The Directory Interchange Format (DIF) is a data structure used to exchange directory-level information about data sets among information systems. In general, the format consists of a number of fields that describe the attributes of a directory entry and text blocks that contain a descriptive summary of and references for the directory entry. All fields and the summary are preceded by labels identifying their contents. All values are ASCII character strings. The structure is intended to be flexible, allowing for future changes in the contents of directory entries.

The manual is structured as follows: Section I is a general description of what constitutes a directory entry; section II describes the content of the individual fields within the data structure, together with some examples. Next are six appendices.

Appendix A describes the syntax used within the examples.

Appendix B shows samples of the directory interchange format applied to different data sets.

Appendix C gives allowable discipline keywords.

Appendix D provides a current list of valid location keywords.

Appendix E lists allowable parameter keywords.

Appendix F provides a list of acronyms and a glossary of terms used.

Appendix G describes the Standard Formatted Data Unit header, which may be added to the front of a DIF file to identify the file as a registered standard format.

NOTE! It is not necessary to read the entire manual to understand the basics of the format or to get started creating DIF files. For a quick review, you should go through section I. The rest of the manual should be considered as reference material to answer specific questions on individual field syntax, valid field values, keywords, etc. The only fields required within each DIF file are the following:

- Directory Entry Identifier
- Directory Entry Title
- Parameter Keyword
- Data Center
- Summary

Of each of these required fields, the Summary is the most important and the most flexible. You can freely describe the data and include any necessary qualifying details in the Summary.
If you need more information or assistance, contact the Master Directory User Support Office:

I. Directory Entry: Definition and Example

1.1 Directory Entry Overview

A directory entry consists of a collection of "metadata" fields describing a group of data. The individual fields are described in detail in section II of this manual. They include the list of items below. A directory entry always begins with the Entry ID as its first field. Although the remaining fields may be specified in any order, it is recommended that the fields be supplied in the order given in this manual.

A key question when preparing data descriptions in Directory Interchange Format is what "group" of data should be described in a single entry. In some cases, a group of data commonly regarded as a "data set" will be described by a single directory entry. In other cases, you may choose to group related data together even though they may be readily identifiable in smaller subsets at the catalog or inventory level. As the technical, archive, or data system contact who is preparing the directory information, your determination of the appropriate group of data to describe at the directory level should be the primary guideline. In writing directory level data descriptions, you should consider both the scientific users of the directory as well as the structure of the data systems supporting the data. The following guidelines are offered as suggestions that may be used in writing directory data descriptions.

At a directory level, it is recommended that data be grouped to

- minimize the number of similar entries a user needs to read, and
- bring together data sets which have only minor differences.

Data set characteristics that might suggest separate directory entries are

- a unique sensor/platform/project combination.
- a unique parameter, parameter combination, or set of independent variables contained in the data set.
- a unique processing level.

Data set characteristics that generally do not indicate a need for separate entries include

- identical data sets available on different media.
- data held at multiple locations, except when significant differences exist between the data archived in different places (e.g., different processing algorithms).
- distinct spatial or temporal resolutions or coverages for a given group of data.
• data used for the interpretation or organization of a data set (e.g., map overlays, indices to
data), which would not be listed separately but which would be mentioned in the summary.

A few examples of how data sets might be grouped into single directory level entries are as
follows:

• A set of 1-second, 15-second, and 1-minute averages of magnetic field data that describe
the same parameters but at differing temporal resolutions would be described in a single
entry with the differing resolutions being discussed in the summary.

• Data that contain the same parameter information (derived from the same source and/or
processing methods) for large, non-adjacent areas such as north polar and south polar
areas, would be described as a single entry (in this case, the DIF file would list the largest
single continuous area that contained the actual areas of coverage, with the specific areas
covered mentioned in the summary).

• A series of data sets containing similar physical parameters derived from a common
instrument on a satellite series, such as the AVHRR data from the NOAA series satellites,
would be entered as a single directory entry with multiple sources (spacecraft) entered.

The fields that may be used in creating a directory entry are as follows:

- Directory Entry Identifier
- Directory Entry Title
- Start and Stop Dates
- Sensor Name
- Source Name
- Investigator
- Technical Contact
- Author
- Data Center (Name, Contact Person, and Dataset ID)
- Originating Center
- Campaign or Project Name
- Storage Medium
- Parameter Measured
- Discipline Keywords
- Location Keywords
- General Keywords
- Coverage
- Revision Date
- Science Review Date
- Future Review Date
- Reference
- Quality
- Summary

In order for the directory entry to be useful to directory users, it is strongly recommended that all
applicable fields for a given data set be entered. Some information may not be available or cannot
be recovered for an older data set, and some fields do not necessarily apply to every space and
Earth science data set. These fields include campaign/project, coverage, sensor, and source (e.g.,
data sets composed of recorded human observations, such as mineral locations, may not have a
sensor or meaningful source). Other fields are critical for use in data set selection (e.g., parameter,
time coverage, discipline) or user understanding of the data (e.g., summary, reference, data set
personnel). In cases where the field information cannot be obtained or would not make sense, the
entire field should be omitted. The minimum set of required fields that must be provided with DIF
data descriptions are as follows:

- Directory Entry Identifier
- Directory Entry Title
- Parameter Keyword
- Data Center
- Summary

The definitions and examples of these fields are given in the next section, but an example of how
they are used to create a Directory Interchange Format (DIF) file is shown below.

In several fields the DIF provides for both long names and short names for the field. In such cases
the short name is listed first followed by the ">" character and then the long name.

**EXAMPLE**

The following example is for a relatively standard type of directory entry representing a data set.
Other examples may be found in Appendix B. Definitions of the individual fields are found in the
next section. The full list of fields together with the syntax used is defined in Appendix A.

Group: Summary

The ERB (Earth Radiation Budget) MATRIX Summary Tape (EMST) is a single 6250 bpi tape which contains monthly averaged world grid (WG) data extracted from the Nimbus-7 ERB MATRIX tapes (also available through NSSDC and NCDS). Only monthly averaged WG data are included in the EMST. The WG data for each ERB parameter consists of 2070 ERB target areas, each target area having an equal area of 500 km x 500 km.

The ERB parameters on the EMST include outgoing longwave radiation, albedo, net radiation and their statistics calculated from the fixed Wide Field of View (WFOV) sensors and the Narrow Field of View (NFOV) scanner. Both daytime (ascending node) and nighttime (descending node) data are available. The scanner failed on June 22, 1980 and the NFOV data are available only for the period November 1978 - June 1980.

The EMST covers the period November 1978 - October 1986. Each data file contains one month worth of WG data. Other related data sets include: the NOAA heat budget data from AVHRR (HB/NOAA), CMATRIX from the Nimbus-7 THIR (CL/TN7), and ERBE-S9 and -S10 from ERBS and NOAA-9 and -10.

End_Group
II. Individual Field Specifications:
Field Definitions and Examples

2.1 Directory Entry Identifier

This field is the unique identifier used by the data system or data producer to distinguish this entry (or data set) from all others. It should be the same as the Data Set Identifier (see Data Center, section 2.7), but in cases where the data set is broken into several directory entries the data set identifier should be modified, usually by the addition of a numeric suffix, to be unique. When a directory entry represents more than one data set, a more generic identifier should be created. In cases where there is no unique data set identifier, a short mnemonic giving some indication of content is recommended.

The Directory Entry Identifier must be the first field in the DIF file.

This field may appear only once. The field is required as part of the DIF file.

EXAMPLES

Entry_ID: BPSSAL5A
Entry_ID: THEP87-1
2.2 Directory Entry Title

This field contains a concise title of the directory entry sufficiently descriptive to allow a reader to make a reasonable decision as to whether the data may be of interest. The following guidelines are suggested for directory entry titles:

- Titles should be similar to journal article titles in that they must convey the entry's content to the reader.
- The instrument, mission, and/or investigator should be included when these are important identifying characteristics of the data.
- The parameters or variables measured by the data and processing level should be included when these are important identifying characteristics of the data.
- Acronyms that are not common knowledge across science disciplines should be kept to a minimum or spelled out.
- Titles should be limited to 160 characters or no more than two lines. (Quotation marks are used to denote entries with a length of more than one line.)

This field may appear only once. This field is a required part of the DIF file.

