The MHOST Finite Element Program:
3-D Inelastic Analysis Methods for Hot Section Components

Volume III - Systems' Manual

Shohei Nakazawa
The Finite Element Factory
Sunnyvale, California

July 1989

Prepared for
Lewis Research Center
Under Contract NAS3 - 23697

NASA
National Aeronautics and
Space Administration
This document discusses the internal structure of the MHOST finite element program designed for three-dimensional inelastic analysis of gas turbine hot section components. This computer code is the first implementation of the mixed iterative solution strategy for improved efficiency and accuracy over the conventional finite element method.

This document covers the control structure of the program, the data storage scheme and the memory allocation procedure and the file handling facilities including the read/write sequences.
This document discusses the internal structure of the MHOST finite element program designed for three-dimensional inelastic analysis of gas turbine engine hot section components. The computer code is the first implementation of the mixed iterative solution strategy for improved efficiency and accuracy over the conventional finite element method. The formulation of the mixed iterative solution method is an original development under the HOST project (contract NAS3-23697) and detailed documentation is available in the MHOST Theoretical Manual and other publications. The computer program has been written, tested and maintained at MARC Analysis Research Corporation, Advanced Project Group as a subcontractor to the United Technology Pratt and Whitney Aircraft.

The complete computer program consists of about 450 subroutines and a total of 47,000 lines of Fortran 77 statements. The current version 4.2 is no longer compatible with the ANSI Fortran 66 standard.

This document covers:

(i) the control structure of the program;

(ii) the data storage scheme and the memory allocation procedure;

(iii) the file handling facilities including the read/write sequences.

A brief note on the control variables in the labelled common blocks is given in the control structure section. Pointers for the working arrays in the common block are described in the second section of this document. The files used internally and those produced to communicate with other softwares (such as the graphic post-processing systems) are discussed in detail in the last section.

The appendix includes the brief description of each subroutine in conjunction with the names of common block referenced therein.

The MHOST code has been developed on PRIME 9955 at MARC running under Primos operating system (Rev.19.4.2 of F77 compiler has been used) and recently ported over to Alliant FX/8 running under unix operating system. This version is portable to any other unix-based computers with minimum amount of the conversion work. Versions are available on IBM mainframes with VS-Fortran Compiler (tested at United Technology Pratt and Whitney Aircraft) and CRAY X-MP COS using CFT compiler (the installation at NASA Lewis Research Center).

0.0 INTRODUCTION

The MHOST program has evolved from a small finite element code for testing new and innovative ideas into a versatile package usable as a research and development tool in solid and structural mechanics. Several code developers have worked on this program at various times over four years; more than 47,000 lines of extensively commented Fortran 77 code now make up the program. This document describes the internal architecture of the code. Particular emphasis is placed here on the facilities by which users can modify the code to incorporate new ideas such as different elements or constitutive equations.

The concept of three libraries plays a central role in the MHOST code. These libraries are:

The element library. Almost all the element specific operations are coded in this library with a common interface subroutine. Note that the MHOST code is written based on the mixed iterative solution concept and the element library is accessed significantly more often than in the case for conventional displacement method codes.

The material library. All the constitutive equations built into the MHOST program are accessed through an interface routine for the material library. The nodal evaluation of the constitutive equations in the mixed iterative solution process enables this operation to occur independently of the loop structure for the element formulation.

The solution algorithm library. The MHOST code uses a number of modern iterative solution algorithms and two types of solvers for a linearized system of algebraic equations. These options are accessed directly from the finite element driver routines; from a programming point of view, the routines in the solution algorithm library are not as clearly identifiable as other library routines.

0.1 Program Architecture

The MHOST program is designed and constructed to perform inelastic finite element computations in a reliable manner. A number of analysis driver routines are coded to perform individual clearly defined tasks. Inter-relations between analysis tasks are controlled by the execution supervisor subprogram and the utilities attached to it. All three libraries discussed briefly in the previous section are executed by each analysis driver routine. The program architecture of the MHOST program is illustrated in Figure 1.
Figure 1 Architecture of MHOST Program Version 4.2
The concept of multiple-drivers prevents users from combining unreasonable options, and avoids program troubles. Also this coding strategy allows code developers to add new analysis capabilities without affecting existing functions of the MHOST program.

The nonlinear finite element computations are arranged in a nested loop structure. The outer loops which control the algorithmic operations are coded in the analysis driver routines, while the inner loops involving incremental data addressing are coded in the element assembly submodules, a level below the analysis drivers.

A unique feature of MHOST is that all information is stored at nodes. The finite element nodal database resides in the lower address of working space in the blank common block. The storage allocation for this nodal database is virtually independent of analysis and solution algorithms and takes place before reading the finite element model data.

The working space required to perform the solution is allocated in the higher address portion of the same working space. The allocation of this working space is analysis dependent and takes place inside of the finite element driver routine.

0.2 Rules and Conventions

Coding rules are established to maintain the readability and maintainability of the MHOST program.

Subroutine names are selected as close as possible to a plain English word representing the operation performed by the subroutine. Because of limitations set by the old Fortran standard of six characters, some subroutine names can be cryptic.

A special rule has been implemented for subroutines in the element library:

- SnmmN Shape functions for elements consisting of mm-nodal points in nn-geometrical configuration.

- DnmmN Cartesian derivatives for elements consisting of mm-nodal points in nn-geometrical configuration.

<table>
<thead>

</thead>
<tbody>
<tr>
<td>2D</td>
<td>Two dimensional</td>
</tr>
<tr>
<td>AX</td>
<td>Axi-symmetric</td>
</tr>
</tbody>
</table>
3D | Three dimensional
SH | Three dimensional shell

Some of the other rules are:

- The subroutine names with string IN are used for data read from the main input channel.
- The string INIT is used to indicate subprograms involving memory allocation, except for INITST which generates the initial stress terms in the stiffness equations.
- The string SUB appears in subroutine names for subroutines involving the subelement scheme and the local-global analysis.
- The subroutine names starting with U indicate user subroutines.

Variable names are chosen as close as possible to a plain English word representing the information contained in the variables. Because of limitations set by the old Fortran standard of six characters, some variable names can be often cryptic.

Note that the implicit data types of Fortran specification are assumed. Variable names starting with I, J, K, L, M and N are integers except for those specifically declared as logical variables.

Some of the variable name conventions are:

- The string MAX is used for the maximum number of entries in adjustable dimensioned arrays.
- The string NEL is used for the actual number of entries in adjustable dimensioned arrays containing element related information.

Statement Numbers

Four-digit statement numbers are used for better visibility of the Fortran program listing. Codes which are ported from other software do not necessarily follow the conventions defined below.

The format statements referred from the read statements are labelled by statement numbers from 1000 to 1999. The format statements referred from the write statements are labelled by statement numbers from 2000 to 2999.
Ends of DO loops are labelled by statement numbers from 5000 to 5999. Statements to which control is transferred by the conditional GO TO statements are labelled by statement numbers from 8000 to 8999.

Efforts have been made to avoid arithmetic IF and GO TO statements in the MHOST code. Instead the block IF structure is implemented wherever possible. Note that this approach has made the code incompatible with Fortran 66 compilers.

0.3 Subroutines and Common Blocks

All the subroutines included in the MHOST program Version 4.2 are listed below in alphabetical order:

ACCLIN       ADAPIC       ADAPTID       ADAPTS

Most of the variables and arrays in the common blocks are used to store control variables and counters. The exceptions are START1 to START8 which contain all the pointer values for working storage allocation.

0.4 System Dependency

The MHOST Version 4.2 program is written in Fortran 77, as closely as possible to ANSI specification. The code has been developed on the PRIME 9955 under PRIMOS F77 Rev. 19.4.2.
In the original version, integer and single precision real word lengths of 32 bits are assumed and double precision is specified by using

\texttt{IMPLICIT REAL*8 (A-H, O-Z)}

for all real variables except for working storage arrays. The ratio of integer and double precision word length is stored in the variable IDP in common block \texttt{MACHIN}. The value is set at 2 in the main program of the original version.

To generate versions for 64 bits/word machines such as CRAYs and CYBERs, the value of IDP must be set 1 (one) in the main program.

The file opening and error handling procedures are system dependent. The subroutine \texttt{INTINT} is called from the main program to perform these functions. An example of this routine for the PRIME version is included here.

\texttt{Page : 11}
On the PRIME a user will have to prepare a file called T$FILES in the working directory containing names of all the files to be opened as Fortran I/O units.

On other systems, this operation can be performed either by issuing commands at the operating system level or by duplicating the PRIME version approach directly in the MHOST program.

Note it is recommended that on IBM machines the error and warning message print-outs be disabled for double precision floating point operations. This is due to the fact that the solution of an algebraic system of equations involves double precision variables with fictitiously large exponents.
The real time clock and calendar routine and the CPU clock routine both involve system calls and differ depending on the machinery and operating system. The organization of common block CTITLE in which the date and time are stored may need to be modified depending on how the system returns these values. The actual call to the system’s clock and calendar is made through SUBROUTINE DATER. The following code is used to communicate with the PRIME/PRIMDS:

```fortran
C SUBROUTINE DATER
  SUBROUTINE DATER(IDAT, IDAT4)
    C
    C DATE ROUTINE FOR THE PRIME
    C
    C * * * * * * *
    INTEGER*2 ARRAYS(15), NUM, IDAT(6)
    DIMENSION IDAT4(2)
    NUM=4
    CALL TIMDAT(ARRAYS, NUM)
    IDAT(1)=ARRAYS(1)
    IDAT(2)=ARRAYS(1)
    IDAT(3)=ARRAYS(2)
    IDAT(4)=ARRAYS(2)
    IDAT(5)=ARRAYS(3)
    IDAT(6)=ARRAYS(3)
    I0=ARRAYS(4)
    I1=I0/60
    I2=I0-60*I1
    IDAT4(1)=I1
    IDAT4(2)=I2
    RETURN
  END
```

On the CRAY, this operation is simplified to two system calls in SUBROUTINE HEAD as shown below:

```fortran
C SUBROUTINE HEAD CALLED BY 'DATINI'
  SUBROUTINE HEAD
    1 (VERNO, MONTH, JDATE, ILPRNT, ICONSL)
  C
  C **********************************************************************
  C
  C PICK UP TODAY'S DATE AND TIME AND THEN PRINT 'HOST' LOGO ON THE
  C FIRST PAGE OF LISTING. NOTE THIS OCCURS EVEN WHEN VACANT DATA FILE
  C IS ASSIGNED ( ON PRIME ).
```

Calls to the CPU clock for the execution time are also system dependent. SUBROUTINE TIME in the original PRIME version interfaces with the system's clock and returns the time in seconds as a double precision real variable.

To be able to obtain a reasonably accurate estimate of the CPU time, it is recommended that these routines be modified for the particular system on which the MHOST program is installed.
1.0 CONTROL STRUCTURE

In this chapter, a description of major subprograms is given. This is preceded by a brief note on the architecture of the MHOST program. The third section here is devoted to the definition of control variables appearing in the common blocks.

1.1 Overview

The architecture of the MHOST code is schematically shown in Figure 1. The execution supervisor routine (SUBROUTINE HOST) controls several analysis modules in a consistent manner. In Version 4.2 of the MFDST code, a pair of subroutines, LETCMD and RUMCMD, have been added to check the consistency of the Parameter Data and to generate internal flags for the selection of analysis modules. The intention here is to stop users from combining features of the program package not designed to be used together.

*******************************************************************************
The analysis modules represent the control structure for the incremental iterative algorithms implemented in the MHOST code. The source code with comments is designed to serve as the schematic flow chart of the computational process.

The schematic flow of the element and nodal data manipulations is coded in the element assembly submodules identified by the string ASSEM in the subroutine names which are entered from analysis modules. The element assembly submodules perform operations independent of element types and constitutive models. The assumptions introduced in the mechanics aspects of the formulations are explicitly coded at this level. These submodules call the librarian routines for elements and constitutive models.

The element librarian subprogram (SUBROUTINE DERIV) generates quantities unique to the element used in an analysis. The MHOST code uses standard finite element matrix notation as in ZIENKIEWICZ (1977). The element specific information returned from the librarian subprogram is the strain-displacement array referred to as the B matrix in previous writeups for 1987.

