The physical acoustics group at the Jet Propulsion Laboratory has developed a single mode acoustic levitator technique for advanced containerless materials processing. This technique was successfully demonstrated in ground-based studies to temperatures = 1000 °C in a uniform temperature furnace environment and to temperatures > 1500 °C using laser beams to locally heat the sample. At this time, we are evaluating microwaves as a more efficient means than lasers for locally heating a positioned sample. Recent tests of a prototype single mode hybrid microwave/acoustic levitator successfully demonstrated the feasibility of using microwave power as a heating source. The potential advantages of combining acoustic positioning forces and microwave heating for containerless processing investigations will be discussed and results of ground-based acoustic, microwave, and hybrid microwave/acoustic studies will be presented.
