incremental sensitivity which is the detectability of a change of intensity is examined; emphasis is placed on measuring changes in intensity discrimination and incremental threshold curves for the rod and cone systems. Dark adaptation and the equivalent background principle are discussed.

A87-33507
COLORIMETRY AND COLOR DISCRIMINATION
Concentration is given to the measurement of radiant energy, the spectral luminous efficiency function, and photometry. Wavelength, colorimetric purity, and lights of equal luminance discriminations and the effects of stimuli manipulation and chromatic adaptation on discrimination are examined. The use of the Young-Helmholtz trichromatic theory, the Hurvich and Jameson (1955) theory, the opponent-process theory, and line-element theories to describe color vision is studied. The classification of color defects and congenital color defects are discussed.

A87-33508
EYE MOVEMENTS
The geometric aspects of stationary eyes orientation to the three-dimensional world; the three-dimensional aspects of the anatomy and movements; and the use of cartography to handle three-dimensional problems are reviewed. Physiological principles related to different types of eye movements, various methods for measuring eye movements, and models for studying eye movements are described. Experimental data on eye movements under different circumstances, such as eye movements with a fixed visual target, in complete darkness, and to rolling targets, are presented and discussed.

A87-33509
THE VESTIBULAR SYSTEM
The structure, physiology, and psychophysics of the vestibular system are reviewed. The composition and dynamics of the otolith organs, the afferent signal from the otolith organs, the central projections of otolith afferents, and linear acceleration thresholds are discussed. Consideration is given to the characteristics of the vestibular canals, the afferent signal from the vestibular canals, the central projections of canal afferents, and rotary acceleration.

A87-33517
BINOCULAR VISION
The advantages of binocular and monocular sensitivities are analyzed and compared. Binocular suppression and rivalry and stereopsis are examined. Free stereoscopy, stereoscopes, filter separation techniques, and random-dot stereograms, which are methods of displaying a visual scene in three dimensions, are described. The resolution and dynamics of binocular vision are discussed and the theories utilized to explain binocular vision are reviewed.

A87-33941
HYPERBARIC HYPOXIA REVERSIBLY INHIBITS ERYTHROCYTE PHOSPHOLIPID FATTY ACID TURNOVER
The effect of hyperbaric hypoxia on the acylation of membrane phospholipids was studied by measuring the rates of activation of exogenous tritiated oleic acid to acyl thioester and of transesterification of the thioester into membrane phospholipids in intact human erythrocytes obtained 1 h after an exposure of the subjects to a hyperbaric oxygen atmosphere (3.5 h, 100 pct O2, 3 ATA). Exposure to pure oxygen was found to inhibit both the acylation and transesterification reactions by more than 30 percent, with partial recovery detected 24 h later. On the other hand, no rate changes were observed when isolated membranes from the same batches of cells were used in similar experiments. It is suggested that the decrease in the incorporation of tritiated oleic acid after hyperbaric hypoxia may reflect an early event in the pathogenesis of oxygen-induced cellular injury and that it may be a useful index for the assessment of the tolerance of tissues to hypoxia.

MAGNESIUM HOMEOSTASIS DURING HIGH-INTENSITY ANAEROBIC EXERCISE IN MEN
PATRICIA A. DEUSTER, ERAN DOLIV, SUSAN B. KYLE, RICHARD A. ANDERSON, and ERIC B. SCHOOOMAKER (Uniformed Services University of the Health Sciences, Bethesda; USDA, Vitamin and Mineral Nutrition Laboratory, Beltsville, MD) Journal of Applied Physiology (ISSN 0161-7567), vol. 62, Feb. 1987, p. 545-550. Research supported by the Uniformed Services University of the Health Sciences and USDA. refs
The relative contributions of the breathing frequency and the tidal volume to the increase in ventilation observed in humans during acute or prolonged exposure to hypoxia were assessed. End-tidal O2 tension, end-tidal CO2 tension, and expired airflow were measured with a fuel-cell O2 analyzer, an IR analyzer, and expired airflow were measured with a fuel-cell O2 analyzer, an IR analyzer, and a hot-film flowmeter, respectively. Arterial O2 saturation was monitored by ear oximetry. It was found that an increase in the tidal volume accounted for the increased ventilation during 7 to 30 min of isocapnic and poikilocapnic hypoxic exposures and during 7 h of poikilocapnic hypobaric hypoxia (4800 m in a hypobaric chamber); tidal volume was also a major contributor in sea-level residents during 3 days of isocapnic hypoxic exposure (4100-4600 m). On the other hand, in sea-level residents during 3 days of poikilocapnic hypobaric hypoxia, the rise in ventilation was mainly due to an increase in the breathing frequency. Thus, while tidal volume contributes more than the breathing frequency to the increase in ventilation during a brief hypoxia, in prolonged poikilocapnic hypoxia the increased frequency is mainly responsible for the rise in ventilation.

A87-33943
BREATHING PATTERN IN HYPOXIC EXPOSURES OF VARYING DURATION
The relative contributions of the breathing frequency and the tidal volume to the increase in ventilation observed in humans during acute or prolonged exposure to hypoxia were assessed. End-tidal O2 tension, end-tidal CO2 tension, and expired airflow were measured with a fuel-cell O2 analyzer, an IR analyzer, and a hot-film flowmeter, respectively. Arterial O2 saturation was monitored by ear oximetry. It was found that an increase in the tidal volume accounted for the increased ventilation during 7 to 30 min of isocapnic and poikilocapnic hypoxic exposures and during 7 h of poikilocapnic hypobaric hypoxia (4800 m in a hypobaric chamber); tidal volume was also a major contributor in sea-level residents during 3 days of isocapnic hypoxic exposure (4100-4600 m). On the other hand, in sea-level residents during 3 days of poikilocapnic hypobaric hypoxia, the rise in ventilation was mainly due to an increase in the breathing frequency. Thus, while tidal volume contributes more than the breathing frequency to the increase in ventilation during a brief hypoxia, in prolonged poikilocapnic hypoxia the increased frequency is mainly responsible for the rise in ventilation.

UNALTERED NOREPINEPHRINE-HEART RATE RELATIONSHIP IN EXERCISE WITH EXOGENOUS HEAT
L. B. ROWELL, G. L. BRENGELMANN, and P. R. FREUND

Plasma norepinephrine (NE) and epinephrine (E) concentrations were measured in six normal young men during mild to severe exercise, with and without superimposed heat stress. The primary objective was to observe whether the normally close relationship between heart rate and log NE concentration is upset when heat rate at a given work load is increased by heat stress. Exercise, beginning at 50 W, was graded in 50-W increments lasting 10 min each up to 200 W, which lasted 5-10 min. Each subject went through the protocol twice, once with skin temperature kept low by a water-perfused suit and then with skin temperature raised to 38 C. Exogeneous heart stress raised log circulating NE concentration in proportion to the rise in heart rate at a given work load so that the usual relationship between these variables, previously observed during other stresses, was preserved. In contrast to some other stresses, heat stress had no added effect on E concentration, indicating that this stress during exercise raises sympathetic neural activity (as reflected in the rise in NE) without stimulating additional adrenal release of E. A87-34404
THE ROLE OF VAVILOV-CERENKOV RADIATION IN VISUAL SENSATIONS INDUCED BY PROTONS [ROL' IZLUCHENIIA VAVILOVA-CERENKOV V ZRITEL'NYKH OSHUCHUSHENIACHYK VYZVANNYKH PROTONAMI]

The mechanism responsible for the detection of ionizing particles by the human eye and for the production of a "flash" sensation was studied using 1-ms monoenergetic proton beams directed at the subject's eye and recording the location, the features and the moment of the appearance of the 'flash' sensations. In particular, the relative importance in this mechanism of the Vavilov-Cerenkov radiation induced in the vitreous humor, as opposed to the importance of alternative mechanisms (the scintillation of the eye tissues or the direct stimulation of the retina), was investigated by comparing the sensations caused by 460 and 1850 MeV beams and by irradiating the eye from different angles. Bright diffuse flashes were seen with the 1850-MeV beams but not with the 460-MeV beams even when high-intensity 460-MeV beams were used. This evidence and other results (e.g., localization of the flash in the vision field after lateral) indicate that the proton-induced Cerenkov radiation in the vitreous body plays a dominant role in the sensation of the retina.

RESEARCHERS ARE STUDYING HOW OUR BODIES REACT TO LONG STAYS IN A WEIGHTLESS ENVIRONMENT
LORETTA KETT BIERER Commercial Space (ISSN 8756-4831), vol. 2, no. 4, Winter 1987, p. 46-49.

Medical consequences of long-duration spaceflight are examined, including diminished capacity of heart and blood vessels, a tendency for blood to pool in the upper body in space and in the legs on return to earth, and the loss of calcium and other minerals from the weight-carrying bones. Of the problem areas defined by NASA for investigation, calcium metabolism and bone loss are likely to be the most important because the magnitude of the calcium loss from the body appears to be the deciding factor for the duration of the flight. Muscle atrophy and bone loss left Soviet cosmonauts of the 211-day Salyut 6/Soyuz mission in very weak condition. Experiments in which growing rats were exposed to weightlessness for 19 days, showed that the animals required about 25 days for adaptation to earth's gravity and for bone growth to begin again. Additional animal studies are reported, along with research into how weightlessness affects the bone remodeling process. NASA has targeted several areas for study: the time required for bone loss to plateau, the possibility of irreversible bone loss, the toxic effects of calcium and phosphorus released from bone on soft tissue (particularly the kidneys), and the potential for fracture. Efforts to prevent bone demineralization have concentrated on diet and exercise, as with a treadmill device.

RADIATION PROTECTION GUIDELINES FOR SPACE MISSIONS

NASA's current radiation protection guidelines date from 1970, when the career limit was set at 400 rem. Today, using the same approach, but with the current risk estimates, a considerably lower career limit would obtain. Also, there is considerably more information about the radiation environments to be experienced in different missions than previously. Since 1970 women have joined the ranks. For the first time, other than the need to reexamine the radiation protection guidelines. This task was undertaken by the National Council on Radiation Protection and Measurements Scientific Committee 75 (NCRP SC 75). Below the magnetosphere the radiation environment varies with altitude and orbit inclination. In outer space missions galactic cosmic rays, with the small but important heavy ion component, determine the radiation environment. The new recommendations for career dose limits, based on lifetime excess risk of cancer mortality, take into account age at first exposure and sex. The career limits range from 100 rem (4.0 Sv) for a 24 year old female to 400 rem for a 55 year old male compared to the previous single limit of 400 rem (4.0 Sv). The career limit for the lens of the eye was reduced from 600 to 400 rem (6.0 to 4.0 Sv).

SPACE BIOLOGY AND MEDICINE ON THE TWENTY-FIFTH ANNIVERSARY OF THE FIRST SPACEFLIGHT OF YURI ALEKSEYEVICH GAGARIN

Avail: NTIS HC A08/MF A01

Soviet Space exploration has come a long way in the quarter century since the first manned flight of V. A. Gagarin on 12 April 1961. The first flight, which lasted only 106 min, was to determine human capacities under conditions prevailing in space. As of 1 January 1986, Soviet cosmonauts had made 109 manned flights involving 60 people. Some of the
participants had been in space 2 to 3 and even 5 times (V. A. Dzhanibekov). The Salyut orbital stations became a permanent space research laboratory. The crew consisting of L. D. Kizim, V. A. Dzhanibekov and V. P. Savinykh stayed for 23 days. V. A. Dzhanibekov and V. P. Savinykh were able to find and dock with the inactive Salyut-7 station in space, repair it and completely restore its work capacity. In the 25 years that have passed since the first flight, space science has become a solid part of life, an inseparable element of the scientific, economic and sociocultural life of mankind. The file of organizations that are planning space exploration is full of applications for investigations in the interests of the most diverse scientific disciplines and the national economy.

**STAGES OF DEVELOPMENT OF THE PROBLEM OF FLIGHT SAFETY IN AVIATION MEDICINE**

Aviation medicine is a direct participant in technological progress in aviation. The high level of development of aviation equipment at the present stage would be inconceivable without adequate solutions of problems of its control by man. In past years, aviation medicine was enriched with new theoretical conceptions and vast practical experience in the area of assuring flight safety. New growth points emerged, both in aviation medicine proper and at its boundaries with allied disciplines in engineering psychology and ergonomics. Organization of protection of man on the basis of providing an optimum environment was recognized as the key direction of scientific research at the first stage of development of aviation medicine, since in essence it determined the assurance of human vital functions and work capacity. Practical implementation of the basic ideas of protection of an individual connected into a technological system was based not only on advances in applied physiology, but new investigative methods that permitted gaining deeper understanding of the biological bases of adaptation to a unique environment and disclosure of mechanisms and patterns that control processes of interaction between the environment and man.

**INTERLABYRINTHINE ASYMMETRY, VESTIBULAR DYSFUNCTION AND SPACE MOTION SICKNESS**

Avail: NTIS HC A08/MF A01

Data suggest that a disorder in the labyrinthine paired function can be regarded as the factor responsible for the initiation and development of space motion sickness. This concept is based on the assumption that in the norm the vestibular function is to a certain extent asymmetric which is made up for by a compensatory center in the central nervous system. Exposure to an unusual space environment leads to a disorder of this compensation and development of a new vestibular asymmetry. This exposure involves: elimination of the difference in the weight of otolith membranes, disorder of the canal-otolith interaction, asymmetric blood-CSF changes, distinct interhemispheric asymmetry, and general stress. Vestibular asymmetry developing in the weightless state may become sufficient for the generalization of afferent impulses to normal stimuli and development of a strong reaction. Adaptation to weightlessness continues due to rearrangements in the compensatory center responsible for lower vestibular asymmetry. The compensatory mechanisms evolved in weightlessness continue to function during a certain time interval after recovery. They facilitate a re-initiation of vestibular asymmetry and motion sickness that is mainly provoked by head movements, as in the weightless state.

**EVALUATION OF PHYSICAL WORK CAPACITY OF COSMONAUTS ABOARD SALYUT-6 STATION**

Avail: NTIS HC A08/MF A01

Electrocardiograms of Salyut-6 prime crewmembers recorded during their exercises on a bicycle ergometer and treadmill are presented. ECG were recorded by a portable tape recorder Cardiocassette and transmitted to the Earth via the radiocommunication channel. This procedure helped to better understand cardiovascular adaptation to different workloads, including submaximal, as well as reserve abilities of the body at various flight stages. This can be used advantageously to correct and control the training process as well as to predict the cardiovascular status at the final flight stage.

**BLOOD LIPIDS AND INCIDENCE OF LIPEMIA IN FLIGHT PERSONNEL**

Avail: NTIS HC A08/MF A01

The content of cholesterol and triglycerides was measured in healthy pilots. Over 1500 subjects were examined and age-related norms of the parameter were established. They were compared with published data. Physiological variations of cholesterol and triglycerides were related to age, height and body weight. The authors developed a method for diagnosing hyperlipidemia based on the agreement or disagreement between experimentally measured and theoretically calculated values. The authors maintain that hyperlipidemia can be diagnosed if the difference between the real and expected values is over 10%. The authors calculated the incidence of hyperlipidemia in all subjects examined (over 2100) and found that it was high: even in pilots of the age group 20 to 29 years hyperlipidemia occurred in 30% of the subjects.

