Independent Orbiter Assessment
Analysis of the Nose Wheel Steering Subsystem

1.0 EXECUTIVE SUMMARY

The McDonnell Douglas Astronautics Company (MDAC) was selected in June 1986 to perform an Independent Orbiter Assessment (IOA) of the Failure Modes and Effects Analysis (FMEA) and Critical Items List (CIL). Direction was given by the STS Orbiter and GFE Projects Office to perform the hardware analysis using the instructions and ground rules defined in NSTS 22206, Instructions for Preparation of FMEA and CIL, October 1986. The IOA approach features a top-down analysis of the hardware to determine failure modes, criticality, and potential critical items. To preserve independence, this analysis was accomplished without reliance upon the results contained within the NASA FMEA/CIL documentation. This report documents (Appendix C) the independent analysis results for the Orbiter Nose Wheel Steering (NWS) hardware.

The NWS hardware provides primary directional control for the Orbiter vehicle during landing rollout. The system consists of the following components:

- Steering Control Box (SCB)
- Rudder Pedal Assemblies (RPA)
- Steering Actuator Assembly
- Failure Annunciator System
- Activation System
- Multiplexer/Demultiplexers (MDM)

The IOA analysis process utilized available NWS hardware drawings and schematics for defining hardware assemblies, components, and hardware items. Each level of hardware was evaluated and analyzed for possible failure modes and effects. Criticality was assigned based upon the severity of the effect for each failure mode.

Figure 1 presents a summary of the failure criticalities for each of the seven major subdivisions of the NWS. A summary of the number of failure modes, by criticality, is also presented below with Hardware (HW) criticality first and Functional (F) criticality second.

The original NWS design was envisioned as a backup system to differential braking for directional control of the Orbiter during landing rollout. No real effort was made to design the NWS system as fail operational. The brakes have much redundancy built into their design but the poor brake/tire performance has forced the NSTS to upgrade NWS to the primary mode of directional control during rollout. As a result, a large percentage of the NWS system components have become Potential Critical Items (PCI). This current state of conditions will continue to exist until the planned NWS system redesign (Phase III upgrade) is implemented.
2.0 INTRODUCTION

2.1 Purpose

The 51-L Challenger accident prompted the NASA to readdress safety policies, concepts, and rationale being used in the National Space Transportation System (NSTS). The NSTS Office has undertaken the task of reevaluating the FMEA/CIL for the Space Shuttle design. The MDAC is providing an independent assessment of the Orbiter FMEA/CIL for completeness and technical accuracy.

2.2 Scope

The scope of the independent FMEA/CIL assessment activity encompasses those Shuttle Orbiter subsystems and GFE hardware identified in the Space Shuttle Independent FMEA/CIL Assessment Contractor Statement of Work. Each subsystem analysis addresses hardware, functions, internal and external interfaces, and operational requirements for all mission phases.

2.3 Analysis Approach

The independent analysis approach is a top-down analysis utilizing as-built drawings to breakdown the respective subsystem into components and low-level hardware items. Each hardware item is evaluated for failure mode, effects, and criticality. These data are documented in the respective subsystem analysis report, and are used to assess the NASA and Prime Contractor FMEA/CIL reevaluation results. The IOA analysis approach is summarized in the following Steps 1.0 through 3.0. Step 4.0 summarizes the assessment of the NASA and Prime Contractor FMEAs/CILs that is performed and documented at a later date.

Step 1.0 Subsystem Familiarization
   1.1 Define subsystem functions
   1.2 Define subsystem components
   1.3 Define subsystem specific ground rules and assumptions

Step 2.0 Define subsystem analysis diagram
   2.1 Define subsystem
   2.2 Define major assemblies
   2.3 Develop detailed subsystem representations

Step 3.0 Failure events definition
   3.1 Construct matrix of failure modes
   3.2 Document IOA analysis results
Step 4.0  Compare IOA analysis data to NASA FMEA/CIL
    4.1  Resolve differences
    4.2  Review in-house
    4.3  Document assessment issues
    4.4  Forward findings to Project Manager

2.4  NWS Ground Rules and Assumptions

The NWS ground rules and assumptions used in the IOA are defined in Appendix B. The subsystem specific ground rules were defined to correct omissions and clarify ambiguities.
3.0 SUBSYSTEM DESCRIPTION

3.1 Design and Function

The NWS hardware provides the primary directional control for the Orbiter during landing rollout. Deflection of the rudder pedals transmits electrical steering signals to the NWS Control Box. These electrical signals meter hydraulic power through the NWS Actuator which physically displaces the actuator piston. The piston, which is mechanically linked to the nose wheel collar, can rotate the nose wheel through +/- 10 degrees for directional control during rollout.

3.2 NWS Modes

The three modes of NWS operation are: 1) General Purpose Computer (GPC), 2) Direct (Manual), and 3) Free Castor. The GPC mode of NWS is now the primary mode of directional control during landing rollout. The GPC processes the steering signals before sending them to the SCB. The GPC mode also has a triple channel wraparound position feedback system with compare logic in the software. This added redundancy was a key factor in elevating NWS to its present status. The Direct mode of NWS uses its own command transducer (xducer) and the steering signals bypass the computer and go directly to the SCB. In the free castor mode of NWS, the NW rotates freely and steering is accomplished by differential braking and use of the rudder. During free castor, the hydraulic system has an internal damping capability which prevents the NW from shimmy oscillations.

3.3 Steering Timeline

The steering timeline is important to the analysis because some failure modes have different effects and criticalities depending on when the failure occurs. The GPC mode of NWS is selected during the final approach phase of landing. Between main gear touchdown (MGTD) and nose gear touchdown (NGTD), all directional control is performed by the rudder. Simulations at the NASA Ames moving base simulator have shown that when the crew applied the brakes while the nose wheel was in the air, it led to an uncontrollable negative pitching moment that resulted in large pitch rates at NGTD that would structurally damage the NW strut. Following NGTD, NWS is active and operates in tandem with the rudder. The rudder effectiveness decreases as the Orbiter decelerates, becoming essentially ineffective at about 75 knots airspeed. Braking may begin at about 150 knots ground speed. Studies and flight data have shown that initiating braking at higher speeds will result in brake/tire failures.
3.4 NWS Effectiveness

Steering with the NW takes advantage of an effective moment arm about five times as long as that available when using differential braking. The turning capability using only differential braking is not adequate to maintain directional control of the Orbiter for a landing scenario with blown tires. This inadequacy has contributed to the recent upgrades to the NWS requirements.

