REMOTE HYDROGEN SENSING TECHNIQUES

prepared for
MARSHALL SPACE FLIGHT CENTER

prepared by
C L PERRY ASSOCIATES, PO BOX 4325, HUNTSVILLE, AL 35815
STATEMENT OF WORK

OBJECTIVES
The objective of this project is to evaluate remote hydrogen sensing methodologies utilizing metal oxide semi-conductor field effect transistors (MOS-FET) and mass spectrometric (MS) technologies and combinations thereof.

APPROACH
The research program is to be structured as a feasibility study. Combinations of MOS-FET sensors and MS instrumentation systems shall be assessed for application to remote hydrogen sensing. As remote monitoring through computer data acquisition systems is an accepted technology, it is anticipated that several instrumentation/sensor combinations may exhibit potential for detection and monitoring of hydrogen leaks remotely. It is the goal of the feasibility study to identify the optimum approach by tailoring the system to the engine test stand or test bed configuration. This phase is expected to require approximately four months for completion.

Following the identification of the optimum approach, testing and development of the system or systems selected in the initial phase shall be performed. Test plans shall be defined and the approved test program completed for the optimization of instrumentation combinations. The resulting test methodology shall be demonstrated to MSFC personnel. A final report documenting the accomplished research shall be submitted at the conclusion of the project.

TASK 1 CALIBRATION OF MOS-FET/HYDROGEN DETECTION SYSTEM
The approach governing the assessment is to tailor the government furnished MOS-FET hydrogen sensors, portable mass spectrometers, data acquisition system and computer to the specific research task. The resulting configuration will be calibrated using known gas concentrations for verification and quantification.

TASK 2 INTERFACING OF OPTIMIZED DETECTION SYSTEM TO TEST BED/TEST STAND ENVIRONMENT
The optimized detection system will be interfaced and installed with the hardware provided by EP55 for area monitoring of the test bed/test stand. EP55 will provide a sample transport lines, valving and sequencing, additional data processing capability and support personnel as needed for interfacing.

TASK 3 FINAL REPORT
A final report documenting the research which has been accomplished and including identification of shortfalls or problem areas and recommendations for further work shall be submitted at the conclusion of the project.
INTRODUCTION

The concept for this project was formulated during the course of a previous contract in which some preliminary tests of a MOS/FET detector as a hydrogen detector were performed. A portable hydrogen leak detector, Sensistor AB model 8012, procured from Sensistor AB, Linkoping Sweden, was used to detect traces of hydrogen from a foam insulated test article.

It was proposed that an array of these small probes could be strategically located in a facility and provide coverage of a wide area with a warning system to detect hydrogen leaks. The Sensistor AB has a multiprobe control box, model 8506, which allows the simultaneous conditioning of six hydrogen sensors, model HS85. It is necessary to supply a 12 volt DC source to the box and monitor the gas dependent output voltage.

Two portable mass spectrometers had recently been procured to provide field support to the Test Laboratory. The Perkin-Elmer model MGA-1200 and Model MGA-1600 were obtained from The Perkin-Elmer Corporation, Applied Science Division, Pomona, CA 91767. The mass spectrometers, along with the MOS/FET probes could cover requirements to monitor for any of the air gasses as needed.

TASK 1 CALIBRATION OF MOS-FET/MS HYDROGEN DETECTION SYSTEM

The MOS-FET Hydrogen sensor system consists of a Sensistor model 8506 six probe control box with six solid state (MOS-FET) sensor probes, a Keithley model 500 data acquisition system with a computer interface, Keithley SOFT500 proprietary software, and a digital computer running under the DOS 3.2 operating system and GWBASIC interpreter. Figure 1 is a schematic of the MOS-FET/MS test setup used for testing and calibration of the system.

The mass spectrometer system (MS) is actually two mass spectrometers, a Perkin-Elmer model MGA-1200 continuous ratio reading mass spectrometer and a Perkin-Elmer model MGA-1600 computer controlled mass spectrometer.

Six channels of the MOS-FET system were assembled into a gas manifold consisting of six 3/4 inch plastic plumbing T's and tested for response and sensitivity. It was discovered that, although the MOS-FET sensors are very sensitive to hydrogen in the low parts-per-million (ppm) range, the recovery to the original voltage levels before having sensed hydrogen was very slow.