The constitutive equation librarian subprogram (SUBROUTINE STRESS and BMSTRS) is designed to incorporate the nodal storage of stress and strain values. The STRESS subroutine sets up the loop over the points at which
constitutive equations are evaluated. The current implementation is a nested double loop with the outer loop being over the nodes and the inner loop over the integration layers through the thickness. Note that the conventional displacement method can be recovered by restructuring this loop in conjunction with a few minor modifications in the core allocation for stresses and strains.

The librarian subprogram utilizes the constitutive equation package (SUBROUTINE NODSTR) from which individual subprograms for initial strains, stress recovery and the material tangent are called. The librarian subprogram also controls the pre-integration of stresses, strains and the material tangent over thickness for the shell element.

Note that application of the constitutive equation represents one of the most costly operations in nonlinear finite element computations. An attempt is made in MHOST to optimize the execution of this process which occurs, for example, once every iteration during the recovery of the residual vector. At the beginning of each increment, this process may be executed to evaluate the material tangent and to determine the contribution of initial strain terms which are often necessary for proper displacement preconditioning.

Except for a small amount of information related to convergence of the iterative solution, all report generation is performed at the end of an increment. Optionally, post-processing and restart files are written at the end of user-specified increments. Generic reporting subprograms are called from analysis modules inside the increment loop.

1.2 Execution Supervisor and Analysis Drivers

This section describes major subprograms in the MHOST package. For the sake of clarity no listings are attached in this section. Also this section does not discuss the arguments and common blocks appearing in each subroutine.

Execution Supervisor

MAIN PROGRAM - declares work space in blank common as an integer array. Also defines system parameters which are machine independent. Then passes control to actual execution supervisor SUBROUTINE HOST.

SUBROUTINE HOST - controls the sequence of execution for the analysis modules. First, this routine executes the control parameter data reader SUBROUTINE DATINI and checks for consistency by entering SUBROUTINE LETCMD and RUNCMD. The current structure of the code allows certain combinations...
of two analysis modules to be executed sequentially. Analysis modules called from the execution supervisor are:

SUBROUTINE STATIC for a quasi-static incremental iterative solution.

SUBROUTINE DYNAMT for a transient time integration of the dynamic equilibrium equations in an incremental-iterative manner.

SUBROUTINE MODAL for an eigenvalue extraction in vibration mode analysis. This subsystem may be executed after quasi-static analysis for modal analysis of prestressed structures.

SUBROUTINE BUCKLE for an eigenvalue extraction in buckling load calculations. This subsystem is executable only after quasi-static analysis.

SUBROUTINE FRONTS for a quasi-static incremental iterative solution by the out-of-core frontal approach. Note that certain options are not available in this subsystem.

SUBROUTINE SUPER for linear dynamic response calculations by the method of mode superposition.

Input Data Reader

There are three major subprograms:

SUBROUTINE DATIN1 - Reads and interprets the parameter data input called by the execution supervisor. All the default values for control variables are set in this routine.

SUBROUTINE BULKIN - Reads and interprets the finite element model definition data and prints the mesh and loading data for the initial increment (number 0). The bulk data reader is entered before the execution of analysis modules. This subroutine utilizes the following lower level routines:

SUBROUTINE INITI1 for memory allocation of integer workspace in blank common to store nodal and element data.

SUBROUTINE DATIN2 for model data input.

SUBROUTINE DATOU1 for reporting model definition data.

SUBROUTINE CHKELM for the detection of clockwise element connectivity definition which results in a negative Jacobian.
This routine automatically corrects the connectivity table to a counterclockwise direction.

SUBROUTINE SUBDIV for memory allocation of subelement mesh data and automatic mesh generation of subelements.

SUBROUTINE INCRIN - Reads and interprets the loading and constraint data for each increment. This routine is invoked by individual analysis modules from inside the loop over the increments.

SUBROUTINE DATIN3, a small subset of the bulk data reader SUBROUTINE DATINI is used for actual operations including initialization of arrays at the beginning of an increment.

Algebraic Operation Subsystem

There are three groups of routines for the profile solver, frontal solver and eigenvalue extraction, respectively. The profile solution package consists of:

SUBROUTINE CCMPRO - Sets up the integer array for the profile of global stiffness equations to be stored in a profile form.

SUBROUTINE ASSEM5 - Assembles the element stiffness equations into the global equation system stored in a profile form.

SUBROUTINE SOLUT1 - Controls the iterative solution processes including the vector update required for the quasi- and secant-Newton iterations.

SUBROUTINE DECOMP - Factorizes the global stiffness equations stored in a profile form.

SUBROUTINE SOLVER - Performs the back substitution and generates the update vector for the incremental displacement.

The frontal solution package consists of:

SUBROUTINE FRONTW - Estimates the front matrix size to be accommodated in the core memory.

SUBROUTINE INTPR - Allocates memory for the work space required for the frontal solution.

SUBROUTINE PRFRNT - Sets up the elimination table for the frontal solution.
SUBROUTINE FRONTIF - Assembles and factorizes the global stiffness equation simultaneously.

SUBROUTINE FRONTB - Performs the back substitution and generates the updates for the displacement vector.

SUBROUTINE FRONTR - Controls the iterative solution processes including the vector update required for the quasi- and secant-Newton iterations. Calls SUBROUTINE FRONTB for the incremental displacement update vector.

SUBROUTINE VDSKIO - Controls the data stream stored in the in-core buffer area and the actual out-of-core storage devices.

The eigenvalue analysis package consists of:

SUBROUTINE EIGENV - Controls the execution of the eigenvalue extraction subsystem.

SUBROUTINE INIDOP - Initializes the array for eigenvectors.

SUBROUTINE SUBSPC - Performs the subspace iteration and generates a specified number of eigenvalues and eigenvectors.

SUBROUTINE JACOBI - Solves the eigenvalue problem in subspace by the Jacobi iteration.

There are a number of subprograms used commonly by the braic Operation Subsystem:

SUBROUTINE STRUCT - Controls the memory allocation for the global algebraic manipulations at the beginning of every increment.

SUBROUTINE INITI2 - Allocates memory required for the storage of global stiffness matrix and other vectors required in the linear algebraic manipulation of finite element equations.

SUBROUTINE LINESR - Calculates the search distance when the line search option is turned on.

Element Assembly Submodules

These are subprograms that construct vectors and matrices appearing in the algorithmic description of mixed iterative process discussed in the previous subsections.
SUBROUTINE ASSEMI - Assembles the displacement stiffness matrix for
preconditioning purposes. All the kinematic and constitutive options
are tested in this module.

SUBROUTINE ASSEM2 - Assembles the coefficient matrix for transient time
integration by the Newmark family of algorithms. This routine has
evolved from SUBROUTINE ASSEMI and contains all the same options.

SUBROUTINE ASSEM3 - Assembles the coefficient matrix for quasi-static
analysis using the frontal solution subsystem. Large displacement,
stress stiffening and centrifugal mass terms are not available in this
package.

SUBROUTINE ASSEM4 - Calculates the nodal strain and recovers the
residual vector in a mixed form. The subelement solution package is
entered from this subprogram.

Element Loop Structure and Library Routines

In the element assembly submodules, element arrays are generated in the
loops over elements. The protocol for accessing the element library is
designed and implemented to involve a sequence of subroutine calls:

SUBROUTINE ELVULV - Sets up the current element parameters (See Table 2
for variables and values) from the element library table.

SUBROUTINE CNODEL - Pulls out quantities for the current element from
the global nodal array and restores them in the element workspace.
Coordinate transformations necessary for beam and shell elements are
performed in this subprogram.

SUBROUTINE DERIV - Sets up the displacement-strain matrix for the
current element by calling the element library subroutines. Those are:

- SUBROUTINE BPSTRS for plane stress elements, types 3 and 101.
- SUBROUTINE BPSTRN for plane strain elements, types 11 and 102.
- SUBROUTINE BSOLID for three-dimensional solid element, type 7.
- SUBROUTINE BSHELL for three-dimensional shell element, type 75.
- SUBROUTINE BAXSYM for axisymmetric solid-of-revolution elements,
types 10 and 103.
SUBROUTINE BTBEAM for linear Timoshenko beam element, type 98.

SUBROUTINE BASPST for the assumed stress plane stress element, type 151.

SUBROUTINE BASPSN for the assumed stress plane strain element, type 152.

SUBROUTINE BASSOL for the assumed stress three-dimensional solid element, type 154.

SUBROUTINE UDERIV - A slot for user coded element B matrix routine.

The following subprograms are used to calculate terms appearing in the finite element equations:

SUBROUTINE IMPMAS - Calculates nodal weight factor for the strain projection.

SUBROUTINE STIFF - Performs matrix triple products to assemble the element stiffness matrix and the element load vector associated with the initial strain terms.

SUBROUTINE STRAIN - Calculates element strain at specified sampling points and projects to nodes.

SUBROUTINE CNSMAS - Assembles the consistent mass matrix for modal and transient analysis.

SUBROUTINE INITST - Generates initial stress terms for quasi-static, buckling and modal analysis of prestressed structures.

SUBROUTINE CENMAS - Evaluates the centrifugal mass terms for rotating structures at speed.

SUBROUTINE RESID - Calculates the element residual vector for the global element.

SUBROUTINE SUBFEM - Performs the subelement solution and calculates the element residual vector for the subelement mesh.

SUBROUTINE RELDFG - Calculates the relative deformation gradient at the element sampling points and projects to nodes.

SUBROUTINE RESDYN - Calculates the contribution of mass and damping...
terms in the element residual vector when the transient dynamics option is used.

Material Library

A system of subroutines is included in the MHOST code which covers a wide range of material models and initial strain assumptions:

SUBROUTINE SIMPLE - Integrates the stress over the increment assuming the elastic-plastic response of the material is modeled by the total secant modulus approach. Also generates the material modulus matrix.

SUBROUTINE PLASTS - Integrates the stress over the increment and calculates the plastic strain by using the radial return algorithm.

SUBROUTINE PLASTD - Calculates the consistent elastic-plastic modulus if the incremental equivalent plastic strain is positive.

SUBROUTINE WALKEQ - Integrates the Walker unified creep plasticity constitutive equation and also generates a material modulus based on the temperature dependent elasticity assumption.

SUBROUTINE LELAST - Calculates the stress for the constant material modulus given as data.

SUBROUTINE THSTN - Calculates the thermal strain.

SUBROUTINE CRPSN - Calculates the creep strain.

Report Generation Subsystem

A system of subroutines is included in the MHOST code to generate reports on the line printer image file and the formatted post-processing file readable by MENTAT, Version 5 and up (a proprietary interactive pre- and post- processor program developed by and available from MARC Analysis Research Corporation). Note that the format of the post-processing file is similar to that of the MARC General Purpose Finite Element Program, Version 7.1 and the commercially available post-processing packages compatible with this program can easily be modified for use with MHOST.

SUBROUTINE PRININ - Reads and restores the user instructions for the print options. This routine is entered from the model data reader and/or the incremental reader. This program interprets user instructions including the type of information, the locations (either nodes or element integration points) at which the information is
printed and specified by character strings, and the range of nodes or elements specified by integer numbers.

SUBROUTINE PRINU - Writes the reports on the line printer image file. A loop is constructed over the instruction set restored by PRININ.

SUBROUTINE PRINSU - Generates the reports for the subelement solution on the line printer image file. The same control structure as the global solution writer PRINU is implemented. This routine also follows the instruction set generated by PRININ.

SUBROUTINE POSTOU - Writes formatted records on the post-processing file, Fortran Unit 19. All the information generated by the analysis is written. The user has no control over the records to be written on this file. The nodal values of stress and strain invariants and components are written in this subroutine.

SUBROUTINE POSTEN - Packs the nodal value record buffer and writes out the record when the buffer is filled.

1.3 Control Variables

The control variables effective globally through a number of subprograms are stored in the following common blocks:

ADDVAL  Variables related to additional point masses, dashpots and springs.

ALGEM   Fortran unit numbers and record number counters. Also the value of p is stored in this common block.

AUTOIN  Real variables used for automatic load increments. Also control variables for adaptive load increments by the arc length method are stored here.

