LIST OF FIGURES

1. A sample X-Y plot (not true size). 12
2. A sample twinplot (not true size). 13
1.0 INTRODUCTION

Graphics is one of the important tools in engineering analysis and design. However, plotting routines that generate output on high quality laser printers normally come in graphics packages, which tend to be expensive and system dependent. These factors become important for small computer systems or desktop computers, especially when only some form of a simple plotting routine is sufficient. With the Postscript language becoming popular, there are more and more Postscript laser printers now available. Simple, versatile, low cost plotting routines that can generate output on high quality laser printers, are needed and standard Fortran language plotting routines using output in Postscript language seems logical. The purpose of this report is to explain the use of two simple Fortran plotting routines that generate output in Postscript language.
2.0 OVERVIEW OF THE PROGRAMS

The listing of two Fortran plotting programs, PSPLTXY.FOR and PSTWINPLOT.FOR, is in the appendices. The first program generates plots in X-Y format. A sample output is show in figure 1. The second program generates two plots on the same page (called twinplot). A possible and popular application for the second program is to display both phase and magnitude for a set of complete data on the same page. A sample plot in this format is shown in figure 2.

These two routines can generate multiple curves (a maximum of 4) on the same plot with different line styles. Users have options to label curves, label the axes, and title the plot. In addition, two lines of comments can be included. Furthermore, the routine can automatically list the plot date and the time the plots are generated. However, this option is system dependent and it makes the programs nonportable. Users have the option to include this feature at the cost of code portability. This is described in section 5.0 in detail.

The two programs and their inputs are similar, thus the instructions for their use can be combined.
3.0 PROGRAM STRUCTURES

The main program is very simple. It makes two calls to the subroutines. The first call is to subroutine DATAIN to read data to be plotted. The second call is to subroutine PPLOT to generate the plot. The calls to these subroutines are repeated for multiple plots.

The subroutine that reads in the data requires that the data be formatted in one of two specific formats. These formats are explained in section 4.0.

The second subroutine generates all the plots, labels, etc. The explanation of this subroutine requires some knowledge of the Postscript language [1], which is beyond the scope of this report, and will be skipped.
4.0 INPUT FILE FORMAT

The subroutine that reads data to be plotted is named DATAIN. The data should be stored in a file in one of the two following formats:

Format 1:

NPTS, XMIN, DX
AM(1), PH(1)
AM(2), PH(2)
AM(3), PH(3)
...

The first line represents the number of data points, NPTS, the starting X value, XMIN, and the increment DX between successive values of X. This format assumes data are equally spaced in the X coordinate with XMIN being X(1).

The input lines following the first represent the amplitude, AM, and phase, PH, values of the data. AM and PH are values in the vertical coordinates. AM and PH represent Amplitude and Phase arrays, respectively (although the data may be something else if the users wish). For XY plots (PSPLTXXY.FOR), only the AM array is used in plotting. However, the PH array is still required in the input to maintain input file compatibility for both programs PSPLTXXY.FOR and PSTWINPLOT.FOR.

Format 2:

NPTS
X(1), AM(1), PH(1)
X(2), AM(2), PH(2)
X(3), AM(3), PH(3)
... ... ...

...
The first line represents the number of points, NPTS. The following lines represent the X values for the horizontal axis and the AM and PH values for the vertical axis. For XY plots (PSPLOYXY FOR), only the X and AM arrays are used. However, the users must specify dummy PH values for the data to be read properly.
5.0 INTERACTIVE INPUT

Program users compile and run codes just like any other Fortran program. The programs prompt the users for input. The procedure is very self-explanatory. For completeness, the inputs are explained below:

**Input 1: NPLOTS**

NPLOTS is the number of curves to be plotted on the same plot; the maximum number of curves to be plotted is four.

**Input 2: IDEF**

IDEF is the axis label indicator.

