Independent Orbiter Assessment
Analysis of the Orbital Maneuvering System

1.0 EXECUTIVE SUMMARY

The McDonnell Douglas Astronautics Company (MDAC) was selected in
June 1986 to perform an Independent Orbiter Assessment (IOA) of
the Failure Modes and Effects Analysis (FMEA) and Critical Items
List (CIL). Direction was given by the STS Orbiter and GFE
Projects Office to perform the hardware analysis using the
instructions and ground rules defined in NSTS 22206, Instructions
for Preparation of FMEA and CIL, 10 October 1986. The IOA
approach features a top-down analysis of the hardware to
determine failure modes, criticality, and potential critical
items. To preserve independence, this analysis was accomplished
without reliance upon the results contained within the NASA
FMEA/CIL documentation. This report documents (Appendix C) the
independent analysis results for the Orbital Maneuvering System
(OMS) hardware.

Although the OMS and aft Reaction Control System (RCS) are housed
in the same pod, this report only addresses the OMS. The aft RCS
report addresses the analysis of the RCS separately.

The OMS provides the thrust to perform orbit insertion, orbit
circularization, orbit transfer, rendezvous, and deorbit. The
OMS is housed in two independent pods located one on each side of
the tail and consists of the following subsystems:

- Helium Pressurization
- Propellant Storage and Distribution
- Orbital Maneuvering Engine
- Electrical Power Distribution and Control

The IOA analysis process utilized available OMS hardware drawings
and schematics for defining hardware assemblies, components, and
hardware items. Each level of hardware was evaluated and
analyzed for possible failure modes and effects. Criticality
was assigned based upon the severity of the effect for each
failure mode.

Figure 1 presents a summary of the failure criticalities for each
of the four subsystems of the OMS. A summary of the number of
failure modes, by criticality, is also presented below with
Hardware (HW) criticality first and Functional (F) criticality
second.

Of the 951 failure modes analyzed, 376 were determined to be PCIs.
2.0 INTRODUCTION

2.1 Purpose

The 51-L Challenger accident prompted the NASA to readdress safety policies, concepts, and rationale being used in the National Space Transportation System (NSTS). The NSTS Office has undertaken the task of reevaluating the FMEA/CIL for the Space Shuttle design. The MDAC is providing an independent assessment of the Orbiter FMEA/CIL for completeness and technical accuracy.

2.2 Scope

The scope of the independent FMEA/CIL assessment activity encompasses those Shuttle Orbiter subsystems and GFE hardware identified in the Space Shuttle Independent FMEA/CIL Assessment Contractor Statement of Work. Each subsystem analysis addresses hardware, functions, internal and external interfaces, and operational requirements for all mission phases.

2.3 Analysis Approach

The independent analysis approach is a top-down analysis utilizing available drawings, schematics and documents to breakdown the respective subsystem into components and low-level hardware items. Each hardware item is evaluated for failure mode, effects, and criticality. These data are documented in the respective subsystem analysis report, and are used to assess the NASA and Prime Contractor FMEA/CIL reevaluation results. The IOA analysis approach is summarized in the following Steps 1.0 through 3.0. Step 4.0 summarizes the assessment of the NASA and Prime Contractor FMEAs/CILs that is to be performed and documented at a later date.

Step 1.0 Subsystem familiarization
   1.1 Define subsystem functions
   1.2 Define subsystem components
   1.3 Define subsystem specific ground rules and assumptions

Step 2.0 Define subsystem analysis diagram
   2.1 Define subsystem
   2.2 Define major assemblies
   2.3 Develop detailed subsystem representations

Step 3.0 Failure events definition
   3.1 Construct matrix of failure modes
   3.2 Document IOA analysis results
Step 4.0 Compare IOA analysis data to NASA FMEA/CIL
4.1 Resolve differences
4.2 Review in-house
4.3 Document assessment issues
4.4 Forward findings to Project Manager

2.4 OMS Ground Rules and Assumptions

The OMS ground rules and assumptions used in the IOA are defined in Appendix B. The subsystem specific ground rules were defined to provide necessary additions and clarifications to the ground rules and assumptions contained in NSTS 22206.
3.0 SUBSYSTEM DESCRIPTION

3.1 Design and Function

The Orbital Maneuvering System (Figure 2) provides propulsive thrust for orbit insertion, on-orbit translations, and deorbit. The OMS is housed with the aft RCS in two pods on either side of the tail. The OMS utilizes the hypergolic propellants, monomethyl hydrazine (MMH, fuel) and nitrogen tetroxide (NTO, oxidizer), to provide a total delta V capability of up to 1000 ft/s. The OMS is also used during aborts to dump OMS propellants. Figures 3 and 4 present an overview of the OMS breakdown hierarchy and Figure 5 presents the OMS schematic.

The IOA analysis has defined the OMS as being comprised of the following subsystems.

- Helium Pressurization
- Propellant Storage and Distribution
- Orbital Maneuvering Engine
- Electrical Power Distribution and Control

3.1.1 Helium Pressurization Subsystem

The helium pressurization subsystem is used to maintain pressure in the propellant tanks to feed propellants to the OMS engines. The subsystem consists of a helium tank, two helium pressurization valves, two dual pressure regulator assemblies, two parallel vapor isolation valves, a dual series-parallel check valve assembly, and couplings. A schematic diagram of the OMS helium pressurization subsystem is shown in Figure 6.

3.1.1.a Helium Tanks

Each pod contains one helium supply tank for the purpose of pressurizing the oxidizer and fuel tanks. The helium supply tank is a spherical pressure vessel consisting of a titanium liner with a fiberglass structural overwrap. The maximum diameter of the tank is 40.2 inches producing a usable volume of 17.03 cubic feet. The tank operating pressure ranges from a low of 460 psia to a maximum of 4800 psia.

3.1.1.b Helium Isolation Valves

The helium isolation valves (Figure 7) are continuous-duty solenoid-operated valves. The valves are energized open and spring-loaded closed. The OMS HE PRESS/VAPOR ISOL switches on Panel 08 permit automatic or manual control of the valves. With the switches in the General Purpose Computer (GPC) position, the valves are automatically controlled by the GPC during an engine firing sequence. The valves are controlled...

manually by placing the switches in the OPEN or CLOSE position. Each valve contains a position feedback that is sent to the GPC for display on the Cathode Ray Tubes (CRTs).

3.1.1.c Helium Pressure Regulator Assemblies

Pressure regulation is accomplished by two pressure-regulating assemblies, one downstream of each helium tank isolation valve. Each assembly contains a primary and secondary regulator in series, and a flow limiter (Figure 8). The primary regulator is normally the controlling regulator. The secondary regulator is normally open and will not become the controlling regulator until the primary regulator allows a higher pressure than normal. The flow limiter allows a minimum of 104 scfm and a maximum of 304 scfm. All regulator pressures are in reference to a bellows assembly that is vented to ambient (Figure 8).

</tbody>
</table>

3.1.1.d Vapor Isolation Valves

These valves are low-pressure, two-position, two-way, solenoid-operated valves (Figure 9). The valves are energized open and spring-loaded closed. These valves are used to isolate the helium system and fuel tank from the oxidizer tank.

These valves can be commanded manually or by the GPC depending on the position of the HE PRESS/VAPOR ISOL switches on Panel 08. Either of the two (A or B) switches in the OPEN position energize both VAPOR ISOL valves to the open position. With the switches in GPC or CLOSE positions the GPC is allowed to open or close the valves automatically.

3.1.1.e Quad Check Valve

The check valve unit is mounted between the regulators and the propellant tank to pass ullage pressure demand flow downstream and to preclude upstream backflow of helium and propellant vapors, or liquids. Each unit consists of four check valve elements arranged as two parallel assemblies of two series check valve elements (Figure 10). External test/checkout ports allow functional checkout without disassembly of the unit. Filter elements are located at unit's inlet and test ports.
Figure 8 - HELIUM PRESSURE REGULATOR ASSEMBLY
Figure 9 - VAPOR ISOLATION VALVE
Figure 10 - QUAD CHECK VALVE
3.1.2 Propellant Storage and Distribution Subsystem

This subsystem consists of one fuel and one oxidizer tank, tank and crossfeed isolation valves, pressure relief assembly, manual isolation valve, corresponding feedlines, and couplings. The subsystem is capable of several propellant feed configurations. These include nominal OMS feed, OMS crossfeed, OMS/RCS interconnect and mixed crossfeed. The OMS engines can be operated individually using propellant from either pod. All valves can be controlled manually by switches located in the forward flight deck, with GPC software sequences or GPC memory write procedures. A schematic of the OMS propellant storage and distribution subsystem is shown in Figure 11.

3.1.2.a Propellant Tanks

The propellant supply is contained in domed, cylindrical titanium tanks within the OMS pod. The forward and aft sections of each tank has a fluid volume of 63 and 27 cubic feet, respectively.

The tank operating pressure is 250 psia with a maximum operating pressure of 313 psia. The propellant tanks contain the propellant gaging and the propellant acquisition and retention assemblies.

3.1.2.a.1 Propellant Acquisition and Retention Assembly

Each propellant tank is divided into two compartments: forward and aft. The propellant acquisition and retention assembly (Figure 12) is located in the aft compartment and consists of a communication screen and a trap reservoir.

The communication screen allows propellant flow while preventing helium gas from crossing through the screen, and retains propellant in the aft compartment during zero g.

The trap reservoir contains four stub galleries and a collector manifold. The stub galleries acquire wallbound propellant at OMS startup. The stub galleries also have screens which allow propellant flow while preventing gas ingestion. The collector manifold is connected to the four stub galleries and contains a gas arrester screen to further prevent gas ingestion.

3.1.2.a.2 OMS Gaging

A capacitance system is used to measure the amount of propellant in the OMS tanks. The system consists of forward and aft capacitance probes and an electronic
Figure 11 - PROPELLANT STORAGE AND DISTRIBUTION SUBSYSTEM
Figure 12 - PROPELLANT TANKS WITH ASSEMBLIES
totalizer. Propellant quantities are updated only during OMS burns. Figure 12 shows an overview of the OMS gaging system.

The design of the probes uses the electrical properties of the propellant to measure the height of propellant between two concentric tubes. Fuel is a conductor and forms one capacitor plate; the other plate is the inner tube of the probe, which is a glass tube with a metalized silver coating on the inside. The oxidizer is dielectric, and the capacitor plates are the outer and inner nickel tubes of the probe.

An ungageable region exists between the top of the bulkhead screen and the bottom of the forward probe. This represents the tank quantity between 30 percent and 44 percent. An integration routine using burn time and a preset flowrate is used by the totalizer to update the quantity of this region.

Forward Probe - The forward probe measures the propellant above the bulkhead screen. The forward probe consists of the concentric capacitance probes, probe electronics, helium pressurization gas inlet, and the gas inlet diffuser screen.

Aft Probe - The aft probe measures the propellant below the bulkhead screen. The aft probe consists of the concentric capacitance probes and the probe electronics.

Totalizer - The totalizer receives inputs from the forward probe, aft probe, tank isolation valves, crossfeed valves, engine control valves and outputs total and aft quantities for each tank. A block diagram of the totalizer logic flow is shown in Figure 12.

An OMS to RCS gaging program calculates the OMS propellant used by the aft RCS from each pod during interconnect operations.

3.1.2.b Pressure Relief Valves

The pressure relief valve is located upstream of the propellant tanks but downstream of the helium quad check valves. The pressure relief valve (Figure 13) consists of a relief valve, burst diaphragm, and a filter.

In the event excessive helium and/or propellant vapor pressure ruptures the burst diaphragm, the relief valve opens and vents the system. The relief valve will close and reseal after the excessive pressure has returned to the operating level.
Figure 13 - PRESSURE RELIEF VALVE
The burst diaphragm provides a more positive seal of helium than a relief valve. The filter prevents any fragments from the nonfragmentation type diaphragm from entering the relief valve seat.

The diaphragm rupture pressure is 305+/-8 psig. The relief valve will open at a minimum of 291 psig and a maximum of 307 psig. The minimum reseat pressure is 285 psig.

3.1.2.c Propellant Feed and Interconnect Lines

The propellant feed lines connect each of the left and right pod's propellant tanks to their corresponding engine. The crossfeed lines are connected to the feed lines to allow the crossfeeding of propellant from one pod's propellant tanks to the other pod's engine. Furthermore, the OMS propellant interconnect lines are connected to the RCS crossfeed lines to feed propellant from either OMS pod's tanks to the RCS aft jets.

3.1.2.d Tank Isolation and Crossfeed Valves

These valves are ac motor operated with bistable ball type flow control (Figure 14). They serve to isolate the propellant tank from the feed and crossfeed lines. The TANK ISOLATION and the CROSSFEED switches on Panel 08 permit GPC or manual control of the valves. With the switch in the GPC position, the valves can be automatically controlled by the computers. The valves are controlled manually by placing the switches in the OPEN position allowing an electric signal to provide power to the ac motors to open the valves. With the switches in the CLOSE position a signal is sent to allow power to the ac motor to drive the valves closed.

The ac motor valve operates on 115 volt ac, 400 Hz three-phase power but will operate with only two phases if required. The microswitch position indicators utilize 28 volt dc power to generate the open and close position discretes. The valves are activated by logic circuits in the Orbiter Motor Control Assemblies (MCA). Valves may be moved by manual or GPC command.

A valve will operate when ac power to the motor is turned on by a set of relays in the MCA logic. The high rpm input of the ac motor is stepped down by the planetary gears to turn a semicircular gear sector (not shown). The gear sector in turn drives the brake/clutch (rocker assembly) on the top of the valve assembly. The brake/clutch turns a torsion rod, which is connected to an actuator finger. The actuator finger is the device that moves the valve ball.
Figure 14 - TANK AND CROSSFEED ISOLATION VALVE
When the valve drives to the command position, cams on the bottom of the semicircular gear sector activate microswitch position indicators. These discretes are fed back to the MCA logic to remove power from the valve within 50 msec after reaching the commanded position.

The actuation time for a valve is from 1.1 to 1.3 seconds for three-phase operation and approximately 1.5 seconds for two-phase operation. Propellant flow through the valve is established within 0.5 seconds of the first valve motion.

3.1.2.e Manual Isolation Valve

The ground manual isolation valve is used to isolate the propellant tank from the helium pressurization subsystem for ground operations. The nonpowered valve can only be opened with a special tool which cannot be detached with the valve in the closed position. Open during all flight phases, the valve has redundant seals to external leak paths (Figure 15).

3.1.3 Orbital Maneuvering Engine Subsystem

The OMS engine is a pressure fed, hypergolic reacting bipropellant, regenerative-cooled, fixed thrust rocket engine. The engine can be gimbaled to provide thrust vector control (TVC). Major assemblies are the GN2 (pneumatic), bipropellant ball valves, injector, combustion chamber, nozzle extension, engine purge valve, fuel/oxidizer lines, couplings, and gimbal system (Figure 16). Two OMS engines are installed on the Orbiter vehicle, one per pod.

Engine operation is controlled via GPC software sequences. Ignition is commanded only after specific crew system configurations (switch positions and CRT inputs) have been completed. However, shutdown can be commanded manually at any time during a burn. Crew/flight controller insight into engine operation is via pressure, temperature, and valve position instrumentation provided with the engine.

3.1.3.a Gaseous Nitrogen (GN2) Assembly

The purpose of the OMS GN2 (pneumatic) assembly is to store pressurized nitrogen gas and supply on command regulated GN2 to actuate the bipropellant ball valves and purge the fuel side of the injector assembly. Also, sufficient regulated GN2 is stored in an accumulator for a minimum of one engine start.