**LINK BETWEEN ASYMMETRY OF OPTOKINETIC NYSTAGMUS, OPTOVESTIBULAR AND VESTIBULOVEGETATIVE STABILITY**

Avail: NTIS HC A08/MF A01

Comparative quantitative analysis of physiological asymmetry of the optokinetic nystagmus produced predominantly by central optokinetic stimulation (field of vision = 30 deg) or peripheral stimulation (field of vision = 110 deg) reveals an objective correlation between the asymmetry coefficient of the central optokinetic nystagmus with respect to the angular velocity of its slow phase and susceptibility to motion sickness caused by Coriolis and pseudo-Coriolis acceleration, the nystagmus velocity being up to 4 deg/sec.
Aerospace Medicine, Vol. 20, No. 3, May - Jun. 1986

PHYSIOLOGICAL MECHANISMS LIMITING EXTERNAL RESISTANCE TO RESPIRATION

A study was performed on 8 healthy male subjects to investigate the effect of nonelastic resistance 6-40 GPa (the air flow velocity being 90 1/min) on the duration of proprioceptive reflexes of respiratory muscles, volume and velocity parameters of forced exhalation. Resistance of 15 and 25 GPa combined with a workload of 100 to 150 W increased the duration of proprioceptive reflexes from 0.18 + or - 0.015 to 0.29 + or - 0.012 sec and to 0.38 + or - 0.06 sec, respectively, which indicates fatigue of respiratory muscles. Resistance of 25 GPa reduced significantly (by 55%) the maximum volume velocity of forced exhalation and increased its duration by 31%, the exhalation volume decreasing insignificantly (by 6%). The major factor limiting man's tolerance to external respiration resistance is functional deficiency of proprioceptive regulation of respiration and strength and velocity of respiratory muscles.

Author

INTERPRETATION OF RIGHT HEART KINETOCARDIOGRAM

The effect of hemosorption of blood rheology was examined in 9 healthy men exposed to head-down tilt (8 deg). Venous-venous hemosorption was performed on tilt day 7 using activated charcoal SKN-2M. It was found that by tilt day 7 rheological parameters of blood had increased significantly and returned to the norm after 2-hour hemoperfusion through activated charcoal. This shows that hemosorption can noticeably increase the effectiveness of perfusion on the whole.

INTERPRETATION OF RIGHT HEART KINETOCARDIOGRAM

The effect of hemosorption of blood rheology was examined in 9 healthy men exposed to head-down tilt (8 deg). Venous-venous hemosorption was performed on tilt day 7 using activated charcoal SKN-2M. It was found that by tilt day 7 rheological parameters of blood had increased significantly and returned to the norm after 2-hour hemoperfusion through activated charcoal. This shows that hemosorption can noticeably increase the effectiveness of perfusion on the whole.

PRELIMINARY DEVELOPMENT, HEAD-NECK SIMULATOR. VOLUME 1: ANALYSIS VOLUNTEER TESTS Final Report
(PB87-133245; DOT-HS-807-034) Avail: NTIS HC A06/MF A01 CSCL 06P
The initial work of an ongoing research program of which the objective is to develop a head-neck simulator with omni-directional biofidelity is documented. In Volume 1 of a two volume set, a detailed analysis is presented of a large number of human volunteer tests conducted by the Naval Biodynamics Laboratory in New Orleans. The human subjects were exposed to frontal, lateral and oblique impacts with an impact severity up to 15 g and 17 m/s. The analysis results for each impact direction in a simple analog system that completely specifies the observed dynamical behavior are presented.

The goals for the research were to define, describe, and study those neuroendocrine and mechanical mechanisms that may play a role in the initiation and maintenance of an increase in, or cause regression of, the mass of the left ventricle. Dynamic changes in heart mass have been observed to occur in man and animals: (1) enlargement of the heart is frequently encountered in patients with hypertensive disease, and (2) decrease in heart mass has been reported for men exposed to prolonged space flight. The basic physiologic processes which may explain how these changes occur, and the effects of gain or loss of myocardial mass on cardiac performance were considered significant questions to be answered for the benefit of the National Aeronautics and Space Administration.

Sleep loss appears to influence subsequent exercise in a manner dependent upon the nature of that exercise. To investigate this, the author examined the effect of 24 sleepless hours on the ability to produce and maintain maximal ventilation, a form of exercise involving a limited muscle mass. It was found that sleep loss reduced maximal ventilatory output and also resulted in persistent mood changes. In addition, sleep loss worsened performance of both short- and long-term maximal ventilation, indicating that its influence was not limited to prolonged, boring tasks. It was concluded that those forms of exercise utilizing the largest muscle mass are most resistant to the influence of sleep deprivation.

The EFFECT OF ALTERED LEVELS OF CARBON DIOXIDE ON THE INCIDENCE OF ALTITUDE DECOMPRESSION SICKNESS Ph.D. Thesis
RONALD C. HILL 1987 140 p
(AE-A76558; AFT/CI/NR-87-25D) Avail: NTIS HC A07/MF A01 CSCL 06E
Goats were exposed to 30, 32, and 34 thousand ft simulated altitude while breathing carbon dioxide tensions of 15, 30, or 46 tor in oxygen during 15 min prebreathing and 30 min peak altitude exposures. Risk of decompression was determined by detecting venous gas emboli (VGE) in the pulmonary artery with an implanted Doppler cuff. VGE scores were calculated using the ratio of cardiac cycles containing VGE to total cardiac cycles. The VGE scoring methodology proved sensitive to other treatment effects (air versus oxygen prebreathing); however, no significant change in VGE scores occurred as a result of varying the carbon dioxide level in the inspired air. Furthermore, there was no significant change in cardiac index during the various carbon dioxide exposures and the VGE scores were not correlated with cardiac index. Ground level studies revealed that end-tidal carbon dioxide tensions were significantly elevated at all three levels of inspired carbon dioxide, but no change in cardiac index was observed. It was interesting to note that increasing one animal, conditions producing high VGE scores did not produce arterial emboli. Short duration prebreathing of carbon dioxide in oxygen does not appear to affect DCS incidence.

N87-21557# Research Inst. for Road Vehicles, TNO, Delft (Netherlands).
The report documents the initial work of an ongoing research program of which the objective is to develop a head-neck simulator with omni-directional biofidelity. Volume 2 documents the validation of the proposed analog systems and compares the behavior of the Part 572 and Hybrid 3 head-neck systems with the human volunteer behavior. It follows that both neck designs are stiffer than any of the volunteers in the impact ranges tested. Preliminary results are presented of computer aided design activities in order to improve existing designs in view of these new findings.
Translations from a Russian language bimonthly journal are presented. The articles are mainly on the effects of long duration space flight on physiology of human beings. The contents range from the medical screening of cosmonauts to the effect of a stationary magnetic field on escherichia coli. Other effects examined are long term immobilization, hypokinesia and group dynamics under extreme conditions.

N87-21559# Joint Publications Research Service, Arlington, Va. INCEPTION OF SOVIET SYSTEM OF MEDICAL SCREENING OF COSMONAUTS (HOSPITAL STAGE)
The system of medical selection of Soviet cosmonauts stemmed from that used in aviation medicine, particularly medical expertise of flying personnel. Selection in the hospital included two-stage detailed clinical and physiological examinations using various provocative tests. The system of medical selection and clarification of medical requirements was improved and refined through regular observations over candidates and cosmonauts and careful analysis of their grounding due to medical problems. The American and Soviet systems of selection used at an early stage of space programs are compared and similarities and differences between them are indicated. Author

N87-21560# Joint Publications Research Service, Arlington, Va. EFFECT OF SPACEFLIGHT FACTORS ON HEMOPOIESIS
Published data concerning space flight effects upon hemopoiesis are discussed. Possible pathogenetic mechanisms of hemopoietic changes in response to space flight effects are described. Author

N87-21561# Joint Publications Research Service, Arlington, Va. EVALUATION OF FUNCTIONAL STATE OF PILOTS ON THE BASIS OF INTERHEMISPHERIC ASYMMETRY
The stability of the functional asymmetry of brain hemispheres (with respect to the right ear coefficient-REC) of pilots was investigated during their exposure to extreme flight factors. It was found that the functional asymmetry of brain hemispheres was sufficiently stable in the subjects whose initial REC was not less than 10%. After exposure the decline of the REC in some subjects was accompanied by deterioration of their health status and quality of their operational work. Author

N87-21562# Joint Publications Research Service, Arlington, Va. INDIVIDUAL DISTINCTIONS OF FLUID-ELECTROLYTE METABOLISM DURING HYPOKINESIA WITH HEAD-DOWN TILT FOR 120 DAYS AND EFFICACY OF PREVENTIVE AGENTS
Sodium balance and circulating plasma, intracellular, extracellular and interstitial fluid volumes were measured in the test subjects exposed for 120 days to head-down tilt at -5 deg. The large scatter of the above parameters was associated with individual variations and with the use of different countermeasures against demineralization (exercise and drugs-xydiphone and glucamak). The effect of the counter-measures was different in both qualitative and quantitative terms. It appears that the target of their action was different. The best prophylactic effect was seen when exercise and drugs were used in combination. These findings suggest that individual variations of fluid-electrolyte metabolism during prolonged hypokinesia are related to the different capacity of tissues for water and electrolytes. Author

N87-21563# Joint Publications Research Service, Arlington, Va. BIOELECTRICAL ACTIVITY OF THE HEART AND BLOOD ELECTROLYTES IN ESSENTIALLY HEALTHY SUBJECTS SUBMITTED TO ANTIORTHOSTATIC HYPOKINESIA FOR 120 DAYS
Electrocardiographic parameters and serum concentrations of potassium, sodium, calcium (total and ionized) and magnesium in 6 essentially healthy men, aged 30 to 45 years, were measured before, during and after 120-day head-down tilt at -4.5 deg. A close correlation was demonstrated between T-wave depression and serum concentrations of potassium (direct correlation) and calcium and magnesium (inverse correlation). No consistent changes in the sodium content during the 120-day test were seen. In spite of electrolyte changes in blood induced by head-down tilt, ECG variations showed minor hypokalemia that was not followed by any clinical symptoms. These data can be used to evaluate the status of healthy people exposed to prolonged hypokinesia and to develop adequate prophylactic measures. Author

N87-21564# Joint Publications Research Service, Arlington, Va. EFFECT OF IMMERSION HYPOKINESIA ON SOME PARAMETERS OF HUMAN MUSCLE POTENTIALS
During 3-day immersion hypokinesia stimulation, muscle potentials and averaged potentials of total EMG of m. biceps brachii were investigated in six test subjects. Stimulation potentials were obtained by exciting n. cutaneus with a train of square impulses. The large scatter of the above parameters was associated with individual variations and with the use of different countermeasures against demineralization (exercise and drugs-xydiphone and glucamak). The effect of the counter-measures was different in both qualitative and quantitative terms. It appears that the target of their action was different. The best prophylactic effect was seen when exercise and drugs were used in combination. These findings suggest that individual variations of fluid-electrolyte metabolism during prolonged hypokinesia are related to the different capacity of tissues for water and electrolytes. Author
was 28% and that of averaged potentials of total EMG was 31%.

After immersion hypokinesia the propagation rate decreased
and the length of the depolarized zone of potentials in space shortened.

Factors responsible for these changes are discussed.

CHANGE IN BILE ACID AND LIPID CONTENT OF HUMAN BILE
DURING EXPOSURE TO ANTIORTHOSTATIC HYPOKINESIA AND ITS CORRECTION

Avail: NTIS HC A01/ MF A01

The spectrum of bile acids and bile lipids in men exposed to
120-day head-down tilt was investigated. The test subjects were divided into four groups: group 1-bed rest per se, group 2-bed rest + exercise, group 3-bed rest + drugs normalizing calcium and cholesterol in the bile, the latter being more responsible for concrement formation. Author

POSSIBILITY OF PHARMACOLOGICAL CORRECTION OF REGIONAL OSTEOPOROSIS IN NONBEARING EXTREMITY

Avail: NTIS HC A01/ MF A01

In 20- and 40-day rat studies the prophylactic effect of retabolil and calcitin (calcitonin) against hypodynamics-induced osteoporosis was investigated. Hypodynamics was produced by surgical amputation of the lower third of the leg and hence by loss of the support function of the limb. Retabolil was injected intramuscularly at a dose of 0.2 ml once a day for 10 days and calcitin was injected subcutaneously at a dose of 2 units MRC in 0.5 ml distilled water once a day. The results indicate that osteoporosis in the supportless bone of the leg was more pronounced than that seen during space flight developed in a similar way. In the experiment retabolil and calcitin inhibited the progressive development of osteoporosis but the strongest effect was obtained upon a combined application of the two drugs.

HYDROLYSIS, TRANSPORT AND UTILIZATION OF CARBOHYDRATES IN RATS WITH RESTRICTED MOTOR ACTIVITY

Avail: NTIS HC A01/ MF A01

Carbohydrate hydrolysis, transport and utilization were investigated in rats exposed to diminished motor activity for 90 days. Glycemic curves were examined using provocative tests with equivalent quantities of poly-, oligo- and monosaccharides. Simultaneously, carbohydrases were measured in the homogenates of the pancreas, duodenal mucosa and small intestine as well as radioimmune insulin and glucagon were determined in blood. In the course of hypokinesia carbohydrate hydrolysis, transport and utilization varied in a different manner. At the beginning of exposure the activity of carbohydrases responsible for carbohydrate hydrolysis in the gut and pancreatic enzymes increased which was accompanied by hyperglycemia and rapid utilization of carbohydrates. This is associated with nonspecific reactions to hypokinesia and higher requirements of the body for the energy substrate. By hypokinesia day 30 carbohydrate hydrolysis and transport were inhibited, hypoglycemia developed but glucose utilization remained unchanged.