3.5 NWS Upgrades

A three phase upgrade to NWS was initiated with the goal of making the system fail operational/fail safe. Phase I upgrade consisted of rewiring the GPC and Direct positions on the NWS switch, disconnecting the GPC contact, and adding a 2.5 inch extension to the switch toggle. The rewiring inhibited the GPC mode and the extension made the task of turning on Direct, which must be done after NGTD, a little easier. The Phase II upgrade was implemented on flights STS-61A, STS-61C, and STS-51L. It primarily consisted of reconnecting the GPC switch contact and adding the wraparound FB system that includes Redundancy Management (RM) for operational control and failure detection logic. Parabolic signal shaping was also added to the command xducer steering signal (Direct mode of NWS). This is the current design and was used in the analysis. The Phase III upgrade is in the early design stage. Until the NWS redesign has eliminated all the single point failure modes, the system is at best fail safe.

3.6 NWS Component Description

The following sections highlight the major components of NWS:

(Reference Figure 2)

1. The SCB has a single electrical power source, Main Bus A. At NGTD the GPC issues enable signals that trigger the SCB to route this power to the pilot valve solenoids in the steering actuator assembly. The steering signal current is monitored in the SCB before being transmitted to the steering actuator system. The SCB contains five separate failure detection circuits that monitor potential NWS failure modes. Any one failure detection will automatically downmode NWS to the free caster mode and announce the fail light.

(Reference Figure 3).

2. The RPA consist of the commander's and pilot's rudder pedals and linkages, two rudder pedal transducer assemblies (RPTA), one NWS command transducer and four brake pedal position transducers. The commander's and pilot's rudder pedals are mechanically linked to each other and to the transducers. Steering signals are proportional to the translational deflection of the rudder pedals. Braking signals are proportional to the rotational (toe) deflection of the rudder pedals. Rudder commands are independent of NWS (Reference Figure 4).
3. The NWS Actuator Assembly converts electrical steering signals into a displacement of the actuator arm which is mechanically linked to the NW. Hydraulic system No.1 provides 3000 psi fluid to the NWS actuator. The fluid is filtered before it reaches the shutoff valve. Pilot valve No.1 opens or closes the shutoff valve. Pilot valve No.2 opens or closes the Bypass/Control valves. Both pilot valves must be open to energize the system; if either one closes, the system downmodes to the free castor mode. Once the hydraulic pressure in the actuator reaches 1350 psi, a pressure sensitive switch closes which inhibits the hardwired electrical path to the NWS fail light. If the pressure falls below 1000 psi, the pressure switch will close and annunciate the fail light. After the system is energized, the electro-hydraulic (EH) servo valve meters high pressure flow proportional to the steering signal transmitted by the SCB. The high pressure drives the actuator piston/arm which is attached to a collar on the nose gear strut which rotates the torque link and the NW. A feedback xducer provides "steering velocity" data to the SCB which is used in one of the failure detection circuits. In the GPC mode, the steering position transducer (SPT) and steering position amplifier (SPA) provide NW position data which is used by the GPC failure detection logic in the NW Subsystem Operating Program (SOP). System protection against high pressure is provided by two overload check valves and a return line check valve. Low system pressure required for shimmy damping during free castor is provided by the accumulator through the anti-cavitation check valves (Reference Figure 5).

4. The Failure Annunciator System illuminates a NWS fail light which warns the crew that a detectable failure has occurred or that the NWS system may be unreliable. A subsystem specific groundrule was written stating that the crew will respond the the annunciated fail light by manually downmoding NWS to free castor. Control Bus ABI provides power to a Type III hybrid circuit driver which will allow annunciator circuit lamp power to illuminate the NWS fail light. The fail signal may originate in either the hardwired path from the pressure switch or the MDM FF4 path from the NW Position SOP. In the GPC mode the hardwired path is inhibited until NGTD (Reference Figure 6).
5. The Activation System was included to maintain a more complete NWS analysis. The single power source for NWS is Main Bus A. The NWS toggle switch must be in the GPC or Direct position for power to enter the system. A circuit breaker provides protection against high voltage/current spikes. The ROLL/YAW CSS/AUTO PBIs configure a flight control channel that determines whether the steering signals originate at the rudder pedals or in autoland guidance. The activation system also has a current limit resistor in line with the fail light power source CNTL ABI. There are three isolation resistors providing circuit protection to MDM lines that monitor the power lines (Reference Figure 7).

6. The Data Processing System (DPS) Flight Critical Forward MDMs were included in this analysis because of the strong dependence NWS has on the health of this interfacing subsystem. Many of the NWS commands and signals are transmitted via the flight critical MDMs. The MDMs act as data acquisition, distribution and signal conditioning units. This analysis will only consider single data path failures (Reference Figure 8).

Above Items 4 and 5 interface with the Electrical Power and Distribution Control (EPD&C) system. Item 6 interfaces with the Orbiter DPS system. This document contains only a partial analysis of these interfacing components. The analysis examines only the NWS related effects of these component failure modes.

3.7 Interfaces and Locations

All of the major NWS components are located in one of three locations on the Orbiter. The Activation System, the Failure Annunciation System, and the Rudder Pedal Assemblies are located on the Flight Deck. The NWS Control Box and Actuator Assembly are both attached to the nose gear strut. The GPCs and the Flight Forward MDMs are all located in Avionics Bays 1, 2, and 3. (Reference Figure 9).

3.8 Hierarchy

Figure 2 illustrates the hierarchy of the NWS hardware. Figures 3 through 8 comprise the detailed system representations.

4.0 ANALYSIS RESULTS

Detailed analysis results for each of the identified failure modes are presented in Appendix C. Table I presents a summary of the failure criticalities for each of the six major subdivisions of the NWS. Further discussion of each of these subdivisions and the applicable failure modes is provided in subsequent paragraphs.