The GN2 assembly consists of a fill and vent valve, storage tank, engine pressurization valve, check valve, pressure regulator, relief valve, accumulator, and associated instrumentation (Figures 17 and 18).
Figure 16 - ORBITAL MANEUVERING ENGINE SUBSYSTEM
Figure 18 - GN2 PRESSURIZATION ASSEMBLY SCHEMATIC
3.1.3.a.1 Fill and Vent Valve

The fill and vent valve is a two-way, high-pressure coaxial, single solenoid-operated valve (Figure 19). The valve is used only during ground operations to pressurize or vent the GN2 (pneumatic) assembly. There is no electrical power to the solenoid coil during flight. The valve is designed to fail closed via an internal spring. During fill operations the GN2 is filtered through sintered stainless steel wire filters at the inlet and outlet ports. The valve is bolted directly to the GN2 storage tank. There is no instrumentation on this valve.

3.1.3.a.2 Storage Tank

The GN2 storage tank is a fracture-critical component. The tank is manufactured from titanium bar stock in two halves, then welded together. One half incorporates the mounting flange for the fill and vent valve. The second half incorporates the mounting flanges and flow passages for the remaining GN2 components. Initial GN2 loading is 0.43 pounds at 3000 psia and 70 degrees F. Nominally, this loading will supply 17 engine start/purge cycles. Instrumentation consists of two strain gage-type pressure transducers, which can be monitored on CRT display "GNC SYS SUMM 2" and the cockpit dedicated meter "OMS PRESS N2/He" on Panel F7. The tank pressure transducer designated P1 is hardwired to this meter. The transducer outputs are limit sensed in the PASS (OPS 2 and 8) and the BFS (OPS 1, 3, and 6) and will trigger an SM alarm (class 3) if one or both go out of limits. These pressures are included in the Guidance, Navigation, and Control (GNC) downlist for ground monitoring.

3.1.3.a.3 Engine Pressurization Valve

The OMS engine pressurization (PRESS) valve is a two-way, high-pressure, dual solenoid-operated shutoff valve. The purpose of this valve is to start and stop the flow of GN2 in the pneumatic actuation system. The valve will open with the application of electrical power (23-28 V dc) and only one solenoid is required for nominal operation. With the loss of electrical power the valve is designed to fail closed via an internal spring. During GN2 flow conditions, the gas is filtered through a sintered stainless steel wire filter at the inlet port. Instrumentation consists of a leaf spring switch, which is activated by a push rod integral to the valve poppet assembly. Closure of the switch completes an electrical circuit to indicate an open valve. Valve open/closed status can be monitored.
Figure 19 - GN2 Fill and Vent Valve
on CRT display "GNC SYS SUMM 2" in the PASS (OPS 2 and 8) and BFS (OPS 1, 3, and 6). The switch's open/closed status is in the GNC downlist and is available for ground monitoring.

The engine pressurization valve is not controlled by the GPC software. Activation of the valve can only be accomplished by manual control of the "OMS ENG" switch on cockpit Panel C3. Placing the "OMS ENG" switch in the "ARM/PRESS" position will open the "ENG PRESS VLV" and allow GPC software to activate the engine control valves for a burn, open the purge valves at burn completion, and repressurize the GN2 accumulator. With the "OMS ENG" switch in the "ARM" position the software will inhibit opening of the purge valves.

3.1.3.a.4 Pressure Regulator/Relief Valve

The GN2 pressure regulator is a modulating, pressure reducing, direct acting pressure-operated mechanical regulator with an integral pressure operated relief valve. The purpose of the regulator is to reduce high upstream GN2 tank pressure (470 to 3000 psig) to the downstream nominal on-orbit ball valve actuator pressure (310 +/- 10 psig). If downstream pressure does increase, (at 360 psig maximum) the regulator will lock up stopping GN2 back-flow. If the regulator fails open or if downstream pressure rises to 450 psig, the integral relief valve will open to vent GN2. At 400 psig the relief valve will reseat to stop venting. During active GN2 flow the gas is filtered through a sintered stainless steel wire filter at the inlet port. There is no instrumentation on this device. However, actual operation can be inferred from the GN2 storage tank and reservoir outlet pressures. The operating pressure levels of the regulator and relief valve may be mechanically reset.

3.1.3.a.5 Check Valve

The GN2 check valve is a one-way flow, cartridge type valve. The purpose of this valve is to prevent GN2 accumulator back flow from occurring if a leak occurs upstream of the check valve. The valve is held close by a mechanical spring and will open with a pressure 6 psig above the downstream level. Reseat pressure is 1 psig delta across the valve. There is no instrumentation associated with this component.

3.1.3.a.6 GN2 Reservoir

The GN2 reservoir (accumulator) is a fracture-critical component manufactured from titanium bar stock. Manufacturing is done in two halves, which are welded
together. The assembly is then bolted to a mounting flange, which is part of the GN2 storage tank. The reservoir nominally holds about 0.0008 pounds of GN2 at 320 psia and 70 degrees F. This quantity is enough to guarantee a minimum of one engine start. Instrumentation consists of one strain gage-type pressure transducer located between the check valve and the reservoir inlet/outlet. This measurement is titled "GN2 REG P", and is monitored on the CRT display "GNC SYS SUMM 2" in the PASS (OPS 2 and 8) and BFS (OPS 1, 3, and 6). This pressure is also limit sensed and will trigger an SM alert (class 3) if it goes out of limits. GNC downlist of this pressure, for ground monitoring, is also available.

3.1.3.a.7 Engine Control Valve

The engine control valve is a three-way, two-position, dual solenoid-operated valve (Figure 20). The valve is normally closed to the bipropellant valve pneumatic actuator inlet port. Upon receipt of electrical power (23-32 V dc) redundant solenoids in tandem will open the valve allowing the flow of pressure regulated GN2 into the actuator, deflecting a piston and opening the bipropellant valves. Removal of electric power will close the valve. Closure is accomplished mechanically by an internal spring. Under flow conditions the GN2 is filtered through a sintered stainless steel wire filter located in the inlet port. The valve is bolted to an integral attach flange on the actuator assembly. Purge of pressurized GN2 from the valve and the actuator cylinder is done during the close cycle. Instrumentation for the control valve is a leaf spring switch. Activation is by a push rod, which is an integral part of the valve poppet assembly. Design and operation of the switch is identical to the "ENG PRESS VLV". However, this switch is not monitored in the cockpit but is in the OI downlist for ground monitoring.

3.1.3.a.8 Actuator

The bipropellant ball valve actuator is a pneumatically operated rack for opening the fuel and oxidizer ball valves (Figure 21). The actuator is mechanically closed via internal spring forces. Comprising the assembly are an actuation piston/cylinder, a toothed rack for mating with the ball valve pinion, closure springs, and a Linear Variable Differential Transformer (LVDT). The LVDT is calibrated to show the percentage of ball valve rotation as a function of the rack's linear motion. Output of the LVDT can be monitored on the "GNC SYS SUMM 2" in the PASS (OPS 2 and 8) and BFS (OPS 1, 3, and 6). The output is also in the GNC downlist for ground monitoring.
Figure 20 - ENGINE CONTROL VALVE
Figure 21 - ACTUATOR ASSEMBLY CROSS SECTION
3.1.3.a.9 Bipropellant Ball Valve Assembly

The bipropellant ball valve was analyzed as part of the OME assembly but is discussed here for continuity. The OMS engine bipropellant ball valve is a rotating open/close flow valve used to control the flow of propellant to the OMS engine. The assembly consists of four valves; pairs of fuel and oxidizer valves in series. Each pair is linked mechanically to its actuator via a pinion that mates with the actuator rack. Valve pairs are rotated simultaneously 90 degrees for 100 percent open. There is no instrumentation on these valves. However, nominal valve operation is inferred by engine start, stop, and performance levels.

3.1.3.a.10 Engine Purge Valve

The purpose of the engine purge valve is to allow, on command, the flow of regulated GN2 into the engine's fuel (MMH) cooling passages. The GN2 purge is done, nominally after every burn, to minimize the possibility of fuel freezing in the internal cooling and injector flow passages. The assembly consists of two valves in series, a check valve, and instrumentation for monitoring the open-closed status of the purge valves.

The purge valve is a two-way solenoid-operated shutoff valve (Figure 22). With the application of electrical power (23-32 V dc), the valve will open to allow GN2 flow. With the removal of power, internal spring forces will close the valve. During the active GN2 flow conditions the gas is filtered through a sintered stainless steel wire filter at the valve inlet port. Instrumentation consists of a leaf spring switch. The switch is activated by a push rod that is an integral part of the poppet assembly. Closure of the switch completes an electrical circuit to indicate an open position. This signal is part of the GNC downlist for monitoring the valve position by the ground. The purge valve operation is not monitored in the cockpit; however, a purge operation can be inferred by monitoring the "GN2 TK P", "GNC REG P" on GNC SYS SUMM 2, Pc, and injector temperature readings. Integral to the second valve is a check valve of identical design to the check valve of 3.1.3.a.5.

Purging of the OMS engine fuel lines, cooling passages, and injector head is accomplished systematically by the OMS GPC firing sequencer software. Nominally the OMS ENG switch is placed in the "ARM/PRESS" position for a burn. This action opens the ENG PRESS VLV, repressurizing the GN2 reservoir and allowing the GPC to issue the open command to the purge valves following the burn.
Figure 22 - PURGE VALVE ASSEMBLY CROSS SECTION
If the OMS ENG switch is placed in the "ARM" position, the open commands are inhibited by the GPC.

3.1.3.b OME Assembly

The OME assembly consists of an injector, combustion chamber, nozzle extension, and plumbing. The assembly feeds fuel and oxidizer at the design mixture ratio, confines the combustion of the propellants, and provides for the expansion of the combustion gases to produce thrust. There is one OME assembly in each pod.

3.1.3.b.1 Injector

The OMS engine injector meters, atomizes, and directs fuel and oxidizer into the combustion chamber, at the design mixture ratio. This produces efficient and stable combustion that will provide the required thrust without endangering hardware durability. The injector consists of an oxidizer/fuel manifold, core, fuel distribution ring, platelet injector, and manifold covers (Figure 23). All fuel and oxidizer passages are separated by parent metal or redundant metallurgical joints.

All oxidizer and fuel manifold passages are machined into the stainless steel core billet. The distribution ring mates with the combustion chamber regenerative cooling passages and delivers fuel to the fuel manifold. The injector is made up of six 8-mil thick platelet disks (one external, one face, three metering, and one orifice). Each platelet hole pattern is photographically etched to assure no metal chips or burns remain in the electron beam welded stack. The injector hole pattern consists of 16 concentric alternating rings of oxidizer and fuel orifices. Ring 16 sprays fuel on the combustion chamber wall for film cooling. The manifold covers incorporate attachment bosses for installation of instrumentation (pressure and temperature). All are sealed off except two, one for a combustion chamber pressure transducer and the second for a fuel injector inlet temperature thermocouple. The fuel injector inlet temperature is on "PRPLT THERMAL (DISP 89)" in the PASS (OPS 2) and on "GNC SYS SUMM 2" in the BFS (OPS 1, 3, and 6). The combustion chamber pressure is hardwired to "OMS PRESS PC" meter on panel F7 (output in percent). Both parameters are part of the GNC downlist for ground monitoring. The fuel injector temperature is limit sensed and will trigger an SM alert (class 3) if it exceeds a high limit.
Figure 23 - INJECTOR ASSEMBLY
3.1.3.b.2 Combustion Chamber

The OMS engine combustion chamber confines the hot combustion gases in a fixed volume producing the required pressure and temperature that provides the design thrust. The combustion chamber consists of an acoustic resonator, inner and outer walls, nozzle throat, fuel inlet distribution ring, thrust-gimbal ring mounting pads, clevis mounts for attachment of other assemblies and a nozzle attachment flange (Figure 24). Fuel is used to cool the assembly during engine burns by regenerative and film cooling methods.

One hundred twenty longitudinal grooves are machined into the combustor's stainless steel inner wall. When mated to the outer wall these grooves make up the regenerative cooling passages. These passages are aligned and mated to the injector assemblies' fuel distribution ring during final chamber assembly. The remaining part of the regenerative cooling system is the fuel inlet-distribution ring, which is an integral part welded to the outer wall. The nozzle attachment flange is an integral part of the distribution ring. The thrust-gimbal ring mounting pads are also welded to the distribution ring while the hardware-subsystem clevis mounts are welded to the outer chamber wall.

Integral to the inner wall of the combustion chamber is the converging-throat-diverging (initial) section of the engine's nozzle. The converging section has an area ratio (Ac/At) of 1.934:1, which blends into the throat area (approx. 26.5 square inches). The diverging section is the initial section of the engine's bell-shaped exhaust nozzle. The area ratio of this section is 5.866:1 with a mean divergence angle of about 30.5 degrees.

3.1.3.b.3 Nozzle Extension

The nozzle extension, when bolted to the combustion chamber, completes the engine's bell-shaped exhaust nozzle (Figure 25). It is fabricated from a columbium alloy sheet stock. Nominal thickness is 0.030 inch. However, the attach flange is made from 0.10 inch sheet and the exhaust plane stiffener ring is from 0.0775 inch sheet. These two sections are tapered to match the 0.030 sheet at the girth welds. The final assembly is coated with a silicide compound as a corrosion preventive. Attachment to the combustion chamber is by a split retainer ring with a graphite gasket. Thirty-six bolts hold the extension in place.

The nozzle exit plane area is about 1458 square inches, resulting in an expansion ration (Ae/At) of 55:1. The
Figure 24 - COMBUSTION CHAMBER ASSEMBLY

**DESIGN FEATURES**

- All Columbiun alloy construction
- 80% bell nozzle contour
- Over 20 min continuous firing capability
exit plane divergent angle is 0.55 degrees, which gives a radial thrust component of about 900 pounds (symmetric). At steady state operation, the exhaust gas exit velocity is approximately 10,100 ft/sec.

3.1.3.b.4 Plumbing

Plumbing for the OMS engine is divided into GN2 (pneumatic), fuel, and oxidizer lines. These lines are fabricated from titanium alloy tubing incorporating integral end fittings.

The fuel and oxidizer inlet lines are fabricated from 1.50-in.-O.D. stainless steel tube. Fittings are welded to the tube for attachment in the propellant feed lines and the inlet side of the bipropellant ball valve assembly. The inlet lines also incorporate bellows to allow for line flexing during gimbal operations and engine assembly. At the attachment to the feed lines, a flow balancing orifice and filter are fitted to each line.

Outlet lines for the fuel and oxidizer are made from 1.250-in. O.D. titanium alloy tubing. End fittings are welded in place for mating to the bipropellant ball valve assembly, the oxidizer inlet manifold, and the fuel's inlet distribution ring. Bellows are incorporated in the lines to allow for engine alignment during vehicle/engine mating.

Instrumentation for the plumbing consists of strain gage type pressure transducers and thermocouples on the fuel and oxidizer inlet lines. The pressure measurements can be monitored in the cockpit on "GNC SYS SUMM 2" in the PASS (OPS 2 and 8) and in the BFS (OPS 1, 3, and 6). The temperatures can be monitored in the cockpit on "PRPLT THERMAL (DISP 89)" in SM OPS 2. The pressures and temperatures are part of the GNC/OI downlist for ground monitoring. The temperatures are also limit sensed and will trigger an SM alert (class 3) if the limits are exceeded.