**EXAMPLES**

Entry Title: "Dynamics Explorer-1 Energetic Ion Composition Spectrometer Stand-alone Telemetry Files"

Entry Title: SEASAT SMMR Sea Surface Temperature, Atm. Water & Vapor content, Wind Speed and Rain Rate Level 2.5"

Entry Title: "International Satellite Cloud Climatology Program & (ISCCP) Cloud Cover Radiance Data From GOES-5 VAS"

Entry Title: "Middle Atmosphere Electrodynamics Electron Precipitations From The Aurorozone-I X-RAY Detector"
2.3 Directory Entry Start and Stop Date

These fields contain the first and last dates of the data associated with the directory entry. Times of
day may be attached if they are necessary for the directory user. If the data continue through the
present, then the stop date should be omitted.

Dates and times shall be specified in a form compatible with ISO 8601, as follows:

- yyyy-mm-dd for date only without time
- yyyy-mm-ddThh:mm:ss for date with unqualified (local) time
- yyyy-mm-ddThh:mm:ssZ for date with UTC time

Years shall be full four-digit years. Month and day of month shall be two digits, with leading
zeroes if necessary.

For directory entries, start and stop dates are normally specified without the time of day. If times
are included, it is strongly recommended that they be in UTC (tagged with the "Z" suffix).

These fields may appear only once.

EXAMPLES

Start_date: 1986-06-31
Start_date: 1986-06-31T12:00:31Z
Stop_date: 1986-06-31T16:00:00
2.4 Sensor Name

The sensor is the instrument or hardware used to acquire the data. Both a long name and a short name should be provided. These are placed on the same line separated by the ">" character, with the short name first. The long name is the full name normally used to describe the sensor. The short name is usually a mnemonic or otherwise abbreviated version of the long name. If no obvious short name exists, contact the terminology control point for your discipline or the NSSDC to obtain one.

This field may be repeated as many times as necessary.

EXAMPLES

Sensor_Name: ALT>Altimeter
Sensor_Name: AVHRR>Advanced Very High Resolution Radiometer
Sensor_Name: SMMR>Scanning Multichannel Microwave Radiometer
Sensor_Name: XBT>Expendable Bathythermographs
Sensor_Name: VISSR>Visual and Infrared Spin Scan Radiometer
Sensor_Name: SSM/I>Special Sensor Microwave/Imager
2.5 Source Name

The data source refers to the spacecraft, instrument, platform, ship, ground station, or telescope, etc., that contains the sensors. Both a long name and a short name should be provided. These are placed on the same line separated by the " > " character, with the short name first. The long name is the full name normally used to describe the source. The short name is usually a mnemonic or abbreviated version of the long name. If no obvious short name exists, contact the terminology control point for your discipline or the NSSDC to obtain one.

This field may be repeated as many times as necessary.

EXAMPLES

Source_Name: DE-2>Dynamics Explorer 2
Source_Name: DE-1>Dynamics Explorer 1
Source_Name: MMT>Multiple Mirror Telescope
Source_Name: KAO>Kuyper Airborne Observatory
Source_Name: VGR1>Voyager-1
Source_Name: POWB>Pacific Ocean Weather Buoys
2.6 **Investigator, Technical Contact, and Author**

The investigator is the person who headed the investigation or experiment that resulted in the acquisition of the data described (e.g., Principal Investigator, Experiment Team Leader). The investigator is listed so that a scientist or other user may contact the individual (or the technical contact described below) for high level data interpretation, algorithm information, and data quality questions. This information may also be useful in determining agency or departmental funding or technical responsibility for the data.

In situations where data were produced through an interagency effort or with co-principal investigators, more than one investigator may be listed. In situations where a new investigator has assumed the duties of leading the acquisition or processing of data, only the currently active investigator should be listed in an investigator group.

If many investigators are listed, the usefulness of this field will be diminished, in that there is no indication of which investigator is responsible for any subset of the data. Therefore, if a single DIF file represents a large aggregation of data produced through the cooperation of several investigator teams, it is recommended either to identify the principal investigator (PI) and list that person in the DIF file or to indicate no investigators and use the summary or reference text blocks to point to the location of a comprehensive list of investigators and their relationships to the data.

The technical contact is a person who is knowledgeable about the technical content of the data (quality, processing methods, units, available software for further processing, etc.). This may be the investigator or it could be a co-investigator or other knowledgeable person. Preferably, there should be listed one technical contact only. In exceptional cases, i.e., where the same data set is available at geographically remote locations like one in Europe, one in the USA, one in the USSR, more listings of technical contacts are allowed with the understanding that from the locations of the technical contacts it is clear to the user which contact is the most appropriate.

The author is the person responsible for the accuracy of the information content of the directory entry.

Additional information (address, phone, etc.) useful for contacting the person is included along with the name. Since the file may be used for other data bases in the future, it is better to provide this information whenever possible. The syntax for this information is shown in Appendix A.

Investigator may be repeated as many times as necessary. The author may appear only once.

End_Group
End_Group
2.7 Data Center

The Data Center group is a block of information identifying the data center holding the data described in the directory entry, the unique identifier used by the data center to point to the data set, and a person to be contacted at that center for information on data access. The data center name is composed of both short and long versions in the same manner as short and long sensor and data source names. If no obvious short name exists, contact the terminology control point for your discipline or NSSDC to obtain one. It will often be sufficient simply to fill in the data center short name since the DIF file recipient may have previously stored supplementary information about the major data centers. Such supplementary information briefly informs a user about the nature of the data center and how to access it for further information.

The data center contact is the person who can supply information about how the data are stored, how to obtain copies, associated costs, etc.

The Dataset ID field (data set identifier) is used to store the internal identifier by which a data set is known within the data center where it is stored. The identifier may be followed optionally by a descriptive term, separated by the "->" character, to distinguish this data set from others. The ID may not necessarily be unique among the data systems. The Dataset ID should be useful as information to pass to a data system if a user chooses that entry and then is connected to the data system in which it is stored. Note that a data set may be broken into several directory entries all of which would have the same data set identifier. For the reverse case, where many data sets are grouped into one directory entry, all corresponding Dataset IDs should be listed. In this case, the description can help the user select a particular data set. In cases where there are a large number of Dataset IDs, the location of a listing of Dataset IDs should be noted in the summary.

Since the data described by a directory entry may be stored in several places, the data center group may be repeated.

EXAMPLE

Group: Data Center
  Data_Center_Name: NODS>NASA Ocean Data System
  Dataset_ID: NODS8831>24000 high-resolution images
  Dataset_ID: NODS8833>1000 low-resolution images

Group: Data_Center_Contact

  First_name: Ruby
  Email: SPAN>STANS::DATASPEC
  Email: NSN>DATASPEC@STANS.JPL.NASA.GOV
  Phone: 1-818-354-8031

Group: Address
  MS 300-324
  Jet Propulsion Laboratory
  4800 Oak Grove Drive
  Pasadena, CA 91109

End_Group
End_Group
End_Group
2.8 Originating Center

This field contains the short name of the data center that has generated the directory entry. When only a single data center is entered in the directory entry, this field may be omitted and the listed data center will be assumed to be the originating data center. When more than one data center is provided, this field must be included in the directory entry.

EXAMPLES

```
Originating_Center: PDS
Originating_Center: NSSDC
Originating_Center: NGDC
```
2.9 Campaign or Project

This field should be supplied only when there is a relationship of this directory entry to a campaign or project (WOCE, FIRE, PROMIS, etc.). Campaigns or projects usually encompass data from a number of diverse data sources. The field should not be supplied if it does not differ significantly from the data source field (e.g., the VOYAGER project compared to the VOYAGER 1 and VOYAGER 2 data sources). The field includes both short and long names. If no obvious short name exists, contact the terminology control point for your discipline or the NSSDC to obtain one. It is anticipated that some directories will have supplementary information about the major campaigns and projects, so a simple indication of the campaign/project short name will be sufficient if it is known that the directory has the other information on the campaign or project. Note that either the word Campaign or Project may be used as the label for the field, as appropriate.

This field may be repeated as often as necessary.

EXAMPLES

Project:  ISTP>International Solar-Terrestrial Physics
Campaign:  WOCE>World Ocean Circulation Experiment
2.10 Storage Medium

Entries in the storage medium field first indicate the quantity and type of medium on which the data are currently stored. This is followed by the volume of data, preferably in megabytes for easy comparison with other entries if this is digital data. The quantity is in the form of a number of units of the medium (e.g., ten magnetic tapes, six optical disks, 16 printed volumes, 70 microfiche reels, etc.). The medium should be chosen from standard names such as

- magnetic tapes
- optical disks
- magnetic disk
- microfilm reels
- microfiche slides
- hardcopy plots
- 35 mm slides

Details about the characteristics of the medium (6250 bpi, 5.25 inch disk, etc.) should be mentioned in the summary text if it is important for the user to know.