Author

MORPHOLOGICAL AND BIOCHEMICAL ANALYSIS OF SOME RAT ORGANS AND TISSUES FOLLOWING EXPOSURE TO 1.1 AND 2.0 G GRAVITY

Avail: NTIS HC A01/ MF A01

During 30 days rats were centrifuged at 1.1 and 2.0 G. On centrifugation days 30 the rats showed body mass losses, decrease of plasma ACTH, activation of the renin-angiotensin-aldosterone system (RAAS) and ultrastructural changes in the mossy fiber terminals in the nodulus cortex which were indicative of the state of excitation or excessive excitation in the system of the ulricus receptor cell and vestibular ganglion neuron (RCN). On the 2nd day after centrifugation the ultrastructural changes in the terminals

Author
pointed to a lower activity of the RCN system which was below the physiological norm. As compared to centrifugation day 30, the RAAS became more active on the 2d day of recovery. On the 7th day of recovery the RCN ultrastructure, RAAS and ACTH concentrations returned to the normal. The general trends of the RAAS and RCN changes seen on the 2d day of recovery and identified by other authors at an acute stage of adaptation to microgravity suggest that the data obtained on the 2d day of recovery may be used to analyze certain effects which develop during an acute stage of adaptation to microgravity in mammalian organs and systems responsible for the perception of modified gravity and their adaptation to a new level of gravity. Author

N87-21570# Joint Publications Research Service, Arlington, Va. EFFECT OF ALTERED CIRCULATION ON HUMAN NYSTAGMIC REACTIONS
Avail: NTIS HC A01/MF A01
Optokinetic and vestibulooptokinetic nystagmus in response to optokinetic and combined vestibulo-optokinetic stimulation applied during head-down tilt was investigated. TilT-induced circulation changes produced a modifying effect on nystagmic reactions which included a decrease of optokinetic and vestibulo-optokinetic nystagmus and its subsequent recovery after return to the horizontal position. The absolute parameters of vestibulo-optokinetic nystagmus changed depending on the direction of head movements in the sagittal plane relative to the long axis of the body. Some aspects of the relationships between sensory and nystagmic components of vestibular reactions during conflict stimulation of the vestibular and visual systems are discussed. Author

Avail: NTIS HC A01/MF A01
Forty-seven healthy test subjects were exposed several times each to linear acceleration of varying value. Depending on the acceleration value, they reported subjectively three types of sensations at the threshold level: nondiscriminated in terms of direction (P1), inverted (P2), and discriminated (P3). The acceleration value at which P2 was recorded caused most typical responses in different test subjects whereas at which P3 was recorded induced greatest individual variations. Evoked potentials in response to linear acceleration were recorded in such a manner which excluded potential instrumental artefacts or possible contribution of the acceleration-induced evoked potentials to the normal acceleration and muscle tone changes. The data obtained indicate that acceleration-induced evoked potentials are predominantly of vestibular origin and consist of three peaks, latencies of which are equal to 31.3 + or - 7.2, 69.1 + or - 9.1 and 157.8 + or - 10.5 msec at the threshold where they emerge. Author

Avail: NTIS HC A01/MF A01
A mathematical model of the otolith of mammals represented as a system with parameters of distribution is described. Two versions of the model are analyzed and the lowest frequencies of natural oscillations of the system are evaluated. Author

N87-21573# Joint Publications Research Service, Arlington, Va. REACTIVITY OF ADRENOSYMPATHETIC SYSTEM AND TOLERANCE TO EXERCISE LOAD DURING REPEATED EXPOSURE TO STATIONARY MAGNETIC FIELD
Avail: NTIS HC A01/MF A01
For 30 days, rats were exposed daily, 3 h a day, to a constant magnetic field of 1.6 T. The time within which the rats were swimming with a load until they were fatigued was measured and the concentration of catecholamines in blood and adrenals was determined. Two stages of the response to the magnetic field were identified. During the first stage (1-15 days) physical work capacity increased and the reactivity and reserve ability of the sympatho-adrenal system (SAS) grew. During the second stage (30th day and early recovery period) work capacity returned to normal and the SAS reactivity decreased, although the catecholamines stored in the adrenals remained unchanged. These findings indicate that the SAS is involved in mechanisms underlying changes in work capacity and adaptation processes during exposure to a constant magnetic field. Author

N87-21574# Joint Publications Research Service, Arlington, Va. DIRECT AND INDIRECT EFFECTS OF STATIONARY MAGNETIC FIELD ON BIOLOGICAL SYSTEMS
Avail: NTIS HC A01/MF A01
The effect of a constant magnetic field (CMF) of H = 2.3 x 100,000 A/m (290 G) on the viability and radiosensitivity of E. coli B and the effect of magnetically activated water (MAW) on the radioresistance of rats were examined. The exposure did not influence the growth kinetics of E. coli B. Cell cultivation in the magnetically pretreated nutrient medium enhanced the bacterial growth. Preliminary exposure of bacterial cells to a CMF for 24 and 48 h increased and that for 72 h decreased their radiosensitivity. At the same time the experimental weanlings were given MAW and the controls-tap water. The postradiation longevity of the MAW rats proved extended as compared to that of the controls. The MAW rats showed a higher osmotic stability of erythrocytes, a higher concentration of nucleic acids, and a larger count of leukocytes. Author

AFTER EXPOSURE TO LONG-TERM HIGH-LEVEL +GZ 

TARDOV

Avail: NTIS HC A01/MF A01

Circulatory conditions in the region of the human pelvis minor can be described as follows when performing maneuvers on modern aircraft involving long term accelerations of high levels. In the presence of an increasing hydrostatic component of blood pressure reaching about 27 to 32 kPa with 9 G accelerations, the antigravity gear effects compensatory mechanical compression of the anterior abdominal wall and lower extremities, forcing up to ultimately lead to marked increase in blood volume. The first specific investigation revealed that adverse symptoms related to increased delivery of blood to organs of the pelvis minor can develop in the vascular system and, consequently, in organs situated in the region of the pelvis minor. In view of the clinical significance of the demonstrated phenomena, it is desirable to continue investigation of this matter from the standpoint of both diagnosis and development of a set of preventive measures.

A87-31696 SLOW OSCILLATIONS OF PSYCHOPHYSIOLOGICAL PARAMETERS IN HUMAN OPERATORS DURING MONOTONY

Pavel V. Simonov and Mikhail V. Frolov (AN SSSR, Institut Vysshei Nervnoi Deiatel'nosti i Neirofiziologii, Moscow, USSR) Aviation, Space, and Environmental Medicine (ISSN 0095-6652), vol. 58, Feb. 1987, p. 132-135.

Objective estimation of the human operator's functional state is an urgent problem in applied psychophysiology. It helps to forecast the reliability and efficiency of the operator's activity. Slow (minute) changes in the functional state of 22 subjects were recorded and analyzed in experiments simulating the long-term operator's activity. Spatial synchronization of the electroencephalogram (EEG) and the heart-rate (HR) served as parameters. It was shown that the time of detection and identification of visual signals (geometrical figures) amid visual 'noise' in a long-term observation naturally depends on the changes in a subject's state. These changes were estimated by slow (2-3 min) components of the changes in spatial synchronization of EEG and HR throughout 3 h of the experiment. These objective parameters of the human operator's state may be used to predict efficiency. The connection between minute oscillations of electrophysiological parameters and time of reaction is absent during the first 30 min of the experiment, then appears and increases throughout further stages, becoming clearly marked in its second half.

Author

A87-32631 SIMULATOR SICKNESS - A REVIEW OF ITS COSTS, COUNTERMEASURES, AND PREDICTION

Lawrence H. Frank (Virginia Polytechnic Institute and State University, Blacksburg, VA) and John G. Casali (SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 13-16, 1986. 13 p. refs (SAE PAPER 861782)

The potential costs of vehicle simulators that induce operator discomfort and disorientation and feasible procedural countermeasures for reducing the effects of simulator sickness are discussed. A review of the ability to predict a person's susceptibility to simulator sickness based upon tests of perceptual sensitivity (field dependence-independence) reveals that there is little convincing evidence to support the contention that field-independent subjects are more susceptible than field dependent. A reevaluation of several studies reporting to show such a relationship indicated considerable contradictory evidence.

A87-33007 DEVELOPMENT OF THE CRITERION TASK SET PERFORMANCE DATA BASE

The initial phase of a large-scale experimental study was conducted involving the training and testing of fifty human subjects on the Criterion Task Set (Version 1.0). Testing was performed under baseline conditions and the stressors of noise and sleep loss. The resulting data base includes CTS performance data and subjective ratings obtained using the Subjective Workload Assessment Technique (SWAT) for each task, along with information on subject individual differences. This paper presents the methodology used for the data collection and analysis efforts and provides a summary of the performance and subjective assessment information. In general, no performance differences were found under the noise stress condition. Following sleep loss, response times for the central processing tasks deteriorated as did performance on the Unstable Tracking and Interval Production tasks.

Author

A87-33008 INDIVIDUAL DIFFERENCES IN CRITERION TASK SET PERFORMANCE

As part of a larger standardization study of the U.S. Air Force Criterion Task Set (CTS), a number of individual difference variables were assessed to evaluate their relationship to CTS performance. The selection of these individual difference variables was based

53 BEHAVIORAL SCIENCES

Includes psychological factors; individual and group behavior; crew training and evaluation; and psychiatric research.
on their known or hypothesized relationship to performance or perceptual abilities. This paper reports some of the preliminary findings with regard to these individual difference variables. Of the variables measured, Stimulus Screening, Thrill and Adventure Seeking, Neuroticism, Type A Behavior, and General Intelligence showed the most promising relationships to CTS performance variables.

LINGUISTIC PROCESSING - PHYSIOLOGICAL, PERFORMANCE AND SUBJECTIVE CORRELATES

The CTS linguistic processing task, a standardized loading task that places variable demands upon mental resources associated with the manipulation and comparison of linguistic information, is studied. The mental processes occurring with the performance of this task are validated and explained. The cortical evoked potentials elicited by the task indicate that the resource allocation of the mental processes and the time needed for the comparison and decision processes both increase with an increase in the level of difficulty. The peripheral physiological indices were insensitive to the difficulty levels.

UTILITY AND UTILIZATION OF AIRCREW TRAINING DEVICE ADVANCED INSTRUCTIONAL FEATURES

The utility and utilization of the Advanced Instructional Features (AIFs) capabilities of USAF Aircrew Training Devices (ATDs) was explored by means of a survey of 534 Simulator Instructors from the Air Training Command, Military Airlift Command, Strategic Air Command, and Tactical Air Command training sites. The primary purpose of the survey was to provide a database that could be used in defining the requirements for ATD procurements and in developing future ATD training programs. In general, the features that were rated highest in utility and utilization were those used for training management, variation of task difficulty/fidelity, and monitoring student performance. The level of AIF use was affected somewhat by hardware and/or software deficiencies; however, the presumed training value of an AIF was the most important determiner of its use.

RESOLUTION LEVELS VS RECOGNIZABLE FEATURES IN PROGRESSIVE TRANSMISSION IMAGES

The paper presents an aircraft map system which organizes terrain data in a hierarchical structure so that memory requirements are minimized and pilots are presented with course images containing 'fat pixels' to reduce presentation time. An experiment is carried out to determine the hierarchical level at which a subject viewing the image can discern features which can aid navigation and flight. It is concluded that a high resolution image (512 by 512 or larger) is not necessary to convey pertinent information to a pilot.

ASYNCHRONOUS VISUAL DELAYS AND THE DEVELOPMENT OF SIMULATOR SICKNESS

(Contract N61339-85-C-0044)

Three asynchronous visual throughput delays were investigated for possible relationship to the development of simulator sickness in a fixed-base flight trainer. The SH-60B Vertical Takeoff and Land (VTOL) Simulator, part of the Navy's Visual Technology Research Simulator (VTRS) program, was used to investigate this issue. Twenty-four experienced pilots flew two, 20-minute tasks under each delay condition for a total of three nonconsecutive hours over the course of three days. Objective and self-report indices were collected and, while results showed no differences between delay conditions, there was a high initial incidence of illness among all pilots followed by a rapid adaptation. Relationships between indices are presented along with suggested areas for future research.

DISPLAY PROXIMITY IN MULTICUE INFORMATION INTEGRATION

(Contract F30602-81-C-0206; MDA903-83-K-0255)

This study investigates the ability of an individual to integrate probabilistic information from a number of sources, focusing particularly on the extent to which this integration is influenced by display proximity in space, and object configuration. In support of the principle of compatibility of proximity, the data indicated that performance was clearly ordered according to the degree of display integrity, those in the more integral rectangular conditions were significantly better at integration than those in the bargraph
condition. Proximity of space had little effect upon performance, while proximity in time significantly improved performance in all three format conditions. Speed stress significantly hindered performance in all three format conditions. Finally, memory for isolated, unintegrated attributes of a cue was not harmed by the increasing integrality of the rectangle formats. Author

A87-33029
THE PERCEIVED RELATIONS BETWEEN COLOR, DIRECTION, AND SPEED OF MOTION

This study investigated the perceived relations between color, direction of motion, and speed of motion. According to formal definitions of integrality and separability (Garner and Felfoldy, 1970), direction and speed of motion are integral while color is separable. Ten individuals classified two levels of each dimension in a speeded classification task. Performance with redundant and orthogonal manipulations of all possible pair and triplet combinations was investigated. Results for classifying speed and direction showed that they are asymmetrically integral. That is, variations in direction affected the classification of speed far more than the converse. In addition, redundant color facilitated classification of speed and direction but orthogonal color did not interfere. Classification of color, however, is far from resistant to variations in direction. Both redundant and orthogonal manipulations of direction interfered with color classification. A second experiment demonstrated that the locus of interference for direction on color is at the perceptual level rather than the response stage of processing. It is more difficult to classify the color of a moving stimulus than a stationary one. Taken together, the findings of this study have important implications for the use of color in dynamic flight displays. Author

A87-33028
DISPLAY/CONTROL INTEGRALITY AND TIME-SHARING PERFORMANCE

Time-sharing performance was investigated as a function of the display and response integrality of the time-shared tasks. A manual step-tracking task was time-shared with a Stroop task that could be responded to manually or by speech. A secondary manual step-tracking task was time-shared with a Stroop task of multiple resources. Results were also in concordance with Kahneman's object file model of attention; demonstrating that irrelevant elements within an object were difficult to ignore. The findings demonstrated the interactive effects of resource competition and task integrality on time-sharing performance. Author

A87-33032
THE EFFECTS OF EXPERIENCE AND TRAINING ON THE ASSESSMENT OF PILOT SUBJECTIVE WORKLOAD

This paper presents the results of an experiment designed to evaluate the effectiveness of a pilot workload assessment technique called POSWAT. The motivation for this research arises from the need to evaluate the workload impact of complex cockpit systems being advanced for improved safety, efficiency and reduced pilot workload. In this study 36 experienced instrument pilots gave workload ratings at periodic intervals while making three LOFT type simulated instrument cross-country flights of varying levels of induced workload in a Frasca 141 simulator. Results indicate that the POSWAT workload evaluation method is highly correlated with induced workload. They are also correlated with some, but not all performance measures. Pilot currency was also reflected in POSWAT ratings. Author

A87-33033
EMPirical WORKLOAD AND COMMUNICATIONS ANALYSIS OF SCOUT HELICOPTER EXERCISES

The objective was to find independent real-world data to validate results of paper-and-pencil analyses predicting workload savings by automating functions in an advanced scout-attack helicopter. Videotapes existed that had captured cockpit activities during force-on-force exercises. The videotapes were analyzed to determine the relative workload contribution of communications and crew station activities for the pilot and copilot observer. The findings indicated search activity was the single most time consuming mission-related function other than flying the aircraft. Further, data entry required a crewmember's undivided attention; therefore automated communications should consider the implications of manual data entry which may increase rather than decrease workload. Author
A87-33034
A METHODOLOGY FOR PREDICTING CREW WORKLOAD IN NEW WEAPON SYSTEMS

The Army currently is evaluating the feasibility of single-crewmember operation of a multipurpose, lightweight helicopter, designated the LHX. To determine if a single operator can perform the LHX scout and attack missions, 29 mission segments were analyzed for excessive workload. The mission segments were divided into performance elements (tasks) and were positioned on mission segment timelines. For each performance element, the man-machine interface was identified and estimates of the visual, auditory, cognitive, and psychomotor components of workload were assigned. The mission/task/workload data were used to build one- and two-crewmember computer models designed to predict total workload and to identify overloads in each mission segment. Two baseline analyses were conducted to predict workload under low-automation conditions for one- and two-crewmember LHX configurations. In addition, adiative analyses were conducted to predict the reduction in workload associated with each of 26 individual automation options and 16 combinations of options. The methodology provides a systematic means of predicting human operator workload in advance of system design.

EVIDENCE FOR GLOBAL PROCESSING OF COMPLEX VISUAL DISPLAYS

Polar graphic displays, in which changes in system status are represented by distortions in the form of a geometric figure, were presented to subjects, and reaction time (RT) to discriminate system status was recorded. Of interest was the extent to which reaction time showed evidence of global processing of these displays as the number of nodes and difficulty of discrimination were varied. When discrimination of system status was easy, RT showed no increase with increasing number of nodes, providing evidence of global processing. When discrimination was difficult, systematic increases in RT to discrimination of the number of nodes suggested the invocation of other (local) processes, although the data were not consistent with a node-by-node search process. 

A87-33044 EFFECTS OF DISPLAY PROXIMITY AND MEMORY DEMANDS ON THE UNDERSTANDING OF DYNAMIC MULTIDIMENSIONAL INFORMATION

Two experiments explored the ability of individuals to integrate several sources of information about units or conceptual objects. The task domain might describe the air traffic controller's monitoring of the horizontal and vertical separation of several aircraft, the process controller's supervision of the temperature, pressure, and entropy of several energy systems, or any other multidimensional database. The first experiment examined working memory limits for different object-attribute combinations. When subjects monitored a display with a smaller number of objects with more attributes, responses were slower but significantly more accurate than for a larger number of objects with few attributes. In the second experiment, interest centered on how variations of proximity affect the detection of events that occur within a multidimensional database. Results showed that the use of color and spatial position to define proximity facilitated information integration and thereby event detection. 