BODYFR  A real array to store the direction of the body force vector for gravity loading or the position of two points defining the axis of rotation for centrifugal loading.

BSECT   Pointers and counters for beam section definitions.

CONTRO  Control variables and binary switches to activate options built into the MHOST program.

COMPND  Flags for sequential execution of multiple analysis drivers.
COUNT Counters for the line on the current page of the line printer image file.
CTITLE The title line and the date and time when the execution is initiated.
DAMP A damping factor array for transient dynamic analyses.
EIGEN Counters for eigenvalue extraction by the subspace iteration method.
MODSUP Counters for transient response calculation by vibration mode superposition.
ELEMEN A element type indicator and flags for element array manipulations.
ELTYP Counters for the element variables which are currently being processed. The entries in this common block are redefined every time the element loop is incremented.
ERRORS Data input error counter.
FREE Working arrays for the free format reader.
HARMON Control variables for harmonic analysis
INCON Variables for the incremental data reader.
MACHIN Machine dependent ratio of the integer and real word lengths.
MAXIMA Maximum number of element variables appearing in the current problem.
LOUBIN Flags for the selection of integration processes for various element arrays.
PAGCNT Counters for the page numbers of the line printer image output file.
PARAM Mesh parameters for the total number of data entries.
PERIOD Parameters to define time periodic loading and boundary conditions.
POSTPN  Control variables used for generation of the post-processing file.

POWER  Control variables for the power spectrum.

PULSES  Counters and pointers for pulse leads in dynamic analysis.

RESULT  Control variables for generation of the line printer output file.

SUBELM  Control variables for the subelement analysis option.

SUBTYP  Element variables for the subelement analysis option. The information stored in this common block is the subelement counterpart of ELTYP and entries are updated every time the loop over the subelements is incremented.

SUBSTR  Space allocated for the control variables of the substructure option (not used in Version 4.2).

SHIFT  Control variables for the power-shift option in the eigenvalue extraction for modal analysis.

TIME  Time parameters for transient dynamics and rate dependent calculations.

TIMLOC  The initial value for the CPU clock.

TMARCH  Parameters to define the time integration operator.

TRANSF  Local coordinate transformation arrays. Typically updated in an element-by-element manner.

TOLER  Error and tolerance for the global iterative solution.

VRTDSK  Control variables for the out-of-core solution by the frontal process.

ZPRINT  Control variables for a definition of a record in the line printer output file.

Control variables which play a significant role are summarized below:

Maximum number of terms in the tying equations in the present mesh.
Total number of nodal coordinate transformations specified by the user in the current mesh.
Number of update vectors for the BFGS quasi-Newton method.

2.0 DATA STORAGE SCHEME

This chapter discusses the dynamic core allocation scheme implemented in the MHOST code. The first section outlines the design principle and is followed by the code actually allocating memory in the second section. The third section is devoted to the definition of pointers.

2.1 Overview

A dynamic core allocation strategy is implemented in the MHOST code. An integer array is defined as an entry to blank common. This array is used as the working storage. Except for the frontal solution and transient dynamic analysis options, all the information required for the finite element computation is stored in this workspace. First parameters defining the number of variables for element types in use is copied from the array residing in SUBROUTINE TYPEIN.

The first section of this space stores the nodal variables and element arrays. The amount of memory required to store these data is found from the number of nodes, elements and attributes given by the user as part of the parameter data. This portion of working storage and information stored therein is often referred to as the finite element database. The pointers for the finite element database are defined in SUBROUTINE INITI1 before reading the model data section of the input data file. The model data is read directly into the space allocated for the finite element database.
In finite element computations, space is required to store arrays where size varies depending on the analysis type and mesh topology. For instance, in most of the analysis options, the global stiffness matrix is stored in a profile form. After the model data is read, the mesh topology (element connectivity) is swept through and column heights are calculated for each degree of freedom in SUBROUTINE COMPRO. The pointers for the global arrays are then calculated in INITI2.

For the local-global analysis inherent to the subelement procedure, an indirect accessing scheme is implemented. When the subelement option is invoked by the parameter data, element arrays to store subelement data pointers are prepared as a part of the finite element database. The pointers are calculated only for the global elements which are divided into subelements. The mechanism of this indirect addressing scheme is implemented in the memory allocation routine INITSE and the subelement solution driver routine SUBFEM.

2.2 Memory Allocation Subprograms

The following SUBROUTINE TYPEIN substitutes the element characteristics array into the workspace:

FUNCTION
  --
  ALLOCATES CORE STORAGE FOR THE SUBELEMENT MESH ASSOCIATED
  WITH THE IELEM-TH MASTER ELEMENT

SYSTEMS' MANUAL  MHOST Version 4.2
Page : 80
**ARGUMENTS**

- **IWORK**: INTEGER WORKING SPACE
- **RWORK**: SINGLE PRECISION REAL WORK SPACE
- **ISIZE**: TOTAL SIZE OF THE WORKING ARRAY
- **KEMBER**: THE FLAGS INDICATING THE PRESENCE OF SUB-ELEMENT DIVISION
  - = 1 FOR UNIFORM 2X2 SUBELEMENT GRID
  - = 10 FOR USER DEFINED SUBELEMENT GRID
  - < 0 SUBELEMENT MESH DEFINED BUT THE CORE IS NOT ALLOCATED
- **KSUBELEN**: NUMBER OF SUBELEMENTS
- **KSUEBNP**: NUMBER OF NODES IN THE SUBELEMENT NODES
- **KSUBTY**: SUBELEMENT TYPE
- **NNODE**: NUMBER OF NODES IN THE GLOBAL MESH
- **NELEM**: NUMBER OF ELEMENTS IN THE GLOBAL MESH
- **IERR**: ERROR COUNTER (IF IERR .GT. 0) EVENTUALLY THE JOB SHOULD QUIT
- **IPOINT**: ARRAY FOR SUBELEMENT ARRAY POINTERS
- **NSDATA**: NUMBER OF ENTRIES PER ELEMENT FOR THE SUBELEMENT POINTER ARRAY
- **IELEM**: COUNTER FOR THE CURRENT ELEMENT
- **ILAST**: LAST ADDRESS OF THE WORKING STORAGE (UPDATED IN THIS ROUTINE)
- **IDP**: RATIO OF THE REAL / INTEGER WORD LENGTH

**POINTERs**

**IPOINT( I ,IELEM)**

COMPLETE MIXED FINITE ELEMENT SOLUTION FOR THE SUBELEMENT MESH SUBDIVISION. RESULTS ARE FED BACK TO THE GLOBAL MESH AS A MODIFIED RESIDUAL FORCE VECTOR, AND NODAL QUANTITIES ASSOCIATED WITH THE SUBELEMENT GRIDS ARE RESTORED FOR FURTHER DATA MANIPULATIONS.

ARGUMENTS
---------
RWORK SINGLE PRECISION REAL WORKAREA
IWORK INTEGER WORKAREA
ISIZE TOTAL SIZE FOR THE WORKAREA
IPOINT POINTER ARRAY FOR THE SUBELEMENT DATA STORAGE
IELEM INDEX FOR THE CURRENT 'MASTER7 ELEMENT
NSUBEL ARRAY FOR THE NUMBER OF SUBELEMENT ELEMENTS
NSUBNP ARRAY FOR THE NUMBER OF SUBELEMENT NODES
NSUBTY ARRAY FOR THE SUBELEMENT ELEMENT TYPES
NSDATA NUMBER-OF-ENTRIES/ELEMENT IN IPOINT
KEMBED FLAG FOR THE EMBEDDED SUBELEMENTS
WORKSP DOUBLE PRECISION REAL WORKSPACE

POINTERS

2.3 Counters and Pointers
Most of the variables used as either counters or pointers are documented in the Fortran source program. In this section, we discuss the counter and pointer variables stored in the common blocks:

START 1

Stores pointers for storing global data and some of the element data. Variables are:

IELPRM  Pointer to the array storing the element parameters for all element types used in the present mesh.
ITYP     Pointer to the element type identifier array.
INEL     Pointer to the element connectivity array.
ICHAR    Pointer to the nodal material property data array.
IPRES    Flag for pressure loading.
IPRINT   Pointer to the line printer output control data array.
IBPRES   Pointer to the nodal pressure definition array.
IBNORM   Pointer to the nodal array storing the components of the nodal point normal.

START 2

Stores pointers for the global mesh data. Variables are:

INOD     Pointer to the nodal coordinate definition array.
ITEM     Pointer to the nodal total temperature array.
ITEMDF   Pointer to the nodal incremental temperature array.
IDUP     Pointer to the array storing the duplicate node input data.

START 3

Stores the pointers for the global nodal constraint and loading data arrays. Variables are:

IKBC     Starting address for the nodal displacement constrain
array.

ITI  Pointer to the integer array for defining the tying equations.

ITR  Pointer to the real array for defining the tying equations.

ITRAN Starting address of the array for nodal coordinate transformation input.

ISBC Starting address of the integer array for storing nodal stress boundary condition data input.

ISBCR Pointer to the real array for the prescribed nodal stress values.

START 4

Stores the pointer for nodal data storage. Variables are:

IDINC  Pointer to the incremental displacement array.

IDTOT  Pointer to the total displacement array.

IFORCE  Pointer to the total load vector due to the mechanical loading.

IRESID  Pointer to the residual vector.

IWINOD  Not used in version 4.2.

ISIGNO  Pointer to the total nodal stress array.

IEPSNO  Pointer to the total nodal strain array.

IPSTINO Pointer to the total nodal plastic strain array.

ICSTINO Pointer to the total nodal creep strain array.

ITSTINO Pointer to the total nodal thermal strain array.

IISTINO Pointer to the incremental nodal stress array.

IISNNO Pointer to the incremental nodal strain array.
IIPSNO Pointer to the incremental nodal plastic strain array.

IIICSNO Pointer to the incremental nodal creep strain array.

IITSNO Starting address for the incremental thermal strain defined at nodes.

IDMINO Starting address for the material tangent arrays defined at nodes. In case of shells, the constitutive resultant array is stored.

IOMENO Starting address for the total shift tensor defined at nodes. This array is used for the kinematic hardening and the unified viscoplastic constitutive models.

ITDSNO Starting address for the total initial stress terms due to the initial strain terms defined at nodes.

IDYNA Starting address for the total nodal acceleration array.

IDYNV Pointer to the total nodal velocity array. IDYNA and IDYNV are defined only when the transient analysis option is invoked.

IPREF Pointer to the material orientation vector for anisotropic material response defined at a node.

IDFINC Pointer to the nodal array for the incremental deformation gradient. This array is allocated and used for finite deformation analysis.

IDPTOT Pointer to the nodal array for the total deformation gradient.

IYIELD Pointer to the array used to define nodally the strain hardening slope table.

START 5

Stores pointers for global arrays. Variables are:

IRL Starting address for a vector storing the nodal loads including the residual.

IREAC Starting address for a vector storing the nodal reactions.
IES  Starting address for the space of banded global stiffness matrix. Not used in Version 4.2.

IAB  Starting address for the space to pull a row of the global stiffness array.

ILAST  Pointer to the last word used in the blank common workspace.

IDIA0  Pointer to the array for diagonal entries of the global stiffness array stored in profile form.

IUPTTRI  Pointer to the array storing the upper triangular part of the global stiffness array in profile form.

IC0LPT  Pointer to the integer array storing the column height for each degree of freedom of the global stiffness matrix in profile form.

IMASDI  Pointer to the space reserved for the diagonal entry of the global mass matrix. This space is allocated only when the modal analysis option is invoked.

IMASUP  Pointer to the upper triangular entries of the mass matrix stored in profile form.

START 6

Stores pointers for the element workspace. Variables are:

IELV  Starting address for the connectivity array of the element being processed.

ICOR  Starting address for the nodal coordinate array for the current element.

ISIG  Starting address for the element total stress array at integration points.

IEPS  Starting address for the element total strain array at integration points.

IXRL  Starting address for the total nodal displacement array defined for the current element.
IXIRL  Starting address for the incremental nodal displacement array.

IXP    Starting address for the workspace to store the element load vector.

IXK    Starting address for the workspace for the element stiffness array.