#### 4.1 THE RUDDER PEDAL ASSEMBLIES (RPA)

The analysis of the RPA examined the failure modes for the rudder pedals, the RPTAs, and the command transducer. The rudder pedals are a linkage system whose transducer measured deflections control NWS, the rudder, and the brakes. The Orbiter relies solely on the rudder for directional control between MGTD and NGTD. If the rudder pedals jammed during this phase of landing, it could result in the loss of the Orbiter. For this reason, a criticality of 1/1 was assigned to this failure mode. The RPTA and command transducer signal outputs were failed in two modes: no output and erroneous output. The failure of these transducer signals results in the loss of NWS and/or rudder control. The highest criticality assigned to the transducer failures was 2/1R. Out of a total of eight failure modes examined for the RPA, six PCIs have been identified in Appendix D.
4.2 THE STEERING CONTROL BOX (SCB)

Schematics of the SCB 'as-built' are considered proprietary by the customer and were not available for this study. The SCB analysis considered the failure of the three primary functions of the control box: NWS command output, NWS pilot valve actuation, and NWS failure detection. Of the six failure modes examined, four were assigned criticalities of 2/IR. These failure modes resulted in the automatic downmoding of NWS to free castor leaving only differential braking to be relied upon for directional control. These four PCIs have been identified in Appendix D.

4.3 THE STEERING ACTUATOR ASSEMBLY

The Steering Actuator Assembly has by far the largest number of components in the NWS system. Electronic hardware and various types of hydraulic hardware were included in the actuator analysis. The NWS capability is lost should the actuator piston that turns the nose wheel jam. If the jam occurs when the nose wheel is turned through some large angle, differential braking may not provide enough turning force to overcome the effects of the nose wheel deflection. This possible loss of vehicle led to a criticality assignment of 1/1 for this failure mode. The GPC and Direct modes of NWS both use the actuator in order to control the nose wheel. One of various valve subcomponents of the actuator failing closed usually results in the loss of the NWS capability leaving only differential braking to be relied upon for directional control. As a result, there are twenty criticalities of 2/IR for the actuator. A broken actuator piston linkage or a rupture in either the actuator housing or hydraulic lines can cause the loss of all NWS and shimmy damping capabilities and result in the loss of the Orbiter. These failure modes were assigned criticalities of 1/1. Those failures that result in the total loss of shimmy damping capability (Accumulator) but do not affect NWS were assigned criticalities of 2/IR based on the subsystem specific groundrule No. 8 (See Appendix B). Components whose failure modes result in the loss of only the GPC mode of NWS (SPA,SPT) were assigned criticalities of 3/IR. Out of a total of thirty-seven failure modes examined for the actuator assembly, twenty-three PCIs have been identified in Appendix D.
4.4 THE NWS/EPD&C FAILURE ANNUNCIATION SYSTEM

The NWS/EPD&C Failure Annunciation Subsystem is comprised of a fail light, a control assembly, and a hybrid driver. The two failure modes that resulted in the annunciation of the fail light were assigned a criticality of 2/IR based on the subsystem specific ground rule No. 7 (See Appendix B). Out of the five failure modes examined in this subsystem, two PCIs have been identified in Appendix D.

4.5 THE NWS/EPD&C ACTIVATION SYSTEM

The NWS/EPD&C Activation Subsystem consists of the NWS toggle switch, the NWS circuit breaker, the CSS/AUTO PBIs, and resistors. Jamming a CSS/AUTO PBI to the AUTO contact reconfigures Flight Control (DAP) and causes the loss of all manual rudder control for the vehicle. The Orbiter relies solely on the rudder for directional control between MGTD and NGTD. When landing in the AUTO mode, Autoland Guidance requires a Microwave Scanning Beam Landing System (MSBLS) for the generation of effective rudder commands. Because a MSBLS is not available at all runways (Flight Rules only require a MSBLS for night landings), failure to AUTO can result in the possible loss of the Orbiter. The failure can be corrected by holding the CSS PBI depressed; however, this corrective action is not defined by nominal crew procedures. Because off-nominal crew procedures are not considered in assigning criticalities, a criticality of 1/1 was assigned to this failure mode.

Failing the toggle switch off or the circuit breaker open removes power from the NWS system leaving only differential braking to be relied upon for directional control. These failures were assigned criticalities of 2/IR. Out of the ten failure modes examined for this subsystem, three PCIs have been identified in Appendix D.

4.6 THE NWS/DPS FLIGHT FORWARD MDMS

MDMs FF1, FF2, FF3, and FF4 were examined in this analysis because their function is essential to the operation of the NWS system. The lowest criticality assigned to an MDM failure in this analysis was 3/1R. Four failure modes that result in the loss of both active modes of NWS have criticalities of 2/1R. Out of the twelve failure modes examined for the MDMS, four PCIs have been identified in Appendix D.

DEFINITIONS, GROUND RULES, AND ASSUMPTIONS

B.1 Definitions
B.2 Project Level Ground Rules and Assumptions
B.3 Subsystem-Specific Ground Rules and Assumptions
APPENDIX B
DEFINITIONS, GROUND RULES, AND ASSUMPTIONS

B.1 Definitions

Definitions contained in NSTS 22206, Instructions For Preparation of FMEA/CIL, 10 October 1986, were used with the following amplifications and additions.

**INTACT ABORT DEFINITIONS:**

- **RTLS** - begins at transition to OPS 6 and ends at transition to OPS 9, post-flight
- **TAL** - begins at declaration of the abort and ends at transition to OPS 9, post-flight
- **AOA** - begins at declaration of the abort and ends at transition to OPS 9, post-flight
- **ATO** - begins at declaration of the abort and ends at transition to OPS 9, post-flight

**CREDIBLE (CAUSE)** - an event that can be predicted or expected in anticipated operational environmental conditions. Excludes an event where multiple failures must first occur to result in environmental extremes.

**CONTINGENCY CREW PROCEDURES** - procedures that are utilized beyond the standard malfunction procedures, pocket checklists, and cue cards.

**EARLY MISSION TERMINATION** - termination of onorbit phase prior to planned end of mission.

**EFFECTS/RATIONALE** - description of the case which generated the highest criticality.

**HIGHEST CRITICALITY** - the highest functional criticality determined in the phase-by-phase analysis.

**MAJOR MODE (MM)** - major sub-mode of software operational sequence (OPS).

**MC** - Memory Configuration of Primary Avionics Software System (PASS).

**MISSION** - assigned performance of a specific Orbiter flight with payload/objective accomplishments including orbit phasing and altitude (excludes secondary payloads such as GAS cans, middeck P/L, etc.)
MULTIPLE ORDER FAILURE - describes the failure due to a single cause or event of all units which perform a necessary (critical) function.

OFF-NOMINAL CREW PROCEDURES - procedures that are utilized beyond the standard malfunction procedures, pocket checklists, and cue cards.

OPS - software operational sequence.

PRIMARY MISSION OBJECTIVES - worst case primary mission objectives are equal to mission objectives.