A87-33053 IMPROVING VISUAL PERFORMANCE THROUGH VOLITIONAL FOCUS CONTROL

Nine undergraduates at New Mexico State University were trained to control eye accommodation volitionally and, by exercising that acquired ability, to improve their visual acuity, contrast sensitivity, and flash target resolution by varying amounts. Performance improvements were elicited by each of two methods, one relatively complex and the other relatively simple, but larger gains were attained in far less time with the simpler approach in which training is mainly self-administered.

THE RELATIONSHIP BETWEEN WORKLOAD AND TRAINING - AN INTRODUCTION

This paper reviews the relationships among workload, performance, and training. Its goal is to introduce the concepts of workload and training and to suggest how they may be related. It suggests some of the practical and theoretical benefits to be derived from their joint consideration. Training effectiveness can be improved by monitoring trainee workload and the reliability of workload predictions, and measures can be improved by identifying and controlling the training levels of experimental subjects. 

A87-33056* Toronto Univ. (Ontario).

PROGRESS IN MENTAL WORKLOAD MEASUREMENT

Two new techniques are described, one using subjective, the other physiological data for the measurement of workload in complex tasks. The subjective approach uses fuzzy measurement to analyze and predict the difficulty of combinations of skill based and rule based behavior from the difficulty of skill based behavior and rule based behavior measured separately. The physiological technique offers an on-line real-time filter for measuring the Mulder signal at 0.1 Hz in the heart rate variability spectrum. 

A87-33057* Illinois Univ., Urbana-Champaign.

THE EFFECTS OF TASK DIFFICULTY AND WORKLOAD ON TRAINING

Four hypotheses regarding the possible effects of workload and task difficulty on training are proposed. These are: (1) increased levels of task difficulty will facilitate learning to the extent that these increases are (a) resource loading and (b) intrinsic to the component task to be learned; (2) decrease of task difficulty will facilitate learning to the extent that these decreases (a) reduce the resource load and (b) are extrinsic of the component task to
be learned; (3) the learner's tendency to conserve resources may be altered by the adoption of undesirable, short-term, low resource strategies early in training; and (4) the effect of changes in resource demand on learning will depend upon the similarity of the resource whose demand is changed to the resource involved in learning. Author

TRAINING AND SUBJECTIVE WORKLOAD IN A CATEGORY SEARCH TASK

This study examined automaticity as a means by which training influences mental workload. Two groups were trained in a category search task. One group received a training paradigm designed to promote the development of automaticity; the other group received a training paradigm designed to prohibit it. Resultant performance data showed the expected improvement as a result of the development of automaticity. Subjective workload assessments mirrored the performance results in most respects. The results supported the position that subjective mental workload assessments may be sensitive to the effect of training when it produces a lower level of cognitive load. Author

INTERACTION BETWEEN WORKLOAD AND TRAINING - CONVERGING EVIDENCE FROM PSYCHOPHYSIOLOGY AND PERFORMANCE MEASUREMENT

(Contract F49620-83-C-0144)

Traditionally, the domains of mental workload and training have been studied in isolation even though they share many common characteristics. The present paper integrates findings from psychophysiological and performance-based studies which address both of these issues. By augmenting traditional indices of skill acquisition such as RMS error scores, reaction times, and accuracy measures with psychophysiological measures such as the event-related brain potential, it is shown that workload effects can be assessed throughout the training process. More specifically, it is argued that the effects of workload on the human operator can be modeled within the framework of resource theories of attentional allocation. Also described is how converging evidence from psychophysiological and behavioral studies can be used to examine subtle changes in operator strategies during training. Author

A87-33061 National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.

EFFECTS OF STIMULUS CHARACTERISTICS AND TASK DEMANDS ON PILOTS' PERCEPTION OF DICHTIC MESSAGES

The experiment is an initial investigation of pilot performance when auditory advisory messages are presented dichotically, either with or without a concurrent pursuit task requiring visual/motor dexterity. The dependent measures were percent correct and correct reaction times for manual responses to the auditory messages. Two stimulus characteristics which show facilitation effects in traditional dichotic-listening paradigms, differences in pitch and semantic content of the messages, were examined to determine their effectiveness during the functional simulation of helicopter pursuit. In an effort to accumulate points for the advisory messages for accuracy alone or for both accuracy and reaction times which were faster than their opponent's. In general, the combined effects of the stimulus and task variables are additive. When interactions do occur they suggest that an increase in task demands can sometimes mitigate, but usually does not remove, any processing advantages accrued from stimulus characteristics. The implications of these results for cockpit displays are discussed. Author

A87-33062 EFFECTS OF A LOW BLOOD ALCOHOL LEVEL ON PILOT PERFORMANCE

Pilots and nonpilots were tested on simulator flying tasks after attaining a .04 percent blood alcohol concentration and after ingestion of placebo drinks. Half of the pilots and half of the nonpilots were blind with respect to the contents of their drinks while half were informed. Two turbulence conditions were employed, and subjects were instructed to scan for aircraft silhouette targets that appeared on monitors in front and to the sides of the subject. The subject's task was to maintain straight and level flight, with the pilots given an additional flight segment during which the simulator's instruments and external horizon display gradually indicated an unusual attitude, either a banked steep climb of bumpted step descent, while the subject was performing other tasks such as copying weather information or changing radio settings. Head movements, control movements, time to detect targets, and simulator flight measures were digitized and computer recorded and analyzed. Alcohol affected the performance of pilots and nonpilots on several performance measures during straight and level flight. The performance of pilots during the divided attention unusual attitude flight segment was such that unsafe flight conditions would have resulted. Author

HANDBOOK OF PERCEPTION AND HUMAN PERFORMANCE.
VOLUME 1 SENSORY PROCESSES AND PERCEPTION.
VOLUME 2 - COGNITIVE PROCESSES AND PERFORMANCE.
KENNETH R. BOFF, ED. (USAF, Armstrong Aerospace Medical
Research Laboratory, Wright-Patterson AFB, OH), LLOYD
KAUFMAN, ED. (New York University, NY), and JAMES P.
THOMAS, ED. (California, University, Los Angeles) New York,
individual items see A87-33502 to A87-33532.

Papers are presented on psychophysical measurement and
theory; strategy and optimization in human information processing;
and computer graphics. Consideration is given to basic sensory
processes such as eye movements, temporal sensitivity, colorimetry
and color discrimination, the vestibular system, and kinesthesia.
Topics discussed include space and motion perception, information
processing, perceptual organization and cognition, and human
performance. I.F.

STRATEGY AND OPTIMIZATION IN HUMAN INFORMATION
PROCESSING
GEORGE DOSHER (New York University, NY) and BARBARA
ANNE DOSHER (Columbia University, New York) IN: Handbook of
perception and human performance. Volume 1. New York,
Wiley-Interscience, 1986, p. 2-1 to 2-65. refs

Methods and theories for studying a subject's strategies in the
performance of perceptual and cognitive tasks are discussed.
Compound and concurrent tasks are defined and compared. The
signal detection theory, attention, and economics are examined.
Resource sharing and concurrent tasks, in particular simultaneous
auditory two-channel detection, shadowing, concurrent visual
search, and attention operating characteristics, are analyzed.
Consideration is given to ideal performance in compound
reaction-time tasks, the costs and benefits in reaction time tasks,
and speed-accuracy trade-offs. Pure strategy, resource allocation,
and strategy mixtures are described. Path dependence in
performance operating characteristics and the dynamics of strategy
switching are investigated. Examples of compound and concurrent
tasks are presented. I.F.

TEMPORAL SENSITIVITY
ANDREW B. WATSON (NASA, Ames Research Center, Moffett
Field, CA) IN: Handbook of perception and human performance.
Volume 1. New York, Wiley-Interscience, 1986, p. 6-1 to 6-43. refs

Human visual temporal sensitivity is examined. The stimuli used
to measure temporal sensitivity are described and the linear
systems theory is reviewed in terms of temporal sensitivity. A
working model which represents temporal sensitivity is proposed.
The visibility of a number of temporal wave forms, sinusoids,
rectangular pulses, and pulse pairs, is analyzed. The relation
between spatial and temporal effects is studied. Temporal variations
induced by image motion and the effects of light adaptation on
temporal sensitivity are considered. I.F.

A87-33506

SEEING SPATIAL PATTERNS
LYNN A. OLZAK and JAMES P. THOMAS (California, University,

The visual perception of two-dimensional spatial patterns is
studied. Consideration is given to spatial tuning; stimulus patterns;
the tasks of detection and identification; measuring performance;
masking; pattern-selective adaptation; and the effects of mean
luminance, retinal location, and stimulus uncertainty on
performance. The detection task is examined in terms of detection
sensitivity parameters and interaction phenomena, and models
representing the mechanisms involved in detection are presented.
Data on the factors which affect identification and the mechanisms
involved in identification are discussed, and identification models
are provided. Procedures for measuring visual acuity and factors
affecting acuity are described. I.F.

A87-33510

MOTION PERCEPTION IN THE FRONTAL PLANE - SENSORY
ASPECTS
STUART ANSTIS (York University, Downsview, Canada) IN:
Handbook of perception and human performance. Volume 1. New
York, Wiley-Interscience, 1986, p. 16-1 to 16-27. refs

Some phenomena of visual motion are discussed. Direction-specified adaptation, motion aftereffect, and velocity
aftereffect are examined. Consideration is given to motion
perception in peripheral vision, real motion versus apparent motion,
and the relationship between space and time and apparent motion.
Motion perception models, such as the correlation and gradient
models of directional selectivity, are described. I.F.

A87-33511

PERCEPTUAL ASPECTS OF MOTION IN THE FRONTAL
PLANE
ARIEN MACK (New School for Social Research, New York) IN:
Handbook of perception and human performance. Volume 1. New
York, Wiley-Interscience, 1986, p. 17-1 to 17-38. refs

Subject-relative and object-relative data are the two sets of
perceived object motion determinants; subject-relative information
is based on an egocentric coordination system and object-relative
information is based on an external reference system. The relation
between subject- and object-relative motion is discussed. Eye
movement and pointing responses are examined under conditions
in which the perceived position or motion of a target stimulus
does not correlate with its actual position. Subject-relative motion
perception, in particular head, saccadic eye, and pursuit eye
movements, and induced motion, which represents perceived
motion based on object-relative motion data, are analyzed.
Configurational event perception and velocity perception are
considered. I.F.
A87-33512

THE PERCEPTION OF POSTURE, SELF MOTION, AND THE VISUAL VERTICAL

Postural reflexes and vertical posture control are examined. Consideration is given to vestibular nystagmus; the interaction between vestibular nystagmus and visual pursuit; the coordination of head and eye movements; eye movement in response to combined rotary and linear acceleration; counter torsion; and cervicoocular and arthroocular responses. The relation between motion perception and movements of the head and body, in particular the effects of self motion on the visual sensation of motion and of scene motion on self motion sensations, is studied. The adaptability of the vestibular system, judging the visual vertical, and visual direction and postural asymmetry are discussed. I.F.

A87-33513

MOTION IN DEPTH AND VISUAL ACCELERATION

Experimental data on motion that is nonuniform in time and is sensitive to the acceleration of targets moving in the frontal plane, and perceived motion in depth due to changing size and disparity are presented and analyzed. The direction of self-movement in depth and optical flow patterns are examined; data revealing that the human visual system is sensitive to certain relationships between the velocities at different locations in the retinal image are provided. Multiple sensitivities are studied in terms of channel theories of motion in depth, and the application of the multiple specific sensitivity concept to the study of flying performance in a simulator and a real aircraft is discussed. I.F.

A87-33514

VISUAL LOCALIZATION AND EYE MOVEMENTS

The role of extraretinal eye position in visual localization is studied and four procedures for measuring visual localization are described. The cancellation theory and two kernels of Helmholtz are examined in terms of visual localization. Local signs, reference directions, and spatial discriminations are analyzed. Consideration is given to localization with steady gaze, in the presence of voluntary saccades, and during pursuit eye movements. I.F.

A87-33515

SPACE PERCEPTION

Visual space perception is defined and various approaches for studying visual space perception are described. The basic characteristics of the perception of size, distance, shape, and slant of surfaces in the environment are discussed. The data provided by surface texture and linear perspective to be applied to spatial layout and motion-produced information for the perception of spatial layout are considered. I.F.

A87-33518

ADAPTATION OF SPACE PERCEPTION

The ability to modify perception and perceptual-motor coordination when confronted with a discrepancy between or within the spatial modalities is described and evaluated. Consideration is given to the ability of a person to adapt to prismatic displacement; visual transposition; tilt; loss of visual position constancy; size-depth, distance, and form distortions; auditory right-left reversal and displacement; and underwater perception distortions. Individual differences in adaptation which may be attributed to personality and perceptual traits, sex, age, athletic and artistic skill, mental illness, and brain damage are discussed. It is concluded that human beings are capable of adapting to spatial perception rearrangement; however, it is not proven that these capabilities are acquired from experience by the newborn and developing infant. I.F.

A87-33519

INTERSENSORY INTERACTIONS

ROBERT B. WELCH (Kansas, University, Lawrence) and DAVID H. WARREN (California, University, Riverside) IN: Handbook of perception and human performance. Volume 1. New York, Wiley-Interscience, 1986, p. 25-1 to 25-36. refs

Intersensory interactions are examined with respect to the multimodal perception tasks of detection, spatial perception, and temporal perception. The characteristics of various sensory and temporal modalities are described and compared. The effects of nonspecific accessory stimulation on detection threshold and of discrete signals in one modality on detection reaction time in second modality are investigated. Attention is given to spatial acuity, orientation, egocentric localization, shape, size, texture, and intersensory bias. Interactions involving temporal duration, rate, and pattern are studied. I.F.

A87-33520

MOTOR CONTROL

The factors that influence the duration of the basic components of motor skill, decision and movements, are described. Simple and choice reaction times, the effects of movement and more than one response per stimulus on reaction time, the processing of signals, and procedures for minimizing the interference between multiple signal and response are examined. The time and accuracy of target-directed movements (movements controlled and not controlled by visual feedback) are analyzed. Movement sequences and rules that govern skill components are studied. Recent motor skill concepts, in particular the component-analysis view of skill learning, hierarchical conceptions of motor programs, synergies and motor learning, and the role of feedback in motor learning and performance, are discussed. Various approaches for improving skill are proposed. I.F.

A87-33521

AUDITORY PATTERN RECOGNITION

The effects of perceptual and cognitive psychology and the music theory on auditory pattern recognition are studied. Auditory grouping phenomena, in particular perceptual fusion and separation of components of a complex sound spectrum, the grouping of sound elements emanating from different spatial locations, and the grouping of sounds that occur in rapid succession, are examined. The perception and recognition of patterns formed of pitch combinations are analyzed. Consideration is given to the perception of timbre, temporal order, and rhythm. I.F.

A87-33522

THE DESCRIPTION AND ANALYSIS OF OBJECT AND EVENT PERCEPTION

(Contract NIH-MH-30865)

Objects and events which compose visual perception in daily life and in the laboratory are described. Perceptual organization is defined and examined. Attention is given to perception, recognition, and identification; factors affecting perceived object shape; form perception anomalies; visual dominance and visual capture; and illusions. Perceptual constancy, in particular dual modes of
perception, the proximal stimulus code, deviations from constancy, underconstancy, overconstancy, and constancy theories, are studied. The perception of events such as motion and events other than motion is discussed. I.F.