The quantitative response to hydrogen also decreased unpredictably after multiple rapid exposures to hydrogen. For this reason, the MOS-FET system will only be recommended for area monitoring to indicate the presence of hydrogen without quantifying the amount present.

The two mass spectrometer systems were calibrated using bottles of gas mixtures as specified in the vendor operating and maintenance manuals. The gas sampling systems of the two mass spectrometers were connected in series so that a given gas sample was analyzed first by one mass spectrometer and then by the other. Monitoring of the outputs showed that both were stable over a period of several days.
Several BASIC language computer programs were written to support this task. One set of programs allow the simultaneous monitoring of six Sensistor MOS-FET probes and the four data channels of the MGA-1200 mass spectrometer with simultaneous recording of data to a disk file and on-screen display. The recorded data can be redisplayed or played back from the disk file. Another similar set of programs allow the same data display, recording and playback for the two mass spectrometers operating in tandem. These programs and documentation are presented in the attached appendix.

**TASK 2 INTERFACING OF OPTIMIZED DETECTION SYSTEM TO TEST BED/TEST STAND ENVIRONMENT**

Following the calibration and laboratory testing, the MOS-FET/MS system was delivered to EP55 in the East Test area and installed in an instrument trailer for integration into the Test Laboratory environment. The mass spectrometer systems were given preliminary checkouts and were functioning normally. A system response test was performed and showed a response of about 5 seconds when sampling from a distance of 30 feet.

Test Laboratory personnel decided not to use the Keithley data acquisition system and will provide their own valve and instrument control and data acquisition systems in order to be compatible with test stand operations.

Test Laboratory is in the process of assembling a sampling and calibration valve manifold for the system. Several delays in the delivery of the test article which this project was to support brings this project to the present time with no clear delivery schedule in sight.

**RECOMMENDATIONS FOR FURTHER WORK**

It is recommended that the MOS-FET/MS system be fully field tested for response to hydrogen and other gases of interest following the completion of the system integration.

Consideration should be given to another mass spectrometer system which EH32 has. It is the Perkin-Elmer Industrial Central Atmosphere Monitoring System model ICAMS-II. This system is capable of analyzing all the air gasses and several organic trace gasses simultaneously and monitoring a large number of locations sequentially. This system should be installed and evaluated as a permanent Test Stand support instrument.

Final Report

APPENDIX

MGA-1200/1600 Program Document

The program TWOMASS.BAS was written in GWBASIC in order to monitor the MGA-1200 and MGA-1600 Mass Spectrometer systems simultaneously. This program, when used in conjunction with the Keithley SOFT500 data acquisition software package and the Keithley model 500 Data Acquisition interface unit, allow for the acquiring of five channels of data from each mass spectrometer and the subsequent storage of the data on a computer disk. Sampling to the MGA-1200 mass spectrometer can also be controlled from the computer keyboard by typing the number 1 through 4 to select the desired sample inlet valve and by typing 0 to turn all the valves off. The stored data may be recalled and printed in tabular form on paper.

Before running this program, the operator must be assured that all of the proper cabling connections are in place. Reference to the Perkin-Elmer operating manuals for each mass spectrometer will show the connector and pin locations of the various signals from the mass spectrometers. The connections to the data acquisition board in the Keithley model 500 Data Acquisition box can be found in the following BASIC program listing. The CALL IONAME function assigns each signal to the data acquisition slot and channel. Each signal channel from the mass spectrometers must be connected to the channel as specified in the CALL IONAME for each channel.