KPSTNO  Pointer to the nodal plastic strain array for the current element.

KCSTNO  Pointer to the nodal creep strain array for the current element.

KTSTNO  Pointer to the nodal thermal strain array for the current element.

KISTNO  Pointer to the nodal incremental stress for the current element.

KISNNO  Pointer to the nodal incremental strain for the current element.

KIPSNO  Pointer to the nodal incremental plastic strain for the current element.

KICSNO  Pointer to the nodal incremental creep strain for the current element.

KITSNO  Pointer to the nodal incremental thermal strain for the current element.

KDMAT   Pointer to the element material tangent array defined at the integration points for the current element.

KDMINO  Pointer to the nodal material tangent array for the current element.

KTDSNO  Pointer to the nodal array for the initial stress due to initial strains such as thermal and creep effects defined for the current element.

KITDST  Pointer to the element initial stress vector.
START 7

Stores more pointers for global and element arrays. Variables are:

ICON Not used in Version 4.2.

IKBCR Starting address for a double precision real array storing the prescribed displacement values.

ITRANR Starting address for a double precision real array storing the angle of rotation for the user specified nodal coordinate transformations.

ITRACR Starting address for a double precision real array storing the values of user specified nodal concentrated loads.

ITRANR Starting address for a double precision real array storing the values of user specified nodal coordinate transformations.

IBETA Starting address for a double precision real array storing the strain displacement matrix at integration points of the current element.

IDET Starting address for a double precision real array storing the determinant of the Jacobian for isoparametric mapping at integration points of the current element.

START 8

Stores pointers for the resultant quantities. Variables are:

KGEPS Pointer to the strain resultant array at element integration points.

KIGEPS Pointer to the incremental strain resultant array at element integration points.

KGEPS Pointer to the strain resultant array at element integration points.

KIGEPS Pointer to the incremental strain resultant array at element integration points.

KGSIG Pointer to the stress resultant array at element
integration points.

KIGSIG Pointer to the incremental stress resultant array at element integration points.

KGIDST Pointer to the total resultant for initial stress at element integration points.

IGEPNO Pointer to the global array for the strain resultants.

IIGENO Pointer to the global array for the incremental strain resultants.

IGSINO Pointer to the global array for the stress resultants.

IIGSNO Pointer to the global array for the incremental stress resultants.

IGTDNO Pointer to the global array for total resultants of initial stress.

KGEPNO Starting address for the nodal array of strain resultants of the current element.

KIGENO Starting address for the nodal array of incremental strain resultants of the current element.

KGSINO Starting address for the nodal array of stress resultants of the current element.

KIGSNO Starting address for the nodal array of incremental stress resultants of the current element.

KGTDNO Starting address for the nodal array of total resultant for initial stresses of the current element.

START 9

Stores pointers for creep related quantities. Variables are:

KEQCSI Pointer to the equivalent incremental creep strain at nodes of the current element.

KEQCST Pointer to the equivalent total creep strain at nodes of
3.0 THE FILE SYSTEM

This chapter is devoted to a discussion of the file system for supporting a series of structural analyses by the MHOST program. In the next section, the overview of this file system is presented followed by a detailed discussion on the user interface (input and output files), restart file, and post-processing data file.

3.1 Overview

The MHOST program is a batch processor and when execution is initiated the user does not need to interact with the program until the Fortran STOP statement is executed (or an execution error is detected by the operating system). Under an interactive operational environment, the code produces a summary of the execution log on the terminal screen. Note that the same information is written on the main output file.

The file system is composed of three parts: the standard input and output files referred to as the user interface; the restart file; and the post processing data file. The main report part is referred to as Fortran unit number ILPRNT (see Block Data Subprogram, common block ALGEM) which consists of the input data echo print (card image print out), the input data as it is interpreted by the MHOST code, and the summary of execution such as the usage of memory and time consumed by CPU. The analysis result part is referred to as Fortran unit number JLPRNT. To make this logical distinction clear, separate header records and page counters are provided to these units.

The user interface files are the standard input file, the log file and the line printer output file. All the instructions to accomplish the analysis task are written in the input file. The MHOST program assumes that the input file is a card image file. That is, the input file is a sequentially accessed, formatted file, and the record length is fixed to 80 bytes. Under most operating systems (perhaps IBM systems are the only exceptions), it is not necessary to declare explicitly the record length. As shown in the next section, records are individually read into the read buffer as 80 separate characters and the user interface routine decodes each line.

The output file is assumed to contain 132 bytes/record which is the standard width for most line printers (as well as other printers driven in the same manner as the line printer). Again, except for IBM systems, this file is opened without explicitly specifying the record length. The line
printer file is logically separated into two parts. As the default setting, the code is delivered with the same Fortran unit number.

The log file is the standard output unit on which the system's messages are printed. This file is defined as Fortran unit ICONSL and is handled in a manner which depends on the computer systems default value for interactive terminal output.

Typically, on PRIME systems, ICONSL is the unit number 1 (one) and under the UNIX environment, unit number 6 (six) is assigned to ICONSL.

The restart file is a sequentially accessed binary file. The record length is fixed to 256 bytes/record. The contents of common block and the work space are written and read by the MHOST code. This file is referred to as Fortran unit number IRSTRT. The unit number 8 (eight) is assigned as default value when the MHOST code is delivered.

The post-processing file is a sequentially written formatted file. A record length of 80 bytes is implicitly assumed but not necessarily declared explicitly when the file is opened (under most operating systems). Except for minor differences in the format to write nodal stresses and strains, construction of this file is compatible with the post-processing file output of the MARC general purpose finite element package version K1. Any commercially available finite element post-processing package can easily be modified to read this file. The MENTAT interactive finite element pre- and post-processing package available from MARC is shipped with the MHOST post-processing interface as a standard feature.

3.2 User Interface

The free format reader is written in Fortran 66 to interpret data coming in through the input data file in a line-by-line manner. Two utilities are available. One is the keyword interpreter SUBROUTINE KEY and another is the free format numeric data reader SUBROUTINE FREFOR:

3.3 Restart File

The restart file is designed to store all the information necessary to resume execution of an incremental analysis or to use the final result stored in the file for starting a new set of calculations. The alteration of certain parameter data is supported by the following SUBROUTINES: SAVER to write and RESTART to read the restart file:

C ... SUBROUTINE SAVER ... RESTART FILE WRITER
C
SUBROUTINE SAVER( RWORK, IWORK, ISIZE )
C
C **********************************************************************
C ** **
C ** WRITES A BINARY FILE FOR LATER RESTART **

MHOST Version 4.2
JINC = JINC+1
C
RETURN
END

3.4 Post-Processing Data File

The MHOST program produces an industry-standard formatted post-processing data file when the user requests it. The format is almost compatible with the MARC general purpose finite element program, Versions J.3 and K.1. The difference is that the stress variables (referred to as element variables in most of the finite element programs) are produced at nodal points and written on the file in a tightly packed manner.

CONTENTS OF HOST POST TAPE - Version 4.2

The following describes the contents of the ten blocks which will be found on the Post Tape. This information is the same for either the binary or the formatted Post Tape.

<table>
<thead>
<tr>
<th>Block Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Block I</td>
<td>Title</td>
</tr>
<tr>
<td>NR;80A1;(TITLE(J),J=1,70)</td>
<td>TITLE(J) is Jth character</td>
</tr>
<tr>
<td>Block II</td>
<td>Control Information</td>
</tr>
<tr>
<td>1. NR;6I3;INUM</td>
<td>Number of variables per element</td>
</tr>
<tr>
<td>2. LNUM</td>
<td>Number of nodes in mesh</td>
</tr>
<tr>
<td>3. MNUM</td>
<td>Number of elements in mesh</td>
</tr>
<tr>
<td>4. NDEG</td>
<td>Number of degrees of freedom per node</td>
</tr>
<tr>
<td>5. NSTRES</td>
<td>Dummy</td>
</tr>
<tr>
<td>6. INOD</td>
<td>Number of nodal variables - See Note below.</td>
</tr>
<tr>
<td>7. IPSTCC</td>
<td>Connectivity and coordinate flag (1- given)</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td>---</td>
<td>-------------</td>
</tr>
<tr>
<td>8.</td>
<td>IPSTYP</td>
</tr>
<tr>
<td>9.</td>
<td>NCRD</td>
</tr>
<tr>
<td>10.</td>
<td>NNOMNX</td>
</tr>
<tr>
<td>11.</td>
<td>IANTYP</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>12.</td>
<td>ICOMPL</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>13.</td>
<td>NBCTRA</td>
</tr>
<tr>
<td>14.</td>
<td>POSTRV</td>
</tr>
<tr>
<td>IDM4</td>
<td>IDM5</td>
</tr>
</tbody>
</table>

**Note:**

\[ \text{INOD} = \{NDEG\} \times JNODE \]

If IANTYP = 2 on 2

\[
\begin{array}{ccc}
4 & 4 \\
15 & 1 \\
16 & 1 \\
\end{array}
\]

IANTYP = 15 only appears during subincrements

IANTYP = 16 only appears during subincrements

If IANTYP = 8 and ICOMPL = 1 JNODE = 2

If IANTYP = 9 and ICOMPL = 1 JNODE = 4

**Block II**

**CODE NUMBER ASSOCIATED WITH ELEMENT VARIABLES**

INUM Records; J=1, INUM
Block IV

NR; 6I3; JPLT(J)
Element Variable Code

CONNECTIVITY LIST
If IPSTCC is zero this block will be omitted.

MNUM Records; J=1, MNUM

NR; 6I3; LM(1)
Element Type

LM(2)
Number of Nodes in this Element

LM(3)
1st Node of Element J

LM(NNODMX+2)
Last Node of Element J

Block V

COORDINATE LIST
If IPSTCC is zero this block will be omitted.

LNUM Records; J=1, LNUM

NR; 6E13.6; SUM(1)
1st Coordinate of Jth Node

SUM(2)

SUM(NCRD)
Last Coordinate of Jth Node

Block VI

TRANSFORMATION LIST
If NBCTRA is zero this block will be omitted.

Binary 1 record
Formatted (NBCTRA-1)/6 + 1 records

NR; 6I13; LM(I)
List of nodes which have transformations applied

Block VII

TRANSFORMATION - DIRECTION COSINES
If NBCTRA is zero this block will be omitted.
1 record per each node listed in Block VI if binary tape

NR;6E13.6; D(1,1) D(2,1) D(3,1) D(1,2) D(2,2) D(3,2) D(1,3) D(2,3) D(3,3)

2 records per node if formatted tape

Transformations are for local to global

Blocks VIII, IX and X are repeated for each increment.

Block VIII

INCREMENT, TIME AND FREQUENCY

NR;6E13.6 X1(1) X1(2) X1(3) X1(4) X1(5) X1(6)

Transient Time
Increment number is a real formed as I + J/100
I is the static increment number
J is either the harmonic subincrement or the eigenvector number

Frequency
Flag to read new blocks II, III, IV, V, VI, VII. Set to 1 to read these blocks again.

IANTYP analysis type flag.
Not used; reserved for future expansion.

Block IX

VALUES OF ELEMENT VARIABLES

If INUM is zero, this block is omitted.

If IANTYP=15 or IANTYP=16, this block is omitted.

NUM*NSTRES Records

NR;6E13.6;

VALUE((CI,J), I=1,INUM), J=1,INODE)

VALUE is the name of an array storing all the element variables at nodes.
Block X

VALUE OF NODAL VARIABLES

If INOD is zero, this block is omitted.

INUM Records

NR; 6E136; SUM(1)
SUM(NDEG)
SUM(NDEG+1)
SUM(2*NDEG)
SUM(INOD)

Nodal displacements, velocities, accelerations and reactions

During subincrements:

The first NDEG quantities are:

IANTYP = 15
Nodal Components of Dynamic Mode

IANTYP = 16
Nodal Components of Buckle Eigenvector

NOTES:

NR     Indicates the beginning of a new record for the binary post tape.

NR; Format Indicates the beginning of a new set of information which is to be read with the following format:

Appendix 1 provides a sample program to dump the post tape.