<table>
<thead>
<tr>
<th>IDEF</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>For automatic axis labeling of Magnitude vs. Frequency,</td>
</tr>
<tr>
<td>1</td>
<td>For automatic axis labeling of Magnitude vs Angle plots,</td>
</tr>
<tr>
<td>2</td>
<td>For the program to prompt users to input axis labels,</td>
</tr>
<tr>
<td>9</td>
<td>To change plot size and prompt for axis labels.</td>
</tr>
</tbody>
</table>

The default plot size is 8.0 X 5.5 inches for XY plot (figure 1) and 5.688 x 3.438 inches for each plot on the twinplot (figure 2).

**Input 3: IFI**

IFI indicates which format the data is in, as explained previously.

**Input 4: INFILE**

Input data file name. The file must have the format specified by Input 3.
Input 4a:

If IDEF = 2 users are prompted for axis labels for horizontal and vertical axis.

If IDEF = 9 users are prompted for a new plot size and axis labels.

Input 5: XMIN, XMAX, XINC

After displaying the minimum and maximum values of X array, users are prompted for the lower (XMIN) and upper (XMAX) limits of plot, and the X increment (XINC) between adjacent tic marks for the horizontal axis.

Input 6: YMIN, YMAX, YINC

Users are prompted for lower and upper limits of the vertical axis. YINC is the vertical axis increment between the tic marks on the plot.

Input 6a: PHMIN, PHMAX, PHINC (Twinplots only)

For the program that generates twin plots (PSTWINPLOT.FOR), additional inputs for the vertical axis of the upper plot (usually the phase plot as in figure 2) are needed. PHMIN, PHMAX are the lower and upper limits of vertical axis, and PHINC is the coordinate increment between the tic marks.

Input 7: TITLE

Input title for plot, 60 characters maximum. However, to avoid overlapping problems, a maximum of 35 characters is recommended for the twinplot case.
Input 8: Input first line of comments.

Users can input two lines of comments. In addition, the program has an option to automatically put the date and time under the comment lines (see figures 1,2). This option is system dependent as can be seen on program line labeled 23 in subroutine PPLOT (program PSTWINPLOT.FOR) and in subroutine PLOTXY (program PSPLTXY.FOR). Thus the users are recommended to change the program line to their own system call. The program line is currently commented out to make the code portable.

Input 9: Input second line of comments

Input 9a: Input next data file name (if multiple plots).

Input 10: PLOTLAB

Input labels for the curves. Users are prompted to type in labels for each of the NPLOTS curves.

The numerical labels at each of the ticmarks on the output plot is written with Fortran format F6.1. Program users can change this format to suit their need by changing appropriate parameters on program lines labeled 2002 and 2006 in subroutine PPLOT of PSPLTXY.FOR and lines labeled 2002, 2006 and 2007 in subroutine PPLOT of PSTWINPLOT.FOR. Line labeled 2002 is for the horizontal axis. Line labeled 2006 is for formatting numerical labels at the ticmarks of the vertical axis on the X-Y plot and for the vertical axis of amplitude plot on a twinplot. Line labeled 2007 is for the vertical axis of the phase plot in the twinplot case.
Figure 1: A sample X-Y plot (not true size)
Figure 2: A sample twinplot (not true size).
6.0 PROGRAM OUTPUT

The programs generate postscript output files named either "RECPLOT.ps" for a X-Y plot program or "TWINPLOT.ps" for a twinplot program.
7.0 ACKNOWLEDGMENT

The author wishes to give special thanks to Ali Moaghaddar at Ohio State University for the skeleton twinplot program, which is the basis for the two described computer programs and to Karen Gray for her assistance in formatting this report.