3.1.3.c TVC (Gimbal) Assembly

Each OMS engine is attached to the Orbiter via a pivoting mount, which can be gimbaled up-and-down (pitch) and side-to-side (yaw) to provide 3-axis thrust vector control (Figure 26). Gimbalhing is driven by two electromechanical actuators on each engine (Figure 27). Gimbal travel in the pitch and yaw axes is approximately +/-7 degrees and +/-8 degrees, respectively, about the null. Since the engines are mounted on opposite sides of the Orbiter's centerline (X-axis), pointing one engine up and one down produces a roll.
Figure 26 - THRUST RING TO TCA ATTACHMENT

43
Figure 27 - OMS GIMBAL ACTUATOR
moment. With both engines firing, coordinated 2-axis gimbaling of the two engines produces 3-axis Orbiter flight control. The yaw gimbals control only yaw, whereas the pitch gimbaling produces both a pitch and a roll moment together. 3-axis TVC control is impossible with only one engine. For a one-engine OMS burn, TVC controls pitch and yaw and the RCS is used to control roll. The crew can read the current engine gimbal pitch and yaw angles on the CRT XXXX MNVR YYYY display. The pitch and yaw angles are included in the OI down-list for ground monitoring.

Each gimbal actuator has two channels: primary and secondary. If the active channel stops running, the other can take over. Both channels operate at the same speed, taking four seconds to steer an engine through its entire gimbal range at top speed. The crew can select actuator drive via the CRT XXXX MNVR YYYY display.

3.1.4 Electrical Power Distribution and Control Subsystems

3.1.4.a Thermal Control

Thermal control for the OMS is achieved by insulation of propellant lines and walls that enclose OMS hardware components, and by line-wraparound heaters and blanket-type heaters. The heater system is divided into two areas: the OMS/RCS pods, and the aft fuselage cross-feed and bleed lines. Each of the heater systems has two redundant heater systems, A and B, and are controlled by switches on Panel A14.

3.1.4.a.1 Pod Thermal Control

The OMS/RCS pods use heater patches to provide thermal control. Each heater patch consists of a redundant set of wires, or elements, which have been formed into a flat, tightly spiraled patch. The patch is then mounted on existing hardware, and as electricity flows through the highly resistant wires, the heat generated warms the hardware as well as radiating into the surrounding open areas. Each of the OMS/RCS pods are divided into nine heater areas. Each of the heater patches in the pods contain an A and a B element. Each element has a thermostat which controls the temperature from 55 degrees to 75 degrees, +/-5 degrees F. Temperature sensors are located throughout the pods and supply temperature information to the propellant thermal CRT display and to telemetry. The crew can monitor this display only in SM OPS 2, whereas the ground can monitor the temperature in all OPS.
3.1.4.a.2 Crossfeed and Bleedline Thermal Control

The aft fuselage is divided into eleven heater areas. Each area is heated in parallel by heater systems A and B, and each area has a control thermostat to maintain temperature at 55 degrees to 75 degrees, +/-5 degrees F. Temperature sensors are located on the control thermostats and on the crossfeed and bleed lines. The temperature sensors supply temperature to the propellant thermal CRT display in SM OPS 2, and to telemetry to all OPS.

3.2 Interfaces and Locations

The OMS engine interfaces with the Shuttle's Data Processing System (DPS), Pulse Code Modulator Master Unit (PCMMU), Caution and Warning System (C&W), Displays and Controls (D/C), and the Electrical Power Distribution and Control System (EPDCS).

Data from the OMS engine consisting of pressures, temperatures, actuator position, and valve position are sent to the DPS via the Flight Critical (FC) Multiplexer/Demultiplexers (MDMs) for processing by the GPCs. Display and annunciation of the health and status of the engine is accomplished by the DPS via CRT displays, cockpit meters, C&W, and telemetry. The DPS system in turn provides the engine with commands for valve configurations, engine ON/OFF, and Thrust Vector Control (TVC).

A subset of the engine data is sent to the PCMMU via the Operational Instrumentation (OI) MDMs to be telemetered. The PCMMU combines these data with other OMS parameters, output from the GPCs as part of the downlist, and routes them to the onboard recorders and to the S-band to be transmitted to the ground as part of the downlink.

A carefully selected subset of OMS engine data is sent to the C&W for fault determination and alarm annunciation. The C&W processes these data against present limits to determine anomalies in engine performance. When anomalies are found, hardware C&W signals are issued that activate indicator lights in the C&W panel and the master alarm pushbuttons and turn on the C&W tone.

Dedicated cockpit meters in the D&C panels are used to display engine data either sent directly from the engine or routed through the GPCs. The D&C panels also have switches and circuit breakers that are used for manual valve configuration and power routing. In the manual TVC mode, crew deflection of the Rotational Hand Controller (RHC) is routed through the GPC for scaling and then to the engine gimbal actuators to provide TVC.

Electrical power is provided to the engine by the EPDCS. Logic power and dc power is provided to valve relays and TVC servo-actuators.
The OMS also interfaces with the aft RCS through propellant interconnect lines. OMS propellant can be fed to RCS jets for attitude holds, maneuvers, and translations on-orbit, and during aborts for more rapid OMS propellant dumping. RCS propellant is not fed to the OMS.

3.3 Hierarchy

Figures 3 and 4 illustrate the hierarchy of the OMS hardware components. Figures 5 through 27 depict the functional details of the OMS subsystem components.
4.0 ANALYSIS RESULTS

Detailed analysis results for each of the identified failures are presented in Appendix C. Table I presents a summary of the failure criticalities for the three major hardware subsystems of the OMS. Table II presents a separate summary of the failure criticalities for the Electrical Power Distribution and Control (EPD&C) subsystem of the OMS. Further discussion of each of these subsystems and the applicable failure modes is provided in subsequent paragraphs. The OMS analysis hierarchy is illustrated in Figures 3 and 4.

Of the 284 hardware failure modes analyzed, 160 were determined to be PCIs. A summary of the hardware PCIs is presented in Table III. Of the 667 EPD&C failure modes analyzed, 216 were determined to be PCIs. A summary of the EPD&C PCIs is presented in Table IV.

Appendix D contains a cross reference between each PCI and analysis worksheet in Appendix C.

4.1 Analysis Results - Helium Pressurization Subsystem

Forty-one (41) failure modes were analyzed in the helium pressurization subsystem and twenty-seven (27) are identified as PCIs. Of the 27 PCIs, twenty-two (22) are single point failures which could result in possible damage to surrounding pod components, inability to repressurize the propellant tanks, or mixing of hypergolic propellants in helium lines. The remaining five (5) PCIs could result in the loss of life or vehicle if all redundancy were lost.

These critical failures are caused by helium tank rupture, helium leakage due to structural failure of components or lines, flow path loss due to failure to open of components or system contamination, and check valve failures. The redundancy provided by the existence of two OMS pods is of no benefit in the helium pressurization subsystem since there is no helium connection between the pods.

4.2 Analysis Results - Propellant Storage and Distribution Subsystem

One hundred seven (107) failure modes were analyzed in the propellant storage and distribution subsystem, of which fifty-nine (59) are identified as PCIs. Fifty-three (53) of the 59 PCIs are single point failures which could result in leakage of propellant, inability to use or deplete propellant, system overpressurization, or loss of OMEs. One (1) of the 59 PCIs could result in the loss of life or vehicle if all redundancy were lost. The remaining five (5) PCIs could result in loss of mission with the loss of all redundancy.

These critical failures are caused by structural failure of the propellant tank, components, and propellant lines, seal failures, contamination, failure of valves to open, failure of the pressure relief assembly, and acquisition system screen structural failures. The dual pod redundancy benefits only those components located downstream of the crossfeed line.

4.3 Analysis Results - Orbital Maneuvering Engine Subsystem

4.3.1 Analysis Results - OME Assembly

Thirty-nine (39) failure modes were analyzed in the OME assembly, of which twenty-seven (27) are identified as PCIs. All of the 27 PCIs are single point failures resulting in the leakage of propellant, loss of propellant flow path, engine explosion, or loss of engine on-off control.

These critical failures are caused by structural failure of components and propellant lines, seal failures, contamination, failure to open or close of the bipropellant valves, inadequate engine cooling, and structural failures of the injector assembly, combustion chamber, and nozzle extension.
4.3.2 Analysis Results - OME GN2 Pressurization Subsystem

Seventy-five (75) failure modes were analyzed in the GN2 pressurization subsystem and thirty-seven (37) are found to be PCIs. Thirty (30) of the 37 PCIs are single point failures which could result in possible shrapnel damage to surrounding pod components or inability to actuate the bipropellant valves. The remaining seven (7) PCIs could produce the same result after the loss of all redundancy.

These critical failures are caused by storage tank, accumulator, and actuator ruptures, leakage of GN2 due to structural failures of components, lines, and seal failures, loss of GN2 flow path due to failure to open of components or system contamination, and structural failures of the actuator and rack-and-pinion assemblies. The accumulator is considered redundant for upstream pressurization loss failures because of its remaining single engine start capability.

The loss of purge capability is a critical failure for the Manual TAL procedure, which is considered a contingency abort mode.

4.3.3 Analysis Results - OME Thrust Vector Control Subsystem

Of the twenty-two (22) failure modes analyzed in the TVC subsystem, ten (10) are identified as PCIs. All of the 10 PCIs are single point failures which could result in possible propellant leakage, engine burn-through, or possible loss of vehicle control.

These critical failures are caused by structural failures in the gimbal actuators and engine-to-vehicle attachments.

Loss of TVC control of one engine is also a critical failure for the Manual TAL procedure, which is considered a contingency abort mode.

4.4 Analysis Results - Electrical Power Distribution and Control Subsystem

4.4.1 Analysis Results - Controls

Two hundred and eighty-one (281) failure modes have been analyzed in the EPD&C controls subsystem and ninety-four (94) are PCIs. Of the 94 PCIs, eighteen (18) are single point failures since their failure resulted in critical valves being stuck open or closed. Another thirty-one (31) of the 94 PCIs could result in loss of vehicle/life if all redundancy were lost. The remaining forty-five (45) PCIs could result in loss of mission if all redundancy were lost.

Criticalities assigned to EDP&C failure modes were derived from the effect the failure had on the component being controlled (valve or TVC actuator). The majority of the EPD&C items
controlled valves. Therefore, critical EPD&C failure modes caused critical valves to be stuck open or closed resulting in overpressurization of lines, underpressurization of lines, mixing of hypergolic propellants, loss of crossfeed, or loss of bi-propellant valve control.

4.4.2 Analysis Results - Instrumentation

Forty-one (41) failure modes have been analyzed in the EPD&C instrumentation subsystem and four (4) are PCIs. All four of the PCIs are single point failures. Three (3) are false indications of low propellant temperature in either the TK or engine inlet line. The remaining one (1) PCI is a false sensor indication in the GN2 assembly. The effect is OME engine failure criticalities assigned to instrumentation (pressure, position, and temperature sensors) failure modes are based on the ability to discern between the failure of the sensor and a real failure of the system. Also taken into account was the time available in which a decision, based on instrument indication, must be made.

4.4.3 Analysis Results - Thermal Control

Three hundred forty-five (345) failure modes have been analyzed in the thermal control subsystem and one hundred eighteen (118) are PCIs. Forty-nine (49) of the 118 are single point failures leading to possible pod structural damage, an unplanned change in vehicle attitude, or early mission termination. The remaining sixty-nine (69) PCIs result in the pod or crossfeed HTR system failed "off" once all redundancy has failed. The effects of losing the thermal system are unplanned change in vehicle attitude, loss of crossfeed/interconnect, or early mission termination.

APPENDIX B

DEFINITIONS, GROUND RULES, AND ASSUMPTIONS

B.1 Definitions
B.2 Project Level Ground Rules and Assumptions
B.3 Subsystem-Specific Ground Rules and Assumptions
APPENDIX B
DEFINITIONS, GROUND RULES, AND ASSUMPTIONS

B.1 Definitions

Definitions contained in NSTS 22206, Instructions For Preparation of FMEA/CIL, 10 October 1986, were used with the following amplifications and additions.

INTACT ABORT DEFINITIONS:

RTLS - begins at transition to OPS 6 and ends at transition to OPS 9, post-flight

TAL - begins at declaration of the abort and ends at transition to OPS 9, post-flight

AOA - begins at declaration of the abort and ends at transition to OPS 9, post-flight

ATO - begins at declaration of the abort and ends at transition to OPS 9, post-flight

CREDIBLE (CAUSE) - an event that can be predicted or expected in anticipated operational environmental conditions. Excludes an event where multiple failures must first occur to result in environmental extremes

CONTINGENCY CREW PROCEDURES - procedures that are utilized beyond the standard malfunction procedures, pocket checklists, and cue cards

EARLY MISSION TERMINATION - termination of onorbit phase prior to planned end of mission

EFFECTS/RATIONALE - description of the case which generated the highest criticality

HIGHEST CRITICALITY - the highest functional criticality determined in the phase-by-phase analysis

MAJOR MODE (MM) - major sub-mode of software operational sequence (OPS)

MC - Memory Configuration of Primary Avionics Software System (PASS)

MISSION - assigned performance of a specific Orbiter flight with payload/objective accomplishments including orbit phasing and altitude (excludes secondary payloads such as GAS cans, middeck P/L, etc.)
MULTIPLE ORDER FAILURE - describes the failure due to a single cause or event of all units which perform a necessary (critical) function

OFF-NOMINAL CREW PROCEDURES - procedures that are utilized beyond the standard malfunction procedures, pocket checklists, and cue cards

OPS - software operational sequence

PRIMARY MISSION OBJECTIVES - worst case primary mission objectives are equal to mission objectives

PHASE DEFINITIONS:

PRELAUNCH PHASE - begins at launch count-down Orbiter power-up and ends at modeing to OPS Major Mode 102 (liftoff)

LIFTOFF MISSION PHASE - begins at SRB ignition (MM 102) and ends at transition out of OPS 1 (Synonymous with ASCENT)

ONORBIT PHASE - begins at transition to OPS 2 or OPS 8 and ends at transition out of OPS 2 or OPS 8

DEORBIT PHASE - begins at transition to OPS Major Mode 301 and ends at first main landing gear touchdown

LANDING/SAFING PHASE - begins at first main gear touchdown and ends with the completion of post-landing safing operations
APPENDIX B
DEFINITIONS, GROUND RULES, AND ASSUMPTIONS

B.2 IOA Project Level Ground Rules and Assumptions

The philosophy embodied in NSTS 22206, Instructions for Preparation of FMEA/CIL, 10 October 1986, was employed with the following amplifications and additions.

1. The operational flight software is an accurate implementation of the Flight System Software Requirements (FSSRs).
   
   RATIONALE: Software verification is out-of-scope of this task.

2. After liftoff, any parameter which is monitored by system management (SM) or which drives any part of the Caution and Warning System (C&W) will support passage of Redundancy Screen B for its corresponding hardware item.
   
   RATIONALE: Analysis of on-board parameter availability and/or the actual monitoring by the crew is beyond the scope of this task.

3. Any data employed with flight software is assumed to be functional for the specific vehicle and specific mission being flown.
   
   RATIONALE: Mission data verification is out-of-scope of this task.

4. All hardware (including firmware) is manufactured and assembled to the design specifications/drawings.
   
   RATIONALE: Acceptance and verification testing is designed to detect and identify problems before the item is approved for use.

5. All Flight Data File crew procedures will be assumed performed as written, and will not include human error in their performance.
   
   RATIONALE: Failures caused by human operational error are out-of-scope of this task.
6. All hardware analyses will, as a minimum, be performed at the level of analysis existent within NASA/Prime Contractor Orbiter FMEA/CILs, and will be permitted to go to greater hardware detail levels but not lesser.

   RATIONALE: Comparison of IOA analysis results with other analyses requires that both analyses be performed to a comparable level of detail.

7. Verification that a telemetry parameter is actually monitored during AOS by ground-based personnel is not required.

   RATIONALE: Analysis of mission-dependent telemetry availability and/or the actual monitoring of applicable data by ground-based personnel is beyond the scope of this task.

8. The determination of criticalities per phase is based on the worst case effect of a failure for the phase being analyzed. The failure can occur in the phase being analyzed or in any previous phase, whichever produces the worst case effects for the phase of interest.