PHASE DEFINITIONS:

PRELAUNCH PHASE - begins at launch count-down Orbiter power-up and ends at moding to OPS Major Mode 102 (liftoff).

LIFFTOFF MISSION PHASE - begins at SRB ignition (MM 102) and ends at transition out of OPS 1 (Synonymous with ASCENT).

ONORBIT PHASE - begins at transition to OPS 2 or OPS 8 and ends at transition out of OPS 2 or OPS 8.

DEORBIT PHASE - begins at transition to OPS Major Mode 301 and ends at first main landing gear touchdown.

LANDING/SAFING PHASE - begins at first main gear touchdown and ends with the completion of post-landing safing operations.
APPENDIX B
DEFINITIONS, GROUND RULES, AND ASSUMPTIONS

B.2 IOA Project Level Ground Rules and Assumptions

The philosophy embodied in NSTS 22206, Instructions for Preparation of FMEA/CIL, 10 October 1986, was employed with the following amplifications and additions.

1. The operational flight software is an accurate implementation of the Flight System Software Requirements (FSSRs).

   RATIONALE: Software verification is out-of-scope of this task.

2. After liftoff, any parameter which is monitored by system management (SM) or which drives any part of the Caution and Warning System (C&W) will support passage of Redundancy Screen B for its corresponding hardware item.

   RATIONALE: Analysis of on-board parameter availability and/or the actual monitoring by the crew is beyond the scope of this task.

3. Any data employed with flight software is assumed to be functional for the specific vehicle and specific mission being flown.

   RATIONALE: Mission data verification is out-of-scope of this task.

4. All hardware (including firmware) is manufactured and assembled to the design specifications/drawings.

   RATIONALE: Acceptance and verification testing is designed to detect and identify problems before the item is approved for use.

5. All Flight Data File crew procedures will be assumed performed as written, and will not include human error in their performance.

   RATIONALE: Failures caused by human operational error are out-of-scope of this task.
6. All hardware analyses will, as a minimum, be performed at the level of analysis existent within NASA/Prime Contractor Orbiter FMEA/CILs, and will be permitted to go to greater hardware detail levels but not lesser.

RATIONALE: Comparison of IOA analysis results with other analyses requires that both analyses be performed to a comparable level of detail.

7. Verification that a telemetry parameter is actually monitored during AOS by ground-based personnel is not required.

RATIONALE: Analysis of mission-dependent telemetry availability and/or the actual monitoring of applicable data by ground-based personnel is beyond the scope of this task.

8. The determination of criticalities per phase is based on the worst case effect of a failure for the phase being analyzed. The failure can occur in the phase being analyzed or in any previous phase, whichever produces the worst case effects for the phase of interest.

RATIONALE: Assigning phase criticalities ensures a thorough and complete analysis.

9. Analysis of wire harnesses, cables and electrical connectors to determine if FMEAs are warranted will not be performed nor FMEAs assessed.

RATIONALE: Analysis was substantially complete prior to NSTS 22206 ground rule redirection.

10. Analysis of welds or brazed joints that cannot be inspected will not be performed nor FMEAs assessed.

RATIONALE: Analysis was substantially complete prior to NSTS 22206 ground rule redirection.

11. Emergency system or hardware will include burst discs and will exclude the EMU Secondary Oxygen Pack (SOP), pressure relief valves and the landing gear pyrotechnics.

RATIONALE: Clarify definition of emergency systems to ensure consistency throughout IOA project.
B.3 NWS-Specific Ground Rules and Assumptions

1. The GPC (CSS) mode of NWS will be considered the primary mode of directional control for the Orbiter Vehicle following NGTD during landing rollout.

RATIONALE: This is the flight rule since the Phase II upgrade of NWS which has flown on 61-A, 61-C and 51-L.

2. The GPC (CSS) mode of NWS will be active (HOT) for all landing sites and all landings: EOM and INTACT ABORTS.

RATIONALE: This is the flight rule since the Phase II upgrade of NWS which has flown on 61-A, 61-C and 51-L.

3. The Flight Rules will restrict landing conditions (weather, landing surface, and crosswinds) such that the brake energy and rollout margins will fall within their assigned limits when differential braking is used as the primary mode of directional control following NGTD during landing rollout.

RATIONALE: The NWS system is presently fail safe at best with several single point failure points. Differential braking must be a capable backup system to NWS for directional control of the vehicle during landing rollout until the Phase III upgrade of NWS is completed.

4. Differential braking will be considered an unlike, redundant backup system to NWS for directional control of the Orbiter Vehicle during landing rollout following NGTD.

RATIONALE: Differential braking applies differential forces to the main gear tires in order to steer the Orbiter but NWS uses an actuator system to turn the nose wheel and steer the vehicle. Current flight rules restrict landings to those conditions that allow a safe rollout using differential braking for directional control.
5. The DIRECT (MANUAL) mode of NWS will be considered a like, redundant backup system to the GPC (CSS) mode of NWS for directional control of the Orbiter Vehicle following NGTD during landing rollout.

RATIONALE: Both systems use MAIN BUS A power, the rudder pedals, the NWS Control Box, the NWS Actuator, and the nose wheel for directional control of the Orbiter Vehicle.

6. The GPC (AUTO) mode of NWS will not be considered a redundant system to the GPC (CSS) mode of NWS for directional control of the Orbiter Vehicle during landing rollout.

RATIONALE: The GPC (AUTO) mode of NWS requires an active Microwave Scanning Beam Landing System (MSBLS) which is not available at all runways/landing sites. The crew does not train using this control mode.

7. The crew will respond to the annunciation of the NWS fail light by manually moving the NWS toggle switch to the OFF position.

RATIONALE: MOD recommended crew procedures dictate that the NWS switch be toggled to OFF when the NWS fail light annunciates; however, the DIRECT mode of NWS may then be selected if conditions warrant the risk.

8. For purposes of determining the functional criticality of an item, the total loss of the NWS Actuator Assembly shimmy damping capability shall result in the possible loss of life/vehicle.

RATIONALE: Although the co-rotating nose wheels have a stabilizing effect; sufficient test data is not available to determine that the total loss of the nose wheel shimmy damping capability is not life threatening.

9. For purposes of passing Redundancy Screen B, the term "Readily Detectable" shall be satisfied by the pilot's ability to see the lack of Orbiter response to NWS inputs during landing rollout.