APPENDICES
APPENDIX A

Program PSPLTXYIFOR
C******************************************************************
C
C THIS PROGRAM GENERATES PLOTS IN XY COORDINATE.
C THE OUTPUT FILE IS IN POSTSCRIPT LANGUAGE.
C
C -NUMERICAL LABELS AT THE TIC MARKS ARE WRITTEN
C WITH FORMAT "F6.1" ON LINE LABEL 2002 AND 2006 IN
C SUBROUTINE PPLOTXY. USER MAY WISH TO MODIFY THAT FORMAT
C IF NEEDED.
C
C -MAXIMUM ARRAY SIZE IS 2000. TO INCREASE, CHANGE BOTH
C PARAMETERS "NDIM" IN MAIN AND "NMAX" IN PPLOTXY
C
C -MAXIMUM 4 CURVES ON THE PLOT
C
C -LINE LABEL 23 IN SUBROUTINE PPLOTXY MAKES CALL TO A SYSTEM
C DEPENDENT FUNCTION TO GET DATE AND TIME. USER SHOULD REPLACE
C THIS LINE WITH A FUNCTION THAT WORKS ON THEIR SYSTEM.
C FOR PORTABILITY THIS STATEMENT IS TEMPORARILY COMMENTED OUT.
C
C -THE CONTENTS OF DATA FILES SHOULD BE IN ONE OF THE TWO
C FOLLOWING FORMATS:
C
1. FORMAT 1:
   - First line : Npts, X(1), Xinc
   where Npts = Number of Points,
   X(1) = First data X value
   Xinc = X increment (equally spaced data)
   - Following lines:
     Y(1), PH(1)
     Y(2), PH(2)
     Y(3), PH(3)
     ...
     Where PH array is a dummy array (could be set to zero)
     to maintain data files compatibility between PSPLTXY.FOR
     and PSPLTAMPH.FOR

2. FORMAT 2:
   - First line : Npts
   where Npts = Number of Points,
   - Following lines:
     X(1), Y(1), PH(1)
     X(1), Y(2), PH(2)
     X(1), Y(3), PH(3)
     ...
     Where PH array is a dummy array (could be set to zero)
     to maintain data files compatibility between PSPLTXY.FOR

APPENDIX B

Program PSTWINPLOT.FOR
THIS PROGRAM GENERATES TWO PLOTS ON THE SAME PAGE (AM VS X AND PH VS X). THE OUTPUT FILE IS IN POSTSCRIPT LANGUAGE.

- NUMERICAL LABELS AT THE TIC MARKS ARE WRITTEN WITH FORMAT "F6.1" ON LINE LABEL 2002, 2006 AND 2007 IN SUBROUTINE PPLOT. USER MAY WISH TO MODIFY THAT FORMAT IF NEEDED.

- MAXIMUM ARRAY SIZE IS 1024. TO INCREASE, CHANGE BOTH PARAMETERS "NDIM" IN MAIN AND "NMAX" IN PPLOT

- MAXIMUM 4 CURVES ON THE PLOT

- LINE LABEL 23 IN SUBROUTINE PPLOT MAKES CALL TO A SYSTEM DEPENDENT FUNCTION TO GET DATE AND TIME. USER SHOULD REPLACE THIS LINE WITH A FUNCTION THAT WORKS ON THEIR SYSTEM. FOR PORTABILITY THIS STATEMENT IS TEMPORARILY COMMENTED OUT.

- THE CONTENTS OF DATA FILES SHOULD BE IN ONE OF THE TWO FOLLOWING FORMATS:

  1. FORMAT 1:
     - First line : Npts, X(1), Xinc
       where Npts = Number of Points,
       X(1) = First data X value
       Xinc = X increment (equally spaced data)
     - Following lines:
       Y(1), PH(1)
       Y(2), PH(2)
       Y(3), PH(3)
       ...

  2. FORMAT 2:
     - First line : Npts
       where Npts = Number of Points,
     - Following lines:
       X(1), Y(1), PH(1)
       X(1), Y(2), PH(2)
       X(1), Y(3), PH(3)
       ...

**Abstract**

Graphics is one of the important tools in engineering analysis and design. However, plotting routines that generate output on high quality laser printers normally come in graphics packages, which tend to be expensive and system dependent. These factors become important for small computer systems or desktop computers, especially when only some form of a simple plotting routine is sufficient. With the Postscript language becoming popular, there are more and more Postscript laser printers now available. Simple, versatile, low cost plotting routines that can generate output on high quality laser printers, are needed and standard Fortran language plotting routines using output in Postscript language seems logical. The purpose of this report is to explain the use of two simple Fortran plotting routines that generate output in Postscript language.

**Key Words (Suggested by Author(s))**

- Postscript
- Fortran
- Graphics
