3-4 April 1990

SPACE TRAVEL IN
THE NEXT MILLENIUM?

☐ How do we predict the future?

• We do so by examining the past
  — We predict the near future by examining the immediate past and extrapolate into the far future by studying the more distant past

• We also use a lot of imagination

☐ Constraint: In the use of our imagination, we are constrained to obey the "known" laws of physics
Ray of hope: The laws of physics are known to have been through many evolutionary and revolutionary changes. In fact, they are in a continuous state of flux.

Example: For many centuries physics was taught with the atom being exactly what the word means, INDIVISIBLE. Now, of course, atom is just a name and its splitting is history.

GOALS FOR THE 21ST CENTURY

- Expanded space travel and establishment of permanent manned outposts

- Lunar and Mars outposts represent the most immediate future in space travel and both have history from the very recent past
LUNAR OUTPOSTS

• The Apollo program was successfully conducted with chemical propulsion

• It was necessary to advance from the liquid oxygen/alcohol propellants of the V-2 to liquid oxygen/liquid hydrogen of the Saturn V upper stages in 15 years

APOLLO 16 MISSION PROFILE
MARS OUTPOSTS

- Trips to Mars were planned and vehicles were designed for landings and returns
  - Unmanned 1984
  - Manned 1988

- Trade studies compared chemical cryogenics ($O_2/H_2$) with direct nuclear thermal propulsion using the NERVA engine

- The following charts summarize the trades and vehicle designs conducted between 1965 and 1973

HISTORY

- Nuclear Engine
  - KIWI - A (Los Alamos) 1957-1960
  - KIWI - B (Los Alamos) 1961-1964
    - KIWI-B4E Aug 1964
      - 340 MW, 10-min, restart
  - Phoebus (Los Alamos) 1965-1968
    - 4100 MW, 30-min
  - NRX (Aerojet/Westinghouse) 1964-1967
  - XE-1 (Aerojet/Westinghouse) 1969

- Nuclear Stage
  - Douglas Aircraft 1965-1969
    - Nuclear Flight Definition Study
      - Saturn derivative
      - Shuttle
    - Nuclear Stage System Definition Study
      - Propulsion module
    - Reusable Nuclear Shuttle (RNS)
      - Lunar
      - LEO-GEO
      - Earth – Mars

Total Propellant Required = 1,097,800 lb
LAUNCH CONSIDERATIONS FOR MANNED MARS
CAPTURE AND LANDING MISSION (1988)

Class 1

- 4 stages, 1,097,800 lb LH₂
- Each stage weighs 69,245 lb dry
- Assume ALS 180,000 lb
- Mission requires 8 ALS launches
  - 4 launches of stage (70,000 lb) + 110,000 lb LH₂
  - 4 launches of 174,000 lb LH₂ (assume 6000-lb tank)

Class 3

- 4 stages (1 propulsion, 8 propellant, 1 command
  and control module)
- Assume 1,335,000 lb LH₂
- Each stage weighs 85,000 lb dry
- Requires:
  - 4 launches for propulsion (30,475 lb) plus
    command and control module (4615 lb)
  - 32 launches for propellant module (40,075 lb)
    (containing 34,000 lb LH₂)
  - 6 launches 42,000 lb LH₂
- Total 42 launches (Space Shuttle/Titan IV)

* Requires two launches for payload
VISIONS OF THE FUTURE

- Deep space travel requires energy and delta velocity ($\Delta V$) in particular
- Propulsion systems with $I_s > 1500$ sec are needed

PROPULSION SYSTEM $\Delta V$ CAPABILITIES

- Chemical propulsion can barely achieve earth escape with a single-stage vehicle
- Higher $I_s$ propulsion systems substantially increase payload delivery capabilities
- New exotic propulsion systems need to be developed and made economical to produce, store and use
SPECIFIC IMPULSES OF ROCKET FUELS

</table>

- The initial vehicle mass serves as the key criterion of optimization.

- The higher specific impulse of the fusion system results in lower propellant and vehicle mass for the specified mission and payload.
FISSION AND FUSION ROTV COMPARISON

Problems and promises

- Production: USAF has priced a production facility at BNL for $10^{15}$ p/yr at approximately $14$ million (1989).

- Containment: Antiprotons have been stored for long periods at CERN and preliminary designs for transportable storage bottles have been proposed.

- Antimatter use holds great promises for applications in:
  - Medicine: Diagnosis and eradication of tumors
  - Materials: Location and cure of flaws, processing of composites, etc.