RATIONALE: One of the pilot's primary tasks during landing rollout has been to keep the Orbiter Vehicle on the runway centerline. A loss of NWS response during rollout is almost immediately recognizable by the pilot following a rudder pedal input. Corrective action in the form of differential braking is immediately available.
APPENDIX C
DETAILED ANALYSIS

This section contains the IOA analysis worksheets generated during the analysis of this subsystem. The information on these worksheets is intentionally similar to the NASA FMEAs. Each of these sheets identifies the hardware item being analyzed, and parent assembly, as well as the function. For each failure mode, the possible causes are outlined, and the assessed hardware and functional criticality for each mission phase is listed, as described in the NSTS 22206, Instructions for Preparation of FMEA and CIL, 10 October 1986. Finally, effects are entered at the bottom of each sheet, and the worst case criticality is entered at the top.

LEGEND FOR IOA ANALYSIS WORKSHEETS

Hardware Criticalities:
1 = Loss of life or vehicle
2 = Loss of mission or next failure of any redundant item (like or unlike) could cause loss of life/vehicle
3 = All others

Functional Criticalities:
1R = Redundant hardware items (like or unlike) all of which, if failed, could cause loss of life or vehicle.
2R = Redundant hardware items (like or unlike) all of which, if failed, could cause loss of mission.

Redundancy Screen A:
1 = Is Checked Out PreFlight
2 = Is Capable of Check Out PreFlight
3 = Not Capable of Check Out PreFlight
NA = Not Applicable

Redundancy Screens B and C:
P = Passed Screen
F = Failed Screen
NA = Not Applicable

REDUNDANCY SCREENS: A [ ] B [ ] C [P]

LOCATION: AREA 30 (FLIGHT DECK)
PART NUMBER:

CAUSES: CONTAMINATION (LOOSE DEBRIS), PC PART FAILURE (BENT/BROKEN RODS)

EFFECTS/RATIONALE:
THE RUDDER PEDALS PROVIDE A MECHANICAL LINKAGE TO THE RPTAs, THE COMMAND TRANSDUCER, AND THE BRAKE TRANSDUCERS. THE RPTAs OUTPUT CONTROL SIGNALS FOR THE RUDDER AND NWS.
BEFORE NGTD (CRIT 1/1): FAILING THE RUDDER PEDALS JAMMED WILL RESULT IN THE LOSS OF THE ONLY DIRECTIONAL CONTROL USED BETWEEN MAIN GEAR TOUCHDOWN AND NOSE GEAR TOUCHDOWN. THE LOSS OF DIRECTIONAL CONTROL WOULD RESULT IN THE POSSIBLE LOSS OF CREW/VEHICLE.
AFTER NGTD (CRIT 2/1R): THIS FAILURE WILL NOT AUTOMATICALLY DOWNMODE NWS. THE CREW MUST MANUALLY DOWNMODE NWS BY TOGGING THE NWS SWITCH TO OFF. DIFFERENTIAL BRAKING IS THE ONLY MODE AVAILABLE TO STEER THE VEHICLE AFTER NGTD.

LOCATION: AREA 30 (FLIGHT DECK)
PART NUMBER: 

CAUSES: VIBRATION, MECHANICAL SHOCK

EFFECTS/RATIONALE:
THE RUDDER PEDALS PROVIDE A MECHANICAL LINKAGE TO THE RPTAs AND THE COMMAND TRANSDUCER FOR NWS AND TO THE BRAKE TRANSDUCERS FOR DIFFERENTIAL BRAKING. LOSS OF ONE RPTA LINKAGE HAS NO EFFECT—THERE IS A SECOND RPTA. LOSS OF A SINGLE BRAKE TRANSDUCER LINKAGE DOES NOT INHIBIT DIFFERENTIAL BRAKING BECAUSE THERE ARE FOUR BRAKE TRANSDUCERS; THE PILOT CAN ASSUME THE BRAKING TASK. THE LOSS OF THE COMMAND TRANSDUCER LINKAGE WILL TRIP THE BROKEN LINKAGE DETECTOR IN THE NWS CONTROL BOX, AUTOMATICALLY DOWNSHIFT NWS TO FREE CASTOR AND ANNUNCIATE THE NWS FAI' LIGHT. THE DIRECT MODE OF NWS WILL ALSO FAIL. RUDDER CONTROL OF THE VEHICLE IS AVAILABLE AT EFFECTIVE SPEEDS. DIFFERENTIAL BRAKING MUST BE USED TO STEER THE VEHICLE WHEN THE RUDDER BECOMES INEFFECTIVE.

REFERENCES:

BREAKDOWN HIERARCHY:
1) NWS
2) RUDDER PEDAL ASSEMBLIES
3) COMMAND TRANSDUCER

LOCATION: 30V51A21; FLIGHT DECK
PART NUMBER: MC621-0058-0014

CAUSES: VIBRATION, MECHANICAL SHOCK, LOSS OF MECHANICAL LINKAGE (SEPARATED COIL), ELECTRICAL OPEN

EFFECTS/RATIONALE:
THE COMMAND TRANSDUCER SENDS THE STEERING SIGNALS TO THE NWS CONTROL BOX WHEN NWS IS IN THE DIRECT (BACKUP) MODE. IF THE COMMAND TRANSDUCER FAILS, THE DIRECT MODE WILL NO LONGER BE AVAILABLE. IF THE FAILURE IS A TRANSDUCER OPEN/SHORT OR BROKEN LINKAGE DETECTED BY THE NWS CONTROL BOX, NWS WILL AUTOMATICALLY DOWNMODE TO FREE CASTOR AND THE NWS FAIL LIGHT WILL ANNUNCIATE. THESE TWO TYPES OF COMMAND TRANSDUCER FAILURES WILL RESULT IN THE DOWNMODOING OF BOTH THE GPC AND DIRECT MODES OF NWS.

RUDDER CONTROL OF THE VEHICLE IS AVAILABLE AT EFFECTIVE SPEEDS. DIFFERENTIAL BRAKING MUST BE USED TO STEER THE VEHICLE WHEN THE RUDDER BECOMES INEFFECTIVE.

LOCATION: 21V51A16; NOSE GEAR STRUT
PART NUMBER: MC621-0058-0015

CAUSES: VIBRATION, MECHANICAL SHOCK, ELECTRICAL/RESISTOR SHORT

EFFECTS/RATIONALE:
IF ANY OF THE FIVE FAULT DETECTOR FAILS ON, THE FAIL DETECTOR WILL LATCH ON. FAILURE ON WILL RESULT IN AN AUTOMATIC DOWNDOWN OF NWS TO THE FREE CASTOR MODE AND THE ANNUNCIATION OF THE NWS FAIL LIGHT.