The storage medium field contains information on the volume of data in bytes as well as the quantity and type of medium on which the data are stored. The intent is to give the user a feeling for what will be involved in acquiring the data. Note that the storage media may differ from the media on which the data are distributed. It is assumed that the user can acquire information on the available distribution media through general online information about the data center or by contacting the data center. If these data are not available in the standard forms, this information should be indicated in the summary.

The storage medium field may be repeated as often as necessary if the data are stored in multiple forms.

EXAMPLES

- Storage_medium: 20 magnetic tapes, 300 Mbytes
- Storage_medium: 1 magnetic disk, 0.5 Mbytes
- Storage_medium: 3 optical disks, 3400 Mbytes
- Storage_medium: 2000 hardcopy plots
- Storage_medium: 10 volumes printed tables
2.11 Parameter Measured

The parameter field indicates what kinds of measurements are represented by the data. The value(s) entered in this field should be selected from the list of valid values in Appendix E. It is important that all applicable parameter groups and parameters be included, since many users search for data by specifying the parameters of interest. The choice of parameter group and parameter are placed on a single line and separated by the "->" character, to indicate the hierarchy as shown in the examples below. The parameter part may be left blank (and the "->" omitted) but, again, it is best to specify all applicable parameters. Only one parameter group and parameter may be specified on a line. If more than one parameter within a single parameter group applies, multiple lines should be entered with the parameter group repeated on each. The list of allowable parameter groups and parameters is contained in Appendix E.

Finer breakdowns of parameters may be added following the parameter, separated by "->". These lower levels of breakdown may be controlled by supplemental standards or agreements used within each discipline area but are not guaranteed to be recognized or unique outside the scope of applicability of such standards or agreements. New values could be included in the list of valid parameter fields once it is determined that they are necessary and do not overlap with those already available.

This field is a required part of the DIF file. The field may be repeated as many times as necessary.

EXAMPLES

Parameter: Atmospheric Dynamics->Storms
Parameter: Astronomical Parameters->Transverse Velocities
Parameter: Hydrologic Parameters->Turbidity
Parameter: Radiance and Imagery->Microwave
Parameter: Charged Particles
Parameter: Solar Properties->Solar Wind
Parameter: Biological Entities->Ocean Vegetation->Plankton
2.12 Discipline Keywords

The discipline keywords describe the science discipline(s) and subdiscipline(s) in which the data described in this entry are normally used. The valid discipline keywords are listed in Appendix C. It is important that all applicable disciplines and subdisciplines be included, since many users search for data by specifying their field of interest. The choices of discipline and subdiscipline are placed on a single line and separated by the "->" character to indicate the hierarchy as shown in the examples below. The subdiscipline part may be left blank (and the "->" omitted) but, again, it is best to specify all applicable keywords. Only one discipline and subdiscipline may be specified on a line. If more than one subdiscipline within a single discipline applies, multiple lines should be entered, with the discipline repeated on each. The list of allowable disciplines and subdisciplines is contained in Appendix C.

Finer breakdowns of subdisciplines may be added following the subdiscipline, separated by "->". These lower levels of breakdown may be controlled by supplemental standards or agreements used within each discipline area but are not guaranteed to be recognized or unique outside the scope of applicability of such standards or agreements.

This field may be repeated as many times as necessary.

EXAMPLES

- Discipline: Earth Science->Atmosphere
- Discipline: Planetary Science
- Discipline: Earth Science->Land
- Discipline: Astronomy->Ultraviolet Astronomy
- Discipline: Earth Science->Land->Agriculture
2.13 Coverage

The coverage fields indicate (usually in very coarse resolution) the spatial coverage of the data described by the directory entry. This can be done in latitude and longitude for Earth observations. Earth science disciplines should include the coverage information for the directory entry whenever possible, even if the data being described are global.

In all cases, *Minimum Latitude* refers to the southernmost latitude point covered, and *Maximum Latitude* refers to the northernmost point covered. *Minimum Longitude* refers to the westernmost longitude covered, and * Maximum Longitude* refers to the easternmost longitude covered. Latitude and longitude values are given in whole degrees. Any finer coverage that needs to be specified should be described in the summary.

As an alternative, directional terms may be substituted for the minimum and maximum terminology for Earth-based coverage in accordance with the following correspondence:

- Minimum Longitude --> Westernmost Longitude
- Maximum Longitude --> Easternmost Longitude
- Minimum Latitude --> Southernmost Latitude
- Maximum Latitude --> Northernmost Latitude

Either one full set or the other full set should be used. They should not be mixed. The directionality of these terms on a map would be:

- Maximum Latitude
  - Minimum Longitude  Maximum Longitude
  - Minimum Latitude

- Northernmost Latitude
  - Westernmost Longitude  Easternmost Longitude
  - Southernmost Latitude

In accordance with the FIPS and ANSI standards (FIPS PUB 70-1, ANSI X3.61-1986), Earth geographic coordinates must be submitted with alphanumeric or integer hemispheric indicators. When using alphanumeric characters, indicators (N, S, E, W) must be uppercase and immediately follow the last digit for latitude or longitude; no blanks are allowed. When using the integer representation (+, -) the plus sign (+) or minus sign (-) must immediately precede the longitude or latitude value.

Latitudes north of the equator are indicated by a plus sign (+) or an "N." Latitudes south of the equator are indicated by a minus sign (-) or an "S." Longitudes east of the prime meridian (Greenwich) are indicated by a plus sign (+) or an "E." Longitudes west of the prime meridian are indicated by a minus sign (-) or a "W." A point on the prime meridian shall be assigned to the Eastern Hemisphere, a point on the one hundred eightieth meridian shall be assigned to the Western Hemisphere, and a point on the equator shall be assigned to the Northern Hemisphere, and for this reason, values of 0 and 180 do not require hemispheric indicators.

For non-Earth (planetary) data sets, latitude values should be given following the same guidelines as for the Earth data. Longitude values shall be given in whole numbers representing 0-360
degrees with no hemispheric indicators. This is in accordance with the IAU cartographic guidelines. Planetary science disciplines should include the item "Coord_System:," followed by the planet name (if Coord_System is not specified, Earth is implied). A plus sign (+) is optional for positive integers. Integer and alphanumeric indicators should not be mixed within a single DIF file.

For astronomical data sets, two different sets of fields are possible. For coordinates in the RA-Dec notation, Minimum_Dec refers to the southernmost latitude point covered; Maximum_Dec refers to the northernmost latitude point covered; Minimum_RA refers to the westernmost longitude; and Maximum_RA to the easternmost longitude covered. For coordinates in the Galactic coordinate system, the equivalent terms are Minimum_Gal_Lat, Maximum_Gal_Lat, Minimum_Gal_Long, and Maximum_Gal_Long.

For the RA-dec notation, right ascension should be entered to the nearest hour or minute, in the form "hours" followed by "H," followed optionally by a blank followed by "minutes" followed by "M." Declination and galactic coordinates follow the same guidelines as for planetary sets.

Two additional fields may appear only once within the group. The first of these is Epoch, and the other is Equinox. Values are to be entered numerically, preferably to the nearest tenth of a year.

This group may appear as often as necessary, but care should be taken when repeating the group. Each of the fields may appear only once within the group.

**EXAMPLES**

**Coverage**

Minimum_Latitude: 65S
Maximum_Latitude: 90N
Minimum_Longitude: 71W
Maximum_Longitude: 105E

**Coverage**

Southernmost_Latitude: -65
Northernmost_Latitude: +90
Westernmost_Longitude: -71
Easternmost_Longitude: 105

**Coverage**

Minimum_RA: 10H 20M
Maximum_RA: 24H
Minimum_Dec: -30
Maximum_Dec: 90
Epoch: B1950.0

**Coverage**

Minimum_Gal_Long: 335
Maximum_Gal_Long: 15
Minimum_Gal_Lat: -5
Maximum_Gal_Lat: 5

End_Group
2.14 Location Keywords

The location keywords provide the capability of selecting place names to be used as search parameters, usually as an alternative to specifying latitudes and longitudes (which may not apply in some disciplines). The keywords for the highest level should be chosen from the list in Appendix D. A list categorized by science disciplines is shown first in Appendix D followed by an alphabetized version. The keyword "Earth" is not included in the list since the term "Global" means the entire Earth, and the other terms within the Earth science category are presumed to be locations subordinate to the Earth.

If you feel a more specific place name (usually descriptive of a place contained within one of the general terms shown in Appendix D) is an important piece of information about the data, this may be specified as an additional breakdown within the hierarchy, following a ">". Lists of locations at levels below those listed in Appendix D may be controlled by supplemental standards or agreements used within each discipline area but are not guaranteed to be recognized or unique outside the scope of applicability of such standards or agreements.

