"Investigate the feasibility and utility of developing a knowledge-based scheduling aid..."

- Approach:
  - Replicate current scheduling in automated environment
  - Develop prototype with user interaction
  - Create user-friendly, graphical interface
Range Scheduling - New Approach

RSA Features

- Graphical User Interface
  - Similar look and feel to paper based approach
  - Real-time response to schedulers

- Constraint Based Analytical Capability
  - Provides scheduling tools
  - Automates scheduler heuristics

- Multi-user
  - Architecture supports real-time multi-user capability

- Portable
  - Sun, Symbolics, TI Explorer, and Mac II
Constraint Based Analytic Capability

- **Conflict Identification**
  - Oversubscribed resources?
    - At local Remote Tracking Station
    - Across AFSCN
    - Adequate turnaround time

- **Conflict Explanation**
  - Type of conflict
  - Specific resources and times associated with conflict
Constraint Based Analytic Capability (concluded)

- Conflict Resolution
  - For single task (list of possible solutions)
  - Globally across time slice

- Error Checking
  - Satellite visible?
  - In requested time window?
  - At proper RTS?

RSA Architecture
Range Scheduling Aid Benefits

- Automated scheduling
- Electronic schedule dissemination
- Simultaneous scheduling
- Extensible system
- Reduced training time

MITRE