THE DIRECT MODE OF NWS WILL ALSO FAIL. RUDDER CONTROL OF THE VEHICLE IS AVAILABLE AT EFFECTIVE SPEEDS. DIFFERENTIAL BRAKING MUST BE USED TO STEER THE VEHICLE WHEN THE RUDDER BECOMES INEFFECTIVE.

</table>

LOCATION: 21V51A16; NOSE GEAR STRUT
PART NUMBER: MC621-0058-0015

CAUSES: VIBRATION, MECHANICAL SHOCK, ELECTRICAL/RESISTOR OPEN

EFFECTS/RATIONALE:

THE TRIPLE CHANNEL WRAPAROUND FEEDBACK TRANSDUCER LOGIC PROVIDES PROTECTION IN THE NORMAL GPC MODE OF OPERATION. THE FAILING OFF OF THE CONTROL BOX LOGIC HAS NO EFFECT ON THE NORMAL OPERATING MODE OF NWS.

FAILING OFF OF THE CONTROL LOGIC IN THE DIRECT MODE OF NWS RESULTS IN THE LOSS OF ONE OR MORE OF THE FIVE NON-REDUNDANT DETECTOR TYPES.

THE DIRECT MODE OF NWS IS STILL AVAILABLE. RUDDER CONTROL OF THE VEHICLE IS AVAILABLE AT EFFECTIVE SPEEDS. DIFFERENTIAL BRAKING IS A MODE OF STEERING THAT IS STILL AVAILABLE.

</table>

LOCATION: 21V51A16; NOSE GEAR STRUT
PART NUMBER: MC621-0058-0015

CAUSES: VIBRATION, MECHANICAL SHOCK, PIECE PART FAILURE

EFFECTS/RATIONALE:
THE PILOT VALVE CONTROL CIRCUITS ACTIVATE OR DEACTIVATE THE NWS ACTUATOR PILOT VALVES BY RESPECTIVELY PROVIDING OR REMOVING GROUNDS TO THE PILOT VALVE SOLENOIDS' POWER SOURCE. IF ONE OF THE CIRCUITS FAILS CLOSED, ONE OF THE PILOT VALVES IS PREMATURELY ACTIVATED (OPENED). THERE IS NO EFFECT ON NWS BECAUSE THE SECOND PILOT VALVE PREVENTS HYDRAULIC ACTIVATION OF THE ACTUATOR UNTIL NWS ACTIVATION.
THE DIRECT MODE OF NWS IS STILL AVAILABLE. RUDDER CONTROL OF THE VEHICLE IS AVAILABLE AT EFFECTIVE SPEEDS. DIFFERENTIAL BRAKING IS A MODE OF STEERING THAT IS STILL AVAILABLE.

LOCATION: 21V51A16; NOSE GEAR STRUT
PART NUMBER: KC621-0058-0015

CAUSES: VIBRATION, MECHANICAL SHOCK, PIECE PART FAILURE, ELECTRICAL OPEN

EFFECTS/RATIONALE:
The NWS Control Box performs the final processing of the NWS signals. The loss of output would result in a miscompare between the commanded position and the feedback position, resulting in an automatic downmode to free castor mode and the annunciation of the fail light.
The direct mode of NWS would also fail. Rudder control of the vehicle is available at effective speeds. Differential braking must be used to steer the vehicle when the rudder becomes ineffective.

LOCATION: 21V51A22 (ACTUATOR ASSEMBLY); NOSE GEAR STRUT
PART NUMBER: MC621-0058-0010 (ACTUATOR ASSEMBLY)

CAUSES: CONTAMINATION, BINDING, PIECE PART FAILURE (POPPET)

EFFECTS/RATIONALE:
THE PURPOSE OF THE ACCUMULATOR IS TO MAINTAIN A CONSTANT
BACKPRESSURE ON THE STEERING DAMPING SYSTEM TO PREVENT CAVITATION
OF THE STEERING ACTUATOR DURING FREE CASTOR DAMPING. FAILING THE
ACCUMULATOR OPEN HAS NO EFFECT AS OPEN IS THE NORMAL OPERATING
POSITION FOR THE ACCUMULATOR DURING NWS.
FAILING THE ACCUMULATOR OPEN DURING FREE CASTOR (DAMPING MODE)
RESULTS IN THE CAVITATION OF THE ACTUATOR, THE TOTAL LOSS OF
THE NWS ACTUATOR SHIMMY DAMPING CAPABILITY, AND THE POSSIBLE LOSS
OF THE ORBITER VEHICLE.
THE DIRECT MODE OF NWS IS STILL AVAILABLE. RUDDER CONTROL OF THE
VEHICLE IS AVAILABLE AT EFFECTIVE SPEEDS. DIFFERENTIAL BRAKING IS
A MODE OF STEERING THAT IS STILL AVAILABLE.

LOCATION: 21V51A22 (ACTUATOR ASSEMBLY); NOSE GEAR STRUT
PART NUMBER: MC621-0058-0010 (ACTUATOR ASSEMBLY)

CAUSES: CONTAMINATION, BINDING, PIECE PART FAILURE (POPPET)

EFFECTS/RATIONALE:
THE PURPOSE OF THE ACCUMULATOR IS TO MAINTAIN A CONSTANT
BACKPRESSURE ON THE STEERING DAMPING SYSTEM TO PREVENT CAVITATION
OF THE STEERING ACTUATOR DURING FREE CASTOR DAMPING. FAILING THE
ACCUMULATOR CLOSED PREVENTS THE RETURN OF FLUID FROM THE ACTUATOR
TO HYDRAULIC SYSTEM 1. THE RESULTING PRESSURE BUILDUP WOULD
INHIBIT THE ACTUATOR CONTROL OF THE NOSE WHEEL, TRIP A FAULT
DETECTION CIRCUIT, DOWNMODE NWS TO FREE CASTOR AND ANNUNCIATE THE
NWS FAIL LIGHT.
FAILURE CLOSED DURING FREE CASTOR HAS NO EFFECT.
THE DIRECT MODE OF NWS WILL ALSO FAIL. RUDDER CONTROL OF THE
VEHICLE IS AVAILABLE AT EFFECTIVE SPEEDS. DIFFERENTIAL BRAKING
MUST BE USED TO STEER THE VEHICLE WHEN THE RUDDER BECOMES
INEFFECTIVE.