- This synergism should be explored and pursued.
FAR FUTURE PROPULSION SCHEMES

□ Matter/antimatter

- Antimatter safely stored will deliver its energy, via beam technology, to a flowing propellant. Rates of energy delivery and propellant flowrate to control the level of the thrust to any desired level

□ Teleportation "Beam me up, Scotty"

- Matter destructuring (i.e., breakdown into particles), and restructuring to be first perfected on inanimate objects. Transportation to be done by beam technology

FAR FUTURE PROPULSION SCHEMES (CONT)

□ Antigravity

- Gravity waves will be fully characterized (Why not?)
- Each celestial body sends out waves whose amplitude and frequency are directly related to its mass and size
- The net gravity field at any point in space is the result of the gravity wave interference pattern
- Super sensors and supercomputers analyze this wave pattern and identify its basic components
- An "antigravity wave generator" will then generate waves of precisely the same amplitude and frequency but of opposite phase. Thus, by causing an exact destructive interference, it will precisely cancel out the gravity field
- A suitable propulsion system can then accelerate the vehicle to very high velocities with a rather low force and low energy expenditure
(a) The dashed line is a sawtooth "wave" commonly encountered in electronics. The Fourier series for this function is 
\[ y(t) = \frac{1}{\pi} \sin \omega t - \frac{1}{2\pi} \sin 2\omega t - \frac{1}{3\pi} \sin 3\omega t - \cdots. \]

The solid line is the sum of the first six terms of this series and can be seen to approximate the sawtooth quite closely.

(b) Here we show the first six terms of the Fourier series which, when added together, yield the solid curve in (a).

WAVE DESTRUCTIVE INTERFERENCE

Result: No Wave
SCIENCE FICTION?

Yes!

☐ Science fiction of one time period is science fact of some later time

☐ Let us consider the following

BUCK ROGERS IN THE 25th CENTURY
SCIENCE FICTION 1934

BUCK ROGERS' SPACESHIP

BUCK ROGERS WITH HIS FLYING BELT

ORIGINAL PAGE IS OF POOR QUALITY

SCIENCE FACT 1934

THE 25TH CENTURY ARRIVED IN 50 YRS

ASTRONAUT'S SPACE SHIP

NASA ASTRONAUT WITH HIS "FLYING BELT"
"STAR TREK"
SCIENCE FICTION 1966

- 23rd CENTURY STARSHIP ENTERPRISE POWERED BY AN ANTIMATTER REACTION CHAMBER CAN REACH SPEEDS UP TO WARP 8

SCIENCE FACT 2016?
(50 YEARS LATER)

- WILL THE 23rd CENTURY HAVE ARRIVED?
- WILL STARSHIP ENTERPRISE AND STARBASE 12 HAVE BECOME REALITIES?

"PIONEERING THE SPACE FRONTIER"
CAN WE DO IT?

- Recent history tells us: Yes!
- We went from Sputnik 1 to Apollo 11 in less than 12 years
- From the basic university lab atom splitting experiment (Berlin, Dec 1938) to Hiroshima and Nagasaki (Aug 1945) in 6.5 years
- We need a strong resolve, commitment of resources, and dedication
- We should not be afraid of risk and failure
Some of the greatest advances and discoveries resulted from some apparent "failure" and setback.

Example: The negative results of the Michelson-Morley experiment resulted in the Theory of Relativity, $E = MC^2$ etc.

The space exploration initiative, some times called "The Bush Push", will present us with unparalleled challenges and it will undoubtedly lead to even greater developments and discoveries.

Go For It!

HISTORIC SCIENTIFIC MILESTONES

- 1905: $E = MC^2$
- 1938/39: Uranium Nucleus Split/Einstein writes to FDR
- 1945: Alamogordo – Hiroshima – Nagasaki (40 years later)
  - Notes: – Pressing need (WWII)
    - Manhattan Project, $$$, etc.
- 1955: – Antiproton is discovered
  - Antimatter becomes fact
- 1994: – Trapping and storage of antiprotons achieved
  (40 years later)

SHOULD WE BE DOING SOMETHING?
FAMOUS PRONOUNCEMENTS

- "Heavier than air flying machines are impossible"
  Lord Kelvin, President, Royal Society, 1895

- "Everything that can be invented has already been invented"
  Charles H. Duell, Director of U.S. Patent Office, 1899

- "There is no likelihood man can ever tap the power of the atom"
  Robert A. Millikan, Nobel Prize in Physics, 1923

- "Who the hell wants to hear actors talk"