   RATIONALE: Assigning phase criticalities ensures a thorough and complete analysis.

9. Analysis of wire harnesses, cables, and electrical connectors to determine if FMEAs are warranted will not be performed nor FMEAs assessed.

   RATIONALE: Analysis was substantially complete prior to NSTS 22206 ground rule redirection.

10. Analysis of welds or brazed joints that cannot be inspected will not be performed nor FMEAs assessed.

    RATIONALE: Analysis was substantially complete prior to NSTS 22206 ground rule redirection.

11. Emergency system or hardware will include burst discs and will exclude the EMU Secondary Oxygen Pack (SOP), pressure relief valves and the landing gear pyrotechnics.

    RATIONALE: Clarify definition of emergency systems to ensure consistency throughout IOA project.
B.3 OMS Ground Rules and Assumptions

The IOA analysis was performed to the component or assembly level. The analysis considered the worst case effects of the hardware or functional failure on the subsystem, mission, and crew and vehicle safety.

1. Top level redundancy will be considered in determining functional criticality. The OMS function is to provide delta-v for orbit insertion, on-orbit ops, and deorbit. From a top down system analysis approach, the OMS has redundancy via the left and right subsystems. In determining redundancy for hardware items downstream of the crossfeed line, items which perform the same function in each pod may be considered redundant to each other, depending on the failure mode.

2. No RCS backup deorbit capability exists in the event of loss of OMS deorbit capability. It cannot be ensured that enough OMS propellant will remain to complete an RCS deorbit burn since the RCS jets have a lower Isp. However, OMS through RCS can be used to achieve orbit insertion. An AOA abort can be accomplished without OMS engines.

3. Loss of an OME is, at a minimum, a loss of mission during the on-orbit phase. Loss of the first OME is possible loss of mission objectives (ref. flight rule 6-48), and loss of the next OME will lead to loss of deorbit capability (no RCS deorbit assumed) and loss of life/vehicle. An OMS engine which will be used only for critical burns is not considered lost.

4. OMS blowdown capability to use/deplete OMS prop will be determined by MOD HP9825 Blowdown program.

5. The OMS payload bay kit hardware will not be addressed in this analysis.

6. Flight rules and Flight Systems Software Requirements (FSSR) will not be used to downgrade criticalities, only to upgrade and provide better system understanding.

7. Redundant seals are considered in analyzing internal and external leakage of components.
8. An OMS TVC failure (inability to control position of OMS engine) does not affect the ability to perform an OMS dump before MECO.

9. Analysis of component filters are covered in the analysis of the component. Filters which are not integral to other components are analyzed separately.

10. For the thermal control analysis it is assumed that, at the time of vehicle liftoff, all areas of the thermal environment are within redlines.

11. If applicable, the redundancy and criticalities assigned to an electrical component shall be tied to those assigned to mechanical parts affected by the failure of the electrical component.

12. Electrical components which enable and inhibit operation (e.g., allows a valve to be opened and closed) shall not be redundant to electrical components which control the operation (e.g., actually opens and closes the valve).

13. Instrumentation passage of screen B does not require the ability to discern between sensor or hardware failure, but on detection of the measurement being out of a predefined limit. The ability to differentiate between sensor and hardware failure will be reflected in the criticality assignment.

14. Two OMS engines are required to ensure the successful completion of RTLS and TAL pre-MECO OMS dumps. Loss of one engine may result in the inability to complete the planned dump before MECO leading to violations of propellant tank landing constraints and/or Orbiter mass properties constraints.

15. The Manual TAL procedure is considered a contingency abort mode. The Manual TAL is different from the normal intact TAL abort, as defined in STS 22206, due to the Manual TAL requirement of a post-MECO OMS dump. Criticalities assigned for a Manual TAL are not considered in the final abort criticality assignment, but are included in the Effects/Rationale portion of the analysis sheets as additional information. In assigning Manual TAL criticalities, the following assumptions were made: (1) two OMS engines are required to perform the post-MECO OMS dump to avoid Orbiter mass properties violations, (2) both engines must, therefore, have successful purges between the pre and post-MECO dumps, and (3) loss of TVC control of one engine will result in either inability to use the affected engine or loss of vehicle control.
16. The crew will manually shut down an OMS engine in response to an OMS FDA caused by the violation of engine operating limits before the effects become life/vehicle threatening (e.g., engine explosion). However, this action may not preclude damage to and loss of the engine. This assumption does not apply to failures which lead directly to catastrophic effects (e.g., engine structural failures).
This section contains the IOA analysis worksheets generated during the analysis of this subsystem. The information on these worksheets is intentionally similar to the NASA FMEAs. Each of these sheets identifies the item being analyzed and the parent assembly. For each failure mode, the possible causes are outlined, and the assessed hardware and functional criticality for each mission phase is listed, as described in the NSTS 22206, Instructions for Preparation of FMEA and CIL, 10 October 1986. Finally, effects are entered at the bottom of each sheet, and the worst case criticality is entered at the top.

**LEGEND FOR IOA ANALYSIS WORKSHEETS**

---

**Hardware Criticalities:**
- 1 = Loss of life or vehicle
- 2 = Loss of mission or next failure of any redundant item (like or unlike) could cause loss of life/vehicle
- 3 = All others

**Functional Criticalities:**
- 1R = Redundant hardware items (like or unlike) all of which, if failed, could cause loss of life or vehicle.
- 2R = Redundant hardware items (like or unlike) all of which, if failed, could cause loss of mission.

**Redundancy Screen A:**
- 1 = Is Checked Out PreFlight
- 2 = Is Capable of Check Out PreFlight
- 3 = Not Capable of Check Out PreFlight
- NA = Not Applicable

**Redundancy Screens B and C:**
- P = Passed Screen
- F = Failed Screen
- NA = Not Applicable

REDUNDANCY SCREENS: A [ ] B [ ] C [ ]

LOCATION:

PART NUMBER: 73P550013

CAUSES: STRUCTURAL FAILURE, HIGH PRESSURE, SEAL FAILURES, WELD FAILURE, MATERIAL DEFECT, MANUFACTURING DEFECT, MISHANDLING, HIGH PROP LOAD DURING ENTRY

EFFECTS/RATIONALE:
FIRST FAILURE IS POSSIBLE LOSS OF LIFE/VEHICLE. RUPTURE RESULTS IN LOSS OF PROPELLANT, POSSIBLE POD STRUCTURAL DAMAGE, CORROSIVE EFFECTS ON POD COMPONENTS, POSSIBLE FIRE/EXPLOSION HAZARD, AND HAZARD TO GROUND CREW.

REDUNDANCY SCREENS: A [ ] B [ ] C [ ]

LOCATION:
PART NUMBER: 73P880001

CAUSES: CONTAMINATION, PIECE-PART STRUCTURAL FAILURE,
MISHANDLING, LOSS OF INPUT POWER, MANUFACTURING DEFECT, MATERIAL
DEFECT, WELD FAILURE

EFFECTS/RATIONALE:
LOSS OF OUTPUT IS NO EFFECT. LOSS OF LOW QUANTITY WARNING
COULD ALLOW HELIUM INGESTION AND PROP DEPLETION, HOWEVER PROP
MANAGEMENT AND TRACKING IS SUCH THAT UNEXPECTED/UNDESIRED
DEPLETION OF PROP IS UNCREDIBLE. LOSS OF OUTPUT COULD ALLOW
FAILURE OF COMMUNICATION SCREEN AND PASSAGE OF HELIUM INTO AFT
COMPARTMENT TO GO UNDETECTED (REQUIRES MULTIPLE FAILURES).
REDUNDANCY PROVIDED BY PVT METHOD AND GROUND TRACKING.

REDUNDANCY SCREENS: A [ ] B [ ] C [ ]

LOCATION:

PART NUMBER: 73P880001

CAUSES: CONTAMINATION, PIECE-PART STRUCTURAL FAILURE, MISHANDLING, IMPROPER INPUT, MANUFACTURING DEFECT, MATERIAL DEFECT, WELD FAILURE

EFFECTS/RATIONALE:
ERRONEOUS INDICATION OF PROP QUANTITY OR LOW LEVEL QUANTITY IS NO EFFECT. PROP MANAGEMENT AND TRACKING IS SUCH THAT ACTUAL PROP QUANTITY IS KNOWN. ERRONEOUS INDICATION OF COMMUNICATION SCREEN FAILURE AND HELIUM PASSAGE (LESS THAN FULL AFT COMPARTMENT READING WITH PROP REMAINING IN FORWARD COMPARTMENT) MAY RESULT IN PERFORMANCE OF ULLAGE BURNS PRIOR TO OMS BURNS AND POSSIBLE LOSS OF ON-ORBIT INTERCONNECT FROM AFFECTED TANK.

DEORBIT: 3/3 ATO: 3/3
LANDING/SAFING: 3/3

REDUNDANCY SCREENS: A [ ] B [ ] C [ ]

LOCATION:
PART NUMBER: 73P880001

CAUSES: IMPROPER INPUT, CONTAMINATION, MANUFACTURING DEFECT, MISHANDLING, PIECE-PART FAILURE

EFFECTS/RATIONALE:
ERRONEOUS INDICATIONS OF PROP QUANTITY OR LOW LEVEL QUANTITY ARE NO EFFECT. PROP MANAGEMENT AND TRACKING IS SUCH THAT ACTUAL PROP QUANTITY IS KNOWN. ERRONEOUS INDICATION OF COMMUNICATION SCREEN FAILURE AND PASSAGE OF HELIUM WOULD RESULT IN THE PERFORMANCE OF ULLAGE BURNS PRIOR TO OMS BURNS AND POSSIBLE LOSS OF INTERCONNECT CAPABILITY FROM AFFECTED TANK.

REDUNDANCY SCREENS: A [ ] B [ ] C [ ]

LOCATION:
PART NUMBER: 73P880001

CAUSES: IMPROPER INPUT, CONTAMINATION, MANUFACTURING DEFECT, MISHANDLING, PIECE-PART FAILURE

EFFECTS/RATIONALE:
ERRATIC OPERATION IS NO EFFECT. LOSS OF LOW QUANTITY WARNING COULD ALLOW HELIUM INGESTION AND PROP DEPLETION, HOWEVER PROP MANAGEMENT AND TRACKING IS SUCH THAT UNEXPECTED/UNDESIRED DEPLETION OF PROP IS UNCREDOIBLE. LOSS OF OUTPUT COULD ALLOW FAILURE OF COMMUNICATION SCREEN AND PASSAGE OF HELIUM INTO AFT COMPARTMENT TO GO UNDETECTED (REQUIRES MULTIPLE FAILURES).

LOCATION:
PART NUMBER: MC284-0430-0023,-0024

CAUSES: CONTAMINATION, LOSS OF INPUT, PIECE-PART STRUCTURAL
FAILURE, MATERIAL DEFECT, MANUFACTURING DEFECT, MISHANDLING

EFFECTS/RATIONALE:
WITH ONE VALVE FAILED MIDTRAVEL, ONE FAILURE (FAILURE TO OPEN OF
OTHER VALVE) AWAY FROM POSSIBLE LOSS OF LIFE/VEHICLE DURING ENTRY
DUE TO INABILITY TO USE/DEPLETE PROP RESULTING IN POSSIBLE
VIOLATIONS OF PROP TANK STRUCTURAL AND ORBITER MASS PROPERTIES
CONSTRAINTS. FLOW RATE INSUFFICIENT TO SUPPORT BURN MAKES PROP
IN AFFECTED TANK UNUSABLE. VALVE FAILED PARTIALLY OPEN COULD
RESULT IN LOSS OF CROSSFEED CAPABILITY TO AFFECTED POD (TO AVOID
DIRECT CONNECTION TO TANKS).

REDUNDANCY SCREENS: A [ ]  B [ ]  C [ ]

LOCATION:
PART NUMBER: MC621-0009

CAUSES: PIECE-PART STRUCTURAL FAILURE, MANUFACTURING DEFECT,
MECHANICAL SHOCK, MISHANDLING, CONTAMINATION

EFFECTS/RATIONALE:
FAILURE OF BELLOWS TO PROVIDE ANGULAR COMPENSATION FOR ENGINE AND
PROP LINE MOVEMENTS COULD RESULT IN RUPTURE OF LINE, LOSS AND
LEAKAGE OF PROP, FIRE/EXPLOSION HAZARD, AND HAZARD TO GROUND
CREW. LOCATED BETWEEN ENGINE INTERFACE CONNECTION AND BIPROP
VALVES.

REDUNDANCY SCREENS: A [ ]  B [ ]  C [ ]

LOCATION:
PART NUMBER: MC621-0009

CAUSES: CONTAMINATION, PIECE-PART STRUCTURAL FAILURE, MANUFACTURING DEFECT

EFFECTS/RATIONALE:
FIRST FAILURE IS NO EFFECT OTHER THAN LOSS OF REDUNDANCY. FAILURE OF A NONREDUNDANT ITEM REQUIRED FOR EFFECTS TO BE MANIFESTED. A FAILED OPEN RELIEF VALVE ALLOWS PROP TO BYPASS FIRST BIPROP VALVE AND, THEREFORE, RESULTS IN LOSS OF BIPROP VALVE SERIES REDUNDANCY. FAILURE TO CLOSE OR LEAKAGE OF SERIES BIPROP VALVE WOULD RESULT IN POSSIBLE LOSS OF LIFE/VEHICLE. (CRIT 2/1R FOR NOMINAL AND ABORTS)

BIPROP PRESSURE RELIEF PATH LINE. FIRST FAILURE RESULTS IN INABILITY TO RELIEVE OVERPRESSURIZATION AND ALLOWS POSSIBLE DAMAGE TO BIPROP VALVES RESULTING IN POSSIBLE LOSS OF AFFECTED ENGINE. WITH FIRST FAILURE, ONE FAILURE (SAME FUNCTION IN OTHER POD) AWAY FROM POSSIBLE LOSS OF LIFE/VEHICLE DUE TO LOSS OF BOTH ENGINES. FIRST FAILURE DURING RTLS OR TAL IS POSSIBLE LOSS OF LIFE/VEHICLE DUE TO LOSS OF ENGINE AND POSSIBLE INABILITY TO COMPLETE TIME-CRITICAL OMS DUMP RESULTING IN POSSIBLE VIOLATIONS OF PROP TANK STRUCTURAL AND ORBITER MASS PROPERTIES CONSTRAINTS. FIRST FAILURE COULD RESULT IN LEAKAGE OF PROP.

**Redundancy Screens:** A [ ]  B [P]  C [P]

**Location:**
**Part Number:** MC621-0009

**Causes:** Piece-Part Structural Failure, High Pressure, High Temperature, Weld Failure, Material Defect, Manufacturing Defect

**Effects/Rationale:**
With loss of GN2 Tank, remaining engine start (in Accumulator) saved for Deorbit. No effect on mission. Loss of all redundancy is possible loss of life/vehicle due to loss of start capability for both engines. With first failure during RTLS or TAL, one failure (accumulator) away from possible loss of life/vehicle due to loss of engine and inability to complete time-critical OMS dump resulting in possible violations of prop tank structural and orbiter mass properties constraints. Accumulator provides fail-safe protection for upstream failures and is considered redundant. Crit 1/1 for manual TAL contingency OMS dump purge requirement.