LOCATION: 21V51A22 (ACTUATOR ASSEMBLY); NOSE GEAR STRUT
PART NUMBER: MC621-0058-0010 (ACTUATOR ASSEMBLY)

CAUSES: VIBRATION, MECHANICAL SHOCK

EFFECTS/RATIONALE:
The actuator piston arm is a mechanical arm that links the actuator to the collar of the nose wheel strut that turns the nose wheel. The loss of the arm linkage causes the loss of NWS and all shimmy damping capability to the nose wheel resulting in the possible loss of the vehicle.
The direct mode of NWS will also fail. Rudder control of the vehicle is available at effective speeds. Differential braking must be used to steer the vehicle when the rudder becomes ineffective.

LOCATION: 21V51A22 (ACTUATOR ASSEMBLY); NOSE GEAR STRUT
PART NUMBER: MC621-0058-0010 (ACTUATOR ASSEMBLY)

CAUSES: OVERLOADED, OVERUSED

EFFECTS/RATIONALE:
THE INLET FILTER FILTERS THE HYDRAULIC FLUID ENTERING THE
ACTUATOR ASSEMBLY. IF IT FAILS OPEN ALL THE VALVES IN THE
ACTUATOR ASSEMBLY ARE SUBJECT TO CONTAMINATION THAT WOULD RESULT
IN THE LOSS OF NWS. THE RESULTING CONTAMINATION WOULD ALSO
DEGRADE SHIMMY DAMPING IN THE FREE CASTOR MODE.
THE DIRECT MODE OF NWS WILL ALSO FAIL. RUDDER CONTROL OF THE
VEHICLE IS AVAILABLE AT EFFECTIVE SPEEDS. DIFFERENTIAL BRAKING IS
A MODE OF STEERING THAT IS STILL AVAILABLE.

LOCATION: 21V51A22 (ACTUATOR ASSEMBLY); NOSE GEAR STRUT
PART NUMBER: MC621-0058-0010 (ACTUATOR ASSEMBLY)

CAUSES: CONTAMINATION, WATER HAMMER

EFFECTS/RATIONALE:

THE ANTI-CAVITATION VALVES(2) ARE FREE FLOATING BALL VALVES THAT PREVENT CAVITATION OF THE ACTUATOR DURING FREE CASTOR AND PREVENT HIGH PRESSURE FLUID FROM ENTERING THE RETURN LINE PREMATURELY. IF THE VALVES FAIL CLOSED, THERE IS NO EFFECT ON NWS AS CLOSED IS THE NORMAL OPERATING MODE FOR THE VALVES DURING NWS. FAILED CLOSED DURING FREE CASTOR WOULD RESULT IN A DEGRADATION IN SHIMMY DAMPING.

Failing closed may not be considered a credible failure mode. The direct mode of NWS is still available. Rudder control of the vehicle is available at effective speeds. Differential braking is a mode of steering that is still available.

LOCATION: 21V51A22 (ACTUATOR ASSEMBLY); NOSE GEAR STRUT
PART NUMBER: MC621-0058-0010 (ACTUATOR ASSEMBLY)

CAUSES: CONTAMINATION

EFFECTS/RATIONALE:
The overload check valves are free floating ball valves that relieve excessive pressure buildup on the operational side of the actuator assembly. These two nonredundant valves each protect a separate line. If the valve fails open during NWS, the supply pressure would have a direct path to the return line resulting in a loss of steering pressure that could trip an error detection circuit, automatically downmoding NWS to the free castor mode and annunciating the NWS fail light. Failure open during free castor has no effect. The direct mode of NWS will also fail. Rudder control of the vehicle is available at effective speeds. Differential braking must be used to steer the vehicle when the rudder becomes ineffective.

LOCATION:  21V51A22 (ACTUATOR ASSEMBLY); NOSE GEAR STRUT
PART NUMBER:  MC621-0058-0010 (ACTUATOR ASSEMBLY)

CAUSES:  CONTAMINATION, WATER HAMMER

EFFECTS/RATIONALE:
The overload check valves are free floating ball valves that relieve excessive pressure buildup on the operational side of the actuator assembly—each protecting a separate line. The valves failing closed have no immediate effect on NWS; however, any excessive pressure buildup (i.e. tire hitting a bump/rock) will result in damage to the actuator assembly and the loss of NWS. Failure closed during free castor has no effect. Closed may not be considered a credible failure mode for this type of valve.
The direct mode of NWS will also fail under similar circumstances. Rudder control of the vehicle is available at effective speeds. When the rudder becomes ineffective, differential braking must be used to steer the vehicle if NWS is not available.

CAUSES: CONTAMINATION, BINDING, PIECE PART FAILURE (SPRING)

EFFECTS/RATIONALE:
THE SPRING LOADED SHUTOFF VALVE PORTS OR BLOCKS HYDRAULIC FLUID TO THE ACTUATOR ASSEMBLY. IF THE VALVE FAILS OPEN THERE IS NO EFFECT ON NWS EXCEPT ONE HARDWARE PATH FOR DOWNMOLDING NWS IS LOST. PILOT VALVE NO. 2 CAN STILL DOWNMODE NWS.
FAILURE OPEN DURING FREE CASTOR HAS NO EFFECT.
THE DIRECT MODE OF NWS IS STILL AVAILABLE. RUDDER CONTROL OF THE VEHICLE IS AVAILABLE AT EFFECTIVE SPEEDS. DIFFERENTIAL BRAKING IS A MODE OF STEERING THAT IS STILL AVAILABLE.

LOCATION: 21V51A22 (ACTUATOR ASSEMBLY); NOSE GEAR STRUT
PART NUMBER: MC621-0058-0010 (ACTUATOR ASSEMBLY)

CAUSES: CONTRA MINATION, BINDING

EFFECTS/RATIONALE:
THE SPRING LOADED SHUTOFF VALVE PORTS OR BLOCKS HYDRAULIC FLUID TO THE ACTUATOR ASSEMBLY. IF THE VALVE FAILS CLOSED, HYDRAULIC PRESSURE WILL NOT REACH THE ACTUATOR PISTON BALANCE AREA. THE RESULTING LOSS IN STEERING RESPONSE WILL TRIP AN ERROR DETECTION CIRCUIT, AUTOMATICALLY DOWNMODE NWS TO THE FREE CASTOR MODE AND ANNUNCIATE THE NWS FAIL LIGHT. IF THE VALVE FAILS CLOSED DURING FREE CASTOR THERE IS NO EFFECT. THE DIRECT MODE OF NWS WILL ALSO FAIL. RUDDER CONTROL OF THE VEHICLE IS AVAILABLE AT EFFECTIVE SPEEDS. DIFFERENTIAL BRAKING MUST BE USED TO STEERING THE VEHICLE WHEN THE RUDDER BECOMES INEFFECTIVE.