If the program is to be executed immediately upon computer startup, the following lines must be included at the end of the AUTOEXEC.BAT file in the main directory:
\KEITHLEY\SETCLOCK -i OxFF8 -s
\KEITHLEY\HARDINIT -c OxFF8 CONFIG.TBL -p
CD\KEITHLEY
SOFT500

The SOFT500 software modules and GWBASIC.COM must be in the \KEITHLEY directory. Also in the \KEITHLEY directory is the program, AUTOEXEC.BAS which is used to initialize the SOFT500 system. By inserting the following line, the program will continue on and execute the mass spectrometer program:
250 TWOMASS.BAS

The program, TWOMASS.BAS, is used for data acquisition, real-time display of the data and recording to the computer fixed disk. The computer system is programmed to autostart the program, TWOMASS.BAS, when it is powered on or when it is reset (Ctrl,Alt,Del). After the startup process, the user is prompted by the system for required inputs. Answering the prompts will allow the user to describe the experiment, collect, record and display data at the desired intervals.
Data recording is in a file which is automatically created by the program. It is of the form:

T2041435.DAT

- • • • • • • • • — file extension
- • • • • • • • • — time file was created
- • • • • • • • — day of the month
- • • — month
- • — prefix letter

After an experiment is completed and the data acquisition is complete, the data can be recalled or played back from the disk storage with TWOPLAY.BAS. This program can be run after exiting TWOMASS.BAS by the following procedure:

LOAD "TWOPLAY.BAS"
RUN

or it may be run simply by typing:

RUN "TWOPLAY.BAS"

TWOPLAY.BAS may be run on any computer with GWBASIC capability. The file, TWOMASS.FIL, must also be present as it contains the parameters of the last experiment and is used by TWOPLAY.BAS upon startup. The data file, as described above, must also be present in the same directory.

To run TWOPLAY.BAS without running TWOMASS.BAS, start up the system in the normal manner. When TWOMASS.BAS comes up and asks for its first data entry, just type control-C to escape from the program to BASIC. The computer BASIC will prompt "Ok". Now load TWOPLAY.BAS and run it as above.

The following two lines are the contents of TWOMASS.FIL. This file allows the main and playback programs to print out the most immediately run experiment without the need to figure out the name of the file where the data are stored:

T5261036.DAT

The following two programs allow the simultaneous operation of the Perkin-Elmer MGA-1200 mass spectrometer and six MOS-FET hydrogen detection probes. Data from all channels are graphically presented on the computer monitor and recorded to the disk for subsequent playback and data analysis.

Operation of these two programs is similar to the previous programs.

**REPORT DOCUMENTATION PAGE**

**1. AGENCY USE ONLY (Leave Blank)**

**2. REPORT DATE**
November, 1992

**3. REPORT TYPE AND DATES COVERED**
Final, April to November, 1992

**4. TITLE AND SUBTITLE**
REMOTE HYDROGEN SENSING TECHNIQUES

**5. FUNDING NUMBERS**
H-07982D

**6. AUTHOR(S)**
CORTES L. PERRY

**7. PERFORMING ORGANIZATION NAME(S) AND ADDRESS(ES)**
C. L. PERRY ASSOCIATES
P. O. BOX 4325
HUNTSVILLE, AL 35815

**8. PERFORMING ORGANIZATION REPORT NUMBER**
NONE

**9. SPONSORING/MONITORING AGENCY NAME(S) AND ADDRESS(ES)**
NASA/MARSHALL SPACE FLIGHT CENTER
EH-32
MARSHALL SPACE FLIGHT CENTER, AL 35812

**10. SPONSORING/MONITORING AGENCY REPORT NUMBER**
NONE

**11. SUPPLEMENTARY NOTES**
N/A

**12a. DISTRIBUTION /AVAILABILITY STATEMENT**

**12b. DISTRIBUTION CODE**

**13. ABSTRACT (Maximum 200 words)**

Final report on a study to assess the feasibility of a combined Metal Oxide Semiconductor Field Effect Transistor (MOS-FET) and Mass Spectrometer (MS) system for remotely sensing hydrogen leaks in a test stand/test bed environment.

The MOS-FETs are suitable for low level qualitative detection whereas the MS is suitable for higher level quantitative detection.

**14. SUBJECT TERMS**
hydrogen leak detection, MOS-FET, MS

**15. NUMBER OF PAGES**
24

**16. PRICE CODE**

**17. SECURITY CLASSIFICATION OF REPORT**
unclassified

**18. SECURITY CLASSIFICATION OF THIS PAGE**
unclassified

**19. SECURITY CLASSIFICATION OF ABSTRACT**
unclassified

**20. LIMITATION OF ABSTRACT**