CAUSES: HOUSING STRUCTURAL FAILURE, SEAL FAILURES, WELD FAILURE, MATERIAL DEFECT, HIGH PRESSURE, MANUFACTURING DEFECT

EFFECTS/RAIONALE:
WITH LOSS OF GN2 IN TANK, REMAINING ENGINE START (IN ACCUMULATOR) SAVED FOR DEORBIT. NO EFFECT ON MISSION. LOSS OF ALL REDUNDANCY IS POSSIBLE LOSS OF LIFE/VEHICLE DUE TO LOSS OF START CAPABILITY FOR BOTH ENGINES. WITH FIRST FAILURE DURING RTLS OR TAL, ONE FAILURE (ACCUMULATOR) AWAY FROM POSSIBLE LOSS OF LIFE/VEHICLE DUE TO LOSS OF ENGINE AND INABILITY TO COMPLETE TIME-CRITICAL OMS DUMP RESULTING IN POSSIBLE VIOLATIONS OF PROP TANK STRUCTURAL AND ORBITER MASS PROPERTIES CONSTRAINTS. ACCUMULATOR PROVIDES FAIL-SAFE PROTECTION FOR UPSTREAM FAILURES AND IS CONSIDERED REDUNDANT. CRIT 1/1 FOR MANUAL TAL CONTINGENCY OMS DUMP PURGE REQUIREMENT.

LOCATION:
PART NUMBER: MC621-0009

CAUSES: CONTAMINATION, PIECE-PART STRUCTURAL FAILURE, MANUFACTURING DEFECT, BINDING

EFFECTS/RATIONALE:
FIRST FAILURE IS NO EFFECT. REGULATOR MUST FAIL HIGH FOR RELIEF VALVE FAILURE EFFECTS TO BE MANIFESTED. LOSS OF ALL REDUNDANCY IS POSSIBLE LOSS OF LIFE/VEHICLE DUE TO LOSS OF BOTH ENGINES. OVERPRESSURIZATION OF SUBSYSTEM COULD RESULT IN POSSIBLE RUPTURE OF LINES CAUSING LOSS OF GN2 PRESSURANT AND LOSS OF ENGINE START CAPABILITY. WITH FAILURE OF RELIEF VALVE DURING RTLS OR TAL, ONE FAILURE (REGULATOR) AWAY FROM POSSIBLE LOSS OF LIFE/VEHICLE DUE TO POSSIBLE RUPTURE OF GN2 LINES, LOSS OF ENGINE START CAPABILITY, AND POSSIBLE INABILITY TO COMPLETE TIME-CRITICAL OMS DUMP.

CLOSE TANK ISOL VALVES TO SHUT DOWN ENGINE. ATTEMPTING TO RESTART ENGINE WITH TANK ISOL VALVES COULD RESULT IN DAMAGE TO AND LOSS OF ENGINE AND INABILITY TO USE/DEPLETE PROP IN AFFECTED POD. ANY USE OF PROP IN AFFECTED POD INITIATES FLOW THROUGH ENGINE. POSSIBLE HAZARD TO GROUND CREW.

REDUNDANCY SCREENS: A [ ] B [ ] C [ ]

LOCATION:
PART NUMBER: MC621-0009

CAUSES: PIECE-PART STRUCTURAL FAILURE, MECHANICAL SHOCK, MATERIAL DEFECT, MANUFACTURING DEFECT

EFFECTS/RATIONALE:
FIRST FAILURE IS POSSIBLE LOSS OF LIFE/VEHICLE DURING INSERTION BURN OR ABORT DUMP. STRUCTURAL FAILURE OF SHAFT MAY ALLOW MOVEMENT (>1.5 DEG) OF NOZZLE INTO MAX Q FLOWSTREAM WHERE BUCKLING COULD OCCUR. FAILURE MAY NOT CAUSE DEFLECTION OF ACTUATOR ARM AND, THEREFORE, MAY NOT BE DETECTED BY ACTUATOR LVDT. SUBSEQUENT FIRING OF ENGINE WITH UNDETECTED DAMAGE MAY CAUSE POD/VEHICLE DAMAGE RESULTING FROM THROAT/NOZZLE BURN THROUGH.

LOCATION: AV BAY 5, PCA 2; AV BAY 6, PCA 3
PART NUMBER: 55V76A132RPC37, 56V76A133RPC30

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
LOSE GPC CAPABILITY TO OPEN HE ISOL B VALVE. VALVE CAN STILL BE FULLY OPERATED USING SWITCH. LOSS OF ALL REDUNDANCY WOULD BE THE SAME AS HE ISOL A & B FAILING CLOSED RESULTING IN AN INABILITY TO USE/DEPLETE PROPELLANT. TRAPPED PROPELLANT IS POSSIBLE VIOLATION OF PROP TANK STRUCTURAL AND ORBITER ENTRY CG CONSTRAINTS.

3) HE PRESS SUBSYSTEM
4) HE ISOL A VLVS
5) DIODE

LOCATION: AV BAY 4, PCA 1
PART NUMBER: 54V76A131A3CR16; AICR14

CAUSES: CONTAMINATION, VIBRATION, MECHANICAL SHOCK, THERMAL SHOCK, OVERLOAD

EFFECTS/RATIONALE:
LOSE CAPABILITY TO OVERRIDE GNC HE ISOL A CLOSE CMD. VALVE CAN STILL BE FULLY OPERATED BY GPC. FOR LOSS OF ALL REDUNDANCY THE EFFECTS WOULD BE THE SAME AS HE ISOL A & B FAILING CLOSED RESULTING IN AN INABILITY TO USE/DEPLETE PROPELLANT. TRAPPED PROPELLANT IS POSSIBLE VIOLATION OF PROP TANK STRUCTURAL AND ORBITER MASS PROPERTIES CONSTRAINTS.

REDUNDANCY SCREENS:

A [ 2 ]

B [ P ]

C [ P ]

LOCATION:

AV BAY 6, PCA 3; AV BAY 5, PCA 2

PART NUMBER:

56V76A133A1CR6; 55V76A132A1CR6

CAUSES:

CONTAMINATION, VIBRATION, MECHANICAL SHOCK, THERMAL SHOCK, OVERLOAD

EFFECTS/RATIONALE:

POSSIBLE LOSS OF BOTH HE PRESS/VAPOR ISOL SWITCHES A & B TO OPEN VAPOR ISOL 1 & 2 VALVES. GPC CMD OF ALL VALVES STILL FULLY OPERATIONAL. LOSS OF ALL REDUNDANCY IS THE SAME AS VAPOR ISOL 1 & 2 VALVES FAILED CLOSED RESULTING IN AN INABILITY TO USE/DEPLETE PROPELLANT. TRAPPED PROPELLANT IS POSSIBLE VIOLATION OF PROP TANK STRUCTURAL AND ORBITAL MASS PROPERTIES CONSTRAINTS.

LOCATION: AV BAY 4, MCA 1; AV BAY 6, MCA 3
PART NUMBER: 54V76A114-ALL DIODES; 56V76A116-ALL DIODES

CAUSES: CONTAMINATION, VIBRATION, MECHANICAL SHOCK, OVERLOAD

EFFECTS/RATIONALE:
OUT OF THE 28 DIODES THERE ARE 6 OF WHICH A FAILURE WOULD RESULT IN LOSS OF ONE OF FOUR SIGNAL PATHS TO OPEN THE TK ISOL A VLVS. LOSS OF ALL REDUNDANCY IS LOSS OF MISSION DUE TO LOSS OF OMS INTERCONNECT/CROSSFEED CAPABILITY AND LOSS OF ENGINE REDUNDANCY. FIRST FAILURE DURING RTLS OR TAL, ONE FAILURE AWAY FROM LOSS OF VEHICLE/LIFE DUE TO INABILITY TO DUMP OMS PROP THROUGH RCS JETS RESULTING IN POSSIBLE INABILITY TO COMPLETE TIME CRITICAL DUMP.

LOCATION: AV BAY 6, MCA 3
PART NUMBER: 54V76A114AR19 TYPE I; 56V76A116AR25 TYPE 1

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
BARBERPOLE TALKBACK TO CREW FALSELY INDICATES EITHER THE OX VLV A, THE FU VLV A OR BOTH VLV'S FAILED TO OPEN WHEN COMMANDED AND HAVE FAILED PARTIALLY CLOSED.
WORST CASE IS VLV'S DECLARED FAILED CLOSED AND REDUNDANT VLV'S ARE USED TO COMPLETE XFEED. LOSS OF ALL REDUNDANCY COULD RESULT IN FALSELY FAILING THE XFEED SYSTEM RESULTING IN LOSS OF MISSION. DURING ABORTS THE XFEED SHOULD NOT BE DECLARED FAILED AND THE DUMP SHOULD TAKE PLACE REGARDLESS OF INDICATIONS, BUT SINCE THE XFEED COULD BE FALSELY FAILED CLOSED. THE RESULT IS LOSS OF VEHICLE/LIFE FOR RTLS & TAL.

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
BARBERPOLE TALKBACK TO CREW FALSELY INDICATES EITHER OX VLVS A, FU VLVS A OR BOTH VLVS FAILED TO CLOSE WHEN COMMANDED AND HAVE FAILED PARTIALLY OPEN/PARTIALLY CLOSED.
GPC TALKBACK TO CREW IS STILL OPERATIONAL AND REDUNDANT VLVS ARE AVAILABLE TO CLOSE XFEED LINE.
LOSS OF ALL TALKBACK INDICATION OF XFEED VLVS CLOSING, WORST CASE, WOULD RESULT IN FAILING THE CROSSFEED VALVES OPEN. THIS IS POSSIBLE LOSS OF MISSION DUE TO LOSS OF INTERCONNECT/CROSSFEED CAPABILITY TO RCS (TO AVOID DIRECT CONNECTION OF TK'S).

PART NUMBER: 54V76A114AR17 TYPE 1; AR21 TYPE 1

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
CREW LT/RT OMS ISOL A POSITION INDICATION DS5/DS7 WOULD FALSELY SHOW A BARBERPOLE INDICATING EITHER THE FUEL OR OX "A" VALVES ARE STUCK PARTIALLY OPEN/CLOSE OR THERE IS A POSITION MISMATCH BETWEEN THE TWO VALVES.

LOSS OF ALL REDUNDANCY WOULD RESULT IN LOSS OF DIRECT VALVE TALKBACK TO CREW. WORST CASE WOULD BE FALSELY FAILING THE A OR B VALVE CLOSED RESULTING IN LOSS OF MISSION DUE TO SAFETY CONSIDERATIONS (ONE FAILURE AWAY FROM LOSS OF VEHICLE/LIFE).

LOCATION:  AV BAY 4, MCA 1
PART NUMBER:  54V76A114K43, 44; K59, 60

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
A FAILED OPEN RELAY K43 OR 44/K59 OR 60 (LT/RT) HAS NO EFFECT ON VALVE OPERATION. A FAILURE OF ALL REDUNDANCY RESULTS IN AN INABILITY TO OPEN FU TK ISOL VALVE'S A & B (LT/RT). THIS PRECLUDES USE/DEPLETION OF PROP RESULTING IN VIOLATION OF STRUCTURAL AND MASS PROPERTIES CONSTRAINTS DURING ENTRY.

EFFECTS/RATIONALE:
NONE, LOSE ONE OF TWO ELECTRICAL PATHS TO OPEN LT/RT OX TK XFEED VLV B. LOSS OF ALL REDUNDANCY HAS THE SAME RESULT AS LT/RT TK XFEED VALVES FAILING CLOSED (LOSS OF MISSION) RESULTING IN LOSS OF ENGINE REDUNDANCY, LOSS OF PROTECTION AGAINST SUBSEQUENT ENGINE OR PROP FAILURES, AND LOSS OF CAPABILITY TO BALANCE PROP WEIGHTS BETWEEN PODS IF PREVIOUS FAILURE REQUIRES SUCH ACTION. WITH FIRST FAILURE DURING RTLS OR TAL, ONE FAILURE (FAILURE TO OPEN PARALLEL VALVE) AWAY FROM POSSIBLE LOSS OF LIFE/VEHICLE DUE TO INABILITY TO DUMP OMS PROP THROUGH RCS AND COMPLETE TIME CRITICAL OMS DUMP RESULTING IN POSSIBLE TK STRUCTURAL AND MASS PROPERTY VIOLATIONS.

LOCATION: AV BAY 5, MCA 2
PART NUMBER: 55V76A115K45, 44, K53, K52

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
FIRST FAILURE RESULTS IN FAILED OPEN OX TK XFEED "B" VALVES AND
LOSS OF ANY RCS CROSSFEED CAPABILITY DURING AN OMS BURN TO AVOID
A DIRECT CONNECTION OF OMS AND RCS TANKS. LOSS OF ALL REDUNDANCY
IS POSSIBLE LOSS OF MISSION DUE TO LOSS OF CROSSFEED CAPABILITY
TO AVOID DIRECT CONNECTION OF OMS AND RCS TANKS.
A SECOND FAILURE, A FAILED OPEN RCS CROSSFEED VALVE, WOULD
REQUIRE THE USE OF TANK ISOL VALVES TO AVOID CONNECTION OF OMS
AND RCS TANKS.

CAUSES: CONTAMINATION, VIBRATION, MECHANICAL SHOCK, THERMAL SHOCK, OVERLOAD

EFFECTS/RATIONALE:
BARBER POLE TALKBACK TO CREW FALSELY INDICATES THAT EITHER THE OX VLVS, FU VLVS, OR BOTH VLVS ARE FAILED PARTIALLY OPEN/PARTIALLY CLOSED. GPC TALKBACK TO CREW STILL OPERATIONAL. WORST CASE IS VLVS DECLARED FAILED CLOSED AND REDUNDANT VLVS ARE USED TO COMPLETE XFEED. LOSS OF ALL REDUNDANCY COULD RESULT IN FALSELY FAILING THE XFEED SYSTEM RESULTING IN LOSS OF MISSION. DURING ABORTS THE XFEED SHOULD NOT BE DECLARED FAILED AND THE DUMP SHOULD TAKE PLACE REGARDLESS OF INDICATIONS, BUT SINCE THE XFEED COULD FALSELY BE FAILED THE RESULT IS LOSS OF VEHICLE/LIFE FOR RTLS & TAL.

PART NUMBER: 54V76A114 J3-43; 56V76A116 J3-10

CAUSES: CONTAMINATION, VIBRATION, MECHANICAL SHOCK, THERMAL SHOCK, OVERLOAD

EFFECTS/RATIONALE:
SWITCH TALKBACK TO GPC CONTINUALLY INDICATE LT/RT FU VALVE A DOES NOT OPEN. BARBER POLE TALKBACK TO CREW STILL OPERATIONAL. WORST CASE IS VLV DECLARED FAILED CLOSED AND REDUNDANT VLV IS USED TO COMPLETE XFEED. LOSS OF ALL REDUNDANCY COULD RESULT IN FALSELY FAILING THE XFEED SYSTEM RESULTING IN LOSS OF MISSION. DURING ABORTS THE XFEED SHOULD NOT BE DECLARED FAILED AND THE DUMP SHOULD TAKE PLACE REGARDLESS OF INDICATIONS, BUT SINCE THE XFEED COULD FALSELY BE FAILED CLOSED THE RESULT IS LOSS OF VEHICLE/LIFE FOR RTLS & TAL.

CAUSES: CONTAMINATION, VIBRATION, MECHANICAL SHOCK, THERMAL SHOCK, OVERLOAD

EFFECTS/RATIONALE:
CREW LT/RT OMS ISOL B POSITION INDICATION DS6/DS8 WOULD FALSELY SHOW A BARBERPOLE INDICATING EITHER THE FUEL OR OX "B" VALVES ARE STUCK PARTIALLY OPEN/CLOSE OR THERE IS A POSITION MISMATCH BETWEEN THE TWO VALVES.
LOSS OF ALL REDUNDANCY WOULD RESULT IN LOSS OF DIRECT VALVE TALKBACK TO CREW. WORST CASE WOULD BE FALSELY FAILING THE A OR B VALVE CLOSED RESULTING IN LOSS OF MISSION DUE TO SAFETY CONSIDERATIONS (ONE FAILURE AWAY FROM LOSS OF VEHICLE/LIFE).