LOCATION: AREA 30 (FLIGHT DECK); PANELS F2,F4
PART NUMBER: ME452-0061-7141,-7142

CAUSES: CONTAMINATION, VIBRATION, MECHANICAL SHOCK, PIECE PART FAILURE (SPRING)

EFFECTS/RATIONALE:
THE ROLL/YAW (CSS/AUTO) PBIs CONFIGURE THE FLIGHT CONTROL (DAP) TO EITHER MANUAL OR AUTO GUIDANCE (AUTOLAND) CONTROL. JAMMING THE SWITCH TO CSS HAS NO EFFECT. JAMMING THE SWITCH TO AUTO RESULTS IN THE LOSS OF ALL MANUAL DIRECTIONAL CONTROL AND POSSIBLE LOSS OF VEHICLE. THE ORBITER RELIES SOLELY ON THE RUDDER FOR DIRECTIONAL CONTROL BETWEEN NGTD AND NGTD AND AUTOLAND REQUIRES A RUNWAY WITH MSBLS FOR EFFECTIVE STEERING COMMAND GENERATION. MANUAL OVERRIDE OF THE JAMMED AUTO IS POSSIBLE IF THE CSS PBI IS HELD DEPRESSED; HOWEVER THIS IS AN OFF-NOMINAL PROCEDURE. AFTER NGTD, THE DIRECT MODE OF NWS IS AVAILABLE BUT THE RUDDER, WHICH WOULD STILL BE CONTROLLED BY AUTOLAND GUIDANCE, MAY OPPOSE THE TURNING EFFECT OF THE NW. DIFFERENTIAL BRAKING IS A MODE OF STEERING THAT IS STILL AVAILABLE.

LOCATION: 31V73A2A1-A5R2; PANEL L2A1
PART NUMBER: RLR320201GR

CAUSES: VIBRATION, MECHANICAL SHOCK, THERMAL STRESS

EFFECTS/RATIONALE:
THE CURRENT LIMIT RESISTOR PROVIDES CIRCUIT PROTECTION TO ONE PATH OF THE NWS FAILURE ANNUNCIATION CIRCUITRY FROM POWER BUS AB1. A FAILURE OF LOW RESISTANCE HAS NO EFFECT ON NWS EXCEPT THE CIRCUIT PROTECTION AGAINST HIGH CURRENT/VOLTAGE SPIKES IS LOST. DIRECT MODE OF NWS IS STILL AVAILABLE. RUDDER CONTROL OF THE VEHICLE IS AVAILABLE AT EFFECTIVE SPEEDS. DIFFERENTIAL BRAKING IS A MODE OF STEERING THAT IS STILL AVAILABLE.

LOCATION: 31V73A21A1-S6; PANEL L2A1
PART NUMBER: ME452-0102-7373

CAUSES: PIECE PART FAILURE, CONTAMINATION, VIBRATION, MECHANICAL SHOCK

EFFECTS/RATIONALE:
THE NWS TOGGLE SWITCH SELECTS THE MODE OF NWS TO BE ACTIVATED. IF
THE SWITCH FAILS TO GPC, THERE IS NO EFFECT EXCEPT THE CAPABILITY
TO DESSELECT NWS USING THE SWITCH WOULD BE LOST.
THE SWITCH FAILING TO DIRECT WOULD RESULT IN THE LOSS OF THE GPC
WRAPAROUND PROTECTION, COMMAND LIMITING/FADING, AND LATERAL
ACCELERATION FEEDBACK; BUT THE MAXIMUM COMMANDED NW DEFLECTION
WOULD INCREASE FROM 5 TO 9 DEG.
IF BOTH ACTIVE CONTACTS FAIL ON, NWS IS DEFAULTED TO GPC MODE.
STICKER PEDAL CONTROL OF THE VEHICLE IS AVAILABLE AT EFFECTIVE
SPEEDS. DIFFERENTIAL BRAKING IS A MODE OF STEERING THAT IS STILL
AVAILABLE.

PART NUMBER: ME452-0102-7373

CAUSES: PIECE PART FAILURE, CONTAMINATION, VIBRATION, MECHANICAL SHOCK

EFFECTS/RATIONALE:

THE NWS TOGGLE SWITCH SELECTS THE MODE OF NWS TO BE ACTIVATED. IF THE SWITCH FAILS OFF, POWER WILL NOT REACH THE SYSTEM AND NWS WILL AUTOMATICALLY DOWNMODE TO FREE CASTOR MODE AND THE NWS FAIL LIGHT WILL ANNUNCIATE.

THE DIRECT MODE OF NWS WILL ALSO FAIL. RUDDER CONTROL OF THE Vehicle IS AVAILABLE AT EFFECTIVE SPEEDS. DIFFERENTIAL BRAKING MUST BE USED TO STEER THE VEHICLE WHEN THE RUDDER BECOMES INEFFECTIVE.

LOCATION: 81V72A6; FWD AVIONICS BAY No. 2
PART NUMBER: MC615-0004-5100

CAUSES: VIBRATION, CONTAMINATION, CORROSION

EFFECTS/RATIONALE:
MDM FF4 PROCESSES THE NW ACTIVE STATUS SIGNAL, THE NW POS ERROR SIGNAL AND ONE CHANNEL OF THE SPA. THE ACTIVE STATUS IS ONLY USED BY RM. A PREMATURE NW POS ERROR SET TO TRUE WOULD CAUSE THE NWS FAIL LIGHT TO ANNUNCIATE. THE CREW WOULD MANUALLY DOWNMODE NWS TO THE FREE CASTOR MODE BY Toggling THE NWS SWITCH TO OFF. SWITCHING TO THE DIRECT MODE OF NWS WOULD NOT EXTINGUISH THE NWS FAIL LIGHT.
RUDDER CONTROL OF THE VEHICLE IS AVAILABLE AT EFFECTIVE SPEEDS. DIFFERENTIAL BRAKING IS A MODE OF STEERING THAT IS STILL AVAILABLE.