A87-33523
SPATIAL FILTERING AND VISUAL FORM PERCEPTION

Data supporting the hypothesis that visual form perception is based on a form of spatial image processing are presented. The basic principles of the linear systems theory and filtering in the Fourier transform domain are discussed. The existence of spatial filtering in the mammalian visual system and the relation between spatial filtering, contrast sensitivity, and visual channel theory are studied. The manner in which spatial filters can predict perceptual phenomena characterized by the Gestalt laws of organization is described. The correlations between the concept of spatial filtering and the perception of texture and visual illusions, and between spatial filtering and multistable images are examined. The characteristics and performance of a multichannel model based on the existence of biological filters in the human visual system are considered. I.F.

A87-33524
VISUAL FUNCTIONS OF MENTAL IMAGERY

Experiments relating mental imagery to visual perception are discussed. The functional equivalence, symbolic representation, tacit knowledge, experimental bias, and eye movement hypotheses are described and compared. Consideration is given to visual imagery comparison, identification, and resolution; visual imagery in determining distance, location, and visual-motor control; visual transformation; and visual attention. The individual differences in the ability to use imagery, the use of imagery modalities other than vision, and the application of mental imagery in perceptual learning are examined. It is determined that the functional equivalence hypothesis best explains the visual function of mental imagery. I.F.

A87-33525*
COMPUTATIONAL APPROACHES TO VISION

Vision is examined in terms of a computational process, and the competence, structure, and control of computer vision systems are analyzed. Theoretical and experimental data on the formation of a computer vision system are discussed. Consideration is given to early vision, the recovery of intrinsic surface characteristics, higher levels of interpretation, and system integration and control. A computational visual processing model is proposed and its architecture and operation are described. Examples of state-of-the-art vision systems, which include some of the levels of representation and processing mechanisms, are presented. I.F.

A87-33526
THE EFFECTS OF CONTROL DYNAMICS ON PERFORMANCE

The relationship between control dynamics and human performance is studied. The tracking, manual control paradigm and methodological techniques which measure tracking performance are discussed. The human performance limits which influence tracking and two human tracking performance models are described. Experimental results and data concerned with the effects of control dynamics on performance are presented and analyzed. Consideration is given to gain, system lags, control order, higher order tracking, the tracking of unstable systems, displays, multitaxis and multiphase control, and auditory displays. I.F.

A87-33527
MONITORING BEHAVIOR AND SUPERVISORY CONTROL

The general characteristics of supervisory control and mathematical models of monitoring behavior are described and empirical data supporting the models are presented. Data acquisition and the applications of optimal estimation theory and optimal control theory to modeling human intervention in process control are discussed. Particular attention is given to the general properties of human information processing; supervisory control; the detection and diagnosis of system failures; and the allocation of functions between operator and machine. I.F.

A87-33530
VIGILANCE, MONITORING, AND SEARCH

The processes underlying vigilance decrement, the identification of the factors controlling the overall level of vigilance, and the regulation and control of vigilance in operational settings are examined. Various methods for measuring vigilance include: detection rate, reaction time, self reports, changes in signal discriminability, and mental workload measures. The decision theory analysis of vigilance; the effects of signal probability, instructions, and the payoff matrix on the decision criterion; and criterion shifts over time are discussed. Consideration is given to task classification and vigilance, complex monitoring and search, vigilance in operational settings, and human factor principles for the control of vigilance. I.F.

A87-34532
THE EFFECTS OF AGE, SLEEP DEPRIVATION, AND ALTITUDE ON COMPLEX PERFORMANCE
HENRY W. MERTENS and WILLIAM E. COLLINS (FAA, Civil Aeromedical Institute, Oklahoma City, OK) Human Factors (ISSN 0001-4966), VOL. 28, Oct. 1986, p. 541-551. refs

The performances of men ranging in age from 30-39 and 60-69 years at different altitudes (ground and 3810 m) and under various sleep conditions (sleep permitted and sleep deprived) are investigated. The multiple task performance battery consisted of: the monitoring of warning lights and meters, mental arithmetic, problem solving, target identification, and tracking. It is observed that there was a significant interaction between sleep deprivation and altitude that was enhanced by increasing work load. The performance of subjects sleep deprived was lower and the greatest decrease occurred at 3810 m. The data reveal that the performance of the 60-69 year old subjects was lower and more affected by an increase in work load than that of the younger subjects; however, sleep deprivation and altitude effects were not influenced by age. I.F.

A87-35072
FREQUENCY EFFECTS IN PROFILE ANALYSIS AND DETECTING COMPLEX SPECTRAL CHANGES
DAVID M. GREEN, ZEKIYE A. ONSAN, and TIMOTHY G. FORREST (Florida, University, Gainesville) Acoustical Society of America, Journal (ISSN 0001-4968), vol. 81, March 1987, p. 692-699. NIH-USAF-supported research. refs

Seven experiments on the detectability of intensity changes in complex multitone acoustic spectra are reported. Two general questions organize the experimental efforts. The first question is how the detectability of a change in a flat (equal energy) spectrum
depends on the frequency region where a single intensive change is made. The answer is that frequency region plays a relatively minor role. Frequency changes in the midregion of the spectrum are the easiest to hear, but thresholds increase by only about 5 dB over the range from 200 to 5000 Hz. For all frequencies, the psychometric function can be written as a K(Delta p), where K is a constant and Delta p is the change in pressure. The second question is how can the detectability of complex changes over the entire frequency range be predicted from the detectability of change at each separate region. Thresholds for detecting a change from a flat spectrum to a spectrum whose amplitude varies in sinusoidal ('rippled') fashion over logarithmic frequency are measured at different frequencies of ripple. The thresholds are found to be independent of ripple frequency and are 7 dB higher than predicted on the basis of an optimum combination rule.

TO CATCH A CHILD'S IMAGINATION 2: EDUCATIONAL UPDATE ON CAN-DO
JAMES H. NICHOLSOn In NASA. Goddard Space Flight Center The 1986 Get Away Special Experimenter's Symposium p 179-186 Feb. 1987
Avail: NTIS HC A11/MF A01 CSCL 051
At the G.A.S. Symposium last year, the Charleston County Public School CAN DO Project outlined an ambitious educational program revolving around the photography of Comet Halley from the Shuttle using a GAS canister. The target flight was STS 61-E scheduled for a March, 1986, launch. Such strict time constraints and highly specific mission requirements made the CAN DO program even more risky than normal. In spite of this, almost all of the planned educational goals were achieved, even after the postponement of all Shuttle activities in January of 1986. This follow-up paper summarizes the effects of events on the program as proposed and the attempts to carry out as many of the activities as possible. It is hoped that this paper will suggest constructive ways in which to cope with the delays and mishaps that are the inevitable lot of pioneers who break new ground and attempt the new and untried.

Dec. 1986 p 82-83 Avail: NTIS HC A01/MF A01 When psychologists analyze the process of social and emotional group dynamics of a small group spending the winter in Antarctica, they pay attention to the dynamics of psychophysiological responses related to this process. The behavioral disturbances discovered by a number of authors, which are elicited by long term natural isolation, form the so-called wintering syndrome. The most frequent manifestations of this syndrome are depression, hostility, irritability, impaired sleep, loss of interest on one's job, diminished intellectual capacities and interests. These signs are related to the duration of the stay in an isolated group, monotony of the environment (monotony, boredom) and absence of customary emotional stimuli. Analogous distinctions were also noted in many laboratory studies simulating spaceflight conditions, as well as during long term spaceflights.

N87-20747* National Aeronautics and Space Administration. Ames Research Center, Moffet Field, Calif. HUMAN-DISPLAY INTERACTIONS: CONTEXT-SPECIFIC BIASES

Recent developments in computer engineering have greatly enhanced the capabilities of display technology. As displays are no longer limited to simple alphanumeric output, they can present a wide variety of graphic information, using either static or dynamic presentation modes. At the same time that interface designers exploit the increased capabilities of these displays, they must be aware of the inherent limitation of these displays. Generally, these limitations can be divided into those that reflect limitations of the medium (e.g., reducing three-dimensional representations onto a two-dimensional projection) and those reflecting the conceptual limitations can be divided into those that reflect limitations of the medium (e.g., reducing three-dimensional representations onto a two-dimensional projection) and those reflecting the conceptual limitations can be divided into those that reflect limitations of the medium (e.g., reducing three-dimensional representations onto a two-dimensional projection) and those reflecting the conceptual...

EFFECTS OF DISPLAY DENSITY AND FORMAT TYPE ON CONTROL DISPLAY UNIT FORMAT DESIGN

Frequently, guidelines for displaying information do not exist for a specific type of hardware; i.e., a control/display unit (CDU). A study which addresses the issue of defining an optimal CDU display format design was completed. Seven formats of three display densities and three information types were evaluated to determine which combination of these factors facilitates information transfer from a CDU display to the user. Subjects searched alphanumeric displays visually for a single piece of information and indicated when it was found. Data was collected on the elapsed time to isolate the information as well as their accuracy in a tracking task. Results suggest that the optimal format for textual data is the serial (left-to-right) arrangement, while for numerical data, the optimal format is tabular with labels along the left hand column. As display densities approach 65 percent, the relative differences between the formats disappear and these recommendations become less applicable. In general, the design of display formats must be given careful consideration on the basis of specific hardware and information to be presented.

VIRTUAL INTERFACE ENVIRONMENT

A head-mounted, wide-angle, stereoscopic display system controlled by operator position, voice and gesture has been developed for use as a multipurpose interface environment. The system provides a multisensory, interactive display environment in which a user can virtually explore a 360-degree synthesized or remotely sensed environment and can viscerally interact with its components. Primary applications of the system are in telerobotics, management of installations of intelligent integrated information systems, and human factors research. System configuration, application scenarios, and research directions are described.

THE EFFECT OF ANTIMICROBIAL UNDERWEAR ON THE AUTOMICROFLORA OF SEAMEN DURING A SEA VOYAGE [ALTIMETRIE ANTIMIKROBNOGO BELYA NA SOSTOIANIE AUTOMIKROFLORY U MORIAKOV V PVLAVANII]
B. I. ZHOLUS, V. N. BORTNOVSKII, and A. A. ARZUMANOV Voenno-Meditsinskii Zhurnal (ISSN 0026-0505), Oct. 1986, p. 41, 42. In Russian. refs

The effect of underwear made of cotton fibers containing a bactericidal chemical (hexachloran) on the skin microflora of seamen and their health status during a seven-month sea voyage status was investigated. It was found that the use of antimicrobial underwear (changed daily after a shower) by the ten subjects of the experimental group prevented a build-up of microbial counts which was registered in ten controls of similar age and occupation who were issued regular underwear. While all subjects in the experimental group remained disease-free during the course of the voyage, four cases of influenza-like and/or skin infection were registered among the (ten) control subjects.

A87-32012
CORRECTED UNIPOSIUTION LEAD SYSTEM FOR VECTOR MAGNETOCARDIOGRAPHY
HANNU J. ESKOLA (Tampere University Central Hospital, Finland), JAAKKO A. V. M. MEHTO (Tampere University, Finland), JUHA J. O. NOUSIAINEN, and JUKKA O. LEKKALA (Technical Research Centre of Finland, Tampere) IEEE Transactions on Biomedical Engineering (ISSN 0018-9294), vol. 36, Feb. 1987, p. 81-90. refs

Various corrected and combined vector magnetocardiographic (VMCG) lead systems have been designed and studied by using a physical, realistic torso model. Although having quite ideal lead fields, many of these new lead systems produce a low signal level, thus lowering the actual information capacity of the lead system. Furthermore, the combined lead systems are technically complex and slightly impractical to use. The corrected unipositional lead system was found to be free of all these disadvantages. This system has a simple geometry consisting of three coaxial detector coils located on the point V2 of the standard 12-lead ECG. On the other hand, its accuracy for the determination of the magnetic heart vector was concluded to be sufficient. Based on the VMCG measured on normal subjects, it was also stated that the lead system has a low sensitivity to the displacement of the detector.

INVESTIGATION OF LIMB-SIDE STICK DYNAMIC INTERACTION WITH ROLL CONTROL

A system which uses Salcomine (ethoxy salicylaldehyde ethylene diamine cobalt) to separate and concentrate the oxygen produced in a CEAS for the Space Station is described. The Salcomine absorbs the oxygen under normal temperatures (less than 40 C) and desorbs oxygen under temperatures higher than 80 C. The system was tested in a CELSS for the Space Station. The Salcomine absorbs the oxygen under normal temperatures (less than 40 C) and desorbs oxygen under temperatures higher than 80 C. The concept of CELSS is reviewed and a diagram of a CELSS is provided. The operation of the gas recycle system, which is utilized as a reservoir in the CELSS to compensate for the difference between the gas production and consumption, is examined. The ability of the Salcomine to absorb or desorb oxygen is evaluated for Salcomine alone and about 2.7 percent for Salcomine in a canister. Diagrams of the proposed gas recycle system and oxygen separating and concentration system are presented.

DEVELOPMENT OF CARBON DIOXIDE REMOVAL SYSTEM - EXPERIMENTAL STUDY OF SOLID AMINES

This paper describes the carbon dioxide removal system in the Environmental Control and Life Support System for the Japanese Experiment Module of the Space Station. A solid amine, carbon dioxide removal substrate is under development at present to replace the consumptive adsorbent (LiOH). It is characterized by a regenerative agent which makes it possible to adsorb and desorb repeatedly. The other systems such as the electrochemical depolarized carbon dioxide concentration system and molecular sieves carbon dioxide removal system are also being developed.

GAS AND WATER RECYCLING SYSTEM FOR IOC VIVARIUM EXPERIMENTS

A design for a gas and water recycling system to support life science missions at the initial operational capability of the Space Station is proposed. The gas recycling subsystem is composed of: prefilters to remove harmful gas; canister units for CO2 and O2 gas content control; humidifiers; gas bottles; and a controller. The operation of the subsystem, which is to remove CO2 gas from the outlet air of the animal vivariums and to remove excessive O2 gas from the outlet air of the phytotron and algae cultivator, is described. The water recycling subsystem is to use a high polymer membrane filtration unit and a distiller to purify the water; the roles of the microfiltration, ultrafiltration, and reverse osmosis filters of the membrane filtration unit are examined. Diagrams of the two subsystems are provided.

Author

A87-32458
WATER RECYCLING SYSTEM USING THERMOPERVAPORATION METHOD

A space station water recycling system is evaluated on the basis of fundamental experiments and simulated calculations of absorption-type thermopervaporation. The specific electric conductivity of the treated water was below 10 microS/cm, and the coefficient of permeation through the membrane was more than 1 kg/sq m day mm Hg. The optimum operating conditions for the recycling system are presented.

A87-32459
WATER RECYCLING FOR SPACE STATION

A system configuration, based on membrane-based technology, for water recycling in the Space Station is proposed to purify water wastes produced by both the crew and the facilities of life science experiments. A three-step filtration process consisting of prefiltration, ultrafiltration and reverse osmosis provides water for showers and the life science experiments. A portion of the permeate from the reverse osmosis process is further processed by a thermopervaporation membrane technique to provide potable water. Ground experimental equipment for the water recycling system for the IOC Japanese life science experiments is described.