LOCATION: AV BAY 4, MCA 1; AV BAY 6, MCA 3
PART NUMBER: 54V76A114 J1-60; 56V76A116 J1-77

CAUSES: CONTAMINATION, VIBRATION, MECHANICAL SHOCK, THERMAL SHOCK, OVERLOAD

EFFECTS/RATIONALE:
SWITCH TALKBACK TO GPC CONTINUALLY INDICATES LT/RT OX AND FU VALVE A STUCK PARTIALLY OPEN/PARTIALLY CLOSED. BARBER POLE TALKBACK TO CREW STILL OPERATIONAL.
WORST CASE IS VLVS DECLARED FAILED CLOSED AND REDUNDANT VLVS ARE USED TO COMPLETE XFEED. LOSS OF ALL REDUNDANCY COULD RESULT IN FALSELY FAILING THE XFEED SYSTEM RESULTING IN LOSS OF MISSION.
DURING ABORTS THE XFEED SHOULD NOT BE DECLARED FAILED AND THE DUMP SHOULD TAKE PLACE REGARDLESS OF INDICATIONS, BUT SINCE THE XFEED COULD FALSELY BE FAILED THE RESULT IS LOSS OF VEHICLE/LIFE FOR RTLS & TAL.

PART NUMBER: 55V76A115 J2-62; J2-68

CAUSES: CONTAMINATION, VIBRATION, MECHANICAL SHOCK, THERMAL SHOCK, OVERLOAD

EFFECTS/RATIONALE:
SWITCH TALKBACK TO GPC CONTINUALLY INDICATES LT/RT OX AND FU VALVE B STUCK PARTIALLY OPEN/PARTIALLY CLOSED. BARBER POLE TALKBACK TO CREW STILL OPERATIONAL.
WORST CASE IS VLVS DECLARED FAILED CLOSED AND REDUNDANT VLVS ARE USED TO COMPLETE XFEED. LOSS OF ALL REDUNDANCY COULD RESULT IN FALSELY FAILING THE XFEED SYSTEM RESULTING IN LOSS OF MISSION.
DURING ABORTS THE XFEED SHOULD NOT BE DECLARED FAILED AND THE DUMP SHOULD TAKE PLACE REGARDLESS OF INDICATIONS, BUT SINCE THE XFEED COULD BE FALSELY FAILED THE RESULT IS LOSS OF VEHICLE/LIFE FOR RTLS & TAL.

PART NUMBER: 54V76A114 J1-67; 56V76A116 J1-28

CAUSES: CONTAMINATION, VIBRATION, MECHANICAL SHOCK, THERMAL SHOCK, OVERLOAD

EFFECTS/RATIONALE:
BARBER POLE TALKBACK TO CREW FALSELY INDICATES THAT EITHER THE OX VLVS, FU VLVS, OR BOTH VLVS ARE FAILED PARTIALLY OPEN/PARTIALLY CLOSED. GPC TALKBACK TO CREW STILL OPERATIONAL. WORST CASE IS VLVS DECLARED FAILED CLOSED AND REDUNDANT VLVS ARE USED TO COMPLETE XFEED. LOSS OF ALL REDUNDANCY COULD RESULT IN FALSELY FAILING THE XFEED SYSTEM RESULTING IN LOSS OF MISSION. DURING ABORTS THE XFEED SHOULD NOT BE DECLARED FAILED AND THE DUMP SHOULD TAKE PLACE REGARDLESS OF INDICATIONS, BUT SINCE THE XFEED COULD BE FALSELY FAILED THE RESULT IS LOSS OF VEHICLE/LIFE FOR RTLS & TAL.

LOCATION: PNL 08
PART NUMBER: 33V73A8-S26; S28

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
LOSE ABILITY TO OVERRIDE THE GPC COMMANDS FOR LT/RT OMS XFEED A VALVES. GPC COMMANDS AND REDUNDANT VALVES STILL AVAILABLE TO SUPPORT XFEED FUNCTION. LOSS OF ALL REDUNDANCY, WORST CASE, WOULD RESULT IN LOSS OF MISSION DUE TO LOSS OF XFEED CAPABILITY (LOSE OMS ENGINE REDUNDANCY AND RCS PROP MGR TECHNIQUES). DURING RTLS AND TAL LOSE THE ABILITY TO PERFORM TIME CRITICAL PROPELLANT DUMPS THROUGH THE RCS JETS RESULTING IN LOSS OF VEHICLE/LIFE.

</tbody>
</table>

LOCATION: PNL 08
PART NUMBER: 33V73A8-S26; S28

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
FIRST FAILURE RESULTS IN AN INABILITY TO CLOSE THE OX TK XFEED "A" VALVE AND LOSS OF LT & RT RCS CROSSFEED CAPABILITY DURING AN OMS BURN TO AVOID A DIRECT CONNECTION OF OMS AND RCS TANKS. LOSS OF ALL REDUNDANCY IS POSSIBLE LOSS OF MISSION DUE TO LOSS OF CROSSFEED CAPABILITY (TO AVOID DIRECT CONNECTION OF ALL OMS AND RCS TANKS). WITH ONE OMS CROSSFEED VALVE FAILED OPEN, A SECOND FAILURE, A FAILED OPEN RCS CROSSFEED VALVE, WOULD REQUIRE THE USE OF TANK ISOL VALVES TO AVOID CONNECTION OF OMS AND RCS TANKS.

REDUNDANCY SCREENS: A [ ] B [ ] C [ ]

LOCATION: AV BAY 5, PCA 2; AV BAY 6, PCA 3
PART NUMBER: 55V76A132F17; 56V76A133F9

CAUSES: CONTAMINATION, VIBRATION, MECHANICAL SHOCK, THERMAL SHOCK, OVERLOAD

EFFECTS/RATIONALE:
NONE, LOSE PRIMARY POWER SUPPLY FOR TOTALIZER, SECONDARY STILL AVAILABLE. POWER SUPPLIES ARE CROSS-STRAPPED.
LOSS OF ALL REDUNDANCY IS NOT CONSIDERED FEASIBLE SINCE IT WOULD REQUIRE LOSS OF GROUND CALCULATIONS FROM FLOW RATE-BURN TIME DATA THEREFORE THE WORST CASE EFFECT WOULD BE LOSS OF ALL QUANTITY GAGE DATA EXCEPT GND CALCULATIONS, NO EFFECT ON MISSION.

CAUSES: CONTAMINATION, VIBRATION, MECHANICAL SHOCK

EFFECTS/RATIONALE:
BARBERPOLE TALKBACK TO CREW FALSLEY INDICATES EITHER THE OX VLVS, THE FU VLVS OR BOTH VLVS FAILED TO OPEN WHEN COMMANDED AND HAVE FAILED PARTIALLY CLOSED.
WORST CASE IS VLVS DECLARED FAILED CLOSED AND REDUNDANT VLVS ARE USED TO COMPLETE XFEED. LOSS OF ALL REDUNDANCY COULD RESULT IN FALSELY FAILING THE XFEED SYSTEM RESULTING IN LOSS OF MISSION.
DURING ABORTS THE XFEED SHOULD NOT BE DECLARED FAILED AND THE DUMP SHOULD TAKE PLACE REGARDLESS OF INDICATIONS, BUT SINCE THE XFEED COULD FALSLEY BE FAILED CLOSED THE RESULT IS LOSS OF VEHICLE/LIFE FOR RTLS & TAL.

LOCATION: PNL 03 M10  
PART NUMBER: 33V76A3-M10

CAUSES: VIBRATION, MECHANICAL SHOCK, ELECTROMAGNETIC FIELDS, MISHANDLING/ABUSE

EFFECTS/RATIONALE:
GAGE M10 PROVIDES A FALSE INDICATION OF RCS HE AND ULLAGE PRESSURES (ALSO KIT ULLAGE PRESSURES). TWO OTHER REDUNDANT MEASUREMENT PATHS ARE AVAILABLE FOR EACH FRCS HE TK AND ONE REDUNDANT PATH FOR FU/OX ULLAGE PRESSURES. RESPECTIVE MSID #'S ARE V42P1113C&V42P1114C/V42P1110C & V42P1112C AND V42P1116C/V42P1115C. FOR ERRONEOUS INDICATIONS FROM ALL REDUNDANCY; 1ST DUE TO THE TIME CRITICALITY DURING ASCENT, MCC WOULD DECLARE FRCS FAILED (REF FLIGHT RULE 6-41) RESULTING IN PROP MGR IN THE APS, THEREFORE LOSS OF MISSION CAPABILITIES, 2ND FOR OTHER PHASES IT IS ASSUMED MCC WOULD MONITOR FRCS PROP TK OUT PRESSURE FOR HE TK HEALTH.

LOCATION: PROPELLANT OXIDIZER TANK
PART NUMBER: 51V43TT404, 52V43TT504

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
LOSS OF MISSION WOULD OCCUR IN THE LIFTOFF PHASE. A SENSOR FAILURE COULD INCORRECTLY LEAD TO FAILING OMS OX PROPELLANT TANK (REF: JSC 20923 PCN-1, RULE 6-2) LEADING TO THE ESTABLISHMENT OF A SHALLOW ATO BEFORE SENSOR FAILURE IS DETERMINED.

LOCATION: PNL 03 S10
PART NUMBER: 33V73A3-S10

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
LOSE CAPABILITY TO UTILIZE GAGES M9, M10, AND M11 FOR MONITORING.
REDUNDANT MEASUREMENTS ARE AVAILABLE THROUGH GPC AND ARE PART OF
THE C&W SYSTEM. THE LOSS OF ALL SIGNAL PATHS FOR OMS RT/LT/KIT
PROP ULLAGE, RCS RT/LT/FWD PROP ULLAGE AND RCS RT/LT/FWD HE TK
PRESSURE WOULD RESULT IN LOSS OF MISSION FOR SAFETY REASONS SINCE
THE ACTUAL STATUS OF THE SYSTEMS ARE UNAVAILABLE.

(130) TYPE III

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
FIRST FAILURE CAUSES THE ENG PURGE VLVS TO BE FAILED OPEN AND IS
NO EFFECT. LOSS OF ALL REDUNDANCY IS POSSIBLE LOSS OF
LIFE/VEHICLE DUE TO LOSS OF ALL GN2 PRESSURANT, INABILITY TO
MAINTAIN OPEN BI-PROP VALVES, AND LOSS OF BOTH ENGINES. WITH
FIRST FAILURE DURING RTLS OR TAL, ONE FAILURE (FAILURE OF SERIES
VALVE TO REMAIN CLOSED) AWAY FROM POSSIBLE LOSS OF LIFE/VEHICLE
DUE TO LOSS OF GN2 PRESSURANT IN ONE POD. LOSS OF AFFECTED
ENGINE, AND POSSIBLE INABILITY TO COMPLETE TIME-CRITICAL OMS DUMP
RESULTING IN POSSIBLE VIOLATION OF PROP TANK STRUCTURAL AND
ORBITER MASS PROPERTIES CONSTRAINTS.

PART NUMBER: 54V76A121 J11-G; 56V76A123 J11-R (142) TYPE III

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
FIRST FAILURE CAUSES ENGINE PURGE VLVS TO BE FAILED CLOSED AND IS NO EFFECT. AFFECTED ENGINE IS LOST FOR 10 MINUTES AFTER SHUTDOWN TO ALLOW FOR SUBLIMATION OF FROZEN PROP IN ENGINE LINES. OTHER ENGINE AVAILABLE IS BURN REQUIRED WITHIN 10 MINUTES. LOSS OF ALL REDUNDANCY IS POSSIBLE LOSS OF MISSION DUE TO LOSS OF BOTH ENGINES FOR 10 MINUTES AFTER BURNS. CRIT 1/1 FOR MANUAL TAL CONTINGENCY OMS DUMP PURGE REQUIREMENT.

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
FIRST FAILURE CAUSES THE ENG PURGE VLV TO BE FAILED OPEN AND IS NO EFFECT. LOSS OF ALL REDUNDANCY IS POSSIBLE LOSS OF LIFE/VEHICLE DUE TO LOSS OF ALL GN2 PRESSURANT, INABILITY TO MAINTAIN OPEN BI-PROP VALVES, AND LOSS OF BOTH ENGINES. WITH FIRST FAILURE DURING RTLS OR TAL, ONE FAILURE (FAILURE OF SERIES VALVE TO REMAIN CLOSED) AWAY FROM POSSIBLE LOSS OF LIFE/VEHICLE DUE TO LOSS OF GN2 PRESSURANT IN ONE POD, LOSS OF AFFECTED ENGINE, AND POSSIBLE INABILITY TO COMPLETE TIME-CRITICAL OMS DUMP RESULTING IN POSSIBLE VIOLATION OF PROP TANK STRUCTURAL AND ORBITER MASS PROPERTIES CONSTRAINTS.

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
LOSE CAPABILITY TO DIRECTLY SHUT DOWN THE OME DURING A BURN.
IF A MALFUNCTION OCCURRED, LOW PC AND DELTA V, THE PLACEMENT OF THE ARM/PRESS SWITCH TO THE OFF POSITION WOULD INSTRUCT THE GPC TO PERFORM SHUT DOWN. LOSS OF ALL REDUNDANCY RESULTS IN GPC CMDS AS THE ONLY METHOD FOR OME SHUTDOWN.

TYPE III

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
NONE, LOSS OF ONE OF TWO ELECTRICAL PATHS TO OPEN GN2 PRESS ISOL VALVE. FOR LOSS OF ALL REDUNDANCY EFFECT IS THE SAME AS GN2 PRESS ISOL VLV FAILING CLOSED RESULTING IN POSSIBLE LOSS OF LIFE/VEHICLE DUE TO LOSS OF START CAPABILITY FOR BOTH ENGINES (ACCUMULATOR IS CONSIDERED REDUNDANT TO GN2 ISOL VLV). THEREFORE POSSIBLE VIOLATION OF PROP TANK STRUCTURAL AND CG CONSTRAINTS DURING DEORBIT.

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
FAILURE OF DRIVER RESULTS IN HAVING TO PLACE EITHER THE ARM/PRESS SWITCH OR THE ENG VLV SWITCH IN THE OFF POSITION TO CLOSE ENG CONTROL VLV NO. 2. FAILURE OF ALL REDUNDANCY RESULTS IN ALL ENG CONTROL VLV'S FAILED OPEN REQUIRING THE CLOSURE OF THE TK ISO VLV'S TO STOP THE BURN. OMS PROPELLANT OR ENGINES ARE NO LONGER AVAILABLE SINCE REOPENING OF THE TK ISO VLV'S COULD RESULT IN SEVERE POD DAMAGE.

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
LOSE CAPABILITY TO DIRECTLY SHUT DOWN THE OME DURING A BURN.
IF A MALFUNCTION OCCURRED, LOW PC AND DELTA V, THE PLACEMENT OF
THE ARM/PRESS SWITCH TO THE OFF POSITION WOULD INSTRUCT THE GPC
to PERFORM SHUT DOWN. LOSS OF ALL REDUNDANCY RESULTS IN GPC
CMDS AS THE ONLY METHOD FOR OME SHUTDOWN.