Alternatively, a word implying location may be specified as a General Keyword (see the definition and examples for that field on the following page) and mentioned in the summary text. If you think a location name should be added to the list in Appendix D, contact the Master Directory User Support Office.

This field may be repeated as many times as necessary.

EXAMPLES

Location: Jupiter
Location: Troposphere
Location: North America > United States > Kansas > Topeka
Location: Atlantic Ocean > North Atlantic Ocean > Sargasso Sea
2.15 General Keywords

This field provides the capability of entering general keywords that are not found in the parameter, discipline, or location keywords. It could be used, for example, to specify fine resolution location words or more specific discipline-dependent words or phenomena. Any words or phrases may be entered, but they should be kept short to facilitate their use as meaningful keys into the text. The user will have to specify the keyword exactly as it is entered in this field in order to retrieve this directory entry.

This field may be repeated as many times as necessary.

EXAMPLES

Keyword:      Mount St. Helens
Keyword:      quasar
Keyword:      flare
Keyword:      eddy
Keyword:      lightning
2.16 Revision Date

This represents the date and possibly the time that this directory entry was created or the latest date and time of its modification or update. Usually the date without time will be sufficient.

This field may appear only once.

EXAMPLES

Revision_Date: 1987-10-01
Revision_Date: 1987-06-09T04:10:00Z
2.17 Science Review Date

This represents the date and time of the latest review of the directory entry for accuracy of scientific or technical content. It is suggested that this review be done by the investigator or a member of the science team that produced the data. Usually the date will be sufficient, though a time may also be given.

This field may appear only once.

EXAMPLES

Science_Review_Date: 1954-07-04
Science_Review_Date: 1987-06-09T04:10:00
2.18 Future Review Date

This date, suggested by the author, indicates a time at which the DIF file should be reviewed for technical content. On or soon after that date, a request will be made to the author to review the DIF file and submit an updated version, if necessary (either the author or a knowledgeable person to whom the author refers the DIF file would do the review). Normally, the content of the directory entry should be reviewed at regular intervals of the order of a year or more. If this will be done, this field may be omitted. If the author wishes to specify a particular review date or has reason to believe that significant changes will occur before a year, a suggested review date can be included and this date will take precedence. Significant changes can include an anticipated change in the contact person or author fields; planned changes to the data content (e.g., change in processing algorithm); regular changes in the stop date, which are frequent but not so frequent as to justify leaving the stop date blank; anticipated change in the storage location for the data; expected inclusion of the data as part of a campaign, etc.

This field may appear only once.

EXAMPLES

Future_Review_Date: 1989-01-01
Future_Review_Date: 1989-06-15
2.19 Reference

The reference text group should contain a few key bibliographic references pertaining to the directory entry. It is recommended that bibliographic references be provided in the style used by the *Journal of Geophysical Research* (JGR).

This field may appear only once.

**EXAMPLES**

Group: Reference

End_Group
2.20 Quality

The quality text group is composed of unstructured text containing information about any quality procedures followed in producing the data described by this entry. Any other indicators of data quality or, in contrast, recognized or potential problems with quality (e.g., successful or unsuccessful usage by the research community) should be included. The quality description should be succinct. When established quality control mechanisms are used, these should be included in this section. When possible, established quantitative quality measurements applicable to the entry should be included. References can be mentioned in this section but should also be included in the reference section.

This group may appear only once.

EXAMPLES

Group: Quality

This data entry has been processed using the NASA Planetary Data System quality control peer review.

End_Group

Group: Quality

The data set has been documented and peer reviewed in the publication: King, J. H., OMNI, Online Interplanetary Data Access, J. Geophys. Res., V, nnnn-nnnn, 1992.

End_Group

Group: Quality

The data set has been in extensive use for over 5 years by many researchers and has resulted in multiple publications.

End_Group

Group: Quality

For good quality results in the use of these data it is recommended that researchers contact the principal investigator regarding processing methods.

End_Group
2.21 Summary

The summary text group is composed of unstructured text containing information about the directory entry that cannot be found in the previous fields. The summary should be a concise abstract and should contain brief statements of important information for the potential user. It should, where possible, include

- a discussion of the parameters measured by the data (accuracy, precision, etc.),
- statements of time, spatial resolution, coverage, and frequency of updates or modifications to the data set (e.g., monthly addition of newly processed data or acquisition of additional coverage),
- data processing level,
- a discussion of ancillary data sets needed for processing,
- the similarities and differences of these data to other closely-related data sets,
- ordering information unique to this particular data set,
- sensor and source information unique to this particular data set,
- other information needed for a user to determine the usefulness of the data set (e.g., what the user would need in order to process this data).

In addition, the summary should have the following characteristics.

- It should be suitable for presentation on a standard computer terminal (80-character width × 24-line height).
- It should not exceed two or three screen pages (300-500 words).
- It should be written using standard elements of style.
- It should contain only standard alphanumeric characters A-Z, a-z, 0-9, and ! @ $ % & * ( ) [ ] / _ - = + ` ~ > < ; : '' ? / , and no special characters (e.g., no TABs, form feeds, Greek letters, etc.).
- It should have ragged right margins (i.e., not right justified).
- It should be single spaced with blank lines separating paragraphs.
- It should be proofread for spelling, typing, and grammar.

The summary text field may also contain tabular information in cases where this is an effective way to convey information about a data set to a user.

This field is a required part of the DIF file. The field may appear only once.
EXAMPLE

Group: Summary

Seasat was launched on June 28, 1978 carrying a five sensor payload. The objective of the Altimeter (ALT) was to determine ocean topography with a height measurement precision of 10 cm. The ALT carrier frequency was 13.5 GHz and operated in chirp pulse mode with a 3.2 micro-sec uncompressed pulse width and 3.125 ns compressed pulse width. The pulse limited footprint diameter was 1.2 km for calm seas; beam-limited footprint diameter was 22.2 km.

The primary parameters telemetered to the ground processing system at 10/sec rate were height, significant wave height, and Automatic Gain Control (AGC). The height, described herein, is the sea surface height with respect to the reference ellipsoid. From altimeter workshop results, the height measurement bias has been determined as 0.0 +/- 0.7 m when the sea state bias effects are modeled.

Height data are available on 1600 or 6250 bpi magnetic tapes for: Level 1 Sensor Data Record, Level 1.5 Sensor File and Level 2 Geophysical Data Record. Level 2.5 data sets are maintained on-line by the NODS archive system. Full tape copies will be made on request. Please specify the period of interest when ordering. Allow 1-3 weeks for delivery depending on the order size.

End_Group
Appendix A

Formal Syntax

Purpose

This appendix is divided into three sections. The first provides the general format of the syntax formalism adopted for the manual. The next provides the syntax for the overall structure of the DIF file. The third provides the detailed syntax for each of the DIF file fields.

The following formal syntax definition is not intended to be sufficiently precise to be used as input to a parser generator. It is intended to be readable by the user of the DIF manual.
A.1 General Syntax Rules

Notation:

\[ m\{xxx\}n \]
means item(s) within braces occurs at least \( m \) times but not more than \( n \) times. If \( n \) is stated as "\( n \)" rather than an integer constant, then the item may occur an arbitrary number of times. However, a large number of repetitions is not generally encouraged.

\[ + \]
means concatenation.

\[ | \]
means choose any single alternative.

Spaces are allowed and optional where + is used for concatenation.

Rules and Conventions

Entries may be multi-line. Two methods may be used to indicate the continuation of an entry. Either the last non-blank character of each line contains "&" to indicate that the entry value is continuing, or the entire entry value is enclosed in quotation marks or apostrophes. Note, however, the quotation mark and apostrophe should not be used for continuation in textline groups such as Address, Reference, and Summary.

Any value field or portion of a value field separated by ">" may be enclosed in quotation marks or apostrophes. The rules are

- If a value has an opening apostrophe, it must be terminated by an apostrophe and must not contain any internal apostrophes; if a value has an opening quotation mark, it must be terminated by a quotation mark and must not contain any internal quotation marks.

- Special characters ">" and "&" do not have their normal functions inside values enclosed in quotation marks or apostrophes and are treated as regular textual characters.

- The enclosing quotation marks or apostrophes are not part of the value.

- The value obtained after removing the enclosing quotation marks or apostrophes must be a valid value.

- The use of a quotation mark or apostrophe implies line continuation until the closing matching quotation mark or apostrophe is found.

- Whether enclosing quotation marks or apostrophes are used or not, leading and trailing spaces are not part of the value.