A87-32454
CONCEPT STUDY OF REGENERABLE CARBON DIOXIDE REMOVAL AND OXYGEN RECOVERY SYSTEM FOR THE SPACE STATION

Results are presented from Japanese studies of technologies for an atmosphere regeneration system (ARS) for the Space Station. The choice is between solid amine systems with either ion exchange resin (IER) or an amine impregnated adsorbant (AIA). IER Systems contain amino radicals that ion exchanges HCO3(-) produced by CO2 and atmospheric moisture. AIA systems holding a polyethylene-resin, potassium-n-methyl alaminite or other amine directly adsorb CO2 from the air. In the IER, CO2 is desorbed by steam heating, while in the AIA, CO2 is desorbed by heating or vacuum sucking. Experimental versions of the two types of ARSs are described, along with data indicating a preferred steam canister configuration, a greater CO2 absorbancy of the IER relative to the AIA system, and lower energy requirements with steam regeneration. The principles of the Bosch and Sabatier processes for oxygen recovery are reviewed, and test data which indicate areas requiring further development are identified.

M.S.K.
would be controlled by an operator in the Orbiter cabin and would be an asset to the Space Station. Alternative system architectures are described, including the Shuttle Remote Manipulator System and its applications in consumer products, and the evaluation of design efforts that describe the configuration: a 'private-public' dimension and a 'group-individual' dimension. Seven specific recommendations for the TWS concept, augmented with AI capabilities, are discussed.

A87-33003* McDonnell-Douglas Astronautics Co., Huntington Beach, Calif.

THE USE OF MULTIDIMENSIONAL SCALING FOR FACILITIES LAYOUT - AN APPLICATION TO THE DESIGN OF THE SPACE STATION

Before an optimum layout of the facilities for the proposed Space Station can be designed, it is necessary to understand the functions that will be performed by the Space Station crew and the relationships among those functions. Five criteria for assessing functional relationships were identified. For each of these criteria, a matrix representing the degree of association of all pairs of functions was developed. The key to making inferences about the layout of the Space Station from these matrices was the use of multidimensional scaling (MDS). Applying MDS to these matrices resulted in spatial configurations of the crew functions in which smaller distances in the MDS configuration reflected closer associations. An MDS analysis of a composite matrix formed by combining the five individual matrices resulted in two dimensions that describe the configuration: a 'private-public' dimension and a 'group-individual' dimension. Seven specific recommendations for Space Station layout were derived from analyses of the MDS configurations. Although these techniques have been applied to the design of the Space Station, they can be applied to the design of any facility where people live or work.

A87-33004* Human Factors Implications of Project Forecast, II - Aircrew Combat Mission Enhancement (ACME) Technology

Aircrew combat mission enhancement (ACME) technology consists of the hardware, software, and associated interfaces and integration that will enable aircrews to reach the acme of tactical air combat performance. In time of peace, ACME technology provides the realistically complex scenarios necessary for effective combat mission training. In time of war, it provides the real-time, updated, combat-arena visual scenes of a combat mission rehearsal enhancer, especially when it is coupled to the capabilities envisioned with the virtual cockpit technology and its use in future tactical aircraft systems.
A87-33005 THE SUPER COCKPIT AND ITS HUMAN FACTORS CHALLENGES

A revolutionary virtual crew station concept titled the 'Super Cockpit' is introduced with its applications and operational advantages. Unique aspects of the virtual information portrayal and interactive medium of the super cockpit are discussed leading to a need for new areas of human factors research and engineering.

A87-33006 RAPIDLY RECONFIGURABLE CREWSTATION

The objective of the rapidly reconfigurable crewstation (RRC) program is the ability to create an entirely new crewstation within one working day. A system description is given with attention focused on the automated layout center (ALC), translation software, the graphics complex, the mission computer complex, and the all-glass crewstation (AGC). The user has two interface points with the RRC laboratory: the ALC and the AGC. The AGC will allow the pilot to evaluate individual control and display technologies as well as examine the synergistic relationships among various combinations of technologies.

A87-33011 USE OF EYE CONTROL TO SELECT SWITCHES

Eye-controlled switching has been proposed as a biocybernetic control approach which may increase system effectiveness while reducing pilot workload. In this experiment, six subjects selected discrete switches on the front panel of a cockpit simulator while manually tracking a target. In two eye-controlled methods, the subjects directed their gaze at the switch indicated by an auditory cue and then made a consent input (either a manual response or a verbal response). In a conventional manual condition, subjects selected the switches with their left hand. The analysis of mean switching time suggests that eye control is a feasible alternative when hands-off control is desired. Tracking performance was found to differ significantly among switching conditions, indicating the importance of quantifying the efficiency of candidate control methods in visual workload environments analogous to that of the application environment.

A87-33012 NAMING COLORS ON A CRT DISPLAY IN SIMULATED DAYLIGHT

The use of control CRT displays in daylight conditions is accompanied by problems of visibility and discriminability. A simulator was constructed, and six experiments were conducted to measure the color-naming performance for CRT-displayed symbols. The effects of display and daylight luminance, and symbol chromaticity, size, and shape were studied. A reciprocal relationship was found between display and daylight luminance, and models of visual performance were constructed. In addition, color metrics based on the CIE 1976 space were found to be inconsistent predictors of performance. This finding was attributed to the dependency of these measures on symbol size and chromaticity. Finally, complex interactions involving symbol chromaticity and shape were discovered, suggesting that simplistic analytical models may not be viable substitutes for empirical research.

A87-33013 A COMPARISON BETWEEN SPACE SUIT AND UNSUITED REACH ENVELOPES

A comparison was made for the reach capability of Shuttle space suit vs unsuited. Graphics were generated and reach envelope volumes computed. The space suit reduces the reach envelope volume from about 64 to 97 percent, depending on the type of envelope measured.

A87-33014 MODELING OF MANUAL HANDLING IN UNUSUAL POSTURES

Subjects performed a series of psychophysical lifting tasks simulating USAF aircrew maintenance activities. The tasks involved lifting while in unusual postures: lying prone, supine, sideways, and standing. Maximum acceptable weights on the tasks were related to performance on a series of isonertial and isometric strength tests. High correlations were obtained between lifting task strength test performance. Prediction models developed indicated that an isonertial 1.8 m lift and isometric one hand pull were the best predictors of task performance. The prediction models can be used in the establishment of design weights for aircrew maintenance tasks.

A87-33015 MULTI-MODAL INTERFACES IN SUPERVISORY CONTROL

The need in a supervisory control environment to develop multimodal interfaces to exploit processing resources is discussed. In the present paper, consideration is given to speech input as a means of facilitating operator interaction. The performance of operators using voice-augmented and keyboard inputs was compared on the basis of an experiment incorporating speech input into a simulated control room environment. It is shown that speech input can actually hinder the operator's control performance.

A87-33017 EYE-VOICE-CONTROLLED INTERFACE

The Ocular Attention-Sensing Interface System (OASIS) is an innovative human-computer interface which utilizes eye movement and voice commands to communicate messages between the operator and the system. This report initially describes some technical issues relevant to the development of such an interface.
The results of preliminary experiments which evaluate alternative eye processing algorithms and feedback techniques are presented. Candidate interface applications are also discussed. Author

A87-33018 National Aeronautics and Space Administration, Ames Research Center, Moffett Field, Calif.

RESPONSE MODALITIES AND TIME-SHARING PERFORMANCE

An experiment performed to investigate the role of resource competition and asymmetric transfer in dual-task performance is described. It is shown that there is an advantage to mixed manual/speech response modality configurations that cannot be accounted for by asymmetric transfer. The present results support the multiple resources approach to the application of speech technology. Once speech recognition achieves an acceptable level of operational reliability, speech controls can be used to reduce resource competition and improve performance in multitask environments.

A87-33020 MAN/SYSTEM INTEGRATION STANDARDS FOR SPACE SYSTEMS

This paper presents an overview of the Man/System Integrations Standards (MSIS) program. The standards to be developed by this program provide specific information for use in the design of space systems to ensure proper integration of the man/system interface requirements with those of other aerospace disciplines. These man/system interface requirements apply to the launch, reentry, on-orbit, and extraterrestrial space environments. Concise design considerations, design requirements, and design examples are provided. The standards are being developed with broad government and industry collaboration via a Government/Industry Advisory Group (GIAG) that meets four times with the contractor team to critique the standards as they are being developed. The documentation (released in January 1987) will consist of four hardcopy volumes, a videotape, and a relational database. The videotape uses in-space film footage from Gemini, Skylab, and the Shuttle to illustrate specific man/system integration problems (scenes are cross-referenced to the MSIS topics). The relational database provides a means for storing and manipulating the MSIS data.

A87-33022 HUMAN FACTORS STANDARDS FOR SPACE HABITATION

NASA is developing a Man/System Integration Standard. It is to be a single source for human factors engineering standards for the design and development of space habitats. Included in this paper is a discussion of the Anthropometrics, Architecture, Activity Centers, and Health Management sections of the standard. There is a brief description of the general contents of each of these sections and some of the human factors considerations that are unique to the space environment.

A87-33023 HUMAN ENGINEERING DESIGN STANDARDS FOR EXTRAVEHICULAR ACTIVITY IN ADVANCED SPACE PROGRAMS

The National Aeronautics and Space Administration is currently developing the Man/Systems Integration Standard which will detail the human factors engineering design requirements for future spacecraft. Several existing standards and guidelines from the Johnson Space Center and the Marshall Space Flight Center, along with human engineering standards from the Department of Defense will be superseded by this NASA wide standard. One chapter to be included in this human engineering standard, which is not usually included in general standards, will deal with extravehicular activity (EVA) where the human wears a pressurized life support system and operates in the microgravity environment. This paper details the development and contents of the EVA portion of the new NASA Man/System Integration Standard.

A87-33035 A COMPARISON OF THREE METHODS FOR CONTROLLING AIRCRAFT SYSTEMS

The objective of this study was to compare the relative effectiveness of three modes of subsystem control: a voice recognition system with visual feedback presented on the head-up display, a standard multifunction control device with tailored switching logic, and a remotely operated multifunction control with feedback presented on the head-up display. Comparisons were based on measures of interference with a loading task and overall speed and accuracy of the control operations performed. The working hypothesis was that the voice system and head-up multifunction control would manifest substantially lower interference with the primary task, while subsystem control operation times would remain unaffected by control mode. The results indicate that performance with the remote touch panel was significantly poorer than with the voice or standard multifunction control systems.

A87-33036 COCKPIT CURSOR CONTROL - EFFECTS OF TASK LOADING AND CONTROLLER LOCATION

Current trends in tactical aircraft missions and avionics require two-dimensional control of a display cursor by the pilot. This study varied cursor controller location (left hand: throttle; right hand: stick grip) and task loading (concurrence of flight control) in a 2 x 2 within-subjects design. Nine test pilots, seated in a laboratory cockpit mockup, used an isometric rate controller to acquire targets on a head-up display with a cursor. This task was performed either alone or concurrently with compensatory pitch/roll tracking. There were no main effects for hand used (controller location) on any performance measures, nor did this factor interact with any other. As such, there is no evidence of design constraints on cursor controller location. Task loading increased time to initiate cursor control trials by 0.5 sec (p less than 0.01) and target acquisition time by 2.2 sec (p less than 0.01). Diagonally located targets took 0.62 sec longer to acquire than targets on the vertical or horizontal axes (p less than 0.05), and were more susceptible to task loading interference (less than 0.10). The 'loading problem' and task loading decrements appear to be central effects and may not be amenable to equipment design solutions. These
perceptual-motor limitations will constrain the allocation of mission functions to the display cursor, which are time-critical and must be performed during air combat maneuvers.

A87-33037
EXPERT SYSTEM ADVICE - HOW SHOULD IT BE GIVEN?

The objective of this research was to investigate different alternatives for pilot-computer interaction with a simulated expert system. Three methods of advice presentation were investigated: automatic, subject requested, and a combination of the two. Also, three experience levels of the subjects were examined: novice, intermediate, and expert. The dependent variables were total score for successful missions completed during the experimental session and average time to complete a mission. The analysis of the data revealed that the automatic condition was the best overall method for advice presentation (p less than 0.1) and the experience level of the subjects was not a significant factor.

A87-33039
MODELING THE COGNITIVE COMPLEXITY OF VISUAL DISPLAYS

An approach for measuring the cognitive complexity of visual display formats is presented. The approach involves modeling both the knowledge that can be extracted from a format and the knowledge an operator brings to a task. A semantic network formalism is developed to capture task-relevant knowledge, from which four orthogonal predictor measures of cognitive complexity are derived. In an experiment, seven different avionic missions, performed with the aid of a horizontal situation display, were studied, and three of the predictor measures were found to correlate significantly with observed task difficulty. The results indicate that a semantic network formalism can be used to produce an objective metric of format quality in terms of cognitive complexity.

AN EVALUATION OF MENU SYSTEMS FOR SPACE STATION INTERFACES

Menu systems are considered in terms of their ability to meet proposed basic requirements for Space Station interfaces. The following command modes are evaluated: (1) the direct mode, in which all commands are typed on a QWERTY keyboard (2) the menu mode, and (3) the hybrid mode which presented the same menus as were displayed in the menu mode, but commands could be selected from the menu via cursor control or typed in directly. It is concluded that the menu selection dialogue may be a useful and even preferred interactive environment for all levels of users; however, it must be well designed and flexible enough to meet their many needs.

A87-33045
OPERATOR/MANAGER CLASSIFICATION AS A PRECURSOR TO FUNCTION ALLOCATION

As part of the Cockpit Automation Technology program, a procedure was developed to classify functions into operator or manager roles. The functions were derived from sample air-to-air and air-to-ground tactical missions. Each function in these missions was classified as either operator or manager roles based on the action required by the function. This procedure provided guidelines for subsequent allocation of the function to a crew member or to a machine, depending on if a man or a machine is to be in the cockpit.

HUMAN FACTORS ENGINEERING ANALYSIS OF MARINE CORPS NIGHT ATTACK AIRCRAFT

The U.S. Marine Corps has proposed sensor and display improvements to provide night attack capability for the AV-8B and F/A-18 aircraft. The aircraft enhancements include the addition of a Forward Looking Infrared sensor displayed on a new raster Head-Up Display, Night Vision Goggle compatibility, and a color multipurpose display. A human factors engineering analysis was performed to identify the human factors impact of the cockpit changes involved. Included in the analysis were a literature review, interviews with pilots, design considerations reviews, and development of recommendations based on both human factors standards and lessons learned from similar projects. The primary areas researched were: cockpit lighting,彩色 displays, and night vision sensor utilization.

A87-33048
PLANNING FOR UNANTICIPATED SATELLITE SERVICING TELEOPERATIONS

The role that man will play in the space-based servicing of satellites will change with standardization and automation of such operations. If history is any indication, man cannot be completely removed from servicing duties because unanticipated servicing operations occasionally will require his direct intervention and control through either extra-vehicular activities (EVA) or teleoperations. As a result, certain minimum user-system interface capabilities must be maintained, no matter how sophisticated future technology becomes. This paper discusses research related to
some of the basic human factors problems that will probably always have an impact on space-based teleoperated servicing operations. The implicit warning is that future advanced systems must implement solutions to these problems if humans are to provide effective backup support. Furthermore, it is believed that there are several critical gaps in the present knowledge of teleoperator human factors that must be closed before such backup operations can be effective. There is a danger that system developers may become so enamored of advanced teleoperator technology that they may fail to provide an adequate user/system interface for backup operations. Human factors issues discussed include: vision systems, control devices, and communication time delays.

A87-33050
USER INTERFACE DESIGN GUIDELINES FOR EXPERT TROUBLESHOOTING SYSTEMS

This paper describes the status and preliminary results of an ongoing research project to develop and validate user interface design guidelines for expert troubleshooting systems (ETS). The project is part of a larger research program to study the application of emerging user interface technologies to the design and development of user interfaces for Space Station-era systems. The project has two separate research thrusts. The first and central thrust is to develop and validate a set of human engineering guidelines for designing the user interface of an ETS. The second thrust is to design and implement an electronic data base to manage storage and retrieval of the guidelines. This paper discusses the human factors issues that are unique to the design of a user interface for an ETS.