The table below provides codes for selecting strains and stresses for plotting:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-6</td>
<td>Components of total strain.</td>
</tr>
<tr>
<td>7</td>
<td>Equivalent plastic strain.</td>
</tr>
<tr>
<td>8</td>
<td>Equivalent creep strain.</td>
</tr>
<tr>
<td>9</td>
<td>Total temperature.</td>
</tr>
<tr>
<td>11-16</td>
<td>Component of stress</td>
</tr>
<tr>
<td>17</td>
<td>Equivalent Mises tensile stress.</td>
</tr>
</tbody>
</table>
Mean normal stress (tensile positive) (for Mohr-Coulomb).
User definable quantity to write on post tape.
Physical components of the total plastic strain.
Total equivalent plastic strain.
Second state variable.
Physical components of total creep strain.
Total equivalent creep strain.

If several layers (shell or beam) are to be plotted, the code number should be as follows: code for variable as above + 100 x layer number.

An example of the post tape file for a 20 four node plane stress element used to model a cantilever beam is:

BEAM PROBLEM
16 33 20 2 2 4

IPOSTF (19)  I FORMATTED OUTPUT FILE FOR POST-PROCESSING

VERSION 2.0 GENERATES MARC COMPATIBLE POST TAPE CONTAINING
ONLY MESH DATA AND DISPLACEMENT + REACTION AT NODES.
THIS CAN BE PROCESSED BY INVOKING 'POSTDATA' COMMAND WITH 'MARC'
OPTION IN 'MENTAT' INTERACTIVE SESSION.

SYSTEMS' MANUAL
MHOST Version 4.2
Page: 160
FULLY MENTAT COMPATIBLE POST PROCESSING FILE WILL EVENTUALLY WRITTEN ON IPIOTF FILE AND THEN IPOSTF WILL BE USED FOR THE TOPOLOGICAL MESH DEFINITION OUTPUT TO BE PROCESSED BY 'READ' OPTION IN MENTAT

APPENDIX SUBROUTINES

Subroutines included in the MHOST code, Version 4.2, are summarized in this appendix. The routine names are sorted in alphabetical order. A brief description of each routine is given, in conjunction with the names of common blocks referenced therein. Names of routines referenced in some of the vitally important routines are given in this document. Note that almost all subprograms written for the MHOST package are self-documented and further information can be obtained directly from the source listing.

ACCLIN
   Reads in initial acceleration data from the main input data reader.

Common block: MACHIN

ADAPTC
   Controls the adaptive time step size adjustment for creep strain evaluation

Common block: ALGEM

ADAPTD

Common block: TIME, TOLER, CONTO

ADAPTS
   Controls the adaptive load increment size adjustment for the arc length method

Common block: ALGEM

ADD
   Adds two double precision real vectors.

ADDBAN
   Adds the lumped values listed in SVAL with the connectivity specified in LCON to the global array GABF in band form. Not used for profile-stored global arrays.

ADDIAG
   Adds the lumped values listed in SVAL to the global array. This subroutine is the profile-storage counterpart of ADDBAN.
ADDINC
Updates total quantities by adding together the values at the beginning of the increment and the incremental values.

Common block: AUTOIN, ELTYP, CONTRO, SUBEIM, MAXIMA, PARAM, START1, START2, START3, START4, START6, START8, TIME

ASMVEC
Assembles global vector from the d.o.f. conversion table. See also SUBST1.

ASSEM1
Assembles the displacement stiffness matrix for quasi-static analysis. Works with the profile solver.

Common block: ALGEM, ADDVAL, AUTOIN, BSECT, CONTROL, BODYFR, LOUBIN, ELEMEN, ELTYP, ERRORS, MAXIMA, PARAM, PULSES, START1, START2, START3, START4, START5, START6, START7, START8, SUBEIM, SUBSTR, TIME, TRANSF, MACHIN

ASSEM2
Assembles the global time integration operator matrix for direct time integration. Works with the profile solver.

Common block: ALGEM, ADDVAL, AUTOIN, BSECT, CONTROL, BODYFR, LOUBIN, ELEMEN, ELTYP, ERRORS, MAXIMA, PARAM, PULSES, START1, START2, START3, START4, START5, START6, START7, START8, SUBEIM, SUBSTR, TIME, TRANSF, MACHIN

ASSEM3
Assembles the displacement stiffness matrix for quasi-static analysis. Works with the frontal solution.

Common block: ALGEM, ADDVAL, AUTOIN, BSECT, CONTROL, BODYFR, LOUBIN, ELEMEN, ELTYP, ERRORS, MAXIMA, PARAM, PULSES, START1, START2, START3, START4, START5, START6, START7, START8, SUBEIM, SUBSTR, TIME, TRANSF, MACHIN

ASSEM4
Assembles the residual vector for quasi-static and transient dynamic analyses. The routine includes the variational recovery of nodal strains, nodal stress recovery and element loop for the internal force calculation.

Common block: ALGEM, ADDVAL, BSECT, COUNTR, CONTRO, ELEMEN, ELTYP, ERRORS,
ATTRIB

Attributes the element connectivity data by the duplicate node and tying options.

Common block: ALGEM, ERRORS, MAXIMA

BACSUB

Performs back-substitution for the nodal displacement vector as a part of the frontal solution subsystem.

BANDBR

Calculates the maximum bandwidth.

Common block: ELTYP

BANNER

Prints banner on the line printer output file.

BASAXS

Generates strain-displacement matrix for axisymmetric element based on the assumed stress method.

BASEIN

Reads in parameters defining harmonic base excitation.

Common block: MACHIN

BASPSN

Generates strain-displacement matrix for plane strain element derived from the assumed stress method.

BASPST

Generates strain-displacement matrix for plane stress element derived from the assumed stress method.

BAXSYM

Generates strain-displacement matrix for axisymmetric element by the numerical integration.

BEAMIN

Reads in beam section properties.
Common block: MACHIN

BFGSLH
Performs the BFGS update for the left hand side of the nonlinear equations.

BFGSRH
Performs the BFGS update for the right hand side of the nonlinear equations.

BFGSVW
Generates the global projection vectors required for the BFGS update.

BFLOAD
Controls the generation of element body force load vector.

EMSTRS
Evaluates constitutive equations for the beam element. Note that the current version only supports a linear elastic beam element.

ENDTRM
Preintegrates the lamina constitutive matrix to obtain the constitutive resultant with respect to the bending moment - curvature terms for shell elements.

BODYIN
Reads in parameters defining body force loading.

Common block: MACHIN

BOUND1
Applies the displacement constraint by eliminating row and column of the global profile-stored stiffness equations.

BOUND2
Applies the displacement constraint to a global vector.

BOUND3
Applies the displacement constraint to a substructure. Obsolete in Version 4.2.

BOUNDN
Calculates the weighted normal vector at nodes on the boundary.
Common block: ALGEM

BOUNFR
Applies the nodal displacement constraint to the frontal solution elimination process.

BOUNIN
Reads in boundary displacement constraint data.

Common block: MACHIN

BPSTRN
Generates strain-displacement matrix for isoparametric plane strain element by numerical integration.

BPSTRS
Generates strain-displacement matrix for isoparametric plane stress element by numerical integration.

BREAD
Reads an array from a specified Fortran I/O unit stored in binary form.

BSHELL
Generates strain-displacement matrix in resultant form for isoparametric shell element by means of selective reduced integration.

BSOLID
Generates strain-displacement matrix for isoparametric solid element by numerical integration.

BTBEAM
Generates strain-displacement matrix for the linear isoparametric Timoshenko beam element by reduced integration.

BUCKLE
Drives the buckling analysis using subspace iterations for eigenvalue extraction.

Common block: AUTOIN, MAXIMA, CTITLE, DAMP, EIGEN, INCON, MACHIN, ELEMEN, ELTYP, CONTRO, SUBSTR, ERRORS, PARAM, START1, START2, START3, START4, START5, START6, START8, TIME

BULKIN

SUBROUTINES
Supervises the reading operation of the bulk (model) data.

Common block: CONTRO PARAM, SUBELM

External reference: INIT1, DATIN2, DATOUI, CHKELM, SUBDIV

WRITE
Writes an array to a specified Fortran I/O unit in binary form.

CENMAS
Assembles the stiffness matrix entries related to the centrifugal mass terms for an element.

Common block: BODYFR

External reference: NUL, GAUSSP, COPY, S2DO4N, VSH04N, TEMO2N, S1DOZN,
S3DO8N, D2DO4N, D3DO8N, DAXO4N, GSH04N, DEMO2N, SUBT

CENT2D
Calculates the centrifugal load vector for a two-dimensional (plane stress/strain) element.

CENT3D
Calculates the centrifugal load vector for a three-dimensional solid element.

CENTAX
Calculates the centrifugal load vector for an axisymmetric element.

CENTBM
Calculates the centrifugal load vector for a beam element.

CENTSH
Calculates the centrifugal load vector for a shell element.

CHARIN
Reads in material property data.

Common block: MACHIN, ELTYP

CHCHAR
Identifies the value of a number given as a single character.

CHKELM
Checks to see if the element connectivity is given in the counter
clockwise manner. If not, prints warning messages and repairs the connectivity table entries. Dangerous.

Common block: ALGEM, AUTOIN, BSECT, CONTRO, BODYFR, LOUBIN, ELEMT, ELTYP, ERRORS, MAXIMA, PARAM, START1, START2, START3, START4, START5, START6, START7, START8, SUBSTR, TIME, TRANSF, MACHIN

External reference: ELVULV, QNODEL, INSIDE, LINES

CNODEL Pulls out information related to the current element. See Section 2.2 for detail.

Common block: TMARCH, ALGEM, CONTRO, ELTYP, MAXIMA, PARAM, START1, START2, START4, START5, START6, START7, START8, START9, MACHIN

External reference: SEARCl, SEARCH, INTERP, ROTMT, TSHO4N, SHTRAN, TRANSP, MATINV, TBM02N, ADD, ADDSMU, NUL

CNSMAS Assembles the consistent mass matrix for an element.

CNSTNM Constructs a consistent transformation from nodal to modal data for linear dynamics by modal superposition.

Common block: EIGEN, ELTYP, MACHIN, MAXIMA, MODSUP, PARAM, POWER, START1, START2, START6

COLRED Performs column-wise reduction for back-substitution.

COMPDF Copies the definition of element parameters in the workspace for composite shells

Common block: START1

COMPIN Reads material property data for the composite laminate option with shell elements.

Common block: ALGEM

COMPROM
Computes the profile column heights and pointers for profile-storage of the global stiffness array.

Common block: ELTYP, MAXIMA, PARAM, ALGEM

CONDSE
Removes specified row and column of a square matrix.

CONNIN
Reads element connectivity data.

Common block: ELTYP

CONTIN
Adds incremental load (defined as the nodal force) to the total load vector.

Common block: MACHIN

COORIN
Reads coordinate data for nodes.

COPY
Copies a double precision real array to another double precision real array.

COPYDS
Copies a double precision real array to a single precision real array.

COPYIN
Copies an integer array to another integer array.

COPYSD
Copies a single precision real array to a double precision real array.

CORDIR
Transforms the coordinate system defining the strain component from global to local, filters out specific components and transforms back to the original global coordinate system. Used by the strain-displacement matrix routines.

COROUT
Debug writes the nodal coordinates.
CPXBK1, CPXBK2
Back substitutes for the solution of complex matrix equations stored in the band-matrix form.

CPXDIV
Divides a complex number by another complex number.

CPXEXC
Sets up complex harmonic based excitation vector. The function is fully commented.

CPXFAC
Performs the crout decomposition of complex matrix equations stored in the banded form.

Common block: ALGEM

CPXFOR
Sets up the nodal force vector for the complex harmonic analysis.

CPXMUL
Multiplies two complex numbers.

CPXREA
Assembles the complex nodal reaction force vector due to the complex base excitation.

CPXRES
Calculates the harmonic nodal force.

CRPLAW
Defines the equivalent creep strain increment. To be used as a User Subroutine. See also the MHOST Version 4.2 Users' Manual.

CRPSIN
Determines quantities related to creep strain effects.

CUTHIL
Optimizes the band-width of global equations by Cuthil-McGee algorithm. Called by OPTIM.

D2DO4N
Calculates derivatives for two dimensional four node elements.

D2DO9N
Calculates derivatives for two dimensional nine node elements.