If an unrecognized keyword is present, any program reading a DIF file should ignore the line or group introduced by that keyword. It is a local option whether to issue a warning message. Any unrecognized keyword in the form

\[ \text{keyword ":"|"=" textline} \]
should be ignored. However, the textline must be parsed to be sure to find and ignore any continuation. Any unrecognized input in the form

\[
group "::" | "=" \ keyword
\]

should ignore the entire group, up to the matching \textit{End Group}. However, the group must be parsed in order to find the correct matching \textit{End Group}.

Field labels begin at the first non-blank character on a line.

Field labels end with colon or an equal sign, preceded and/or followed by zero or more spaces, except the label \textit{End Group}, which does not contain a colon or equal sign.

Field labels should have only the first letter capitalized (style standard), but recognizer should be case-insensitive.

The parameter value associated with a field label is delimited by end-of-line unless explicitly continued as described above.

Where the syntax specifies an \textit{h spec} (concatenation with ">" character, see definition in syntax), which consists of a variable number of terms implying a hierarchy, a DIF file may contain more levels of hierarchy than a particular directory implementation can use or validate. These extra levels should be retained and displayed as text where possible but need not be validated or searchable.

The complete file should be human readable exactly as delivered.

Only printable ASCII characters shall be used: No TABs, no backspaces, or attempts at underlining.

Use ragged right margins, no right justification.

A "\textit{word}" is 1 to 31 alphanumeric characters, with embedded ",", ",", ",", "," allowed, delimited by space and/or comma and/or ">".

A "\textit{textline}" is any text not beginning with "\textit{End_}", ending at end-of-line or end-of-continuation.

The end-of-line character is the new line character (ASCII decimal 10).
A.2 Overall Structure

DIFs shall be transferred according to one or more of the following protocols:

1. Network file transfers that preserve byte order.

2. Unlabeled 0.5 inch magnetic tape in the following densities: 1600 bpi, 6250 bpi.

3. ANSI/ISO standard-labeled 0.5 inch magnetic tape with the following densities: 1600 bpi, 6250 bpi.

4. Other transfer protocols as agreed upon.

A directory entry is defined as follows:

```
Directory_entry ::=  
                   Entry_ID +  
                   Entry_Title +  
                   0{Start_Date}1 +  
                   0{Stop_Date}1 +  
                   0{Sensor_Name}n +  
                   0{Source_Name}n +  
                   0{Investigator}n +  
                   0{Technical_Contact}1 +  
                   0{Author}l +  
                   1{Data_Center}n +  
                   0{Originating_Center}1 +  
                   0{Campaign_or_Project}n +  
                   0{Storage_Medium}n +  
                   1{Parameter}n +  
                   0{Discipline}n +  
                   0{Coverage}n +  
                   0{Location}n +  
                   0{Keyword}n +  
                   0{Revision_Date}1 +  
                   0{Science_Review_Date}1 +  
                   0{Future_Review_Date}1 +  
                   0{Reference}1 +  
                   0{Quality}l +  
                   Summary
```

Note: Fields in the Directory_Entry may be in any order except the Entry_ID, which must appear first.
A.3 Field Syntax

Entry_ID ::= "Entry_ID" + ":" |"=" + word

Word ::= 1 to 31 characters, from set
{alphanumeric, ",", "]", ",", "/"}
delimited by spaces and/or commas and/or ">"
and/or end of line

Entry_Title ::= "Entry_Title" + "":" |"=" + textline

textline ::= 1 to 80 characters from the printable ASCII
character set plus continuation if any.

Start_Date ::= "Start_Date" + ":" |"=" + Date_time

Stop_Date ::= "Stop_Date" + ":" |"=" + Date_time

Date_time ::= yyyy-mm-ddThh:mm:ssZ
(Thh:mm:ssZ part is optional and may be
omitted if time is not significant;
the final "Z" should be omitted if time is
not GMT (UTC))

Sensor_Name ::= "Sensor_Name" + ":" |"=" +
Sensor_short + 0{">" + Sensor_long}

Sensor_short ::= word
Sensor_long ::= textline

Source_Name ::= "Source_Name" + ":" |"=" +
Source_short + 0{">" + Source_long}

Source_short ::= word
Source_long ::= textline

Investigator ::= "Group" + ":" |"=" + "Investigator" +
Personal_data + "End_Group"

Technical_contact ::= "Group" + ":" |"=" + "Technical_contact" +
Personal_data + "End_Group"

Author ::= "Group" + ":" |"=" + "Author" +
Personal_data + "End_Group"

Data_Center ::= "Group" + ":" |"=" + "Data_Center" +
Data_Center_info + "End_Group"

Data_Center_info ::= 
Data_Center_Name +
1[Dataset_ID]n +
Data_Center_Contact

Data_Center_Name ::= "Data_Center_Name" + ":" |"=" +
Center_short + 0{">" + Center_long}

Center_short ::= word
Center_long ::= textline

Dataset_ID ::= "Dataset_ID" + ":" |"=" + textline +
0{">" + textline}
Data_Center_Contact ::= 
   "Group" + ":"|=" + Data_Center_Contact" + 
   Personal_data + 
   "End_Group"

Originating_Center ::= "Originating_Center" + ":"|=" + 
   Center_short

Personal_data ::= 
   Last_name + 
   First_name + 
   0{Middle_name}1 + 
   0{Email_address}5 + 
   0{Phone}2 + 
   Address

Last_name ::= "Last_name" + ":"|=" + word
First_name ::= "First_name" + ":"|=" + word
Middle_name ::= "Middle_name" + ":"|=" + word
Email_address ::= "Email" + ":"|=" + 
   Network_name + ">" + Network_address

Network_name ::= word
   where word is one of:
      "SPAN", "Telemail", "Internet", "NSI/DECnet", "BITNET", "OMNET"

Network_address ::= textline
Phone ::= "Phone" + ":"|=" + textline
Address ::= "Group" + ":"|=" + Address + 
   1{textline}5 + "End_Group"

Campaign_or_Project ::= 
   "Campaign" | "Project" + ":"|=" + 
   c_p_short + 0{"">" + c_p_long}1

   c_p_short ::= word
   c_p_long ::= textline

Storage_medium ::= textline

Parameter ::= "Parameter" + ":"|=" + h_spec
   (See Appendix E.)

   h_spec ::= word + 0{"">" + word}n

Discipline ::= "Discipline" + ":"|=" + h_spec
   (See Appendix C.)

Coverage ::= "Group" + ":"|=" + "Coverage" + 
   Lat_Long_Coverage | RA_Dec_Coverage | Gal_Coverage + 
   "End_Group"

   Lat_Long_Coverage ::= Minimum_latitude + 
      Maximum_latitude + 
      Minimum_longitude + 
      Maximum_longitude + 
      0{Coord_system}1

   RA_Dec_Coverage ::= Minimum_RA + 
      Maximum_RA +
\[ Gal\_Coverage ::= Minimum\_Gal\_Lat + \]
\[ \text{Maximum}\_Gal\_Lat + \]
\[ \text{Minimum}\_Gal\_Long + \]
\[ \text{Maximum}\_Gal\_Long + \]
\[ 0\{'Epoch}' + \]
\[ 0\{'Equinox}' + \]
\[ Minimum\_lat\_itude ::= "Minimum\_lat\_itude" + ":" + Lat\_spec \]
\[ Maximum\_lat\_itude ::= "Maximum\_lat\_itude" + ":" + Lat\_spec \]
\[ Minimum\_lon\_gitude ::= "Minimum\_lon\_gitude" + ":" + Lon\_spec \]
\[ Maximum\_lon\_gitude ::= "Maximum\_lon\_gitude" + ":" + Lon\_spec \]
\[ Coord\_system ::= "Coord\_system" + "::" + Co\_Sys \]
\[ Minimum\_RA ::= "Minimum\_RA" + "::" + RA\_spec \]
\[ Maximum\_RA ::= "Maximum\_RA" + "::" + RA\_spec \]
\[ Minimum\_Dec ::= "Minimum\_Dec" + "::" + Lat\_spec \]
\[ Maximum\_Dec ::= "Maximum\_Dec" + "::" + Lat\_spec \]
\[ Minimum\_Gal\_Lat ::= "Minimum\_Gal\_Lat" + "::" + Lat\_spec \]
\[ Maximum\_Gal\_Lat ::= "Maximum\_Gal\_Lat" + "::" + Lat\_spec \]
\[ Minimum\_Gal\_Long ::= "Minimum\_Gal\_Long" + "::" + Lon\_spec \]
\[ Maximum\_Gal\_Long ::= "Maximum\_Gal\_Long" + "::" + Lon\_spec \]
\[ Epoch ::= "Epoch" + "::" + YYYYf \]
\[ Equinox ::= "Equinox" + "::" + YYYYf \]
\[ Lat\_spec ::= \text{signed integer in \([-90,90]\)] + \text{integer in \([0,90]\)} + \text{integer in \([0,180]\)} + \text{"N"\text{or}"S"} \]
\[ Lon\_spec ::= \text{signed integer in \([-180,180]\)] + \text{integer in \([0,180]\)} + \text{"E"\text{or}"W"} \]

where \( N \) indicates latitudes north of the Equator (0 degrees N or S), \( S \) indicates latitudes south of the Equator, \( E \) indicates longitude east of Greenwich (0 degrees E or W), and \( W \) indicates longitude west of Greenwich, and where (-) indicates latitudes south of the equator (or ecliptic) or longitudes west of the prime meridian (Greenwich), and (+) indicates latitudes north of the equator (or ecliptic) or longitudes east of the prime meridian (or vernal equinox or galactic center).

