Objectives

The long-term objective of this investigation is aimed at attaining a complete understanding of the inelastic response of metal matrix composites subjected to arbitrary, biaxial load histories. The core of the research program is a series of biaxial tests conducted on different types of advanced metal matrix composite systems using the combined axial/torsional hydraulic load frame in the Composite Mechanics Laboratory at the University. Tests involve primarily tubular specimens and include tension, compression, torsion and combinations of the above load histories in order to critically assess the inelastic response of advanced metal matrix composites in a wide temperature range.
Yielding of SCS-6/Ti-15-3 MMC Under Biaxial Loading

Abstract

Elements of the analytical/experimental program to characterize the response of silicon carbide titanium (SCS-6/Ti-15-3) composite tubes under biaxial loading are outlined. The present investigation is part of a long-term program to investigate the inelastic response of metal matrix composites in a wide temperature range under arbitrary, biaxial loading. The analytical program comprises prediction of initial yielding and subsequent inelastic response of unidirectional and angel-ply silicon carbide titanium tubes using a combined micromechanics approach and laminate analysis. The micromechanics approach is based on the method of cells model and has the capability of generating the effective thermomechanical response of metal matrix composites in the linear and inelastic region in the presence of temperature and time-dependent properties of the individual constituents and imperfect bonding. The preliminary results discussed herein illustrate the effect of residual stresses and imperfect bonding on the initial yield surfaces and inelastic response of \([0]\) and \([±45]\), SCS-6/Ti-15-3 laminates loaded by different combinations of stresses. The generated analytical predictions will be compared with the experimental results.

The experimental program comprises generation of initial yield surfaces, subsequent stress-strain curves and determination of failure loads of the SCS-6/Ti-15-3 tubes under selected loading conditions. The results of the analytical investigation will be employed to define the actual loading paths for the experimental program. A brief overview of the experimental methodology is given herein. This includes the test capabilities of the Composite Mechanics Laboratory at the University of Virginia, the SCS-6/Ti-15-3 composite tubes secured from McDonnell Douglas Corporation, a text fixture specifically developed for combined axial-torsional loading, and the MTS combined axial-torsion loader that will be employed in the actual testing.

OBJECTIVES

Long-term

- Inelastic response of metal matrix composites in a wide temperature range under arbitrary, biaxial loading

Short-term

- Characterization of the response of SCS-6/Ti-15-3 tubes under biaxial loading
  - [0] tubes
  - [±45]_s tubes
  - initial yielding
  - inelastic response
  - failure
METHODOLOGY

• Analytical/experimental approach

  Analysis

• Micromechanical modeling of lamina response
  — Method of cells (Jacob Aboudi, Tel-Aviv University)

• Macromechanical modeling of laminate response
  — Method of cells + tube analysis
  — Method of cells + laminate analysis

• Initial yield surfaces

• Stress-strain response
METHODOLOGY

Experiment

• Biaxial loading of SCS-6/Ti-15-3 tubes
  — room and elevated temperatures
  — different loading paths
ANALYTICAL INVESTIGATION
METHOD OF CELLS

Doubly periodic array of cells
METHOD OF CELLS

- Repeating unit cell array

- Square geometry
  - square fiber
  - three matrix subcells

- Linear displacement field in each subcell

- Averaging process
  - microstructure $\rightarrow$ continuum

- Closed form expressions
METHOD OF CELLS

Capabilities

• elastic moduli

• initial yield surfaces

• elastoplastic response

• viscoelastic response

• thermal loading

• temperature-dependent properties

• imperfect bonding: $R_n$ and $R_t$ parameters
  — $R_n$: normal interfacial compliance
  — $R_t$: tangential interfacial compliance
CONSTITUENT RESPONSE

- Linear elastic fibers

- Initial yielding: Von Mises matrix

\[ f(\dot{\mathbf{S}}_{ij}) = \frac{1}{2} \hat{\mathbf{S}}_{ij} \dot{\mathbf{S}}_{ij} - \frac{1}{3} \gamma^2 = 0 \]

- Inelastic response: Bodner-Partom matrix

\[ \dot{L}_{ij}^{(\beta\gamma)} = \Lambda_{(\beta\gamma)} \hat{\mathbf{S}}_{ij}^{(\beta\gamma)} , \; \beta + \gamma \neq 2 \]

\[ \Lambda_{(\beta\gamma)} = D_0 \exp \left\{ -\hat{n} \left[ Z_{(\beta\gamma)} \left/ \left( 3 J_2^{(\beta\gamma)} \right) \right. \right] \right\} \left/ \left[ J_2^{(\beta\gamma)} \right] \right\}^{1/2} \]

\[ Z_{(\beta\gamma)} = Z_1 + (Z_0 - Z_1) \exp \left\{ -m W_p^{(\beta\gamma)} / Z_0 \right\} \]

ANALYTICAL RESULTS - SUMMARY

- Initial yielding
  - Residual stresses: translation and decrease in the size of initial yield surfaces, more pronounced effect on initial yielding of $[\pm 45]_s$ laminates than $[0]$ laminae
  - Imperfect bonding: increase in the size of initial yield surfaces, more pronounced effect on $[\pm 45]_s$ laminates than $[0]$ laminae

- Inelastic response
  - Imperfect bonding: reduction in the initial elastic moduli and subsequent inelastic response, loading direction dependent
EXPERIMENTAL INVESTIGATION
Material:

SCS6/Ti15-3

Ti15-3 = Ti - 15V - 3Cr - 3AL - 3Sn

Geometry:

A: Six Tubes  D=4", L=12", t=0.032"

B: Four Tubes  D=1.5", L=7", t=0.032"

Stacking Sequence:

A: \([\pm45]_s\)

B: \([0]_4\)
Loading:

1 - Axial (Tension, Compression)
2 - Torsional (Positive, Negative)
3 - Internal Pressure
4 - Combinations of 1, 2, and 3

Environment:

A & B: Room temperature
A: Elevated temperature ≤ 425°C (800°F)
B: Elevated temperature ≤ 1700°C (3100°F)

SCS6/Ti15-3 TUBE
SCS6/Ti15-3 PHOTOMICROGRAPH
PRESENT AND FUTURE WORK

• Analytical
  — Further exercise micromechanics model at the lamina and laminate level
  — Extend existing composite tube model to metal matrix composites

• Experimental
  — Generate initial yield surfaces at room and elevated temperatures
  — Generate stress-strain curves under biaxial loading
  — Determine failure loads for selected loading paths

• Correlate theory and experiment