A87-33065
ASSESSING SATellite CONTROL CAPABILITY STATUS

As the status of space systems move from research and development into that of full operational systems, they are subject to operational test and evaluation. The objective of this paper is to examine the performance and workload levels of the satellite control operator as an effect of downtimes, anomalies, and malfunctions, all contributors to the reliability and availability of the satellite system. These observations are based on a review of the command and control operations centers for several Department of Defense (DOD) satellites.

A87-33067
SAFETY EVALUATION OF HELMET AND OTHER MASS ADDITIONS TO THE HEAD

The biodynamic effects of helmet and other mass additions to the head have been of concern for more than two decades. The kinematic response of the head was measured for each subject with no mass addition, a helmet and weight-carrying frame, and a helmet with weights positioned on the frame symmetrically about the midsagittal plane. There was approximately a 30 percent addition to the head mass with these weights. Safety monitoring procedures for this investigation illustrate: (1) Computer-based methods which may apply during helmet design; and (2) experimental procedures which may be applied to assess helmet safety test and evaluation.

A87-33068
HUMAN FACTORS ENGINEERING SIMULATION METHODOLOGY

This report describes a methodology of simulation research which is designed to accomplish requirements of a human factors engineering simulation, plan. This approach, accompanied by detailed test plans and schedules will fulfill the data item DI-H-7052 (Human Engineering Dynamic Simulation Plan) for intended use of dynamic simulation techniques in support of human engineering analysis, design support and test and evaluation. This methodology will cover the need for dynamic simulation, evaluation techniques, procedures and guidelines, and the behavioral, subjective and physiological methods recommended for use in human engineering evaluations.

A87-33071
HUMAN FACTORS DESIGN CRITERIA FOR SPACEFLIGHT INTRAVEHICULAR CREW RESTRAINTS

Proper design of devices to restrain and position astronauts in microgravity is essential for working and living in space. This paper traces the development of crew restraints throughout the history of the U.S. space program. The paper also examines the functioning of various restraints in their conditions of use. Finally, design issues and recommended design guidelines for intravehicular crew restraints are identified.

A87-33072
RECENT SPACE SHUTTLE CREW COMPARTMENT DESIGN IMPROVEMENTS

Significant design changes to the Space Shuttle waste management system (WMS) and its related personal hygiene support provisions (PHSP) have been made recently to improve overall operational performance and human factors interfaces. The WMS design improvements involve increased urinal flow, individual urinals, and provisions for manually compacting feces and cleanup materials to ensure adequate mission capacity. The basic management system (WMS) and its related personal hygiene support provisions (PHSP) have been made recently to improve overall operational performance and human factors interfaces. The WMS design improvements involve increased urinal flow, individual urinals, and provisions for manually compacting feces and cleanup materials to ensure adequate mission capacity. The basic design, development, and flight test evaluation. In addition, provisions for an eighth crewmember and a new four-tier sleep station are described.

Author
The sound attenuation characteristics of two military helmets were measured using an acoustic manikin as the test apparatus. The manikin results are compared to the results of attenuation measurements made on human subjects wearing identical helmets. The testing room and instrumentation were the same for both the manikin and human subjects. Procedures in ANSI S3.19-1974 were used in the real-ear attenuation at threshold (REAT) part of this study. The results are encouraging as they suggest that the manikin may be used in place of a panel of human subjects to evaluate the hearing protection characteristics of military head gear.

G-LOC - NEW IDEAS BUT NO EASY CURES
BILL SWEETMAN Interavia (ISSN 0020-5168), vol. 42, Feb. 1987, p. 121, 122

G-induced loss of pilot consciousness, or "G-loc", has become a frequently encountered and not easily remediable aeromedical problem as high performance fighter maneuverability reaches the point where the body's normal defenses against high-G, such as increased heart rate and blood pressure, cannot maintain blood pressure in the brain. Upon falling below a critical level, brain blood pressure loss leads to sudden and complete loss of pilot consciousness. The USAF Armstrong Aerospace Medical Research Laboratory is approaching this problem from the standpoints of both a reduction of the G-vs.-time envelope in which it may occur, and the minimization of its consequences when it does occur despite precautionary measures. G-suits are a major focus of R&D, and the minimization of its consequences when it does occur despite precautionary measures. G-suits are a major focus of R&D, and attention has been given to the addition of CO2 to the pilot's breathing air.

A87-33338
ATMOSPHERIC POLLUTANTS IN AIRCRAFT WITH PRESSURIZED CABINS SEARCH FOR A STUDY METHOD [LES POLLUANTS ATMOSPHERIQUES DANS LES AVIONS A CABINE PRESSURISEE - RECHERCHE D'UNE METHODE D'ETUDE]

Sources of air pollution (atmospheric, human, and aircrew-related) in aircraft with pressurized cabins are examined, and a method for the study of atmospheric pollutants, based on a physiochemical analysis of various environmental and biomedical parameters, is proposed. The pressurization, climatization, and ventilation of the cabin environment are first considered, following which the human physiological constraints related to the normal flight environment are discussed. It is suggested that a method based on the advantages of each of the three current areas of pollution-related research (epidemiological research, animal experimentation, and the in vitro study of noxious substances) be used to better understand the action mechanisms of the different pollutants.

A87-33335
PILOT SEAT INCLINATION - ADVANTAGE AND LIMITS [L'INCLINAISON DU Siege PILOTE - INTERET ET LIMITES]

The reduction of the hydrostatic column value (represented by the heart-brain distance) by the reduction of the cosine of the inclination angle of the pilot seat is investigated, with application to minimizing the acceleration effects experienced by fighter pilots. An experiment using angles of inclination between 30 and 60 deg and accelerations up to 9 Gz demonstrates the protection from acceleration provided by increased angle, though problems associated with the optimum angle of 60 deg, including the difficulty of viewing the cockpit and the obscuration of vision, make this solution nonoptimum. The effectiveness of pressure pants as a function of increased pressure gradient is found to improve with seat inclination.

A87-33475
LIVING IN SPACE: A HANDBOOK FOR SPACE TRAVELLERS

The state of the art in manned space flight as of 1985 is surveyed and illustrated with extensive drawings and photographs, with an emphasis on the on-orbit living conditions and activities of astronauts on the Space Shuttle and the planned Space Station. Consideration is given to the Shuttle launch facilities; the Shuttle Orbiter; a typical mission profile; the habitat modules for the Space Station; eating, drinking, sleeping, etc. in space; space manufacturing; past Salyut, Skylab, and Space lab missions; and proposals for colonizing the moon, Mars, and Venus.

CHANGES IN OPERATOR EFFICIENCY AS A FUNCTION OF ENVIRONMENTAL STRESS, FATIGUE, AND CIRCADIAN RHYTHMS

The effects of physical stressors, social stress, drugs, fatigue states, and cyclical changes on performance are studied. The stress state variables are examined in terms of information-processing theory and the arousal theory. Consideration is given to evaluating the influences of impulse, intermittent, and continuous noise; heat effects; incentives; anxiety; stimulants; depressants; boredom; fatigue; and sleep disturbances on performance. The characteristics of bodily rhythms, diurnal

175
variations in performance, adaptation to altered schedules, and
non-24-hour periodicities are analyzed. Performance response to
multiple stresses and factors which help to alleviate stress are
investigated. The need for a taxonomy of performance, field testing,
and the consideration of coping strategies is discussed. I.F.

THE MODEL HUMAN PROCESSOR - AN ENGINEERING MODEL
OF HUMAN PERFORMANCE
STUART K. CARD, THOMAS P. MORAN (Xerox Research Center,
Palo Alto, CA), and ALLEN NEWEILL (Carnegie-Mellon University,
Pittsburgh, PA) IN Handbook of perception and human
45-1 to 45-35. refs

A human processor model of the human mind is proposed.
The model is composed of a set of memories and processors
combined with a set of operating principles, and it represents
three interacting subsystems. The functions of the perceptual,
motor, and cognitive systems are described. Consideration is given
to the performance of tasks such a perception, motor skill, simple
decision, learning and retrieval, and problem solving; examples of
these tasks are presented. The limitations of the human processor
model are discussed. I.F.

OVERVIEW OF THE NASA AUTOMATION AND ROBOTICS
RESEARCH PROGRAM
LEE HOLCOMB and RON LARSEN (NASA, Washington, DC) IN:
Association for Unmanned Vehicle Systems; Annual Meeting, 12th,
Anahiem, CA, July 15-17, 1985, Preliminary Proceedings .
Washington, DC, Association for Unmanned Vehicle Systems, 1985,
20 p. refs
NASA studies over the last eight years have identified five
opportunities for the application of automation and robotics
technology: (1) satellite servicing; (2) system monitoring, control,
sequencing and diagnosis; (3) space manufacturing; (4) space
structure assembly; and (5) planetary rovers. The development of
these opportunities entails two technology R&D thrusts: telerobotics
and system autonomy; both encompass such concerns as operator
interface, task planning and reasoning, control execution, sensing,
and systems integration.

QUANTITATIVE EVALUATION OF PERSPECTIVE AND
STEREOCOPIC DISPLAYS IN THREE-AXIS MANUAL
TRACKING TASKS
STEPHEN R. ELLIS (NASA, Ames Research Center, Moffett Field,
California, University, Berkeley), MITCHELLE E. TYLER, BLAKE
HANNAFORD, LAWRENCE W. STARK, and WON S. KIM
(California, University, Berkeley) IEEE Transactions on Systems,
Man, and Cybernetics (issn 0018-9472), vol. SMC-17, Jan.-Feb.
1987, p. 81-72. refs

Optimal presentation of three-dimensional information on a
two-dimensional display screen requires careful design of the
projection to the display surface. Monoscopic perspective projection
alone is usually not sufficient to represent three-dimensional spatial
information. It can, however, be improved by the adjustment of
perspective parameters and by geometric visual enhancements
such as reference lines and a background grid. Stereoscopic display is
another method of providing three-dimensional information to
the human operator. Two experiments are performed with three-axis
manual tracking tasks. The first experiment investigates the effects
of perspective parameters on tracking performance. The second
experiment investigates the effects of visual enhancements for
both monoscopic and stereoscopic displays. Results indicate that
although stereoscopic displays do generally permit superior tracking
performance, monoscopic displays can allow equivalent
performance when they are defined with optimal perspective
parameters and provided with adequate visual enhancements.

TELEROBOTICS - DISPLAY, CONTROL, AND COMMUNICATION
PROBLEMS
LAWRENCE STARK, WON-SOO KIM, FRANK TENDICK, BLAKE
HANNAFORD, STEPHEN ELLIS (California, University, Berkeley)
et al. IEEE Journal of Robotics and Automation (issn 0882-4967),
vol. RA-3, Feb. 1987, p. 67-75. refs

An experimental telerobotics simulation is described suitable
for studying human operator (HO) performance. Simple manipulator
pick-and-place and tracking tasks allowed quantitative comparison
of a number of calligraphic display viewing conditions. An enhanced
perspective display was effective with a reference line from target
to base, with or without a complex three-dimensional grid framing
the view. This was true especially if geometrical display parameters
such as azimuth and elevation were arranged to be near optimal.
Quantitative comparisons were made possible, utilizing control
performance measures such as root mean square error. There was
a distinct preference for controlling the manipulator in
end-effector Cartesian space for the primitive pick-and-place task,
rather than controlling joint angles and then, via direct kinematics,
the end-effector position. An introduced communication delay was
found to produce decrease in performance. In considerable part,
this difficulty could be compensated for by preview control
information. The fact that neurological control of normal human
movement contains a sampled data period of 0.2 s may relate to
this robustness of HO control to delay.

OPERATOR WORK CAPACITY IN TRACKING SYSTEM WHEN
SUBMITTED TO ANTIORTHOSTATIC HYPOKINESIA
L. S. KHACHATURYANTS and A. K. YEPISHKIN in its USSR
Report: Space Biology and Aerospace Medicine, Vol. 20, No. 3,
Transl. into ENGLISH from Kosmicheskaya Biologiya i
Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 3, May
Jun. 1986 p 36-39
Avail: NTIS HC A08/ MF A01

It is shown that the work capacity of head-down tilted operators
performing sensorimotor pursuit depends on the health of their
central nervous system (CNS). The operators who react to the
exposure showing moderate predominance of excitation processes
display the best work capacity.

N87-20748 Department of the Navy, Washington, D. C.
AUTOMATED ANTHROPOMETRIC DATA MEASUREMENT
SYSTEM Patent
WILLIAM F. MORONEY, inventor (to Navy), JAMES C.
BARTHOLOMEW, inventor (to Navy), CLIFFORD M. CAGLE,
inventor (to Navy), and ROBERT E. HUGHES, inventor (to Navy)
5 Aug. 1986 8 p Supersedes N86-33017. AD-D12299 (24 -
24, p 3777)

An automated anthropometric data measurement system is
described which includes a standing measuring assembly and a
seated measuring assembly to determine pertinent anthropometric
features of aviators being screened for assignment to particularly
suitable aircraft. Both assemblies have a plurality of position
sensors and measuring probes which are selectively placed by an
operator upon the aviator, each measuring probe producing a digital
data signal indicative of the particular feature measured when
selective position sensors indicate body contact. The signals are
then collected by a microcomputer which compares them to a
predetermined population and outputs the compared data to
magnetic storage media.

GRA
INTEGRATED DIGITAL CONTROL AND MAN-MACHINE INTERFACE FOR COMPLEX REMOTE HANDLING SYSTEMS

J. C. ROWE, R. F. SPILLE, and S. D. ZIMMERMANN

Dec. 1986

The Advanced Integrated Maintenance System (AIMS) is part of a continuing effort within the Consolidated Fuel Reprocessing Program at Oak Ridge National Laboratory to develop and extend the capabilities of remote manipulation and maintenance technology. The AIMS is a totally integrated approach to remote handling in hazardous environments. State-of-the-art computer systems connected through a high-speed communication network provide a real-time distributed control system that supports the flexibility and expandability needed for large integrated maintenance applications. A Man-Machine Interface provides high-level human interaction through a powerful color graphics menu-controlled operator console. An auxiliary control system handles the real-time processing needs for a variety of support hardware. A pair of dedicated fiber-optic-linked master/slave computer system control the Advanced Servomanipulator master/slave arms using powerful distributed digital processing methods. The FORTH language was used as a real-time operating and development environment for the entire system, and all of these components are integrated into a control room concept that represents the latest advancements in the development of remote maintenance facilities for hazardous environments.

ADVANCED REMOTE HANDLING FOR FUTURE APPLICATIONS: THE ADVANCED INTEGRATED MAINTENANCE SYSTEM

J. N. HERNDON, C. T. KRING, and J. C. ROWE

1986 26 p

The Consolidated Fuel Reprocessing Program at Oak Ridge National Laboratory has been developing advanced techniques for remote maintenance of future US fuel reprocessing plants. The developed technology has a wide spectrum of application for other hazardous environments. These efforts are based on the application of teleoperated, force-reflecting servomanipulators for dexterous remote handling with television viewing for large-volume hazardous applications. These developments fully address the nonrepetitive nature of remote maintenance in the unstructured environments encountered in fuel reprocessing. This paper covers the primary emphasis in the present program: the design, fabrication, installation, and operation of a prototype remote handling system for reprocessing applications, the Advanced Integrated Maintenance System.