\[ RA\_spec ::= \text{integer in \([0,24]\)} + \text{"H"} + \text{"::"} + \text{integer in \([0,180]\)} + \text{"M"} + \text{"::"} + \text{integer in \([0,180]\)} + \text{"S"} + \text{"M"} + \text{"::"} + \text{integer in \([0,180]\)} \]
\[ YYYYf ::= \text{word} \]
\[ Co\_sys ::= "Earth" + \text{planet} \]

where planet is a planet name from those listed in the location keyword list (Appendix D).

\[ Location ::= "Location" + "::" + \text{h\_spec} \]

(See Appendix D.)
Keyword ::= "Keyword" + "":"|"=" + word

Revision_Date ::= "Revision_Date" + "":"|"=" + Date_Time

Science_Review_Date ::= "Science_Review_Date" + "":"|"=" + Date_Time

Future_Review_Date ::= "Future_Review_Date" + "":"|"=" + Date_Time

Reference ::= "Group" + "":"|"=" + "Reference" + l{textline}n + "End_Group"

Quality ::= "Group" + "":"|"=" + "Quality" + l{textline}n + "End_Group"

Summary ::= "Group" + "":"|"=" + "Summary" + l{textline}n + "End_Group"
Appendix B

Overall Examples

Purpose

This appendix provides overall examples for the construction of DIF files. The examples present a range of different data set types and their translations into directory entries.
Overall Examples

1. The following DIF file example presents an NSSDC multiple data set directory entry. Four data sets from the NSSDC inventory are aggregated into a single entry in this example.

Entry_ID: 78-041A-01A
Entry_Title: "Heat Capacity Mapping Mission (HCMM) Visible and IR Imagery and Day/Night Registered Imagery"
Start_date: 1978-06-06
Stop_date: 1980-09-07
Sensor_name: HCMR>HCMM RADIOMETER
Source_name: HCMM>HEAT CAPACITY MAPPING MISSION
Group: Investigator
   First_name: W.
   Last_name: BARNES
Group: Address
   CODE 625
   NASA-GSFC
   GREENBELT, MD 20771
End_Group
End_Group
Group: Technical_Contact
   First_Name: L.
   Last_Name: Stuart
   Phone: (301) 286-3157
Group: Address
   CODE 620
   NASA-GSFC
   GREENBELT, MD 20771
End_Group
End_Group
Group: Data_Center
   Data_Center_Name: NSSDC
   Dataset_Id: 78-041A-01A
   Dataset_Id: 78-041A-01B
   Dataset_Id: 78-041A-01C
   Dataset_Id: 78-041A-01D

      Earthnet User Services
      C.P. 64
      00044 Frascati Italy
End_Group
End_Group
The Heat Capacity Mapping Mission Radiometer (HCMR) which flew on board the Heat Capacity Mapping Mission (HCMM) collected visible and thermal infrared day/night data which may be useful for a variety of Earth science studies such as making thermal inertia studies for the discrimination of rock types and mineral resource location, measuring plant canopy temperatures, observing soil temperature cycles, and mapping natural and man-made thermal effluents.

The HCMM local times of equator crossings were 2 PM (ascending node) and 2 AM (descending node). This provided day/night coverage about once every 16 days at approximately 12-hour intervals depending on latitude. The HCMM provided global coverage from 85 N to 85 S, but due to the lack of onboard recorders, image acquisition was limited by the availability of ground receiving stations. Areas covered include parts of the United States, western Canada, western Europe, northern Africa, and eastern Australia. The spatial resolution for this data is approximately 600 m at nadir for the IR channel (10.5 - 12.5 micrometers) and 500 m for the visible channel (0.5 - 1.1 micrometers). Specific coverage information is available from NSSDC.

HCMM radiometer image data are available in both film (NSSDC ID 78-041A-01A) and digital (CCT) format (NSSDC ID 78-041A-01B) at a scale of 1:4,000,000. The film products are on 241-mm rolls (totalling about 25,000 scenes), and are available as positive or negative prints or transparencies and contain, in addition to the actual imagery, annotation information, a gray scale, frame identification (id), resolution targets, registration marks, and tick marks (Hotine oblique mercator coordinates). Digital HCMM data are arranged in a band sequential (BSQ) format.
In addition, HCMM images are available as day/night registered imagery in both film (NSSDC ID 78-041A-01C) and digital format (NSSDC ID 78-041A-01D), also with a scale of 1:4,000,000. These day/night registered data consist of five types of images: visible, day thermal infrared, night thermal infrared, the temperature difference, and the apparent thermal inertia. Day/night registered data also contain a 16-step gray scale, time and location annotation, geometric correction information, etc.

All HCMM data are available from the NSSDC. HCMM data acquired at Lannion, France, may also be ordered from ESA Earthnet User Services.

End_Group
Group: Reference

End_Group
2. The following is an example of a multi-data source, multi-sensor directory entry from the NASA Climate Data System. Note that the DIF file does not capture the relationship between a specific sensor and a specific source.

Entry_ID: ISCCPB
Entry_Title: "Global Radiance Data from International Satellite Cloud Climatology Project (ISCCP-B)"
Parameter: Radiance and Imagery > Visible
Parameter: Radiance and Imagery > Infrared
Sensor_name: AVHRR>ADVANCED VERY HIGH RESOLUTION RADIOMETER
Sensor_name: VAS>VISSR ATMOSPHERIC SOUNDER
Sensor_name: MIR>MULTISPECTRAL IMAGING RADIOMETER
Sensor_name: VISSR>VISIBLE INFRARED SPIN SCAN RADIOMETER
Source_name: NOAA-7
Source_name: NOAA-8

Group: Summary
This data set contains visible and infrared radiance data from imaging radiometers (AVHRR, MIR, and VISSR) onboard several satellites (NOAA, GOES, and METEOSAT) collected as part of the International Satellite Cloud Climatology Project (ISCCP) which focuses on the derivation of a global climatology of cloud radiative properties. The ISCCP covers a five-year period July 1983 through June 1988.

These radiance values have been reduced from the original resolutions of each of the satellites and are available at 10km resolution (ISCCP-B1) or 30km resolution (ISCCP-B3). In addition, radiances were temporally reduced to observations sampled every 3 hours, with the exception of GMS-2 and the polar orbiters. In processing radiances observed by different satellites, radiances values were normalized to a single standard radiometer the calibrations of geostationary radiometers compared to the AVHRR sensor carried on the NOAA polar orbiter.

The ISCCPB radiance data set is being processed through the cooperation of several processing centers. The ISCCP-B1 (10km resolution) data will be available on approximately 1988 6250-bpi tapes per year. The ISCCP-B3 (30km resolution) will be available on approximately 144 6250-bpi tapes per year. The ISCCP data are archived at the ISCCP Central Archive at NOAA/NESDIS. ISCCP-B3 data are also available through NASA's Climate Data System (NCDS). The ISCCP Cloud Property data set (ISCCP-C) may also be of interest. This data set contains cloud, atmospheric, and surface parameters derived from the ISCCP-B radiance data and other ancillary data.

The Scanning Multichannel Microwave Radiometer (SMMR) is a passive microwave radiometer measuring dual polarized microwave radiation from the Earth's surface and atmosphere in 5 frequencies: 6.63, 10.69, 18.0, 21.0 and 37.0 GHz. SMMR swath width is 600 km. SMMR flew aboard the NIMBUS-7 platform which has a height of 950 km and an inclination of 99.3 degrees.

