NASA Lewis Research Center is developing advanced seal concepts and sealing technology for advanced combined cycle ramjet/scramjet engines being designed for the National Aerospace Plane (NASP). Technologies are being developed for both the dynamic seals that seal the sliding interfaces between articulating engine panels and sidewalls, and for the static seals that seal the heat-exchanger to back-up structure interfaces.

This paper will provide an overview of the candidate engine seal concepts, seal material assessments, and unique test facilities used to assess the leakage and thermal performance of the seal concepts.

Outline

- Introduction
- Flow Modeling
- High Temperature Material Friction and Wear Tests
- High Temperature Durability/Flow Assessments
- High Heat Flux Facility
- Summary
HYPERSONIC ENGINE PANEL-EDGE SEAL

HIGH SPEED FLOW

PANEL-EDGE SEAL
Flow Modeling

Ceramic Wafer Seal Flow Modeling

\[ \dot{M}_{TOT} = \dot{M}_{1} + \dot{M}_{2} + \dot{M}_{3} \]

- \( h_{1,v} \): Seal leakage gap heights
- \( h_{2,v} \): Seal-to-wall contact dim.
- \( h_{CTE} \): Seal length
- \( P_s;P_o \): Inlet & outlet pressures
- \( \mu;\rho;T \): Gas viscosity, density, temp.
- \( R \): Gas constant

</tr>
</tbody>
</table>

Where:

\[ \phi D_{f.avg} = \text{Characteristic length} \]

\[ e_{avg} = 1 - \frac{A_y N_c + A_y N_s}{t^2} \cos \theta \]
Braided Ceramic Rope Seal Leakage vs Temperature
Comparison of Measured and Predicted

$\Delta P = 10 \text{ psi}$

Leakage rate, lb/s ft

$14 \times 10^{-3}$

$\circ$ Measured

--- Predicted

$\varepsilon_{\text{avg}} = 0.43$

$\varepsilon_{\text{min}} = 0.22$

Tentative leakage limit

Temperature, F

$0 \quad 200 \quad 400 \quad 600 \quad 800 \quad 1000 \quad 1200 \quad 1400$

$\Delta P = 35 \text{ psi}$

Leakage rate, lb/s ft

$14 \times 10^{-3}$

$\circ$ Measured

--- Predicted

$\varepsilon_{\text{avg}} = 0.43$

$\varepsilon_{\text{min}} = 0.22$

Tentative leakage limit

Temperature, F

$0 \quad 200 \quad 400 \quad 600 \quad 800 \quad 1000 \quad 1200 \quad 1400$
High Temperature
Solid Seal Durability/Flow Studies

High Temperature Dynamic Seal Rig (U)

- Adjustable lateral preload system
- Test Seals: Rope or wafer seals
- Axial Preload
- Sabre
- Simulated wall roughness/waviness
- Percent crush (channel depth) or load (bellows) control
- High watt density surface heaters
- Seal Cartridge
- Hot, pressurized metered supply gas
- Temp. and pressure measurement
- Mesh heat exchanger

Braided Rope Seal

Rocket Nozzle Exit

CRL–22 Hot Gas Facility
Summary

- Hypersonic engines pose unique dynamic seal challenges:
  - Prevent leakage of combustible hydrogen/oxygen mixtures
  - Seal highly distorted sidewalls during sliding
  - Operate hot requiring minimum coolant
  - Resist mechanical abrasion and supersonic-flow erosion

- NASA Lewis has developed unique test capabilities for evaluating the seal/material performance under engine simulated conditions:
  - Materials/Lubricant Friction Apparatus
  - High Temperature Dynamic Seal Rig
  - High Heat Flux Facility

- NASA Lewis developed hybrid seal meets the dynamic engine seal life requirements at temperatures ≥1500 F.