LOCATION: PNL C3A1 S1; S2
PART NUMBER: 35V73A3A1F1; F3

CAUSES: CONTAMINATION, VIBRATION, MECHANICAL SHOCK, THERMAL SHOCK, OVERLOAD

EFFECTS/RATIONALE:
FIRST FAILURE RESULTS IN LOSS OF PURGE CAPABILITY FOR ASSOCIATED LT/RT OME. IF A 2ND FAILURE OCCURS IN THE OTHER POD'S ARM/PRESS SYSTEM DURING AN OMS BURN TRIGGERING THE FDI SYSTEM AND REQUIRING MANUAL SHUTDOWN, THE OMS RM WOULD INCORRECTLY SHUTDOWN GOOD POD AND NOT PERFORM THE OME GN2 PURGE. THE RESULT WOULD BE A FAILED POD WHICH CANNOT BE USED AND A GOOD POD WHICH CANNOT BE USED FOR 10 MINUTES. THIS COULD CAUSE YOU TO MISS DESIRED TARGETS DURING OMS 1 INSERTION OR CAUSE AN OVERSHEEP OF THE LANDING SITE DURING DEORBIT RESULTING IN POSSIBLE LOSS OF LIFE/VEHICLE. FOR A MANUAL TAL THE LOSS OF THE PURGE RESULTS IN AN INABILITY TO PERFORM TIME CRITICAL PROP DUMPS.

LOCATION: PNL C3A1 S1; S2
PART NUMBER: 35V73A3A1F2; F4

CAUSES: CONTAMINATION, VIBRATION, MECHANICAL SHOCK, THERMAL SHOCK, OVERLOAD

EFFECTS/RATIONALE:
FIRST FAILURE RESULTS IN LOSS OF PURGE CAPABILITY FOR ASSOCIATED LT/RT OME. IF A 2ND FAILURE OCCURS IN THE OTHER POD'S ARM/PRESS SYSTEM DURING AN OMS BURN TRIGGERING THE FDI SYSTEM AND REQUIRING MANUAL SHUTDOWN, THE OMS RM WOULD INCORRECTLY SHUTDOWN THE GOOD POD AND NOT PERFORM THE OME GN2 PURGE. THE RESULT WOULD BE A FAILED POD WHICH CANNOT BE USED AND A GOOD POD WHICH CANNOT BE USED FOR 10 MINUTES. THIS COULD CAUSE YOU TO MISS DESIRED TARGETS DURING OMS 1 INSERTION OR CAUSE AN OVERSHOOT OF THE LANDING SITE DURING DEORBIT RESULTING IN POSSIBLE LOSS OF VEHICLE/LIFE. FOR A MANUAL TAL THE LOSS OF THE PURGE RESULTS IN AN INABILITY TO PERFORM TIME CRITICAL PROP DUMPS.

CAUSES: CONTAMINATION, VIBRATION, MECHANICAL SHOCK, THERMAL SHOCK, OVERLOAD

EFFECTS/RATIONALE:
TALKBACKS FOR THE ENGINE CONTROL NO. 1 AND ENGINE PRESS ISOL VALVES WOULD FALSELY INDICATE VALVES FAILED CLOSED. THE ENGINE CONTROL VALVE OPERATION CAN BE DETERMINED BY MONITORING OME OPERATION.
A FALSE INDICATION OF AN ENGINE PRESS ISOL VALVE FAILED CLOSE COULD RESULT IN FAILING THE ASSOCIATED OME FOR ALL BURNS EXCEPT DEORBIT, NO EFFECT ON MISSION.
LOSS OF ALL REDUNDANCY WOULD FALSELY INDICATE A FAILURE IN BOTH OME'S GN2 SYSTEM. AT THIS POINT THE NEXT OMS BURN SHOULD BE PERFORMED WITH SETP, FOR DETERMINATION OF OME HEALTH, NO EFFECT ON MISSION.

CAUSES: CONTAMINATION, VIBRATION, MECHANICAL SHOCK, THERMAL SHOCK, OVERLOAD

EFFECTS/RATIONALE:
FIRST FAILURE IS NO EFFECT. A 2ND FAILURE OCCURS IN THE OTHER POD'S ARM/PRESS SYSTEM DURING AN OMS BURN TRIGGERING THE FDI SYSTEM AND REQUIRING MANUAL SHUTDOWN. THE OMS RM WOULD INCORRECTLY SHUTDOWN THE GOOD POD AND NOT PERFORM THE OME GN2 PURGE. THE RESULT WOULD BE A FAILED POD WHICH CANNOT BE USED AND A GOOD POD WHICH CANNOT BE USED FOR 10 MINUTES. THIS COULD CAUSE YOU TO MISS DESIRED TARGETS DURING OMS 1 INSERTION OR CAUSE AN OVERSHEEET OF THE LANDING SITE DURING DEORBIT RESULTING IN POSSIBLE LOSS OF VEHICLE/LIFE.

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
LOSE CAPABILITY TO INHIBIT THE LT/RT ENGINE PURGE AFTER AN OME BURN AND TO CLOSE LT/RT GN2 PRESS ISOL VLV. ON/OFF SELECTION STILL AVAILABLE THROUGH LT/RT OMS ENG VLV SWITCH S9/S7, NO MISSION IMPACT.

LOSS OF ALL REDUNDANCY IS THE SAME EFFECT AS GN2 PRESS ISOL VLV FAILING OPEN (FAILS TO CLOSE) RESULTING IN POSSIBLE LOSS OF LIFE/VEHICLE DUE TO OVERPRESSURIZATION AND POSSIBLE RUPTURE OF DOWNSTREAM LINES OR DAMAGE TO COMPONENTS RESULTING IN LOSS OF GN2 PRESSURANT AND/OR INABILITY TO START ENGINES.

LOCATION: PNL C3A1
PART NUMBER: 35V73A3A1-S1; S2

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
FIRST FAILURE IS NO EFFECT, REMAINING ENGINE START (IN ACCUMULATOR) SAVED FOR DEORBIT. LOSS OF ALL REDUNDANCY IS THE SAME EFFECT AS GN2 ISOL VLV FAILING CLOSED RESULTING IN POSSIBLE LOSS OF LIFE/VEHICLE DUE TO LOSS OF START CAPABILITY FOR BOTH ENGINES. WITH FIRST FAILURE DURING RTLS OR TAL, ONE FAILURE (ACCUMULATOR) AWAY FROM POSSIBLE LOSS OF LIFE/VEHICLE DUE TO LOSS OF ENGINE AND INABILITY TO COMPLETE TIME-CRITICAL OMS DUMP RESULTING IN POSSIBLE VIOLATION OF PROP TANK STRUCTURAL AND ORBITER ENTRY CG CONSTRAINTS. ACCUMULATOR PROVIDES FAIL-SAFE PROTECTION FOR UPSTREAM FAILURES AND IS CONSIDERED REDUNDANT.

PART NUMBER: 54V76A131RPC26; 56V76A133RPC17

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
LOSE ONE OF TWO ELECTRICAL PATHS FOR THE SUPPLY OF TVC MTR PWR TO
THE ACTIVE PITCH & YAW MOTORS.
LOSS OF ALL REDUNDANCY RESULTS IN AN INABILITY TO CONTROL EITHER
OME THEREFORE, DEORBIT CAPABILITY IS LOST WHEN ABOVE RCS RELINES,
LOSS OF VEHICLE/LIFE.
( FOR MANUAL TAL LOSS OF ALL REDUNDANCY RESULTS IN 1/1.)

REDUNDANCY SCREENS: A [ ] B [ ] C [ ]

LOCATION: OME
PART NUMBER: 51V43PT001, 52V43PT001

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
LOSE ABILITY TO UTILIZE PT001 FOR FUEL INLET PRESSURE MEASUREMENT. THE MEASUREMENT IS USED FOR LEAK ISOLATION AND (IN CONJUNCTION WITH PC, FUEL INJECTOR TEMP AND BALL VALVE POSITION INDICATOR) FOR ISOLATION OF OX FLOW RESTRICTION. FAILURE OF THE SENSOR SEVERELY DEGRADES CREW MONITORING CAPABILITY. DECREASED CAPABILITY TO DETERMINE FLOW RATE AND DISCERN BETWEEN ENGINE AND PROPELLANT FAILURES. RECOMMEND THIS PRESSURE MEASUREMENT BE INCLUDED IN FLIGHT RULE 6-27.

LOCATION: OME
PART NUMBER: 51V43TT002, 52V43TT002

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
WITH A FAILURE OF THE SENSOR, A FALSE TEMP INDICATION OF EITHER <25 F OR >130 F THE ASSOCIATED ENGINE WOULD BE DECLARED FAILED (REF JSC 20923 PCN-1, RULE 6-3) RESULTING IN LOSS OF FULL MISSION CAPABILITIES DUE TO IMPOSED PROP MGR TECHS TO ENSURE DEORBIT CAPABILITIES. FAILURE OF ALL REDUNDANCY COULD LEAD TO INCORRECTLY FAILING TWO OMS ENGINES AND IF THIS DECISION IS NOT REVERSED A POSSIBLE LOSS OF DEORBIT CAPABILITY WOULD RESULT THUS LOSS OF VEHICLE/CREW. FOR RTLS & OMS BOTH ENGINES ARE NEEDED TO DUMP PROP AND ESTABLISH WEIGHT & CG FOR ACCEPTABLE LANDING.

LOCATION: AV BAY 4, LCA 1; AV BAY 5, LCA 2
PART NUMBER: 54V76A121AR J11-CC TYPE III O; 55V76A122AR J11-KK TYPE III O

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
LOSS OF ALL REDUNDANCY WOULD RESULT IN INABILITY TO MAINTAIN PROPELLANTS AT DESIRED TEMPERATURE AND WOULD BE CAUSE FOR ENTRY ON NEXT DAILY GO/NO-GO.
OF THE SEVEN KEEL WEB HYBRID DRIVERS THERE ARE THREE OF WHICH A FAILURE OF ANY ONE WOULD NOT BE DETECTABLE IN FLIGHT (THE FAILURE WOULD NOT RESULT IN AN UNSAFE CONDITION.)

PART NUMBER: 54V76A121AR J11-D' TYPE III O; 55V76A122AR J11-F
TYPE III O

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
FIRST FAILURE RESULTS IN THE ASSOCIATED HTR SET BEING FAILED "ON" WHICH COULD RESULT IN A HIGHER THAN DESIRED TEMP IN POD. A SECOND FAILURE IN THE SAME HTR GROUP WOULD RESULT IN BOTH ELEMENTS OF TWO OR MORE HTR'S "ON" SIMULTANEOUSLY WHEN THE REDUNDANT HTR GROUP IS ACTIVE RESULTING IN A TEMPERATURE EXCEEDING THE POD STRUCTURAL QUALIFIED LIMIT OF 425 F AND POSSIBLE LOSS OF VEHICLE/LIFE DUE TO STRUCTURAL DAMAGE. TESTS HAVE SHOWN THAT A 4" BY 8" 47W HTR WITH BOTH ELEMENTS ON WILL HAVE A MAX TEMP OF 552 F AND A 1" BY 7" 10W HTR WILL HAVE A MAX TEMP OF 615 F UNDER SAME CONDITIONS

FIRST FAILURE RESULTS IN THE ASSOCIATED HTR SET BEING FAILED "ON" WHICH COULD RESULT IN A HIGHER THAN DESIRED TEMP IN POD. A SECOND FAILURE IN THE SAME HTR GROUP WOULD RESULT IN BOTH ELEMENTS OF TWO OR MORE HTR'S "ON" SIMULTANEOUSLY WHEN THE REDUNDANT HTR GROUP IS ACTIVE RESULTING IN A TEMPERATURE EXCEEDING THE POD STRUCTURAL QUALIFIED LIMIT OF 425 F AND POSSIBLE LOSS OF VEHICLE/LIFE DUE TO STRUCTURAL DAMAGE. TESTS HAVE SHOWN THAT A 4" BY 8" 47W HTR WITH BOTH ELEMENTS ON WILL HAVE A MAX TEMP OF 552 F AND A 1" BY 7" 10W HTR WILL HAVE A MAX TEMP OF 615 F UNDER SAME CONDITIONS

PART NUMBER: 55V76A122AR J11-T' TYPE III; 54V76A123AR J11-T'
(144) TYPE III

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
FIRST FAILURE RESULTS IN THE ASSOCIATED HTR SET BEING FAILED "ON" WHICH COULD RESULT IN A HIGHER THAN DESIRED TEMP IN POD. A SECOND FAILURE IN THE SAME HTR GROUP WOULD RESULT IN BOTH ELEMENTS OF TWO OR MORE HTR'S "ON" SIMULTANEOUSLY WHEN THE REDUNDANT HTR GROUP IS ACTIVE RESULTING IN A TEMPERATURE EXCEEDING THE POD STRUCTURAL QUALIFIED LIMIT OF 425 F AND POSSIBLE LOSS OF VEHICLE/LIFE DUE TO STRUCTURAL DAMAGE. TESTS HAVE SHOWN THAT A 4" BY 8" 47W HTR WITH BOTH ELEMENTS ON WILL HAVE A MAX TEMP OF 552 F AND A 1" BY 7" 10W HTR WILL HAVE A MAX TEMP OF 615 F UNDER SAME CONDITIONS

PART NUMBER: 55V76A122AR J11-T' TYPE III; 54V76A121AR J11-T'
(144) TYPE III

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
LOSS OF ALL REDUNDANCY WOULD RESULT IN INABILITY TO MAINTAIN
PROPELLANTS AT DESIRED TEMPERATURE AND WOULD BE CAUSE FOR ENTRY
ON NEXT DAILY GO/NO-GO.
OF THE SEVEN KEEL WEB HYBRID DRIVERS THERE ARE THREE OF WHICH A
FAILURE OF ANY ONE WOULD NOT BE DETECTABLE IN FLIGHT (THE FAILURE
WOULDN'T RESULT IN AN UNSAFE CONDITION.)

PART NUMBER: 56V76A123AR J11-MM (154) TYPE III; 54V76A121AR J11-MM TYPE III

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
FIRST FAILURE RESULTS IN THE ASSOCIATED HTR SET BEING FAILED "ON" WHICH COULD RESULT IN A HIGHER THAN DESIRED TEMP IN POD. A SECOND FAILURE IN THE SAME HTR GROUP WOULD RESULT IN BOTH ELEMENTS OF THE HTR "ON" SIMULTANEOUSLY WHEN THE REDUNDANT HTR GROUP IS ACTIVE RESULTING IN A TEMPERATURE EXCEEDING THE POD STRUCTURAL QUALIFIED LIMIT OF 425 DEG F AND POSSIBLE LOSS OF VEHICLE LIFE DUE TO STRUCTURAL DAMAGE. TESTS HAVE SHOWN THAT A 4" BY 8" 47W HTR WITH BOTH ELEMENTS ON WILL HAVE A MAX TEMP OF 552 DEG F AND A 1" BY 7" 10W HTR WILL HAVE A MAX TEMP OF 615 DEG F UNDER SAME CONDITIONS. AND BOTH TYPES WILL EXCEED THE QUALIFIED TEMP OF 425 DEG F IN APPROXIMATELY 2 MIN.

LOCATION: KEEL WEB

PART NUMBER: 51V43HR 17, 19, 21, 23, 25, 29, 31, 33, 37, 41, 43, 45, 47; 52V43HR 18, 20, 22, 24, 26, 30, 32, 34, 38, 42, 44, 46, 48

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
LOSS OF ALL REDUNDANCY WOULD RESULT IN INABILITY TO MAINTAIN PROPELLANTS AT DESIRED TEMP. FAILURE OF ALL REDUNDANCY WOULD BE CAUSE FOR ENTRY ON NEXT DAILY GO/NO-GO. OUT OF THE 14 HTR'S THERE ARE SIX IN WHICH A SHORT WOULD NOT BE DETECTED (HR19,21,25,29,41,47/HR20,22,26,30,42,48), BUT FAILURE OF ANY OF THE SIX WOULD NOT RESULT IN AN UNSAFE CONDITION.

EFFECTS/RATIONALE:
LOSS OF ALL REDUNDANCY WOULD RESULT IN INABILITY TO MAINTAIN PROPER THERMAL CONTROL IN THE RCS HOUSING AND WOULD BE CAUSE FOR ENTRY ON NEXT DAILY GO/NO-GO.