D3D08N

Calculates derivatives for three dimensional eight node hexahedral elements.

D3D27N

Calculates derivatives for three dimensional quadratic elements with 27 nodes.

DAMPIN

Reads in parameters defining damping terms in transient dynamic analysis.

Common block: MACHIN

DASHIN

Reads in the definition of additional damping terms in the form of discrete dashpots.

Common block: MACHIN

DAT1

Outputs an integer array on the line printer file.

Common block: ALGEM

DAT2

Outputs a real array on the line printer file.

Common block: ALGEM

DAT3, DAT5

Outputs a pair of integer and real arrays on the line printer file.

Common block: ALGEM

DATEMS

Prints out elastic beam section properties.

Common block: ALGEM

DATCG1

Modifies parameter data during a restart job.
DATER
Calls systems’ routine to pull out today’s date and time of the day. System dependent. See Section 0.4.

DATIN1
Supervises read operations of parameter data.

DATIN2
Supervises read operations of model data and construction of in-core database.

DATIN3
Supervises read operations of incremental data.

DATOU1
Prints out parameter data as interpreted on the line printer.

DATOU4
Prints incremental data as interpreted on the line printer.

SUBROUTINES
DAX04N  Calculates derivatives for four node axisymmetric elements.

DAX09N  Calculates derivatives for nine node axisymmetric elements.

DEMO2N  Calculates derivatives for two node linear Timoshenko beam elements.

DECINT  Converts a given string to an integer.
Common block:  ALGEM

DECOMP  Factorizes a symmetric matrix stored in profile form.
Common block:  PARAM

DECREA  Converts a given string to a real.
Common block:  ALGEM

DEFGUP  Updates the total deformation gradient at the end of an increment.

DERIV  Controls access to the entries in the element library.
Common block:  ALGEM, CONTRO, ELTYP, ELEMEN, ERRORS

DIAM  Measures maximum bandwidth from a root node. Called by CUTHIL and used for bandwidth optimization.
Common block:  ALGEM

DIRECT  Generates three orthogonal vectors, one of which is orthogonal to the plane defined by two given vectors.
Common block:  ALGEM
DISPIN
Reads in initial displacements for transient analysis.
Common block: MACHIN

DISTIN
Reads in distributed load data.
Common block: MACHIN

DIV2Q2
Generates two dimensional subelement mesh composed of 9 node quadratic quadrilaterals.

DIV2X2
Generates two dimensional subelement mesh composed of 4 node linear quadrilaterals.

DMATIN
Reads in stress-strain matrix defined directly at nodes.
Common block: MACHIN

DMPING
Sets up the modal damping matrix for the current element.

DOT (Function Subprogram)
Calculates dot-product of two double precision real vectors.

DSH04N
Calculates derivatives for four node shell elements in the lamina coordinate system.

DSHELL
Converts the notation between tensorial and matrix forms for stress-strain matrix.

DSLOAD
Controls the access to the element distributed load routines.
Common block: CONTRO, ELTYP, ELEMEN, MAXIMA, PARAM, START1, START2, START3, START4, START5, START6, START7, MACHIN

DUPLIN
Reads in duplicate node definition data.
Common block: MACHIN

DXOUT
  Prints out a double precision array for debugging purposes.

DYNAMT
  Drives the transient time integration for dynamic analysis.

Common block: ALGEM, AUTOIN, PERIOD, CTITLE, DAMP, EIGEN, INCON, ELEMEN, ELTYP, MAXIMA, CONTR0, SUBSTR, ERRORS, PARAM, START1, START2, MACHIN, START3, TMARCH, START4, START5, START6, TIME

DYNOP
  Assembles the element operator matrix for transient time integration.

Common block: ALGEM, TMARCH

EIGENV
  Drives the eigenvalue extraction subsystem by subspace iteration.

Common block: CONTR0, ELEMEN, EIGEN, SHIFT, ELTYP, PARAM, MACHIN, START3, START4, START5, START7

ELVULV
  Pulls out parameters defining element characteristics from the workspace.

Common block: ALGEM, CONTR0, ELTYP, START1, PARAM, ELEMEN

EQVC
  Calculates the strain invariant from the given deviatoric strain tensor stored in vector form.

EQVS, EQVSTR
  Calculates the stress invariant from the given deviatoric stress tensor stored in vector form.

ERROR
  Prints error message on the line printer output file.

Common block: ALGEM

ETRANS
  Transforms coordinates for the nodal displacement vector according
to user instructions.

Common block: ALGEM

FILINT

Fills an integer array with its address or its inverse order.

Common block: ALGEM

FILL

Fills a double precision real array with a specified number.

FIRST1

Re-numbers the nodes for Cuthill-McKee optimization.

FIXINT

Imposes constraints onto the frontal solution.

External reference: FILINT, VULVRG, COPY

FOLOIN

Reads parameters specifying the concentrated nodal follower force.

Common block: MACHIN

FORRES

Calculates forced vibration response by modal superposition.

FREDOM

Drives the linear dynamic analysis in frequency domain.

Common block: CTITLE, TIME, AUTOIN, START1, START2, START3, START4, START5, START7, START8, ALGEM, EIGEN, MODSUP, POWER, DAMP, INCON, MACHIN, ELEMEN, MAXIMA, ELTYP, CONTRO, SUBSTR, ERRORS, PARAM, SHIFT

External reference: STRUCT, TIMOUT, ASSEMI, SOLUT1, ASSEMI4, RESCON, ADDINC, PRINOU, POSTOU, COPY, NUL, INITST, SUBT, MASMAT, MADD, EIGENV, CNSTNM, PNTTNM, INISQQ, SETRMS, QUIT

FREFOR

Reads free format numeric data line from the card reader.

Common block: ALGEM, FREE
FRNTBL
Sets up the elimination table for the frontal solution and calculates maximum front matrix size.

Common block: ALGEM, PARAM, MAXIMA, MACHIN

FRNTOP

FRONTB
Performs back substitution of global equations factorized the by the frontal process.

FRONTF
Performs forward elimination of global equations by the frontal process.

FRONTR
Performs resolution by frontal solution for a newly defined load vector with a readily factorized system of equations.

FRONTS
Drives the quasi-static solution process utilizing the frontal solution scheme.

Common block: CTITLE, TIME, AUTOIN, START1, START2, START4, START5, START6, ALGEM, EIGEN, INCON, MACHIN, ELEMEN, MAXIMA, ELTYP, CONTRO, SUBSTR, ERRORS, PARAM, START8

FRONIW
Computes the maximum front width from the element connectivity table.

Common block: ALGEM, MAXIMA, MACHIN

GAUSSP
Returns coordinates and weight factors for Gaussian quadrature.

GEM02N
Calculates derivatives for two node linear Timoshenko beam element with respect to element coordinate system.

GENCOR
Generates coordinates for subelement nodes which divide global
element uniformly.

**GENNOD**
Generates connectivity table for uniformly divided subelement mesh.

**GEOMAT**
Assembles the geometric stiffness for large displacement and buckling analyses.

External reference: GAUSSP, COPY, S2D04N, S3D08N, D2D04N, DAX04N, DSH04N, D3D08N, NOTION

**GETBSP**
Extracts data for beam section properties.

Common block: ALGEM

**G02GLO**
Rotates stresses and strains back to global configuration in finite deformation analysis.

External reference: ROTTEN, ROTBAK

**G02ROT**
Rotates stresses and strains to mid-increment configuration in finite deformation analysis.

External reference: ROTTEN, ROTFOR

**GRAV2D**
Produces body force vector due to gravity acceleration for two-dimensional elements.

Common block: ALGEM

**GRAV3D**
Produces the body force vector due to gravity acceleration for three-dimensional elements.

**GRAVAX**
Produces the body force vector due to gravity acceleration for axisymmetric elements.

**GRAVBM**
Produces the body force vector due to gravity acceleration for beam elements.

GRAVSH

Produces the body force vector due to gravity acceleration for shell elements.

GSH04N

Calculates the element normal to four node shells.

HARMIN

Reads in parameters for harmonic base excitation.

Common block: ALGEM

HEAD

Prints the MHOST banner and system's information on the line printer output file and terminal screen.

Common block: CTITLE

HOLECR

Generates coordinate data for an embedded hole represented by a subelement mesh. Called by HOLEDF.

HOLEDF

Defines an element with a parameterized hole using the subelement procedure.

Common block: MAXIMA, ELTYP, SUBTYP, MACHIN, START1, TRANSF, START6

External reference: ELVULV, QNODEL, HOLECR, HOLEM

HOLEIN

Reads parameters to define a embedded hole in a global element.

Common block: ELTYP, SUBELM, MACHIN

HOLEM

Generates connectivity array for an embedded hole represented by a subelement mesh. Called by HOLEDF.

HOOKEM

Calculates the linear elastic stress-strain matrix for beam elements.
HOOKLW

Calculates the linear elastic stress-strain matrix for all element types other than beams.

HOST

Supervises execution of the MHOST code. See Section 1.2 for detail.

Common block: CONTRO, ALGEM, ADDVAL, TMARCH, AUTOIN, PERIOD, POWER, PULSES, EIGEN, ERRORS, MODSUP, HARMON, LOUBIN, START5, START4, PARAM, BSECT, INCON, MACHIN, SUBSTR, SUBELM, SHIFT

ICLEAR

Zero clears an integer array.

INCRIN

Drives the reader and report writer for incremental data.

External reference: DATIN3, DATOU4, DATOU1

INCSBC

Imposes stress boundary conditions.

INIIMP

Creates initial eigenvectors for subspace iteration.

Common block: CONTRO, MAXIMA, ETYPE, ELEMEN, PARAM, EIGEN, START1, START2, START3, START4, START5, START6, START7, START8, MACHIN

External reference: QUIT, NUL, COPY, RATIO, MAXIM

INITDF

Initializes the nodal deformation gradient array.

INITFR

Allocates memory for frontal solution option.

Common block: ALGEM, CONTRO, PARAM, MACHIN, MAXIMA, EIGEN, START5, START6

INITI1

Allocates memory for in-core nodal database.
INITI2
Allocates memory for the profile solution for quasi-static, dynamic and eigenvalue analyses.

Common block: ADDVAL, ALGEM, CONTRO, DAMP, EIGEN, MODSUP, HARMON, POWER, PULSES, MAXIMA, PARAM, TMARCH, PERIOD, SUBELM, SHIFT, SUBTYP, BSEC, START1, START2, START3, START4, START5, START6, START7, START8, START9, SUBSTR, MACHIN, ERRORS

INITIN
Reads parameters defining initial conditions for transient analysis.

Common block: ALGEM, CONTRO, PERIOD, EIGEN, ERRORS, MAXIMA, PARAM, START1, START3, START5, START4, MACHIN

External reference: KEY, DISPIN, VELCIN, ACCLIN, PERDIN, QUIT

INITSE
Allocates memory for the subelement nodal database. See Section 2.2 for detail.

Common block: SUBTYP, ALGEM

External reference: SUBELV, NULINT

INITST
Assembles the global initial stress matrix for quasi-static, dynamic and eigenvalue analysis.

Common block: AUTOIN, EIGEN, CONTRO, BODYFR, LOUBIN, ELEMEN, ETYPE, START1, START5, PARAM, FREE, START2, START4

External reference: NUL, ELVULV, CNODEL, GEOMAT, ASSEM5

INRDIR
Redirects the input stream.

Common block: ALGEM, FREE

INRFRC

SUBROUTINES
Recovers the velocity and acceleration from the displacement update in transient dynamics.

Common block: TMARCH

INSIDE

Checks to see if the element is inside-out and repairs the connectivity array, if necessary, for the linear quadrilateral and hexahedral elements.

INITDYN

Initializes the scratch file for transient dynamics.

INTERP

Interpolates nodal values to the integration points.

INTINT

Initializes the file system and execution environment. System dependent. See Section 0.4. Called by MAIN program.

Common block: VRIDSK

INITSQO

Integrates the spectral density function over a given range of frequencies.

INV3

Inverts a 3 by 3 matrix.

INVERT

Inverts a general square matrix.

Common block: ALGEM

ITERIN

Reads parameters defining convergence criteria.