USSR REPORT: LIFE SCIENCES. BIOMEDICAL AND BEHAVIORAL SCIENCES

10 Feb. 1987 86 p

Transl. into ENGLISH from various Russian articles

Calculation of thermodynamic equilibrium of a gas mixture CO2-H2O-H2-N2 for the cathode space of the electrolyzer containing a solid electrolyte with extracted oxygen taken into consideration were derived. Equilibrium partial gas pressures, thermal effect of reactions, theoretical voltage of dissociation (the standard enthalpy of reactions at unity mole fraction), and heat capacity were determined. These parameters are functions of temperature, total pressure of the gas mixture, initial gas composition, and the coefficient characterizing the degree of oxygen transfer from the cathode cell to the anode cell of the electrolyzer.

INVESTIGATION OF MICROSTRUCTURE OF ARBITRARY MOTIONS OF OPERATOR

G. G. TSULAYA, M. V. KHAVINGIYA, I. F. CHEKIRDA, and V. V. DANILOVTESEV

Transl. into ENGLISH from Soobshcheniya Akademii Nauk Gruzenskoy SSR (Tbilisi, USSR), v. 121, no. 2, Feb. 1986 p 330-372

Calculation of thermodynamic equilibrium of a CO2-H2O-H2-N2 mixture in the cathode space of an electrolyzer with solid electrolyte shows that theoretical voltage of dissociation of gas mixture with sub 1 as a function of oxygen content of the mixture (C(O2) - (upsilon sub n)) is represented by S-shaped curves for all tested temperatures. Evaluation of electrolyzer temperature shifts the curves in the direction of decline of theoretical dissociation voltage, without changing their appearance. An increase in (H/C) sup 00 causes insignificant shift
were investigated for projectiles of 1.5 mm diameter fired in the

tolerance. GRA

This study explores and analyzes architectural design
approaches for the interior of the Space Station Habitability Module
(Originally defined as Habitability Module 1 in Space Station
Reference Configuration Decpiction, JSC-19889, August 1984). In
the Research Phase, architectural program and habitability design
guidelines are specified. In the Schematic Design Phase, a range
of alternative concepts is described and illustrated with drawings,
scale-model photographs and design analysis evaluations.
Recommendations are presented on the internal architectural,
configuration of the Space Station Habitability Module for such
functions as the wardrobe, galley, exercise facility, library and
control work station. The models show full design configurations
for on-orbit performance. Author

This report presents a summary of the work performed by
Anacapa Sciences, Inc. (ASI) for the Army Research Institute (ARI)
Field Unit at Fort Rucker Alabama, under the contract Human
Factors Research in Aircrew Performance and Training. This
research note contains summary descriptions of each of the
projects on which ASI personnel worked during the third contract
year -- September 1983 to August 1984. Each summary description
contains: a background section that described the rationale for
the research and the research objectives; a research approach
section that described the tasks and activities required to fulfill
the project objectives; and a project status section that describes
the work completed, the preliminary findings (if available), and the
anticipated project completion date. GRA

This report provides summaries of FY86 Independent Research
(IR) and Independent Exploratory Development (IED) efforts and
the IR/IED funding profile, and presentations and publications
based on IR/IED efforts. The following IR efforts are described:
models for calibrating multiple-choice items, enhancing approaches
to multiple objective assignment, performance on computer-based
cognitive task, knowledge and process in adult language
competence, analysis of cognition in natural settings, and brain
mechanisms for human color vision. The following IED efforts are
described: development of graphic design aids, trend analysis for
real-time stochastic problems, and changes in cognitive structures
training.
EWAM: A MODEL FOR PREDICTING FOOD AND WATER INGESTION, AND INHALATION RATES OF MAN

A computer model, EWAM (Energy, Water and Air Model), was designed and implemented for predicting food and water ingestion, and inhalation rates of man for use in environmental assessment models. EWAM uses physiological, energetic, nutritional and physical relationships in combination with activity time budgets, and mass and energy balances. The calculated ingestion and inhalation rates are closely related. Various age and sex classes of man are taken into account. EWAM is best described as a deterministic equilibrium or steady state model, operating on a daily time scale with both detailed research and more general assessment model features. The parameters of EWAM are reviewed and suitable values recommended to allow biologically meaningful predictions.

PHARMACOLOGY

Medication prescriptions and fitness for flight

p 150 A87-33397

USAIR report: Life sciences. Biomedical and behavioral sciences

[JPUR-UBB-87-001] p 177 N87-20751

Individual distinction of fluid-electrolyte metabolism during hypokinesia with head-down tilt for 120 days and efficacy of preventive agents

p 156 N87-21562

Possibility of pharmacological correction of regional osteoporosis in nonbearing extremity

p 157 N87-21568

PHOTOCHEMICAL REACTIONS

Photodegradation of uril's in fish and the possibility of its application to the dosimetry of genetically active ultraviolet radiation

p 144 A87-34403

PHOTODECAY

Effect of light and development of photosynthetic cells

[DBET-005183] p 145 N87-20728

PHOTORESISTIVITY

Sensitivity to light --- of human visual system

p 150 A87-33504

PHOTOSENSITIVITY

Effect of light and development of photosynthetic cells

[DBET-005183] p 145 N87-20728

PHYSICAL EXAMINATIONS

New perspectives offered by the specific quantity of cutaneous free cholesterol

p 149 A87-33294

PHYSICAL EXERCISE

Evaluation of the prevention by physical exercise of cardiovascular deconditioning during prolonged bed rest from the study of systolic time intervals

p 148 A87-33386

Reactivity of adrenergic sympathetic system and tolerance to exercise load during repeated exposure to stationary magnetic field

p 158 N87-21573
VEGETATION GROWTH

VEGETATION GROWTH
Microwave culture collection, 1986-1987
[DE87-025578] p 145 N87-20729

VELOCITY
The perceived relations between color, direction, and speed of motion
p 161 A87-33027

VENTILATION
Sleep deprivation and exercise tolerance
IAD: A1761711 p 155 N87-21555

VERTICAL ORIENTATION
The perception of posture, self-motion, and the visual vertical
p 165 A87-33512

VESTIBULAR Nystagmus
Interlabyrinthine asymmetry, vestibular dysfunction and space motion sickness
p 153 N87-20734

VESTIBULAR Tests
Link between asymmetry of optokinetic nystagmus, optovestibular and vestibulo vegetative stability
p 153 N87-20738

Mathematical model of the otolith
p 158 N87-21572

VESTIBULUS
The vestibular system - and physiological acceleration
p 151 A87-33509

VIBRATION EFFECTS
Noise, vibration and changes in wakefulness during helicopter flight
p 146 A87-31694

The effects of whole-body-vibration
p 150 A87-33450

VISION
Papillary druse and aeronautical fitness
p 149 A87-33391

VISUAL ACCOMODATION
Improving visual performance through volitional focus control
p 162 A87-33053

VISUAL ACUITY
Improving visual performance through volitional focus control
p 162 A87-33053

VISUAL CONTROL
Use of eye control to select switches
p 171 A87-33011

Eye-voice-controlled interface
p 171 A87-33017

VISUAL DISCRIMINATION
Naming colors on a CRT display in simulated daylight
p 171 A87-33012

Evidence for global processing of complex visual displays
p 182 A87-33043

Sensitivity to light - of human visual system
p 150 A87-33504

Colorimetry and color discrimination
p 151 A87-33507

VISUAL PERCEPTION
The perceived relations between color, direction, and speed of motion
p 161 A87-33027

Display format and the perception of numerical data
p 161 A87-33029

Seeing spatial patterns
p 164 A87-33506

Eye movements - and human visual perception
p 151 A87-33508

The perception of posture, self motion, and the visual vertical
p 165 A87-33512

Visual localization and eye movements
p 165 A87-33514

The description and analysis of object and event perception
p 165 A87-33522

Spatial filtering and visual form perception
p 166 A87-33523

Visual functions of mental imagery
p 166 A87-33521

Computational approaches to vision
p 166 A87-33524

The role of Vavilov-Cerenkov radiation in visual sensations induced by protons
p 152 A87-34404

Human-display interactions - Context-specific bases

VISUAL SIGNALS
Asynchronous visual delays and the development of simulator sickness
p 160 A87-33004

VISUAL STIMULI
Temporal sensitivity - time dependent human perception of visual stimuli
p 164 A87-33505

Perceptual aspects of motion in the frontal plane - and pilot performance
p 164 A87-33511

VISUAL TASKS
Effects of display density and format type on control display unit format design
p 168 A87-31492

VOICE CONTROL
Multi-modal interfaces in supervisory control - voice and manual input for display devices monitoring
p 171 A87-33016

Eye-voice-controlled interface
p 171 A87-33017

Response modalities and time-sharing performance
p 172 A87-33018

Display/control integrity and time-sharing performance
p 161 A87-33028

W

WAKEFULNESS
Noise, vibration and changes in wakefulness during helicopter flight
p 146 A87-31694

WASTE DISPOSAL
Recent Space Shuttle crew compartment design improvements
p 174 A87-33072

WASTE WATER
Water recycling for Space Station
p 169 A87-32459

WATER
Gas and water recycling system for LEO vehicles experiments - Initial Operational Capacity
p 169 A87-32457

WATER BALANCE
Individual distinctions of fluid-electrolyte metabolism during hypokinesia with head-down tilt for 120 days and efficacy of preventive agents
p 156 N87-21562

WATER IMMERSION
Effect of immersion hypokinesia on some parameters of human muscle potentials
p 156 N87-21564

WATER RECLAMATION
Water recycling system using thermopneumoporation method
p 169 A87-32458

Water recycling for Space Station
p 169 A87-32459

WEAPON SYSTEMS
A methodology for predicting crew workload in new weapon systems
p 162 A87-33034

WEIGHTLESSNESS
A question of gravity
p 148 A87-32116

A life-support system developed for the fish experiment in Spacelab
p 144 A87-32555

Researchers are studying how our bodies react to long stays in a weightless environment
p 152 A87-33459

Effect of immersion hypokinesia on some parameters of human muscle potentials
p 156 N87-21564

Quantitative study of osteoblasts and osteoclasts of rat bones with simulation of weightlessness
p 157 N87-21566

Mechanism of action of local negative pressure applied to human body on dynamics of central circulation
p 159 N87-21579

WORK CAPACITY
Operator work capacity in tracking system when submitted to antorthostatic hypokinesia
p 176 N87-20736

Dynamics of bood flow of human brain in a continuous waking state
p 154 N87-20745

Reactivity of adrenosympathetic system and tolerance to exercise load during repeated exposure to stationary magnetic field
p 156 N87-21573

WORKLOADS (PSYCHOPHYSIOLOGY)
Development of the Criterion Task Set performance data base
p 159 A87-33607

Use of eye control to select switches
p 171 A87-33011

Resolution levels vs recognizable features/inprogressive transmission images
p 160 A87-33015

Multi-modal interfaces in supervisory control - voice and manual input for display devices monitoring
p 171 A87-33016

The effects of experience and training on the assessment of plus objective workload
p 161 A87-33002

Empirical workload and communications analysis of scout helicopter exercises
p 161 A87-33033

A methodology for predicting crew workload in new weapon systems
p 162 A87-33034

A comparison of three methods for controlling aircraft systems
p 172 A87-33035

An expert system approach to workload reduction
p 172 A87-33042

The relationship between workload and training - An introduction
p 162 A87-33055

Progress in mental workload measurement
p 162 A87-33056

The effects of task difficulty and workload on training
p 162 A87-33057

Training and subjective workload in a category search task
p 163 A87-33055

Interaction between workload and training - Converging evidence from psychophysiology and performance measurement
p 163 A87-33055

Assessing satellite control capability status
p 174 A87-33065

Workload - An examination of the concept
p 175 A87-33528

Workload assessment methodology
p 175 A87-33529

Evaluation of physical work capacity of cosmonauts aboard Soyuz-6 station
p 153 N87-20735

WOUND HEALING
Effect of hypoxia on DNA synthesis and collagen content of regenerating skin
p 154 N87-20742
The causes for the appearance of specific sicknesses from the study of systolic time intervals of human performance are discussed. The evaluation of countermeasures and prediction of left ventricular mass exercise with exogenous heat is also reviewed. Neurohumoral and mechanical factors in the modulation of unaltered norepinephrine-heart rate relationship in men are considered.

The effects of chemical defense antigens (atropine) on aviator performance (simulated flight and zero input tracking analyzer) are evaluated. In a study on the vitreous of calcium-magnesium ethylenediaminetetraacetate (EDTA) treated eyes of human cadavers, the effect of magnesium homeostasis during high-intensity anaerobic exercise on the central nervous system is investigated. The role of Vavilov-Cerenkov radiation in visual sensations stimulated by protons is also examined.

The causes for the appearance of specific sicknesses from the study of systolic time intervals of human performance are discussed. The evaluation of countermeasures and prediction of left ventricular mass exercise with exogenous heat is also reviewed. Neurohumoral and mechanical factors in the modulation of unaltered norepinephrine-heart rate relationship in men are considered.

The effects of chemical defense antigens (atropine) on aviator performance (simulated flight and zero input tracking analyzer) are evaluated. Listings in this index are arranged alphabetically by corporate source. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the index. If applicable, a report number is also included as an aid in identifying the document.

Listings in this index are arranged alpha-numerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A87-10000 Series)

Publications announced in IAA are available from the AI&A Technical Information Service as follows: Paper copies of accessions are available at $10.00 per document (up to 50 pages), additional pages $0.25 each. Microfiche of documents announced in IAA are available at the rate of $4.00 per microfiche on demand. Standing order microfiche are available at the rate of $1.45 per microfiche for IAA source documents and $1.75 per microfiche for AI&A meeting papers.

Minimum air-mail postage to foreign countries is $2.50. All foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to: Technical Information Service, American Institute of Aeronautics and Astronautics, 555 West 57th Street, New York, NY 10019. Please refer to the accession number when requesting publications.

STAR ENTRIES (N87-10000 Series)

One or more sources from which a document announced in STAR is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the STAR citation. Current values for the price codes are given in the tables on NTIS PRICE SCHEDULES.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other report number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to microimages (not to exceed 26:1 reduction).
Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in Energy Research Abstracts. Services available from the DOE and its depositories are described in a booklet, DOE Technical Information Center - Its Functions and Services (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: ESDU. Pricing information on specific data, computer programs, and details on ESDU topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address, both of which are on page vi.

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from Dissertation Abstracts and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: US Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of $1.50 each, postage free. (See discussion of NASA patents and patent applications below.)

Avail: (US Sales Only). These foreign documents are available to users within the United States from the National Technical Information Service (NTIS). They are available to users outside the United States through the International Nuclear Information Service (INIS) representative in their country, or by applying directly to the issuing organization.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.
PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC: NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

EUROPEAN: An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in STAR. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA — Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 CEDEX 15, France.

FEDERAL DEPOSITORY LIBRARY PROGRAM
In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 50 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 50 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are not sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

STANDING ORDER SUBSCRIPTIONS
NASA SP-7011 and its supplements are available from the National Technical Information Service (NTIS) on standing order subscription as PB 86-912300 at the price of $8.00 domestic and $16.00 foreign, and at $14.00 domestic and $28.00 foreign for the annual index. Standing order subscriptions do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber. Questions on the availability of the predecessor publications, Aerospace Medicine and Biology (Volumes I-XI), should be directed to NTIS.

### IMPORTANT NOTICE

**NTIS Shipping and Handling Charges**

- U.S., Canada, Mexico — ADD $3.00 per TOTAL ORDER
- All Other Countries — ADD $4.00 per TOTAL ORDER

**Exceptions** — Does NOT apply to:

- ORDERS REQUESTING NTIS RUSH HANDLING
- ORDERS FOR SUBSCRIPTION OR STANDING ORDER PRODUCTS ONLY

**NOTE:** Each additional delivery address on an order requires a separate shipping and handling charge.
This bibliography lists 232 reports, articles and other documents introduced into the NASA scientific and technical information system in July, 1987.