LOCATION: AV BAY 4, PCA 1; AV BAY 5, PCA 2
PART NUMBER: 54V76A121R J3-127A; 55V76A122R J3-113A

CAUSES: CONTAMINATION, VIBRATION, MECHANICAL SHOCK, THERMAL SHOCK, OVERLOAD

EFFECTS/RATIONALE:
FIRST FAILURE DOES NOT RESULT IN LOSS OF ANY HTR GROUP. SECOND FAILURE RESULTS IN LOSS OF GROUP 1 HTRS, GROUP 2 STILL FULLY OPERATIONAL.
LOSS OF ALL REDUNDANCY WOULD RESULT IN INABILITY TO MAINTAIN PROPER THERMAL CONTROL IN THE RCS HOUSING AND WOULD BE CAUSE FOR ENTRY ON NEXT DAILY GO/NO-GO.

NONE, LOSE DIRECT TEMP MEASUREMENT FOR THE OUTBD Y-WEB HTR SYSTEM. ALTHOUGH VALIDITY OF THE MEASUREMENT (SENSOR FAILURE) MIGHT NOT BE IMMEDIATELY DETERMINED A THERMOSTAT FAILURE "OFF" IS CONSIDERED FAIL OPERATIONAL AND A THERMOSTAT FAILURE "ON" CAN BE DETERMINED BY MONITORING THE UPPER INBD Y-WEB TEMP V43T4703A/V43T5703A.

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
RESULTS IN FAILED OFF CONDITION FOR GSE SERVICE PANEL HTR SYSTEM.
THE GSE SERVICE PNL HTR SYSTEM IS NOT A CRITICAL HTR SYSTEM.
REMAINING HTR SYSTEMS MAINTAIN THERMAL ENVIRONMENT WITHIN
REDLINES.
LOSS OF ALL REDUNDANCY WILL RESULT IN LOSS OF MISSION DUE TO
INABILITY TO MAINTAIN PROPER POD THERMAL ENVIRONMENT.

LOCATION: LOWER INBOARD Y-WEB
PART NUMBER: 51V43S35; 52V43S36

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
FIRST FAILURE RESULTS IN THE ASSOCIATED HTR SET BEING FAILED "ON" WHICH COULD RESULT IN A HIGHER THAN DESIRED TEMP IN POD. A SECOND FAILURE IN THE SAME HTR GROUP WOULD RESULT IN BOTH ELEMENTS OF TWO OR MORE HTR'S "ON" SIMULTANEOUSLY WHEN THE REDUNDANT HTR GROUP IS ACTIVE RESULTING IN A TEMPERATURE EXCEEDING THE POD STRUCTURAL QUALIFIED LIMIT OF 425F AND POSSIBLE LOSS OF VEHICLE/LIFE DUE TO STRUCTURAL DAMAGE. TESTS HAVE SHOWN THAT A 4" BY 8" 47W HTR WITH BOTH ELEMENTS ON WILL HAVE A MAX TEMP OF 552 F AND A 1" BY 7" 10W HTR WILL HAVE A MAX TEMP OF 615 F UNDER SAME CONDITIONS.

LOCATION: RCS HOUSING
PART NUMBER: 51V43S45, 51V42S49; 52V43S45, 52V42S49

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
FIRST FAILURE RESULTS IN THE ASSOCIATED HTR SET BEING FAILED "ON" WHICH COULD RESULT IN A HIGHER THAN DESIRED TEMP IN POD. A SECOND FAILURE IN THE SAME HTR GROUP WOULD RESULT IN BOTH ELEMENTS OF TWO OR MORE HTR'S "ON" SIMULTANEOUSLY WHEN THE REDUNDANT HTR GROUP IS ACTIVE RESULTING IN A TEMPERATURE EXCEEDING THE POD STRUCTURAL QUALIFIED LIMIT OF 425F AND POSSIBLE LOSS OF VEHICLE/LIFE DUE TO STRUCTURAL DAMAGE. TESTS HAVE SHOWN THAT A 4" BY 8" 47W HTR WITH BOTH ELEMENTS ON WILL HAVE A MAX TEMP OF 552 F AND A 1" BY 7" 10W HTR WILL HAVE A MAX TEMP OF 615 F UNDER SAME CONDITIONS.

LOCATION: PNL 14
PART NUMBER: 36V73A14-S2 ; 36V73A14-S5

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
FIRST FAILURE RESULTS IN LOSS OF GROUP 1 HTR'S, GROUP 2 STILL FULLY OPERATIONAL. LOSS OF ALL REDUNDANCY (2ND FAILURE) RESULTS IN LOSS OF MISSION DUE TO INABILITY TO MAINTAIN POD THERMAL ENVIRONMENT.

LOCATION: AV BAY 4, LCA 1
PART NUMBER: 54V76A121AR J6-PP TYPE III

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
LOSS OF ALL REDUNDANCY IS POSSIBLE LOSS OF MISSION DUE TO LOSS OF INTERCONNECT/XFEED CAPABILITY, LOSS OF ENGINE REDUNDANCY, LOSS OF PROTECTION AGAINST SUBSEQUENT ENGINE OR PROP FAILURES, AND LOSS OF CAPABILITY TO BALANCE PROP WEIGHTS BETWEEN PODS IF PREVIOUS FAILURE REQUIRES SUCH ACTION.

LOCATION: AV BAY 4, LCA 1
PART NUMBER: 54V76A121AR J6-PP TYPE III

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
LOSS OF ALL REDUNDANCY RESULTS IN AN INABILITY TO UTILIZE THE CONTROL TEMP THERMOSTAT. THE OVER TEMP THERMOSTAT STILL AVAILABLE TO MAINTAIN SAFE HTR OPERATION.
SECOND FAILURE IN THE SAME SYSTEM (OVERTEMP THERMOSTAT) WILL RESULT IN THE LOSS OF THE ASSOCIATED HTR GROUP A OR B. LOSS OF ALL REDUNDANCY RESULTS IN BOTH ELEMENTS OF ONE OR MORE HTR'S FAILED "ON" WHICH COULD RESULT IN LOSS OF MISSION FOR SAFETY REASONS (OVER TEMP OF CROSSFEED LNS). (ONE HTR ELEMENT FAILED "ON" CONTINUOUSLY CAN HAVE A SURFACE TEMP AS HIGH AS 352 F.)

LOCATION: AFT BODY
PART NUMBER: 50V43HR1041; HR1042; HR1043; HR1044

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
IN DETERMINING CRITICALITIES IT IS ASSUMED A LAUNCH WOULD NOT
TAKE PLACE IF TEMPERATURES ON THE MAIN CROSSFEED LN'S WERE
OUTSIDE THE DESIRED LIMITS (<50 F OR >90 F). THIS WILL ENSURE
CROSSFEED CAPABILITIES FOR ABORTS. EFFECTS: FIRST FAILURE COULD
RESULT IN LOSS OF ASSOCIATED HTR GROUP A OR B. LOSS OF ALL
REDUNDANCY WOULD RESULT IN A FAILED "OFF" HTR SYSTEM ON A MISSION
CRITICAL CROSSFEED LN.
LOSS OF MISSION DUE TO LOSS OF INTERCONNECT/XFEED CAPABILITY.

redundancy screens: a [ ] b [ ] c [ ]

location: aft body
part number: 50v43hr1151; hr1152

causes: contamination, vibration, piece part failure, overload

effects/rationale:
in determining criticalities it is assumed a launch would not

take place if temperatures on the main crossfeed ln's were

outside the desired limits (<50 f or >90 f). this will ensure
crossfeed capabilities for aborts. effects: lose associated htr

system. second failure results in loss of redundant system. the

htr system is not mission critical. crossfeed can still be

accomplished.

REDUNDANCY SCREENS: A [ ] B [ ] C [ ]

LOCATION: AFT BODY
PART NUMBER: 50V43MT11

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
IN DETERMINING THE CRITICALITIES IT IS ASSUMED A LAUNCH WOULD NOT TAKE PLACE WITH A SENSOR INDICATING CROSSFEED TEMPERATURES OUTSIDE THE DESIRED LIMITS (<50 F OR >90 F) WITH OUT FIRST UNDERSTANDING IT WAS A SENSOR FAILURE AND SECOND EXCEPTING THE RISKS OF LOSS OF DETECTABILITY FOR THE THERMAL SYSTEM. (THIS ENSURES XFEED FOR ABORTS) EFFECT: LOSE FAILURE DETECTION OF ASSOCIATED HTR SYSTEM. HTR SYSTEM IS NOT MISSION CRITICAL, CROSSFEED CAN STILL BE ACCOMPLISHED.

# Independent Orbiter Assessment

## Orbiter Subsystem Analysis Worksheet

**Date:** 1/17/87  
**Subsystem:** OMS  
**MDAC ID:** 994

**Highest Criticality HDW/Func:**

<table>
<thead>
<tr>
<th>Flight Phase</th>
<th>HDW/Func</th>
<th>Abort</th>
<th>HDW/Func</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prelaunch</td>
<td>3/3</td>
<td>RTLS: 3/3</td>
<td></td>

<td>Deorbit</td>
<td>3/3</td>
<td>ATO: 3/3</td>
<td></td>
</tr>
<tr>
<td>Landing/Safing</td>
<td>3/3</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Redundancy Screens:** A [ ]  B [ ]  C [ ]

**Location:** Aft Body  
**Part Number:** 50V43MT14

**Causes:** Contamination, Vibration, Piece Part Failure, Overload

**Effects/Rationale:**

In determining the criticalities it is assumed a launch would not take place with a sensor indicating crossfeed temperatures outside the desired limits (<50 F or >90 F) without first understanding it was a sensor failure and second excepting the risks of loss of detectability for the thermal system. (This ensures xfeed for aborts) Effect: worst case would be a false indication of HTR system failed "off" on a mission critical crossfeed ln. Loss of mission due to loss of interconnect/xfeed capability.

REDUNDANCY SCREENS: A [ ]  B [ ]  C [ ]

LOCATION: AFT BODY
PART NUMBER: 50V43MT9

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
IN DETERMINING THE CRITICALITIES IT IS ASSUMED A LAUNCH WOULD NOT TAKE PLACE WITH A SENSOR INDICATING CROSSFEED TEMPERATURES OUTSIDE THE DESIRED LIMITS (<50 F OR >90 F) WITH OUT FIRST UNDERSTANDING IT WAS A SENSOR FAILURE AND SECOND EXCEPTING THE RISKS OF LOSS OF DETECTABILITY FOR THE THERMAL SYSTEM. (THIS ENSURES XFED FOR ABORTS) EFFECT: LOSE FAILURE DETECTION OF ASSOCIATED HTR SYSTEM. HTR SYSTEM IS NOT MISSION CRITICAL, CROSSFEED CAN STILL BE ACCOMPLISHED.

LOCATION: AFT BODY
PART NUMBER: 50V43S1052; S2052

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
IN DETERMINING CRITICALITIES IT IS ASSUMED A LAUNCH WOULD NOT TAKE PLACE IF TEMPERATURES ON THE MAIN CROSSFEED LN'S WERE OUTSIDE THE DESIRED LIMITS (<50 F OR >90 F). THIS WILL ENSURE CROSSFEED CAPABILITIES FOR ABORTS. EFFECTS: FIRST FAILURE COULD RESULT IN LOSS OF ASSOCIATED HTR GROUP A OR B. LOSS OF ALL REDUNDANCY WOULD RESULT IN A FAILED "OFF" HTR SYSTEM ON A MISSION CRITICAL CROSSFEED LN. LOSS OF MISSION DUE TO LOSS OF INTERCONNECT/XFEED CAPABILITY.

LOCATION: AFT BODY
PART NUMBER: 50V43S1052; S2052

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
In determining criticalities it is assumed a launch would not take place if temperatures on the main crossfeed LN's were outside the desired limits (<50 F or >90 F). This will ensure crossfeed capabilities for aborts. Effects: First failure results in an increase of the HTR system's operating range (75 F to 90 F). Second failure in the same system (Overtemp thermostat) will result in the loss of the associated HTR group A or B. Loss of all redundancy results in both elements of one or more HTR's failed "on" which could result in loss of mission for safety reasons (Overtemp of crossfeed LNS). (One HTR element failed "on" continuously can have a surface temp as high as 352 F.)

LOCATION: AFT BODY
PART NUMBER: 50V43S1011; S2011

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
IN DETERMINING CRITICALITIES IT IS ASSUMED A LAUNCH WOULD NOT TAKE PLACE IF TEMPERATURES ON THE MAIN CROSSFEED LN'S WERE OUTSIDE THE DESIRED LIMITS (<50 F OR >90 F). THIS WILL ENSURE CROSSFEED CAPABILITIES FOR ABORTS. EFFECTS: FIRST FAILURE COULD RESULT IN LOSS OF ASSOCIATED HTR GROUP A OR B. LOSS OF ALL REDUNDANCY WOULD RESULT IN A FAILED "OFF" HTR SYSTEM ON A MISSION CRITICAL CROSSFEED LN. LOSS OF MISSION DUE TO LOSS OF INTERCONNECT/XFEED CAPABILITY.

EFFECTS/RATIONALE:
IN DETERMINING CRITICALITIES IT IS ASSUMED A LAUNCH WOULD NOT TAKE PLACE IF TEMPERATURES ON THE MAIN CROSSFEED LN'S WERE OUTSIDE THE DESIRED LIMITS (<50 F OR >90 F). THIS WILL ENSURE CROSSFEED CAPABILITIES FOR ABORTS. EFFECTS: FIRST FAILURE RESULTS IN AN INCREASE OF THE HTR SYSTEM'S OPERATING RANGE (75 F TO 90 F). SECOND FAILURE IN THE SAME SYSTEM (OVERTEMP THERMOSTAT) WILL RESULT IN THE LOSS OF THE ASSOCIATED HTR GROUP A OR B. LOSS OF ALL REDUNDANCY RESULTS IN BOTH ELEMENTS OF ONE OR MORE HTR'S FAILED "ON" WHICH COULD RESULT IN LOSS OF MISSION FOR SAFETY REASONS (OVER TEMP OF CROSSFEED LNS). (ONE HTR ELEMENT FAILED "ON" CONTINUOUSLY CAN HAVE A SURFACE TEMP AS HIGH AS 352 F.)

LOCATION: AFT BODY
PART NUMBER: 40V43S1131; S2131

CAUSES: CONTAMINATION, VIBRATION, PIECE PART FAILURE, OVERLOAD

EFFECTS/RATIONALE:
IN DETERMINING CRITICALITIES IT IS ASSUMED A LAUNCH WOULD NOT TAKE PLACE IF TEMPERATURES ON THE MAIN CROSSFEED LN'S WERE OUTSIDE THE DESIRED LIMITS (<50 F OR >90 F). THIS WILL ENSURE CROSSFEED CAPABILITIES FOR ABORTS. EFFECTS: FIRST FAILURE RESULTS IN AN INCREASE OF THE HTR SYSTEM'S OPERATING RANGE (75 F TO 90 F). SECOND FAILURE IN THE SAME SYSTEM (OVERTEMP THERMOSTAT) WILL RESULT IN THE LOSS OF THE ASSOCIATED HTR GROUP A OR B. LOSS OF ALL REDUNDANCY RESULTS IN BOTH ELEMENTS OF ONE OR MORE HTR'S FAILED "ON" WHICH COULD RESULT IN LOSS OF MISSION FOR SAFETY REASONS (OVER TEMP OF CROSSFEED LNS). (ONE HTR ELEMENT FAILED "ON" CONTINUOUSLY CAN HAVE A SURFACE TEMP AS HIGH AS 352 F.)