Common block: TOLE

External reference: FREFOR

JACOB1

Extracts eigenvalues of a square matrix. Called by SUBSPC.

Common block: ALGEM
External reference: MAXIM, SMULT, LINES

JT (Function subprogram)
  Gives the address of a specified entry in a global array stored in band matrix form.

KEY
  Checks to see if a string matches to a keyword.

Common block: ALGEM, FREE

L2NORM
  Calculates 1 norm of a given vector.

LAXSYM
  Calculates the load vector due to body force loading on axisymmetric elements.

Common block: ALGEM

LAYINT
  Integrates lamina quantities to resultants for thick shell elements.

LELAST
  Calculates linear elastic response of a material for a pre-defined stress-strain matrix.

LETCMD
  Sets up the integer control variables for the compound execution of analysis drivers. See Section 1.2 for detail.

Common blocks: ALGEM, CONTRO, COMPND, PARAM, EIGEN, MACHIN

LEVEL
  A part of the front matrix size optimization package. Not used in Version 4.2.

LINES
  Advances the line number of the line printer output file (ILPRNT).

Common block: ALGEM

External reference: PAGE
LINE52  Advances the line number of the line printer output file (JLPRNT).
Common block:  MAXIMA, ALGEM, ZPRINT
External reference:  PAGE2, PAGE3

LINESR  Calculates search distances for the line search algorithm.
Common block:  MACHIN, CONTRO, ALGEM, AUTOIN, PARAM, START3, START4, START5, START7, TOLER

LINESU  Advances the line number of the line printer output page used for the subelement solution.
Common block:  MAXIMA, ALGEM, ZPRINT
External reference:  PAGE2S, PAGE 3S

IMPMAS  Calculates the diagonalized Gramm matrix for nodal strain projections. Either Gauss-Lobatto or Gauss/now-sum algorithm can be used.

LOCVEC  Fills up the address table for the global array stored in band matrix form.
Common block:  ELYTYP

LPSTRN  Calculates the load vector due to body force loading on plane strain elements.

LPSTRS  Calculates the load vector due to body force loading on plane stress elements.

LSHELL  Calculates the load vector due to body force loading on shell elements.

LSOLID

SUBROUTINES
Calculates the load vector due to body force loading on solid elements.

LTBEAM
Calculates the load vector due to body force loading on beam elements.

MADD
Adds a matrix to a product of another matrix and a scalar.

MAIN
Main program.

Common block: blank, MACHIN

MASMAT
Assembles the global consistent matrix stored in profile form.

Common block: AUTOIN, EIGEN, CONTRO, BODYFR, LOUBIN, ELEMEN, ELTYP, ERRORS, MAXIMA, BSEC, PARAM, START1, START2, START3, START4, START5, START6, START7, START8, SUBSTR, TIME, TRANSF, MACHIN

MASSIN
Reads in the connectivity and magnitude of added mass.

Common block: MACHIN

MATINV
Inverts a given square matrix.

MATONE
Fills the diagonal entry of a global matrix by unity.

MATPRT
Prints out a two dimensional array with a header.

Common block: ALGEM

MATSUM
Adds two arrays multiplied by given constants for each array.

MAXCON
Finds the maximum connectivity at nodes used for bandwidth optimization.
MAXIM
Pulls out the maximum value from a double precision array.

PERDIN
Reads data defining the periodic loading in transient dynamics.
Common block: MACHIN, ELTYP, PERIOD

PERDOP
Applies periodic loading to the current time integration step.
Common block: ALGEM

PJOOP
Debug - writes a double precision real variable/array.

PLASTD
Calculates a consistent tangent modulus for an elastic plastic material at a given state of stress and deformation history.
Common block: ELEMEN

PLASTS
Calculates the stress state of an elastic-plastic material by return mapping.
Common block: ELEMEN

PAGE
Advances a page of line-printer output file (ILPRNT) and prints the header.
Common block: ALGEM, CTITLE, PAGCNT

PAGE2
Advances a page of line-printer output file (JLPRNT) and prints the header for nodal variables.
Common block: ALGEM, CONTRO, CTITLE, RESULT, TIME, PAGCNT

PAGE3
Advances a page of line-printer output file (JLPRNT) and prints the header for element variables.
Common block: ALGEM, CONTRO, CTITLE, RESULT, TIME, PAGCNT
Same as PAGE2. Used for subelement solution.

Same as PAGE3. Used for subelement solution.

Zero - clears a double precision real array.

Zero - clears an integer array.

Zero - clears space allocated for nodal normals of shell coordinate definition.

Controls execution of the bandwidth optimization option.

Generates the coordinate transformation matrix to the preferred orientation of an anisotropic material.

Performs the outer product of two three-dimensional vectors.

Common block: START2, START3, START4, START5, START6, START7, START8, SUBSTR, TIME, TRANSF, MACHIN

Updates the velocity vector at the beginning of a time integration step.

Computes the nodal pressure and directly adds it into the global load vector.

Computes stress at a given point and generates material tangent.

External reference: NUL, COPY, ROTPRF, THRSTN, CRPSTN, SUBT, SIMPLE, MULT, LELAST, PLASTS, PLASTD, WALKEQ
NOTION
Converts stresses and strains stored in vector form to tensorial form.

NRMNRM
Normalizes the nodal normal vector and stores its components as a part of the coordinate data for shell elements.

MULT
Multiplies two two-dimensional matrices.

MULTT
Multiplies a matrix by the transpose of another matrix.

NEWACC
Updates the acceleration vector at the beginning of a time integration step.

NGWADD
Allocates the acceleration and velocity vector at the beginning of a time step to temporary storage.

NEWMRK
Adds the element stiffness and mass matrices to generate the element time integration operator matrix.

External reference: MADD

NEWRHS
Forms global load vector.

Common block: AUTOIN, BSECT, CONTRO, BODYFR, LOUBIN, ELEMEN, ELTYP, ERRORS, PULSES, MAXIMA, PARAM, START1

MESURE
Calculates a distance from the integration point to a straight line defined by two points.

MID
Calculates the coordinate of the mid edge node. Not used in Version 4.2.

MIDDLE
Drives the calculation of coordinates and connectivity for mid edge nodes. Not used in Version 4.2.
MKFAKE
Sets up a fake connectivity table including tying constraint for bandwidth optimization.

MODAL
Drives the modal analysis.

Common block: CTITLE, TIME, AUTOIN, START1, START4, START5, ALGEM, EIGEN, INCON, MACHIN, ELEMEN, MAXIMA, ELTYP, CONTRO, SUBSTR, ERRORS, PARAM, SHIFT, START8

External reference: STRUCT, TIMOUT, ASSEM1, MASMAT, MADD, EIGENV, POSTOU

PNTINM
Sets up the convolution terms for nodal loads.

POLD2D
Performs polar decomposition of a two-dimensional second order tensor.

POLD3D
Performs polar decomposition of a three-dimensional second order tensor.

POLICE
Debug - writes contents of a specified common block.

POSTEN
Packs the record of nodally defined element variables for the post tape. See Section 3.4 for detail.

Common block: POSTPN

POSTOU
Writes out post processing data. See Section 3.4 for detail.

POSTPR
Writes contents of buffer to the post processing tape.

PREFIN
Reads in the parameters defining the preferred orientation of an anisotropic material.

Common block: MACHIN
PRELEM  Extracts information of the current element from the nodal database. A simplified version of CNODEL used in PRINOU.

Common block:  CONTRO, ELTYP, MAXIMA, PARAM, START1, START2, START3, START4, START5, START6, START7, START8, MACHIN

PRESET  Initializes working arrays used for front matrix size optimization.

Common block:  ALGEM

PRESIN  Reads parameters defining pressure loads.

Common block:  MACHIN

PRFRNT  Controls the front matrix size calculation and the subsequent memory allocation.

Common block:  CONTRO, PARAM, ELEMEN, ELTYP, MAXIMA, MACHIN, START1, START2, START3

PRINCV  Solves a 3 by 3 eigen problem by Jacobi iteration.

PRININ  Reads control data for line printer output.

Common block:  FREE

PRIN01, PRIN02, PRIN03  Writes an array with a header.

PRINOU  Controls the line printer output of the global solution.

Common block:  CONTRO, ALGEM, ELEMEN, ELTYP, RESULT, START1, START2, START4, START6, SUBELM, TIME, TRANSF, ZPRINT, MACHIN

PRINSU  Controls the line printer output of the subelement solution.
Common block: CONTRO, ALGEM, ELEMEN, ELTYP, RESULT, START1, START2, START4, START6, TIME, TRANSF, ZPRINT, MACHIN

PRNIM
Debug - writes the element stiffness matrix.

Common block: ALGEM, ELEMEN

PRINTS
Debug - writes the global stiffness matrix stored in band matrix form.

Common block: ALGEM

PRNSHL
Prints the nodal coordinate transformation matrix for shells.

PRNTEL
Reports the connectivity table resulting from automatic subelement mesh generation.

PRNINO
Reports the coordinates resulting from automatic subelement mesh generation.

PRTERR
Prints error message and does not STOP but returns the control.

Common block: ALGEM

PRWARN
Prints warning message.

Common block: ALGEM

PSDIN
Reads the power spectrum definition.

Common block: MACHIN

PULSIN
Reads the pulse load definition.

Common block: MACHIN
PUTDUP

Adds the duplicate node option as a special element in the frontal solution subsystem.

PUTTIE

Adds the tying equation as a special element in the frontal solution subsystem.

QNODEL

Extracts element quantities from the global nodal database. This is yet another subset of CNODEL.

Common block: TMARCH, ALGEM, CONTRO, ELTYP, MAXIMA, PARAM, START1, START2, START4, START5, START6, START7, START8, START9, MACHIN

QUIT

Prints the error message and terminates the execution.

Common block: ALGEM

R3DTEN

Defines three-dimensional rotation matrix for decomposition of the deformation gradient.

RAMDSK

Initializes the buffer area used for the out-of-core frontal solution.

Common block: VRIDS, ALGEM, PARAM, MACHIN, START5

RATIO

Subdivides entries of one array by corresponding entries of another array.

RBF

Rotates stress and strain vectors to preferred orientations.

READEX

Reads header and a double precision real array from a binary file.

REASPR

Calculates reaction force due to an added spring.

REDIAG

Reduces the diagonal entries of a profile store global stiffness
RELDGF
Computes the nodal incremental deformation gradient.

RELOAD
Forms the follower force at the end of an increment.

Common block: ALGEM, ADDVAL, AUTOIN, BSECT, CONTRO, BODYFR, LOUBIN, ELENEW, ELTYP, ERRORS, MAXIMA, PARAM, PULSES, START1, START2, START3, START4, START5, START6, START7, START8, SUBELM, SUBSTR, TIME, TRANSF, MACHIN

External reference: NUL, ADD, RTFOLF, ELVULV, CNODEL, DERIV, INTERQ, STIFF, ETRANs, SUBST1, BFLOAD, DSOAD, QUIT

RESCHK
Tests for convergence flag associated with the residual.

RESCON
Tests for convergence in terms of residual reaction and displacement.

Common block: ALGEM, CONTRO, PARAM, START1, START2, START3, START4, START5, START6, START7, START8, SUBELM, SUBSTR, TIME, TRANSF, MACHIN

External reference: ADD, SUBT, TYING2, BOUND2, MAXIM, L2NORM, LINES, SUBT

RESDYN
Calculates the contribution of mass and damping terms to the residual vector. Called by ASSEM4 when the direct time integration flag is on.

Common block: TMARCH, ALGEM

RESEQ1

RESEQ2

RESID
Forms the residual vector. Called by ASSEM4.

Common block: PARAM

RESOLV

Resolves the same equation by frontal solution method for a different load vector.

Common block: ALGEM

RESTRT

Reads the restart file. See Section 3.3 for detail.

Common block: ADDVAL, ALGEM, AUTOIN, BODYPR, BSECT, CONTRA, COMPN, COUNT, DAMP, EIGEN, MODSUP, ELEMEN, HARMON, INCON, MAXIMA, LOUBIN, PARAM, PERIOD, POSTPN, POWER, PULSES, RESULT, START1, START2, START3, START4, START5, START6, START7, START8, START9, SUBELM, SUBTYP, SUBSTR, SHIFT, TIME, TMARCH, TOLER, VRIDSK, ZPRINT

ROTBK

Rotates the stress state back to the global coordinate system in finite deformation analysis.