The TOGA Heat Exchange Project (THEP) will make available processed satellite data to the NODS archive system. This data set represents the first phase of a two phase project. The data parameters are: sea surface temperature, (degrees centigrade), integrated water vapor (grams/cm²), surface-level wind speed (m/s) and latent heat flux (W/m²). THEP data covers the tropical oceans from 30 degrees south latitude to 30 degrees north latitude, with an areal resolution of 2 degrees latitude by 2 degrees longitude. The data begins in January 1980 and is ongoing. Monthly averages of the parameters are available.

Data Set Description

This data set contains the best estimates for the electron moment density and temperature. Adjacent low and high energy electron measurements are combined to form a composite spectra which is used for the moment calculation. The moment calculations generally are performed as described in Scudder et al. (JGR, 86, 8157, 1981) except on day 64. On day 64 the PLS ion densities were used to constrain the electron densities from 0415-1400 and from 1830-1940, and PRA densities were used to constrain electron densities from 1400 to 1830. These constraints and analysis are described in Sittler and Strobel (JGR, 92, 5741, 1987).

Instrument Description

The Voyager plasma science experiment consists of four modulated grid Faraday cups, three (A, B, C) of which are positioned about the main antenna axis and generally point toward the Earth with the fourth (D) at a right angle to this direction. Ion currents are sampled simultaneously in all four cups, electrons in the D-cup only. The instrument has an energy range of 10-5950 eV. Data is taken in four modes: high and low resolution ion modes, and high and low energy electron modes.

  Boggs, D. H. and G. H. Born, Seasat Geophysical Data Record (GDR)
  Users Handbook: Scatterometer. NASA, Jet Propulsion Laboratory,
  California Inst. of Technology, Pasadena, CA [JPL-622-232],
  Kirwan, A. D., T. J. Ahrens, and G. H. Born, eds., "SEASAT Special Issue II:
  Scientific Results," JGR, 88(c3), February, 1983.
Group: Summary
  SEASAT was launched on June 28, 1978, carrying a five sensor payload, and
  operated successfully until a power failure brought transmission to a stop on
  October 10, 1978. Its height and inclination were 791 km and 108.0 deg.,
  respectively.

The microwave scatterometer (SASS) on the SEASAT-A satellite had the goal of
determining the surface vector wind stress over the oceans and the neutral
stability wind vector at a 19.5 m reference height. The physical basis for
the measurement technique is the Bragg scattering of microwaves from
centimeter length capillary ocean waves created by the surface wind. The
strength of the radar backscatter is proportional to the capillary wave amplitude, which is in equilibrium with the wind friction speed. SASS cut two 500 km swaths 400 km apart along the ground track on either side of nadir. In addition, there was a central swath 140 km wide, centering on nadir. SASS had a 50 km resolution cell and 100 km spacing between cells. The FOV was +/- 0.25 degrees "cross cone." Pulse duration was 4.8 milliseconds, and the data stream was updated every 1.89 seconds.

Global coverage was achieved within the extremes +/-79 deg. latitude. From July 7 - August 17, 1978, the ground track equatorial spacing was 165 km. From August 18 - October 10, 1978 (the date that SEASAT terminally malfunctioned), the ground track equatorial spacing was 900 km. From July 7 to August 26, 1978, the ground track was repeated every 17 days. From August 27 to October 10, 1978, the ground track repeated once every 3 days.

This data set contains Level 2.0 backscatter coefficient corrected for atmospheric and oceanic attenuation. It also contains windspeed and 4 possible directions ("ambiguities") derived from the backscatter coefficient. Output is Geophysical Data Record (GDR) magnetic tapes, with a measurement temporal resolution of 1.89 seconds.

For wind speed of 4-26 m/s, the error was +/- 2 m/s or 10%, whichever was greater. For winds above 20 m/s in non-heavy rain areas, the mean error was +/- 2.4 m/s. The mean error for wind direction was +/- 20 degrees.

Related Data Sets: SEASAT SASS (Levels 1, 1.5 and 2.5)
Altimeter (Levels 1, 1.5, 2 and 2.5)
SMMR (Levels 1, 1.5, 2 and 2.5) and
SAR (Levels 1 and 1.5)
Robert Atlas Dealiased SASS winds (Level 2.5)

Data Set Status: COMPLETE
Level 2.0 tapes are maintained by NODS and can be ordered via the NODS on-line inventory system for the entire 96 day SEASAT mission. These data reside on 548 (1600 bpi) magnetic tapes.

Appendix F

Glossary

Purpose

This appendix defines acronyms and other important terms that are used in this manual and terms that may be used in writing DIF entries. The glossary section of this appendix contains the latest version of the Earth Science and Applications Data Systems (ESADS) lexicon.
Glossary

F.1 Acronyms

ASCII: American Standard Code for Information Interchange
DIF: Directory Interchange Format
DPDC: Data Processing and Distribution Center
ESADS: Earth Science and Applications Data Systems
ISO: International Organization for Standardization
NASA: National Aeronautics and Space Administration
NCDS: NASA Climate Data System
NODS: NASA Ocean Data System
NSI: NASA Science Internet
NSN: NASA Science Network
NSSDC: National Space Science Data Center (NASA)
PCDS: Pilot Climate Data System
PDS: Planetary Data System
PLDS: Pilot Land Data System
SFDU: Standard Formatted Data Unit
SPAN: Space Physics Analysis Network
F.2 Lexicon

Interim ESADS Lexicon

Sites and Facilities

(Note that a given organization may satisfy more than one of the definitions below; for example, many data centers are archives.)

Active Data Base Site - A site where data are being used actively in research and from which those data and resident expertise may be obtained.

Data Archive - A facility providing indefinitely long storage, preservation, disposition, and distribution of data sets and associated metadata.

Data Center - An institutionally supported facility providing convenient access to, manipulation of, and/or distribution of data sets (including supporting information and expertise) for a wide community of users. It has a long term charter (not tied to the lifetime of a specific project). A data center can create Special Data Products when needed.

Data Processing and Distribution Center (DPDC) - A facility that processes, maintains, and distributes data during the active phase of a spaceflight or other project.

Institutional DPDC - A DPDC supported by institutional resources and acting as a DPDC for a series of projects.

Project DPDC - A DPDC funded by and operated by (or for) a specific project.
Interim ESADS Lexicon

Data Types

Ancillary Data - Data other than instrument data needed for the processing and correct interpretation of the instrument's science data (e.g., spacecraft orbit/attitude, instrument pointing information, calibration data, meteorologic conditions).

Correlative Data - Data used to extract additional information from a given data set (e.g., two data sets may be correlative to each other).

Data - The representative forms of information, including facts, concepts, rules, or any other kind of knowledge.

Instrument Data - Data produced by the science and engineering sensors of an instrument.

Instrument Engineering Data - Data produced by an instrument's engineering sensor(s) (e.g., instrument temperature).

Instrument Science Data - Data produced by an instrument's science sensor(s) and containing the primary observables.

Near Real-Time Data - Data from the source that are available for use within a time that is short in comparison to important time scales in the phenomena being studied.

Playback Data - Data stored on a spacecraft, platform, or other carrier that are transmitted at a later time.

Raw Data - Numerical values representing the direct observations output by a measuring instrument in the order they were obtained after all effects of transmission have been removed.

Quick-Look Data - Data available for examination within a short time of receipt, where completeness of processing is sacrificed to achieve rapid availability.

Real-Time Data - Data received from the source with only propagation delays.
**Telemetry Data** - Electromagnetically transmitted data stream of measured values that may be in analog or digital format.
Interim ESADS Lexicon

Data Collection /Hardware

**Instrument** - An integrated collection of hardware containing one or more sensors and associated controls designed to produce data on an environment.

**Commercial Instrument** - An instrument developed and operated by a private organization whose data are sold commercially to the general user community.

**Operational Facility Instrument** - An instrument developed and operated by a national or international agency (e.g., NOAA, DOD) to support its operational requirements. Data from such an instrument may be made available to the research community.

**Principal Investigator Instrument** - An instrument developed and managed by a Principal Investigator (PI) selected through the NASA, or equivalent, Announcement of Opportunity (AO) process.

**Prototype Instrument** - An instrument primarily intended as a prototype for developing an operational instrument capability. The instrument may be replaced by an operational model or declared operational after the functional utility of the instrument is understood.

**Research Facility Instrument** - An instrument provided and managed by an institution for use by a group of approved investigators. Data from the instrument may be made available for the operational applications.

**Sensor** - A device that transmits an output signal in response to a physical input stimulus (as radiance, sound, etc.). Science and engineering sensors are distinguished according to the stimuli to which they respond.
Interim ESADS Lexicon

Data Aggregation

**Browse Data Set** - A data set, typically of limited size and resolution, created to rapidly provide an understanding of the type and quality of available full resolution data sets. It may also enable the selection of intervals for further processing or analysis of physical events. For example, a browse image might be a reduced resolution version of a single channel from a multi-channel instrument. *Note:* Full resolution data sets may be browsed, (see Browse, page F-13).