ROTDMT

Rotates the element stress strain matrix into the global coordinate system for shells.

External reference: ORIENT, COPY, QUIT, MATINV, NUL, TSHIFT, TFULL2, MULT

ROTFOR

Rotates the stress state state into the deformed configuration coordinate system in finite deformation analysis.

ROTPRF

Rotates the stresses and strains defined in global coordinates to the preferred orientation of an anisotropic material.

ROTTEN

Calculates the rotation tensor from the polar decomposition of the deformation gradient in finite deformation analyses.

ROW

Pulls out a complete row from profile stored global matrix.
RSHELL
Treats the random vibration input for shell elements.

RTBEAM
Treats the random vibration input for beam elements.

RTFOLF
Rotates load vector entries treated as follower forces.

RUNCMD
Loads control parameters for compound executions.

Common block: CONTRO, COMPND, MACHIN

SID02N
Shape functions for the one-dimensional two node element.

S2D04N
Shape functions for the two-dimensional four node element.

S2D09N
Shape functions for the two-dimensional nine node element.

S3D08N
Shape functions for the three-dimensional eight node element.

S3D27N
Shape functions for three-dimensional twenty-seven node element.

SAVER:
Writes the restart file. See Section 3.3 for detail.

Common block: ADDVAL, ALGEM, AUTOIN, BODYFR, BSECT, CONTRO, COMPND, COUNT, DAMP, EIGEN, MODSUP, ELEMEN, HARMON, INCCON, MAXIMA, LOUBIN, PARAM, PERIOD, POSTPN, POWER, PULSES, RESULT, START1, START2, START3, START4, START5, START6, START7, START8, START9, SUBELM, SUBTYP, SUBSTR, SHIFT, TIME, TMARCH, TOLER, VRIDS, ZPRINT

SBCIN
Reads in stress boundary condition data.

Common block: MACHIN

SCALER
Scales loading to a given proportion.

Common block:  MACHIN, START8

SEARCH
Pulls out double precision real element nodal quantities from the global nodal data base.

SEARCI
Pulls out integer element nodal quantities from the global nodal database.

SELECT
Reads and decodes strings for print option data input.

SETCCM
Sets up the complex coefficient matrix for base excitation.

SETHFN
Sets up the vector for complex modal damping.

SETOLR
Sets the limit for the search distance in the line search option.

SETQMD
Calculates modal damping.

SETRMS
Finds the root-mean-square value for a modal function from the frequency response.

SETUP
Computes the adjacency list for front width optimization. Not functional for Version 4.2.

SHIFIN
Reads parameters defining the power shift in modal dynamics.

Common block:  MACHIN

SHOHEI
Debug - writes an integer array.

SHTRAN
Transforms nodally defined shell stress and strain resultants to
values in element coordinates.

SIMPLE
Calculates the stress and generates the tangent modulus for secant elasticity model for elastoplastic response under a monotonically increasing load.

SK
Integrates the element coefficient matrix into the global array stored in band matrix form.

SMASTR
Extracts element quantities from the global element used for subelement analysis. Yet another variation of CNODEL.

Common block: TMARCH, CONTRO, ELTYP, MAXIMA, PARAM, START1, START2, START4, START5, START6, START8, MACHIN

SMULT
Multiplies an array by a scalar.

SNODEL
Transfers global element results into the subelement mesh.

SOLUT1
Controls execution of the linear algebraic equation solver by the profile method.

Common block: AUTOIN, CONTRO, EIGEN, ELTYP, MAXIMA, PARAM, PULSES, START1, START3, START4, START5, START7, MACHIN, TOLER

External reference: ADD, RITFOL, ADDPUL, SUBT, TYING1, BOUND1, DECOMP, BFGSW, BFGSRH, COPY, SOLVER, MADD, MATSUM, BFGSLH, TYING3, L2NORM, TYING2, BOUND2, ADAPTS

SOLUT2
Controls execution of the linear algebraic equation solver by the band matrix method. Not used in Version 4.2.

SOLVER
Solves linear equations for nodal displacement.

Common block: ALGEM, PARAM

SOLVIT

SUBROUTINES

Page : A - 36
Solves a small system of algebraic equations by Gaussian elimination.

SPRIN
Reads parameters defining the added spring stiffness.

Common block:  MACHIN

SPSTRS
Generates the strain displacement matrix at a given point in the current element of plane stress type.

SSOLID
Generates the strain displacement matrix at a given point in the current element of three-dimensional continua type.

STATIC
Drives the incremental iterative solution of a quasi-static problem.

STICKIO
Controls the data flow between in-core buffer and the work file for the frontal solution.

Common block:  ALGEM, MACHIN, VRDSSK

STIFF
Calculates the current element tangent stiffness matrix and the load vector.

External reference:  NUL, MATPRT, SMULT, MULT, TMULT

STRAIN
ReCOVERS strain at nodes.

Common block:  COUNTR

STRESS
Controls the nodal stress recovery operation including pre-integration through the shell thickness.

STRING
Decodes the input data string.

External reference:  NUL, MATPRT, SMULT, MULT, TMULT

Common block:  ALGEM, MACHIN, VRDSSK

STRAIN
ReCOVERS strain at nodes.

Common block:  COUNTR

STRESS
Controls the nodal stress recovery operation including pre-integration through the shell thickness.

STRING
Decodes the input data string.
Common block: ALGEM, FREE, COUNT

STRIPB
Finds non-blank entry in a given character string.

STRSBC
Imposes the stress boundary condition called by ASSEM4.

STRUCT
Controls the core allocation and elimination table construction for global matrix manipulation.

Common block: ALGEM, CONTRO, MAXIMA, PARAM, START1, START2, START3, START4, START5, SUBSTR

SUBALC
Allocates working storage for the subelement solution.

SUBCHK
Checks convergence of the subelement solution in terms of displacement update.

Common block: ALGEM, SUBCNV

SUBDER
Controls access to the element library in the subelement solution.

Common blocks: ALGEM, CONTRO, SUBTYP, ELEMEN, ERRORS

SUBDIV
Controls the subelement mesh generation.

Common blocks: ALGEM, CONTRO, ELTYP, ERRORS, MACHIN, MAXIMA, PARAM, START1, START5, START6, SUBTYP

SUBELV
Extracts element definition variable for the current subelement.

Common block: ALGEM, SUBTYP, START1, PARAM, ELEMEN

SUBFEM
Supervises the mixed iterative solution in the subelement mesh. Called by ASSEM4.

Common block: ALGEM, CONTRO, ELTYP, ELEMEN, SUBTYP, TRANSF, LOUBIN,
MAXIMA, PARAM, ERRORS, MACHIN, TIME, START1, START2, START3,
START4, START5, START6, START7, START8, START9, TOLER

External reference: TIMOUT, SUBELV, SUBALC, SMASTR, NUL, SNODEL, LMPMAS,
SUBINT, SUBT, STRESS, ADD, SUBDER, INTERP, STIFF,
SYSEQN, SUBSOL, STRAIN, SUBRES, SUBCHK, SUBGLB, SUBGLD

SUBGLB, SUBGLD
Calculates residual for a global element generated by the subelement solution.

SUBINC
Adds the incremental values of the subelement solution to the total array.

Common block: AUTOIN, CONTRO, SUBTYP, START1, START2, START4, START6,
START8, TIME

SUBINT
Interpolates global quantities at subelement nodes.

SUBRES
Calculates the mixed residual for the subelement solution.

SUBSIN

SUBSOL, SUBSOL2
Back-substitutes for the factors of the global array stored in band matrix form to generate the displacement corresponding to the given load vector. Not used in Version 4.2.

SUBSOL
Solves the subelement stiffness equations for the subelement displacement.

SUBSPC
Controls execution of the subspace iteration for eigenvalue extraction.

Common block: ALGEM, SHIFT

External reference: NUL, UPIX, JACOBI, TIMOUT, COPY, MADD, QUIT, SMULT,
LINES

SUBROUTINES

MHOST Version 4.2

Page : A - 39
**SUBST1**
Converts the element load vector to the global load vector.

**SUBSTN**
Adds the element nodal value to the global vector.

**SUBT**
Subtracts arrays.

**SUBVAL**
Interpolates element nodal values to a given point specified by the isoparametric coordinate system.

**SUPER**
Drives modal superposition for linear dynamics.

**Common block:**
CTITLE, TIME, AUTOIN, START1, START2, START4, START5, ALGEM, EIGEN, MODSUP, HARMON, INCON, DAMP, MACHIN, ELEMEN, MAXIMA, ELTYP, CONTRO, SUBSTR, ERRORS, PARAM, SHIFT, START8

**SYSEQN**
Assembles the global finite element equations for subelement analysis.

**T2D04N**
Calculates the local coordinate system for two-dimensional four node elements.

**T2D04P**
Calculates the local coordinate system for two-dimensional four node elements using the Cayley-Hamilton formula.

**T3D08N**
Calculates the local coordinate system for three-dimensional eight node element.

**TEMO2N**
Calculates the local coordinate system for two node beam element.

**TEMPIN**
Reads in nodal temperature definition data.

**Common block:**
MACHIN

**TFULL2**
Transorms the material modulus into fully three-dimensional form.

**THRSTN**
Calculates thermal strain.

External reference: UTEMP, NUL, UCOEF

**TIMEIN**
Reads in parameters defining the time increment control.

**TIMER**
Accesses to the system dependent CPU clock routine. See Section 0.3.

**TIMOUT**
Reports the job step and elapsed CPU time.

Common block: ALGEM, CONTRO, TIMLOC

**TMULT**
Multiplies the transpose of an array by a matrix.

**TMLTV**
Multiplies the transpose of an array by a vector.

**TNSPRD**
Multiplies two tensors stored in vector form.

**TRACIN**
Reads in nodal concentrated forces.

Common block: MACHIN

**TRANIN**
Reads nodal coordinate transformation data.

Common block: MACHIN

**TRANS1**
Applies a transformation to the global stiffness matrix stored in band matrix form.

**TRANS2**
Applies a transformation to the global vector.
TRANSP
Transposes a two-dimensional matrix.

TSH04N
Calculates local coordinates for four node shell elements.

TSHIFT
Sets up tensor transformation with respect to the preferred orientation of an anisotropic material.

TYING1
Imposes tying constraints on the global stiffness matrix stored in band matrix form.

TYING2
Imposes tying constraints on the global vector.

TYING3
Releases tying constraints in the global vector.

TYININ
Reads in coefficients of the tying equations.

Common block: MACHIN

TYPEIN
Defines element parameters used in the analysis.

UBOUN, UCOEF, UCOOR, UDERIV, UFORCE, UHOOK, UPRESS, UTEMPD, UTERM, USXX, VSWELL
User subroutines. Fully documented in MHOST Volume 1 USERS' MANUAL.

UNITST
Generates the global unit matrix in profile stored form.

UPTX
Multiplies a banded matrix by a vector.

UPTXL
Multiplies a lumped mass matrix by a vector.

VALINT
Linearly interpolates data given in a table.
VDSKID
Manages a record for out-of-core frontal solution.

Common block: ALGEM, MAXIMA, MACHIN, VRIDSK

VELCIN
Reads initial velocity definition data.

Common block: MACHIN

VMULT
Multiplies an array by a vector.

VSH04N
Generates the local coordinate system for four node shell elements.

VIMULT
Multiplies the transpose of an array by a vector.

VULVRG
Makes the conversion table for the degree of freedom from the connectivity and constraint data.

VVMULT
Multiplies two vectors.

WALCON
Calculates temperature dependent material constraints for the Walker model.

WALKEQ
Calculates stress and internal variables for the Walker model.

WORKIN
Reads in work-hardening data for a homogeneous elastic plastic material.

Common block: MACHIN

WKSLP
Calculates the hardening slope for elastoplasticity.

WRITEX
YIEL

Calculates the yield stress and hardening slope for a given equivalent plastic strain.

External reference: WKSLP

YELIN

Reads in the nodal definition of a stress-strain curve for an elastic plastic material.

Common block: MACHIN