**Data Base** - (1) A collection of data sets with supporting metadata related to a system, project, or facility. (2) A collection of integrated data serviced by a Data Base Management System (DBMS), often organized for quick search and retrieval.

**Data Granule** - The smallest aggregation of data that is independently managed (i.e., described, inventoried, retrievable). Granules may be managed as logical granules and/or physical granules.

- **Logical Granule** - The smallest aggregation of data independently identified (i.e., described, inventoried).
- **Physical Granule** - The smallest aggregation of data independently accessible (i.e., located, readable, copyable) on physical media.

**Data Item(s)** - Value(s) of a measured or derived parameter, implicitly or explicitly accompanied by an identification of the points in independent variable space where the value(s) applies (e.g., x, y, z, t; a, b, c).

**Data Set (Dataset)** - A logically meaningful grouping or collection of similar or related data. Data having mostly similar characteristics (source or class of source, processing level and algorithms, resolution, etc.) but different independent variable ranges are normally considered part of a single data set.

**Data Product** - A uniformly processed and formatted data set, portion of a data set, or transformed representation of data (e.g., plot, photograph, digital image); may be produced by (or for) a project or by a data center.

**Standard Data Product** - (1) A data product, produced for a wide community, over most or all of the available independent variable space generated using fixed processing algorithms. (2) A data product produced to a format or on a medium that can be requested from a data center using its normal ordering procedure.
Interim ESADS Lexicon

Data Aggregation (continued)

Special Data Product - (1) A data product produced for specific use over a limited range of independent variable space or using non-standard processing algorithms. (2) A data product produced to a format or on a medium that a data center or DPDC produces under special arrangements (e.g., to user specifications).
Interim ESADS Lexicon

Metadata

**Catalog Service** - A set of information, consisting of some or all of directory, catalog (guide), and inventories, combined with a mechanism to provide responses to queries, possibly including ordering data.

**Catalog System** - A specific implementation of a catalog service.

**Data Set Catalog** - A uniform set of detailed descriptions of a number of data sets and related entities, containing information suitable for making a determination of the nature of each data set and its potential usefulness for a specific application; also called a Data Set Guide.

**Data Set Directory** - A uniform set of descriptions of a large number of data sets containing information suitable for making an initial determination of the existence and nature of each data set. Each directory entry contains brief data set information (e.g., type of data, data set name, time and location bounds).

**Data Set Guide** - See Data Set Catalog.

**Data User Guide** - A document, either on line or hard copy, containing the necessary information for the correct usage of the data.

**Directory (General)** - A uniform set of descriptions of a class or classes of entities (e.g., data sets, data sources, Data Set Catalogs) with pointers to more details and to the entities themselves, as appropriate.

**Directory Service** - A directory, possibly supplemented with other kinds of information, combined with a mechanism to provide responses to queries.

**Directory System** - A specific implementation of a directory service.

**Inventory** - A uniform set of descriptions of granules from one or more data sets with information required to select and obtain a subset of those granules. Granule descriptions typically include temporal and spatial coverage, data quality indicators, and physical storage information. An inventory may describe physical granules, logical granules, or both, including a mapping between them if they are not identical.
**Inventory Service** - An inventory, possibly supplemented with other kinds of information, combined with a mechanism to provide responses to queries, possibly including ordering data.
Interim ESADS Lexicon

**Metadata (continued)**

**Inventory System** - A specific implementation of an inventory service.

**Metadata** - Information describing a data set, including data user guide, descriptions of the data set in directories, catalogs, and inventories, and any additional information required to define the relationships among these.
Interim ESADS Lexicon

Data Storage

**File** - (1) A set of one or more related physical records treated as a unit. For example, a file is the unit characterized in an operating system's directory for disk storage. (2) An unstructured stream of bytes of a specified length (in bytes), referenced by a name string.

**Logical Record** - A collection of data whose location and extent are defined in terms of the information they contain and not in terms related to the physical medium on which they are stored. Portions of the same logical record may be located in different physical records, or several logical records may be located in one physical record.

**Logical Volume** - That portion of a volume viewed by a computer operating system as a complete collection of available files. For instance, with today's WORM optical disk drives, each side of a two-sided disk is a logical volume.

**Physical Record** - A collection of data whose location and extent are defined in terms related to the physical medium on which it is stored. A physical record may contain one or several logical records or a part of a logical record.

**Volume** - A unit of physical media containing data, usually physically interchangeable with other volumes of a similar type, and requiring a specific device for reading or writing (e.g., a dismountable CD-ROM).

**Physical Medium** - Any physical material capable of holding data (e.g., pages, film, magnetic tape, optical disk, wire, silicon).
Interim ESADS Lexicon

Miscellaneous Terms

Browse - (1) To look over or through data or some representation of data in search of something of interest. (2) To view data, metadata, or browse data sets to determine the usefulness of the data to some application.

Discipline - A field of study (e.g., oceanography, meteorology, geology, land biology).

Data Rights - An agreement between the funding agent, the project, and the investigation team whereby the team is accorded exclusive use of data for a limited period of time.

Data System - An integrated system containing data catalog(s) and inventories as well as data storage, access, manipulation, retrieval, and display capabilities.

Parameter - A measurable or derived variable.

Principal Investigator (PI) - The individual selected by proposal review with primary responsibility for preparing the proposal, selecting the investigation team, carrying out the investigation, and reporting the results. Responsibilities often include supplying an instrument.

Co-Investigator - An individual selected by the Principal Investigator who typically provides support in preparing the proposal and who has specific responsibilities in the development, operations, or analysis phases of the investigation.

Guest Investigator - An individual who receives data rights to the project data based on approval of a research proposal.

Interdisciplinary Scientist - An individual selected by the project and/or the peer review process who is responsible for conducting investigations requiring analysis, interpretation, and use of data crossing instrument and discipline boundaries.

Participating Scientist - An individual selected by the funding agency who joins the investigation during the data acquisition and analysis phase.
Appendix G

SFDU Headers on DIF Files

Purpose

This appendix defines the Standard Formatted Data Unit (SFDU) header, which may be placed in front of the DIF file to identify it as a standard registered format for the transfer of information.
SFDU Headers on DIF Files

The SFDU header is a fixed ASCII character string that may be added to the front of a DIF file as an added form of documentation. It is recognizable to the international community as an indicator that the file is written according to a standard registered format obtainable from the SFDU control office that issued the registration number. In this case the DIF file as defined by this manual has been registered at the SFDU control office in the National Space Science Data Center at Goddard Space Flight Center.

This appendix will not describe all of the elements of the SFDU header. The definition of these headers may be found through literature available through any of the SFDU control offices.

In general, the ASCII character string elements that make up the header are as follows (note that cf represents the combination of the carriage return and line feed characters and no other carriage returns or line feeds should be assumed):

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CCSD1Z0000001</td>
<td>This part indicates this package is an SFDU.</td>
</tr>
<tr>
<td>00000069</td>
<td>This is the number of bytes that follow in the HEADER.</td>
</tr>
<tr>
<td>CCSD1R0000003</td>
<td>This part identifies a subheader that defines conventions used in the body of the package.</td>
</tr>
<tr>
<td>00000049</td>
<td>This is the number of bytes for the remainder of the subheader.</td>
</tr>
<tr>
<td>DELIMITER=EOFcf</td>
<td>This determines how the package ends.</td>
</tr>
<tr>
<td>PROTOCOL=NONEcf</td>
<td>This determines the protocol.</td>
</tr>
<tr>
<td>TYPE=NSSD1I0000003cf</td>
<td>This defines the following part of the package as standard format #3 registered at the NSSDC Control Office.</td>
</tr>
</tbody>
</table>

Putting all of this together as an ASCII character string attached to the front of a DIF file, the following would be seen at the receiving end.

```
CCSD1Z00000100000069CCSD1R00000300000049DELIMITER=EOF
PROTOCOL=NONE
TYPE=NSSD1I0000003
Entry_ID: Sample_DIF_1
...
```

Here are the other DIF fields...
...

In this case the line feed and carriage returns are indicated only by the start of a new line. The end of the package is the standard ending character added automatically by computers as the end of the file.

In summary, the character string to be added to the front of a DIF file to identify it as an SFDU standard is

```
CCSD1Z00000100000069CCSD1R00000300000049DELIMITER=EOF
```
where carriage returns and line feeds occur at the ends of each of the lines (these are usually inserted automatically when the carriage return is pushed).
